colorCount	(Mandatory)	The maximum number of colors that image should have after after reduction. Must be between 16 - 256.
blackAndWhite	false	A true value means the image will be converted to black and white (with grey levels). A false value means the image will not be converted to black and white.

Return Value
The actual number of colors the converted image has.

27.16.85 removeDynamicLayer(keepOriginal as boolean = false)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Removes the dynamic layer if any.

27.16.86 resize(newWidth as Integer, newHeight as Integer, filter as Integer = 1, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Resize the drawing surface.
Notes:

Argument	Default	Description
newWidth	(Mandatory)	The new width of the drawing surface in pixels.
newHeight	(Mandatory)	The new height of the drawing surface in pixels.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

27.16.87 ring(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other ring method, but uses color instead of integer data type for passing color values.
See also:

- 27.16.88 ring(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, edgeColor as Integer, fillColor as Integer) 5064

27.16.88 ring(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, edgeColor as Integer, fillColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Draws a ring.
See also:

- 27.16.87 ring(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, edgeColor as color, fillColor as color) 5064

27.16.89 ringSector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, a1 as Double, a2 as Double, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other ringSector method, but uses color instead of integer data type for passing color values.
See also:

- 27.16.90 ringSector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, a1 as Double, a2 as Double, edgeColor as Integer, fillColor as Integer) 5065

27.16.90 ringSector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, a1 as Double, a2 as Double, edgeColor as Integer, fillColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Draws a ring sector.
See also:

- 27.16.89 ringSector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, a1 as Double, a2 as Double, edgeColor as color, fillColor as color) 5064

27.16.91 rotate(angle as Double, bgColor as color, cx as Double = -1, cy as Double = -1, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other rotate method, but uses color instead of integer data type for passing color values.
See also:

- 27.16.92 rotate(angle as Double, bgColor as Integer = & hFFFFFF, cx as Double = -1, cy as Double = -1, filter as Integer = 2, blur as Double = 1.0) 5065

27.16.92 rotate(angle as Double, bgColor as Integer = & hFFFFFF, cx as Double = -1, cy as Double = -1, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Rotate the drawing surface.
Notes:

Argument	Default	Description
angle	(Mandatory)	The rotation angle measured clockwise in degrees.
bgColor	FFFFFF	The background color used to fill the space left after rotation.
cx	-1	The x coordinate of the center of rotation. -1 means rotating about the center of the drawing surface.
cy	-1	The y coordinate of the center of rotation. -1 means rotating about the center of the drawing surface.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

See also:

- 27.16.91 rotate(angle as Double, bgColor as color, cx as Double = -1, cy as Double = -1, filter as Integer = 2, blur as Double = 1.0) 5065

27.16.93 sector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other sector method, but uses color instead of integer data type for passing color values.
See also:

- 27.16.94 sector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, edgeColor as Integer, fillColor as Integer) 5066

27.16.94 sector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, edgeColor as Integer, fillColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Draws a circular or elliptical sector.
Notes:

Argument	Default	Description
cx	(Mandatory)	The x coordinate of the center of the circle or ellipse.
cy	(Mandatory)	The y coordinate of the center of the circle or ellipse.
rx	(Mandatory)	The horizontal radius of the circle or ellipse.
ry	(Mandatory)	The vertical radius of the circle or ellipse.
a1	(Mandatory)	The start angle of the sector in degrees. The angle is measured clockwise, with 0 degree being the upward pointing direction.
a2	(Mandatory)	The end angle of the sector in degrees. The angle is measured clockwise, with 0 degree being the upward pointing direction.
edgeColor	(Mandatory)	The border color. To disable border, set the edgeColor the same as the fillColor.
fillColor	(Mandatory)	The fill color. To disable filling, set the fillColor to Transparent.

See also:

- 27.16.93 sector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, edgeColor as color, fillColor as color) 5066

27.16.95 setAntiAlias(shapeAntiAlias as boolean=true, textAntiAlias as Integer = 2)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Controls whether anti-alias is used when drawing lines, shapes and text.
Notes:

For anti-aliasing text, ChartDirector supports the following modes.

ConstantValueDescription

NoAntiAlias	0	Disable anti-alias when drawing text
AntiAlias	1	Always use anti-alias when drawing text
AutoAntiAlias	2	Automatically determine if anti-alias should be used for the text. This is the default.

Currently, ChartDirector will anti-alias only large or bold fonts. For small fonts, assuming it is of high quality, anti-alias is unnecessary. It is because high quality fonts are normally designed to be sharp and clear at low resolution. Anti-aliasing will blur the fonts and make them look worse.

However, for complicated fonts (e.g. some fonts with oriental characters), or for lower quality fonts (e.g. some freeware fonts), anti-alias may be necessary. In this case, it may be needed to force anti-aliasing of all fonts using AntiAlias mode.

Argument	Default	Description
shapeAntiAlias	true	A true value enables anti-alias when drawing lines and shapes. A false value disables anti-alias when drawing lines and shapes
textAntiAlias	AutoAntiAlias	The text anti-alias mode, which must be one of AutoAntiAlias, AntiAlias or NoAntiAlias.

27.16.96 setAntiAliasText(value as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Set how text is antialiased.

27.16.97 setBgColor(c as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setBgColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.16.98 setBgColor(c as Integer) 5067

27.16.98 setBgColor(c as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the background color of the image.
Notes:

Argument	Default	Description
c	(Mandatory)	The background color of the image.

See also:

- 27.16.97 setBgColor(c as color) 5067

27.16.99 setClipRect(left as Integer, top as Integer, right as Integer, bottom as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the clip rectangle.
Notes:

When performing graphics operation, only regions inside the clip rectangle will be affected. Regions outside will be unaffected.

Argument	Default	Description
left	(Mandatory)	The x coordinate of the left side of the clip rectangle.
top	(Mandatory)	The y coordinate of the top side of the clip rectangle.
right	(Mandatory)	The x coordinate of the right side of the clip rectangle.
bottom	(Mandatory)	The y coordinate of the bottom side of the clip rectangle.

27.16.100 setColorTable(colors() as color, offset as Integer)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setColorTable method, but uses color instead of integer data type for passing color values.
See also:

- 27.16.101 setColorTable(colors() as Integer, offset as Integer) 5068

27.16.101 setColorTable(colors() as Integer, offset as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Change the colors in the palette starting with the specified offset position.
Notes:

See Color Specification on how colors are represented in ChartDirector.

See also:

Argument	Default	Description
colors	(Mandatory)	An array of colors to replace the colors in the palette.
offset	(Mandatory)	The position in the palette to start the replacement.

- 27.16.100 setColorTable(colors() as color, offset as Integer) 5068

27.16.102 setDefaultFonts(normal as string, bold as string, italic as string, boldItalic as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the defaults for normal, bold, italic and bold-italic fonts.
Notes:

See Font Specification for details on various font attributes.

Argument	Default	Description
normal	(Mandatory)	The default normal font. This is the same as the first font in the font table.
bold	""	The default bold font. This is the same as the second font in the font table. An empty string means the default is unchanged.
italic	""	The default italic font. This is the same as the third font in the font table. An empty string means the default is unchanged.
boldItalic	""	The default bold-italic font. This is the same as the fourth font in the font table. An empty string means the default is unchanged.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

27.16.103 setDitherMethod(value as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the dithering method in case dithering is necessary.
Notes:

Dithering is a process of reducing the colors of an image. It is required if an image has more colors than can be supported by the image format. For example, a GIF image can only have 256 colors. If the actual image contains more than 256 colors, dithering is needed to reduce the colors to less than 256.

The dithering method must be one of the following predefined constants.

ConstantValueDescription

Quantize	0	ChartDirector will first compute an optimal 256-color palette based on colors on the actual image. It then replaces the color of each pixel with the nearest color in the palette. This is the default method and produces the best result in most cases.
OrderedDither	1	Use the ordered dithering algorithm with a 4 x 4 matrix, and with the standard web-safe palette. The web-safe palette is a palette compatible with very old browsers (e.g. Netscape 1.x and 2.x browsers) on 256-color displays.

Web-safe palette is not an optimal palette. In most cases, this method is not as good as the Quantize method. Use this method only if you have to use the web-safe palette.

ErrorDiffusion	2	Similar to OrderedDither but use the Floyd and Steinberg error diffusion algorithm.

Argument	Default	Description
m	(Mandatory)	The dithering method to use in case dithering is necessary.

27.16.104 setFontTable(index as Integer, font as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets an entry in the font table to the specified font name.
Notes:

The first 4 fonts in the font table have special significance. They are the defaults for normal, bold, italic and bold-italic fonts.

See Font Specification for details on various font attributes.

Argument	Default	Description
index	(Mandatory)	An index to the font table, starting from 0.
font	(Mandatory)	The font name to be put into the font table.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

27.16.105 setInterlace(value as boolean)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the interlace mode when creating the image.
Notes:

Note that in many case an interlaced image is less compressible, and may have a large image size. The default is non-interlace.

Note that this method only applies to image formats that support interlacing (GIF and PNG). It is ignored for image formats that does not support interlacing.

Argument	Default	Description
i	(Mandatory)	A true value means the image is interlaced. A false value means the image is non-interlaced.

27.16.106 setOutputOptions(options as string)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets output format options for the next chart output. Currently, only SVG, SVGZ and PDF output formats support output options.
Notes:

An output option can be a flag (such as "compress") or an attribute-value pair (such as "width=800"). Multiple output options can be joined using semicolons as delimiters.

SVG Options

SVG Option	Type	Description
compress	Flag	Compressed the SVG, that is, output SVGZ.
bitmap	Flag	Render the chart as a bitmap and output the bitmap as SVG.
noxmldecl	Flag	Do not include the xml declaration line "<?xml version="1.0" .... >" in the SVG.
nodoctype	Flag	Do not include the document type declaration line "<!DOCTYPE svg PUBLIC .... >" in the SVG.
width	Flag / Attribute	Specifies the width attribute of the SVG. By default, ChartDirector will not include the width or height attribute in the SVG output. In this case, the SVG is variable in size and would assume the size of its container. For example, if the SVG is inside a <DIV>block in a web page, it will assume the size of the DIV block. If the "width" option is used as a flag, ChartDirector will include the width attribute in the SVG and set it to the chart width. If the "width" option is used as an attribute (such as "width=800"), ChartDirector will include the width attribute in the SVG and set it to the specified value. The specified value should be some text that is valid as SVG width. Examples are "100" and "75% ".
height	Flag / Attribute	Specifies the height attribute of the SVG. See the description on "width" above on how to use it.

PDF Options

The PDF viewer will convert the pixel unit into physical unit (eg. inches) so that it can be layout on paper or other physical media. The default conversion factor for the chart is 96 pixels per inch. The "dpi" attribute can be used to specify an alternative value. The value must be a number.

27.16.107 setPaletteMode(value as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the palette mode to use when writing the image in PNG format.
Notes:

The PNG format supports both palette based images and true color images. Palette based images can only have 256 colors, but is smaller in size.

The palette mode must be one of the following predefined constants.

ConstantValueDescription

PDF Option	Type	Description
bitmap	Flag	Render the chart as a bitmap and output the bitmap as PDF.
width	Attribute	The width of the chart in the PDF in pixel unit. By default, ChartDirector will use the pixel width of the chart as the width of the chart in PDF. The "width" attribute can be used to specify an alternative value. The value must be a number.
height	Attribute	The width of the chart in the PDF in pixel unit. See the description on "width" above for how to use it.
pagewidth	Attribute	The page width in pixel unit. By default, ChartDirector will set the page width to the same width as the chart. The "pagewidth" attribute can be used to specify an alternative value. The value must be a number.
pageheight	Attribute	The page height in pixel unit. By default, ChartDirector will set the page height to the same height as the chart. The "pageheight" attribute can be used to specify an alternative value. The value must be a number.
leftx	Attribute	The x coordinate of the left side of the chart within the page in pixel unit. By default, ChartDirector will center the chart in the page. The "leftx" attribute can be used to specify an alternative horizontal position. The coordinate must be a number.
topy	Attribute	The y coordinate of the top side of the chart within the page in pixel unit. By default, ChartDirector will center the chart in the page. The "topy" attribute can be used to specify an alternative vertical position. The coordinate must be a number.
dpi	Attribute	Specify the factor for conversion from pixel to physical unit.

Argument	Default	Description
options	(Mandatory)	A list of options delimited by semicolons.

27.16.108 setResource(id as string, data as MemoryBlock)

MBS ChartDirector Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Assigns a resource ID to a memory block to allow it to be referenced using a resource path.
Notes:

Many ChartDirector features, such as BaseChart.setBgImage and the <*img*>tag in CDML, expect a file or resource path for loading an image. If the image happens to be in memory, such as if the image is retrieved from a database, setResource can be used to assign a resource ID to the memory. It can then be referenced using "@/res_id", in which res_id is the resource ID.

The assigned resource ID is only valid for the DrawArea object of which this method is called. Use CDBaseChartMBS.setResourceGlobal to assign a resource ID that is valid for all ChartDirector objects.

This method stores only a pointer to the memory. It does not copy the memory. You must ensure the memory contains valid content for as long as the resource is being used.

TryPalette	0	Use palette mode if the image contains less than 256 colors, otherwise use true color mode. This is the default.
ForcePalette	1	Use palette mode. If the image contains more than 256 colors, reduce it to 256 colors using dithering (see DrawArea.setDitherMethod).
NoPalette	2	Use true color mode.

Argument	Default	Description
p	(Mandatory)	The palette mode for PNG images.

While ChartDirector does not copy the data, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.
See also:

- 27.16.109 setResource(id as string, data as string) 5074
- 27.16.110 setResource(id as string, drawArea as CDDrawAreaMBS) 5075

27.16.109 setResource(id as string, data as string)

MBS ChartDirector Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Assigns a resource ID to a memory block to allow it to be referenced using a resource path.
Notes:

Many ChartDirector features, such as BaseChart.setBgImage and the <*img*>tag in CDML, expect a file or resource path for loading an image. If the image happens to be in memory, such as if the image is retrieved from a database, setResource can be used to assign a resource ID to the memory. It can then be referenced using "@/res_id", in which res_id is the resource ID.

The assigned resource ID is only valid for the DrawArea object of which this method is called. Use CDBaseChartMBS.setResourceGlobal to assign a resource ID that is valid for all ChartDirector objects.

This method stores only a pointer to the memory. It does not copy the memory. You must ensure the memory contains valid content for as long as the resource is being used.

While ChartDirector does not copy the data, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.
See also:

- 27.16.108 setResource(id as string, data as MemoryBlock) 5073
- 27.16.110 setResource(id as string, drawArea as CDDrawAreaMBS) 5075

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the memory image.
img	(Mandatory)	The memory that the image occupies.

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the memory image.
img	(Mandatory)	The memory that the image occupies.

27.16.110 setResource(id as string, drawArea as CDDrawAreaMBS)

MBS ChartDirector Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Assigns a resource ID to a DrawArea object to allow it to be referenced using a resource path.
Notes:

This method is the same DrawArea.setResource, except that it assigns the resource ID to a DrawArea object instead of a memory image. This allows the DrawArea object to be reference as an image resource using "@/res_id".

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the DrawArea object.
drawArea	(Mandatory)	The DrawArea object to be used as a resource.

While ChartDirector does not copy the draw area, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.
See also:

- 27.16.108 setResource(id as string, data as MemoryBlock) 5073
- 27.16.109 setResource(id as string, data as string) 5074

27.16.111 setSearchPath(path as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the file system search path for loading image files.
Notes:

Several ChartDirector operations involve loading image files. Examples are wallpapers (BaseChart.setWallpaper), background images (BaseChart.setBgImage and PlotArea.setBackground2), user-defined symbols (DataSet.setDataSymbol2) or for embedding images in text using ChartDirector Mark Up Language.

Argument	Default	Description
path	(Mandatory)	A list of directories, separated with the path separator of your operating system (";" for Windows, ":" for Linux/UNIX).

27.16.112 setSize(width as Integer, height as Integer, bgColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setSize method, but uses color instead of integer data type for passing color values.
See also:

- 27.16.113 setSize(width as Integer, height as Integer, bgColor as Integer = & hFFFFFF) 5076

27.16.113 setSize(width as Integer, height as Integer, bgColor as Integer = & hFFFFFF)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the size and background color of the drawing surface.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the drawing surface in pixels.
height	(Mandatory)	The height of the drawing surface in pixels.
bgColor	FFFFFF	The background color of the drawing surface.

See also:

- 27.16.112 setSize(width as Integer, height as Integer, bgColor as color) 5076

27.16.114 setTransparentColor(value as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setTransparentColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.16.115 setTransparentColor(value as Integer) 5076

27.16.115 setTransparentColor(value as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Specifies a certain color to mean transparent when creating the image output, or to include alpha

transparency channel in the output.
Notes:

There are two types of transparency:

Alpha transparency: In addition to red, green and blue levels, there is a transparency level associated with each pixel, which can range from completely transparent to completely opaque. The data associated with the transparency information is called the alpha channel.

Single color transparency: The image itself has no alpha channel, but a certain color is used to mean completely transparent. For internal drawing, ChartDirector always use alpha transparency. However, when outputting the image as an image file, ChartDirector by default will remove the alpha channel to reduce image size. It is because many image displaying software do not support alpha transparency. For example, the IE browser only supports single color transparency but not alpha transparency.

If you want to use single color transparency in the output, you may specify the transparent color as the argument to the setTransparentColor method. Note that only GIF and PNG can support single color transparency. JPEG, BMP and WBMP cannot support transparency at all.

If you do want to keep the alpha channel in final output, you may pass -1 as the argument to setTransparentColor. Note that the only image format that can support alpha transparency is PNG.

One important thing to note is that the IE browser (and possibly many image displaying software) only supports single color transparency for palette based images with up to 256 colors, but not for true color images. For this reason, if single color transparency is used, ChartDirector will automatically reduce the image to 256 colors if it has more than 256 colors. This may result in lost of image quality, especially if the image contains gradient colors.

Therefore, due to the limitations of the current generations of image displaying software, for highest image quality, sometimes it may be beneficial to not using transparency in image output, but to set the image background color to the same color as the container background.

Argument	Default	Description
c	(Mandatory)	The color that is designated as the transparent color. If -1 is used, the full alpha transparency channel will be included in the final output.

See also:

- 27.16.114 setTransparentColor(value as color) 5076

27.16.116 shearTransform(xShear as Double, yShear as Double = 0, bgColor as Integer = & hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Shear the drawing surface.
Notes:

Shearing can be applied along the horizontal direction and/or vertical direction. A rectangle, after shearing, will become a parallelogram.

Argument	Default	Description
xShear	(Mandatory)	The number of pixels to shear leftwards.
yShear	0	The number of pixels to shear downwards.
bgColor	FFFFFF	The background color used to fill the space left after transformation.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

See also:

- 27.16.117 shearTransform(xShear as Double, yShear as Double, bgColor as color, filter as Integer = 2, blur as Double = 1.0) 5078

27.16.117 shearTransform(xShear as Double, yShear as Double, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other shearTransform method, but uses color instead of integer data type for passing color values.
See also:

- 27.16.116 shearTransform(xShear as Double, yShear as Double = 0, bgColor as Integer = & hFFFFFF, filter as Integer = 2, blur as Double = 1.0) 5078

27.16.118 sphereTransform(xDiameter as Integer, yDiameter as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other sphereTransform method, but uses color instead of integer data type for passing color values.
See also:

- 27.16.119 sphereTransform(xDiameter as Integer, yDiameter as Integer, bgColor as Integer = & hFFFFFF, filter as Integer = 2, blur as Double = 1.0) 5079

27.16.119 sphereTransform(xDiameter as Integer, yDiameter as Integer, bgColor as Integer = & hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Wraps the drawing surface onto a sphere or ellipsoid.
Notes:

Argument	Default	Description
xDiameter	(Mandatory)	The horizontal diameter of the sphere or ellipsoid in pixels.
yDiameter	(Mandatory)	The vertical diameter of the sphere or ellipsoid in pixels.
bgColor	FFFFFF	The background color used to fill the space left after transformation.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

See also:

- 27.16.118 sphereTransform(xDiameter as Integer, yDiameter as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0) 5078

27.16.120 surface(cx1 as Double, y1 as Double, x2 as Double, y2 as Double, depthX as Integer, depthY as Integer, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other surface method, but uses color instead of integer data type for passing color values.
See also:

- 27.16.121 surface(cx1 as Double, y1 as Double, x2 as Double, y2 as Double, depthX as Integer, depthY as Integer, edgeColor as Integer, fillColor as Integer) 5079

27.16.121 surface(cx1 as Double, y1 as Double, x2 as Double, y2 as Double, depthX as Integer, depthY as Integer, edgeColor as Integer, fillColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Draws a parallelogram.
Notes:

See also:

- 27.16.120 surface(cx1 as Double, y1 as Double, x2 as Double, y2 as Double, depthX as Integer, depthY as Integer, edgeColor as color, fillColor as color) 5079

Argument	Default	Description
x1	(Mandatory)	The x coordinate of the first end-point of one line of the parallelogram.
y1	(Mandatory)	The y coordinate of the first end-point of one line of the parallelogram.
x2	(Mandatory)	The x coordinate of the second end-point of one line of the parallelogram.
y2	(Mandatory)	The y coordinate of the second end-point of one line of the parallelogram.
depthX	(Mandatory)	The x displacement of the line segment that is parallel to the line segment above.
depthY	(Mandatory)	The y displacement of the line segment that is parallel to the line segment above.
edgeColor	(Mandatory)	The border color. To disable border, set the edgeColor the same as the fillColor.
fillColor	(Mandatory)	The fill color. To disable filling, set the fillColor to Transparent.

27.16.122 text(str as string, font as string, fontIndex as Integer, fontHeight as Double, fontWidth as Double, angle as Double, vertical as boolean) as CDTTFTextMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a TTFText object representing a text block.
Notes:

The TTFText object contains methods to measure and draw the text. This method is useful if the size of the text is needed before deciding where the draw it.

Argument	Default	Description
text	(Mandatory)	A string representing the text to be drawn. See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.
font	(Mandatory)	The font name. See Font Specification for details on various font attributes.
fontIndex	(Mandatory)	The font index in case the font name refers to a font collection. An index of 0 means the first font.
fontHeight	(Mandatory)	The font height in points.
fontWidth	(Mandatory)	The font width in points.
angle	(Mandatory)	The rotation angle of the text.
vertical	(Mandatory)	A true value means the text is layout vertically (from top to bottom). A false value means the is layout horizontally (from left to right).

Return Value
The TTFText object created.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

- 27.16.125 text(str as string, font as string, fontsize as Double) as CDTTFTextMBS 5082
- 27.16.126 text(str as string, font as string, fontsize as Double, x as Integer, y as Integer, colorvalue as color) 5083
- 27.16.127 text(str as string, font as string, fontsize as Double, x as Integer, y as Integer, colorvalue as Integer) 5084

27.16.124 text(str as string, font as string, fontIndex as Integer, fontHeight as Double, fontWidth as Double, angle as Double, vertical as boolean, x as Integer, y as Integer, colorvalue as Integer, alignment as Integer = 7)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Draws text.
Notes:

Argument	Default	Description
str	(Mandatory)	A string representing the text to be drawn. See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.
font	(Mandatory)	The font name. See Font Specification for details on various font attributes.
fontIndex	(Mandatory)	The font index in case the font name refers to a font collection. An index of 0 means the first font.
fontHeight	(Mandatory)	The font height in points.
fontWidth	(Mandatory)	The font width in points.
angle	(Mandatory)	The rotation angle of the text. The angle is measured in degrees in clockwise direction.
vertical	(Mandatory)	A true value means the text is layout vertically (from top to bottom). A false value means the is layout horizontally (from left to right).
x	(Mandatory)	The x coordinate of a reference point to align the text.
y	(Mandatory)	The y coordinate of a reference point to align the text.
color	(Mandatory)	The color of the text.
alignment	TopLeft	The position of the text relative to the reference point. See Alignment Specification for supported alignment types.

27.16.125 text(str as string, font as string, fontsize as Double) as CDTTFTextMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a TTFText object representing a text block.
Notes:

The TTFText object contains methods to measure and draw the text. This method is useful if the size of the text is needed before deciding where the draw it.

Argument	Default	Description
str	(Mandatory)	A string representing the text to be drawn. See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.
font	(Mandatory)	The font name. See Font Specification for details on various font attributes.
fontSize	(Mandatory)	The font size in points.

Return Value
The TTFText object created.

See font specification here:

- 27.16.127 text(str as string, font as string, fontsize as Double, x as Integer, y as Integer, colorvalue as Integer) 5084

27.16.127 text(str as string, font as string, fontsize as Double, x as Integer, y as Integer, colorvalue as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Draws text.
Notes:

Argument	Default	Description
str	(Mandatory)	A string representing the text to be drawn. See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.
font	(Mandatory)	The font name. See Font Specification for details on various font attributes.
fontSize	(Mandatory)	The font size in points.
x	(Mandatory)	The x coordinate of the top-left corner of the text.
y	(Mandatory)	The y coordinate of the top-left corner of the text.
color	(Mandatory)	The color of the text.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 27.16.122 text(str as string, font as string, fontIndex as Integer, fontHeight as Double, fontWidth as Double, angle as Double, vertical as boolean) as CDTTFTextMBS 5080

- 27.16.124 text(str as string, font as string, fontIndex as Integer, fontHeight as Double, fontWidth as Double, angle as Double, vertical as boolean, x as Integer, y as Integer, colorvalue as Integer, alignment as Integer = 7) 5081
- 27.16.125 text(str as string, font as string, fontsize as Double) as CDTTFTextMBS 5082
- 27.16.126 text(str as string, font as string, fontsize as Double, x as Integer, y as Integer, colorvalue as color) 5083

27.16.128 tile(d as CDDrawAreaMBS, transparency as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Copy another DrawArea to the current DrawArea as a wallpaper.
Notes:

The wallpaper image will be tiled repeatedly on the current DrawArea until the entire DrawArea is covered.

Argument	Default	Description
d	(Mandatory)	A DrawArea object representing the source.
transparency	(Mandatory)	Specify the transparency level when copying the other DrawArea to the current DrawArea. A value of 0 means non-transparent. A value of 255 means totally transparent.

27.16.129 vCylinderTransform(xDiameter as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other vCylinderTransform method, but uses color instead of integer data type for passing color values.
See also:

- 27.16.130 vCylinderTransform(xDiameter as Integer, bgColor as Integer = & hFFFFFF, filter as Integer = 2, blur as Double = 1.0) 5085

27.16.130 vCylinderTransform(xDiameter as Integer, bgColor as Integer = & hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Wraps the drawing surface onto a vertical cylinder.
Notes:

Argument	Default	Description
xDiameter	(Mandatory)	The diameter of the cylinder in pixels.
bgColor	FFFFFF	The background color used to fill the space left after transformation.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

See also:

- 27.16.129 vCylinderTransform(xDiameter as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0) 5085

27.16.131 vFlip

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Flip the drawing surface along the central vertical line.

27.16.132 vline(y1 as Integer, y2 as Integer, x as Integer, c as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Draws a vertical line.
Notes:

Argument	Default	Description
y1	(Mandatory)	The y coordinate of the first end-point of the line.
y2	(Mandatory)	The y coordinate of the second end-point of the line.
x	(Mandatory)	The x coordinate of the line.
c	(Mandatory)	The color of the line.

27.16.133 vTriangleTransform(tHeight as Integer = -1, bgColor as Integer = & hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Wraps the drawing surface onto a vertical triangle pointing upwards.
Notes:

Argument	Default	Description
tHeight	-1	The height of the triangle in pixels.
bgColor	FFFFFF	The background color used to fill the space left after transformation.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

See also:

- 27.16.134 vTriangleTransform(tHeight as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0) 5086

27.16.134 vTriangleTransform(tHeight as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other vTriangleTransform method, but uses color instead of integer data type for passing color values.
See also:

- 27.16.133 vTriangleTransform(tHeight as Integer = -1, bgColor as Integer = & hFFFFFF, filter as Integer = 2, blur as Double = 1.0) 5086

27.16.135 waveTransform(period as Integer, amplitude as Double, direction as Double = 0, startAngle as Double = 0, longitudinal as boolean=false, bgColor as Integer = & hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Moves the pixels on the drawing surface according to a sinusoidal function to achieve a wave effect.
Notes:

Argument	Default	Description
period	(Mandatory)	The period of the wave in pixels.
amplitude	(Mandatory)	The amplitude of the wave in pixels.
direction	0	The propagation direction of the wave. The upward pointing direction is 0 degree, and the angle is measured clockwise.
startAngle	0	The initial phase angle of the wave in degrees.
longitudinal	false	Determine if the wave is transversal or longitudinal. true means transversal. false means longitudinal.
bgColor	FFFFFF	The background color used to fill the space left after transformation.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

See also:

- 27.16.136 waveTransform(period as Integer, amplitude as Double, direction as Double, startAngle as Double, longitudinal as boolean, bgColor as color, filter as Integer = 2, blur as Double = 1.0) 5087

27.16.136 waveTransform(period as Integer, amplitude as Double, direction as Double, startAngle as Double, longitudinal as boolean, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other waveTransform method, but uses color instead of integer data type for passing color values.
See also:

- 27.16.135 waveTransform(period as Integer, amplitude as Double, direction as Double = 0, startAngle as Double = 0, longitudinal as boolean=false, bgColor as Integer = & hFFFFFF, filter as Integer = 2, blur as Double = 1.0) 5087

27.17 class CDDrawObjMBS

27.17.1 class CDDrawObjMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: This is the base class for several drawing related subclasses.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.17.2 Methods

27.17.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The private constructor.

27.17.4 paint(d as CDDrawAreaMBS)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Draws the content to this object into a drawarea.

27.17.5 setZOrder(z as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the z-order.

27.18 class CDFinanceChartMBS

27.18.1 class CDFinanceChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: FinanceChart is a financial charting library built on top of the main ChartDirector library.
Notes:

It extends CDMultiChartMBS by implementing many financial indicators, and allowing complex financial charts to be composed easily.

Key Features:

- Arbitrary Financial Chart Composition: Allows a complex financial chart to be constructed by stacking a main financial chart with arbitrary number of indicator charts in any order.
- Main Chart Layers: The main chart can show information in Candlestick or OHLC, and/or various price lines, such as closing price line, weighted close line, typical price line or median price line.
- Moving Averages: Chart can include arbitrary number of moving average lines of configurable types and periods. Supports simple, exponential, triangular and weighted moving averages.
- Parabolic SAR: A parabolic SAR indicator can be added to the main price chart.
- Bands and Envelops: Built-in Bollinger Band layer, Donchian Channel layer, and moving average envelops. Also supports custom-defined bands.
- Volume Bars: Volume Bars can be displayed as part of the main chart, or as a separate indicator chart.
- Axis Styles: Axis can be log or linear scale, and can display on left or right side of the chart.
- Built-In Indicators: Accumulation/Distribution, Aroon Up/Down, Aroon Oscillator, Average Directional Index, Average True Range (including raw True Range), Bollinger Band Width, Commodity Channel Index, Chaikin Money Flow, Chaikin Oscillator, Chaikin Volatility, Close Location Value, Detrended Price Oscillator, Donchian Channel Width, Ease of Movement, Fast Stochastic, MACD, Mass Index, Money Flow Index, Momentum, Negative Volume Index, On Balance Volume, Performance, Percentage Price Oscillator, Positive Volume Index, Percentage Volume Oscillator, Price Volume Trend, Rate of Change, Relative Strength Index, Slow Stochastic, Standard Deviation, Stochastic RSI, TRIX, Ultimate Oscillator, Volume, William % R.
- Custom Lines and Indicators: Extensible design allows developers to implement additional lines and indicator types.
- Customizable Look and Feel: Preserves the flexibility and power of the ChartDirector API. Background images, custom text boxes, logos, fonts and colors, etc., are all customizable.

Using FinanceChart:
You create an instance of FinanceChart. Next, you may add data to it using setData. After that, you may add the main chart (addMainChart) and other indicator charts to display the data graphically. These charts

may be added in any order.

For the main chart, you may:

- Display price information using Candlesticks (addCandleStick) or HLOC (addHLOC) symbols
- Add various price lines (addCloseLine, addWeightedClose, addTypicalPrice, addMedianPrice)
- Add moving average lines of different types and periods (addSimpleMovingAvg, addExpMovingAvg, addTriMovingAvg, addWeightedMovingAvg)
- Add Parabolic SAR (addParabolicSAR)
- Add price bands or envelops: (addBollingerBand, addDonchianChannel, addEnvelop)
- Add custom lines or bands (addLineIndicator2, addBand)
- Add volume bars (addVolBars)

For indicator charts, FinanceChart includes a wide variety of indicators. Please refer to the table below for details. You may also add your own custom indicator chart using addLineIndicator and addBarIndicator.

In addition to chart building methods, FinanceChart also has a number of chart formatting methods, such as addPlotAreaTitle to add chart title, setPlotAreaStyle to control background color and grid lines, setDateLabelFormat to control date/time formatting, etc.

Furthermore, as FinanceChart is a subclass of CDMultiChartMBS, and the main and indicator charts are implemented as XYChart objects, they can use the powerful ChartDirector API for formatting (eg. background images, custom logos, custom text boxes, metallic colors, etc).
Subclass of the CDMultiChartMBS class.

27.18.4 Methods

27.18.5 addAccDist(height as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addAccDist method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.6 addAccDist(height as Integer, ColorValue as Integer) as CDXYChartMBS 5091

27.18.6 addAccDist(height as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an Accumulation/Distribution indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.5 addAccDist(height as Integer, ColorValue as color) as CDXYChartMBS 5091

27.18.7 addADX(height as Integer, period as Integer, posColor as color, negColor as color, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addADX method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.8 addADX(height as Integer, period as Integer, posColor as Integer, negColor as Integer, ColorValue as Integer) as CDXYChartMBS 5092

27.18.8 addADX(height as Integer, period as Integer, posColor as Integer, negColor as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an Average Directional Index indicators chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
posColor	(Mandatory)	The color of the Positive Directional Index line.
negColor	(Mandatory)	The color of the Negative Directional Index line.
color	(Mandatory)	The color of the Average Directional Index line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.7 addADX(height as Integer, period as Integer, posColor as color, negColor as color, ColorValue as color) as CDXYChartMBS 5091

27.18.9 addAroon(height as Integer, period as Integer, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addAroon method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.10 addAroon(height as Integer, period as Integer, upColor as Integer, downColor as Integer) as CDXYChartMBS 5092

27.18.10 addAroon(height as Integer, period as Integer, upColor as Integer, downColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an Aroon Up/Down indicators chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicators.
upColor	(Mandatory)	The color of the Aroon Up indicator line.
downColor	(Mandatory)	The color of the Aroon Down indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.9 addAroon(height as Integer, period as Integer, upColor as color, downColor as color) as CDXYChartMBS 5092

27.18.11 addAroonOsc(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addAroonOsc method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.12 addAroonOsc(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS 5093

27.18.12 addAroonOsc(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an Aroon Oscillator indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.11 addAroonOsc(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS 5093

27.18.13 addATR(height as Integer, period as Integer, color1 as color, color2 as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addATR method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.14 addATR(height as Integer, period as Integer, color1 as Integer, color2 as Integer) as CDXY-ChartMBS 5094

27.18.14 addATR(height as Integer, period as Integer, color1 as Integer, color2 as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an Average True Range indicators chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color1	(Mandatory)	The color of the True Range line.
color2	(Mandatory)	The color of the Average True Range line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.13 addATR(height as Integer, period as Integer, color1 as color, color2 as color) as CDXY-ChartMBS 5094

27.18.15 addBand(upperLine() as Double, lowerLine() as Double, LineColor as color, FillColor as color, Name as string) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addBand method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.16 addBand(upperLine() as Double, lowerLine() as Double, LineColor as Integer, FillColor as Integer, Name as string) as CDInterLineLayerMBS 5095

27.18.16 addBand(upperLine() as Double, lowerLine() as Double, LineColor as Integer, FillColor as Integer, Name as string) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a generic band to the main finance chart.
Notes:

This method is used internally by other methods to add various bands (eg. Bollinger band, Donchian channels, etc).

Arguments:

Argument	Default	Description
upperLine	(Mandatory)	The data series for the upper band line.
lowerLine	(Mandatory)	The data series for the lower band line.
lineColor	(Mandatory)	The color of the upper and lower band line.
fillColor	(Mandatory)	The color to fill the region between the upper and lower band lines.
name	(Mandatory)	The name of the band.

Return Value
An CDInterLineLayerMBS object representing the filled region.
See also:

- 27.18.15 addBand(upperLine() as Double, lowerLine() as Double, LineColor as color, FillColor as color, Name as string) as CDInterLineLayerMBS 5094

27.18.17 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addBarIndicator method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.18 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDBarLayerMBS 5096
- 27.18.19 addBarIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS 5096

- 27.18.20 addBarIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS 5097

27.18.18 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a bar layer to an existing indicator chart.
Notes:

Arguments:

Argument	Default	Description
c	(Mandatory)	The indicator chart to add the bar layer to.
data	(Mandatory)	The data series of the indicator bars.
color	(Mandatory)	The color of the indicator bars.
name	(Mandatory)	The name of the indicator.

Return Value
A CDBarLayerMBS object representing the bar layer created.
See also:

- 27.18.17 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDBarLayerMBS 5095
- 27.18.19 addBarIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS 5096
- 27.18.20 addBarIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS 5097

27.18.19 addBarIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addBarIndicator method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.17 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDBarLayerMBS 5095
- 27.18.18 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDBarLayerMBS 5096

- 27.18.20 addBarIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS 5097

27.18.20 addBarIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a generic bar indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
data	(Mandatory)	The data series of the indicator bars.
color	(Mandatory)	The color of the indicator bars.
name	(Mandatory)	The name of the indicator.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.17 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDBarLayerMBS 5095
- 27.18.18 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDBarLayerMBS 5096
- 27.18.19 addBarIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS 5096

27.18.21 addBollingerBand(period as Integer, bandWidth as Double, lineColor as color, FillColor as color) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addBollingerBand method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.22 addBollingerBand(period as Integer, bandWidth as Double, lineColor as Integer, FillColor as Integer) as CDInterLineLayerMBS 5098

27.18.22 addBollingerBand(period as Integer, bandWidth as Double, lineColor as Integer, FillColor as Integer) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Bollinger band to the main chart.
Notes:

Arguments:

Argument	Default	Description
period	(Mandatory)	The period to compute the band.
bandWidth	(Mandatory)	The half-width of the band in terms multiples of standard deviation. Typically 2 is used.
lineColor	(Mandatory)	The color of the lines defining the upper and lower limits.
fillColor	(Mandatory)	The color to fill the regional within the band.

Return Value
An CDInterLineLayerMBS object representing the band created.
See also:

- 27.18.21 addBollingerBand(period as Integer, bandWidth as Double, lineColor as color, FillColor as color) as CDInterLineLayerMBS 5097

27.18.23 addBollingerWidth(height as Integer, period as Integer, width as Double, colorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addBollingerWidth method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.24 addBollingerWidth(height as Integer, period as Integer, width as Double, colorValue as Integer) as CDXYChartMBS 5098

27.18.24 addBollingerWidth(height as Integer, period as Integer, width as Double, colorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Bollinger Band Width indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
width	(Mandatory)	The band width to compute the indicator.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.23 addBollingerWidth(height as Integer, period as Integer, width as Double, colorValue as color) as CDXYChartMBS 5098

27.18.25 addCandleStick(upColor as color, downColor as color) as CDCandleStickLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addCandleStick method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.26 addCandleStick(upColor as Integer, downColor as Integer) as CDCandleStickLayerMBS 5099

27.18.26 addCandleStick(upColor as Integer, downColor as Integer) as CDCandleStickLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a candlestick layer to the main chart.
Notes:

Arguments:

Argument	Default	Description
upColor	(Mandatory)	The candle color for a up day.
downColor	(Mandatory)	The candle color for a down day.

Return Value
A CDCandleStickLayerMBS object representing the candlestick layer created.
See also:

- 27.18.25 addCandleStick(upColor as color, downColor as color) as CDCandleStickLayerMBS 5099

27.18.27 addCCI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addCCI method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.28 addCCI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS 5100

27.18.28 addCCI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Community Channel Index indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.
range	(Mandatory)	The distance between the middle line and the upper and lower threshold lines.
upColor	(Mandatory)	The fill color when the indicator exceeds the upper threshold line.
downColor	(Mandatory)	The fill color when the indicator falls below the lower threshold line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.27 addCCI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS 5100

27.18.29 addChaikinMoneyFlow(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addChaikinMoneyFlow method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.30 addChaikinMoneyFlow(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS 5101

27.18.30 addChaikinMoneyFlow(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Chaikin Money Flow indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.29 addChaikinMoneyFlow(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS 5100

27.18.31 addChaikinOscillator(height as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addChaikinOscillator method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.32 addChaikinOscillator(height as Integer, ColorValue as Integer) as CDXYChartMBS 5101

27.18.32 addChaikinOscillator(height as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Chaikin Oscillator indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.31 addChaikinOscillator(height as Integer, ColorValue as color) as CDXYChartMBS 5101

27.18.33 addChaikinVolatility(height as Integer, period1 as Integer, period2 as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addChaikinVolatility method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.34 addChaikinVolatility(height as Integer, period1 as Integer, period2 as Integer, ColorValue as Integer) as CDXYChartMBS 5102

27.18.34 addChaikinVolatility(height as Integer, period1 as Integer, period2 as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Chaikin Volatility indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period1	(Mandatory)	The period to smooth the range.
period2	(Mandatory)	The period to compute the rate of change of the smoothed range.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.33 addChaikinVolatility(height as Integer, period1 as Integer, period2 as Integer, ColorValue as color) as CDXYChartMBS 5102

27.18.35 addCloseLine(ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addCloseLine method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.36 addCloseLine(ColorValue as Integer) as CDLineLayerMBS 5103

27.18.36 addCloseLine(ColorValue as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a closing price line on the main chart.
Notes:

Arguments:

Argument	Default	Description
color	(Mandatory)	The color of the line.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 27.18.35 addCloseLine(ColorValue as color) as CDLineLayerMBS 5103

27.18.37 addCLV(height as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addCLV method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.38 addCLV(height as Integer, ColorValue as Integer) as CDXYChartMBS 5103

27.18.38 addCLV(height as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Close Location Value indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.37 addCLV(height as Integer, ColorValue as color) as CDXYChartMBS 5103

27.18.39 addComparison(data() as Double, ColorValue as color, Name as string) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addComparison method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.40 addComparison(data() as Double, ColorValue as Integer, Name as string) as CDLineLayerMBS 5104

27.18.40 addComparison(data() as Double, ColorValue as Integer, Name as string) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a data series to the main chart for comparison with the closing price.
Notes:

The data series added will be scaled so that the first visible point in the data series will coincide the first visible point of the main closing price. This facilitate comparing the performance of the closing price with the data series. The data series typically is the closing price of another stock, or the value of a market index.

Arguments:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data series.
color	(Mandatory)	The color of the line.
name	(Mandatory)	The name of the data series.

Return Value:
A LineLayer object representing the comparison line created.
See also:

- 27.18.39 addComparison(data() as Double, ColorValue as color, Name as string) as CDLineLayerMBS 5104

27.18.41 addDonchianChannel(period as Integer, lineColor as color, FillColor as color) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addDonchianChannel method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.42 addDonchianChannel(period as Integer, lineColor as Integer, FillColor as Integer) as CDInterLineLayerMBS 5105

27.18.42 addDonchianChannel(period as Integer, lineColor as Integer, FillColor as Integer) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Donchian channel to the main chart.
Notes:

Arguments:

Argument	Default	Description
period	(Mandatory)	The period to compute the band.
lineColor	(Mandatory)	The color of the lines defining the upper and lower limits.
fillColor	(Mandatory)	The color to fill the regional within the band.

Return Value
An CDInterLineLayerMBS object representing the band created.
See also:

- 27.18.41 addDonchianChannel(period as Integer, lineColor as color, FillColor as color) as CDInterLineLayerMBS 5105

27.18.43 addDonchianWidth(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addDonchianWidth method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.44 addDonchianWidth(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS 5106

27.18.44 addDonchianWidth(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Donchian Channel Width indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.43 addDonchianWidth(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS 5105

27.18.45 addDPO(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addDPO method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.46 addDPO(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS 5106

27.18.46 addDPO(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Detrended Price Oscillator indicator chart.
Notes:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.

Arguments:

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.45 addDPO(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS 5106

27.18.47 addEaseOfMovement(height as Integer, period as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addEaseOfMovement method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.48 addEaseOfMovement(height as Integer, period as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS 5107

27.18.48 addEaseOfMovement(height as Integer, period as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Ease of Movement indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to smooth the indicator.
color1	(Mandatory)	The color of the indicator line.
color2	(Mandatory)	The color of the smoothed indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.47 addEaseOfMovement(height as Integer, period as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS 5107

27.18.49 addEnvelop(period as Integer, range as Double, lineColor as color, FillColor as color) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addEnvelop method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.50 addEnvelop(period as Integer, range as Double, lineColor as Integer, FillColor as Integer) as CDInterLineLayerMBS 5108

27.18.50 addEnvelop(period as Integer, range as Double, lineColor as Integer, FillColor as Integer) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a price envelop to the main chart.
Notes:

The price envelop is a defined as a ratio around a moving average. For example, a ratio of 0.2 means 20% above and below the moving average.

Arguments:

Argument	Default	Description
period	(Mandatory)	The period for the moving average.
range	(Mandatory)	The ratio above and below the moving average.
lineColor	(Mandatory)	The color of the lines defining the upper and lower limits.
fillColor	(Mandatory)	The color to fill the regional within the band.

Return Value
An CDInterLineLayerMBS object representing the band created.
See also:

- 27.18.49 addEnvelop(period as Integer, range as Double, lineColor as color, FillColor as color) as CDInterLineLayerMBS 5108

27.18.51 addExpMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addExpMovingAvg method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.52 addExpMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS 5109

27.18.52 addExpMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an exponential moving average line on the main chart.
Notes:

Arguments:

Argument	Default	Description
period	(Mandatory)	The moving average period
color	(Mandatory)	The color of the line.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 27.18.51 addExpMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS 5109

27.18.53 addFastStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addFastStochastic method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.54 addFastStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS 5110

27.18.54 addFastStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Fast Stochastic indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period1	(Mandatory)	The period to compute the % K line.
period2	(Mandatory)	The period to compute the % D line.
color1	(Mandatory)	The color of the % K line.
color2	(Mandatory)	The color of the % D line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.53 addFastStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS 5109

27.18.55 addHLOC(upColor as color, downColor as color) as CDHLOCLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addHLOC method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.56 addHLOC(upColor as Integer, downColor as Integer) as CDHLOCLayerMBS 5110

27.18.56 addHLOC(upColor as Integer, downColor as Integer) as CDHLOCLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a HLOC layer to the main chart.
Notes:

Arguments:

Argument	Default	Description
upColor	(Mandatory)	The candle color for a up day.
downColor	(Mandatory)	The candle color for a down day.

Return Value
A CDHLOCLayerMBS object representing the HLOC layer created.
See also:

- 27.18.55 addHLOC(upColor as color, downColor as color) as CDHLOCLayerMBS 5110

27.18.57 addIndicator(height as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a blank indicator chart to the finance chart.
Notes:

Used internally to add other indicators. Override to change the default formatting (eg. axis fonts, etc.) of the various indicators.

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the chart in pixels.

Return Value
A CDXYChartMBS object representing the chart created.

27.18.58 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addLineIndicator method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.59 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDLineLayerMBS 5112
- 27.18.60 addLineIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS 5112

- 27.18.61 addLineIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS 5113

27.18.59 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a line to an existing indicator chart.
Notes:

Arguments:

Argument	Default	Description
c	(Mandatory)	The indicator chart to add the line to.
data	(Mandatory)	The data series of the indicator line.
color	(Mandatory)	The color of the indicator line.
name	(Mandatory)	The name of the indicator.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 27.18.58 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDLineLayerMBS 5111
- 27.18.60 addLineIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS 5112
- 27.18.61 addLineIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS 5113

27.18.60 addLineIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addLineIndicator method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.58 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDLineLayerMBS 5111
- 27.18.59 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDLineLayerMBS 5112

- 27.18.61 addLineIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS 5113

27.18.61 addLineIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a generic line indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
data	(Mandatory)	The data series of the indicator line.
color	(Mandatory)	The color of the indicator line.
name	(Mandatory)	The name of the indicator.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.58 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDLineLayerMBS 5111
- 27.18.59 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDLineLayerMBS 5112
- 27.18.60 addLineIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS 5112

27.18.62 addMACD(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addMACD method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.63 addMACD(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS 5114

27.18.63 addMACD(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a MACD indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period1	(Mandatory)	The first moving average period to compute the indicator.
period2	(Mandatory)	The second moving average period to compute the indicator.
period3	(Mandatory)	The moving average period of the signal line.
color	(Mandatory)	The color of the indicator line.
signalColor	(Mandatory)	The color of the signal line.
divColor	(Mandatory)	The color of the divergent bars.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.62 addMACD(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS 5113

27.18.64 addMainChart(height as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds the main chart - the chart that shows the data for the prices.
Notes:

The chart added is initially empty. Other methods, such as CDFinanceChartMBS.addCandleStick and CDFinanceChartMBS.addSimpleMovingAvg, may be used to add various layers to the chart.

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the main chart in pixels.

Return Value
A CDXYChartMBS object representing the main chart created.

27.18.65 addMassIndex(height as Integer, ColorValue as color, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addMassIndex method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.66 addMassIndex(height as Integer, ColorValue as Integer, upColor as Integer, downColor as Integer) as CDXYChartMBS 5115

27.18.66 addMassIndex(height as Integer, ColorValue as Integer, upColor as Integer, downColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Mass Index indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
color	(Mandatory)	The color of the indicator line.
upColor	(Mandatory)	The fill color when the indicator exceeds the upper threshold line.
downColor	(Mandatory)	The fill color when the indicator falls below the lower threshold line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.65 addMassIndex(height as Integer, ColorValue as color, upColor as color, downColor as color) as CDXYChartMBS 5115

27.18.67 addMedianPrice(ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addMedianPrice method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.68 addMedianPrice(ColorValue as Integer) as CDLineLayerMBS 5116

27.18.68 addMedianPrice(ColorValue as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a median price line on the main chart.
Notes:

Arguments:

Argument	Default	Description
color	(Mandatory)	The color of the line.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 27.18.67 addMedianPrice(ColorValue as color) as CDLineLayerMBS 5115

27.18.69 addMFI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addMFI method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.70 addMFI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS 5116

27.18.70 addMFI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Money Flow Index indicator chart.
Notes:

Arguments:

Return Value
A CDXYChartMBS object representing the chart created.
See also:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.
range	(Mandatory)	The distance between the middle line and the upper and lower threshold lines.
upColor	(Mandatory)	The fill color when the indicator exceeds the upper threshold line.
downColor	(Mandatory)	The fill color when the indicator falls below the lower threshold line.

- 27.18.69 addMFI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS 5116

27.18.71 addMomentum(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addMomentum method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.72 addMomentum(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS 5117

27.18.72 addMomentum(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Momentum indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.71 addMomentum(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS 5117

27.18.73 addNVI(height as Integer, period as Integer, ColorValue as color, signalColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addNVI method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.74 addNVI(height as Integer, period as Integer, ColorValue as Integer, signalColor as Integer) as CDXYChartMBS 5118

27.18.74 addNVI(height as Integer, period as Integer, ColorValue as Integer, signalColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Negative Volume Index indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the signal line.
color	(Mandatory)	The color of the indicator line.
signalColor	(Mandatory)	The color of the signal line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.73 addNVI(height as Integer, period as Integer, ColorValue as color, signalColor as color) as CDXYChartMBS 5118

27.18.75 addOBV(height as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addOBV method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.76 addOBV(height as Integer, ColorValue as Integer) as CDXYChartMBS 5119

27.18.76 addOBV(height as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an On Balance Volume indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.75 addOBV(height as Integer, ColorValue as color) as CDXYChartMBS 5118

27.18.77 addParabolicSAR(accInitial as Double, accIncrement as Double, accMaximum as Double, symbolType as Integer, symbolSize as Integer, fillColor as color, edgeColor as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addParabolicSAR method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.78 addParabolicSAR(accInitial as Double, accIncrement as Double, accMaximum as Double, symbolType as Integer, symbolSize as Integer, fillColor as Integer, edgeColor as Integer) as CDLineLayerMBS 5119

27.18.78 addParabolicSAR(accInitial as Double, accIncrement as Double, accMaximum as Double, symbolType as Integer, symbolSize as Integer, fillColor as Integer, edgeColor as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a parabolic SAR indicator to the main chart.
Notes:

Arguments

Return Value
A CDLineLayerMBS object representing the parabolic SAR created.
See also:

Argument	Default	Description
accInitial	(Mandatory)	The initial acceleration. A common value to use is 0.02.
accIncrement	(Mandatory)	The incremental acceleration. A common value to use is 0.02.
accMaximum	(Mandatory)	The maximum acceleration. A common value to use is 0.2.
symbolType	(Mandatory)	The symbol used to plot the parabolic SAR. One of the predefined shape constants representing the symbol shape. See Shape Specification for the available built-in shapes.
symbolSize	(Mandatory)	The width and height of the symbol in pixels
fillColor	(Mandatory)	The color used to fill the symbol.
edgeColor	(Mandatory)	The edge color used to draw the edge of the symbol.

- 27.18.77 addParabolicSAR(accInitial as Double, accIncrement as Double, accMaximum as Double, symbolType as Integer, symbolSize as Integer, fillColor as color, edgeColor as color) as CDLineLayerMBS 5119

27.18.79 addPerformance(height as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addPerformance method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.80 addPerformance(height as Integer, ColorValue as Integer) as CDXYChartMBS 5120

27.18.80 addPerformance(height as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Performance indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.79 addPerformance(height as Integer, ColorValue as color) as CDXYChartMBS 5120

27.18.81 addPlotAreaTitle(alignment as Integer, text as string) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a text title above the plot area.
Notes:

You may add multiple title above the plot area by calling this method multiple times.

Arguments:

Argument	Default	Description
alignment	(Mandatory)	The alignment with respect to the region that is on top of the plot area. See Alignment Specification for supported alignment types.
text	(Mandatory)	The text to add.

Return Value
The CDTextBoxMBS object representing the text box above the plot area, which may be used to fine-tune the appearance of the text.

27.18.82 addPPO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addPPO method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.83 addPPO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS 5121

27.18.83 addPPO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Percentage Price Oscillator indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period1	(Mandatory)	The first moving average period to compute the indicator.
period2	(Mandatory)	The second moving average period to compute the indicator.
period3	(Mandatory)	The moving average period of the signal line.
color	(Mandatory)	The color of the indicator line.
signalColor	(Mandatory)	The color of the signal line.
divColor	(Mandatory)	The color of the divergent bars.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.82 addPPO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS 5121

27.18.84 addPVI(height as Integer, period as Integer, ColorValue as color, signalColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addPVI method, but uses color instead of integer data type for passing color values.
See also:

- 181.12.5 addPVI(height as Integer, period as Integer, ColorValue as Integer, signalColor as Integer) as CDXYChartMBS 22166

27.18.85 addPVI(height as Integer, period as Integer, ColorValue as Integer, signalColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Positive Volume Index indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the signal line.
color	(Mandatory)	The color of the indicator line.
signalColor	(Mandatory)	The color of the signal line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.84 addPVI(height as Integer, period as Integer, ColorValue as color, signalColor as color) as CDXYChartMBS 5122

27.18.86 addPVO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addPVO method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.87 addPVO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS 5123

27.18.87 addPVO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Percentage Volume Oscillator indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period1	(Mandatory)	The first moving average period to compute the indicator.
period2	(Mandatory)	The second moving average period to compute the indicator.
period3	(Mandatory)	The moving average period of the signal line.
color	(Mandatory)	The color of the indicator line.
signalColor	(Mandatory)	The color of the signal line.
divColor	(Mandatory)	The color of the divergent bars.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.86 addPVO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS 5123

27.18.88 addPVT(height as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addPVT method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.89 addPVT(height as Integer, ColorValue as Integer) as CDXYChartMBS 5124

27.18.89 addPVT(height as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Price Volume Trend indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.88 addPVT(height as Integer, ColorValue as color) as CDXYChartMBS 5124

27.18.90 addROC(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addROC method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.91 addROC(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS 5124

27.18.91 addROC(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Rate of Change indicator chart.

Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.90 addROC(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS 5124

27.18.92 addRSI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addRSI method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.93 addRSI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS 5125

27.18.93 addRSI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Relative Strength Index indicator chart.
Notes:

Arguments:

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.92 addRSI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS 5125

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.
range	(Mandatory)	The distance between the middle line and the upper and lower threshold lines.
upColor	(Mandatory)	The fill color when the indicator exceeds the upper threshold line.
downColor	(Mandatory)	The fill color when the indicator falls below the lower threshold line.

27.18.94 addSimpleMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addSimpleMovingAvg method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.95 addSimpleMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS 5126

27.18.95 addSimpleMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a simple moving average line on the main chart.
Notes:

Arguments:

Argument	Default	Description
period	(Mandatory)	The moving average period
color	(Mandatory)	The color of the line.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 27.18.94 addSimpleMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS 5126

27.18.96 addSlowStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addSlowStochastic method, but uses color instead of integer data type for

passing color values.
See also:

- 27.18.97 addSlowStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS 5127

27.18.97 addSlowStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Slow Stochastic indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period1	(Mandatory)	The period to compute the % K line.
period2	(Mandatory)	The period to compute the % D line.
color1	(Mandatory)	The color of the % K line.
color2	(Mandatory)	The color of the % D line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.96 addSlowStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS 5126

27.18.98 addStdDev(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addStdDev method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.99 addStdDev(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS 5128

27.18.99 addStdDev(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Moving Standard Deviation indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.98 addStdDev(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS 5127

27.18.100 addStochRSI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addStochRSI method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.101 addStochRSI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS 5128

27.18.101 addStochRSI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Stochastic RSI indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.
range	(Mandatory)	The distance between the middle line and the upper and lower threshold lines.
upColor	(Mandatory)	The fill color when the indicator exceeds the upper threshold line.
downColor	(Mandatory)	The fill color when the indicator falls below the lower threshold line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.100 addStochRSI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS 5128

27.18.102 addThreshold(chart as CDXYChartMBS, layer as CDLineLayerMBS, topRange as Double, topColor as color, bottomRange as Double, bottomColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addThreshold method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.103 addThreshold(chart as CDXYChartMBS, layer as CDLineLayerMBS, topRange as Double, topColor as Integer, bottomRange as Double, bottomColor as Integer) 5129

27.18.103 addThreshold(chart as CDXYChartMBS, layer as CDLineLayerMBS, topRange as Double, topColor as Integer, bottomRange as Double, bottomColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an upper/lower threshold range to an existing indicator chart.
Notes:

Arguments:

See also:

- 27.18.102 addThreshold(chart as CDXYChartMBS, layer as CDLineLayerMBS, topRange as Double, topColor as color, bottomRange as Double, bottomColor as color) 5129

Argument	Default	Description
c	(Mandatory)	The indicator chart to add the threshold range to.
layer	(Mandatory)	The line layer that the threshold range applies to.
topRange	(Mandatory)	The upper threshold.
topColor	(Mandatory)	The color to fill the region of the line that is above the upper threshold.
bottomRange	(Mandatory)	The lower threshold.
bottomColor	(Mandatory)	The color to fill the region of the line that is below the lower threshold.

27.18.104 addTriMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addTriMovingAvg method, but uses color instead of integer data type for passing color values.
See also:

- 122.47.155 addTriMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS 18333

27.18.105 addTriMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a triangular moving average line on the main chart.
Notes:

Arguments:

Argument	Default	Description
period	(Mandatory)	The moving average period
color	(Mandatory)	The color of the line.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 27.18.104 addTriMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS 5130

27.18.106 addTRIX(height as Integer, Period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addTRIX method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.107 addTRIX(height as Integer, Period as Integer, ColorValue as Integer) as CDXYChartMBS 5131

27.18.107 addTRIX(height as Integer, Period as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a TRIX indicator chart.
Notes:

Arguments:

Return Value
A CDXYChartMBS object representing the chart created.
See also:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.

- 27.18.106 addTRIX(height as Integer, Period as Integer, ColorValue as color) as CDXYChartMBS 5131

27.18.108 addTypicalPrice(ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addTypicalPrice method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.109 addTypicalPrice(ColorValue as Integer) as CDLineLayerMBS 5132

27.18.109 addTypicalPrice(ColorValue as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a typical price line on the main chart.
Notes:

Arguments:

Argument	Default	Description
color	(Mandatory)	The color of the line.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 27.18.108 addTypicalPrice(ColorValue as color) as CDLineLayerMBS 5132

27.18.110 addUltimateOscillator(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addUltimateOscillator method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.111 addUltimateOscillator(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS 5133

27.18.111 addUltimateOscillator(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an Ultimate Oscillator indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period1	(Mandatory)	The first moving average period to compute the indicator.
period2	(Mandatory)	The second moving average period to compute the indicator.
period3	(Mandatory)	The third moving average period to compute the indicator.
color	(Mandatory)	The color of the indicator line.
range	(Mandatory)	The distance between the middle line and the upper and lower threshold lines.
upColor	(Mandatory)	The fill color when the indicator exceeds the upper threshold line.
downColor	(Mandatory)	The fill color when the indicator falls below the lower threshold line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.110 addUltimateOscillator(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS 5132

27.18.112 addVolBars(height as Integer, upColor as color, downColor as color, flatColor as color) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addVolBars method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.113 addVolBars(height as Integer, upColor as Integer, downColor as Integer, flatColor as Integer) as CDBarLayerMBS 5134

27.18.113 addVolBars(height as Integer, upColor as Integer, downColor as Integer, flatColor as Integer) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a volume bar chart layer on the main chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the bar chart layer in pixels.
upColor	(Mandatory)	The color to used on an 'up' day. An 'up' day is a day where the closing price is higher than that of the previous day.
downColor	(Mandatory)	The color to used on a 'down' day. A 'down' day is a day where the closing price is lower than that of the previous day.
flatColor	(Mandatory)	The color to used on a 'flat' day. A 'flat' day is a day where the closing price is the same as that of the previous day.

Return Value
A CDBarLayerMBS object representing the bar layer created.
See also:

- 27.18.112 addVolBars(height as Integer, upColor as color, downColor as color, flatColor as color) as CDBarLayerMBS 5133

27.18.114 addVolIndicator(height as Integer, upColor as color, downColor as color, flatColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addVolIndicator method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.115 addVolIndicator(height as Integer, upColor as Integer, downColor as Integer, flatColor as Integer) as CDXYChartMBS 5134

27.18.115 addVolIndicator(height as Integer, upColor as Integer, downColor as Integer, flatColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a Volume indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
upColor	(Mandatory)	The color to used on an 'up' day. An 'up' day is a day where the closing price is higher than that of the previous day.
downColor	(Mandatory)	The color to used on a 'down' day. A 'down' day is a day where the closing price is lower than that of the previous day.
flatColor	(Mandatory)	The color to used on a 'flat' day. A 'flat' day is a day where the closing price is the same as that of the previous day.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.114 addVolIndicator(height as Integer, upColor as color, downColor as color, flatColor as color) as CDXYChartMBS 5134

27.18.116 addWeightedClose(ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addWeightedClose method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.117 addWeightedClose(ColorValue as Integer) as CDLineLayerMBS 5135

27.18.117 addWeightedClose(ColorValue as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a weighted close line on the main chart.
Notes:

Arguments:

Argument	Default	Description
color	(Mandatory)	The color of the line.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 27.18.116 addWeightedClose(ColorValue as color) as CDLineLayerMBS 5135

27.18.118 addWeightedMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addWeightedMovingAvg method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.119 addWeightedMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS 5136

27.18.119 addWeightedMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a weighted moving average line on the main chart.
Notes:

Arguments:

Argument	Default	Description
period	(Mandatory)	The moving average period
color	(Mandatory)	The color of the line.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 27.18.118 addWeightedMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS 5136

27.18.120 addWilliamR(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addWilliamR method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.121 addWilliamR(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS 5137

27.18.121 addWilliamR(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a William % R indicator chart.
Notes:

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.
range	(Mandatory)	The distance between the middle line and the upper and lower threshold lines.
upColor	(Mandatory)	The fill color when the indicator exceeds the upper threshold line.
downColor	(Mandatory)	The fill color when the indicator falls below the lower threshold line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 27.18.120 addWilliamR(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS 5136

27.18.122 Constructor(width as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a new FinanceChart object.
Notes:

Arguments:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels. The height will be automatically determined as the chart is built.

27.18.123 currentChart as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns the current chart of this finance chart.
Notes: While you add parts to the finance chart, you can access the last one here.

27.18.124 enableAntiAlias(antiAlias as boolean)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Enables/Disables anti-alias.
Notes:

Enabling anti-alias makes the line smoother. Disabling anti-alias make the chart file size smaller, and so can be downloaded faster through the Internet. The default is to enable anti-alias.

Arguments:

Argument	Default	Description
antiAlias	(Mandatory)	True to enable anti-alias. False to disable anti-alias.

27.18.125 getToolTipDateFormat as string

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the date/time format string to use for tool tips.
Notes:

The format string returned will be one of the format strings specified when calling CDFinanceChartMBS.setToolTipDateFormat based on data point spacing, or the equivalent default value. The format string may then be used in other ChartDirector functions such as CDBaseChartMBS.getHTMLImageMap for producing image maps.

Returns the date/time format string to use for tool tips.

27.18.126 mainChart as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns the main chart of this finance chart.

27.18.127 setAxisOnRight(b as Boolean)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets whether the main y-axis is on right of left side of the plot area.
Notes:

The default is on right.

Arguments:

Argument	Default	Description
b	(Mandatory)	A true value means the y-axis is on right. A false value means the y-axis is on left.

27.18.128 setData(timeStamps() as Double, highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, volData() as Double, extraPoints as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the data to be used in the chart.
Notes:

If some of the data are not available, some artificial values should be used. For example, if the high and low values are not available, you may use closeData as highData and lowData.

Arguments:

Argument	Default	Description
timeStamps	(Mandatory)	An array of dates/times for the time intervals.
highData	(Mandatory)	The high values in the time intervals.
lowData	(Mandatory)	The low values in the time intervals.
openData	(Mandatory)	The open values in the time intervals.
closeData	(Mandatory)	The close values in the time intervals.
volData	(Mandatory)	The volume values in the time intervals.
extraPoints	(Mandatory)	The number of leading time intervals that are not displayed in the chart. These intervals are typically used for computing indicators that require extra leading data, such as moving averages.

27.18.129 setDateLabelFormat(yearFormat as string, firstMonthFormat as string, otherMonthFormat as string, firstDayFormat as string, otherDayFormat as string, firstHourFormat as string, otherHourFormat as string)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the date/time formats to use for the x-axis labels under various cases.
Notes:

See Parameter Substitution and Formatting on the syntax of ChartDirector format strings.

Arguments:

Argument	Default	Description
yearFormat	(Mandatory)	The format for displaying labels on an axis with yearly ticks. The default is " { value | yyyy } ".
firstMonthFormat	(Mandatory)	The format for displaying labels on an axis with monthly ticks. This parameter applies to the first available month of a year (usually January) only, so it can be formatted differently from the other labels. The default is "<*font=bold*>{ value | mmm yy } ".
otherMonthFormat	(Mandatory)	The format for displaying labels on an axis with monthly ticks. This parameter applies to months other than the first available month of a year. The default is " { value | mmm } ".
firstDayFormat	(Mandatory)	The format for displaying labels on an axis with daily ticks. This parameter applies to the first available day of a month only, so it can be formatted differently from the other labels. The default is "<*font=bold*>{ value | d mmm } ".
otherDayFormat	(Mandatory)	The format for displaying labels on an axis with daily ticks. This parameter applies to days other than the first available day of a month. The default is " { value | d } ".
firstHourFormat	(Mandatory)	The format for displaying labels on an axis with hourly resolution. This parameter applies to the first tick of a day only, so it can be formatted differently from the other labels. The default is "<*font=bold*>{ value | d mmm<*br*>h:nna } ".
otherHourFormat	(Mandatory)	The format for displaying labels on an axis with hourly. resolution. This parameter applies to ticks at hourly boundaries, except the first tick of a day. The default is " { value | h:nna } ".

27.18.130 setDateLabelSpacing(labelSpacing as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the minimum label spacing between two labels on the time axis.
Notes:

Arguments:

Argument	Default	Description
labelSpacing	(Mandatory)	The label spacing in pixels. The default is 50 pixels.

27.18.131 setLegendStyle(font as string, fontSize as Double, fontColor as color, bgColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setLegendStyle method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.132 setLegendStyle(font as string, fontSize as Double, fontColor as Integer, bgColor as Integer) 5141

27.18.132 setLegendStyle(font as string, fontSize as Double, fontColor as Integer, bgColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets legend font style and background color.
Notes:

The default is Arial 8 pt black font on a semi-transparent light grey (80CCCCCC) background.

Arguments:

Argument	Default	Description
font	(Mandatory)	The font of the legend text.
fontSize	(Mandatory)	The font size of the legend text in points.
fontColor	(Mandatory)	The color of the legend text.
bgColor	(Mandatory)	The background color of the legend box.

See also:

- 27.18.131 setLegendStyle(font as string, fontSize as Double, fontColor as color, bgColor as color) 5140

27.18.133 setLogScale(b as Boolean)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Determines if log scale should be used for the main chart.
Notes:

The default is to use linear scale.

Arguments:

Argument	Default	Description
b	(Mandatory)	A true value means using log scale. A false value means using linear scale.

27.18.134 setMargins(leftMargin as Integer, topMargin as Integer, rightMargin as Integer, bottomMargin as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the margins around the plot area.
Notes:

The default is 40 pixels for the left and right margins, and 30 pixels for the top margin and 35 pixels for the bottom margin.

Arguments:

Argument	Default	Description
leftMargin	(Mandatory)	The distance from the left side of the plot area to the left side of the chart.
topMargin	(Mandatory)	The distance from the top of the plot area to the top of the chart.
rightMargin	(Mandatory)	The distance from the right side of the plot area to the right side of the chart.
bottomMargin	(Mandatory)	The distance from the bottom of the plot area to the bottom of the chart.

27.18.135 setNumberLabelFormat(formatString as string)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the number format to use.
Notes:

The default number format in FinanceChart is "P3". See Parameter Substitution and Formatting on the syntax of ChartDirector format strings.

Arguments:

Argument	Default	Description
formatString	(Mandatory)	The format for displaying numbers.

27.18.136 setPercentageAxis as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Label the axis of the main chart in percentage unit.
Notes: By default, the axis of the main chart will be labelled in price unit. If a percentage axis is used, the axis will be labelled in percentage unit, with the first visible point of the closing price being 100% .

27.18.137 setPlotAreaBorder(borderColor as color, borderGap as Integer)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setPlotAreaBorder method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.138 setPlotAreaBorder(borderColor as Integer, borderGap as Integer) 5143

27.18.138 setPlotAreaBorder(borderColor as Integer, borderGap as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the plot area border color and the gap distance between charts.
Notes:

The default is a grey (888888) border with two 2 pixels gap between charts.

Arguments:

Argument	Default	Description
borderColor	(Mandatory)	The plot area border color.
borderGap	(Mandatory)	The distance between charts.

See also:

- 27.18.137 setPlotAreaBorder(borderColor as color, borderGap as Integer) 5143

27.18.139 setPlotAreaStyle(bgColor as color, majorHGridColor as color, majorVGridColor as color, minorHGridColor as color, minorVGridColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setPlotAreaStyle method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.140 setPlotAreaStyle(bgColor as Integer, majorHGridColor as Integer, majorVGridColor as Integer, minorHGridColor as Integer, minorVGridColor as Integer) 5144

27.18.140 setPlotAreaStyle(bgColor as Integer, majorHGridColor as Integer, majorVGridColor as Integer, minorHGridColor as Integer, minorVGridColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the plot area background and grid colors.
Notes:

The default is a white background with light grey (DDDDDD) grid lines.

Arguments:

Argument	Default	Description
bgColor	(Mandatory)	The plot area background color.
majorHGridColor	(Mandatory)	Major horizontal grid color.
majorVGridColor	(Mandatory)	Major vertical grid color.
minorHGridColor	(Mandatory)	Minor horizontal grid color. In current version, minor horizontal grid is not used.
minorVGridColor	(Mandatory)	Minor vertical grid color.

See also:

- 27.18.139 setPlotAreaStyle(bgColor as color, majorHGridColor as color, majorVGridColor as color, minorHGridColor as color, minorVGridColor as color) 5143

27.18.141 setToolTipDateFormat(monthFormat as string, dayFormat as string, hourFormat as string)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the date/time formats to use for the tool tips under various cases.
Notes:

See Parameter Substitution and Formatting on the syntax of ChartDirector format strings.

Arguments:

Argument	Default	Description
monthFormat	(Mandatory)	The tool tip format to use if the data point spacing is one or more months (more than 30 days). The default is " [{ xLabel | mmm yyyy }] ".
dayFormat	(Mandatory)	The tool tip format to use if the data point spacing is 1 day to less than 30 days. The default is " [{ xLabel | mmm d, yyyy }] ".
hourFormat	(Mandatory)	The tool tip format to use if the data point spacing is less than 1 day. The default is " [{ xLabel | mmm d, yyyy hh:nn:ss }] ".

27.18.142 setXAxisStyle(font as string, fontSize as Double, fontColor as color, fontAngle as Double)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setXAxisStyle method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.143 setXAxisStyle(font as string, fontSize as Double, fontColor as Integer, fontAngle as Double) 5145

27.18.143 setXAxisStyle(font as string, fontSize as Double, fontColor as Integer, fontAngle as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets x-axis label style.
Notes:

The default is Arial 8 pt black color as font with no text rotation.

Arguments:

Argument	Default	Description
font	(Mandatory)	The font of the axis labels.
fontSize	(Mandatory)	The font size of the axis labels in points.
fontColor	(Mandatory)	The color of the axis labels.
fontAngle	(Mandatory)	The rotation of the axis labels.

See also:

- 27.18.142 setXAxisStyle(font as string, fontSize as Double, fontColor as color, fontAngle as Double) 5145

27.18.144 setYAxisStyle(font as string, fontSize as Double, fontColor as color, bgColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setYAxisStyle method, but uses color instead of integer data type for passing color values.
See also:

- 27.18.145 setYAxisStyle(font as string, fontSize as Double, fontColor as Integer, bgColor as Integer) 5146

27.18.145 setYAxisStyle(font as string, fontSize as Double, fontColor as Integer, bgColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets y-axis label style.
Notes:

The default is Arial 8 pt black color, with 14 pixels margin.

Arguments:

Argument	Default	Description
font	(Mandatory)	The font of the axis labels.
fontSize	(Mandatory)	The font size of the axis labels in points.
fontColor	(Mandatory)	The color of the axis labels.
axisMargin	(Mandatory)	The margin at the top of the y-axis in pixels (to leave space for the legend box).

See also:

- 27.18.144 setYAxisStyle(font as string, fontSize as Double, fontColor as color, bgColor as color) 5145

27.18.146 Screenshots

27.18.147 finance.jpg

Function: A finance chart created using ChartDirector with the CDFinanceChartMBS class.

27.18.148 finance2.jpg

Function: A finance chart created using ChartDirector with the CDFinanceChartMBS class.

27.19 class CDFinanceSimulatorMBS

27.19.1 class CDFinanceSimulatorMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: FinanceSimulator is a utility class to produce tables with random numbers that look like valid financial data series.
Notes: It facilitates testing and demonstrating ChartDirector financial charts without needing a real database table.

27.19.2 Methods

27.19.3 Constructor(seed as Integer, startTime as Double, endTime as Double, resolution as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a FinanceSimulator object.
Notes:

Argument	Default	Description
seed	(Mandatory)	The seed to be used in the random number generator.
startTime	(Mandatory)	The start date/time of the financial date series.
endTime	(Mandatory)	The end date/time of the financial date series.
resolution	(Mandatory)	The resolution of the financial data series in seconds. For example, a value of 86400 means daily data (1 day = 86400 seconds). A value of 7 * 86400 means weekly data. A value of 30 * 86400 means monthly data.

See also:

- 27.19.4 Constructor(seed as string, startTime as Double, endTime as Double, resolution as Integer) 5149

27.19.4 Constructor(seed as string, startTime as Double, endTime as Double, resolution as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a FinanceSimulator object.
Notes:

See also:

- 27.19.3 Constructor(seed as Integer, startTime as Double, endTime as Double, resolution as Integer) 5149

Argument	Default	Description
seed	(Mandatory)	The seed to be used in the random number generator.
startTime	(Mandatory)	The start date/time of the financial date series.
endTime	(Mandatory)	The end date/time of the financial date series.
resolution	(Mandatory)	The resolution of the financial data series in seconds. For example, a value of 86400 means daily data (1 day = 86400 seconds). A value of 7 * 86400 means weekly data. A value of 30 * 86400 means monthly data.

27.19.5 getCloseData as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the close data series.

27.19.6 getHighData as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the high data series.

27.19.7 getLowData as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the low data series.

27.19.8 getOpenData as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the open data series.

27.19.9 getTimeStamps as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the timestamps of the data series.

27.19.10 getVolData as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the volume data series.

27.20 class CDHLOCLayerMBS

27.20.1 class CDHLOCLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The HLOCLayer class represents high-low-open-close layers.
Notes:

Subclass of the CDBaseBoxLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.20.2 Methods

27.20.3 setColorMethod(colorMethod as Integer, riseColor as color, fallColor as color, leadValue as Double = -1.7E308)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setColorMethod method, but uses color instead of integer data type for passing color values.
See also:

- 27.20.4 setColorMethod(colorMethod as Integer, riseColor as Integer, fallColor as Integer = -1, leadValue as Double = -1.7E308) 5152

27.20.4 setColorMethod(colorMethod as Integer, riseColor as Integer, fallColor as Integer = -1, leadValue as Double = -1.7E308)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the coloring method for the HLOC symbols.
Notes:

See XYChart.addHLOCLayer for the supported coloring methods for HLOC symbols.

Argument	Default	Description
colorMethod	(Mandatory)	The method to color the HLOC layer. Please refer to XYChart.addHLOCLayer3 for the supported coloring methods.
riseColor	(Mandatory)	The color to be used on an "up" day.
fallColor	-1	The color to be used on a "down" day. The default value of -1 means it is the same as the riseColor.
leadValue	[-Infinity]	The lead value to act as the closing pricing before the first day, so as to determine if the first day is an "up" or "down" day.

See also:

- 27.20.3 setColorMethod(colorMethod as Integer, riseColor as color, fallColor as color, leadValue as Double = -1.7E308) 5152

27.21 class CDImageMapHandlerMBS

27.21.1 class CDImageMapHandlerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** ImageMapHandler is a utility class to handle image maps in HTML format (that is, as <AREA>tags).
Notes:

It determines if a given point is on a hot spot as defined by the image map, and retrieves the hot spot parameters.

The BaseChart.getHTMLImageMap method can be used to automatically generate image maps for charts automatically.

The advantages of using HTML image map format is that it is easy for developers to customize the hot spots. For example, one can create custom buttons in the chart image by drawing custom text boxes, and then create custom image maps to define the text boxes as hot spots. These custom image maps can be appended to the image maps generated by BaseChart.getHTMLImageMap using simple string concatenation.

ImageMapHandler will process the various attributes of the HTML & lt;AREA& gt; tags as follows:

AttributeDescription

coords	This attribute defines the position and shape of the hot spot.
href	The URL specified in this attribute will become the attributes of the hot spot. The path portion of the URL will become the path attribute, while the query parameters will become the attributes of the hot spot as is.
title	This attribute defines the tool tip text to display when the mouse moves over and stops on the hot spot.

27.21.2 Methods

27.21.3 Constructor(ImageMap as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Constructs an image map handler object for the given image map.
Notes:

Argument	Default	Description
imageMap	(Mandatory)	A text string representing the image map in HTML format.

27.21.4 getHotSpot(xCoordinate as Integer, yCoordinate as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the hot spot under the given point as the current hot spot.
Notes:

This method will retrieve the hot spot under the given point as the "current hot spot". Its attributes can then be retrieved using ImageMapHandler.getKey, ImageMapHandler.getValue and ImageMapHandler.getValue2.

This method returns an integer representing the hot spot, or -1 if the point is not over any hot spot. Each hot spot region is represented by a unique integer, which can be any arbitrary number. The number is mainly used to determine if the cursor has changed from one hot spot to another hot spot.

Argument	Default	Description
x	(Mandatory)	The x coordinate of a point of which the hot spot is to be retrieved.
y	(Mandatory)	The y coordinate of a point of which the hot spot is to be retrieved.

Return Value
An integer representing the hot spot, or -1 if the given point is not over any hot spot.

27.21.5 getKey(i as Integer) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the key of an attribute of the current hot spot.
Notes:

Each hot spot is associated with an arbitrary number of attributes, in which each attribute consists of a key and a value. This method returns the key of the (i + 1)th attribute. (The first attribute is 0, while the nth attribute is n - 1.)

If the argument i is equal or larger than the number of attributes, an null string will be returned. This behaviour can be used to enumerate the attributes and to determine how many attributes are associated for the hot spot.

Argument	Default	Description
i	(Mandatory)	The index of the attribute to retrieve (index of first attribute is 0).

Return Value
A string representing the key of the attribute, or null if there is no such attribute.

27.21.6 getValue(i as Integer) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the value of an attribute of the current hot spot by using its numeric index.
Notes:

Each hot spot is associated with an arbitrary number of attributes, in which each attribute consists of a key and a value. This method returns the value of the (i + 1)th attribute. (The first attribute is 0, while the nth attribute is n - 1.)

Argument	Default	Description
i	(Mandatory)	The index of the attribute to retrieve (index of first attribute is 0).

Return Value
A string representing the value of the attribute, or null if there is no such attribute.
See also:

- 27.21.7 getValue(key as string) as string 5156

27.21.7 getValue(key as string) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the value of an attribute of the current hot spot by using its key.
Notes:

Each hot spot is associated with an arbitrary number of attributes, in which each attribute consists of a key and a value. This method returns the value of the attribute given the key.

Argument	Default	Description
key	(Mandatory)	A text string representing the key of the attribute.

Return Value
A string representing the value of the attribute, or null if there is no such attribute.
See also:

- 27.21.6 getValue(i as Integer) as string 5156

27.22 class CDInterLineLayerMBS

27.22.1 class CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The InterLineLayer class represents interline layers.
Notes:

Interline layers are used to color the region between two lines. The lines can come from a variety of layer types, such as line layers, spline layers, step line layers, trend layers or axis mark lines.
Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.22.2 Methods

27.22.3 setGapColor(gapColor12 as Color, gapColor21 as Color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setGapColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.22.4 setGapColor(gapColor12 as Integer, gapColor21 as Integer = -1) 5157

27.22.4 setGapColor(gapColor12 as Integer, gapColor21 as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the color used to fill the area under NoValue data points.
Notes:

By default, if there are NoValue data points on the lines, ChartDirector will interpolate across the points. The region will remain continuous.

This method can be used to set up an alternative colors to represent the regions at NoValue data point positions. In particular, if the colors are set to Transparent, the NoValue data points will result in gaps in the fill region.

See also:

- 27.22.3 setGapColor(gapColor12 as Color, gapColor21 as Color) 5157

Argument	Default	Description
gapColor12	(Mandatory)	The color used to fill the region under NoValue positions when value of the first line is greater of the value of the second line.
gapColor21	-1	The color used to fill the region under NoValue positions when value of the second line is greater of the value of the first line. The default value of -1 means it is the same as gapColor12.

27.23 class CDLayerMBS

27.23.1 class CDLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The Layer class is the base class for all XYChart layer classes.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.23.2 Blog Entries

- MBS Real Studio Plugins, version 11.3pr5

27.23.3 Methods

27.23.4 addCustomAggregateLabel(dataItem as Integer, label as string, font as string = """, fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a custom aggregate label to an aggregated object.
Notes:

Aggregate data labels applies to layer types that contains "aggregated data", such as stacked bar layer and stacked area layer. In these layer types, data labels (see Layer.setDataLabelStyle) represents a single data item, while aggregate labels represents the stacked object.

See Font Specification for details on various font attributes.

Argument	Default	Description
dataItem	(Mandatory)	The index of the aggregated object. The first aggregated object is 0, while the nth aggregated object is (n - 1).
label	(Mandatory)	A text string representing the custom aggregate label. Parameter Substitution and Formatting is supported.
font	""	The font used to draw the labels.
fontSize	8	The font size used to draw the labels.
fontColor	TextColor	The color used to draw the labels.
fontAngle	0	The rotation angle of the labels.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of

the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 27.23.5 addCustomAggregateLabel(dataItem as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS 5160

27.23.5 addCustomAggregateLabel(dataItem as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addCustomAggregateLabel method, but uses color instead of integer data type for passing color values.
See also:

- 27.23.4 addCustomAggregateLabel(dataItem as Integer, label as string, font as string = "", fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS 5159

27.23.6 addCustomDataLabel(dataSet as Integer, dataItem as Integer, label as string, font as string = "", fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a custom data label to a data point.
Notes:

Data labels are text used label data points in the layer. Please refer to Layer.setDataLabelStyle for a more detail description.

See Font Specification for details on various font attributes.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 27.23.7 addCustomDataLabel(dataSet as Integer, dataItem as Integer, label as string, font as string,

Argument	Default	Description
dataSet	(Mandatory)	The data set number for the data point. The first data set is 0, while the nth data set is (n - 1).
dataItem	(Mandatory)	The data point number for the data point within the data set. The first data point is 0, while the nth data point is (n - 1).
label	(Mandatory)	A text string representing the data label. Parameter Substitution and Formatting is supported.
font	""	The font used to draw the label.
fontSize	8	The font size used to draw the label.
fontColor	TextColor	The color used to draw the label.
fontAngle	0	The rotation angle of the label.

fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS 5161

27.23.7 addCustomDataLabel(dataSet as Integer, dataItem as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addCustomDataLabel method, but uses color instead of integer data type for passing color values.
See also:

- 27.23.6 addCustomDataLabel(dataSet as Integer, dataItem as Integer, label as string, font as string = "", fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS 5160

27.23.8 addCustomGroupLabel(dataGroup as Integer, dataItem as Integer, label as string, font as string ="", fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a custom data group label to object representing the group.
Notes:

Data group label applies to layer types that may represent data groups. See Layer.addDataGroup on how data groups are created and the layer types that support data groups.

See Font Specification for details on various font attributes.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of

Argument	Default	Description
dataGroup	(Mandatory)	The data group number for the data point. The first data group is 0, while the nth data group is (n - 1).
dataItem	(Mandatory)	The data point number for the data point within the data group. The first data point is 0, while the nth data point is (n - 1).
label	(Mandatory)	A text string representing the data label. Parameter Substitution and Formatting is supported.
font	""	The font used to draw the label.
fontSize	8	The font size used to draw the label.
fontColor	TextColor	The color used to draw the label.
fontAngle	0	The rotation angle of the label.

the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 27.23.9 addCustomGroupLabel(dataGroup as Integer, dataItem as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS 5162

27.23.9 addCustomGroupLabel(dataGroup as Integer, dataItem as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addCustomGroupLabel method, but uses color instead of integer data type for passing color values.
See also:

- 27.23.8 addCustomGroupLabel(dataGroup as Integer, dataItem as Integer, label as string, font as string ="", fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS 5161

27.23.10 addDataGroup(name as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Open a new data group.
Notes:

Currently, only stacked bar layers support data groups for creating "multi-stacked" bars.

In a normal stacked bar layer, all data sets are stacked on top of one another, creating one stacked bar per x-axis position. If data grouping is used, data sets within the same data group with be stacked up. So there

may be multiple stacked bars in each x-axis position. These stacked bars are drawn side by side.

When you add a data set using Layer.addDataSet, the data set will belong to the current data group. The addDataGroup method can be used to open a new data group, so that subsequent data sets will belong to that new group.

You may associate a name with a data group. The name can then be used in data labels or image maps to identify the data group.

Argument	Default	Description
name	""	Name of the data group.

27.23.11 addDataSet(data as CDArrayMBS, colorvalue as color, name as string = "") as CDDataSetMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addDataSet method, but uses color instead of integer data type for passing color values.
See also:

- 27.23.12 addDataSet(data as CDArrayMBS, colorvalue as Integer = -1, name as string = "") as CDDataSetMBS 5163
- 27.23.13 addDataSet(data() as Double, colorvalue as color, name as string = "") as CDDataSetMBS 5164
- 27.23.14 addDataSet(data() as Double, colorvalue as Integer = -1, name as string = "") as CDDataSetMBS 5164

27.23.12 addDataSet(data as CDArrayMBS, colorvalue as Integer = -1, name as string = "") as CDDataSetMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a data set to the chart layer.
Notes:

Return Value
A DataSet object representing the data set added. You may use the methods of this object to fine-tune how the data set is drawn on the chart.
See also:

- 27.23.11 addDataSet(data as CDArrayMBS, colorvalue as color, name as string = "") as CDDataSetMBS 5163

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the data item. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.

- 27.23.13 addDataSet(data() as Double, colorvalue as color, name as string = "") as CDDataSetMBS 5164
- 27.23.14 addDataSet(data() as Double, colorvalue as Integer = -1, name as string = "") as CDDataSetMBS 5164

27.23.13 addDataSet(data() as Double, colorvalue as color, name as string = "") as CDDataSetMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addDataSet method, but uses color instead of integer data type for passing color values.
See also:

- 27.23.11 addDataSet(data as CDArrayMBS, colorvalue as color, name as string = "") as CDDataSetMBS 5163
- 27.23.12 addDataSet(data as CDArrayMBS, colorvalue as Integer = -1, name as string = "") as CDDataSetMBS 5163
- 27.23.14 addDataSet(data() as Double, colorvalue as Integer = -1, name as string = "") as CDDataSetMBS 5164

27.23.14 addDataSet(data() as Double, colorvalue as Integer = -1, name as string = "") as CDDataSetMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a data set to the chart layer.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the data item. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.

Return Value
A DataSet object representing the data set added. You may use the methods of this object to fine-tune how the data set is drawn on the chart.
See also:

- 27.23.11 addDataSet(data as CDArrayMBS, colorvalue as color, name as string = "") as CDDataSetMBS 5163
- 27.23.12 addDataSet(data as CDArrayMBS, colorvalue as Integer = -1, name as string = "") as CDDataSetMBS 5163
- 27.23.13 addDataSet(data() as Double, colorvalue as color, name as string = "") as CDDataSetMBS 5164

27.23.15 addExtraField(numbers() as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an array of numbers/dates to be used as an extra field in various places.
Notes:

This method merely stores the data inside the layer object. The Parameter Substitution and Formatting mechanism will determine how the data are to be used.

A common use for extra fields is to specify extra information (such as a custom serial number for the data points) to be displayed on data labels or on tool tips, or to supply extra query parameters in clickable charts. All these are achieved by specifying the extra field on the data label template or image map templates during parameter substitution.

Argument	Default	Description
numbers	(Mandatory)	An array of numbers/dates to be stored inside the layer object.

See also:

- 27.23.16 addExtraField(texts() as string) 5165

27.23.16 addExtraField(texts() as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an array of text to be used as an extra field in various places.
Notes:

This method merely stores the data inside the layer object. The Parameter Substitution and Formatting mechanism will determine how the data are to be used.

A common use for extra fields is to specify extra information (such as a custom serial number for the data points) to be displayed on data labels or on tool tips, or to supply extra query parameters in clickable charts. All these are achieved by specifying the extra field on the data label template or image map templates during parameter substitution.

Argument	Default	Description
texts	(Mandatory)	An array of text to be stored inside the layer object.

See also:

- 27.23.15 addExtraField(numbers() as Double) 5165

27.23.17 alignLayer(layer as CDLayerMBS, dataSet as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Aligns the layer with a data set of another bar chart layer in Side layout.
Notes:

The Side layout is a layout method specific to the bar chart layer. In this layout method, multiple bars belonging to the same x-position are laid out side by side. Thus the bars are not centered exactly on the x-position, but are shifted. The shift amount depends on the data set numbers of the bars.

In some cases, it may be necessary to overlay another layer (eg. a line chart layer, or a box-whisker chart layer) on top of the bars. The alignLayer method ensures the data points are shifted by the same amount as a given data set on a given BarLayer.

Argument	Default	Description
layer	(Mandatory)	The BarLayer which contains the bars to synchronize with.
dataSet	(Mandatory)	The data set of the bars to synchronize with.

27.23.18 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The private constructor.

27.23.19 getDataSet(dataSet as Integer) as CDDataSetMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the requested DataSet object.
Notes:

Argument	Default	Description
dataSet	(Mandatory)	A data set number, starting from 0. The first data set object is 0, and the nth data set is (n-1).

Return Value
The requested DataSet object.

27.23.20 getDataSetByZ(z as Integer) as CDDataSetMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets a DataSet object based on the order in which it is being drawn.
Notes:

In certain layer types, the data sets are drawn in a certain order. For example, in a line layer, the data sets represent lines and they are drawn one by one. In contrast, for a candlestick layer, the high, low, open and close data sets are combined into candlestick symbols, and there is no specific order on which data sets are drawn.

This method can be used to get the data set based on the order it is being drawn. If the data sets are not drawn in any specific order, this method will return the data sets in the reverse order to which it is added to the layer.

Argument	Default	Description
zIndex	(Mandatory)	The z-index of the required data set. The z-index of the first data set drawn is 0. The z-index for the Nth data set drawn is N - 1.

Returns the DataSet object at the specified z-order.

27.23.21 getDataSetCount as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the number of data sets in the layer.
Notes: Returns the number of data sets in the layer.

27.23.22 getHTMLImageMap(url as string, queryFormat as string = """, extraAttr as string = """, offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Generates an HTML image map for all data points as represented on the layer.
Notes:

Please refer to BaseChart.getHTMLImageMap for the detail description of this method.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
url	(Mandatory)	The URL to be used in the "href" attribute of the image map. Parameter Substitution and Formatting is supported. Use an empty string if no href attribute is needed.
queryFormat	""	A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported.

The special keyword " { default } " represents the default query parameters. This is useful for specifying appending to the default.

Note that an empty string means to use the default query query parameters. To specify no query parameter, use a space character.

extraAttr	""	A text string to specify additional attributes to add to the & lt;area& gt; tag. Parameter Substitution and Formatting is supported.
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string containing the image map generated.

27.23.23 getImageCoor(dataSet as Integer, dataItem as Integer = & h80000001, offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the image map coordinates of a data point as represented in the layer as HTML image map attributes.
Notes:

The image map coordinates will be in the following format:

shape=" [shape] " cords=" [x1] , [y1] , [x2] , [y2] ..."
This format is specially designed so that it can easily be incorporated into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
dataSet	(Mandatory)	The data set number for the data point. The first data set is 0, while the nth data set is (n-1).
dataItem	(Mandatory)	The index of the data point within the data set. The first data point is 0, while the nth data point is (n-1).
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string representing the coordinates of the data point as represented in the layer in HTML image map attribute format.

27.23.24 getImageCoor2(dataItem as Integer, offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the image map coordinates of a region containing all data points at the given x-position as HTML image map attributes.
Notes:

For example, in a stacked bar chart, this method will obtain the image map coordinates of the whole stacked bar, which contains multiple data points at the same x-position.

The image map coordinates will be in the following format:

shape="" cords=" [x1] , [y1] , [x2] , [y2] ..."
This format is specially designed so that it can easily be included into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
dataItem	(Mandatory)	The x-position of the data points.
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string representing the image map coordinates of a region containing all data points at the given x-position as HTML image map attributes.

27.23.25 getLegendIcon(dataSetNo as Integer) as string

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the textual representation of the legend icon for a data set.
Notes:

The textual representation can be used in any ChartDirector API that supports the ChartDirector Mark Up Language. A common usage is to insert the icon to a cell in a CDMLTable to label the data series in the table, or to create a custom legend table.

The legend icon is the same legend icon that would be used in the CDLegendBoxMBS. If you modify the icon appearance using the methods of the CDLegendBoxMBS object (such as using CDLegendBoxMBS.setKeyBorder to configure the legend key border), the modification will also apply to the icon returned this method.

Arguments:

Argument	Default	Description
dataSetNo	(Mandatory)	The data set for which the legend icon represents.

Return Value
The textual representation of the legend icon for the data set.

27.23.26 getNearestXValue(target as Double) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the x data value that is nearest to the specified x pixel coordinate.
Notes:

This method will search all x data values in the Layer to look for the x data value that is nearest to the given x coordinate. If there are two x data values equally near to the specified x pixel coordinate, this method will arbitrarily return one of the values.

Argument	Default	Description
xCoor	(Mandatory)	The x pixel coordinate to search for.

Returns the x data value that is nearest to the specified x coordinate.

27.23.27 getXCoor(value as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the x pixel coordinate of a point given the x data value.
Notes:

Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

Argument	Default	Description
v	(Mandatory)	The x data value.

Return Value
The x coordinate of the x data value.

27.23.28 getXIndexOf(xValue as Double, tolerance as Double = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the data point index at the specified x data value.
Notes:

The index can be used in DataSet.getValue and DataSet.getPosition to obtain the y values and positions of the data points for all data sets in the layer.

The tolerance argument is to allow this method to consider data points that are not exactly at xValue, but are within tolerance from it.

If multiple data points at within tolerance, this method will return the index of the data point nearest to xValue. If multiple data points are equally near to xValue, this method will choose one arbitrarily and return its data point index. If no data points are found, this method will return -1.

Argument	Default	Description
xValue	(Mandatory)	The x data value used to look for the data points in order to get the data point index of the nearest data point.
tolerance	0	The tolerance allowed for for data points that are not exactly at the specified xValue.

Returns the data point index of the data point nearest to the specified x data value up to the specified tolerance, or -1 if no data points are found.

27.23.29 getXPosition(i as Integer) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the x positional value of a data point, as measured on the primary x-axis.
Notes:

Argument	Default	Description
i	(Mandatory)	The data point index of the data point. The first data point is 0; the nth data point is (n - 1).

27.23.30 getYCoor(value as Double, axis as boolean=true) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the y pixel coordinate of a point given the y data value.
Notes:

Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

Argument	Default	Description
v	(Mandatory)	The y data value.
yAxis	[Null]	The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.

For backward compatibility, the axis argument can also be a boolean value. A true value means the primary y-axis. A false value means the secondary y-axis.
Return Value
The y coordinate of the y data value.
See also:

- 27.23.31 getYCoor(value as Double, axis as CDAxisMBS) as Integer 5173

27.23.31 getYCoor(value as Double, axis as CDAxisMBS) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the y pixel coordinate of a point given the y data value.
Notes:

Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

Argument	Default	Description
v	(Mandatory)	The y data value.
yAxis	[Null]	The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.

For backward compatibility, the axis argument can also be a boolean value. A true value means the primary y-axis. A false value means the secondary y-axis.
Return Value
The y coordinate of the y data value.
See also:

- 27.23.30 getYCoor(value as Double, axis as boolean=true) as Integer 5172

27.23.32 moveBack(layer as CDLayerMBS=nil)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Moves the layer in front of another layer.
Notes:

By default, the front to back ordering of the Layer objects are the same as the order in which they are added to the chart. For example, a layer added first will be in front of a layer added last.

This method can be used to move the layer behind another layer.

Arguments:

Argument	Default	Description
layer	nil	The Layer for this layer to move behind. A nil object means the layer will be moved behind all current layers.

27.23.33 moveFront(layer as CDLayerMBS=nil)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Moves the layer in front of another layer.
Notes:

By default, the front to back ordering of the CDLayerMBS objects are the same as the order in which they are added to the chart. For example, a layer added first will be in front of a layer added last.

This method can be used to move the layer in front of another layer.

Arguments:

Argument	Default	Description
layer	nil	The Layer for this layer to move in front of. The default value of null means the layer will be moved in front of all current layers.

27.23.34 set3D(d as Integer = -1, zGap as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the 3D depth of the layer, and the 3D gap between the current layer and the next layer.
Notes:

Argument	Default	Description
d	-1	The 3D depth of the layer in pixels. -1 means the 3D depth is automatically calculated.
zGap	0	The 3D gap between the current layer and the next layer in pixels.

27.23.35 setAggregateLabelFormat(formatString as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the aggregate label format.
Notes:

By default, the aggregate label format is " { value } ". Please refer to Parameter Substitution and Formatting on available parameters and how to format them.

Argument	Default	Description
formatString	(Mandatory)	The format string.

27.23.36 setAggregateLabelStyle(font as string = """, fontSize as Double = 8, fontcolor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Enables aggregate labels and sets their styles.
Notes:

Aggregate data labels applies to layer types that contains "aggregated data", such as stacked bar layer and stacked area layer. In these layer types, data labels (see Layer.setDataLabelStyle) represents a single data item, while aggregate labels represents the stacked object.

See Font Specification for details on various font attributes.

Argument	Default	Description
font	""	The font used to draw the labels.
fontSize	8	The font size used to draw the labels.
fontColor	TextColor	The color used to draw the labels.
fontAngle	0	The rotation angle of the labels.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 27.23.37 setAggregateLabelStyle(font as string, fontSize as Double, fontcolor as color, fontAngle as Double = 0) as CDTextBoxMBS 5175

27.23.37 setAggregateLabelStyle(font as string, fontSize as Double, fontcolor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setAggregateLabelStyle method, but uses color instead of integer data type

for passing color values.
See also:

- 27.23.36 setAggregateLabelStyle(font as string = """, fontSize as Double = 8, fontcolor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS 5175

27.23.38 setBaseLine(BaseLine as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the baseline for the data representation.
Notes:

Certain data representation, such as bars in bar layers and area in area layers, are drawn from a base line. The base line by default is y = 0.

For example, for a vertical bar layer, the bars start from y = 0 and grow upwards for positive data (assuming the y-axis is not reversed), and downwards for negative data.

This method can be used to modify the base line to other values.

Arguments:

Argument	Default	Description
baseLine	(Mandatory)	The value of the base line.

27.23.39 setBorderColor(colorvalue as color, lightingEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the default border color and 3D raised effect when drawing data sets on the layer.
Notes:

This method only applies to layers that represents data with elements that have borders (e.g. bar layer).

This method affect all data sets. To set the color of one particular data set, use DataSet.setDataColor.

See also:

- 27.23.40 setBorderColor(colorvalue as Integer, lightingEffect as Integer = 0) 5177

Argument	Default	Description
color	(Mandatory)	The border color.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument is also used to support glassEffect and softLighting effects.

27.23.40 setBorderColor(colorvalue as Integer, lightingEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the default border color and 3D raised effect when drawing data sets on the layer.
Notes:

This method only applies to layers that represents data with elements that have borders (e.g. bar layer).

This method affect all data sets. To set the color of one particular data set, use DataSet.setDataColor.

Argument	Default	Description
color	(Mandatory)	The border color.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument is also used to support glassEffect and softLighting effects.

See also:

- 27.23.39 setBorderColor(colorvalue as color, lightingEffect as Integer = 0) 5176

27.23.41 setDataCombineMethod(m as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the method used to combine multiple data sets in a layer.
Notes:

This method is used only for layers that can combine multiple data sets in different ways. Some layers can only support a subset of the data combine methods defined below.

ConstantValueDescription

Side	3	The data sets are combined by plotting the data representation side by side.
Stack	1	The data sets are combined by stacking up their data representations.
Overlay	0	The data sets are combined by drawing them independently, overlapping each others.
Percentage	4	The data sets are combined similar to the Stack method, except that the data is scaled so that each stack always summed up to 100. In other words, the region that a data item occupies in a stack represents the percentage of the data item relative to sum of all the data items in the stack.

Argument	Default	Description
m	(Mandatory)	one of the predefined constants representing the data combine method to use.

27.23.42 setDataLabelFormat(formatString as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the data label format.
Notes:

This method affects all data labels in the layer. To set the label format for one particular data set only, use DataSet.setDataLabelFormat.

Data labels are text used label data points in the layer. Please refer to Layer.setDataLabelStyle for a more detail description.

By default, the data label format is " { value } ". Please refer to Parameter Substitution and Formatting on available parameters and how to format them.

Argument	Default	Description
formatString	(Mandatory)	The format string.

27.23.43 setDataLabelStyle(font as string = "", fontSize as Double = 8, fontcolor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setDataLabelStyle method, but uses color instead of integer data type for passing color values.
See also:

- 27.23.44 setDataLabelStyle(font as string = "", fontSize as Double = 8, fontcolor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

27.23.44 setDataLabelStyle(font as string = ””, fontSize as Double = 8, fontcolor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Enables data labels and sets their styles.
Notes:

This method affects all data labels in the layer. To set the style for one particular data set only, use DataSet.setDataLabelStyle.

Data labels are text used label data points in the layer. Different layer types put data labels in different positions. For example, in a bar chart, data labels are put at the internal end of the bar. For a line chart, data labels are put above the data points.

For some chart types, the position of the data labels can be manipulated by calling the TextBox.setAlignment method of the TextBox object returned by the setDataLabelStyle method.

See Font Specification for details on various font attributes.

Argument	Default	Description
font	””	The font used to draw the labels.
fontSize	8	The font size used to draw the labels.
fontColor	TextColor	The color used to draw the labels.
fontAngle	0	The rotation angle of the labels.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 27.23.43 setDataLabelStyle(font as string = ””, fontSize as Double = 8, fontcolor as color, fontAngle as Double = 0) as CDTextBoxMBS 5178

27.23.45 setHTMLImageMap(url as string, queryFormat as string = ””, extraAttr as string = ””)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Override the default arguments used when generating HTML image map for the layer.
Notes:

BaseChart.getHTMLImageMap can be used to generate HTML image map for the whole chart. When BaseChart.getHTMLImageMap is used, the image map for all layers will be generated based on the arguments supplied to BaseChart.getHTMLImageMap.

The setHTMLImageMap method can be used to override those arguments for a chart layer, so the image map for that layer can be different.

For a detail description of image maps, please refer to BaseChart.getHTMLImageMap.

Argument	Default	Description
url	(Mandatory)	The URL to be used in the "href" attribute of the image map. Parameter Substitution and Formatting is supported.

The special keyword " { default } " represents the global URL as specified in BaseChart.getHTMLImageMap. This field is useful for specifying appending to the global URL.

Note that an empty string also means to use the global URL. To specify no URL, use the special keyword " { none } ".

To disable the entire image map, use the special keyword " { disable } ".

queryFormat	""	A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported.

The special keyword " { default } " represents the global query parameters as specified in BaseChart.getHTMLImageMap. This field is useful for specifying appending to the global query parameters.

Note that an empty string also means to use the global query parameters. To specify no query parameters, use the special keyword " { none } ".

extraAttr	""	A text string to specify additional attributes to add to the & lt;area& gt; tag. Parameter Substitution and Formatting is supported.

The special keyword " { default } " represents the global additional attributes as specified in BaseChart.getHTMLImageMap. This field is useful for specifying appending to the global additional attributes.

Note that an empty string also means to use the global additional attributes. To specify no additional attributes, use the special keyword " { none } ".

27.23.46 setLegend(m as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the order of the data set names as appeared in the legend box.
Notes:

This method is for backward compatibility. It is equivalent to Layer.setLegendOrder(m).

Argument	Default	Description
m	(Mandatory)	One of the predefined constants representing the legend entry ordering method for data sets within the layer.

27.23.47 setLegendOrder(dataSetOrder as Integer, layerOrder as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the order of the data set names as appeared in the legend box.
Notes:

By default, ChartDirector will add named data sets to the the legend box. The ordering of the entries follows the order in which the layers are created. For data sets within the same layer, the ordering follows the order in which the data sets are added.

To support flexible ordering of the legend entries, ChartDirector employs a legend entry priority system. Please refer to LegendBox for details of the legend entry priority system.

The base priority of the layer can be specified using the layerOrder argument. The priority of the data sets within a layer can be modified by using the dataSetOrder argument, which must be one of the following predefined constant.

ConstantValueDescription

NormalLegend	0	The data set priority is 10 x (data_set_index + 1). Legend entries are ordered in the order with which the data sets are created.
ReverseLegend	1	The data sets priority is the reverse of the normal data set priority. Legend entries are ordered in the reverse order with which the data sets are created.
NoLegend	2	The data set names are not added to the legend box at all.

Argument	Default	Description
dataSetOrder	(Mandatory)	One of the predefined constants representing the legend entry ordering method for data sets within the layer.
layerOrder	-1	The base legend entry priority of the layer. The default value of -1 means the priority is 10000 x (layer_index + 1).

27.23.48 setLineWidth(w as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the default line width of lines when drawing data sets on the layer.
Notes:

This method only applies to layers that employ lines to represent data (e.g. line layer).

This method affect all data sets. To set the line width of one particular data set, use DataSet.setLineWidth.

Argument	Default	Description
w	(Mandatory)	The width of the line in pixels.

27.23.49 setUseYAxis(axis as CDAxisMBS)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Determine the y-axis to use when drawing the data sets.
Notes:

This method affects all data sets in the layer. To set the y-axis to use for a particular data set, use DataSet.setUseYAxis.

Argument	Default	Description
a	(Mandatory)	The y-axis to use when drawing the data sets.

27.23.50 setUseYAxis2(b as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Determine if the primary or secondary y-axis should be used when drawing the data sets.
Notes:

This method affects all data sets in the layer. To set the y-axis to use for a particular data set, use DataSet.setUseYAxis2.

Note: Layer.setUseYAxis is a more general method that can support more than 2 y-axes.

Argument	Default	Description
b	true	A true value means the secondary y-axis will be used. A false value means the primary y-axis will be used.

27.23.51 setXData(data as CDArrayMBS)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the x values of the data points in the data sets.
Notes:

In most ChartDirector XY chart layers, when a data set is added, only the y Values for the data points are needed. For example, in a bar layer, you just need to specify the values of the bars (y values). ChartDirector will automatically layout the bars evenly on the x-axis. You can then specify the labels on the x-axis using Axis.setLabels.

In ChartDirector, this type of x-axis scaling is called "enumerated" scale. Please refer to Axis.setLabels for a more detail explanation of "enumerated" scale.

However, in some cases, it may be necessary to specify the x values explicitly. For example, if a chart contains data points that are not evenly distributed on the x-axis, it is necessary to specify the x values explicitly. It is because enumerated scale always assume the data points are distributed evenly on the x- axis. In this case, the setXData method can be used to specify the x values for the data points.

In general, if the data points are evenly distributed on the x-axis, it is recommended enumerated x-scale be used and no x values are necessary. Even the data points are evenly distributed, except that some data points are missing, it is still possible to use enumerated x-scale by using the NoValue constant to represent missing data points.

On the other hand, if the data points are by its nature not evenly distributed, the x values should be provided explicitly using the setXData method.

Each layer only supports one x values series. All data sets in the layer will use the same x value series. If two data sets have different x values, they should be put in two separate layers.

Argument	Default	Description
xData	(Mandatory)	An array of numbers representing the x value series.

See also:

- 27.23.52 setXData(data() as Double) 5184
- 27.23.53 setXData(dates() as date) 5185
- 27.23.54 setXData(minValue as Double, maxValue as Double) 5186

27.23.52 setXData(data() as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the x values of the data points in the data sets.
Notes:

In most ChartDirector XY chart layers, when a data set is added, only the y Values for the data points are needed. For example, in a bar layer, you just need to specify the values of the bars (y values). ChartDirector will automatically layout the bars evenly on the x-axis. You can then specify the labels on the x-axis using Axis.setLabels.

In ChartDirector, this type of x-axis scaling is called "enumerated" scale. Please refer to Axis.setLabels for a more detail explanation of "enumerated" scale.

However, in some cases, it may be necessary to specify the x values explicitly. For example, if a chart contains data points that are not evenly distributed on the x-axis, it is necessary to specify the x values explicitly. It is because enumerated scale always assume the data points are distributed evenly on the x- axis. In this case, the setXData method can be used to specify the x values for the data points.

In general, if the data points are evenly distributed on the x-axis, it is recommended enumerated x-scale be used and no x values are necessary. Even the data points are evenly distributed, except that some data points are missing, it is still possible to use enumerated x-scale by using the NoValue constant to represent missing data points.

On the other hand, if the data points are by its nature not evenly distributed, the x values should be provided explicitly using the setXData method.

Each layer only supports one x values series. All data sets in the layer will use the same x value series. If two data sets have different x values, they should be put in two separate layers.

Argument	Default	Description
xData	(Mandatory)	An array of numbers representing the x value series.

- 27.23.53 setXData(dates() as date) 5185

• 27.23.54 setXData(minValue as Double, maxValue as Double) 5186

27.23.53 setXData(dates() as date)

MBS ChartDirector Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the x values of the data points in the data sets.
Notes:

In most ChartDirector XY chart layers, when a data set is added, only the y Values for the data points are needed. For example, in a bar layer, you just need to specify the values of the bars (y values). ChartDirector will automatically layout the bars evenly on the x-axis. You can then specify the labels on the x-axis using Axis.setLabels.

In ChartDirector, this type of x-axis scaling is called "enumerated" scale. Please refer to Axis.setLabels for a more detail explanation of "enumerated" scale.

However, in some cases, it may be necessary to specify the x values explicitly. For example, if a chart contains data points that are not evenly distributed on the x-axis, it is necessary to specify the x values explicitly. It is because enumerated scale always assume the data points are distributed evenly on the x- axis. In this case, the setXData method can be used to specify the x values for the data points.

In general, if the data points are evenly distributed on the x-axis, it is recommended enumerated x-scale be used and no x values are necessary. Even the data points are evenly distributed, except that some data points are missing, it is still possible to use enumerated x-scale by using the NoValue constant to represent missing data points.

On the other hand, if the data points are by its nature not evenly distributed, the x values should be provided explicitly using the setXData method.

Each layer only supports one x values series. All data sets in the layer will use the same x value series. If two data sets have different x values, they should be put in two separate layers.

Argument	Default	Description
xData	(Mandatory)	An array of numbers representing the x value series.

See also:

• 27.23.51 setXData(data as CDArrayMBS) 5183

• 27.23.52 setXData(data() as Double) 5184

• 27.23.54 setXData(minValue as Double, maxValue as Double) 5186

27.23.54 setXData(minValue as Double, maxValue as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the x values of the data points in the data sets as evenly distributed in a range.
Notes:

This method is most useful when two layers contain data at different x axis scale. An example is a line layer with one data point per minute, and another line layer with one data point per 5 minutes.

In the above example, in one hour, the first layer will have 60 data points, while the second layer will have 12 data points. If enumerated x-scale is used, the x-axis will contain 60 positions evenly distributed. The 60 data points in the first layer will corresponds to the 60 positions in the x-axis, which is correct. However, the 12 data points in the second layer will corresponds to the first 12 positions on the x-axis, which is not the desired result.

Instead, the 12 data points in the second layer should corresponds to positions 0, 5, 10, 15, ... A little thought will review that the 12 data points in the second layer should be distributed evenly among positions 0 - 55. The setXData2 method can be used to inform ChartDirector about the scaling used in the second layer.

Argument	Default	Description
minValue	(Mandatory)	The x value of the first point in a data set.
maxValue	(Mandatory)	The x value of the last point in the data set.

See also:

- 27.23.51 setXData(data as CDArrayMBS) 5183
- 27.23.52 setXData(data() as Double) 5184
- 27.23.53 setXData(dates() as date) 5185

27.23.55 xZoneColor(threshold as Double, belowColor as color, aboveColor as color) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other xZoneColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.23.56 xZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer) as Integer 5187

27.23.56 xZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a x-zone color. A x-zone will change from one color to another depending on a threshold value on the x-axis.
Notes:

For example, if a x-zone color is used as the line color in a line layer, the line will switch from one color to another when its passes through a certain value on the x-axis. Similarly, if a x-zone color is used as the fill color in an area layer, the area will switch from one color to another when it passes through a certain value on the x-axis.

The two colors used in a x-zone color can be other dynamic colors. For example, one color could be a solid color, while the other color could be a dash line color (see !BaseChart.dashLineColor). When this x-zone color is as the line color, the line will change from a solid style to a dash line style when the line passes through a certain value on the x-axis

You may create x-zone colors with more than 2 zones by cascading multiple x-zone colors.

Argument	Default	Description
threshold	(Mandatory)	The x value serving as the threshold for switching between two colors.
belowColor	(Mandatory)	The color to use when the x-axis value of the pixel is smaller than the threshold.
aboveColor	(Mandatory)	The color to use when the x-axis value of the pixel is greater than the threshold.

Return Value
A 32-bit integer representing the x-zone color.
See also:

- 27.23.55 xZoneColor(threshold as Double, belowColor as color, aboveColor as color) as Integer 5186

27.23.57 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as boolean=true) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other yZoneColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.23.58 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as CDAxisMBS) as Integer 5188
- 27.23.59 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as boolean=true) as Integer 5188

- 27.23.60 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as CDAxisMBS) as Integer 5189

27.23.58 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as CDAxisMBS) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other yZoneColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.23.57 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as boolean=true) as Integer 5187
- 27.23.59 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as boolean=true) as Integer 5188
- 27.23.60 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as CDAxisMBS) as Integer 5189

27.23.59 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as boolean=true) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a y-zone color. A y-zone will change from one color to another depending on a threshold value on the y-axis.
Notes:

For example, if a y-zone color is used as the fill color in an area layer, the area will switch from one color to another when its value is higher than a certain value on the y-axis.

The two colors used in a y-zone color can be other dynamic colors. You may create y-zone colors with more than 2 zones by cascading multiple y-zone colors.

Argument	Default	Description
threshold	(Mandatory)	The y value serving as the threshold for switching between two colors.
belowColor	(Mandatory)	The color to use when the y-axis value of the pixel is smaller than the threshold.
aboveColor	(Mandatory)	The color to use when the y-axis value of the pixel is greater than the threshold.
yAxis	[Null]	The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.

For backward compatibility, the axis argument can also be a boolean value. A true value means the primary y-axis. A false value means the secondary y-axis.

Return Value
A 32-bit integer representing the y-zone color.
See also:

- 27.23.57 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as boolean=true) as Integer 5187
- 27.23.58 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as CDAxisMBS) as Integer 5188
- 27.23.60 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as CDAxisMBS) as Integer 5189

27.23.60 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as CDAxisMBS) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a y-zone color. A y-zone will change from one color to another depending on a threshold value on the y-axis.
Notes:

For example, if a y-zone color is used as the fill color in an area layer, the area will switch from one color to another when its value is higher than a certain value on the y-axis.

The two colors used in a y-zone color can be other dynamic colors. You may create y-zone colors with more than 2 zones by cascading multiple y-zone colors.

Argument	Default	Description
threshold	(Mandatory)	The y value serving as the threshold for switching between two colors.
belowColor	(Mandatory)	The color to use when the y-axis value of the pixel is smaller than the threshold.
aboveColor	(Mandatory)	The color to use when the y-axis value of the pixel is greater than the threshold.
yAxis	[Null]	The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.

For backward compatibility, the axis argument can also be a boolean value. A true value means the primary y-axis. A false value means the secondary y-axis.
Return Value
A 32-bit integer representing the y-zone color.
See also:

- 27.23.57 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as boolean=true) as Integer 5187

- 27.23.59 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as boolean=true) as Integer 5188

27.24 class CDLegendBoxMBS

27.24.1 class CDLegendBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The class LegendBox represents legend boxes.
Notes:

Subclass of the CDTextBoxMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.24.2 Xojo Developer Magazine

27.24.3 Methods

27.24.4 addKey(pos as Integer, text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addKey method, but uses color instead of integer data type for passing color values.
See also:

- 27.24.5 addKey(pos as Integer, text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5191
- 27.24.6 addKey(text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5192
- 27.24.7 addKey(text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5192

27.24.5 addKey(pos as Integer, text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a custom entry to the legend box with a given legend entry priority.
Notes:

See LegendBox for more information on legend entry priority system.

Argument	Default	Description
pos	(Mandatory)	The legend entry priority
text	(Mandatory)	The text of the legend entry.
color	(Mandatory)	The icon color of the legend entry.
lineWidth	0	The line width for legend entry that represents lines in line charts.
drawarea	[Null]	A DrawArea containing the data symbol represents the legend entry. This is primarily used for legend entries in line charts with data symbols, or in scatter charts.

See also:

- 27.24.4 addKey(pos as Integer, text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5191

- 27.24.7 addKey(text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5192

27.24.7 addKey(text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a custom entry to the legend box.
Notes:

This method adds an entry within a legend entry priority of 1 (followed by 2, 3, 4, ... for repeated calls). This has higher priority than entries added automatically by ChartDirector for representing data sets. As a result, by default, the custom entry will appear before the automatic entries.

To control the order of the custom entry relative to the automatic entries, use LegendBox.addKey2.

See LegendBox for more information on legend entry priority system.

Argument	Default	Description
text	(Mandatory)	The text of the legend entry.
color	(Mandatory)	The icon color of the legend entry.
lineWidth	0	The line width for legend entry that represents lines in line charts.
drawarea	[Null]	A DrawArea containing the data symbol represents the legend entry. This is primarily used for legend entries in line charts with data symbols, or in scatter charts.

See also:

- 27.24.4 addKey(pos as Integer, text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5191
- 27.24.5 addKey(pos as Integer, text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5191
- 27.24.6 addKey(text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5192

27.24.8 getHTMLImageMap(url as string, queryFormat as string = """, extraAttr as string = """, offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Generates an HTML image map for the legend.
Notes:

By default, ChartDirector will add named data representation to the legend box. For pie charts, named sectors (sectors that have text labels) will be added. For xy charts, named data sets will be added. For polar charts, named layers will be added.

You may add custom entries to the legend box by using LegendBox.addKey.

To control the ordering of the legend entries, ChartDirector employs a legend entry priority system. Each entry is given a priority number, and the entries are ordered according to ascending priority (unless reversed

by using LegendBox.setReverse).

For a PieChart, the legend entry priority of a sector is 10000 x (sector_index + 1). The Nth sector has sector_index (N - 1). That means the ordering of the sectors in the legend box is the same as the data array.

For an XYChart, the base legend entry priority for a layer is 10000 x (layer_index + 1). Within a layer, the data set priority is 10 x (data_set_index + 1). For example, the legend entry priority for the 5th dataset in the 3rd layer will be 30050. That means the ordering of the data sets in the legend box follows the order in which the layers are created. For data sets within the same layer, the ordering follows the order in which the data sets are added. The ordering can be modified by using Layer.setLegendOrder.

For an PolarChart, the legend entry priority of a layer is 10000 x (layer_index + 1). That means the ordering of the layers in the legend box follows the order in which the layers are created.

For custom entries added using LegendBox.addKey2, you may control the legend entry priority. That means you may insert custom entries anywhere relative to the automatic entries added by ChartDirector.

27.24.9 getImageCoor(dataItem as Integer, offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the image map coordinates of an legend entry as HTML image map attributes.
Notes:

The image map coordinates will be of the following format:

shape="rect" cords=" [x1] , [y1] , [x2] , [y2] "
where (x1, y1) and (x2, y2) are opposite corners of the box that enclosed the legend entry. The format is specially designed so that it can easily be included into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
dataItem	(Mandatory)	The legend entry number, starting from 0. The first legend entry is 0. The nth legend entry is (n-1).
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string representing the coordinates of the legend entry in HTML image map attribute format.

27.24.10 setCols(noOfCols as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the number of columns in the legend box.
Notes:

Argument	Default	Description
noOfCols	(Mandatory)	The number of columns in the legend box. The special value AutoGrid (= -2) means the number of columns is automatically determined. If this argument is 0, the legend box will use a flow layout (from left to right and then top to bottom, in which the entries may not be vertically aligned).

27.24.11 setKeyBorder(edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setKeyBorder method, but uses color instead of integer data type for passing color values.
See also:

- 27.24.12 setKeyBorder(edgeColor as Integer, raisedEffect as Integer = 0) 5195

27.24.12 setKeyBorder(edgeColor as Integer, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the default border color of the legend icon.
Notes:

This method applies only to data sets of which the icons are rectangles showing the colors of the data sets. If the icon is a shape or symbol (such as for a line with data point symbols), the border color of the original shape or symbol is always used.

Argument	Default	Description
edgeColor	(Mandatory)	The border color.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument is also used to support Chart::glassEffect and Chart::softLighting effects.

See also:

• 27.24.11 setKeyBorder(edgeColor as color, raisedEffect as Integer = 0) 5195

27.24.13 setKeySize(width as Integer = -1, height as Integer = -1, gap as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the size of the legend icon and its distance from the legend text.
Notes:

Each legend entry consists of an icon and a text description. By default, the size of the icon and its distance from the text is determined automatically based on font size. This method can be used to override the default.

Argument	Default	Description
width	(Mandatory)	The width of the legend icon in pixels.
height	-1	The height of the legend icon in pixels. -1 means the height is automatically determined.
gap	-1	The distance between the legend icon and the legend text in pixels. -1 means the distance is automatically determined.

27.24.14 setKeySpacing(keySpacing as Integer, lineSpacing as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the distance between two legend entries.
Notes:

In horizontal legend layout, the legend entries will flow from left to right, top to bottom, with a horizontal gap between two legend entries. In vertical legend layout, the legend entries will flow from top to bottom, with one entry per line.

By default, the horizontal gap and the line spacing is automatically determined based on font size. This method can be used to set the horizontal gap and line spacing in pixels.

Argument	Default	Description
keySpacing	(Mandatory)	The horizontal gap between two legend entries for horizontal legend layout, expressed in pixels.
lineSpacing	-1	The line spacing between two lines in the legend box, expressed in pixels. -1 means the line spacing is automatically determined.

27.24.15 setLineStyleKey(b as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Determines whether to always use "line style legend keys" or not.
Notes:

By default, ChartDirector will use a small colored square box as the legend key icon. This allows people to determine the colors for the data representations.

In some cases, colors alone cannot distinguish the data representations. For example, in a line chart with multiple lines, it is possible all lines are of the same color, and are distinguished by line styles (solid, dash, dotted, etc), etc), or the lines may be distinguished by data symbols (small circles, squares, etc) on the lines.

For charts with non-solid lines (eg. dash, dotted, etc) or lines with data symbols, ChartDirector will use "line style legend keys" for the lines. A line style legend key consist a of line with an optional data symbol, which reflects the line style and data symbol representing the data series.

This method can be used to force ChartDirector to always use the "line style legend keys".

Arguments:

Argument	Default	Description
b	true	A true value means to always use "line style legend keys". A false value means to automatically determined if "line style legend keys" should be used.

27.24.16 setReverse(b as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Reverses the ordering of the legend entries.
Notes:

By default, the legend entries are ordered based on ascending legend entry priority number. This method can be used to change the ordering to following descending legend entry priority number instead.

See LegendBox for more information on legend entry priority system.

Argument	Default	Description
b	true	A true value means the legend entries are ordered based on descending legend entry priority number. false value means the legend entries are ordered based on ascending legend entry priority number.

27.25 class CDLinearMeterMBS

27.25.1 class CDLinearMeterMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The LinearMeter class represents linear meters.
Notes: Subclass of the CDBaseMeterMBS class.

27.25.2 Methods

27.25.3 addBar(startValue as Double, endValue as Double, colorvalue as color, effect as Integer = 0, roundedCorner as Integer = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a bar to the meter.
Notes:

This method adds an empty TextBox to the meter. It configures the textbox position, size and color so that it looks like a bar on the meter scale.

Argument	Default	Description
startValue	(Mandatory)	The start value of the bar.
endValue	(Mandatory)	The end value of the bar.
color	(Mandatory)	The color of the bar.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument can also be used to specify Chart::glassEffect, Chart::softLighting, Chart::cylinderEffect or Chart::flatBorder effects.
roundedCorners	0	The radius for the two corners at the end position of the bar.

Returns a CDTextBoxMBS object representing the bar. This may be used to fine-tune the appearance of the bar.
See also:

- 27.25.4 addBar(startValue as Double, endValue as Double, colorvalue as Integer, effect as Integer = 0, roundedCorner as Integer = 0) as CDTextBoxMBS 5198

27.25.4 addBar(startValue as Double, endValue as Double, colorvalue as Integer, effect as Integer = 0, roundedCorner as Integer = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a bar to the meter.

Notes:

This method adds an empty TextBox to the meter. It configures the textbox position, size and color so that it looks like a bar on the meter scale.

Argument	Default	Description
startValue	(Mandatory)	The start value of the bar.
endValue	(Mandatory)	The end value of the bar.
color	(Mandatory)	The color of the bar.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument can also be used to specify Chart::glassEffect, Chart::softLighting, Chart::cylinderEffect or Chart::flatBorder effects.
roundedCorners	0	The radius for the two corners at the end position of the bar.

Returns a CDTextBoxMBS object representing the bar. This may be used to fine-tune the appearance of the bar.
See also:

- 27.25.3 addBar(startValue as Double, endValue as Double, colorvalue as color, effect as Integer = 0, roundedCorner as Integer = 0) as CDTextBoxMBS 5198

27.25.5 addZone(startValue as Double, endValue as Double, colorvalue as color, label as string = "") as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addZone method, but uses color instead of integer data type for passing color values.
See also:

- 27.25.6 addZone(startValue as Double, endValue as Double, colorvalue as Integer, label as string = "") as CDTextBoxMBS 5199

27.25.6 addZone(startValue as Double, endValue as Double, colorvalue as Integer, label as string = "") as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a zone to the meter.
Notes:

Return Value
A TextBox object representing the label. This may be used to fine-tune the appearance of the label.
See also:

- 27.25.5 addZone(startValue as Double, endValue as Double, colorvalue as color, label as string = "") as CDTextBoxMBS 5199

Argument	Default	Description
startValue	(Mandatory)	The start value (the lower bound) for the zone.
endValue	(Mandatory)	The end value (the upper bound) for the zone.
color	(Mandatory)	The color of the zone.
label	""	The text to be put at the center of the zone.

27.25.7 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other Constructor method, but uses color instead of integer data type for passing color values.
See also:

- 27.25.8 Constructor(width as Integer, height as Integer, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0) 5200

27.25.8 Constructor(width as Integer, height as Integer, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a new LinearMeter object.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

See also:

- 27.25.7 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0) 5200

27.25.9 setMeter(leftX as Integer, topY as Integer, width as Integer, height as Integer, axisPos as Integer = 4, isReversed as boolean=false)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the orientation and position of the meter plot area.

Notes:

The plot area is a rectangular region of the linear meter. The meter scale (the labels showing the values) will be on one external side of the plot area (say on the left side). The pointer start on the opposite side and points towards the meter scale.

This method defines the position and size of the rectangular region, as well as which side the meter scale is on. If the scale is on the left or right side, the meter is assumed to be a horizontal linear meter. If the scale is on the top or bottom side, the meter is assumed to be a vertical linear meter.

Argument	Default	Description
leftX	(Mandatory)	The x-coordinate of the top-left corner of the meter plot area.
topY	(Mandatory)	The y-coordinate of the top-left corner of the meter plot area.
width	(Mandatory)	The horizontal width of the meter plot area.
height	(Mandatory)	The vertical height of the meter plot area.
axisPos	Left	The position of the meter scale. The scale should be on one of the 4 sides of the plot area border, specified by Left, Top, Right and Bottom.
isReversed	false	By default, if the meter is horizontal, the meter scale will run from left to right. If the meter is vertical, the meter scale will run from bottom to top. If this argument is set to true, the meter scale will be reversed.

27.25.10 setRail(railColor as color, railWidth as Integer = 2, railOffset as Integer = 6)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setRail method, but uses color instead of integer data type for passing color values.
See also:

- 27.25.11 setRail(railColor as Integer, railWidth as Integer = 2, railOffset as Integer = 6) 5201

27.25.11 setRail(railColor as Integer, railWidth as Integer = 2, railOffset as Integer = 6)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the position, width and color of the pointer rail.
Notes:

The pointer rail is the locus traced out by the starting point of the meter pointer as the pointer slides on the meter. The pointer rail is on the opposite side of the meter scale.

See also:

Argument	Default	Description
railColor	(Mandatory)	The color of the pointer rail.
railWidth	2	The line width of the the pointer rail in pixels.
railOffset	6	The gap between the pointer rail and the plot area in pixels. A negative value will mean the pointer rail may move within the plot area.

- 27.25.10 setRail(railColor as color, railWidth as Integer = 2, railOffset as Integer = 6) 5201

27.25.12 Screenshots

27.25.13 mutlivmeter.jpg

Function: A meter with three pointers created using ChartDirector with the CDLinearMeterMBS class.

27.26 class CDLineLayerMBS

27.26.1 class CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The LineLayer class represents line layers.
Notes:

Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.26.2 Xojo Developer Magazine

- 7.4, page 34: Easy Charts and Graphs, Using the ChartDirector Plugin

27.26.3 Methods

27.26.4 getLine(dataSet as Integer = 0) as CDLineObjMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Retrieves an opaque LineObj representing a line in the line layer. The opaque LineObj is to be used in XYChart.addInterLineLayer for adding coloring between lines.
Notes:

Argument	Default	Description
dataSet	0	The data set number for the line. The first data set is 0. The nth data set is (n - 1).

Return Value
An opaque LineObj representing the requested line.

27.26.5 setFastLineMode(b as boolean = true)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Enables or disables fast line mode.
Notes:

In a chart, the plot area width is usually a few hundred to around 2000 pixels. For a line chart that "flows" horizontally (eg. from left to right), if there are a lot more data points (eg. 100000 data points than the plot area pixel width, many of the points would be at the same x-pixel coordinates. The line segments joining the data points at the same x-pixel coordinates would just be oscillating up and down, overlapping themselves.

What is visible at each x-pixel position is essentially a line joining the minimum point and the maximum point.

In fast line mode, ChartDirector will automatically detect that there are too many points in the same x-pixel coordinate, and draws only a line segment joining the extreme points at that coordinate. The resulting line is visually indistinguishable from a line in which the line segments join all data points. The fast line mode can significantly reduce the number of points drawn without affecting the chart appearance.

The fast line mode has no effect if there are not significantly more data points than the pixel width of the plot area. For charts with evenly spaced data points, the fast line mode would only act on x-pixel positions with too many data points. Thus the fast line mode can be enabled on line charts regardless of the number of data points.

The fast line mode should not be used if the data points are not flowing horizontally (or vertically if XYChart.swapXY is in effect), but are flowing in random directions.

Argument	Default	Description
b	true	A true value enables fast line mode. A false value disables fast line mode.

27.26.6 setGapColor(lineColor as color, lineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setGapColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.26.7 setGapColor(lineColor as Integer, lineWidth as Integer = -1) 5205

27.26.7 setGapColor(lineColor as Integer, lineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the color and style of the line used for jumping across NoValue data points.
Notes:

By default, the color of the line for jumping across NoValue data points is Transparent, which means the line will become discontinuous.

See also:

- 27.26.6 setGapColor(lineColor as color, lineWidth as Integer = -1) 5205

Argument	Default	Description
lineColor	(Mandatory)	The line color of the line used for jumping across NoValue data points
lineWidth	-1	The line width of the line used for jumping across NoValue data points. -1 means the width will be the same as the line width of the line for drawing normal data points.

27.26.8 setImageMapWidth(Width as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the effective width of the line used for producing image maps.
Notes:

For thin lines, it is hard to click on the lines. So for the purpose of producing image maps for a line chart, ChartDirector can assume the line is very thick. The default is 10 pixels.

Argument	Default	Description
width	(Mandatory)	The effective width of the line used for producing image maps.

27.26.9 setSymbolScale(zDataX() as Double, scaleTypeX as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the size of the symbol for each data point (for creating bubble charts).
Notes:

One common usage for this method is to draw circle symbols of different sizes at each data points, creating a bubble chart.

This method supports any valid data symbols. You can create bubble charts with square bubbles, or even custom data symbols. Also, this method supports independent x and y direction sizing, so you can create bubbles elliptical in shape, and use the horizontal and vertical radius to represent different data.

ChartDirector supports specifying sizes as pixels or in axis scale. The unit is specified by using the following predefined constants.

ConstantValueDescription

PixelScale	0	The unit is measured in pixels.
XAxisScale	1	The unit is measured in x-axis scale.
YAxisScale	2	The unit is measured in y-axis scale.

Argument	Default	Description
zDataX	(Mandatory)	The sizes of the symbols at the x-axis direction, expressed using the unit defined by the scaleTypeX argument.
scaleTypeX	PixelScale	The unit for zDataX, which must be one of the predefined constants in the table above.
zDataY	[Empty_Array]	The sizes of the symbols at the y-axis direction, expressed using the unit defined by the scaleTypeY argument. An empty array means the sizes at the y-axis direction are the means as the sizes at the x-axis direction.
scaleTypeY	PixelScale	The unit for zDataY, which must be one of the predefined constants in the table above.

See also:

- 27.26.10 setSymbolScale(zDataX() as Double, scaleTypeX as Integer, zDataY() as Double, scaleTypeY as Integer = 0) 5207

27.26.10 setSymbolScale(zDataX() as Double, scaleTypeX as Integer, zDataY() as Double, scaleTypeY as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the size of the symbol for each data point (for creating bubble charts).
Notes:

One common usage for this method is to draw circle symbols of different sizes at each data points, creating a bubble chart.

This method supports any valid data symbols. You can create bubble charts with square bubbles, or even custom data symbols. Also, this method supports independent x and y direction sizing, so you can create bubbles elliptical in shape, and use the horizontal and vertical radius to represent different data.

ChartDirector supports specifying sizes as pixels or in axis scale. The unit is specified by using the following predefined constants.

ConstantValueDescription

PixelScale	0	The unit is measured in pixels.
XAxisScale	1	The unit is measured in x-axis scale.
YAxisScale	2	The unit is measured in y-axis scale.

See also:

- 27.26.9 setSymbolScale(zDataX() as Double, scaleTypeX as Integer = 0) 5206

Argument	Default	Description
zDataX	(Mandatory)	The sizes of the symbols at the x-axis direction, expressed using the unit defined by the scaleTypeX argument.
scaleTypeX	PixelScale	The unit for zDataX, which must be one of the predefined constants in the table above.
zDataY	[Empty_Array]	The sizes of the symbols at the y-axis direction, expressed using the unit defined by the scaleTypeY argument. An empty array means the sizes at the y-axis direction are the means as the sizes at the x-axis direction.
scaleTypeY	PixelScale	The unit for zDataY, which must be one of the predefined constants in the table above.

27.27 class CDLineMBS

27.27.1 class CDLineMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The Line class represents straight lines.
Notes:

Subclass of the CDDrawObjMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.27.2 Methods

27.27.3 setColor(c as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.27.4 setColor(c as Integer) 5209

27.27.4 setColor(c as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the color of the line.
Notes:

By default, the color of the line is LineColor. To draw a dash line, you can use a dash line color (created using BaseChart.dashLineColor or DrawArea.dashLineColor).

Argument	Default	Description
c	(Mandatory)	The color of the line.

See also:

- 27.27.3 setColor(c as color) 5209

27.27.5 setPos(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the end-points of the line..
Notes:

Argument	Default	Description
x1	(Mandatory)	The x coordinate of the first end-point of the line.
y1	(Mandatory)	The y coordinate of the first end-point of the line.
x2	(Mandatory)	The x coordinate of the second end-point of the line.
y2	(Mandatory)	The y coordinate of the second end-point of the line.

27.27.6 setWidth(w as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the width of the line in pixels.
Notes:

Argument	Default	Description
w	(Mandatory)	The width (thickness) of the line in pixels.

27.28 class CDLineObjMBS

27.28.1 class CDLineObjMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The line object class.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.28.2 Methods

27.28.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The private constructor.

27.29 class CDMarkMBS

27.29.1 class CDMarkMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The Mark class represents mark lines.
Notes:

Subclass of the CDTextBoxMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.29.2 Xojo Developer Magazine

- 7.4, page 34: Easy Charts and Graphs, Using the ChartDirector Plugin

27.29.3 Methods

27.29.4 getLine as CDLineObjMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Retrieves an opaque LineObj representing the mark line. The opaque LineObj is to be used in XYChart.addInterLineLayer for adding coloring between lines.
Notes:

Return Value
An opaque LineObj representing the mark line.

27.29.5 setDrawOnTop(b as boolean)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Determine whether the mark line is drawn at the front of the chart layers, or at the back of the plot area (that is, like grid lines).
Notes:

Argument	Default	Description
b	(Mandatory)	A true value means drawing the mark line at the front of the chart layers. A false value means drawing the mark line at the back of the plot area.

27.29.6 setLineWidth(width as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the line width of the mark line.
Notes:

Argument	Default	Description
w	(Mandatory)	The mark line width in pixels.

27.29.7 setMarkColor(lineColor as color, textColor as color, tickColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setMarkColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.29.8 setMarkColor(lineColor as Integer, textColor as Integer = -1, tickColor as Integer = -1) 5213

27.29.8 setMarkColor(lineColor as Integer, textColor as Integer = -1, tickColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the line, text and tick colors of the mark line.
Notes:

Argument	Default	Description
lineColor	(Mandatory)	The color of the mark line.
textColor	-1	The color of the text label that will be shown on the axis. -1 means the text label color is the same as the line color.
tickColor	-1	The color of the tick that will be shown on the axis. -1 means the tick color is the same as the line color.

See also:

- 27.29.7 setMarkColor(lineColor as color, textColor as color, tickColor as color) 5213

27.29.9 setValue(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the value of the mark line.
Notes:

Argument	Default	Description
value	(Mandatory)	The value of the mark.

27.30 class CDMeterPointerMBS

27.30.1 class CDMeterPointerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The MeterPointer class represents meter pointers.
Notes:

Subclass of the CDDrawObjMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.30.2 Methods

27.30.3 setColor(fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.30.4 setColor(fillColor as Integer, edgeColor as Integer = -1) 5215

27.30.4 setColor(fillColor as Integer, edgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the fill and border colors of the meter pointer.
Notes:

Argument	Default	Description
fillColor	(Mandatory)	The fill color of the meter pointer.
edgeColor	-1	The border color of the meter pointer. The default value of -1 means it is the same as the fill color.

See also:

- 27.30.3 setColor(fillColor as color, edgeColor as color) 5215

27.30.5 setPos(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the value the pointer points to on the meter scale.
Notes:

Argument	Default	Description
value	(Mandatory)	The value the pointer points to.

27.30.6 setShape(pointerCoor() as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the shape of the meter pointer to a custom polygon.
Notes:

The custom polygon is specified as a list of numbers representing the (x, y) coordinates of polygon vertices.

For an angular meter, the polygon should be defined with a nominal dimension of 1000 units. ChartDirector will scale the polygon so that 1000 units will become the radius of the meter.

For a linear meter, the length of the pointer should be defined with a nominal dimension of 1000 units. ChartDirector will scale the polygon so that 1000 units will be the length required for the pointer to reach the meter scale. The width of the pointer will be in 0.1 pixel units (that is, 10 units = 1 pixel).

The coordinate system for defining the polygon is that the x-axis points from left to right, and the y-axis points from bottom to top. The polygon will be defined as a pointer with the pivot at the origin, pointing to the upward direction.

As an example, the coordinates of the standard diamond pointer for an angular meter are:

0, -100, -50, -50, 0, 1000, 50, -50
The coordinates for the standard pencil pointer for a linear meter are:

-30, 0, 30, 0, 30, 768, 0, 1000, -30, 768
After scaling the pointers based on the nominal units, ChartDirector will in addition applies the lengthRatio and widthRatio scaling factor to the pointer. These ratios allow you to change the pointer sizes without changing the polygon definition. For example, if you want the meter pointer to be only 80% of the radius in the angular meter, you can set the lengthRatio to 0.80.

Argument	Default	Description
pointerCoor	(Mandatory)	An array of numbers x0, y0, x1, y1, x2, y2, ..., representing the coordinates the polygon vertices.
lengthRatio	NoValue	The length ratio applies to the pointer. NoValue means the lengthRatio is not modified. The default is 1.0 for angular meters and 0.75 for linear meters.
widthRatio	NoValue	The width ratio applies to the pointer. NoValue means the widthRatio is not modified. The default is 1.0.

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the shape of the meter pointer to one of the built-in shapes.
Notes:

The built-in symbols are specified by using the following predefined constants as the pointerType argument.

ConstantValueDescription

DiamondPointer	0	The blue pointers in the meters above.
TriangularPointer	1	The purple pointers in the meters above.
ArrowPointer	2	The red pointers in the meters above.
ArrowPointer2	3	The yellow pointers in the meters above.
LinePointer	4	The green pointers in the meters above.
PencilPointer	5	The grey pointers in the meters above.

The length and width of the pointer can be scaled by using the lengthRatio and widthRatio arguments. The meters above are using default length and width ratios, which are both 1 for angular meters, and 0.75 and 1 for linear meters.

See also:

Argument	Default	Description
pointerType	(Mandatory)	One of the predefined pointer shape constants to specify the pointer shape to use.
lengthRatio	NoValue	The length ratio applies to the pointer. NoValue means the lengthRatio is not modified. The default is 1.0 for angular meters and 0.75 for linear meters.
widthRatio	NoValue	The width ratio applies to the pointer. NoValue means the widthRatio is not modified. The default is 1.0.

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the shape of new style angular meter pointers to a custom polygon.
Notes:

The custom polygon is specified as a list of numbers representing the (x, y) coordinates of the polygon vertices, with the x-axis pointing from left to right and the y-axis pointing from bottom to top. The direction of the pointer should be pointing upwards, with the starting point at y = 0, and the ending point at y = 1000.

As an example, the coordinates of the new style triangular pointer are:

-15, 0, 15, 0, 0, 1000, 1000

The coordinates for the new style line pointer are:

-5, 0, 5, 0, 5, 1000, -5, 1000

In actual usage, ChartDirector will rotate the polygon to point it to the desired value, and adjust the polygon size and position based on the startOffset, endOffset and widthRatio arguments. Please refer to MeterPointer.setShapeAndOffset2 for the meaning of these arguments.

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the shape of new style angular meter pointers.
Notes:

New style pointers are designed to have configurable starting and ending points, as well as configurable width. In this documentation, the ending point refers to the "tip" of the pointer, while the starting point is the "base" of the pointer.

By default, the starting and ending points are at -0.15 and 0.95. It means the distance between the starting point and the center is 15% of the scale radius. The negative sign means that relative to the center, the starting point is at the opposite direction to the value the pointer is supposed to point to. Similarly, the distance between the ending point and the center is 95% of the scale radius, which means the ending point

should be quite close to the outer rim of the meter scale.

Argument	Default	Description
pointerType	(Mandatory)	Should be TriangularPointer2 for new style triangular pointer, and LinePointer2 for new style line pointer.
startOffset	NoValue	The radius the pointer starts at, expressed as a ratio to the scale radius. NoValue means the radius is automatically determined.
endOffset	NoValue	he radius the pointer ends at, expressed as a ratio to the scale radius. NoValue means the radius is automatically determined.
widthRatio	NoValue	The width of the pointer relative to the default width. NoValue means the width is automatically determined.

- 27.30.12 setShapeAndOffset(pointerCoor() as Integer) 5222

Argument	Default	Description
pointerType	(Mandatory)	Should be TriangularPointer2 for new style triangular pointer, and LinePointer2 for new style line pointer.
startOffset	NoValue	The radius the pointer starts at, expressed as a ratio to the scale radius. NoValue means the radius is automatically determined.
endOffset	NoValue	he radius the pointer ends at, expressed as a ratio to the scale radius. NoValue means the radius is automatically determined.
widthRatio	NoValue	The width of the pointer relative to the default width. NoValue means the width is automatically determined.

- 27.30.13 setShapeAndOffset(pointerCoor() as Integer, startOffset as Double) 5223

27.30.19 setShapeAndOffset(pointerType as Integer, startOffset as Double, endOffset as Double, widthRatio as Double)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the shape of new style angular meter pointers.
Notes:

New style pointers are designed to have configurable starting and ending points, as well as configurable width. In this documentation, the ending point refers to the "tip" of the pointer, while the starting point is the "base" of the pointer.

By default, the starting and ending points are at -0.15 and 0.95. It means the distance between the starting point and the center is 15% of the scale radius. The negative sign means that relative to the center, the starting point is at the opposite direction to the value the pointer is supposed to point to. Similarly, the distance between the ending point and the center is 95% of the scale radius, which means the ending point should be quite close to the outer rim of the meter scale.

27.31 class CDMLTableMBS

27.31.1 class CDMLTableMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The class for a legend table.
Notes:

Subclass of the CDDrawObjMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.31.2 Methods

27.31.3 appendCol as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Appends a column.

27.31.4 appendRow as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Appends a row.

27.31.5 getCell(col as Integer, row as Integer) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns the textbox object for the cell.
Notes: The index of column and row is zero based.

27.31.6 getColCount as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns the number of columns.

27.31.7 getColStyle(col as Integer) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns the column style.
Notes: col is zero based.

27.31.8 getColWidth(col as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns the width of a column.
Notes: col is zero based.

27.31.9 getHeight as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns the height of the table.

27.31.10 getRowCount as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns the number of row.

27.31.11 getRowHeight(row as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns the height of a row.
Notes: row is zero based.

27.31.12 getRowStyle(row as Integer) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns the row style.
Notes: row is zero based.

27.31.13 getStyle as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns the textbox defining the style of the table.

27.31.14 getWidth as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns the width of the table.

27.31.15 insertCol(col as Integer) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Inserts a column at the given column.
Notes: col is zero based.

27.31.16 insertRow(row as Integer) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Inserts a row on the given position.
Notes: row is zero based.

27.31.17 layout

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Layouts the table, so you can get the size.

27.31.18 setCell(col as Integer, row as Integer, width as Integer, height as Integer, text as string) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the cell to the given text.
Notes: col and row are zero based.

27.31.19 setPos(x as Integer, y as Integer, alignment as Integer = 7)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the position of the table.
Notes: x and y are zero based.

27.31.20 setText(col as Integer, row as Integer, text as string) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the text of a cell.
Notes: col and row are zero based.

27.32 class CDMultiChartMBS

27.32.1 class CDMultiChartMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The MultiChart class represents multi-chart.
Notes:

A multi-chart is a container to contain multiple charts. You can use a multi- chart to combine multiple BaseChart objects (or its subclass such as PieChart, XYChart, PolarChart, AngularMeter or LinearMeter) into one image.
Subclass of the CDBaseChartMBS class.

27.32.3 Methods

27.32.4 addChart(x as Integer, y as Integer, c as CDBaseChartMBS)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a BaseChart object (or its subclass such as PieChart, XYChart, PolarChart, AngularMeter or LinearMeter) into the multi-chart.
Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate of a point in the multi-chart that is to align with the top-left corner of the added BaseChart.
y	(Mandatory)	The y coordinate of a point in the multi-chart that is to align with the top-left corner of the added BaseChart.
c	(Mandatory)	The BaseChart object to be added to the multi-chart.

27.32.5 Constructor(width as Integer = 640, height as Integer = 480, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other Constructor method, but uses color instead of integer data type for passing

color values.
See also:

- 27.32.6 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0) 5236

27.32.6 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a new MultiChart object.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

See also:

- 27.32.5 Constructor(width as Integer = 640, height as Integer = 480, bgColor as color, edgeColor as color, raisedEffect as Integer = 0) 5235

27.32.7 getChart(index as Integer) as CDBaseChartMBS

MBS ChartDirector Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the specified chart in the MultiChart.
Notes:

Argument	Default	Description
i	0	The index of the chart. The index of the first chart set added to the MultiChart is 0. The index of the Nth data set added to the MultiChart is N - 1.

27.32.8 getChartCount as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the number of charts in the MultiChart.

Notes: Returns the number of charts in the MultiChart.

27.32.9 setMainChart(c as CDBaseChartMBS)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the chart that receives view port mouse actions (for zooming and scrolling support).
Notes:

Argument	Default	Description
c	(Mandatory)	The chart that is to receive view port mouse actions.

27.33 class CDNotInitialzedExceptionMBS

27.33.1 class CDNotInitialzedExceptionMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Exception raised if method is called on an uninitialized object.
Notes:

Please report this as it may be a bug.
Subclass of the RuntimeException class.

27.33.2 Blog Entries

- MBS Real Studio Plugins, version 12.3pr17

27.34 class CDPieChartMBS

27.34.1 class CDPieChartMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The PieChart class represents pie charts.
Notes: Subclass of the CDBaseChartMBS class.

27.34.2 Blog Entries

- MBS Xojo Plugins, version 18.5pr4

27.34.4 Methods

27.34.5 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other Constructor method, but uses color instead of integer data type for passing color values.
See also:

- 27.34.6 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as Integer = & hFFFF0000, edgeColor as Integer = & hFF000000, raisedEffect as Integer = 0) 5239

27.34.6 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as Integer = & hFFFF0000, edgeColor as Integer = & hFF000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a new PieChart object.
Notes:

See also:

- 27.34.5 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as color, edgeColor as color, raisedEffect as Integer = 0) 5239

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

27.34.7 sector(sectorNo as Integer) as CDSectorMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Retrieves the Sector object representing a single sector in the pie chart.
Notes:

Argument	Default	Description
sectorNo	(Mandatory)	The sector number of the sector to retrieve, starting from 0. The first sector is 0. The nth sector is (n-1).

Return Value
The requested Sector object.

27.34.8 set3D(depth as Integer = -1, angle as Double = -1, shadowMode as boolean=false)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds 3D effects to the pie.
Notes:

Argument	Default	Description
depth	-1	The 3D depth of the pie in pixels. -1 means the depth is automatically determined.
angle	-1	The 3D view angle in degrees. Must be 0 - 90 for standard 3D mode, and 0 - 360 in shadow 3D mode. -1 means the angle is automatically determined.
shadowMode	false	Flag to indicate whether the pie is in standard 3D or shadow 3D mode. A true value means shadow 3D mode. A false value means standard 3D mode.

See also:

- 27.34.9 set3D(depths() as Double, angle as Double = 45, shadowMode as boolean=false) 5241

27.34.9 set3D(depths() as Double, angle as Double = 45, shadowMode as boolean=false)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds 3D effects to the pie, where each sector can have a different 3D depth.
Notes:

Argument	Default	Description
depths	(Mandatory)	An array of integers representing the 3D depths for the sectors.
angle	45	The 3D view angle in degrees. Must be 0 - 90 for standard 3D mode, and 0 - 360 in shadow 3D mode. -1 means the angle is automatically determined.
shadowMode	false	Flag to indicate whether the pie is in standard 3D or shadow 3D mode. A true value means shadow 3D mode. A false value means standard 3D mode.

See also:

- 27.34.8 set3D(depth as Integer = -1, angle as Double = -1, shadowMode as boolean=false) 5240

27.34.10 setData(data() as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the data used to draw the pie chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points.
labels	[Empty_Array]	An array of text strings representing the labels of the sectors. An empty array means no sector label.

See also:

- 27.34.11 setData(data() as Double, label() as string) 5241

27.34.11 setData(data() as Double, label() as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the data used to draw the pie chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points.
labels	[Empty_Array]	An array of text strings representing the labels of the sectors. An empty array means no sector label.

See also:

• 27.34.10 setData(data() as Double) 5241

27.34.12 setDonutSize(x as Integer, y as Integer, r as Integer, r2 as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the position and size of the donut in the donut chart.
Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate of the donut center.
y	(Mandatory)	The y coordinate of the donut center.
r	(Mandatory)	The inner radius of the donut.
r2	(Mandatory)	The outer radius of the donut.

27.34.13 setExplode(sectorNo as Integer, distance as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Explode a sector from the pie.
Notes:

Argument	Default	Description
sectorNo	(Mandatory)	The sector number of the sector to be exploded from the pie, starting from 0. The first sector is 0. The nth sector is (n - 1).
distance	-1	The explosion distance in pixels. -1 means the distance is automatically determined.

27.34.14 setExplodeGroup(startSector as Integer, endSector as Integer, distance as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Explode a group of sectors from the pie.
Notes:

Argument	Default	Description
startSector	(Mandatory)	The sector number of the first sector in the sector group to be exploded. The first sector is 0. The nth sector is (n - 1).
endSector	(Mandatory)	The sector number of the last sector in the sector group to be exploded. The first sector is 0. The nth sector is (n - 1).
distance	-1	The explosion distance in pixels. -1 means the distance is automatically determined.

27.34.15 setJoinLine(joinLineColor as color, joinLineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setJoinLine method, but uses color instead of integer data type for passing color values.
See also:

- 27.34.16 setJoinLine(joinLineColor as Integer, joinLineWidth as Integer = -1) 5243

27.34.16 setJoinLine(joinLineColor as Integer, joinLineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the color and width of the join lines used to connect the sector labels to the sector perimeter.
Notes:

This method affects all sectors. To set the color and width of the join line for one particular sector only, use Sector.setJoinLine.

By default, for circular label layout, the join line color is Transparent. For side label layout, the join line color is SameAsMainColor.

Argument	Default	Description
joinLineColor	(Mandatory)	The color of the line that joins the sector perimeter with the sector label.
joinLineWidth	1	The line width of the join line.

See also:

- 27.34.15 setJoinLine(joinLineColor as color, joinLineWidth as Integer = -1) 5243

27.34.17 setLabelFormat(formatString as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the format of the all sector labels.
Example:

```
dim c as CDPieChartMBS

// you can use label formats like this:

c.setLabelFormat("<*block,halign=left*><*font=timesbi.ttf,size=12,underline=1*>{ label } <*/font*><*br*>US$
{ value } K ( { percent } % )")

// we can reduce that to this:
```

```
c.setLabelFormat(" { label } { value } { percent } % ")

// and it shows 3 numbers. With | 1 after the variable name, we define the decimals after dot:

c.setLabelFormat(" { label } { value | 1 } { percent | 1 } % ")

// and

c.setLabelFormat(" { label } { value | 1., } { percent | 1., } % ")

// uses dot for thousands and comma for decimal separator.
```

Notes:

This method affects all sectors. To set the label format for one particular sector only, use Sector.setLabelFormat.

The default sector label format depends on the label layout method used (see PieChart.setLabelLayout).

Label Layout MethodDefault Label Format

Circular Layout { label } & lt;*br*& gt; { percent } %

(The "& lt;*br*& gt;" above is the CDML syntax for a line break.)

Side Layout { label } ({ percent } %)

Please refer to Parameter Substitution and Formatting on all available parameters and how to format them.

Argument	Default	Description
formatString	(Mandatory)	The format string.

27.34.18 setLabelLayout(layoutMethod as Integer, pos as Integer = -1, topBound as Integer = -1, bottomBound as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the layout method and location of the sector labels.
Notes:

This method affects all sectors. To set the sector label layout method and location for one particular sector only, use Sector.setLabelLayout.

ChartDirector supports two sector label layout methods - circular layout and side layout. The layout method is determined using the layoutMethod argument, which must be one of the following predefined constants.

Constant	Value	Description
SideLayout	0	Side Label Layout
CircleLayout	1	Circular Label Layout

In the circular layout method, the sector labels are positioned around the perimeter of the pie.

In the side layout method, there is an invisible rectangle containing the pie, where the rectangle can be wider than the diameter of the pie.The sector labels are positioned on the left and right sides outside the rectangle. Because the labels can be quite far away from the sectors, join lines are typically used to connect the labels to the sectors.

The circular layout method usually uses less space and is the default layout method. However, if the pie chart contains a lot of small sectors, the labels may overlap with each others, due to insufficient space on the pie perimeter to position the labels.

The side layout method has the advantages that it can avoid label overlapping. In the side layout method, labels will automatically shift up and down to avoid overlapping.

One common issue in pie charts is the data contain a lot of small sectors. If the data are sorted, the small sectors will be crowded together instead of distributed evenly. Although the side layout method can avoid label overlapping by shifting the labels up and down, some labels may need to be shifted great distances.

Label layout can often be improved if the small sectors are near the horizontal axis. It is because the amount of vertical label space for a sector is greatest at the horizontal axis. This can be achieved by choosing an appropriate start angle (using PieChart.setStartAngle).

If the data is in ascending order (small sectors crowded at the beginning), a start angle of 45 degrees with clockwise sector layout is recommended. With this setting, the first few sectors (the smallest sectors) will be at around 45 - 135 degrees, so is near the horizontal axis (90 degrees). Similarly, if the data is in descending order (small sectors crowded at the end), a start angle of 135 degrees with clockwise sector layout can be used.

For side layout, it is the distance between the pie perimeter and the left or right edges of the invisible containing rectangle (equal to the width of the rectangle minus the pie diameter and then divided by 2).

Argument	Default	Description
layoutMethod	(Mandatory)	Specify the layout method. Must be one of the predefined constants CircleLayout or SideLayout.
pos	-1	For circular layout, it is the distance between the sector perimeter and the sector label. A negative value (but not -1) means the sector label will be drawn in the interior of the sector.

In either case, -1 means the distance is automatically determined.

topBound	-1	This parameter applies only to side label layout. It controls the top bound of the labels (the minimum y coordinate), thereby limiting the extent that the labels can be shifted up to avoid overlapping. This parameter is typically used avoid the labels from moving up too much and overlap with other chart objects (such as the chart title).
bottomBound	-1	This parameter applies only to side label layout. It controls the bottom bound of the labels (the maximum y coordinate), thereby limiting the extent which the labels can be shifted down to avoid overlapping. This parameter is typically used to avoid the labels from moving down too much and overlap with other chart objects.

27.34.19 setLabelPos(pos as Integer, joinLineColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setLabelPos method, but uses color instead of integer data type for passing color values.
See also:

- 27.34.20 setLabelPos(pos as Integer, joinLineColor as Integer = -1) 5246

27.34.20 setLabelPos(pos as Integer, joinLineColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the circular label layout method, and configure the join lines used to connect the sector labels to the sector perimeter.
Notes:

This method affects all sectors. To set the sector label position or join line color for one particular sector only, use Sector.setLabelPos.

See also:

- 27.34.19 setLabelPos(pos as Integer, joinLineColor as color) 5246

Argument	Default	Description
pos	(Mandatory)	The distance between the sector perimeter and the sector label. A negative value means the sector label will be drawn in the interior of the sector.
joinLineColor	-1	The color of the line that joins the sector perimeter with the sector label. The default is Transparent. The join line is ignored if the sector label is inside the sector.

27.34.21 setLabelStyle(font as string = """, fontsize as Double = 8, fontColor as Integer = & hffff0002) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the style used to draw all sector labels.
Notes:

This method affects all sectors. To set the label style for one particular sector only, use Sector.setLabelStyle.

See Font Specification for details on various font attributes.

Argument	Default	Description
font	""	The font used to draw the sector labels.
fontSize	8	The font size in points.
fontColor	TextColor	The text color for the sector labels.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

27.34.22 setLabelStyle(font as string, fontsize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setLabelStyle method, but uses color instead of integer data type for passing color values.
See also:

- 27.34.21 setLabelStyle(font as string = "", fontsize as Double = 8, fontColor as Integer = & hffff0002) as CDTextBoxMBS 5247

27.34.23 setLineColor(edgeColor as color, joinLineColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setLineColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.34.24 setLineColor(edgeColor as Integer, joinLineColor as Integer = -1) 5248

27.34.24 setLineColor(edgeColor as Integer, joinLineColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the sector edge color and join line color.
Notes:

This method affects all sectors. To set the sector label position and join line color for one particular sector, use Sector.setColor.

Argument	Default	Description
edgeColor	(Mandatory)	The colors for the edges of the sectors. By default, the edge color is SameAsMainColor, which means the edge color is the same as the fill color of the sector, and the sector will appear borderless.
joinLineColor	-1	The color of the line that join the sector perimeter with the sector label. By default, for circular label layout, the join line color is Transparent. For side label layout, the join line color is SameAsMainColor.

See also:

- 27.34.23 setLineColor(edgeColor as color, joinLineColor as color) 5248

27.34.25 setPieSize(x as Integer, y as Integer, r as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the position and size of the pie in the pie chart.
Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate of the pie center.
y	(Mandatory)	The y coordinate of the pie center.
r	(Mandatory)	The radius of the pie.

27.34.26 setSectorStyle(shadingMethod as Integer, edgeColor as color, edgeWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setSectorStyle method, but uses color instead of integer data type for passing color values.
See also:

- 27.34.27 setSectorStyle(shadingMethod as Integer, edgeColor as Integer = -1, edgeWidth as Integer = -1) 5249

27.34.27 setSectorStyle(shadingMethod as Integer, edgeColor as Integer = -1, edgeWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the sector shading style, edge color and edge width.
Notes:

This method affects all sectors. To set the sector shading style, edge color and edge width for one particular sector, use CDSectorMBS.setStyle.

ChartDirector supports various shading effects, which are best illustrated using examples.

The followings are textual descriptions of the shading effects.

Arguments:

See also:

- 27.34.26 setSectorStyle(shadingMethod as Integer, edgeColor as color, edgeWidth as Integer = -1) 5249

27.34.28 setStartAngle(startAngle as Double, clockWise as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the angle of the first sector in the pie and the layout direction for the sectors.
Notes:

By default, the start angle is 0 degree (the upward pointing direction), and subsequent sectors are drawn clockwise.

Constant	Value	Description
DefaultShading	0	This is the default shading method. The top surfaces are shaded with flat colors. For 3D sectors, the cylindrical surfaces are shaded with cylindrical lighting effects.
FlatShading	1	All surfaces are shaded with flat colors.
LocalGradientShading	2	The top surfaces are shaded with linear gradient colors. For each sector, the gradient is from the bottom of the sector bounding box to the top of the sector bounding box, with the bottom side brighter and the top side darker. For 3D sectors, the cylindrical surfaces are shaded with cylindrical lighting effects.
GlobalGradientShading	3	The top surfaces are shaded with linear gradient colors. The gradient is from the bottom the pie bounding box to the top of the pie bounding box, with the bottom side brighter and the top side darker. For 3D sectors, the cylindrical surfaces are shaded with cylindrical lighting effects.
ConcaveShading	4	The top surfaces are shaded with a special effect so that they look concave, with the pie center appears to be depressed relative to the perimeter. For 3D sectors, the cylindrical surfaces are shaded with cylindrical lighting effects.
RoundedEdgeShading	6	The top surfaces are shaded with a special effect so that the pie looks raised with a rounded raised edge at the perimeter.
RadialShading	7	The top surfaces are shaded with radial gradient colors, with the pie center brighter and the perimeter darker. For 3D sectors, the cylindrical surfaces are shaded with cylindrical lighting effects.
RingShading	8	This effect is intended to be used with 2D donut charts only. The top surfaces are shaded with a special effect so that a 2D donut will look like a torus.

Argument	Default	Description
shadingMethod	(Mandatory)	The sector shading style to use, which must be one of the constants in the table above. -1 means to keep the existing value unchanged.
edgeColor	-1	The edge color of the sectors. -1 means to keep the existing value unchanged.
edgeWidth	-1	The edge width of the sectors. -1 means to keep the existing value unchanged.

Argument	Default	Description
startAngle	(Mandatory)	The angle to start drawing the first sector in degrees. The angle is measured from the upward pointing direction in the clockwise direction.
clockWise	true	Flag to control the layout direction of the sectors. A true value means clockwise. A false value means anti-clockwise.

27.34.29 Screenshots

27.34.30 legendpie2.jpg

Function: A pie chart with legend created using ChartDirector with the CDPieChartMBS class.

27.34.31 smallsectorpie.jpg

Function: A pie chart with small sectors created using ChartDirector with the CDPieChartMBS class.

27.34.32 threeddonutshading.jpg

Function: A donut created using ChartDirector with the CDPieChartMBS class.

27.35 class CDPlotAreaMBS

27.35.1 class CDPlotAreaMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The PlotArea class represents plot areas in XY charts.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.35.2 Blog Entries

- Runtime error with DLLs

27.35.3 Xojo Developer Magazine

- 7.4, page 34: Easy Charts and Graphs, Using the ChartDirector Plugin

27.35.4 Methods

27.35.5 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The private constructor.

27.35.6 getBottomY as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the bottom y pixel coordinate of the plot area.
Notes: Returns the bottom y pixel coordinate of the plot area.

27.35.7 getHeight as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the height of the plot area.

27.35.8 getLeftX as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the left x pixel coordinate of the plot area.

27.35.9 getRightX as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the right x pixel coordinate of the plot area.
Notes: Returns the right x pixel coordinate of the plot area.

27.35.10 getTopY as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the top y pixel coordinate of the plot area.
Notes:

In some cases, the top y coordinate of a box may be dynamically determined. An example is the top y coordinate of an LegendBox with alignment set to Center. To determine the top y coordinate, the size of the box must be known first. For these cases, the top y coordinate is undefined until the legend box or the entire chart has been laid out (using CDBaseChartMBS.layout or CDBaseChartMBS.layoutLegend), or the chart image has been drawn (eg. using CDBaseChartMBS.makeChart).

Arguments:
None

Return Value
The top y pixel coordinate of the plot area.

27.35.11 getWidth as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the width of the plot area.

27.35.12 moveGridBefore(layer as CDLayerMBS=nil)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Moves the grid lines in front of a Layer.
Notes:

By default, the grid lines will be drawn at the back of the plot area, behind all the layers. This method can be used to move the grid lines in front of a given layer.

Arguments:

Argument	Default	Description
layer	nil	The Layer for the grid lines to move in front of.

27.35.13 set4QBgColor(Q1Color as color, Q2Color as color, Q3Color as color, Q4Color as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other set4QBgColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.35.14 set4QBgColor(Q1Color as Integer, Q2Color as Integer, Q3Color as Integer, Q4Color as Integer, edgeColor as Integer = -1) 5256

27.35.14 set4QBgColor(Q1Color as Integer, Q2Color as Integer, Q3Color as Integer, Q4Color as Integer, edgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets using 4 background plot area colors for 4 quadrants.
Notes:

The first quadrant is the region defined by x & gt; 0 and y & gt; 0. The second quadrant is the region defined by x & lt; 0 and y & gt; 0. The third quadrant is the region defined by x & lt; 0 and y & lt; 0. The fourth quadrant is the region defined by x & gt; 0 and y & lt; 0. These 4 regions can be colored using 4 different background colors.

Argument	Default	Description
Q1Color	(Mandatory)	The background color to be used for the first quadrant.
Q2Color	(Mandatory)	The background color to be used for the second quadrant.
Q3Color	(Mandatory)	The background color to be used for the third quadrant.
Q4Color	(Mandatory)	The background color to be used for the fourth quadrant.
edgeColor	-1	he border color of the plot area. -1 means to use the default, which is LineColor. However, if the axes are configured in 4 quadrant mode (see XYChart.setAxisAtOrigin), the default will change to Transparent.

See also:

- 27.35.13 set4QBgColor(Q1Color as color, Q2Color as color, Q3Color as color, Q4Color as color, edgeColor as color) 5256

27.35.15 setAltBgColor(horizontal as Boolean, color1 as color, color2 as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setAltBgColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.35.16 setAltBgColor(horizontal as Boolean, color1 as Integer, color2 as Integer, edgeColor as Integer = -1) 5257

27.35.16 setAltBgColor(horizontal as Boolean, color1 as Integer, color2 as Integer, edgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets alternating plot area background color.
Notes:

This method can be used to specify two colors that will be used alternatively to draw horizontal or vertical bands on the plot area background, using major grid lines as boundaries for the bands.

Argument	Default	Description
horizontal	(Mandatory)	true means to use horizontal bands. false means to use vertical bands.
color1	(Mandatory)	The first color to be used as the alternating background color.
color2	(Mandatory)	The second color to be used as the alternating background color.
edgeColor	-1	The border color of the plot area. -1 means to use the default, which is LineColor. However, if the axes are configured in 4 quadrant mode (see XYChart.setAxisAtOrigin), the default will change to Transparent.

See also:

- 27.35.15 setAltBgColor(horizontal as Boolean, color1 as color, color2 as color, edgeColor as color) 5257

27.35.17 setBackground(colorvalue as color, altBgColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setBackground method, but uses color instead of integer data type for passing color values.
See also:

- 27.35.18 setBackground(colorvalue as Integer, altBgColor as Integer = -1, edgeColor as Integer = -1) 5258
- 27.35.19 setBackground(file as folderitem, align as Integer = 5) 5258

27.35.18 setBackground(colorvalue as Integer, altBgColor as Integer = -1, edgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the background colors and the border color of the plot area.
Notes:

A plot area can have one or two background colors. If it has two background colors, they are drawn alternatively as horizontal bands on the major background grid.

ChartDirector Ver 4.0 introduces two new methods PlotArea.setAltBgColor and PlotArea.set4QBgColor. They are used for vertical alternating bands, and for supporting 4 background colors for 4 quadrants.

Argument	Default	Description
color	(Mandatory)	The background color.
altBgColor	-1	The second background color. -1 means there is no second background color.
edgeColor	-1	The border color of the plot area. -1 means to use the default, which is LineColor. However, if the axes are configured in 4 quadrant mode (see XYChart.setAxisAtOrigin), the default will change to Transparent.

See also:

- 27.35.17 setBackground(colorvalue as color, altBgColor as color, edgeColor as color) 5257
- 27.35.19 setBackground(file as folderitem, align as Integer = 5) 5258

27.35.19 setBackground(file as folderitem, align as Integer = 5)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the specified image file as the background image of the plot area.
Notes:

ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

See also:

Argument	Default	Description
img	(Mandatory)	The image file that is used as the background image of the plot area.
align	Center	The alignment of the background image relative to the plot area. See Alignment Specification for supported alignment types.

- 27.35.17 setBackground(colorvalue as color, altBgColor as color, edgeColor as color) 5257
- 27.35.18 setBackground(colorvalue as Integer, altBgColor as Integer = -1, edgeColor as Integer = -1) 5258

27.35.20 setGridAxis(xGridAxis as CDAxisMBS, yGridAxis as CDAxisMBS)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the axis used for drawing grid lines.
Notes:

By default, the grid lines will be based on the ticks on the primary x-axis (CDXYChartMBS.xAxis) and primary y-axis (CDXYChartMBS.yAxis). This method may be used to specify alternative x-axis and y-axis to base the grid lines on.

Arguments:

Argument	Default	Description
xGridAxis	(Mandatory)	The x-axis used for drawing grid lines.
yGridAxis	(Mandatory)	The y-axis used for drawing grid lines.

27.35.21 setGridColor(hGridColor as color, vGridColor as color, minorHGridColor as color, minorVGridColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setGridColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.35.22 setGridColor(hGridColor as Integer, vGridColor as Integer = & hff000000, minorHGridColor as Integer = -1, minorVGridColor as Integer = -1) 5260

27.35.22 setGridColor(hGridColor as Integer, vGridColor as Integer = & hff000000, minorHGridColor as Integer = -1, minorVGridColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the horizontal and vertical grid colors of the plot area.
Notes:

Argument	Default	Description
hGridColor	(Mandatory)	The color for the horizontal grid lines associated with major ticks.
vGridColor	Transparent	The color for the vertical grid lines associated with major ticks.
minorHGridColor	-1	The color for the horizontal grid lines associated with minor ticks. -1 means the color is the same as hGridColor.
minorVGridColor	-1	The color for the vertical grid lines associated with minor ticks. -1 means the color is the same as vGridColor.

See also:

- 27.35.21 setGridColor(hGridColor as color, vGridColor as color, minorHGridColor as color, minorVGridColor as color) 5259

27.35.23 setGridWidth(hGridWidth as Integer, vGridWidth as Integer = -1, minorHGridWidth as Integer = -1, minorVGridWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the horizontal and vertical grid line width.
Notes:

Argument	Default	Description
hGridWidth	(Mandatory)	The line width for the horizontal grid lines associated with major ticks.
vGridWidth	-1	The line width for the vertical grid lines associated with major ticks. -1 means the vertical grid line width is the same as hGridWidth.
minorHGridWidth	-1	The line width for the horizontal grid lines associated with minor ticks. -1 means the color is the same as hGridWidth.
minorVGridWidth	-1	The line width for the horizontal grid lines associated with minor ticks. -1 means the color is the same as vGridWidth.

27.36 class CDPolarAreaLayerMBS

27.36.1 class CDPolarAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The PolarAreaLayer class represents polar area layers.
Notes:

Subclass of the CDPolarLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.37 class CDPolarChartMBS

27.37.1 class CDPolarChartMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The PolarChart class represents polar charts (including radar charts).
Notes: Subclass of the CDBaseChartMBS class.

27.37.6 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a polar area layer to the polar chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points in the layer.
color	-1	The color to draw the area. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A PolarAreaLayer object representing the chart layer created.
See also:

- 27.37.5 addAreaLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5262
- 27.37.7 addAreaLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5263
- 27.37.8 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS 5263

27.37.7 addAreaLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addAreaLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.37.5 addAreaLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5262

- 27.37.8 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS 5263

27.37.8 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a polar area layer to the polar chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points in the layer.
color	-1	The color to draw the area. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A PolarAreaLayer object representing the chart layer created.
See also:

- 27.37.5 addAreaLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5262
- 27.37.6 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS 5262
- 27.37.7 addAreaLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5263

27.37.9 addLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addLineLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.37.10 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS 5264
- 27.37.11 addLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5265
- 27.37.12 addLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS 5265

27.37.10 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a polar line layer to the polar chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points in the layer.
color	-1	The color to draw the line. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A PolarLineLayer object representing the chart layer created.
See also:

- 27.37.9 addLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5264
- 27.37.11 addLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5265
- 27.37.12 addLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS 5265

27.37.11 addLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addLineLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.37.9 addLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5264
- 27.37.10 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS 5264
- 27.37.12 addLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS 5265

27.37.12 addLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a polar line layer to the polar chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points in the layer.
color	-1	The color to draw the line. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A PolarLineLayer object representing the chart layer created.
See also:

- 27.37.9 addLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5264
- 27.37.10 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS 5264
- 27.37.11 addLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5265

27.37.13 addSplineAreaLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarSplineAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addSplineAreaLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.37.14 addSplineAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarSplineAreaLayerMBS 5266

27.37.14 addSplineAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarSplineAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a polar spline area layer to the polar chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points in the layer.
color	-1	The color to draw the spline area. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A PolarSplineAreaLayer object representing the chart layer created.
See also:

- 27.37.13 addSplineAreaLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarSplineAreaLayerMBS 5266

27.37.16 addSplineAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarSplineAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a polar spline area layer to the polar chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points in the layer.
color	-1	The color to draw the spline area. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A PolarSplineAreaLayer object representing the chart layer created.
See also:

- 27.37.20 addSplineLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5269

27.37.18 addSplineLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a polar spline line layer to the polar chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points in the layer.
color	-1	The color to draw the spline line. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A PolarSplineLineLayer object representing the chart layer created.
See also:

- 27.37.17 addSplineLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5268
- 27.37.19 addSplineLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5269
- 27.37.20 addSplineLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5269

27.37.19 addSplineLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addSplineLineLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.37.17 addSplineLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5268

- 27.37.20 addSplineLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5269

27.37.20 addSplineLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a polar spline line layer to the polar chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points in the layer.
color	-1	The color to draw the spline line. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A PolarSplineLineLayer object representing the chart layer created.
See also:

- 27.37.17 addSplineLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5268
- 27.37.18 addSplineLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5268
- 27.37.19 addSplineLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5269

27.37.21 addVectorLayer(rdata() as Double, adata() as Double, lengths() as Double, directions() as Double, lengthScale as Integer = 0, colorvalue as Integer = -1, name as string = "") as CDPolarVectorLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a vector layer to the chart.
Notes:

The vectors are specified as 4 data series, representing the radial and angular coordinates of the reference points to put the vectors, and the lengths and directions of the vectors.

By default, the vector starts from the reference point and points away from it. You may use PolarVectorLayer.setArrowAlignment to specify other options, such as for the vectors to point into the reference point, or to have the reference as a pivot at the mid-point of the vector.

ChartDirector supports specifying vectors lengths as pixels or in axis scale. The unit is specified by using the following predefined constants.

ConstantValueDescription

PixelScale	0	The unit is measured in pixels.
RadialAxisScale	2	The unit is measured in the radial axis scale.

Argument	Default	Description
rData	(Mandatory)	An array of numbers representing the radial coordinates for the reference points of the vectors.
aData	(Mandatory)	An array of numbers representing the angular coordinates for the reference points of the vectors.
lengths	(Mandatory)	An array of numbers representing the lengths of the vectors, in unit as specified in the lengthScale argument.
directions	(Mandatory)	An array of numbers representing the direction of the vectors as a clockwise angle in degrees, where 0 is upward pointing direction.
lengthScale	PixelScale	The unit for the lengths, which must be one of the predefined constants in the table above.
color	-1	The color to draw the data points. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A PolarVectorLayer object representing the vector layer created.
See also:

- 27.37.22 addVectorLayer(rdata() as Double, adata() as Double, lengths() as Double, directions() as Double, lengthScale as Integer, colorvalue as color, name as string = "") as CDPolarVectorLayerMBS 5271

27.37.22 addVectorLayer(rdata() as Double, adata() as Double, lengths() as Double, directions() as Double, lengthScale as Integer, colorvalue as color, name as string = "") as CDPolarVectorLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addVectorLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.37.21 addVectorLayer(rdata() as Double, adata() as Double, lengths() as Double, directions() as Double, lengthScale as Integer = 0, colorvalue as Integer = -1, name as string = "") as CDPolarVectorLayerMBS 5270

27.37.23 Constructor(width as Integer = 640, height as Integer = 480, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other Constructor method, but uses color instead of integer data type for passing color values.
See also:

- 27.37.24 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0) 5272

27.37.24 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a new PolarChart object.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

See also:

- 27.37.23 Constructor(width as Integer = 640, height as Integer = 480, bgColor as color, edgeColor as color, raisedEffect as Integer = 0) 5271

27.37.25 getXCoor(r as Double, a as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the x pixel coordinate of a point given its radial and angular coordinates.
Notes:

The radial and angular coordinates are measured using the scale of the radial and angular axes. In particular, the scale of the angular axis may not be in degrees or radians. See AngularAxis.setLabels and AngularAxis.setLinearScale on how the angular axis scale is defined.

Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

Argument	Default	Description
r	(Mandatory)	The radial coordinate of the point.
a	(Mandatory)	The angular coordinate of the point.

Return Value

The x pixel coordinate of the point.

27.37.26 getYCoor(r as Double, a as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the y pixel coordinate of a point given its radial and angular coordinates.
Notes:

The radial and angular coordinates are measured using the scale of the radial and angular axes. In particular, the scale of the angular axis may not be in degrees or radians. See AngularAxis.setLabels and AngularAxis.setLinearScale on how the angular axis scale is defined.

Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

Argument	Default	Description
r	(Mandatory)	The radial coordinate of the point.
a	(Mandatory)	The angular coordinate of the point.

Return Value
The y pixel coordinate of the point.

27.37.27 setGridColor(rGridColor as color, rGridWidth as Integer, aGridColor as color, aGridWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setGridColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.37.28 setGridColor(rGridColor as Integer = & h80000000, rGridWidth as Integer = 1, aGridColor as Integer = & h80000000, aGridWidth as Integer = 1) 5273

27.37.28 setGridColor(rGridColor as Integer = & h80000000, rGridWidth as Integer = 1, aGridColor as Integer = & h80000000, aGridWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the grid colors and widths of the polar plot area.
Notes:

Argument	Default	Description
rGridColor	80000000	The color of grid lines in the radial direction (from the center outwards).
rGridWidth	1	The line width for grid lines in the radial direction (from the center outwards).
aGridColor	80000000	The color of grid lines in the angular direction (concentric circles around the center).
aGridWidth	1	The line width of grid lines in the angular direction (concentric circles around the center) The line width is only used if the polar plot area is using a polygon grid (see PolarChart.setGridStyle). If circular grid is used, the line width is always 1.

See also:

- 27.37.27 setGridColor(rGridColor as color, rGridWidth as Integer, aGridColor as color, aGridWidth as Integer = 1) 5273

27.37.29 setGridStyle(polygonGrid as boolean, gridOnTop as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Configure whether to use circular grids or polygon grids, and whether the grid lines are on top of the polar plot area or are at the back.
Notes:

Argument	Default	Description
polygonGrid	(Mandatory)	A true value means polygonal grid will be used. A false value means circular grid will be used.
gridOnTop	true	A true value means the grid lines will be on top of the polar plot area. A false value means the grid lines will be at the bottom of the polar plot area.

27.37.30 setPlotArea(x as Integer, y as Integer, r as Integer, bgColor as color, edgeColor as color, edgeWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setPlotArea method, but uses color instead of integer data type for passing color values.
See also:

- 27.37.31 setPlotArea(x as Integer, y as Integer, r as Integer, bgColor as Integer = & hff000000, edgeColor as Integer = & hff000000, edgeWidth as Integer = 1) 5275

27.37.31 setPlotArea(x as Integer, y as Integer, r as Integer, bgColor as Integer = & hff000000, edgeColor as Integer = & hff000000, edgeWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the position, background colors, border color and border width of the polar plot area.
Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate of the center of the polar plot area.
y	(Mandatory)	The y coordinate of the center of the polar plot area.
r	(Mandatory)	The radius of the polar plot area in pixels.
bgColor	Transparent	The background color of the polar plot area.
edgeColor	Transparent	The border color of the polar plot area.
edgeWidth	1	The border width of the polar plot area. The border width is only used if the polar plot area is using a polygon grid (see PolarChart.setGridStyle). If circular grid is used, the border width is always 1.

See also:

- 27.37.30 setPlotArea(x as Integer, y as Integer, r as Integer, bgColor as color, edgeColor as color, edgeWidth as Integer = 1) 5274

27.37.32 setPlotAreaBg(bgColor1 as color, bgColor2 as color, altRings as boolean = true)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setPlotAreaBg method, but uses color instead of integer data type for passing color values.
See also:

- 27.37.33 setPlotAreaBg(bgColor1 as Integer, bgColor2 as Integer, altRings as boolean = true) 5275

27.37.33 setPlotAreaBg(bgColor1 as Integer, bgColor2 as Integer, altRings as boolean = true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets alternating background colors for the polar plot area.
Notes:

ChartDirector supports using two alternating background colors for the polar plot area. The colors can change on the radial direction, resulting in concentric circles, on an the angular direction, resulting in alternating sectors.

Argument	Default	Description
bgColor1	(Mandatory)	The first background color.
bgColor2	-1	The second background color. The default value of -1 means it is the same as the first background color.
altRings	true	A true value means the background colors alternate in the radial direction, resulting in concentric circles. A false value means the background colors alternates in the angular direction, resulting in alternating sectors.

See also:

- 175.21.10 setPlotAreaBg(bgColor1 as color, bgColor2 as color, altRings as boolean = true) 21616

27.37.34 setStartAngle(startAngle as Double, clockwise as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the angle of the radial axis, and the layout direction of radial grid lines.
Notes:

The default radial axis angle is 0 degree, which means the radial axis is upward pointing.

Argument	Default	Description
startAngle	(Mandatory)	The angle of the radial axis in degrees. The upward pointing direction is 0 degree, with angle measured in the clockwise direction.
clockwise	true	A true value means the radial grid line will be laid out in the clockwise direction. A false value means the radial grid lines will be laid out in the counter-clockwise direction.

27.37.35 Properties

27.37.36 angularAxis as CDAngularAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the AngularAxis object representing the angular axis of the polar chart.
Notes: (Read only property)

27.37.37 radialAxis as CDRadialAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the RadialAxis object representing the radial axis of the polar chart.
Notes: (Read only property)

27.37.38 Screenshots

27.37.39 polarbubble.jpg

Function: A polar chart created using ChartDirector with the CDPolarChartMBS class.

27.37.40 polarzones.jpg

Function: A polar chart created using ChartDirector with the CDPolarChartMBS class.

27.38 class CDPolarLayerMBS

27.38.1 class CDPolarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The PolarLayer class is the base class for all PolarChart layer classes.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.38.3 Methods

27.38.4 addCustomDataLabel(i as Integer, label as string, font as string = "", fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a custom data label to a data point.
Notes:

See Font Specification for details on various font attributes.

Argument	Default	Description
i	(Mandatory)	The data point number for the data point. The first data point is 0, while the nth data point is (n - 1).
label	(Mandatory)	A text string representing the data label. Parameter Substitution and Formatting is supported.
font	""	The font used to draw the label.
fontSize	8	The font size used to draw the label.
fontColor	TextColor	The color used to draw the label.
fontAngle	0	The rotation angle of the label.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 27.38.5 addCustomDataLabel(i as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS 5281

27.38.5 addCustomDataLabel(i as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addCustomDataLabel method, but uses color instead of integer data type for passing color values.
See also:

- 27.38.4 addCustomDataLabel(i as Integer, label as string, font as string = "", fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS 5280

27.38.6 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The private constructor.

27.38.7 getHTMLImageMap(url as string, queryFormat as string = "", extraAttr as string = "", offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Generates an HTML image map for all data points on the layer.
Notes:

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
url	(Mandatory)	The URL to be used in the "href" attribute of the image map. Parameter Substitution and Formatting is supported. Use an empty string if no href attribute is needed.
queryFormat	""	A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported.

The special keyword " { default } " represents the default query parameters. This is useful for specifying appending to the default.

Note that an empty string means to use the default query query parameters. To specify no query parameter, use a space character.

extraAttr	""	A text string to specify additional attributes to add to the & lt;area& gt; tag. Parameter Substitution and Formatting is supported.
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string containing the image map generated.

27.38.8 getImageCoor(dataItem as Integer, offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the image map coordinates of a data point.
Notes:

The image map coordinates will be in the following format:

shape="rect" cords=" [x1] , [y1] , [x2] , [y2] "
This format is specially designed so that it can easily be included into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
dataItem	(Mandatory)	The data point number for the data point. The first data point is 0, while the nth data point is (n - 1).
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string representing the image map coordinates of the data points as HTML image map attributes.

27.38.9 setAngles(data() as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the angular coordinates of the data points.
Notes:

Note that the angular coordinates are measured using the scale of the angular axis, which may not be in degrees or radians. See AngularAxis.setLabels and AngularAxis.setLinearScale on how the angular axis scale is defined.

If this method is not called, the first data point is assumed to have an angular coordinate of 0, and the nth data point is assumed to have an angular coordinate of (n - 1). This is common for radar charts, in which enumerated scale is used for the angular axis (see AngularAxis.setLabels).

Argument	Default	Description
angles	(Mandatory)	An array of numbers representing the angular coordinates of the data points.

27.38.10 setBorderColor(edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setBorderColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.38.11 setBorderColor(edgeColor as Integer) 5283

27.38.11 setBorderColor(edgeColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the border color for drawing the data on the layer.
Notes:

This method only applies to layers that represents data with elements that have borders (e.g. polar area layer and polar spline area layer).

See also:

- 27.38.10 setBorderColor(edgeColor as color) 5283

Argument	Default	Description
edgeColor	(Mandatory)	The border color.

27.38.12 setData(data() as Double, colorvalue as color, name as string = "")

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setData method, but uses color instead of integer data type for passing color values.
See also:

- 27.38.13 setData(data() as Double, colorvalue as Integer = -1, name as string = "") 5284

27.38.13 setData(data() as Double, colorvalue as Integer = -1, name as string = "")

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the values of the data points.
See also:

- 27.38.12 setData(data() as Double, colorvalue as color, name as string = "") 5284

27.38.14 setDataLabelFormat(formatString as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the data label format.
Notes:

By default, the data label format is " { value } ". Please refer to Parameter Substitution and Formatting on available parameters and how to format them.

Argument	Default	Description
formatString	(Mandatory)	The format string.

27.38.15 setDataLabelStyle(font as string = "", fontsize as Double = 8, fontcolor as Integer = 0, fontangle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Enables data labels and sets their styles.
Notes:

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of

Argument	Default	Description
font	""	The font used to draw the labels.
fontSize	8	The font size used to draw the labels.
fontColor	TextColor	The color used to draw the labels.
fontAngle	0	The rotation angle of the labels.

the obj.
See also:

- 27.38.16 setDataLabelStyle(font as string, fontsize as Double, fontcolor as color, fontangle as Double = 0) as CDTextBoxMBS 5285

27.38.16 setDataLabelStyle(font as string, fontsize as Double, fontcolor as color, fontangle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setDataLabelStyle method, but uses color instead of integer data type for passing color values.
See also:

- 27.38.15 setDataLabelStyle(font as string = "", fontsize as Double = 8, fontcolor as Integer = 0, fontangle as Double = 0) as CDTextBoxMBS 5284

27.38.17 setDataSymbol(area as CDDrawAreaMBS)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Uses a DrawArea object as the graphics symbol to plot the data points.
Notes:

Argument	Default	Description
obj	(Mandatory)	A DrawArea object to be used as the symbol.

See also:

- 27.38.18 setDataSymbol(image as folderitem) 5286
- 27.38.19 setDataSymbol(pic as Picture) 5286
- 27.38.20 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgecolor as Integer = -1) 5287
- 27.38.21 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgecolor as Integer = -1) 5288

- 27.38.22 setDataSymbol(symbol as Integer, size as Integer = 7, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5288
- 27.38.23 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5289

27.38.18 setDataSymbol(image as folderitem)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Load an image from a file and use it as the graphics symbol to plot the data points.
Notes:

ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

Argument	Default	Description
image	(Mandatory)	The filename of the image file. The image type is determined based on file extension, which must be png, jpg/jpeg, gif or wbmp/wmp.

- 27.38.21 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgecolor as Integer = -1) 5288
- 27.38.22 setDataSymbol(symbol as Integer, size as Integer = 7, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5288
- 27.38.23 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5289

27.38.19 setDataSymbol(pic as Picture)

MBS ChartDirector Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Uses a picture object as the graphics symbol to plot the data points.
Notes:

See also:

Argument	Default	Description
obj	(Mandatory)	A picture object to be used as the symbol.

- 27.38.17 setDataSymbol(area as CDDrawAreaMBS) 5285
- 27.38.18 setDataSymbol(image as folderitem) 5286
- 27.38.20 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgecolor as Integer = -1) 5287

- 27.38.22 setDataSymbol(symbol as Integer, size as Integer = 7, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5288
- 27.38.23 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5289

27.38.20 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgecolor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Uses a custom polygon as the graphics symbol to plot the data points.
Notes:

Argument	Default	Description
polygon	(Mandatory)	An array of integers representing the coordinates the polygon vertices. See Shape Specification on how the custom shape is defined.
size	11	The nominal width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means the color of the data set will be used.
edgeColor	-1	The edge color used to draw the edge of the symbol. -1 means the edge color of the data set will be used.

See also:

- 27.38.17 setDataSymbol(area as CDDrawAreaMBS) 5285
- 27.38.18 setDataSymbol(image as folderitem) 5286

- 27.38.23 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5289

27.38.21 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgecolor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setDataSymbol method, but uses color instead of integer data type for passing color values.
See also:

- 27.38.17 setDataSymbol(area as CDDrawAreaMBS) 5285
- 27.38.18 setDataSymbol(image as folderitem) 5286
- 27.38.19 setDataSymbol(pic as Picture) 5286
- 27.38.20 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgecolor as Integer = -1) 5287
- 27.38.22 setDataSymbol(symbol as Integer, size as Integer = 7, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5288
- 27.38.23 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5289

27.38.22 setDataSymbol(symbol as Integer, size as Integer = 7, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Uses one of the built-in symbols as the graphics symbol to plot the data points.
Notes:

Argument	Default	Description
symbol	(Mandatory)	One of the predefined shape constants representing the symbol shape. See Shape Specification for the available built-in shapes.
size	7	The width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means the color of the data set will be used.
edgeColor	-1	The edge color used to draw the edge of the symbol. -1 means the edge color of the data set will be used.
lineWidth	1	The line width used for drawing the symbols.

- 27.38.22 setDataSymbol(symbol as Integer, size as Integer = 7, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5288

27.38.24 setHTMLImageMap(url as string, queryFormat as string = ””, extraAttr as string = ””)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Override the default arguments used when generating HTML image map for the layer.
Notes:

BaseChart.getHTMLImageMap can be used to generate HTML image map for the whole chart. When BaseChart.getHTMLImageMap is used, the image map for all layers will be generated based on the arguments supplied to BaseChart.getHTMLImageMap.

The setHTMLImageMap method can be used to override those arguments for a chart layer, so the image map for that layer can be different.

For a detail description of image maps, please refer to BaseChart.getHTMLImageMap.

Argument	Default	Description
url	(Mandatory)	The URL to be used in the "href" attribute of the image map. Parameter Substitution and Formatting is supported.

The special keyword " { default } " represents the global URL as specified in BaseChart.getHTMLImageMap. This field is useful for specifying appending to the global URL.

Note that an empty string also means to use the global URL. To specify no URL, use the special keyword " { none } ".

To disable the entire image map, use the special keyword " { disable } ".

queryFormat	""	A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported.

The special keyword " { default } " represents the global query parameters as specified in BaseChart.getHTMLImageMap. This field is useful for specifying appending to the global query parameters.

Note that an empty string also means to use the global query parameters. To specify no query parameters, use the special keyword " { none } ".

extraAttr	""	A text string to specify additional attributes to add to the & lt;area& gt; tag. Parameter Substitution and Formatting is supported.

The special keyword " { default } " represents the global additional attributes as specified in BaseChart.getHTMLImageMap. This field is useful for specifying appending to the global additional attributes.

Note that an empty string also means to use the global additional attributes. To specify no additional attributes, use the special keyword " { none } ".

27.38.25 setImageMapWidth(width as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the effective size of a data point for producing image maps.
Notes:

For the purpose of producing image maps for the data points, the sizes of the data points are assumed to be the size of the data symbols. If no data symbol is used, an effective size is assumed. The default is 10 pixels in width and height.

Argument	Default	Description
width	(Mandatory)	The effective width and height of the data point for the purpose of producing image maps.

27.38.26 setLineWidth(w as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the line width of lines when drawing the data on the layer.
Notes:

Argument	Default	Description
w	(Mandatory)	The width of the line in pixels.

27.38.27 setSymbolOffset(offsetX as Integer, offsetY as Integer)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Offset the symbols in the x and y directions in pixel unit.
Notes:

Argument	Default	Description
xOffset	(Mandatory)	The x offset in pixels. A positive value mean shifting to the right.
yOffset	(Mandatory)	The y offset in pixels. A positive value mean shifting to the bottom.

27.38.28 setSymbolScale(data() as Double, scaleType as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the size of the symbol for each data point (for creating bubble charts).
Notes:

One common usage for this method is to draw circle symbols of different sizes at each data points, creating a bubble chart.

This method supports any valid data symbols. You can create bubble charts with square bubbles, or even custom data symbols.

ChartDirector supports specifying sizes as pixels or in axis scale. The unit is specified by using the following predefined constants.

ConstantValueDescription

PixelScale	0	The unit is measured in pixels.
RadialAxisScale	2	The unit is measured in the radial axis scale.

Argument	Default	Description
zData	(Mandatory)	The sizes of the symbols, expressed using the unit defined by the scaleType argument.
scaleType	PixelScale	The unit for zData, which must be one of the predefined constants in the table above.

27.39 class CDPolarLineLayerMBS

27.39.1 class CDPolarLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The PolarLineLayer class represents polar area layers.
Notes:

Subclass of the CDPolarLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.39.2 Xojo Developer Magazine

- 7.5, page 32: Easy Charts and Graphs Part 2, Using the ChartDirector Plugin

27.39.3 Methods

27.39.4 setCloseLoop(b as boolean)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Specifies whether the polar line should form a close loop (joining the last point to the first point) or not.
Notes:

Argument	Default	Description
b	(Mandatory)	A true value means the polar line should form a close loop. A false value means the polar line should not form a close loop.

27.39.5 setGapColor(lineColor as color, lineWidth as Integer)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setGapColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.39.6 setGapColor(lineColor as Integer, lineWidth as Integer) 5293

27.39.6 setGapColor(lineColor as Integer, lineWidth as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the color and style of the line used for jumping across NoValue data points.

Notes:

By default, the color of the line for jumping across NoValue data points is Transparent, which means the line will become discontinuous

Argument	Default	Description
lineColor	(Mandatory)	The line color of the line used for jumping across NoValue data points
lineWidth	-1	The line width of the line used for jumping across NoValue data points. -1 means the width will be the same as the line width of the line for drawing normal data points.

See also:

- 27.39.5 setGapColor(lineColor as color, lineWidth as Integer) 5293

27.40 class CDPolarSplineAreaLayerMBS

27.40.1 class CDPolarSplineAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The PolarSplineAreaLayer class represents polar spline area layers.
Notes:

Subclass of the CDPolarAreaLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.40.2 Methods

27.40.3 setTension(tension as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the tension to use when computing the spline curve.
Notes:

The tension parameter should be between -1 and 1. A positive tension will make the spline tighter. The spline curve will become straight line segments when tension is 1. A negative tension will make the spline looser.

Argument	Default	Description
tension	(Mandatory)	The tension of the spline, which should be between -1 and 1.

27.41 class CDPolarSplineLineLayerMBS

27.41.1 class CDPolarSplineLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The PolarSplineLineLayer class represents polar spline line layers.
Notes:

Subclass of the CDPolarLineLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.41.2 Methods

27.41.3 setTension(tension as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the tension to use when computing the spline curve.
Notes:

The tension parameter should be between -1 and 1. A positive tension will make the spline tighter. The spline curve will become straight line segments when tension is 1. A negative tension will make the spline looser.

Argument	Default	Description
tension	(Mandatory)	The tension of the spline, which should be between -1 and 1.

27.42 class CDPolarVectorLayerMBS

27.42.1 class CDPolarVectorLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The PolarVectorLayer class represents polar vector layers.
Notes:

Subclass of the CDPolarLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.42.2 Methods

27.42.3 setArrowAlignment(alignment as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the alignment of the vector relative to the data point.
Notes:

Argument	Default	Description
alignment	(Mandatory)	A BottomCenter value means the vector will point away from the data point (the default). A TopCenter value means the vector will point into the data point. A Center value means the center of the vector will be at the data point.

27.42.4 setArrowHead(polygon() as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets a custom shape to be used as the arrow head.
Notes:

The custom shape is specified as an array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of 10 x 10 units, in which the x-axis is from left to right, and the y-axis from bottom to top. The origin is assumed to be the bottom center of the arrow (the point where the arrow head joins the arrow stem). The shape is assumed to represent an arrow pointing upwards.

As an example, the followings are the integer array that represents the standard ChartDirector vector arrow head:

-5, -5, 0, 0, 5, -5, 0, 5
ChartDirector will automatically scale the shape to the actual width and height as specified in PolarVectorLayer.setArrowHead.

Argument	Default	Description
polygon	(Mandatory)	An array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates the polygon vertices on a 10 x 10 units grid.

See also:

- 27.42.5 setArrowHead(width as Integer, height as Integer) 5298

27.42.5 setArrowHead(width as Integer, height as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the size of the arrow head.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the arrow head in pixels. The default width is 8 pixels.
height	0	The height of the arrow head in pixels. The default value of 0 means the height is the same as the width.

See also:

- 27.42.4 setArrowHead(polygon() as Integer) 5297

27.42.6 setArrowStem(polygon() as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets a custom shape to be used as the arrow stem.
Notes:

By default, the arrow stem is just a straight line, with the line width controlled using PolarLayer.setLineWidth. The setArrowStem method can specify a custom shape for the arrow stem.

The custom shape is specified as an array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of 10 x 100 units, in which the x-axis is from left to right, and the y-axis from bottom to top. The origin is assumed to be the starting point of the arrow stem,

and the shape is assumed to represent an arrow stem pointing upwards.

ChartDirector will automatically scale the shape so that the total arrow length (head + stem) is the required length of the arrow as according to actual data, and the stem width is as specified in PolarLayer.setLineWidth.

Argument	Default	Description
polygon	(Mandatory)	An array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates the polygon vertices on a 10 x 100 units grid.

27.42.7 setIconSize(height as Integer, width as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the size of the icon to be used in legend box.
Notes:

By default, if a legend box is available on the chart, ChartDirector will insert an legend entry if the PolarVectorLayer is named. The size of the icon will be the size of the vectors used on the chart, using a short vector length to fit the legend box.

This method can be used to override the legend box settings to specify a custom width/height for the icons of the current PolarVectorLayer.

Argument	Default	Description
height	(Mandatory)	The height of the icon in pixels.
width	0	The width of the icon in pixels. The default value of 0 means the width is automatically determined.

27.42.8 setVector(lengths() as Double, directions() as Double, lengthScale as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the lengths and directions for the vectors.
Notes:

ChartDirector supports specifying lengths as pixels or in axis scale. The unit is specified by using the following predefined constants.

ConstantValueDescription

PixelScale	0	The unit is measured in pixels.
RadialAxisScale	2	The unit is measured in the radial axis scale.

Argument	Default	Description
lengths	(Mandatory)	An array of numbers representing the lengths of the vectors, in unit as specified in the lengthScale argument.
directions	(Mandatory)	An array of numbers representing the direction of the vectors as a clockwise angle in degrees, where 0 is upward pointing direction.
lengthScale	PixelScale	The unit for the lengths, which must be one of the predefined constants in the table above.

27.42.9 setVectorMargin(startMargin as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the vector margin.
See also:

- 27.42.10 setVectorMargin(startMargin as Double, endMargin as Double) 5300

27.42.10 setVectorMargin(startMargin as Double, endMargin as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the vector margin.
See also:

- 27.42.9 setVectorMargin(startMargin as Double) 5300

27.43 class CDPyramidChartMBS

27.43.1 class CDPyramidChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The PyramidChart class represents pyramid charts (including cone charts and funnel charts).
Notes:

The PyramidChart class is a subclass of BaseChart.
Subclass of the CDBaseChartMBS class.

27.43.2 Xojo Developer Magazine

- 7.4, page 31: Easy Charts and Graphs, Using the ChartDirector Plugin

27.43.3 Methods

27.43.4 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a new PyramidChart object.
Notes:

Arguments:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	kBackgroundColor	The background color of the chart.
edgeColor	kTransparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

See also:

- 27.43.5 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0) 5302

27.43.5 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other Constructor method, but uses color instead of integer data type for passing color values.
See also:

- 27.43.4 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0) 5301

27.43.6 getLayer(layerNo as Integer) as CDPyramidLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Retrieves the PyramidLayer object representing a single pyramid layer in the pyramid chart.
Notes:

You must call CDPyramidChartMBS.setData to create the layers first before calling this method.
Arguments

Argument	Default	Description
layerNo	(Mandatory)	The layer number of the pyramid layer to retrieve, starting from 0. The first pyramid layer is 0. The nth pyramid layer is (n-1).

Return Value
The requested CDPyramidLayerMBS object.

27.43.7 setCenterLabel(labelTemplate as string = """, font as string = """, fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds labels to the center of the pyramid layers.
Notes:

This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setCenterLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.

Arguments:

Argument	Default	Description
template	" { skip } "	The label template. " { skip } " means to keep the existing value unchanged.
font	" { skip } "	The font style. " { skip } " means to keep the existing value unchanged.
fontSize	-1	The font size in points. -1 means to keep the existing value unchanged.
fontColor	-1	The font color. -1 means to keep the existing value unchanged.

Return Value
A CDTextBoxMBS object representing the prototype of the labels. This may be used to fine-tune the appearance of the labels.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 27.43.8 setCenterLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS 5303

27.43.8 setCenterLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setCenterLabel method, but uses color instead of integer data type for passing color values.
See also:

- 27.43.7 setCenterLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS 5302

27.43.9 setConeSize(cx as Integer, cy as Integer, radius as Integer, height as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the position and size of the cone in a cone chart.
Notes:

Arguments:

Argument	Default	Description
cx	(Mandatory)	The x-coordinate of the center of the cone. The center of the cone is the midpoint of the vertical axis of the cone.
cy	(Mandatory)	The y-coordinate of the center of the cone. The center of the cone is the midpoint of the vertical axis of the cone.
radius	(Mandatory)	The radius of the base of the cone.
height	(Mandatory)	The height of the cone.

27.43.10 setData(data() as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the data used to draw the pyramid chart.
Notes:

Arguments:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data values.
labels	[Empty_Array]	An array of text strings representing the labels of the layers. An empty array means no layer label.

See also:

- 27.43.11 setData(data() as Double, labels() as string) 5304

27.43.11 setData(data() as Double, labels() as string)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the data used to draw the pyramid chart.
Notes:

Arguments:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data values.
labels	[Empty_Array]	An array of text strings representing the labels of the layers. An empty array means no layer label.

See also:

- 27.43.10 setData(data() as Double) 5304

27.43.12 setFunnelSize(cx as Integer, cy as Integer, radius as Integer, height as Integer, tubeRadius as Double = 0.2, tubeHeight as Double = 0.3)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the position and size of the funnel in a funnel chart.
Notes:

A funnel is similar to an inverted cone, except that the vertex of the cone is replaced by a tube.

Arguments:

Argument	Default	Description
cx	(Mandatory)	The x-coordinate of the center of the funnel. The center of the funnel is the midpoint of the vertical axis of the funnel.
cy	(Mandatory)	The y-coordinate of the center of the funnel. The center of the funnel is the midpoint of the vertical axis of the funnel.
radius	(Mandatory)	The radius of the mouth of the funnel.
height	(Mandatory)	The height of the funnel, inclusive of the tube.
tubeRadius	0.2	The radius of the tube, as a ratio to the radius of the mouth of the funnel.
tubeHeight	0.3	The height (length) of the tube, as a ratio to the total height of the funnel. It must be between 0 to 1.

27.43.13 setGradientShading(startBrightness as Double, endBrightness as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets gradient shading mode.
Notes:

Gradient shading only applies to 2D and 3D pyramids, and 2D cones and funnels. 3D cones and funnels always use Phong lighting (see CDPyramidChartMBS.setLighting).

The gradient is specified with two brightness values at the gradient end points. A brightness less than 1 means the color is darkened, while a brightness greater than 1 means the color is brightened. For example, a brightness of 0.5 means the color is half as bright as the original color. If the original color is red, the color will become dark red. Conversely, a brightness of 2 means the color is twice as bright as the original color. If the original color is red, the color will become light red.

For a pyramid or cone layer, the gradient is from left edge to the right edge. For a funnel chart, the gradient is from the right edge to the left edge.

For a pyramid chart, this is the default coloring method. If this method is never called, the default brightness is from 0.75 to 2.

Arguments:

Argument	Default	Description
startBrightness	(Mandatory)	The brightness at the starting point.
endBrightness	(Mandatory)	The brightness at the ending point.

27.43.14 setJoinLine(ColorValue as color, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setJoinLine method, but uses color instead of integer data type for passing color values.
See also:

- 27.43.15 setJoinLine(ColorValue as Integer, width as Integer = -1) 5306

27.43.15 setJoinLine(ColorValue as Integer, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the color and line width of the join lines that join the pyramid layers with the left and right labels.
Notes:

This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use PyramidLayer.setJoinLine.

Arguments:

Argument	Default	Description
color	(Mandatory)	The color of the join line. -1 means to keep the existing value unchanged.
width	-1	The width of the line join. -1 means to keep the existing value unchanged.

See also:

- 27.43.14 setJoinLine(ColorValue as color, width as Integer = -1) 5306

27.43.16 setJoinLineGap(pyramidGap as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the gaps of the join lines that join the pyramid layers with the left and right labels.
Notes:

This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

Arguments:

Argument	Default	Description
pyramidGap	(Mandatory)	The gap in pixels between the starting point of the join line and the pyramid layer edge.
pyramidMargin	10	The distance in pixels between the ending point of the join line and the pyramid bounding box.
textGap	3	The gap in pixels between the label text box and the ending point of the join line.

See also:

- 27.43.17 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer) 5307
- 27.43.18 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer) 5308

27.43.17 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the gaps of the join lines that join the pyramid layers with the left and right labels.
Notes:

This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

Arguments:

Argument	Default	Description
pyramidGap	(Mandatory)	The gap in pixels between the starting point of the join line and the pyramid layer edge.
pyramidMargin	10	The distance in pixels between the ending point of the join line and the pyramid bounding box.
textGap	3	The gap in pixels between the label text box and the ending point of the join line.

See also:

- 27.43.16 setJoinLineGap(pyramidGap as Integer) 5306
- 27.43.18 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer) 5308

27.43.18 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the gaps of the join lines that join the pyramid layers with the left and right labels.
Notes:

This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

Arguments:

Argument	Default	Description
pyramidGap	(Mandatory)	The gap in pixels between the starting point of the join line and the pyramid layer edge.
pyramidMargin	10	The distance in pixels between the ending point of the join line and the pyramid bounding box.
textGap	3	The gap in pixels between the label text box and the ending point of the join line.

See also:

- 27.43.16 setJoinLineGap(pyramidGap as Integer) 5306

- 27.43.17 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer) 5307

27.43.19 setLayerBorder(ColorValue as color, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setLayerBorder method, but uses color instead of integer data type for passing color values.
See also:

- 27.43.20 setLayerBorder(ColorValue as Integer, width as Integer = -1) 5309

27.43.20 setLayerBorder(ColorValue as Integer, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the color and line width of the layer border.
Notes:

This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setLayerBorder.

Arguments:

Argument	Default	Description
color	(Mandatory)	The color of the layer border. -1 means to keep the existing value unchanged.
width	-1	The width of the layer border. -1 means to keep the existing value unchanged.

See also:

- 27.43.19 setLayerBorder(ColorValue as color, width as Integer = -1) 5309

27.43.21 setLayerGap(layerGap as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the gaps between pyramid layers.
Notes:

This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setLayerGap.

Arguments:

Argument	Default	Description
layerGap	(Mandatory)	The gap between layers as a ratio to the height of the pyramid. The gap must be greater than or equals 0. The sum of all gaps must be less than 1.

27.43.22 setLeftLabel(labelTemplate as string = ””, font as string = ””, fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds labels to the left of the pyramid layers.
Notes:

This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setLeftLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.

Arguments:

Argument	Default	Description
template	” { skip } ”	The label template. ” { skip } ” means to keep the existing value unchanged.
font	” { skip } ”	The font style. ” { skip } ” means to keep the existing value unchanged.
fontSize	-1	The font size in points. -1 means to keep the existing value unchanged.
fontColor	-1	The font color. -1 means to keep the existing value unchanged.

Return Value
A CDTextBoxMBS object representing the prototype of the labels. This may be used to fine-tune the appearance of the labels.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 27.43.23 setLeftLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

27.43.23 setLeftLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setLeftLabel method, but uses color instead of integer data type for passing color values.
See also:

- 27.43.22 setLeftLabel(labelTemplate as string = """, font as string = """, fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS 5310

27.43.24 setLighting(ambientIntensity as Double = 0.5, diffuseIntensity as Double = 0.5,specularIntensity as Double = 1, shininess as Double = 8)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets Phong lighting mode.
Notes:

This method adjusts the brightness of the surfaces as according to the Phong lighting model, in which the light source is from the viewer direction and is far away.

For a cone or funnel chart, this is the default coloring method.

For a pyramid chart, only ambient and diffuse reflections are used.

Arguments:

Argument	Default	Description
ambientIntensity	0.5	The ambient reflection coefficient of the Phong lighting model.
diffuseIntensity	0.5	The diffuse reflection coefficient of the Phong lighting model.
specularIntensity	1	The specular reflection coefficient of the Phong lighting model.
shininess	8	The shininess coefficient of the Phong lighting model.

27.43.25 setPyramidSides(noOfSides as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the number of sides of the base polygon in a pyramid chart.
Notes:

By default, the base of a pyramid is a square. This method can be used to change it to other regular polygon.

Arguments:

Argument	Default	Description
noOfSides	(Mandatory)	The number of sides of the base polygon in a pyramid chart.

27.43.26 setPyramidSize(cx as Integer, cy as Integer, radius as Integer, height as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the position and size of the pyramid in a pyramid chart.
Notes:

Arguments:

Argument	Default	Description
cx	(Mandatory)	The x-coordinate of the center of the pyramid. The center of the pyramid is the midpoint of the vertical axis of the pyramid.
cy	(Mandatory)	The y-coordinate of the center of the pyramid. The center of the pyramid is the midpoint of the vertical axis of the pyramid.
radius	(Mandatory)	For a square pyramid, it is the length of the square. For a pyramid with other regular polygonal base, it is the radius of the circumcircle of the base.
height	(Mandatory)	The height of the pyramid.

27.43.27 setRightLabel(labelTemplate as string = """, font as string = """, fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds labels to the right of the pyramid layers.
Notes:

This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setRightLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.

Arguments:

Argument	Default	Description
template	" { skip } "	The label template. " { skip } " means to keep the existing value unchanged.
font	" { skip } "	The font style. " { skip } " means to keep the existing value unchanged.
fontSize	-1	The font size in points. -1 means to keep the existing value unchanged.
fontColor	-1	The font color. -1 means to keep the existing value unchanged.

Return Value:
A TextBox object representing the prototype of the labels. This may be used to fine-tune the appearance of the labels.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 27.43.28 setRightLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS 5313

27.43.28 setRightLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setRightLabel method, but uses color instead of integer data type for passing color values.
See also:

- 27.43.27 setRightLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS 5312

27.43.29 setViewAngle(elevation as Double, rotation as Double = 0, twist as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the 3D view angles.
Notes:

ChartDirector uses elevation, rotation and twist angles to specify the 3D view angles.

To explain the meaning of the angles, imagine the object being viewed is put at the center of a hollow sphere, and a camera (the view point) is put at the surface of the sphere, directed inwards to the center to look at the object.

The elevation angle refers to the "latitude" of the camera. An elevation angle of 0 degrees means the camera is at the "equator" pointing to the object from the side. An elevation angle of 90 degrees means the camera

is at the ”north pole” pointing down to the object. An angle elevation of -90 degrees means the camera is at the ”south pole”, pointing up to the object.

The rotation angle refers to the ”longitude” of the camera. If the elevation is 0 degrees, and the rotation angle varies from 0 to 360 degrees, the camera will move around the ”equator” in the easterly direction (counter-clockwise when viewed from the north pole).

The twist angle is for rotating the camera itself while still pointing to the object. For example, a twist angle of 90 degrees means you are holder the camera ”vertically” instead of ”horizontally”. The rotation is clockwise from the view point of the person holding the camera.

Note that from the view point of the camera, the object will appear to be rotating in the opposite direction. For example, as the rotation angle rotates the camera counter-clockwise along the ”equator”, the object will appear to be rotating clockwise on the screen.

Arguments:

Argument	Default	Description
elevation	(Mandatory)	The elevation angle in degrees.
rotation	0	The rotation angle in degrees.
twist	0	The twist angle in degrees.

27.43.30 Screenshots

27.43.31 cone.jpg

Function: A pyramid chart showing a cone created using ChartDirector with the CDPyramidChartMBS class.

27.43.32 pyramidrotation.jpg

Function: A pyramid chart created using ChartDirector with the CDPyramidChartMBS class.

27.44 class CDPyramidLayerMBS

27.44.1 class CDPyramidLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The PyramidLayer class represents pyramid layers (including cone and funnel layers).
Notes:

The PyramidLayer object is obtained using PyramidChart.getLayer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.44.2 Methods

27.44.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The private constructor.

27.44.4 setCenterLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a label to the center of the pyramid layer.
Notes:

To apply this method to all pyramid layers, use CDPyramidChartMBS.setCenterLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.

Arguments:

Argument	Default	Description
template	" { skip } "	The label template. " { skip } " means to keep the existing value unchanged.
font	" { skip } "	The font style. " { skip } " means to keep the existing value unchanged.
fontSize	-1	The font size in points. -1 means to keep the existing value unchanged.
fontColor	-1	The font color. -1 means to keep the existing value unchanged.

Return Value

A CDTextBoxMBS object representing the prototype of the label. This may be used to fine-tune the appearance of the label.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 27.44.5 setCenterLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS 5318

27.44.5 setCenterLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setCenterLabel method, but uses color instead of integer data type for passing color values.
See also:

- 27.44.4 setCenterLabel(labelTemplate as string = ””, font as string = ””, fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS 5317

27.44.6 setColor(ColorValue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.44.7 setColor(ColorValue as Integer) 5318

27.44.7 setColor(ColorValue as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the color of the pyramid layer.
See also:

- 27.44.6 setColor(ColorValue as color) 5318

27.44.8 setJoinLine(ColorValue as color, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setJoinLine method, but uses color instead of integer data type for passing

color values.
See also:

- 27.44.9 setJoinLine(ColorValue as Integer, width as Integer = -1) 5319

27.44.9 setJoinLine(ColorValue as Integer, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the color and line width of the join line that joins the pyramid layer with the left and right labels.
Notes:

To apply this method to all pyramid layers, use CDPyramidChartMBS.setJoinLine.

Arguments:

Argument	Default	Description
color	(Mandatory)	The color of the join line. -1 means to keep the existing value unchanged.
width	-1	The width of the line join. -1 means to keep the existing value unchanged.

See also:

- 27.44.8 setJoinLine(ColorValue as color, width as Integer = -1) 5318

27.44.10 setJoinLineGap(pyramidGap as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the gaps of the join line that joins the pyramid layer with the left and right labels.
Notes:

To apply this method to all pyramid layers, use CDPyramidChartMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

Arguments:

See also:

Argument	Default	Description
pyramidGap	(Mandatory)	The gap in pixels between the starting point of the join line and the pyramid layer edge.
pyramidMargin	10	The distance in pixels between the ending point of the join line and the pyramid bounding box.
textGap	3	The gap in pixels between the label text box and the ending point of the join line.

- 27.44.11 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer) 5320
- 27.44.12 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer) 5321

27.44.11 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the gaps of the join line that joins the pyramid layer with the left and right labels.
Notes:

To apply this method to all pyramid layers, use CDPyramidChartMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

Arguments:

Argument	Default	Description
pyramidGap	(Mandatory)	The gap in pixels between the starting point of the join line and the pyramid layer edge.
pyramidMargin	10	The distance in pixels between the ending point of the join line and the pyramid bounding box.
textGap	3	The gap in pixels between the label text box and the ending point of the join line.

See also:

- 27.44.10 setJoinLineGap(pyramidGap as Integer) 5319
- 27.44.12 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer) 5321

27.44.12 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the gaps of the join line that joins the pyramid layer with the left and right labels.
Notes:

To apply this method to all pyramid layers, use CDPyramidChartMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

Arguments:

Argument	Default	Description
pyramidGap	(Mandatory)	The gap in pixels between the starting point of the join line and the pyramid layer edge.
pyramidMargin	10	The distance in pixels between the ending point of the join line and the pyramid bounding box.
textGap	3	The gap in pixels between the label text box and the ending point of the join line.

See also:

- 27.44.10 setJoinLineGap(pyramidGap as Integer) 5319
- 27.44.11 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer) 5320

27.44.13 setLayerBorder(ColorValue as color, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setLayerBorder method, but uses color instead of integer data type for passing color values.
See also:

- 27.44.14 setLayerBorder(ColorValue as Integer, width as Integer = -1) 5321

27.44.14 setLayerBorder(ColorValue as Integer, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the color and line width of the layer border.

Notes:

To apply this method to all pyramid layers, use CDPyramidChartMBS.setLayerBorder.

Arguments:

Argument	Default	Description
color	(Mandatory)	The color of the layer border. -1 means to keep the existing value unchanged.
width	-1	The width of the layer border. -1 means to keep the existing value unchanged.

See also:

- 27.44.13 setLayerBorder(ColorValue as color, width as Integer = -1) 5321

27.44.15 setLayerGap(layerGap as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the gap between this pyramid layer and the next pyramid layer.
Notes:

To apply this method to all pyramid layers, use CDPyramidChartMBS.setLayerGap.

Arguments:

Argument	Default	Description
layerGap	(Mandatory)	The gap between layers as a ratio to the height of the pyramid. The gap must be greater than or equals 0. The sum of all gaps must be less than 1.

27.44.16 setLeftLabel(labelTemplate as string = """, font as string = """, fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a label to the left of the pyramid layer.
Notes:

To apply this method to all pyramid layers, use CDPyramidChartMBS.setLeftLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.

Arguments:

Argument	Default	Description
template	" { skip } "	The label template. " { skip } " means to keep the existing value unchanged.
font	" { skip } "	The font style. " { skip } " means to keep the existing value unchanged.
fontSize	-1	The font size in points. -1 means to keep the existing value unchanged.
fontColor	-1	The font color. -1 means to keep the existing value unchanged.

Return Value
A CDTextBoxMBS object representing the prototype of the label. This may be used to fine-tune the appearance of the label.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 27.44.17 setLeftLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS 5323

27.44.17 setLeftLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setLeftLabel method, but uses color instead of integer data type for passing color values.
See also:

- 27.44.16 setLeftLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS 5322

27.44.18 setRightLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a label to the right of the pyramid layer.
Notes:

To apply this method to all pyramid layers, use CDPyramidChartMBS.setRightLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.

Arguments:

Argument	Default	Description
template	" { skip } "	The label template. " { skip } " means to keep the existing value unchanged.
font	" { skip } "	The font style. " { skip } " means to keep the existing value unchanged.
fontSize	-1	The font size in points. -1 means to keep the existing value unchanged.
fontColor	-1	The font color. -1 means to keep the existing value unchanged.

Return Value
A CDTextBoxMBS object representing the prototype of the label. This may be used to fine-tune the appearance of the label.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 27.44.19 setRightLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS 5324

27.44.19 setRightLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setRightLabel method, but uses color instead of integer data type for passing color values.
See also:

- 27.44.18 setRightLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS 5323

27.45 class CDRadialAxisMBS

27.45.1 class CDRadialAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The RadialAxis class represents radial axes in polar charts.
Notes:

In the current version of ChartDirector, RadialAxis is implemented as a special configuration of Axis.
Subclass of the CDAxisMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.46 class CDRanSeriesMBS

27.46.1 class CDRanSeriesMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: RanSeries is a utility class to produce random series.
Notes: It facilitates testing and demonstrating ChartDirector programs without needing a real data source.

27.46.2 Blog Entries

- MBS Real Studio Plugins, version 12.3pr16

27.46.3 Methods

27.46.4 Constructor(seed as Integer)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a RanSeries object.
Notes:

Argument	Default	Description
seed	(Mandatory)	The seed to be used in the random number generator.

27.46.5 create(seed as Integer) as CDRanSeriesMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a RanSeries object.
Notes:

Argument	Default	Description
seed	(Mandatory)	The seed to be used in the random number generator.

27.46.6 get2DSeries(xLen as Integer, yLen as Integer, minValue as Double, maxValue as Double) as Double()

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets an array of random numbers representing points on a 2D grid in which the difference between neighbouring points is random.
Notes:

Argument	Default	Description
xLen	(Mandatory)	The number of points in the grid in the x direction.
yLen	(Mandatory)	The number of points in the grid in the y direction.
minValue	(Mandatory)	The minimum value of the random number.
maxValue	(Mandatory)	The maximum value of the random number.

Returns an array of random numbers representing points on a 2D grid in which the difference between neighbouring points is random. The array will contain (xLen * yLen) elements. The element at index (y * xLen + x) represents the point at (x, y), in which x and y are integers such that 0 <= x <xLen and 0 <= y <yLen.

27.46.7 getDateSeries(len as Integer, startTime as Double, tickInc as Double, weekDayOnly as boolean = false) as Double()

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets an array of date/time values.
Notes:

Argument	Default	Description
len	(Mandatory)	The number of random values to get.
startTime	(Mandatory)	The date/time of the first record in the column.
tickInc	(Mandatory)	The change in date/time for subsequent records in seconds. The value 30 * 86400 is assumed to mean 1 month (which is not a constant interval), and its multiplies are assumed to mean multiple months. In particular, the value 360 * 86400 is assumed to mean 12 months, or 1 year.
weekDayOnly	false	A true value means skipping dates that are not weekdays (Saturday and Sunday). A % F value means no skipping.

Returns an array of date/time values.

27.46.8 getSeries(len as Integer, minValue as Double, maxValue as Double) as Double()

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets an array of numbers that fluctuate randomly.
Notes:

Returns an array of numbers that fluctuate randomly.
See also:

- 27.46.9 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double) as Double() 5328

Argument	Default	Description
len	(Mandatory)	The number of random values to get.
startValue	(Mandatory)	The first value in the sequence.
minDelta	(Mandatory)	The minimum change between two consecutive numbers.
maxDelta	(Mandatory)	The maximum change between two consecutive numbers.
lowerLimit	[-Infinity]	The minimum allowed value of the numbers.
upperLimit	[+Infinity]	The maximum allowed value of the numbers.

- 27.46.10 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) as Double() 5328
- 27.46.11 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) as Double() 5329

27.46.9 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double) as Double()

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets an array of numbers that fluctuate randomly.
Notes:

Argument	Default	Description
len	(Mandatory)	The number of random values to get.
startValue	(Mandatory)	The first value in the sequence.
minDelta	(Mandatory)	The minimum change between two consecutive numbers.
maxDelta	(Mandatory)	The maximum change between two consecutive numbers.
lowerLimit	[-Infinity]	The minimum allowed value of the numbers.
upperLimit	[+Infinity]	The maximum allowed value of the numbers.

Returns an array of numbers that fluctuate randomly.
See also:

- 27.46.8 getSeries(len as Integer, minValue as Double, maxValue as Double) as Double() 5327
- 27.46.10 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) as Double() 5328
- 27.46.11 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) as Double() 5329

27.46.10 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) as Double()

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets an array of numbers that fluctuate randomly.

Notes:

Argument	Default	Description
len	(Mandatory)	The number of random values to get.
startValue	(Mandatory)	The first value in the sequence.
minDelta	(Mandatory)	The minimum change between two consecutive numbers.
maxDelta	(Mandatory)	The maximum change between two consecutive numbers.
lowerLimit	[-Infinity]	The minimum allowed value of the numbers.
upperLimit	[+Infinity]	The maximum allowed value of the numbers.

Returns an array of numbers that fluctuate randomly.
See also:

- 27.46.8 getSeries(len as Integer, minValue as Double, maxValue as Double) as Double() 5327
- 27.46.9 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double) as Double() 5328
- 27.46.11 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) as Double() 5329

27.46.11 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) as Double()

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets an array of numbers that fluctuate randomly.
Notes:

Argument	Default	Description
len	(Mandatory)	The number of random values to get.
startValue	(Mandatory)	The first value in the sequence.
minDelta	(Mandatory)	The minimum change between two consecutive numbers.
maxDelta	(Mandatory)	The maximum change between two consecutive numbers.
lowerLimit	[-Infinity]	The minimum allowed value of the numbers.
upperLimit	[+Infinity]	The maximum allowed value of the numbers.

Returns an array of numbers that fluctuate randomly.
See also:

- 27.46.8 getSeries(len as Integer, minValue as Double, maxValue as Double) as Double() 5327
- 27.46.9 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double) as Double() 5328
- 27.46.10 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) as Double() 5328

27.47 class CDRanTableMBS

27.47.1 class CDRanTableMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: RanTable is a utility class to produce tables with random numbers.
Notes: It facilitates testing and demonstrating ChartDirector programs without needing a real database table.

27.47.2 Xojo Developer Magazine

- 7.5, page 34: Easy Charts and Graphs Part 2, Using the ChartDirector Plugin

27.47.3 Methods

27.47.4 Constructor(seed as Integer, noOfCols as Integer, noOfRows as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a RanTable object.
Notes:

Argument	Default	Description
seed	(Mandatory)	The seed to be used in the random number generator.
noOfCols	(Mandatory)	The number of columns in the random number table.
noOfRows	(Mandatory)	The number of rows in the random number table.

27.47.5 getCol(colNo as Integer) as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the request column as an array of numbers.
Notes:

Argument	Default	Description
i	(Mandatory)	The column to get. The first column is 0. The nth column is (n - 1).

Return Value
An array containing numbers from the requested column.

27.47.6 selectDate(colNo as Integer, minDate as Double, maxDate as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Selects the rows within a certain date range.
Notes:

After executing this method, the RanTable will be reduced to only contain rows that are within minDate and maxDate (inclusive of both dates).

Argument	Default	Description
colNo	(Mandatory)	The date column to be used as selection criteria.
minDate	(Mandatory)	The minimum date (earliest date).
maxDate	(Mandatory)	The maximum date (latest date).

27.47.7 setCol(colNo as Integer, minValue as Double, maxValue as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Fill the given column in the RanTable with random numbers in the given range.
Notes:

Argument	Default	Description
colNo	(Mandatory)	The column to fill. The first column is 0. The nth column is (n - 1).
minValue	(Mandatory)	The minimum value of the random number.
maxValue	(Mandatory)	The maximum value of the random number.

See also:

- 27.47.8 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double) 5331
- 27.47.9 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) 5332
- 27.47.10 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) 5333

27.47.8 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Fill the given column in the RanTable with random numbers that fluctuates within a given speed.
Notes:

Argument	Default	Description
colNo	(Mandatory)	The column to fill. The first column is 0. The nth column is (n - 1).
startValue	(Mandatory)	The value of the first record in the column.
minDelta	(Mandatory)	The minimum change allowed for between the current random number and the previous random number. This parameter is usually negative.
maxDelta	(Mandatory)	The maximum change allowed for between the current random number and the previous random number.
lowerLimit	[-Infinity]	The minimum value of the random number.
upperLimit	[+Infinity]	The maximum value of the random number.

See also:

- 27.47.7 setCol(colNo as Integer, minValue as Double, maxValue as Double) 5331
- 27.47.9 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) 5332
- 27.47.10 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) 5333

27.47.9 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Fill the given column in the RanTable with random numbers that fluctuates within a given speed.
Notes:

Argument	Default	Description
colNo	(Mandatory)	The column to fill. The first column is 0. The nth column is (n - 1).
startValue	(Mandatory)	The value of the first record in the column.
minDelta	(Mandatory)	The minimum change allowed for between the current random number and the previous random number. This parameter is usually negative.
maxDelta	(Mandatory)	The maximum change allowed for between the current random number and the previous random number.
lowerLimit	[-Infinity]	The minimum value of the random number.
upperLimit	[+Infinity]	The maximum value of the random number.

See also:

- 27.47.7 setCol(colNo as Integer, minValue as Double, maxValue as Double) 5331
- 27.47.8 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double) 5331
- 27.47.10 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) 5333

27.47.10 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Fill the given column in the RanTable with random numbers that fluctuates within a given speed.
Notes:

Argument	Default	Description
colNo	(Mandatory)	The column to fill. The first column is 0. The nth column is (n - 1).
startValue	(Mandatory)	The value of the first record in the column.
minDelta	(Mandatory)	The minimum change allowed for between the current random number and the previous random number. This parameter is usually negative.
maxDelta	(Mandatory)	The maximum change allowed for between the current random number and the previous random number.
lowerLimit	[-Infinity]	The minimum value of the random number.
upperLimit	[+Infinity]	The maximum value of the random number.

See also:

- 27.47.7 setCol(colNo as Integer, minValue as Double, maxValue as Double) 5331
- 27.47.8 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double) 5331
- 27.47.9 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) 5332

27.47.11 setDateCol(i as Integer, startTime as Double, tickInc as Double, weekDayOnly as boolean=false)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Fill the given column in the RanTable with a date/time series.
Notes:

Argument	Default	Description
i	(Mandatory)	The column to fill. The first column is 0. The nth column is (n - 1).
startTime	(Mandatory)	The date/time of the first record in the column.
tickInc	(Mandatory)	The change in date/time for subsequent records in seconds. The value 30 * 86400 is assumed to mean 1 month (which is not a constant interval), and its multiplies are assumed to mean multiple months. In particular, the value 360 * 86400 is assumed to mean 12 months, or 1 year.
weekDayOnly	false	A true value means skipping dates that are not weekdays (Saturday and Sunday). A % F value means no skipping.

27.47.12 setHLOCCols(i as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double = 0.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Fill 4 columns in the RanTable with random high, low, open and close records.
Notes:

The 4 columns will meet the constraints that for each record, the high value will be greater than or equal to the low value, and both the open and close values will be in between the high and low values.

Argument	Default	Description
i	(Mandatory)	The column number of the "high" column. The next column will be assumed to be "low", followed by "open" and "close". The column number starts at 0. The first column is 0. The nth column is (n - 1).
startValue	(Mandatory)	The initial "open" value.
minDelta	(Mandatory)	The minimum change allowed for between the current "open" and the previous "close" value, as well as between the current "close" value and the current "open" value. This parameter is usually negative.
maxDelta	(Mandatory)	The maximum change allowed for between the current "open" and the previous "close" value, as well as between the current "close" value and the current "open" value.
lowerLimit	0	The minimum value for "high", "low", "open" and "close".
upperLimit	[+Infinity]	The maximum value for "high", "low", "open" and "close".

See also:

- 27.47.13 setHLOCCols(i as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) 5334

27.47.13 setHLOCCols(i as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Fill 4 columns in the RanTable with random high, low, open and close records.
Notes:

The 4 columns will meet the constraints that for each record, the high value will be greater than or equal to the low value, and both the open and close values will be in between the high and low values.

See also:

- 27.47.12 setHLOCCols(i as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double = 0.0) 5334

Argument	Default	Description
i	(Mandatory)	The column number of the "high" column. The next column will be assumed to be "low", followed by "open" and "close". The column number starts at 0. The first column is 0. The nth column is (n - 1).
startValue	(Mandatory)	The initial "open" value.
minDelta	(Mandatory)	The minimum change allowed for between the current "open" and the previous "close" value, as well as between the current "close" value and the current "open" value. This parameter is usually negative.
maxDelta	(Mandatory)	The maximum change allowed for between the current "open" and the previous "close" value, as well as between the current "close" value and the current "open" value.
lowerLimit	0	The minimum value for "high", "low", "open" and "close".
upperLimit	[+Infinity]	The maximum value for "high", "low", "open" and "close".

27.48 class CDScatterLayerMBS

27.48.1 class CDScatterLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The ScatterLayer class represents scatter layers.
Notes:

Subclass of the CDLineLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.49 class CDSectorMBS

27.49.1 class CDSectorMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The Sector class represents sectors.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.49.2 Methods

27.49.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The private constructor.

27.49.4 getImageCoor(offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the image map coordinates of the sector as HTML image map attributes.
Notes:

The image map coordinates will be in the following format:

shape="poly" cords=" [x1] , [y1] , [x2] , [y2] ..."
where (x1, y1), (x2, y2) ... are vertices of a polygon that approximate the sector. The format is specially designed so that it can easily be incorporated into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string representing the coordinates of the sector in HTML image map attribute format.

27.49.5 getLabelCoor(offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the image map coordinates of the sector label as HTML image map attributes.
Notes:

The image map coordinates will be in the following format:

shape="rect" cords=" [x1] , [y1] , [x2] , [y2] "
where (x1, y1) and (x2, y2) are opposite corners of the box that encloses the sector label. The format is specially designed so that it can easily be incorporated into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string representing the coordinates of the sector label in HTML image map attribute format.

27.49.6 setColor(colorvalue as color, edgeColor as color, joinLineColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.49.7 setColor(colorvalue as Integer, edgeColor as Integer = -1, joinLineColor as Integer = -1) 5338

27.49.7 setColor(colorvalue as Integer, edgeColor as Integer = -1, joinLineColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the fill color, edge color and join line color of the sector.

Notes:

By default, the edge color is SameAsMainColor. For the join line color, if the circular label layout method is used, the default is Transparent, otherwise the default is SameAsMainColor.

Argument	Default	Description
color	(Mandatory)	The color of the sector.
edgeColor	-1	The edge color of the sector. -1 means the color is unchanged.
joinLineColor	-1	The color of the line that join the sector perimeter with the sector label. -1 means the color is unchanged.

See also:

- 27.49.6 setColor(colorvalue as color, edgeColor as color, joinLineColor as color) 5338

27.49.8 setExplode(distance as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Explode the sector.
Notes:

Argument	Default	Description
distance	-1	The explosion distance in pixels. -1 means the distance is automatically determined.

27.49.9 setJoinLine(joinLineColor as color, joinLineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setJoinLine method, but uses color instead of integer data type for passing color values.
See also:

- 27.49.10 setJoinLine(joinLineColor as Integer, joinLineWidth as Integer = 1) 5339

27.49.10 setJoinLine(joinLineColor as Integer, joinLineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the color and width of the join line used to connect the sector label to the sector perimeter.
Notes:

By default, for circular label layout, the join line color is Transparent. For side label layout, the join line color is SameAsMainColor.

Argument	Default	Description
joinLineColor	(Mandatory)	The color of the line that joins the sector perimeter with the sector label.
joinLineWidth	1	The line width of the join line.

See also:

- 27.49.9 setJoinLine(joinLineColor as color, joinLineWidth as Integer = 1) 5339

27.49.11 setLabelFormat(formatString as string = "")

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the format of the sector label.
Example:

```
dim c as CDSectorMBS

// you can use label formats like this:

c.setLabelFormat("<*block,halign=left*><*font=timesbi.ttf,size=12,underline=1*>{ label } <*/font*><*br*>US$
{ value } K ( { percent } % )")

// we can reduce that to this:

c.setLabelFormat(" { label } { value } { percent } % ")

// and it shows 3 numbers. With | 1 after the variable name, we define the decimals after dot:

c.setLabelFormat(" { label } { value | 1 } { percent | 1 } % ")

// and

c.setLabelFormat(" { label } { value | 1., } { percent | 1., } % ")

// uses dot for thousands and comma for decimal separator.
```

Notes:

To set the label format for all sectors, use PieChart.setLabelFormat.

Argument	Default	Description
formatString	(Mandatory)	The format string. See PieChart.setLabelFormat for details.

27.49.12 setLabelLayout(layoutMethod as Integer, pos as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the layout method and location of the sector label.
Notes:

To set the sector label layout method and location for all sectors, use PieChart.setLabelLayout.

ChartDirector supports two sector label layout methods - circular layout and side layout. For detail descriptions, please refer to PieChart.setLabelLayout.

Argument	Default	Description
layoutMethod	(Mandatory)	Specify the layout method. Must be one of the predefined constants CircleLayout or SideLayout.
pos	-1	For circular layout, it is the distance between the sector perimeter and the sector label. A negative value (but not -1) means the sector label will be drawn in the interior of the sector.

For side layout, it is the distance between the pie perimeter and the left or right edges of the invisible containing rectangle (equal to the width of the rectangle minus the pie diameter and then divided by 2).

In either case, -1 means the distance is automatically determined.

27.49.13 setLabelPos(pos as Integer, joinLineColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setLabelPos method, but uses color instead of integer data type for passing color values.
See also:

- 27.49.14 setLabelPos(pos as Integer, joinLineColor as Integer = -1) 5341

27.49.14 setLabelPos(pos as Integer, joinLineColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the circular label layout method, and configure the join lines used to connect the sector label to the sector perimeter.
Notes:

To set the sector label position or join line color for all sectors, use PieChart.setLabelPos.

See also:

Argument	Default	Description
pos	(Mandatory)	The distance between the sector perimeter and the sector label. A negative value means the sector label will be drawn in the interior of the sector.
joinLineColor	-1	The color of the line that joins the sector perimeter with the sector label. The default is Transparent. The join line is ignored if the sector label is inside the sector.

- 27.49.13 setLabelPos(pos as Integer, joinLineColor as color) 5341

27.49.15 setLabelStyle(font as string = """, fontsize as Double = 8, fontcolor as Integer = & hffff0002) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the style used to draw the sector label.
Notes:

To set the label style for all sector labels, use PieChart.setLabelStyle.

See Font Specification for details on various font attributes.

Argument	Default	Description
font	""	The font used to draw the sector label.
fontSize	8	The font size in points.
fontColor	TextColor	The text color for the sector label.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 27.49.16 setLabelStyle(font as string, fontsize as Double, fontcolor as color) as CDTextBoxMBS 5342

27.49.16 setLabelStyle(font as string, fontsize as Double, fontcolor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setLabelStyle method, but uses color instead of integer data type for passing color values.
See also:

- 27.49.15 setLabelStyle(font as string = """, fontsize as Double = 8, fontcolor as Integer = & hffff0002) as CDTextBoxMBS 5342

27.49.17 setStyle(shadingMethod as Integer, edgeColor as color, edgeWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setStyle method, but uses color instead of integer data type for passing color values.
See also:

- 27.49.18 setStyle(shadingMethod as Integer, edgeColor as Integer = -1, edgeWidth as Integer = -1) 5343

27.49.18 setStyle(shadingMethod as Integer, edgeColor as Integer = -1, edgeWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the sector shading style, edge color and edge width.
Notes:

This method is the same as CDPieChartMBS.setSectorStyle, except it only affects one sector. Please refer to CDPieChartMBS.setSectorStyle for the detail explanation of this method.

Arguments:

Argument	Default	Description
shadingMethod	(Mandatory)	The sector shading style to use. -1 means to keep the existing value unchanged.
edgeColor	-1	The edge color of the sector. -1 means to keep the existing value unchanged.
edgeWidth	-1	The edge width of the sector. -1 means to keep the existing value unchanged.

See also:

- 27.49.17 setStyle(shadingMethod as Integer, edgeColor as color, edgeWidth as Integer = -1) 5343

27.50 class CDSplineLayerMBS

27.50.1 class CDSplineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The SplineLayer class represents spline layers.
Notes:

In the current version of ChartDirector, SplineLayer is implemented as a special configuration of LineLayer.
Subclass of the CDLineLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.50.2 Xojo Developer Magazine

- 7.4, page 34: Easy Charts and Graphs, Using the ChartDirector Plugin

27.50.3 Methods

27.50.4 setMonotonicity(m as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the monotonicity constraint when computing the spline curve.
Notes:

Monotonicity means a sequence is increasing or decreasing in one direction. For example, the sequence 1, 2, 3, 4 is monotonically increasing, while the sequence 1, 3, 2, 5, 4 is not monotonic.

A standard spline curve can overshoot or undershoot if the underlying points have "sharp corners". That means without any constrain, even if the data points are monotonic, the spline curve joining the points is not necessarily monotonic. It can overshoot and then "fall back".

In many charts, it may be desirable to constraint the spline curve to flow in a certain direction. For example, in a time based chart, it may be desirable to constraint the curve always flow from left to right.

ChartDirector supports the following monotonic modes.

Arguments:

Constant	Value	Description
MonotonicNone	0	The spline curve is not constraint to flow in any direction. This results in the smoothest spline curve.
MonotonicX	1	The spline curve is constraint to not overshooting or undershooting in the x-axis direction. This means if the data points are monotonic in the x-axis direction, the spline curve will also be monotonic in the x-axis direction.
MonotonicY	2	The spline curve is constraint to not overshooting or undershooting in the y-axis direction. This means if the data points are monotonic in the y-axis direction, the spline curve will also be monotonic in the y-axis direction.
MonotonicXY	3	The spline curve is constraint to not overshooting or undershooting in both the x-axis and the y-axis directions. This means if the data points are monotonic in the x-axis direction, the spline curve will also be monotonic in the x-axis direction. If the data points are monotonic in the y-axis direction, the spline curve will also be monotonic in the y-axis direction.
MonotonicAuto	4	Automatically choose between MonotonicX, MonotonicY or MonotonicXY, depending on whether the data points are monotonic in the x-axis direction, or y-axis direction, or both.

Argument	Default	Description
monotonicMode	(Mandatory)	The monotonic constraint of the spline curve. Must be be one of the constants in the above table. If this method is never called for a spline layer, the default is MonotonicAuto.

27.50.5 setTension(tension as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the tension to use when computing the spline curve.
Notes:

The tension parameter should be between -1 and 1. A positive tension will make the spline tighter. The spline curve will become straight line segments when tension is 1. A negative tension will make the spline looser.

Argument	Default	Description
tension	(Mandatory)	The tension of the spline, which should be between -1 and 1.

27.51 class CDStepLineLayerMBS

27.51.1 class CDStepLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The StepLineLayer class represents step line layers.
Notes:

Subclass of the CDLineLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.51.2 Methods

27.51.3 setAlignment(a as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the alignment of the steps relative to the data points.
Notes:

Argument	Default	Description
a	(Mandatory)	The alignment of the steps relative to the data points. Must be one of the predefined constants Left, Center or Right.

27.52 class CDSurfaceChartMBS

27.52.1 class CDSurfaceChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The SurfaceChart class represents surface charts.
Notes: Subclass of the CDThreeDChartMBS class.

27.52.2 Xojo Developer Magazine

- 7.5, page 33: Easy Charts and Graphs Part 2, Using the ChartDirector Plugin

27.52.3 Methods

27.52.4 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a new SurfaceChart object.
Notes:

Arguments:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	kBackgroundColor	The background color of the chart.
edgeColor	kTransparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

See also:

- 27.52.5 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0) 5348

27.52.5 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other Constructor method, but uses color instead of integer data type for passing color values.
See also:

- 27.52.4 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0) 5347

27.52.6 setBackSideBrightness(brightness as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the back side brightness as a ratio of the front side brightness.
Notes:

The surface of a surface chart has two sides. The side that is facing the positive z direction of the plot region is the front side. The side that is facing the negative z direction of the plot region is the back side.

By default, the back side brightness is half the front side brightness. This method can be used to adjust the ratio.

Arguments:

Argument	Default	Description
brightness	(Mandatory)	The ratio of the back side brightness to the front side brightness.

27.52.7 setBackSideColor(ColorValue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setBackSideColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.52.8 setBackSideColor(ColorValue as Integer) 5348

27.52.8 setBackSideColor(ColorValue as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the color of the back side of the surface.
Notes:

The surface of a surface chart has two sides. The side that is facing the positive z direction of the plot region is the front side. The side that is facing the negative z direction of the plot region is the back side.

By default, the back side is colored similar to the front side, but with different brightness of lighting parameters. This method can be used to color the back side with a fixed color instead.

Arguments:

Argument	Default	Description
color	(Mandatory)	The color used for the back side.

See also:

- 27.52.7 setBackSideColor(ColorValue as color) 5348

27.52.9 setBackSideLighting(ambientLight as Double, diffuseLight as Double, specularLight as Double, shininess as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the Phong lighting parameters for the back side of the surface.
Notes:

The surface of a surface chart has two sides. The side that is facing the positive z direction of the plot region is the front side. The side that is facing the negative z direction of the plot region is the back side.

ChartDirector uses the Phong lighting model to adjust the brightness of the surface to make it look realistic. The default lighting parameters for the back side is half the brightness of those for the front side. This method may be used to set alternative lighting parameters for the back side.

Arguments:

Argument	Default	Description
ambientIntensity	(Mandatory)	The ambient reflection coefficient of the Phong lighting model.
diffuseIntensity	(Mandatory)	The diffuse reflection coefficient of the Phong lighting model.
specularIntensity	(Mandatory)	The specular reflection coefficient of the Phong lighting model.
shininess	(Mandatory)	The shininess coefficient of the Phong lighting model.

27.52.10 setContourColor(contourColor as color, minorContourColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setContourColor method, but uses color instead of integer data type for

passing color values.
See also:

- 27.52.11 setContourColor(contourColor as Integer, minorContourColor as Integer = -1) 5350

27.52.11 setContourColor(contourColor as Integer, minorContourColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the colors of the contour lines on the surface.
Notes:

The contour lines are lines that join regions of the same z value on the surface. The contour levels are determined by the ticks on the z-axis. Major ticks associate with major contour lines. Minor ticks associate with minor contour lines.

Arguments:

Argument	Default	Description
contourColor	(Mandatory)	The color of the major contour lines.
minorContourColor	-1	The color of the minor contour lines. -1 means it is the same as the contourColor.

See also:

- 27.52.10 setContourColor(contourColor as color, minorContourColor as color) 5349

27.52.12 setData(xData() as Double, yData() as Double, zData() as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the data for the surface chart.
Notes:

ChartDirector supports both gridded and scattered data. If the data points are on a rectangular grid will no missing points, they will be handled as gridded data. Otherwise, they will be handled as scattered data.

For gridded data, you may provide the x and y values of the grid, and the z values of the data points. For a 10 x 15 grid, that means the x data series should have 10 values, the y data series should have 15 values, and the z data series should have 150 values. The x and y data series should be strictly monotonic (either strictly increasing or strictly decreasing).

For both gridded and scattered data, you may also provide the (x, y, z) values of the data points. For example, for 150 data points, the x, y and z data series should each have 150 values. ChartDirector will

automatically detect if the data points are gridded or scattered.

Arguments:

Argument	Default	Description
xData	(Mandatory)	An array of numbers representing the x data series.
yData	(Mandatory)	An array of numbers representing the y data series.
zData	(Mandatory)	An array of numbers representing the z data series.

27.52.13 setInterpolation(xSamples as Integer, ySamples as Integer = -1, isSmooth as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Enables and sets the degree and method of interpolation of the data points.
Notes:

A surface chart consists of planar patches, drawn using the data points as the vertices. To create visually smooth surfaces, we may use a large number of small planar patches. However, this requires a large number of data points.

For example, consider a plot region of which the x and y dimensions are both 400 pixels in length. To create a smooth surface, if gridded data are used, the distance between grid lines should be no more than a few pixels. Suppose a grid spacing of 8 pixels is used. The grid size will be 51 x 51, and 2601 data points will be needed.

If the number of available data points are too small to create a smooth surface, This method can be used to generate a denser grid of data points from the original data points using interpolation.

Two types of interpolation are supported. In spline surface interpolation, ChartDirector will compute a smooth surface that passes through the original data points, and sample the spline surface for the new data points. In bilinear/linear interpolation, ChartDirector will apply bilinear/linear interpolation to its vertices of the original patches to compute the new data points.

Arguments:

27.52.14 setLighting(ambientIntensity as Double, diffuseIntensity as Double, specularIntensity as Double, shininess as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the Phong lighting parameters for the front side of the surface.

Argument	Default	Description
xSamples	(Mandatory)	The number of samples on the x-dimension to interpolate to.
ySamples	-1	The number of samples on the y-dimension to interpolate to. -1 means it is the same as xSamples.
isSmooth	true	A true value means to use spline surface interpolation. A false value means to use bilinear/linear interpolation.

Notes:

The surface of a surface chart has two sides. The side that is facing the positive z direction of the plot region is the front side. The side that is facing the negative z direction of the plot region is the back side.

ChartDirector uses the Phong lighting model to adjust the brightness of the surface to make it look realistic. The light source is assumed to be from the direction of the viewer and is far away. The default lighting parameters for the front side are 0.5 for both ambient and diffuse reflections, 1 for specular reflection and 8 for shininess.

Arguments:

Argument	Default	Description
ambientIntensity	(Mandatory)	The ambient reflection coefficient of the Phong lighting model.
diffuseIntensity	(Mandatory)	The diffuse reflection coefficient of the Phong lighting model.
specularIntensity	(Mandatory)	The specular reflection coefficient of the Phong lighting model.
shininess	(Mandatory)	The shininess coefficient of the Phong lighting model.

27.52.15 setShadingMode(shadingMode as Integer, wireWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the shading mode for the surface.
Notes:

ChartDirector supports the following methods for shading the surface.

Arguments:

27.52.16 setSurfaceAxisGrid(majorXGridColor as color, majorYGridColor as color, minorXGridColor as color, minorYGridColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setSurfaceAxisGrid method, but uses color instead of integer data type for

Constant	Value	Description
kSmoothShading	0	The brightness of the surface varies smoothly.
kTriangularShading	0	The surface is divided into triangular patches. The brightness of the patches varies according to their orientation. Within a patch, the brightness is constant.
kRectangularShading	0	The surface is divided into rectangular patches. The brightness of the patches varies according to their orientation. Within a patch, the brightness is constant.
kTriangularFrame	0	The surface is divided into triangular patches. Only the edges of the patches are drawn.
kRectangularFrame	0	The surface is divided into rectangular patches. Only the edges of the patches are drawn.

Argument	Default	Description
shadingMode	(Mandatory)	The shading mode, which must be one of the above constants.
wireWidth	1	The wire width for use with wireframe shading modes.

passing color values.
See also:

- 27.52.17 setSurfaceAxisGrid(majorXGridColor as Integer, majorYGridColor as Integer = -1, minorXGridColor as Integer = -1, minorYGridColor as Integer = -1) 5353

27.52.17 setSurfaceAxisGrid(majorXGridColor as Integer, majorYGridColor as Integer = -1, minorXGridColor as Integer = -1, minorYGridColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the colors of the axis grid lines on the surface.
Notes:

Axis grid lines are grid lines associated with the ticks on the x and y axes. Major grid lines associate with major ticks. Minor grid lines associate with minor ticks. They can be drawn on the surface of the surface chart, and on the plot region walls. This method is for the surface of the surface chart. For the plot region walls, see CDSurfaceChartMBS.setWallGrid.

Arguments:

See also:

- 27.52.16 setSurfaceAxisGrid(majorXGridColor as color, majorYGridColor as color, minorXGridColor as color, minorYGridColor as color) 5352

Argument	Default	Description
majorXGridColor	(Mandatory)	The color of the major x-axis grid lines on the surface.
majorYGridColor	-1	The color of the major y-axis grid lines on the surface. -1 means it is the same as the majorXGridColor.
minorXGridColor	-1	The color of the minor x-axis grid lines on the surface. -1 means it is the same as the majorXGridColor.
minorYGridColor	-1	The color of the minor y-axis grid lines on the surface. -1 means it is the same as the majorYGridColor.

27.52.18 setSurfaceDataGrid(xGridColor as color, yGridColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setSurfaceDataGrid method, but uses color instead of integer data type for passing color values.
See also:

- 27.52.19 setSurfaceDataGrid(xGridColor as Integer, yGridColor as Integer = -1) 5354

27.52.19 setSurfaceDataGrid(xGridColor as Integer, yGridColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the colors of the data grid lines on the surface.
Notes:

Data grid lines are grid lines that define the positions of the data points. They can be drawn on the surface of the surface chart.

Arguments:

Argument	Default	Description
xGridColor	(Mandatory)	The color of the x data grid lines.
yGridColor	-1	The color of the y data grid lines. -1 means it is the same as the yGridColor.

See also:

- 27.52.18 setSurfaceDataGrid(xGridColor as color, yGridColor as color) 5354

27.53.3 Methods

27.53.4 setAlignment(a as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the alignment of the text relative to the container box.
Notes:

Argument	Default	Description
a	(Mandatory)	The alignment specification. See Alignment Specification for supported alignment types.

27.53.5 setFontAngle(angle as Double, vertical as boolean=false)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the rotation angle and layout direction of the text.
Notes:

See Font Specification for details on various font attributes.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

Argument	Default	Description
angle	(Mandatory)	The text rotation angle. Rotation is measured in counter-clockwise direction in degrees.
vertical	false	Determine if the font is layout horizontally (from left to right) or vertically (from top to down). Vertical layout is common for Oriental languages such as Chinese, Japanese and Korean. A true value means vertical layout. A false value means horizontal layout.

27.53.6 setFontColor(colorvalue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setFontColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.53.7 setFontColor(colorvalue as Integer) 5361

27.53.7 setFontColor(colorvalue as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the color of the text.
Notes:

If this method is not called, TextColor will be used to draw the text.

Argument	Default	Description
color	(Mandatory)	The font color.

See also:

- 27.53.6 setFontColor(colorvalue as color) 5361

27.53.8 setFontSize(fontHeight as Double, fontWidth as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the font height and width in points.
Notes:

See Font Specification for details on various font attributes.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

Argument	Default	Description
fontHeight	(Mandatory)	The font height in points.
fontWidth	0	The font width in points. If the font width is zero, it is assumed to be the same as the font height.

27.53.9 setFontStyle(font as string, fontIndex as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the font of the text by specifying the file that contains the font.
Notes:

See Font Specification for details on various font attributes.

Argument	Default	Description
font	(Mandatory)	The font name.
fontIndex	0	The font index in case the font name refers to a font collection. An index of 0 means the first font.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

27.53.10 setHeight(height as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the height of the text box.
Notes:

By default, the height of the text box is automatically determined to be just enough to hold the text. The setHeight method can be used to specified a fix height.

Argument	Default	Description
height	(Mandatory)	The height of the text box in pixels.

27.53.11 setMargin(leftMargin as Integer, rightMargin as Integer, topMargin as Integer, bottomMargin as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the margins of the text box in pixels.
Notes:

The margins of a text box are the distances between the borders of the text box to the text inside. By default, the left and right margins are approximately half the font width, and the top and bottom margins are approximately 1/4 of the font height.

Argument	Default	Description
leftMargin	(Mandatory)	The left margin in pixels.
rightMargin	(Mandatory)	The right margin in pixels.
topMargin	(Mandatory)	The top margin in pixels.
bottomMargin	(Mandatory)	The bottom margin in pixels.

See also:

- 27.53.12 setMargin(m as Integer) 5363

27.53.12 setMargin(m as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets all margins (left, right, top, and bottom) of the text box to the same value.
Notes:

The margins of a text box are the distances between the borders of the text box to the text inside. By default, the left and right margins are approximately half the font width, and the top and bottom margins are approximately 1/4 of the font height.

Argument	Default	Description
m	(Mandatory)	The left, right, top and bottom margins in pixels.

See also:

- 27.53.11 setMargin(leftMargin as Integer, rightMargin as Integer, topMargin as Integer, bottomMargin as Integer) 5362

27.53.13 setMaxWidth(width as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the maximum width of the text box and wraps text if necessary.
Notes:

By default, the width of the text box is automatically determined to be the length of the text. This method can be used to limit the width of the text box. If the text requires a longer width for display, it will be wrapped into multiple lines.

Argument	Default	Description
maxWidth	(Mandatory)	The maximum width of the text box in pixels.

27.53.14 setText(text as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the text to be shown in the text box.
Notes:

See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.

Argument	Default	Description
text	(Mandatory)	The text to be displayed in the text box.

27.53.15 setTruncate(maxWidth as Integer, maxLines as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the maximum number of lines in the text box, and truncate the text if it exceeds the line count.
Notes:

The maxWidth parameter of this method specifies the maximum width of the text box. If the text requires a longer width for display, it will be wrapped into multiple lines. However, if the number of lines exceed maxLines, the text will be truncated, with the last visible characters replaced with "...".

If maxLines is 1 (the default), the text will never be wrapped and will be truncated directly if it needs more than maxWidth for display.

Argument	Default	Description
maxWidth	(Mandatory)	The maximum width of the text box in pixels.
maxLines	1	The maximum number of lines that the text box can have. The text will be truncated if it exceeds the maximum number of lines.

27.53.16 setWidth(width as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the width of the text box and wraps text if necessary.
Notes:

By default, the width of the text box is automatically determined to be the length of the text. The setWidth method can be used to specified a fix width. If the text requires a longer width for display, the text will be

wrapped into multiple lines.

Argument	Default	Description
width	(Mandatory)	The width of the text box in pixels.

27.54 class CDThreeDChartMBS

27.54.1 class CDThreeDChartMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The ThreeDChart class is an abstract class containing methods that are common to all true 3D chart types.
Notes:

ThreeDChart is a subclass of BaseChart.
Subclass of the CDBaseChartMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.54.2 Blog Entries

- MBS Real Studio Plugins, version 12.3pr16

27.54.3 Methods

27.54.4 colorAxis as CDColorAxisMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the ColorAxis object representing the color axis (color legend).
Notes: Returns the ColorAxis object representing the color axis.

27.54.5 Constructor

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The private constructor.
Notes:

The ThreeDChart class is an abstract class containing methods that are common to all true 3D chart types.
ThreeDChart is a subclass of BaseChart.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

27.54.6 getXCoor(xValue as Double, yValue as Double, zValue as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the x pixel coordinate of a point given its x, y and z data values.

Notes:

Note: You must call BaseChart.layout first before calling this method. ChartDirector needs to perform auto-scaling and layout the axis before it can compute pixel coordinates from data values.

Argument	Default	Description
x	(Mandatory)	The x data value of the point.
y	(Mandatory)	The y data value of the point.
z	(Mandatory)	The z data value of the point.

Returns the x pixel coordinate of the point.

27.54.7 getYCoor(xValue as Double, yValue as Double, zValue as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the y pixel coordinate of a point given its x, y and z data values.
Notes:

You must call BaseChart.layout first before calling this method. ChartDirector needs to perform auto-scaling and layout the axis before it can compute pixel coordinates from data values.

Argument	Default	Description
x	(Mandatory)	The x data value of the point.
y	(Mandatory)	The y data value of the point.
z	(Mandatory)	The z data value of the point.

Returns the y pixel coordinate of the point.

27.54.8 setColorAxis(x as Integer, y as Integer, alignment as Integer, length as Integer, orientation as Integer) as CDColorAxisMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the position, length and orientation of the color axis (color legend).
Notes:

27.54.9 setPerspective(perspective as Double)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the strength of the perspective effect.

Argument	Default	Description
x	(Mandatory)	The x-coordinate of the reference point used to position the color axis.
y	(Mandatory)	The y-coordinate of the reference point used to position the color axis.
alignment	(Mandatory)	The alignment of the color axis with respect to the reference point. For example, a value of TopLeft means the reference point is the top- left corner of the color axis. See Alignment Specification for supported alignment types..
length	(Mandatory)	The length of the color axis in pixels.
orientation	(Mandatory)	The orientation of the color axis. A value of Top/Bottom means the axis is horizontal, and the axis labels are at top/bottom side of the axis. A value of Left/Right means the axis is vertical, and the axis labels are at the left/right side of the axis.

Notes:

When taking the photograph of a scene, things closer to the camera are larger in the photograph, while things farther from the camera are smaller. For example, two trees of exactly the same height but at different distances from the camera will have different heights as measured in the photograph. This is known as the perspective effect.

This method configures the strength of the perspective effect for a ThreeDChart object. The nearer part of the plot region will be magnified, while the farther part will be reduced. The average size of the plot region will be approximately unchanged.

Argument	Default	Description
perspective	(Mandatory)	The strength of the perspective effect. It approximately represents the maximum percentage magnification of the plot region, which is the same as the maximum percentage reduction. A value of 0 means no perspective effect. This value is usually between 0 to 100. If this method is never called, the default is 12.

27.54.10 setPlotRegion(cx as Integer, cy as Integer, xWidth as Integer, yDepth as Integer, zHeight as Integer)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the position of the plot region.
Notes:

The plot region is a 3D box, with x, y, and z axes along its border, using a right-hand cartesian coordinate system.

To create the chart image, you may imagine a camera taking a photograph of the box. The photograph can be taken at different angles, configurable with ThreeDChart.setViewAngle. The position of the plot region in the photograph is such that the center of the plot region is at a given point (cx, cy) on the image.

Argument	Default	Description
cx	(Mandatory)	The x pixel coordinate of the point on the image at which the center of the plot region is located.
cy	(Mandatory)	The y pixel coordinate of the point on the image at which the center of the plot region is located.
xWidth	(Mandatory)	The length of the x-dimension of the plot region in pixels.
yDepth	(Mandatory)	The length of the y-dimension of the plot region in pixels.
zHeight	(Mandatory)	The length of the z-dimension of the plot region in pixels.

27.54.11 setViewAngle(elevation as Double, rotation as Double = 0, twist as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the 3D view angles.
Notes:

ChartDirector uses elevation, rotation and twist angles to specify the 3D view angles.

To explain the meaning of the angles, imagine the object being viewed is put at the center of a hollow sphere, and a camera (the view point) is put at the surface of the sphere, directed inwards to the center to look at the object.

The elevation angle refers to the "latitude" of the camera. An elevation angle of 0 degrees means the camera is at the "equator" pointing to the object from the side. An elevation angle of 90 degrees means the camera is at the "north pole" pointing down to the object. An angle elevation of -90 degrees means the camera is at the "south pole", pointing up to the object.

The rotation angle refers to the "longitude" of the camera. If the elevation is 0 degrees, and the rotation angle varies from 0 to 360 degrees, the camera will move around the "equator" in the easterly direction (counter-clockwise when viewed from the north pole).

The twist angle is for rotating the camera itself while still pointing to the object. For example, a twist angle of 90 degrees means you are holder the camera "vertically" instead of "horizontally". The rotation is clockwise from the view point of the person holding the camera.

Note that from the view point of the camera, the object will appear to be rotating in the opposite direction. For example, as the rotation angle rotates the camera counter-clockwise along the "equator", the object will appear to be rotating clockwise on the screen.

Note: The twist angle is not supported in the current version of ChartDirector. It should always be 0, and

should be considered as a reserved argument for future use.

Argument	Default	Description
elevation	(Mandatory)	The elevation angle in degrees.
rotation	0	The rotation angle in degrees.
twist	0	The twist angle in degrees.

27.54.12 setWallColor(xyColor as color, yzColor as color, zxColor as color, borderColor as color)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the color of the plot region walls.
Notes:

By default, the plot region walls are light grey (eeeeee) in color, with a grey (888888) border . This method can be used to modify the colors.

Argument	Default	Description
xyColor	(Mandatory)	The color of the xy wall.
yzColor	-1	The color of the yz wall. -1 means it is the same as xyColor.
zxColor	-1	The color of the zx wall. -1 means it is the same as xyColor.
borderColor	-1	The color of the wall border. -1 means to keep the existing value unchanged.

See also:

- 27.54.13 setWallColor(xyColor as Integer, yzColor as Integer = -1, zxColor as Integer = -1, borderColor as Integer = -1) 5370

27.54.13 setWallColor(xyColor as Integer, yzColor as Integer = -1, zxColor as Integer = -1, borderColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the color of the plot region walls.
Notes:

By default, the plot region walls are light grey (eeeeee) in color, with a grey (888888) border . This method can be used to modify the colors.

See also:

- 27.54.12 setWallColor(xyColor as color, yzColor as color, zxColor as color, borderColor as color) 5370

Argument	Default	Description
xyColor	(Mandatory)	The color of the xy wall.
yzColor	-1	The color of the yz wall. -1 means it is the same as xyColor.
zxColor	-1	The color of the zx wall. -1 means it is the same as xyColor.
borderColor	-1	The color of the wall border. -1 means to keep the existing value unchanged.

27.54.14 setWallGrid(majorXGridColor as color, majorYGridColor as color, majorZGridColor as color, minorXGridColor as color, minorYGridColor as color, minorZGridColor as color)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the grid line colors on plot region walls.
Notes:

The grid lines on the walls are associated with the ticks on the x, y and z axes. Major ticks associate with major grid lines. Minor ticks associate with minor grid lines. By default, the major grid lines are light grey (cccccc), and the minor grid lines are lighter grey (dddddd). This method can be used to modify the grid line colors.

Argument	Default	Description
majorXGridColor	(Mandatory)	The color of the major x-axis grid lines on the walls.
majorYGridColor	-1	The color of the major y-axis grid lines on the walls. -1 means it is the same as the majorXGridColor.
majorZGridColor	-1	The color of the major z-axis grid lines on the walls. -1 means it is the same as the majorXGridColor.
minorXGridColor	-1	The color of the minor x-axis grid lines on the walls. -1 means it is the same as the majorXGridColor.
minorYGridColor	-1	The color of the minor y-axis grid lines on the walls. -1 means it is the same as the majorYGridColor.
minorZGridColor	-1	The color of the minor z-axis grid lines on the walls. -1 means it is the same as the majorZGridColor.

See also:

- 27.54.15 setWallGrid(majorXGridColor as Integer, majorYGridColor as Integer = -1, majorZGridColor as Integer = -1, minorXGridColor as Integer = -1, minorYGridColor as Integer = -1, minorZGridColor as Integer = -1) 5372

27.54.15 setWallGrid(majorXGridColor as Integer, majorYGridColor as Integer = -1, majorZGridColor as Integer = -1, minorXGridColor as Integer = -1, minorYGridColor as Integer = -1, minorZGridColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the grid line colors on plot region walls.
Notes:

The grid lines on the walls are associated with the ticks on the x, y and z axes. Major ticks associate with major grid lines. Minor ticks associate with minor grid lines. By default, the major grid lines are light grey (cccccc), and the minor grid lines are lighter grey (dddddd). This method can be used to modify the grid line colors.

Argument	Default	Description
majorXGridColor	(Mandatory)	The color of the major x-axis grid lines on the walls.
majorYGridColor	-1	The color of the major y-axis grid lines on the walls. -1 means it is the same as the majorXGridColor.
majorZGridColor	-1	The color of the major z-axis grid lines on the walls. -1 means it is the same as the majorXGridColor.
minorXGridColor	-1	The color of the minor x-axis grid lines on the walls. -1 means it is the same as the majorXGridColor.
minorYGridColor	-1	The color of the minor y-axis grid lines on the walls. -1 means it is the same as the majorYGridColor.
minorZGridColor	-1	The color of the minor z-axis grid lines on the walls. -1 means it is the same as the majorZGridColor.

See also:

- 27.54.14 setWallGrid(majorXGridColor as color, majorYGridColor as color, majorZGridColor as color, minorXGridColor as color, minorYGridColor as color, minorZGridColor as color) 5371

27.54.16 setWallThickness(xyThickness as Integer, yzThickness as Integer = -1, zxThickness as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the thickness of the plot region walls.
Notes:

By default, the plot region walls are 10 pixels thick. This method can be used to modify the thickness.

Argument	Default	Description
xyThickness	(Mandatory)	The thickness of the xy wall in pixels.
yzThickness	-1	The thickness of the yz wall in pixels. -1 means it is the same as xyThickness.
zxThickness	-1	The thickness of the zx wall in pixels. -1 means it is the same as xyThickness.

27.54.17 setWallVisibility(xyVisible as boolean, yzVisible as boolean, zxVisible as boolean)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Shows or hides the plot region walls.
Notes:

By default, all walls are visible. This method can be used to hide some or all of the walls.

Argument	Default	Description
xyVisible	(Mandatory)	A true value means the xy wall is visible. A false value means the xy wall is hidden.
yzVisible	(Mandatory)	A true value means the yz wall is visible. A false value means the yz wall is hidden.
zxVisible	(Mandatory)	A true value means the zx wall is visible. A false value means the zx wall is hidden.

27.54.18 setZAxisPos(pos as Integer)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the position of the z-axis.
Notes:

In a ThreeDChart object, the z-axis can be drawn either on the left side or the right side. By default, ChartDirector will draw the z-axis on the side that is nearer to the viewer.

This method can be used to specify which side the z-axis should be drawn.

Argument	Default	Description
pos	(Mandatory)	The position of the z-axis, which must be either Left or Right.

27.54.19 Properties

27.54.20 xAxis as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Retrieves the x-axis of the ThreeDChart object.
Notes:

Returns the Axis object representing the x-axis of the ThreeDChart object.
(Read only property)

27.54.21 yAxis as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Retrieves the y-axis of the ThreeDChart object.
Notes:

Returns the Axis object representing the y-axis of the ThreeDChart object.
(Read only property)

27.54.22 zAxis as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Retrieves the z-axis of the ThreeDChart object.
Notes:

Returns the Axis object representing the z-axis of the ThreeDChart object.
(Read only property)

27.55 class CDThreeDScatterChartMBS

27.55.1 class CDThreeDScatterChartMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The ThreeDScatterChart class represents 3D scatter charts.
Notes:

ThreeDScatterChart is a subclass of ThreeDChart.
Subclass of the CDThreeDChartMBS class.

27.55.2 Blog Entries

- 3D Scatter Charts

27.55.3 Methods

27.55.4 addScatterGroup(xData() as Double, yData() as Double, zData() as Double, name as string = """, symbol as Integer = 7, symbolSize as Integer = 5, fillcolor as Integer = -1, edgeColor as Integer = -1) as CDThreeDScatterGroupMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a group of scatter symbols to the ThreeDScatterChart.
Notes:

A scatter chart can be considered as a special configuration of a line chart, in the data symbols are enabled and the line width is set to zero. Therefore only the data symbols are visible and the chart appears as scattered.

Returns a ThreeDScatterGroup object representing the symbol group created.
See also:

- 27.55.5 addScatterGroup(xData() as Double, yData() as Double, zData() as Double, name as string, symbol as Integer, symbolSize as Integer, fillcolor as color, edgeColor as color) as CDThreeDScatterGroupMBS 5375

27.55.5 addScatterGroup(xData() as Double, yData() as Double, zData() as Double, name as string, symbol as Integer, symbolSize as Integer, fillcolor as color, edgeColor as color) as CDThreeDScatterGroupMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a group of scatter symbols to the ThreeDScatterChart.

Argument	Default	Description
xData	(Mandatory)	An array of numbers representing the x values of the data points.
yData	(Mandatory)	An array of numbers representing the y values of the data points.
zData	(Mandatory)	An array of numbers representing the z values of the data points.
name	""	The name of the symbol group. The name will be used in the legend box, if one is available. An empty string means the symbol group has no name.
symbol	CircleShape	One of the predefined symbol constants to specify the symbol to use. (See Shape Specification for available built-in shapes.)
symbolSize	5	The width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means that the color is automatically selected from the palette. SameAsMainColor means the color is based on the z value of the symbol as according to the ColorAxis (accessible via ThreeDChart.colorAxis).
edgeColor	-1	The edge color used to draw the edge of the symbol. -1 means using LineColor as the edge color.

Notes:

A scatter chart can be considered as a special configuration of a line chart, in the data symbols are enabled and the line width is set to zero. Therefore only the data symbols are visible and the chart appears as scattered.

Argument	Default	Description
xData	(Mandatory)	An array of numbers representing the x values of the data points.
yData	(Mandatory)	An array of numbers representing the y values of the data points.
zData	(Mandatory)	An array of numbers representing the z values of the data points.
name	""	The name of the symbol group. The name will be used in the legend box, if one is available. An empty string means the symbol group has no name.
symbol	CircleShape	One of the predefined symbol constants to specify the symbol to use. (See Shape Specification for available built-in shapes.)
symbolSize	5	The width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means that the color is automatically selected from the palette. SameAsMainColor means the color is based on the z value of the symbol as according to the ColorAxis (accessible via ThreeDChart.colorAxis).
edgeColor	-1	The edge color used to draw the edge of the symbol. -1 means using LineColor as the edge color.

Returns a ThreeDScatterGroup object representing the symbol group created.
See also:

- 27.55.4 addScatterGroup(xData() as Double, yData() as Double, zData() as Double, name as string = "", symbol as Integer = 7, symbolSize as Integer = 5, fillcolor as Integer = -1, edgeColor as Integer = -1) as CDThreeDScatterGroupMBS

27.55.6 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a new ThreeDScatterChart object.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

See also:

- 27.55.7 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0) 5377

27.55.7 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a new ThreeDScatterChart object.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

27.56 class CDThreeDScatterGroupMBS

27.56.1 class CDThreeDScatterGroupMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The ThreeDScatterGroup class represents a group of scatter symbols in a ThreeDScatterChart object.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.56.2 Blog Entries

- MBS Xojo Plugins, version 18.5pr7
- MBS Real Studio Plugins, version 12.4pr3
- MBS Real Studio Plugins, version 12.3pr16

27.56.3 Methods

27.56.4 Constructor

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The private constructor.

27.56.5 setDataSymbol(DrawArea as CDDrawAreaMBS)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Uses a DrawArea object as the graphics symbol to plot the data points.
Notes:

Argument	Default	Description
obj	(Mandatory)	A DrawArea object to be used as the symbol.

See also:

- 27.56.6 setDataSymbol(file as folderitem) 5379

- 27.56.13 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5384

27.56.6 setDataSymbol(file as folderitem)

MBS ChartDirector Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Load an image from a file and use it as the graphics symbol to plot the data points.
Notes:

ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

Argument	Default	Description
image	(Mandatory)	The filename of the image file. The image type is determined based on file extension, which must be png, jpg/jpeg, gif or wbmp/wmp.

- 27.56.13 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5384

27.56.7 setDataSymbol(ImageFilePath as string)

MBS ChartDirector Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Load an image from a file and use it as the graphics symbol to plot the data points.
Notes:

ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

Argument	Default	Description
image	(Mandatory)	The filename of the image file. The image type is determined based on file extension, which must be png, jpg/jpeg, gif or wbmp/wmp.

- 27.56.13 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5384

27.56.8 setDataSymbol(pic as Picture)

MBS ChartDirector Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Uses a picture object as the graphics symbol to plot the data points.
Notes:

Argument	Default	Description
obj	(Mandatory)	A picture object to be used as the symbol.

See also:

27.56.9 setDataSymbol(polygon() as Integer, size as Integer = 11, fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Uses a custom polygon as the graphics symbol to plot the data points.
Notes:

Argument	Default	Description
polygon	(Mandatory)	An array of integers representing the coordinates the polygon vertices. See Shape Specification on how the custom shape is defined.
size	11	The nominal width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means that the color is automatically selected from the palette. SameAsMainColor means the color is based on the z value of the symbol as according to the ColorAxis (accessible via ThreeDChart.colorAxis).
edgeColor	-1	The edge color used to draw the edge of the symbol. -1 means using LineColor as the edge color.

27.56.14 setDropLine

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the drop line color and width.
Notes:

Drop lines are vertical lines that join the data points to the bottom of the plot region. It helps in visualizing the height of the data points.

Argument	Default	Description
dropLineColor	(Mandatory)	The color of the drop line.
dropLineWidth	1	The width of the drop line.

See also:

- 27.56.15 setDropLine(dropLineColor as color, dropLineWidth as Integer = 1) 5385
- 27.56.16 setDropLine(dropLineColor as Integer, dropLineWidth as Integer = 1) 5386

27.56.15 setDropLine(dropLineColor as color, dropLineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the drop line color and width.
Notes:

Drop lines are vertical lines that join the data points to the bottom of the plot region. It helps in visualizing the height of the data points.

See also:

Argument	Default	Description
dropLineColor	(Mandatory)	The color of the drop line.
dropLineWidth	1	The width of the drop line.

- 27.56.14 setDropLine 5385
- 27.56.16 setDropLine(dropLineColor as Integer, dropLineWidth as Integer = 1) 5386

27.56.16 setDropLine(dropLineColor as Integer, dropLineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the drop line color and width.
Notes:

Drop lines are vertical lines that join the data points to the bottom of the plot region. It helps in visualizing the height of the data points.

Argument	Default	Description
dropLineColor	(Mandatory)	The color of the drop line.
dropLineWidth	1	The width of the drop line.

See also:

- 27.56.14 setDropLine 5385
- 27.56.15 setDropLine(dropLineColor as color, dropLineWidth as Integer = 1) 5385

27.56.17 setLegendIcon(width as Integer, height as Integer = -1, color as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Uses one of the built-in symbols as the graphics symbol to plot the data points.
Notes:

See also:

- 27.56.18 setLegendIcon(width as Integer, height as Integer, color as color) 5386

27.56.18 setLegendIcon(width as Integer, height as Integer, color as color)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Uses one of the built-in symbols as the graphics symbol to plot the data points.
Notes:

Argument	Default	Description
symbol	(Mandatory)	One of the predefined shape constants representing the symbol shape. See Shape Specification for the available built-in shapes.
size	5	The width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means that the color is automatically selected from the palette. kSameAsMainColor means the color is based on the z value of the symbol as according to the ColorAxis (accessible via ThreeDChart.colorAxis).
edgeColor	-1	The edge color used to draw the edge of the symbol. -1 means using LineColor as the edge color.
lineWidth	1	The line width used for drawing the symbols.

Argument	Default	Description
symbol	(Mandatory)	One of the predefined shape constants representing the symbol shape. See Shape Specification for the available built-in shapes.
size	5	The width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means that the color is automatically selected from the palette. kSameAsMainColor means the color is based on the z value of the symbol as according to the ColorAxis (accessible via ThreeDChart.colorAxis).
edgeColor	-1	The edge color used to draw the edge of the symbol. -1 means using LineColor as the edge color.
lineWidth	1	The line width used for drawing the symbols.

See also:

- 27.56.17 setLegendIcon(width as Integer, height as Integer = -1, color as Integer = -1) 5386

27.56.19 setSymbolOffset(offsetX as Integer, offsetY as Integer)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Offset the symbols in the x and y directions in pixel unit.
Notes:

Argument	Default	Description
xOffset	(Mandatory)	The x offset in pixels. A positive value mean shifting to the right.
yOffset	(Mandatory)	The y offset in pixels. A positive value mean shifting to the bottom.

27.57 class CDTrendLayerMBS

27.57.1 class CDTrendLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The TrendLayer class represents trend layers.
Notes:

The trend layer performs linear regression analysis on the data points, and represents the result as a best fit straight line with optional confidence and prediction bands.

In linear regression analysis, the data points are assumed to be related by:

y = m * x + c + err
where m and c are constants, and err is a random variable.

Linear regression analysis estimates m, c and err based on available data using the least square method. Using estimated values of m and c, the line y = m * x + c are plotted as the best fit straight line based on available data.

However, as m and c are estimations based on available data, it may not be exactly equal to the "real" m and c. In ChartDirector, the uncertainties are represented visually as a confidence band around the regression line. For example, the 95% confidence band means there are 95% probability that the "real" line is in that band.

To predict a data point (infer y given x), we can use the formula:

y = m * x + c + err
based on estimated values of m, c and err.

The uncertainties of the data point is contributed by the uncertainties in m and c, as well as err. In ChartDirector, the uncertainties of the data points are represented visually as a prediction band around the regression line. For example, a 95% prediction band means there are 95% probability that a data point will be in that band.

The prediction band is always wider than the confidence band. It is because the uncertainties of the regression line is contributed by m and c, while the uncertainties of the data points are contributed by m, c and err. The err term makes the data points less certain that the regression line.
Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.57.2 Methods

27.57.3 addConfidenceBand(confidence as Double, upperFillColor as color, upperEdgeColor as color, upperLineWidth as Integer, lowerFillColor as color, lowerEdgeColor as color, lowerLineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addConfidenceBand method, but uses color instead of integer data type for passing color values.
See also:

- 27.57.4 addConfidenceBand(confidence as Double, upperFillColor as Integer, upperEdgeColor as Integer = & hFF000000, upperLineWidth as Integer = -1, lowerFillColor as Integer = -1, lowerEdgeColor as Integer = -1, lowerLineWidth as Integer = -1) 5389

27.57.4 addConfidenceBand(confidence as Double, upperFillColor as Integer, upperEdgeColor as Integer = & hFF000000, upperLineWidth as Integer = -1, lowerFillColor as Integer = -1, lowerEdgeColor as Integer = -1, lowerLineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a confidence band to the trend layer.
Notes:

Please refer to the description of TrendLayer on what is a confidence band.

Argument	Default	Description
confidence	(Mandatory)	The confidence level - must be between 0 - 1.
upperFillColor	(Mandatory)	The fill color for the upper side of the confidence band (the portion that is above the regression line).
upperEdgeColor	Transparent	The border color for the upper side of the confidence band (the portion that is above the regression line).
upperLineWidth	1	The border width for the upper side of the confidence band (the portion that is above the regression line).
lowerFillColor	-1	The fill color for the lower side of the confidence band (the portion that is below the regression line). -1 means the color is the same as upperFillColor.
lowerEdgeColor	-1	The border color for the lower side of the confidence band (the portion that is below the regression line). -1 means the color is the same as upperEdgeColor.
lowerLineWidth	-1	The border width for the lower side of the confidence band (the portion that is below the regression line). -1 means the color is the same as upperLineWidth.

See also:

- 27.57.3 addConfidenceBand(confidence as Double, upperFillColor as color, upperEdgeColor as color, upperLineWidth as Integer, lowerFillColor as color, lowerEdgeColor as color, lowerLineWidth as Integer = -1) 5389

27.57.5 addPredictionBand(confidence as Double, upperFillColor as color, upperEdgeColor as color, upperLineWidth as Integer, lowerFillColor as color, lowerEdgeColor as color, lowerLineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addPredictionBand method, but uses color instead of integer data type for passing color values.
See also:

- 27.57.6 addPredictionBand(confidence as Double, upperFillColor as Integer, upperEdgeColor as Integer = & hFF000000, upperLineWidth as Integer = -1, lowerFillColor as Integer = -1, lowerEdgeColor as Integer = -1, lowerLineWidth as Integer = -1) 5390

27.57.6 addPredictionBand(confidence as Double, upperFillColor as Integer, upperEdgeColor as Integer = & hFF000000, upperLineWidth as Integer = -1, lowerFillColor as Integer = -1, lowerEdgeColor as Integer = -1, lowerLineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a prediction band to the trend layer.
Notes:

Please refer to the description of TrendLayer on what is a prediction band.

Argument	Default	Description
confidence	(Mandatory)	The confidence level - must be between 0 - 1.
upperFillColor	(Mandatory)	The fill color for the upper side of the prediction band (the portion that is above the regression line).
upperEdgeColor	Transparent	The border color for the upper side of the prediction band (the portion that is above the regression line).
upperLineWidth	1	The border width for the upper side of the prediction band (the portion that is above the regression line).
lowerFillColor	-1	The fill color for the lower side of the prediction band (the portion that is below the regression line). -1 means the color is the same as upperFillColor.
lowerEdgeColor	-1	The border color for the lower side of the prediction band (the portion that is below the regression line). -1 means the color is the same as upperEdgeColor.
lowerLineWidth	-1	The border width for the lower side of the prediction band (the portion that is below the regression line). -1 means the color is the same as upperLineWidth.

See also:

- 27.57.5 addPredictionBand(confidence as Double, upperFillColor as color, upperEdgeColor as color, upperLineWidth as Integer, lowerFillColor as color, lowerEdgeColor as color, lowerLineWidth as Integer = -1) 5390

27.57.7 getCoefficient(index as Integer) as Double

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the coefficients of the regression function.
Notes: The coefficients depend on the regression type. They are indexed as a0, a1, a2, ... in the regression type table published on TrendLayer.

27.57.8 getCorrelation as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the correlation coefficient of the trend line.

27.57.9 getIntercept as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the y-axis intercept of the trend line.

27.57.10 getLine as CDLineObjMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Retrieves an opaque LineObj representing the trend line. The opaque LineObj is to be used in XYChart.addInterLineLayer for adding coloring between lines.

27.57.11 getSlope as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the slope of the trend line.

27.57.12 getStdError as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the standard error of the trend line.

27.57.13 setImageMapWidth(w as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the effective width of the line used for producing image maps.
Notes:

For thin lines, it is hard to click on the lines. So for the purpose of producing image maps for a line chart, ChartDirector can assume the line is very thick. The default is 10 pixels.

Argument	Default	Description
width	(Mandatory)	The effective width of the line used for producing image maps.

27.57.14 setRegressionType(regressionType as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the regression type to be used.
Notes:

RegressionType:
Must be one of the constants kLinearRegression, kConstrainedLinearRegression, kExponentialRegression and kLogarithmicRegression, or the return value of BaseChartMBS.PolynomialRegression. They represent linear regression, constrained linear regression, exponential regression, logarithmic regression, and polynomial regression of configurable degree.

27.58 class CDTTFTextMBS

27.58.1 class CDTTFTextMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The TTFText class represents text blocks.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.58.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr8

27.58.3 Methods

27.58.4 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The private constructor.

27.58.5 destroy

MBS ChartDirector Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Destroys the text object.
Notes: Normally you don't need to call this.

27.58.6 draw(x as Integer, y as Integer, colorvalue as color, alignment as Integer = 7)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other draw method, but uses color instead of integer data type for passing color values.
See also:

- 27.58.7 draw(x as Integer, y as Integer, colorvalue as Integer, alignment as Integer = 7) 5394

27.58.7 draw(x as Integer, y as Integer, colorvalue as Integer, alignment as Integer = 7)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Draws the text block.
Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate of a reference point to align the text.
y	(Mandatory)	The y coordinate of a reference point to align the text.
color	(Mandatory)	The color of the text.
alignment	TopLeft	The location of the text relative to the reference point. See Alignment Specification for supported alignment types.

See also:

- 27.58.6 draw(x as Integer, y as Integer, colorvalue as color, alignment as Integer = 7) 5393

27.58.8 getHeight as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the height of the text block.

27.58.9 getLineDistance as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the distance between two lines in the text block.
Notes:

Return Value
The distance between two lines in the text block in pixels.

27.58.10 getLineHeight as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the height of a typical line in the text block.

27.58.11 getWidth as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the width of the text block.

27.59 class CDVectorLayerMBS

27.59.1 class CDVectorLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The VectorLayer class represents vector layers.
Notes:

Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

27.59.2 Methods

27.59.3 setArrowAlignment(alignment as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the alignment of the vector relative to the data point.
Notes:

Argument	Default	Description
alignment	(Mandatory)	A BottomCenter value means the vector will point away from the data point (the default). A TopCenter value means the vector will point into the data point. A Center value means the center of the vector will be at the data point.

27.59.4 setArrowHead(polygon() as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets a custom shape to be used as the arrow head.
Notes:

The custom shape is specified as an array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of 10 x 10 units, in which the x-axis is from left to right, and the y-axis from bottom to top. The origin is assumed to be the bottom center of the arrow (the point where the arrow head joins the arrow stem). The shape is assumed to represent an arrow pointing upwards.

As an example, the followings are the integer array that represents the standard ChartDirector vector arrow head:

-5, -5, 0, 0, 5, -5, 0, 5
ChartDirector will automatically scale the shape to the actual width and height as specified in VectorLayer.setArrowHead.

Argument	Default	Description
polygon	(Mandatory)	An array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates the polygon vertices on a 10 x 10 units grid.

See also:

- 27.59.5 setArrowHead(width as Integer, height as Integer = 0) 5397

27.59.5 setArrowHead(width as Integer, height as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the size of the arrow head.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the arrow head in pixels. The default width is 8 pixels.
height	0	The height of the arrow head in pixels. The default value of 0 means the height is the same as the width.

See also:

- 27.59.4 setArrowHead(polygon() as Integer) 5396

27.59.6 setArrowStem(polygon() as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets a custom shape to be used as the arrow stem.
Notes:

By default, the arrow stem is just a straight line, with the line width controlled using Layer.setLineWidth. The setArrowStem method can specify a custom shape for the arrow stem.

The custom shape is specified as an array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of 10 x 100 units, in which the x-axis is from left to right, and the y-axis from bottom to top. The origin is assumed to be the starting point of the arrow stem,

and the shape is assumed to represent an arrow stem pointing upwards.

ChartDirector will automatically scale the shape so that the total arrow length (head + stem) is the required length of the arrow as according to actual data, and the stem width is as specified in Layer.setLineWidth.

Argument	Default	Description
polygon	(Mandatory)	An array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates the polygon vertices on a 10 x 100 units grid.

27.59.7 setIconSize(height as Integer, width as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the size of the icon to be used in legend box.
Notes:

By default, if a legend box is available on the chart, ChartDirector will insert an legend entry if the VectorLayer is named. The size of the icon will be the size of the vectors used on the chart, using a short vector length to fit the legend box.

This method can be used to override the legend box settings to specify a custom width/height for the icons of the current VectorLayer.

Argument	Default	Description
height	(Mandatory)	The height of the icon in pixels.
width	0	The width of the icon in pixels. The default value of 0 means the width is automatically determined.

27.59.8 setVector(lengths() as Double, directions() as Double, lengthScale as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the lengths and directions for the vectors.
Notes:

ChartDirector supports specifying lengths as pixels or in axis scale. The unit is specified by using the following predefined constants.

Constant	Value	Description
PixelScale	0	The unit is measured in pixels.
XAxisScale	1	The unit is measured in x-axis scale.
YAxisScale	2	The unit is measured in y-axis scale.

Argument	Default	Description
lengths	(Mandatory)	An array of numbers representing the lengths of the vectors, in unit as specified in the lengthScale argument.
directions	(Mandatory)	An array of numbers representing the direction of the vectors as a clockwise angle in degrees, where 0 is upward pointing direction.
lengthScale	PixelScale	The unit for the lengths, which must be one of the predefined constants in the table above.

27.59.9 setVectorMargin(startMargin as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the margins to shorten the vectors.
Notes:

By default, vectors will be drawn from the given start points to the given end points.

In some cases, it may be desirable to shorten the vectors so that they do not start exactly at the start points and/or end exactly at the end points. For example, the vectors may be used to point to some circular symbols created by a ScatterLayer. The vectors may need to point to the perimeter of the circles, rather than their centers. This can be achieved by shortening the vectors by the radius of the circles.

Arguments:

Argument	Default	Description
startMargin	(Mandatory)	The length to shorten at the start of the vector in pixels.
endMargin	NoValue	The length to shorten at the end of the vector in pixels. NoValue means the length is the same as startMargin.

See also:

- 27.59.10 setVectorMargin(startMargin as Double, endMargin as Double) 5399

27.59.10 setVectorMargin(startMargin as Double, endMargin as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the margins to shorten the vectors.
Notes:

By default, vectors will be drawn from the given start points to the given end points.

In some cases, it may be desirable to shorten the vectors so that they do not start exactly at the start points and/or end exactly at the end points. For example, the vectors may be used to point to some circular symbols created by a ScatterLayer. The vectors may need to point to the perimeter of the circles, rather than their centers. This can be achieved by shortening the vectors by the radius of the circles.

Arguments:

Argument	Default	Description
startMargin	(Mandatory)	The length to shorten at the start of the vector in pixels.
endMargin	NoValue	The length to shorten at the end of the vector in pixels. NoValue means the length is the same as startMargin.

See also:

- 27.59.9 setVectorMargin(startMargin as Double) 5399

27.60 class CDViewPortManagerMBS

27.60.1 class CDViewPortManagerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: A view port can be imagined as a rectangular window of an underlying rectangular surface.
Notes:

For example, a chart that has 10 years of data can be imagined as a very long chart. If one only displays one of the year, we can say the view port covers only 10% of the underlying chart.

With the view port concept, scrolling can be handled as moving the view port, while zooming in and out can be handled as changing the view port size.

ViewPortManager is a utility class for handling view ports. It manages mapping of the mouse and display pixel coordinates to view port coordinates, and supports various user interface constraints that limits how the view port may be changed.

View port coordinates are represented as fractions of the width or height of the underlying surface. For example, the width of a view port is represented as a fraction of the width of the underlying surface, so it must be between 0 to 1. A value of 0.1 means the view port width is 10% of the underlying surface width.

If you are using MFC, there is no need to create a ViewPortManager object directly. You may simply use the MFC CChartViewer control, which is a derived class of ViewPortManager and contains all its functions.

If you are using other GUI framework, and would like to perform zooming and scrolling functions by mouse drag, the ViewPortManager may be useful to you. The section Using ChartDirector with Other GUI Frameworks contains outlines on how the ViewPortManager may be used in general GUI frameworks.

27.60.2 Methods

27.60.3 canZoomIn(zoomDirection as Integer) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Checks if it is possible to zoom in further at a certain direction without violating zoom in limits.
Notes:

See ViewPortManager.setZoomInWidthLimit and ViewPortManager.setZoomInHeightLimit on how to configure zoom in limits.

Return Value
True if can zoom in further, otherwise false.

Argument	Default	Description
zoomDirection	(Mandatory)	The zoom direction to check. Must be one of the predefined constants DirectionHorizontal, DirectionVertical and DirectionHorizontalVertical for horizontal, vertical and bi-directional zooming.

27.60.4 canZoomOut(zoomDirection as Integer) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Checks if it is possible to zoom out further at a certain direction without violating zoom out limits.
Notes:

See ViewPortManager.setZoomOutWidthLimit and ViewPortManager.setZoomOutHeightLimit on how to configure zoom out limits.

Argument	Default	Description
zoomDirection	(Mandatory)	The zoom direction to check. Must be one of the predefined constants DirectionHorizontal, DirectionVertical and DirectionHorizontalVertical for horizontal, vertical and bi-directional zooming.

Return Value
True if can zoom out further, otherwise false.

27.60.5 clearAllRanges

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: A convenience method to clear all the ranges configured using setFullRange.

27.60.6 commitPendingSyncAxis(baseChart as CDBaseChartMBS)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The commitPendingSyncAxis is a method to actually perform the function in syncLinearAxisWithViewPort, syncLogAxisWithViewPort and syncDateAxisWithViewPort.

27.60.7 Constructor

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a new viewport.

27.60.8 dragTo(scrollDirection as Integer, x as Integer, y as Integer) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Scrolls the view port to reflect dragging of the underlying rectangular surface.
Notes:

The amount of drag is measured as changed in mouse cursor coordinates since the call to ViewPortManager.startDrag. A positive change means the dragging is to the right or bottom. A negative change means the dragging is to the left or top.

The drag is considered as applying to the underlying surface. The view port moves in the opposite direction to the drag. For example, dragging the underlying surface to the right is equivalent to moving the view port to the left.

The view port may not change at all if it has reached the borders of the underlying surface.

Argument	Default	Description
scrollDirection	(Mandatory)	The allowed scroll direction. Must be one of the predefined constants DirectionHorizontal, DirectionVertical and DirectionHorizontalVertical for horizontal, vertical and bi-directional scrolling.
deltaX	(Mandatory)	The change in mouse x-coordinates. A positive change means the drag is to the right. A negative change means the drag is to the right.
deltaY	(Mandatory)	The change in mouse y-coordinates. A positive change means the drag is to the bottom. A negative change means the drag is to the top.

27.60.9 getPlotAreaHeight as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the height of the plot area in pixels.
Notes:

Return Value
The height of the plot area in pixels.

27.60.10 getPlotAreaLeft as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the x-coordinate of the left side of the plot area in pixels.
Notes:

Return Value
The x-coordinate of the left side of the plot area in pixels.

27.60.11 getPlotAreaTop as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the y-coordinate of the top side of the plot area in pixels.

27.60.12 getPlotAreaWidth as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the width of the plot area in pixels.

27.60.13 getValueAtViewPort(id as string, ratio as Double, isLogScale as boolean = false) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Converts a view port coordinate to a value of the specified data scale.
Notes:

Please refer to ViewPortManager.setFullRange on how to define a data scale.

Argument	Default	Description
id	(Mandatory)	The name of the data scale.
vpCoor	(Mandatory)	The view port coordinate.
isLogScale	false	true if the conversion is based on a logarithmic scale. false if the conversion is based on a non-logarithmic scale.

Returns the value of the specified data scale at the view port coordinate.

27.60.14 getViewPortAtValue(id as string, ratio as Double, isLogScale as boolean = false) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Converts a value of the specified data scale to a view port coordinate.
Notes:

Please refer to ViewPortManager.setFullRange on how to define a data scale.

Argument	Default	Description
id	(Mandatory)	The name of the data scale.
value	(Mandatory)	The value to be converted.
isLogScale	false	true if the conversion is based on a logarithmic scale. false if the conversion is based on a non-logarithmic scale.

Returns the view port coordinate at the value of the specified data scale.

27.60.15 getViewPortHeight as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the height of the view port.
Notes: The view port height is expressed as a fraction of the height of the underlying surface. It should be between 0 and 1.

27.60.16 getViewPortLeft as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the position of the left side of the view port.
Notes: The position of the view port left side is its distance from the left side of the underlying surface, as a fraction of the width of the underlying surface. It should be between 0 and 1.

27.60.17 getViewPortTop as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the position of the top side of the view port.
Notes: The position of the view port top side is its distance from the top side of the underlying surface, as a fraction of the height of the underlying surface. It should be between 0 and 1.

27.60.18 getViewPortWidth as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the width of the view port.
Notes: The view port width is expressed as a fraction of the width of the underlying surface. It should be between 0 and 1.

27.60.19 getZoomInHeightLimit as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the view port height at maximum zoom in for mouse zoom in actions.

27.60.20 getZoomInWidthLimit as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the view port width at maximum zoom in for mouse zoom in actions.

27.60.21 getZoomOutHeightLimit as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the view port height at maximum zoom out for mouse zoom out actions.

27.60.22 getZoomOutWidthLimit as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the view port width at maximum zoom out for mouse zoom out actions.

27.60.23 inExtendedPlotArea(x as Integer, y as Integer) as boolean

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Determines if a given (x, y) coordinate is within the extended plot area (the plot area plus the extra margin sets up using setPlotAreaMouseMargin).

27.60.24 inPlotArea(x as Integer, y as Integer) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Determines if a given point is within the plot area.
Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate of the point in pixel unit.
y	(Mandatory)	The y coordinate of the point in pixel unit.

Return Value
True if the point is within the plot area, otherwise false.

27.60.25 setChartMetrics(metrics as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the chart metrics to the ViewPortManager so it knows the positions of the necessary chart objects for supporting view ports.
Notes:

Argument	Default	Description
metrics	(Mandatory)	A text string obtained from BaseChart.getChartMetrics that represents the metrics of the chart.

27.60.26 setFullRange(ID as string, minValue as Double, maxValue as Double)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Defines the full range of a view port data scale.
Notes:

In the ChartDirector zooming and scrolling framework, the view port coordinates are expressed as the visible fractions of the "full data scale". For example, if the "full data scale" is 10 years horizontally, a view port width of 0.1 means that 1 year of data are visible.

The setFullRange method defines the full range of a data scale and gives it a name. As ChartDirector supports multiple x-axes and y-axes, so there can be multiple data scales with different names. The name can be used in other ChartDirector APIs to convert between the view port coordinates and data scale (see ViewPortManager.getValueAtViewPort, ViewPortManager.getViewPortAtValue), and to configure an Axis to reflect the visible data scale (see ViewPortManager.syncLinearAxisWithViewPort, ViewPortManager.syncLogAxisWithViewPort and ViewPortManager.syncDateAxisWithViewPort).

Argument	Default	Description
id	(Mandatory)	The name of the data scale.
minValue	(Mandatory)	The minimum value of the data scale.
maxValue	(Mandatory)	The maximum value of the data scale.

27.60.27 setPlotAreaMouseMargin(leftMargin as Integer, rightMargin as Integer, topMargin as Integer, bottomMargin as Integer)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Configures area for mouse tracking.
Notes: SetPlotAreaMouseMargin configures some margins outside the plot area, so that a mouse cursor in that region (and therefore just outside the plot area) will still be considered to be exactly at the boundary of the plot area for the purpose of triggering plot area mouse events. Without this mechanism, it would be difficult to put the mouse exactly at the edge of the plot area (as it is too easy to "overshoot" the edge). Putting the mouse exactly at the edge is very useful for "track cursors" as this tracks the first or last data point.

27.60.28 setViewPortHeight(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the height of the view port.
Notes:

The view port height is expressed as a fraction of the height of the underlying surface. It should be between 0 and 1.

Argument	Default	Description
height	(Mandatory)	The height of the view port.

27.60.29 setViewPortLeft(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the position of the left side of the view port.
Notes:

The position of the view port left side is its distance from the left side of the underlying surface, as a fraction of the width of the underlying surface. It should be between 0 and 1.

Argument	Default	Description
left	(Mandatory)	The position of the left side of the view port.

27.60.30 setViewPortTop(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the position of the top side of the view port.
Notes:

The position of the view port top side is its distance from the top side of the underlying surface, as a fraction of the height of the underlying surface. It should be between 0 and 1.

Argument	Default	Description
top	(Mandatory)	The position of the top side of the view port.

27.60.31 setViewPortWidth(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the width of the view port.
Notes:

The view port width is expressed as a fraction of the width of the underlying surface. It should be between 0 and 1.

Argument	Default	Description
width	(Mandatory)	The width of the view port.

27.60.32 setZoomInHeightLimit(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the view port height at maximum zoom in.
Notes:

In many applications, it is desirable to set a maximum zoom in level, instead of allowing the user to zoom in indefinitely.

This method determines the minimum allowed view port height. It should be between 0 and 1. The default is 0.01, which means a maximum zoom in of 100x (the view port see only 1% of the underlying surface).

Argument	Default	Description
height	(Mandatory)	The minimum allowed view port height.

27.60.33 setZoomInWidthLimit(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the view port width at maximum zoom in.
Notes:

In many applications, it is desirable to set a maximum zoom in level, instead of allowing the user to zoom in indefinitely.

This method determines the minimum allowed view port width. It should be between 0 and 1. The default is 0.01, which means a maximum zoom in of 100x (the view port see only 1% of the underlying surface).

Argument	Default	Description
width	(Mandatory)	The minimum allowed view port width.

27.60.34 setZoomOutHeightLimit(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the view port height at maximum zoom in.
Notes:

In many applications, it is desirable to set a maximum zoom in level, instead of allowing the user to zoom in indefinitely.

This method determines the minimum allowed view port height. It should be between 0 and 1. The default is 0.01, which means a maximum zoom in of 100x (the view port see only 1% of the underlying surface).

Argument	Default	Description
height	(Mandatory)	The minimum allowed view port height.

27.60.35 setZoomOutWidthLimit(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the view port width at maximum zoom out for mouse zoom out actions.

27.60.36 startDrag

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Takes a snapshot of the view port to prepare for dragging.
Notes: This method must be called before calling ViewPortManager.dragTo.

27.60.37 syncDateAxisWithViewPort(id as string, axis as CDAxisMBS)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Synchronizes a date/time Axis with the part of the data scale in view port.
Notes:

If the data scale has already been defined (see ViewPortManager.setFullRange on how to define a data scale), this method will compute the visible data scale based on the view port coordinates using date/time interpolation, and then sets the axis to that date/time scale.

If the data scale has not been defined, this method will define the data scale based on the axis scale and the the view port coordinates using date/time extrapolation. Because the axis scale may not be known at the time of calling this method (the axis could be auto-scaled by ChartDirector, which may not occur until the chart is rendered), the definition of the data scale will not occur immediately, but will be pending until the chart is to be displayed.

If your charting code calls this method but never defines the full data scale or the view port coordinates (in which case the view port defaults to showing the complete data scale), then the first time the code is executed, the data scale will be defined to be equal to the axis scale. Subsequently, when the user zooms into the chart (which means the view port coordinates are changed), the same charting code will set up the axis scale to the range that the user has zoomed to.

Argument	Default	Description
id	(Mandatory)	The name of the data scale.
axis	(Mandatory)	The Axis object to synchronize with.

27.60.38 syncLinearAxisWithViewPort(id as string, axis as CDAxisMBS)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Synchronizes a linear Axis with the part of the data scale in view port.
Notes:

If the data scale has already been defined (see ViewPortManager.setFullRange on how to define a data scale), this method will compute the visible data scale based on the view port coordinates using linear interpolation, and then sets the axis to that linear scale.

If the data scale has not been defined, this method will define the data scale based on the axis scale and the the view port coordinates using linear extrapolation. Because the axis scale may not be known at the time of calling this method (the axis could be auto-scaled by ChartDirector, which may not occur until the chart is rendered), the definition of the data scale will not occur immediately, but will be pending until the chart is to be displayed.

If your charting code calls this method but never defines the full data scale or the view port coordinates (in which case the view port defaults to showing the complete data scale), then the first time the code is executed, the data scale will be defined to be equal to the axis scale. Subsequently, when the user zooms into the chart (which means the view port coordinates are changed), the same charting code will set up the axis scale to the range that the user has zoomed to.

Argument	Default	Description
id	(Mandatory)	The name of the data scale.
axis	(Mandatory)	The Axis object to synchronize with.

27.60.39 syncLogAxisWithViewPort(id as string, axis as CDAxisMBS)

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Synchronizes a logarithmic Axis with the part of the data scale in view port.
Notes:

If the data scale has already been defined (see ViewPortManager.setFullRange on how to define a data scale), this method will compute the visible data scale based on the view port coordinates using logarithmic interpolation, and then sets the axis to that logarithmic scale.

If the data scale has not been defined, this method will define the data scale based on the axis scale and the the view port coordinates using logarithmic extrapolation. Because the axis scale may not be known at the time of calling this method (the axis could be auto-scaled by ChartDirector, which may not occur until the chart is rendered), the definition of the data scale will not occur immediately, but will be pending until the chart is to be displayed.

If your charting code calls this method but never defines the full data scale or the view port coordinates (in which case the view port defaults to showing the complete data scale), then the first time the code is executed, the data scale will be defined to be equal to the axis scale. Subsequently, when the user zooms into the chart (which means the view port coordinates are changed), the same charting code will set up the axis scale to the range that the user has zoomed to.

Argument	Default	Description
id	(Mandatory)	The name of the data scale.
axis	(Mandatory)	The Axis object to synchronize with.

27.60.40 updateFullRangeH(id as string, minValue as Double, maxValue as Double, updateType as Integer) as boolean

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Updates the full range of a horizontal viewport data scale.
Notes:

Argument	Default	Description
id	(Mandatory)	The name of the horizontal data scale.
minValue	(Mandatory)	The new minimum value of the data scale.
maxValue	(Mandatory)	The new maximum value of the data scale.
updateType	(Mandatory)	The method to update the viewport. Must be one of ViewPortNoUpdate, KeepVisibleRange, ScrollWithMax or ScrollWithMin.

27.60.41 updateFullRangeV(id as string, minValue as Double, maxValue as Double, updateType as Integer) as boolean

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Updates the full range of a vertical viewport data scale.
Notes:

Argument	Default	Description
id	(Mandatory)	The name of the vertical data scale.
minValue	(Mandatory)	The new minimum value of the data scale.
maxValue	(Mandatory)	The new maximum value of the data scale.
updateType	(Mandatory)	The method to update the viewport. Must be one of ViewPortNoUpdate, KeepVisibleRange, ScrollWithMax or ScrollWithMin.

27.60.42 validateViewPort

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Ensures the view port left, top, width and height are within valid ranges and adjusts them if necessary.
Notes: The valid ranges of the view port width and height should be 0 to 1. The view port left should be in between 0 and (1 - view port width). The view port top should be in between 0 and (1 - view port height).

27.60.43 zoomAround(x as Integer, y as Integer, xZoomRatio as Double, yZoomRatio as Double) as boolean

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Zoom at a given point using the zoom ratio.

27.60.44 zoomAt(zoomDirection as Integer, x as Integer, y as Integer, zoomRatio as Double) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Zooms in/out around a certain point.
Notes:

This method adjusts the view port position and size to reflect zooming in/out around the given point. If possible, the given point will be at the center of the view port after zooming in/out.

Argument	Default	Description
zoomDirection	(Mandatory)	The allowed zoom direction. Must be one of the predefined constants DirectionHorizontal, DirectionVertical and DirectionHorizontalVertical for horizontal, vertical and bi-directional zooming.
x	(Mandatory)	The x-coordinate of the point to zoom around.
y	(Mandatory)	The y-coordinate of the point to zoom around.
zoomRatio	(Mandatory)	The zoom magnification factor. For example, a value of 2 means zooming in by 2x. A value of 0.5 means zooming out by 2x.

Return Value
True if view port is changed, otherwise false. It is possible for no zooming to occur if zoom limits are reached. See ViewPortManager.setZoomInWidthLimit, ViewPortManager.setZoomOutWidthLimit, ViewPortManager.setZoomInHeightLimit and ViewPortManager.setZoomOutHeightLimit for the meaning of zoom limits.

27.60.45 zoomTo(zoomDirection as Integer, x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Zooms to the selected rectangular region.
Notes:

This method updates the view port position and size to reflect a rectangular region on the chart. (x1, y1) and (x2, y2) are opposite vertices of the rectangular region in pixel coordinates.

The final view port position may not exactly reflect the rectangular region because of zoom limits. See ViewPortManager.setZoomInWidthLimit, ViewPortManager.setZoomOutWidthLimit, ViewPortManager.setZoomInHeightLimit and ViewPortManager.setZoomOutHeightLimit for the meaning of zoom limits.

Return Value
True if view port is changed, otherwise false.

Argument	Default	Description
zoomDirection	(Mandatory)	The allowed zoom direction. Must be one of the predefined constants DirectionHorizontal, DirectionVertical and DirectionHorizontalVertical for horizontal, vertical and bi-directional zooming.
x1	(Mandatory)	The x-coordinate of one vertices of the selected rectangular region.
y1	(Mandatory)	The y-coordinate of one vertices of the selected rectangular region.
x2	(Mandatory)	The x-coordinate of the vertex that is opposite to the vertex (x1, y1).
y2	(Mandatory)	The y-coordinate of the vertex that is opposite to the vertex (x1, y1).

27.61 class CDXYChartMBS

27.61.1 class CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The XYChart class represents XY charts.
Notes: Subclass of the CDBaseChartMBS class.

27.61.4 Methods

27.61.5 addAreaLayer(data() as Double, colorvalue as color, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addAreaLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.61.6 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS 5417
- 27.61.7 addAreaLayer(dataCombineMethod as Integer = 1, depth as Integer = 0) as CDAreaLayerMBS 5417
- 27.61.8 addAreaLayer(dates() as date, colorvalue as color, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS 5418
- 27.61.9 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS 5419

27.61.6 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an area chart layer to the XYChart, and specify the data set to use for drawing the area.
Notes:

Parameter	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the area. -1 means that the color is automatically selected from the color palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
depth	0	The 3D depth of the area layer.

Return Value
An AreaLayer object representing the area layer created.
See also:

- 27.61.5 addAreaLayer(data() as Double, colorvalue as color, name as string = "", depth as Integer = 0) as CDAreaLayerMBS 5416
- 27.61.7 addAreaLayer(dataCombineMethod as Integer = 1, depth as Integer = 0) as CDAreaLayerMBS 5417
- 27.61.8 addAreaLayer(dates() as date, colorvalue as color, name as string = "", depth as Integer = 0) as CDAreaLayerMBS 5418
- 27.61.9 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDAreaLayerMBS 5419

27.61.7 addAreaLayer(dataCombineMethod as Integer = 1, depth as Integer = 0) as CDAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an empty area chart layer to the XYChart.
Notes:

This method is typically used to add multiple data sets to a single bar layer. First an empty area chart layer is created, then the data sets can be added using Layer.addDataSet.

The dataCombineMethod parameter specifies how to combine the data sets together in the area layer. The followings methods are supported:

Return Value
An AreaLayer object representing the area layer created.
See also:

Constant	Value	Description
Stack	1	The data sets are combined by stacking up the areas.
Percentage	4	The data sets are combined similar to stacked area, except that the data are scaled so that the area always stacked up to 100. An area strip within the stacked area therefore represents the percentage of the data item relative to sum of all the data items in the stacked area.

Parameter	Default	Description
dataCombineMethod	Stack	The method to combine the data sets together in the area layer.
depth	0	The 3D depth of the area layer.

- 27.61.5 addAreaLayer(data() as Double, colorvalue as color, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5416
- 27.61.6 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5417
- 27.61.8 addAreaLayer(dates() as date, colorvalue as color, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5418
- 27.61.9 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5419

27.61.8 addAreaLayer(dates() as date, colorvalue as color, name as string = """, depth as Integer = 0) as CDAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addAreaLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.61.5 addAreaLayer(data() as Double, colorvalue as color, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5416
- 27.61.6 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5417
- 27.61.7 addAreaLayer(dataCombineMethod as Integer = 1, depth as Integer = 0) as CDAreaLayerMBS 5417
- 27.61.9 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5419

27.61.9 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an area chart layer to the XYChart, and specify the data set to use for drawing the area.
Notes:

Parameter	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the area. -1 means that the color is automatically selected from the color palette.
name	””	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
depth	0	The 3D depth of the area layer.

Return Value
An AreaLayer object representing the area layer created.
See also:

- 27.61.5 addAreaLayer(data() as Double, colorvalue as color, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS 5416
- 27.61.6 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS 5417
- 27.61.7 addAreaLayer(dataCombineMethod as Integer = 1, depth as Integer = 0) as CDAreaLayerMBS 5417
- 27.61.8 addAreaLayer(dates() as date, colorvalue as color, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS 5418

27.61.10 addAxis(align as Integer, offset as Integer) as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an additional axis to the chart.
Notes:

By default, ChartDirector XY charts have 2 x-axes and 2 y-axes at the 4 borders of the plot area. The addAxis method can be used to create additional axis.

The new axis will be put at one of the 4 borders of the plot area. To avoid overlapping with existing axis, the new axis will not be put exactly as the plot area border, but at an offset from it.

Parameter	Default	Description
align	(Mandatory)	Specifies which side of the plot area is the primary side of the axis. Must be one of the constants Left, Right, Top and Bottom for the 4 sides of the plot area.
offset	(Mandatory)	An offset in pixels to move the axis away from the plot area. If a negative value is used, it will mean to move the axis into the plot area.

27.61.11 addBarLayer(data() as Double, colors() as color, depth as Integer = 0) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addBarLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.61.12 addBarLayer(data() as Double, colors() as color, names() as string, depth as Integer = 0) as CDBarLayerMBS 5420
- 27.61.13 addBarLayer(data() as Double, colors() as Integer, depth as Integer = 0) as CDBarLayerMBS 5421
- 27.61.14 addBarLayer(data() as Double, colors() as Integer, names() as string, depth as Integer = 0) as CDBarLayerMBS 5422
- 27.61.15 addBarLayer(data() as Double, colorvalue as color, name as string = """, depth as Integer = 0) as CDBarLayerMBS 5423
- 27.61.16 addBarLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDBarLayerMBS 5424
- 27.61.17 addBarLayer(dataCombineMethod as Integer = 3, depth as Integer = 0) as CDBarLayerMBS 5425

27.61.12 addBarLayer(data() as Double, colors() as color, names() as string, depth as Integer = 0) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addBarLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.61.11 addBarLayer(data() as Double, colors() as color, depth as Integer = 0) as CDBarLayerMBS 5420
- 27.61.13 addBarLayer(data() as Double, colors() as Integer, depth as Integer = 0) as CDBarLayerMBS 5421

- 27.61.14 addBarLayer(data() as Double, colors() as Integer, names() as string, depth as Integer = 0) as CDBarLayerMBS 5422
- 27.61.15 addBarLayer(data() as Double, colorvalue as color, name as string = ""), depth as Integer = 0) as CDBarLayerMBS 5423
- 27.61.16 addBarLayer(data() as Double, colorvalue as Integer = -1, name as string = ""), depth as Integer = 0) as CDBarLayerMBS 5424
- 27.61.17 addBarLayer(dataCombineMethod as Integer = 3, depth as Integer = 0) as CDBarLayerMBS 5425

27.61.13 addBarLayer(data() as Double, colors() as Integer, depth as Integer = 0) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an empty bar layer to the XYChart.
Example:

```
// Create a XYChart object of size 250 x 250 pixels
dim c as new CDXYChartMBS(250, 250)

// Add a bar chart layer using the given data
dim t as CDTextBoxMBS = c.addBarLayer(data)
t.setPos(0, -10) // move 10 up
```

Notes:

This method is typically used to add multiple data sets to a single bar layer. First an empty bar layer is created, then the data sets can be added using Layer.addDataSet.

The dataCombineMethod parameter specifies how to combine the data sets together in the bar layer. The followings methods are supported:

Return Value
A BarLayer object representing the bar layer created.

To set some more options like transparent border of the bar, please use the methods in CDBarLayerMBS class. e.g. setBorderColor(CDXYChartMBS.kTransparent) will make them transparent.
See also:

- 27.61.11 addBarLayer(data() as Double, colors() as color, depth as Integer = 0) as CDBarLayerMBS 5420
- 27.61.12 addBarLayer(data() as Double, colors() as color, names() as string, depth as Integer = 0) as CDBarLayerMBS 5420

Constant	Value	Description
Side	3	The data sets are combined by plotting the bars side by side.
Stack	1	The data sets are combined by stacking up the bar segments.
Overlay	0	The data sets are combined similar to stacked bars. However, in Overlay, one data set is assumed to already include the other data set. For example, if the data sets are "average" and "peak", the "peak" cannot be stacked on top of "average", because the "peak" already contains "average". In the Overlay style, only "peak - average" is stacked on top of "average", and so the total bar length will be "peak".
Percentage	4	The data sets are combined similar to stacked bars, except that the data in a bar are scaled so that they summed to 100. In other words, all stacked bars will be of the same length. A bar segment within a bar represents the percentage of the data item relative to sum of all the data items in the stacked bar.

Parameter	Default	Description
dataCombineMethod	Side	The method to combine the data sets together in the bar layer.
depth	0	The 3D depth of the bar layer.

- 27.61.14 addBarLayer(data() as Double, colors() as Integer, names() as string, depth as Integer = 0) as CDBarLayerMBS 5422
- 27.61.15 addBarLayer(data() as Double, colorvalue as color, name as string = "", depth as Integer = 0) as CDBarLayerMBS 5423
- 27.61.16 addBarLayer(data() as Double, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDBarLayerMBS 5424
- 27.61.17 addBarLayer(dataCombineMethod as Integer = 3, depth as Integer = 0) as CDBarLayerMBS 5425

27.61.14 addBarLayer(data() as Double, colors() as Integer, names() as string, depth as Integer = 0) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a multi-color bar layer to the XYChart, and specify the data set to use for drawing the bars.
Notes:

A multi-color bar layer is a bar layer in which each bar has a different color. In a normal bar layer, each data set has a different color, but the bars in the same data set have the same color.

Return Value
A BarLayer object representing the bar layer created.

Parameter	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
colors	(Mandatory)	An array of colors to draw the bars. An empty array means the colors are automatically selected from the palette.
names	[Empty_Array]	An array of text strings as the names of the bars. The names will be used in the legend box, if one is available. An empty array means that bars have no name.
depth	0	The 3D depth of the bar layer.

To set some more options like transparent border of the bar, please use the methods in CDBarLayerMBS class. e.g. setBorderColor(CDXYChartMBS.kTransparent) will make them transparent.

- 27.61.13 addBarLayer(data() as Double, colors() as Integer, depth as Integer = 0) as CDBarLayerMBS 5421

- 27.61.14 addBarLayer(data() as Double, colors() as Integer, names() as string, depth as Integer = 0) as CDBarLayerMBS 5422
- 27.61.16 addBarLayer(data() as Double, colorvalue as Integer = -1, name as string = ""), depth as Integer = 0) as CDBarLayerMBS 5424
- 27.61.17 addBarLayer(dataCombineMethod as Integer = 3, depth as Integer = 0) as CDBarLayerMBS 5425

27.61.16 addBarLayer(data() as Double, colorvalue as Integer = -1, name as string = ""), depth as Integer = 0) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a bar layer to the XYChart, and specify the data set to use for drawing the bars.
Notes:

Parameter	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the bars. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
depth	0	The 3D depth of the bar layer.

Return Value
A BarLayer object representing the bar layer created.

To set some more options like transparent border of the bar, please use the methods in CDBarLayerMBS class. e.g. setBorderColor(CDXYChartMBS.kTransparent) will make them transparent.

- 27.61.13 addBarLayer(data() as Double, colors() as Integer, depth as Integer = 0) as CDBarLayerMBS 5421
- 27.61.14 addBarLayer(data() as Double, colors() as Integer, names() as string, depth as Integer = 0) as CDBarLayerMBS 5422
- 27.61.15 addBarLayer(data() as Double, colorvalue as color, name as string = ""), depth as Integer = 0) as CDBarLayerMBS 5423
- 27.61.17 addBarLayer(dataCombineMethod as Integer = 3, depth as Integer = 0) as CDBarLayerMBS 5425

27.61.17 addBarLayer(dataCombineMethod as Integer = 3, depth as Integer = 0) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an empty bar layer to the XYChart.
Notes:

This method is typically used to add multiple data sets to a single bar layer. First an empty bar layer is created, then the data sets can be added using
Layer.addDataSet.

The dataCombineMethod parameter specifies how to combine the data sets together in the bar layer. The followings methods are supported:

Constant	Value	Description
Side	3	The data sets are combined by plotting the bars side by side.
Stack	1	The data sets are combined by stacking up the bar segments.
Overlay	0	The data sets are combined similar to stacked bars. However, in Overlay, one data set is assumed to already include the other data set. For example, if the data sets are "average" and "peak", the "peak" cannot be stacked on top of "average", because the "peak" already contains "average". In the Overlay style, only "peak - average" is stacked on top of "average", and so the total bar length will be "peak".
Percentage	4	The data sets are combined similar to stacked bars, except that the data in a bar are scaled so that they summed to 100. In other words, all stacked bars will be of the same length. A bar segment within a bar represents the percentage of the data item relative to sum of all the data items in the stacked bar.

Parameter	Default	Description
dataCombineMethod	Side	The method to combine the data sets together in the bar layer.
depth	0	The 3D depth of the bar layer.

Return Value
A BarLayer object representing the bar layer created.

To set some more options like transparent border of the bar, please use the methods in CDBarLayerMBS class. e.g. setBorderColor(CDXYChartMBS.kTransparent) will make them transparent.

27.61.18 addBoxLayer(boxTop() as Double, boxBottom() as Double, colorvalue as color, name as string = "") as CDBoxWhiskerLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addBoxLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.61.19 addBoxLayer(boxTop() as Double, boxBottom() as Double, colorvalue as Integer = -1, name as string = "") as CDBoxWhiskerLayerMBS 5426

27.61.19 addBoxLayer(boxTop() as Double, boxBottom() as Double, colorvalue as Integer = -1, name as string = "") as CDBoxWhiskerLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a floating box layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes:

This method is a simplification of XYChart.addBoxWhiskerLayer. Instead of adding a full box-whisker layer, only the box part is used, resulting in a chart layer displaying floating boxes.

Parameter	Default	Description
boxTop	(Mandatory)	An array of numbers representing the top edge of the box.
boxBottom	(Mandatory)	An array of numbers representing the bottom edge of the box.
color	-1	The color to draw the area. -1 means that the color is automatically selected from the color palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.

Return Value
A BoxWhiskerLayer object representing the box-whisker layer created.
See also:

- 27.61.18 addBoxLayer(boxTop() as Double, boxBottom() as Double, colorvalue as color, name as string = "") as CDBoxWhiskerLayerMBS 5426

27.61.20 addBoxWhiskerLayer(boxTop() as Double, boxBottom() as Double) as CDBoxWhiskerLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a box-whisker layer to the XYChart, and specify the data sets to use for drawing the layer. **Notes:**

Traditionally, each box-whisker symbol represents 5 values, which are the as maximum, 3rd quartile, median, 1st quartile and minimum of some data samples.

A vertical box-whisker symbol (on a non-swapped XY chart) consists of a vertical line joining the maximum and minimum points, a box extending from the 1st quartile point to the 3rd quartile point, and 3 horizontal mark lines at the maximum, median and minimum points.

In practice, the box-whisker symbol is not limited to representing the maximum, 3rd quartile, median, 1st quartile and minimum values. It can be used to represent any ordered values.

The boxTop and boxBottom data sets specifies the top and bottom edges of the box. The maxData, minData and midData specifies the top, bottom and middle mark lines.

You can use empty arrays to disable showing some parts of the box-whisker symbol.

For example, if you just want to show a floating box, you can use only boxTop and boxBottom and set the maxData, minData and midData to empty arrays.

Similarly, if the boxTop, boxBottom and midData are set to empty arrays, only the top and bottom mark lines and the joining center line are visible. This style is most often used as "error bands" together with line charts.

In addition to maxData, minData and midData, you can add additional mark lines to the box-whisker element by adding more data sets using Layer.addDataSet.

By default, the box-whisker symbol will be drawn using the colors specified in the fillColor, whiskerColor and edgeColor argument. The fillColor and edgeColor are used as the fill and border colors of the box, while the whiskerColor is used as the color of the center line and the mark lines.

Internally, ChartDirector maps the colors of different parts of the box-whisker symbol to data set colors as shown in the following table. You may control the colors of the box-whisker symbol in more details by setting the data set colors directly. The data set objects can be obtained using Layer.getDataSet, and the

colors can be changed using DataSet.setDataColor.

Box-Whisker Symbol Color	Data Set Color
Fill color of the box	Data Color for the first data set (index = 0)
Border color of the box	Edge Color for the first data set (index = 0)
Center line color	Data Color for the second data set (index = 1)
Maximum value mark line color	Data Color for the third data set (index = 2)
Minimum value mark line color	Data Color for the fourth data set (index = 3)
Middle value mark line color	Data Color for the fifth data set (index = 4)
Mark line color for additional mark lines	Data Color for the data set representing the additional mark line

Parameter	Default	Description
boxTop	(Mandatory)	An array of numbers representing the top edge of the box.
boxBottom	(Mandatory)	An array of numbers representing the bottom edge of the box.
maxData	[Empty_Array]	An array of numbers representing the maximum value mark lines.
minData	[Empty_Array]	An array of numbers representing the minimum value mark lines.
midData	[Empty_Array]	An array of numbers representing the middle value mark lines.
fillColor	-1	The color used to fill the box. -1 means that the color is automatically selected from the palette.
whiskerColor	LineColor	The color used to draw the central line and mark lines.
edgeColor	LineColor	The color used to draw the border of the box.

Return Value
A BoxWhiskerLayer object representing the box-whisker layer created.

- 27.61.23 addBoxWhiskerLayer(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColor as color, whiskerColor as color, edgeColor as color) as CDBoxWhiskerLayerMBS 5432

27.61.25 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double) as CDBoxWhiskerLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a multi-color box-whisker layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes:

This method is similar to XYChart.addBoxWhiskerLayer, except that the layer will be added in multi-color mode. Please refer to XYChart.addBoxWhiskerLayer on basic information of what is a box-whisker layer.

In multi-color mode, the boxes of a BoxWhiskerLayer can have different fill colors. For the whisker, instead of specifying a single whisker color for all boxes, ChartDirector computes the whisker colors by darkening or brightening the corresponding fill colors using a configurable brightness factor.

Return Value

Parameter	Default	Description
boxTop	(Mandatory)	An array of numbers representing the top edge of the box.
boxBottom	(Mandatory)	An array of numbers representing the bottom edge of the box.
maxData	[Empty_Array]	An array of numbers representing the maximum value mark lines.
minData	[Empty_Array]	An array of numbers representing the minimum value mark lines.
midData	[Empty_Array]	An array of numbers representing the middle value mark lines.
fillColors	[Empty_Array]	An array of colors to be used as the fill color of the boxes. If there are insufficient colors in the array for the boxes, the remaining boxes will have their colors automatically selected from the palette.
whiskerBrightness	0.5	The brightness factor for whisker color. A value less than 1 means darkening. A value larger than 1 means brightening. A zero value means black.
names	[Empty_Array]	An array of names for the boxes to be used in the legend box, if one is configured for the chart.

A BoxWhiskerLayer object representing the box-whisker layer created.

- 27.61.32 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColors() as Integer, whiskerBrightness as Double, names() as string) as CDBoxWhiskerLayerMBS 5442

27.61.27 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double) as CDBoxWhiskerLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a multi-color box-whisker layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes:

This method is similar to XYChart.addBoxWhiskerLayer, except that the layer will be added in multi-color mode. Please refer to XYChart.addBoxWhiskerLayer on basic information of what is a box-whisker layer.

In multi-color mode, the boxes of a BoxWhiskerLayer can have different fill colors. For the whisker, instead of specifying a single whisker color for all boxes, ChartDirector computes the whisker colors by darkening or brightening the corresponding fill colors using a configurable brightness factor.

Parameter	Default	Description
boxTop	(Mandatory)	An array of numbers representing the top edge of the box.
boxBottom	(Mandatory)	An array of numbers representing the bottom edge of the box.
maxData	[Empty_Array]	An array of numbers representing the maximum value mark lines.
minData	[Empty_Array]	An array of numbers representing the minimum value mark lines.
midData	[Empty_Array]	An array of numbers representing the middle value mark lines.
fillColors	[Empty_Array]	An array of colors to be used as the fill color of the boxes. If there are insufficient colors in the array for the boxes, the remaining boxes will have their colors automatically selected from the palette.
whiskerBrightness	0.5	The brightness factor for whisker color. A value less than 1 means darkening. A value larger than 1 means brightening. A zero value means black.
names	[Empty_Array]	An array of names for the boxes to be used in the legend box, if one is configured for the chart.

Return Value
A BoxWhiskerLayer object representing the box-whisker layer created.

- 27.61.29 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColors() as color, whiskerBrightness as Double = 0.5) as CDBoxWhiskerLayerMBS 5439
- 27.61.31 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColors() as Integer, whiskerBrightness as Double = 0.5) as CDBoxWhiskerLayerMBS 5440
- 27.61.32 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColors() as Integer, whiskerBrightness as Double, names() as string) as CDBoxWhiskerLayerMBS 5442

27.61.31 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColors() as Integer, whiskerBrightness as Double = 0.5) as CDBoxWhiskerLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a multi-color box-whisker layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes:

This method is similar to XYChart.addBoxWhiskerLayer, except that the layer will be added in multi-color mode. Please refer to XYChart.addBoxWhiskerLayer on basic information of what is a box-whisker layer.

In multi-color mode, the boxes of a BoxWhiskerLayer can have different fill colors. For the whisker, instead of specifying a single whisker color for all boxes, ChartDirector computes the whisker colors by darkening or brightening the corresponding fill colors using a configurable brightness factor.

Parameter	Default	Description
boxTop	(Mandatory)	An array of numbers representing the top edge of the box.
boxBottom	(Mandatory)	An array of numbers representing the bottom edge of the box.
maxData	[Empty_Array]	An array of numbers representing the maximum value mark lines.
minData	[Empty_Array]	An array of numbers representing the minimum value mark lines.
midData	[Empty_Array]	An array of numbers representing the middle value mark lines.
fillColors	[Empty_Array]	An array of colors to be used as the fill color of the boxes. If there are insufficient colors in the array for the boxes, the remaining boxes will have their colors automatically selected from the palette.
whiskerBrightness	0.5	The brightness factor for whisker color. A value less than 1 means darkening. A value larger than 1 means brightening. A zero value means black.
names	[Empty_Array]	An array of names for the boxes to be used in the legend box, if one is configured for the chart.

Return Value
A BoxWhiskerLayer object representing the box-whisker layer created.

- 27.61.31 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColors() as Integer, whiskerBrightness as Double = 0.5) as CDBoxWhiskerLayerMBS 5440

27.61.33 addCandleStickLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, riseColor as color, fallColor as color, edgeColor as color) as CDCandleStickLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addCandleStickLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.61.34 addCandleStickLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, riseColor as Integer = -1, fallColor as Integer = 0, edgeColor as Integer = & hffff0001) as CDCandleStickLayerMBS 5443

27.61.34 addCandleStickLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, riseColor as Integer = -1, fallColor as Integer = 0, edgeColor as Integer = & hffff0001) as CDCandleStickLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a candlestick layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes:

By default, the candlestick symbol will be drawn using the colors specified in the riseColor, fallColor and edgeColor argument. The riseColor and fallColor are used to fill the candle depending on whether the opening value or closing value is larger. The edgeColor is used to the center line and the border of the candle.

Internally, ChartDirector maps the colors of different parts of the candlestick symbol to data set colors as shown in the following table. You may control the colors of the candlestick symbol in more details by setting the data set colors directly. The data set objects can be obtained using Layer.getDataSet, and the colors can be changed using DataSet.setDataColor.

Return Value
A CandleStickLayer object representing the candlestick layer created.

Candlestick Symbol Color	Data Set Color
Fill color for "up" candlesticks	Data Color for the first data set (index = 0).
Fill color for "down" candlesticks	Data Color for the second data set (index = 1).
Border color	Edge Color for the first data set (index = 0).
Center line color	Edge Color for the second data set (index = 1).

Parameter	Default	Description
highData	(Mandatory)	An array of numbers representing the high values.
lowData	(Mandatory)	An array of numbers representing the low values.
openData	(Mandatory)	An array of numbers representing the opening values.
closeData	(Mandatory)	An array of numbers representing the closing values.
riseColor	FFFFFF	The color used to fill the candle if the closing value is higher than the opening value.
fallColor	000000	The color used to fill the candle if the opening value is higher than the closing value.
edgeColor	LineColor	The color used to draw the center line and the border of the candle.

See also:

- 27.61.33 addCandleStickLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, riseColor as color, fallColor as color, edgeColor as color) as CDCandleStickLayerMBS 5443

27.61.35 addContourLayer(xData() as Double, yData() as Double, zData() as Double) as CDContourLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a contour layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes:

ChartDirector supports both gridded and scattered data. If the data points are on a rectangular grid will no missing points, they will be handled as gridded data. Otherwise, they will be handled as scattered data. For gridded data, you may provide the x and y values of the grid, and the z values of the data points. For a 10 x 15 grid, that means the x data series should have 10 values, the y data series should have 15 values, and the z data series should have 150 values. The x and y data series should be strictly monotonic (either strictly increasing or strictly decreasing).
For both gridded and scattered data, you may also provide the (x, y, z) values of the data points. For example, for 150 data points, the x, y and z data series should each have 150 values. ChartDirector will automatically detect if the data points are gridded or scattered.

Arguments:

Return Value:
A ContourLayer object representing the contour layer created.

Argument	Default	Description
xData	(Mandatory)	An array of numbers representing the x data series.
yData	(Mandatory)	An array of numbers representing the y data series.
zData	(Mandatory)	An array of numbers representing the z data series.

27.61.36 addHLOCLayer as CDHLOCLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an empty high-low-open-close (HLOC) layer to the XYChart.
Notes:

Return Value
A HLOCLayer object representing the HLOC layer created.
See also:

- 27.61.37 addHLOCLayer(highData() as Double, lowData() as Double) as CDHLOCLayerMBS 5446
- 27.61.38 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double) as CDHLOCLayerMBS 5447
- 27.61.39 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, colorValue as color) as CDHLOCLayerMBS 5448
- 27.61.40 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, colorValue as Integer = -1) as CDHLOCLayerMBS 5449
- 27.61.41 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as color, downColor as color, colorMode as Integer = -1) as CDHLOCLayerMBS 5450
- 27.61.42 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as color, downColor as color, colorMode as Integer, leadValue as Double) as CDHLOCLayerMBS 5451
- 27.61.43 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer = -1) as CDHLOCLayerMBS 5452
- 27.61.44 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer, leadValue as Double) as CDHLOCLayerMBS 5453

27.61.37 addHLOCLayer(highData() as Double, lowData() as Double) as CDHLOCLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a high-low-open-close (HLOC) layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes:

In this method, all HLOC symbols will be drawn using the color specified in the color argument. Use XYChart.addHLOCLayer for multi-color HLOC layers.

Internally, ChartDirector maps the colors of different parts of the HLOC symbol to data set colors as shown in the following table. You may control the colors of the HLOC symbol in more details by setting the data set colors directly. The data set objects can be obtained using Layer.getDataSet, and the colors can be changed using DataSet.setDataColor.

HLOC Symbol Color	Data Set Color
Central Line	Data Color for the first data set (index = 0)
Open Mark Line	Data Color for the third data set (index = 2)
Close Mark Line	Data Color for the fourth data set (index = 3)

Parameter	Default	Description
highData	(Mandatory)	An array of numbers representing the high values. An empty array means there is no high value data available.
lowData	(Mandatory)	An array of numbers representing the low values. An empty array means there is no low value data available.
openData	[Empty_Array]	An array of numbers representing the opening values. An empty array means there is no opening value data available.
closeData	[Empty_Array]	An array of numbers representing the closing values. An empty array means there is no closing value data available.
color	-1	The color to draw the HLOC symbol. -1 means that the color is automatically selected from the palette.

Return Value
A HLOCLayer object representing the HLOC layer created.

- 27.61.41 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as color, downColor as color, colorMode as Integer = -1) as CDHLOCLayerMBS 5450
- 27.61.42 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as color, downColor as color, colorMode as Integer, leadValue as Double) as CDHLOCLayerMBS 5451
- 27.61.43 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer = -1) as CDHLOCLayerMBS 5452
- 27.61.44 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer, leadValue as Double) as CDHLOCLayerMBS 5453

27.61.38 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double) as CDHLOCLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a high-low-open-close (HLOC) layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes:

In this method, all HLOC symbols will be drawn using the color specified in the color argument. Use XYChart.addHLOCLayer for multi-color HLOC layers.

Internally, ChartDirector maps the colors of different parts of the HLOC symbol to data set colors as shown in the following table. You may control the colors of the HLOC symbol in more details by setting the data set colors directly. The data set objects can be obtained using Layer.getDataSet, and the colors can be changed using DataSet.setDataColor.

HLOC Symbol Color	Data Set Color
Central Line	Data Color for the first data set (index = 0)
Open Mark Line	Data Color for the third data set (index = 2)
Close Mark Line	Data Color for the fourth data set (index = 3)

Return Value
A HLOCLayer object representing the HLOC layer created.
See also:

- 27.61.36 addHLOCLayer as CDHLOCLayerMBS 5445
- 27.61.37 addHLOCLayer(highData() as Double, lowData() as Double) as CDHLOCLayerMBS 5446
- 27.61.39 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, colorValue as color) as CDHLOCLayerMBS 5448

Parameter	Default	Description
highData	(Mandatory)	An array of numbers representing the high values. An empty array means there is no high value data available.
lowData	(Mandatory)	An array of numbers representing the low values. An empty array means there is no low value data available.
openData	[Empty_Array]	An array of numbers representing the opening values. An empty array means there is no opening value data available.
closeData	[Empty_Array]	An array of numbers representing the closing values. An empty array means there is no closing value data available.
color	-1	The color to draw the HLOC symbol. -1 means that the color is automatically selected from the palette.

- 27.61.40 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, colorValue as Integer = -1) as CDHLOCLayerMBS 5449
- 27.61.41 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as color, downColor as color, colorMode as Integer = -1) as CDHLOCLayerMBS 5450
- 27.61.42 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as color, downColor as color, colorMode as Integer, leadValue as Double) as CDHLOCLayerMBS 5451
- 27.61.43 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer = -1) as CDHLOCLayerMBS 5452
- 27.61.44 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer, leadValue as Double) as CDHLOCLayerMBS 5453

27.61.39 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, colorValue as color) as CDHLOCLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addHLOCLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.61.36 addHLOCLayer as CDHLOCLayerMBS 5445
- 27.61.37 addHLOCLayer(highData() as Double, lowData() as Double) as CDHLOCLayerMBS 5446

- 27.61.43 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer = -1) as CDHLOCLayerMBS 5452
- 27.61.44 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer, leadValue as Double) as CDHLOCLayerMBS 5453

27.61.43 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer = -1) as CDHLOCLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a multi-color high-low-open-close (HLOC) layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes:

ChartDirector supports drawing the HLOC symbol using different colors depending on whether the data represents an "up" day or "down" day. ChartDirector supports different definitions of what is an "up" day and "down" day, denoted using the following constants.

Constant	Value	Description
HLOCDefault	0	Do not distinguish between "up" and "down" days and use the same color for all HLOC symbols.
HLOCOpenClose	1	An up day is a day of which the closing value is on or above the opening value. This is the same definition commonly used in candlestick charts.
HLOCUpDown	2	An up day is a day of which the closing value is on or above the closing value of the previous day.

Parameter	Default	Description
highData	(Mandatory)	An array of numbers representing the high values. An empty array means there is no high value data available.
lowData	(Mandatory)	An array of numbers representing the low values. An empty array means there is no low value data available.
openData	(Mandatory)	An array of numbers representing the opening values. An empty array means there is no opening value data available.
closeData	(Mandatory)	An array of numbers representing the closing values. An empty array means there is no closing value data available.
upColor	(Mandatory)	The color to be used on an "up" day.
downColor	(Mandatory)	The color to be used on a "down" day.
colorMode	-1	The method used to determine if a day is an "up" or "down". Must be one of the constants in the above table. The default value of -1 means the colorMode is automatically determine to be either HLOCDefault or HLOCUpDown, depending on whether upColor and downColor are the same or different.
leadValue	[-Infinity]	The lead value to act as the closing pricing before the first day, so as to determine if the first day is an "up" or "down" day.

Return Value
A HLOCLayer object representing the HLOC layer created.

27.61.44 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer, leadValue as Double) as CDHLOCLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a multi-color high-low-open-close (HLOC) layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes:

ChartDirector supports drawing the HLOC symbol using different colors depending on whether the data represents an "up" day or "down" day. ChartDirector supports different definitions of what is an "up" day and "down" day, denoted using the following constants.

Constant	Value	Description
HLOCDefault	0	Do not distinguish between "up" and "down" days and use the same color for all HLOC symbols.
HLOCOpenClose	1	An up day is a day of which the closing value is on or above the opening value. This is the same definition commonly used in candlestick charts.
HLOCUpDown	2	An up day is a day of which the closing value is on or above the closing value of the previous day.

Return Value
A HLOCLayer object representing the HLOC layer created.
See also:

Parameter	Default	Description
highData	(Mandatory)	An array of numbers representing the high values. An empty array means there is no high value data available.
lowData	(Mandatory)	An array of numbers representing the low values. An empty array means there is no low value data available.
openData	(Mandatory)	An array of numbers representing the opening values. An empty array means there is no opening value data available.
closeData	(Mandatory)	An array of numbers representing the closing values. An empty array means there is no closing value data available.
upColor	(Mandatory)	The color to be used on an "up" day.
downColor	(Mandatory)	The color to be used on a "down" day.
colorMode	-1	The method used to determine if a day is an "up" or "down". Must be one of the constants in the above table. The default value of -1 means the colorMode is automatically determine to be either HLOCDefault or HLOCUpDown, depending on whether upColor and downColor are the same or different.
leadValue	[-Infinity]	The lead value to act as the closing pricing before the first day, so as to determine if the first day is an "up" or "down" day.

- 27.61.36 addHLOCLayer as CDHLOCLayerMBS 5445
- 27.61.37 addHLOCLayer(highData() as Double, lowData() as Double) as CDHLOCLayerMBS 5446
- 27.61.38 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double) as CDHLOCLayerMBS 5447
- 27.61.39 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, colorValue as color) as CDHLOCLayerMBS 5448
- 27.61.40 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, colorValue as Integer = -1) as CDHLOCLayerMBS 5449
- 27.61.41 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as color, downColor as color, colorMode as Integer = -1) as CDHLOCLayerMBS 5450
- 27.61.42 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as color, downColor as color, colorMode as Integer, leadValue as Double) as CDHLOCLayerMBS 5451
- 27.61.43 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer = -1) as CDHLOCLayerMBS 5452

27.61.45 addInterLineLayer(line1 as CDLineObjMBS, line2 as CDLineObjMBS, color12 as color, color21 as color) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addInterLineLayer method, but uses color instead of integer data type for

passing color values.
See also:

- 27.61.46 addInterLineLayer(line1 as CDLineObjMBS, line2 as CDLineObjMBS, color12 as Integer, color21 as Integer = -1) as CDInterLineLayerMBS 5455

27.61.46 addInterLineLayer(line1 as CDLineObjMBS, line2 as CDLineObjMBS, color12 as Integer, color21 as Integer = -1) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an inter-line layer the XYChart. An inter-line layer is used to fill the region between any two lines (straight lines, spline curves, step lines, etc).
Notes:

This method expects two "line" objects representing the two lines. The line objects can be obtained using LineLayer.getLine (inherited by SplineLayer and StepLineLayer), TrendLayer.getLine, and Mark.getLine.

Parameter	Default	Description
line1	(Mandatory)	An opaque line object representing the first line.
line2	(Mandatory)	An opaque line object representing the second line.
color12	(Mandatory)	The color used to fill the region of the lines when line1 >line2.
color21	-1	The color used to fill the region of the lines when line2 >line1. -1 means this color is the same as color12.

Return Value
An InterLineLayer object representing the inter-line layer created.
See also:

- 27.61.45 addInterLineLayer(line1 as CDLineObjMBS, line2 as CDLineObjMBS, color12 as color, color21 as color) as CDInterLineLayerMBS 5454

27.61.47 addLineLayer(data as CDArrayMBS, colorvalue as color, name as string = "", depth as Integer = 0) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addLineLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.61.48 addLineLayer(data as CDArrayMBS, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDLineLayerMBS 5456
- 27.61.49 addLineLayer(data() as Double, colorvalue as color, name as string = "", depth as Integer = 0) as CDLineLayerMBS 5456

- 27.61.50 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5457
- 27.61.51 addLineLayer(dataCombineMethod as Integer = 0, depth as Integer = 0) as CDLineLayerMBS 5457

27.61.48 addLineLayer(data as CDArrayMBS, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a line layer to the XYChart, and specify the data set to use for drawing the line.
Notes:

Parameter	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the line. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
depth	0	The 3D depth of the line layer.

Return Value
A LineLayer object representing the line layer created.
See also:

- 27.61.47 addLineLayer(data as CDArrayMBS, colorvalue as color, name as string = "", depth as Integer = 0) as CDLineLayerMBS 5455
- 27.61.49 addLineLayer(data() as Double, colorvalue as color, name as string = "", depth as Integer = 0) as CDLineLayerMBS 5456
- 27.61.50 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5457
- 27.61.51 addLineLayer(dataCombineMethod as Integer = 0, depth as Integer = 0) as CDLineLayerMBS 5457

27.61.49 addLineLayer(data() as Double, colorvalue as color, name as string = "", depth as Integer = 0) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addLineLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.61.47 addLineLayer(data as CDArrayMBS, colorvalue as color, name as string = "", depth as Integer = 0) as CDLineLayerMBS 5455

- 27.61.48 addLineLayer(data as CDArrayMBS, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5456
- 27.61.50 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5457
- 27.61.51 addLineLayer(dataCombineMethod as Integer = 0, depth as Integer = 0) as CDLineLayerMBS 5457

27.61.50 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a line layer to the XYChart, and specify the data set to use for drawing the line.
Notes:

Parameter	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the line. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
depth	0	The 3D depth of the line layer.

Return Value
A LineLayer object representing the line layer created.
See also:

- 27.61.47 addLineLayer(data as CDArrayMBS, colorvalue as color, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5455
- 27.61.48 addLineLayer(data as CDArrayMBS, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5456
- 27.61.49 addLineLayer(data() as Double, colorvalue as color, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5456
- 27.61.51 addLineLayer(dataCombineMethod as Integer = 0, depth as Integer = 0) as CDLineLayerMBS 5457

27.61.51 addLineLayer(dataCombineMethod as Integer = 0, depth as Integer = 0) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds an empty line layer to the XYChart.
Notes:

This method is typically used to add multiple data sets to a single line layer. First an empty line layer is created, then the data sets can be added using Layer.addDataSet.

Parameter	Default	Description
dataCombineMethod	Overlay	In this version of ChartDirector, this parameter is ignored.
depth	0	The 3D depth of the line layer.

Return Value
A LineLayer object representing the line layer created.
See also:

- 27.61.47 addLineLayer(data as CDArrayMBS, colorvalue as color, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5455
- 27.61.48 addLineLayer(data as CDArrayMBS, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5456
- 27.61.49 addLineLayer(data() as Double, colorvalue as color, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5456
- 27.61.50 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5457

27.61.52 addScatterLayer(xData() as Double, yData() as Double, name as string = """, symbol as Integer = 1, symbolSize as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1) as CDScatterLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a scatter chart layer to the XYChart.
Notes:

A scatter chart can be considered as a special configuration of a line chart, in the data symbols are enabled and the line width is set to zero. Therefore only the data symbols are visible and the chart appears as scattered.

Return Value
A ScatterLayer object representing the scatter layer created.
See also:

- 27.61.53 addScatterLayer(xData() as Double, yData() as Double, name as string, symbol as Integer, symbolSize as Integer, fillColor as color, edgeColor as color) as CDScatterLayerMBS 5459
- 27.61.54 addScatterLayer(xDate() as date, yDate() as date, name as string = ""), symbol as Integer = 1, symbolSize as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1) as CDScatterLayerMBS 5460

Parameter	Default	Description
xData	(Mandatory)	An array of numbers representing the x values of the data points. If no explicit x coordinates are used in the chart (eg. using an enumerated x-axis), an empty array may be used for this argument.
yData	(Mandatory)	An array of numbers representing the y values of the data points.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
symbol	SquareShape	One of the predefined symbol constants to specify the symbol to use. (See Shape Specification for available built-in shapes.)
symbolSize	5	The width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means that the color is automatically selected from the palette.
edgeColor	-1	The edge color used to draw the edge of the symbol. The default value of -1 means using LineColor as the edge color.

- 27.61.55 addScatterLayer(xDate() as date, yDate() as date, name as string, symbol as Integer, symbolSize as Integer, fillColor as color, edgeColor as color) as CDScatterLayerMBS 5461
- 27.61.56 addScatterLayer(xDate() as date, yDate() as Double, name as string = "", symbol as Integer = 1, symbolSize as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1) as CDScatterLayerMBS 5462
- 27.61.57 addScatterLayer(xDate() as date, yDate() as Double, name as string, symbol as Integer, symbolSize as Integer, fillColor as color, edgeColor as color) as CDScatterLayerMBS 5463
- 27.61.58 addScatterLayer(xDate() as Double, yDate() as date, name as string = "", symbol as Integer = 1, symbolSize as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1) as CDScatterLayerMBS 5464
- 27.61.59 addScatterLayer(xDate() as Double, yDate() as date, name as string, symbol as Integer, symbolSize as Integer, fillColor as color, edgeColor as color) as CDScatterLayerMBS 5465

27.61.53 addScatterLayer(xData() as Double, yData() as Double, name as string, symbol as Integer, symbolSize as Integer, fillColor as color, edgeColor as color) as CDScatterLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addScatterLayer method, but uses color instead of integer data type for passing color values.
See also:

27.61.60 addSplineLayer as CDSplineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a spline layer to the XYChart.
Notes:

In a spline layer, the data points are connected together using cardinal spline curves (as opposed to straight lines). The "tension" of the curve can be configured using SplineLayer.setTension.

Parameter	Default	Description
data	[Empty_Array]	An array of numbers representing the data set.
color	-1	The color to draw the spline line. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.

Return Value
A SplineLayer object representing the spline layer created.
See also:

- 27.61.61 addSplineLayer(data() as Double, colorvalue as color, name as string = "") as CDSplineLayerMBS 5467
- 27.61.62 addSplineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDSplineLayerMBS 5467

27.61.61 addSplineLayer(data() as Double, colorvalue as color, name as string = "") as CDSplineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addSplineLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.61.60 addSplineLayer as CDSplineLayerMBS 5466
- 27.61.62 addSplineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDSplineLayerMBS 5467

27.61.62 addSplineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDSplineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a spline layer to the XYChart.
Notes:

In a spline layer, the data points are connected together using cardinal spline curves (as opposed to straight lines). The "tension" of the curve can be configured using SplineLayer.setTension.

Return Value
A SplineLayer object representing the spline layer created.
See also:

- 27.61.60 addSplineLayer as CDSplineLayerMBS 5466

Parameter	Default	Description
data	[Empty_Array]	An array of numbers representing the data set.
color	-1	The color to draw the spline line. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.

- 27.61.61 addSplineLayer(data() as Double, colorvalue as color, name as string = "") as CDSplineLayerMBS 5467

27.61.63 addStepLineLayer as CDStepLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a step line chart layer to the XYChart.
Notes:

In a step line layer, the data points are connected together using steps. The alignment of the steps relative to the data points can be configured using StepLineLayer.setAlignment.

Parameter	Default	Description
data	[Empty_Array]	An array of numbers representing the data set.
color	-1	The color to draw the step line. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.

Return Value
A StepLineLayer object representing the step line layer created.
See also:

- 27.61.64 addStepLineLayer(data() as Double, colorvalue as color, name as string = "") as CDStepLineLayerMBS 5468
- 27.61.65 addStepLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDStepLineLayerMBS 5469

27.61.64 addStepLineLayer(data() as Double, colorvalue as color, name as string = "") as CDStepLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addStepLineLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.61.63 addStepLineLayer as CDStepLineLayerMBS 5468
- 27.61.65 addStepLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDStepLineLayerMBS 5469

27.61.65 addStepLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDStepLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a step line chart layer to the XYChart.
Notes:

In a step line layer, the data points are connected together using steps. The alignment of the steps relative to the data points can be configured using StepLineLayer.setAlignment.

Parameter	Default	Description
data	[Empty_Array]	An array of numbers representing the data set.
color	-1	The color to draw the step line. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.

Return Value
A StepLineLayer object representing the step line layer created.

27.61.67 addTrendLayer(Data() as Double, colorvalue as Integer = -1, name as string = ””, depth as Integer = 0) as CDTrendLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a trend chart layer to the XYChart, and specify the data set to use for drawing the trend line.
Notes:

Parameter	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the line. -1 means that the color is automatically selected from the palette.
name	””	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
depth	0	The 3D depth of the line layer.

Return Value
A TrendLayer object representing the trend layer created.

- 27.61.72 addTrendLayer(xData() as Double, yData() as Double, colorvalue as color, name as string = ””, depth as Integer = 0) as CDTrendLayerMBS 5474

27.61.74 addVectorLayer(dates() as date, yData() as Double, directions() as Double, lengths() as Double, lengthScale as Integer = 0, colorvalue as Integer = -1, name as string = ””) as CDVectorLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a vector layer to the chart.

Notes:

The vectors are specified as 4 data series, representing the x and y coordinates of the reference points to put the vectors, and the lengths and directions of the vectors.

By default, the vector starts from the reference point and points away from it. You may use VectorLayer.setArrowAlignment to specify other options, such as for the vectors to point into the reference point, or to have the reference as a pivot at the mid-point of the vector.

ChartDirector supports specifying vectors lengths as pixels or in axis scale. The unit is specified by using the following predefined constants.

Constant	Value	Description
PixelScale	0	The unit is measured in pixels.
XAxisScale	1	The unit is measured in x-axis scale.
YAxisScale	2	The unit is measured in y-axis scale.

Parameter	Default	Description
xData	(Mandatory)	An array of numbers representing the x coordinates for the reference points of the vectors.
yData	(Mandatory)	An array of numbers representing the y coordinates for the reference points of the vectors.
directions	(Mandatory)	An array of numbers representing the direction of the vectors as a clockwise angle in degrees, where 0 is upward pointing direction.
lengths	(Mandatory)	An array of numbers representing the lengths of the vectors, in unit as specified in the lengthScale argument.
lengthScale	PixelScale	The unit for the lengths, which must be one of the predefined constants in the table above.
color	-1	The color to draw the data points. -1 means that the color is automatically selected from the palette.
name	””	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A VectorLayer object representing the vector layer created.
See also:

27.61.76 addVectorLayer(xData() as Double, yData() as Double, directions() as Double, lengths() as Double, lengthScale as Integer = 0, colorvalue as Integer = -1, name as string = "") as CDVectorLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a vector layer to the chart.
Notes:

The vectors are specified as 4 data series, representing the x and y coordinates of the reference points to put the vectors, and the lengths and directions of the vectors.

By default, the vector starts from the reference point and points away from it. You may use VectorLayer.setArrowAlignment to specify other options, such as for the vectors to point into the reference point, or to have the reference as a pivot at the mid-point of the vector.

ChartDirector supports specifying vectors lengths as pixels or in axis scale. The unit is specified by using the following predefined constants.

Constant	Value	Description
PixelScale	0	The unit is measured in pixels.
XAxisScale	1	The unit is measured in x-axis scale.
YAxisScale	2	The unit is measured in y-axis scale.

Parameter	Default	Description
xData	(Mandatory)	An array of numbers representing the x coordinates for the reference points of the vectors.
yData	(Mandatory)	An array of numbers representing the y coordinates for the reference points of the vectors.
directions	(Mandatory)	An array of numbers representing the direction of the vectors as a clockwise angle in degrees, where 0 is upward pointing direction.
lengths	(Mandatory)	An array of numbers representing the lengths of the vectors, in unit as specified in the lengthScale argument.
lengthScale	PixelScale	The unit for the lengths, which must be one of the predefined constants in the table above.
color	-1	The color to draw the data points. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A VectorLayer object representing the vector layer created.
See also:

- 27.61.74 addVectorLayer(dates() as date, yData() as Double, directions() as Double, lengths() as Double, lengthScale as Integer = 0, colorvalue as Integer = -1, name as string = "") as CDVectorLayerMBS 5475

27.61.77 addVectorLayer(xData() as Double, yData() as Double, directions() as Double, lengths() as Double, lengthScale as Integer, colorvalue as color, name as string = "") as CDVectorLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addVectorLayer method, but uses color instead of integer data type for passing color values.
See also:

- 27.61.74 addVectorLayer(dates() as date, yData() as Double, directions() as Double, lengths() as Double, lengthScale as Integer = 0, colorvalue as Integer = -1, name as string = "") as CDVectorLayerMBS 5475
- 27.61.75 addVectorLayer(dates() as date, yData() as Double, directions() as Double, lengths() as Double, lengthScale as Integer, colorvalue as color, name as string = "") as CDVectorLayerMBS 5477

- 27.61.76 addVectorLayer(xData() as Double, yData() as Double, directions() as Double, lengths() as Double, lengthScale as Integer = 0, colorvalue as Integer = -1, name as string = "") as CDVectorLayerMBS 5477

27.61.78 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as Integer = & hFFFF0000, edgeColor as Integer = & hFF000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a new XYChart object.
Notes:

Parameter	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

See also:

- 27.61.79 Constructor(width as Integer, height as Integer, bgcolor as color, edgeColor as color, raisedEffect as Integer = 0) 5479

27.61.79 Constructor(width as Integer, height as Integer, bgcolor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other Constructor method, but uses color instead of integer data type for passing color values.
See also:

- 27.61.78 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as Integer = & hFFFF0000, edgeColor as Integer = & hFF000000, raisedEffect as Integer = 0) 5479

27.61.80 getLayer(i as Integer) as CDLayerMBS

MBS ChartDirector Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets a Layer object based on the order in which it is being added to the chart.
Notes:

Argument	Default	Description
i	(Mandatory)	The index of the data layer. The index of the first layer added to the chart is 0. The index of the Nth layer added to the chart is N - 1.

27.61.81 getLayerByZ(i as Integer) as CDLayerMBS

MBS ChartDirector Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets a Layer object based on the order in which it is being drawn.
Notes:

In ChartDirector, by default, the first layer added will stay on the top of the chart. The second layer will be added under the first layer, and so on. It means The layers will be drawn in the reverse order that they are added to the chart. The ordering can be configured with Layer.moveFront or Layer.moveBack.

Argument	Default	Description
zIndex	(Mandatory)	The z-index of the required layer. The z-index of the first layer drawn is 0. The z-index for the Nth layer drawn is N - 1.

27.61.82 getLayerCount as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the number of layers in the chart.

27.61.83 getNearestXValue(xCoor as Double) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the x data value that is nearest to the specified x pixel coordinate.
Notes:

This method will search all x data values in the XYChart to look for the x data value that is nearest to the given x coordinate. If there are two x data values equally near to the specified x pixel coordinate, this method will arbitrarily return one of the values.

Argument	Default	Description
xCoor	(Mandatory)	The x pixel coordinate to search for.

Returns the x data value that is nearest to the specified x coordinate.

27.61.84 getPlotArea as CDPlotAreaMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the PlotArea object representing the plot area.

27.61.85 getXCoor(value as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the x pixel coordinate of a point given the x data value.
Notes:

Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

For a 3D chart, this method will get the pixel coordinate of the data value on the top surface of the chart. Use Layer.getXCoor to obtain the pixel coordinate of the data value on a particular chart layer.

Parameter	Default	Description
v	(Mandatory)	The x data value.

Return Value
The x coordinate of the x data value.

27.61.86 getXValue(xCoor as Integer) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the x data value given the x pixel coordinate.
Notes:

Note: This method should be used only after ChartDirector has output the chart image, or after XYChart.layoutAxes, BaseChart.layout or XYChart.packPlotArea has been called. ChartDirector needs to perform auto- scaling and layout the axis before it can convert between pixel coordinates and data values.

Argument	Default	Description
xCoor	(Mandatory)	The x pixel coordinate.

Returns the x data value at the x pixel coordinate.

27.61.87 getYCoor(value as Double, yAxis as CDAxisMBS=nil) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the y pixel coordinate of a point given the y data value.
Notes:

Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

For a 3D chart, this method will get the pixel coordinate of the data value on the top surface of the chart. Use Layer.getYCoor to obtain the pixel coordinate of the data value on a particular chart layer.

Parameter	Default	Description
v	(Mandatory)	The y data value.
yAxis	[Null]	The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.

Return Value
The y coordinate of the y data value.

27.61.88 getYValue(yCoor as Integer, axis as CDAxisMBS = nil) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the y data value given the y pixel coordinate.
Notes:

Note: This method should be used only after ChartDirector has output the chart image, or after XYChart.layoutAxes, BaseChart.layout or XYChart.packPlotArea has been called. ChartDirector needs to perform auto- scaling and layout the axis before it can convert between pixel coordinates and data values.

Argument	Default	Description
yCoor	(Mandatory)	The y pixel coordinate.
yAxis	[Null]	The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.

Returns the y data value at the y pixel coordinate.

27.61.89 layoutAxes

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Performs axis auto-scaling and sets the axis positions and lengths.
Notes:

ChartDirector automatically calls this method when creating the chart output (eg. using BaseChart.makeChart). There is usually no need to call this method explicitly.

However, if you would like to draw custom objects whose positions or contents depend on the axis scales, you may call this method to auto-scaling the axes before creating the chart output.

The axes will auto-scale based on the data at the time of calling this method. New data added afterwards will not affect the axis scale.

You should not modify the axis scale (eg. using Axis.setLinearScale, Axis.setLabels, etc) after calling this method.

27.61.90 packPlotArea(leftX as Integer, topY as Integer, rightX as Integer, bottomY as Integer, minWidth as Integer = 0, minHeight as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adjusts the plot area size and position to fit the plot area and the axis labels in a bounding box.
Notes:

In some charts, the axis labels may vary widely and can be very short or very long. It may be difficult to determine to plot area position and size so as to reserve reasonable and sufficient space for the axis labels.
This method adjusts the size and position of the plot area, so that the plot area, together with the axis labels can fit within a given bounding box.
Note that this method only adjusts for the thickness of the primary and secondary axes, and assumes they are at the border of the plot area. For other axes, you may use Axis.getThickness to get their thickness and adjust the plot area size and position accordingly.
For this method to determine the thickness of the axes, it needs to auto-scale the axes to determine the axis labels. That means all the data should be entered to the chart before calling this method.
Furthermore, the labels generated by auto-scaling depend on the number of labels that can fit on the axis, which in turn depends on the plot area size. So even the final plot area size is determined by this method, the XYChart.setPlotArea must still be used to set a reasonable initial plot area size.
To adjust only the plot area width and horizontal position, and leave the height and vertical position unchanged, simply use a bounding box with zero height (eg. set both topY and bottomY to 0). Similarly, to adjust only the height and vertical position, use a bounding box with zero width.
In some extreme cases, the axis labels may be so long that the plot area needs to adjust to an unreasonably small size, or even zero in size. For example, the axis labels may be names entered by the user, and the user may enter a name thousands of characters long. These extreme cases should be avoided by checking

and limiting the length of the labels before passing the labels to ChartDirector. This method also has a safeguard for these unreasonable labels by ensuring the plot area will not shrink below a given minimum size.

Arguments:

Argument	Default	Description
leftX	(Mandatory)	The left x coordinate of the bounding box.
topY	(Mandatory)	The top y coordinate of the bounding box.
rightX	(Mandatory)	The right x coordinate of the bounding box.
bottomY	(Mandatory)	The bottom y coordinate of the bounding box.
minWidth	0	The minimum width the plot area can adjust to.
minHeight	0	The minimum height the plot area can adjust to.

27.61.91 setAxisAtOrigin(originMode as Integer = 3, symmetryMode as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the chart into 4 quadrant mode. The axes may intersect at origin inside the plot area (as opposed to at the border of the plot area).
Notes:

By default, ChartDirector puts the axes at the border of the plot area. This ensures the axes and the axes labels will not block the contents of the plot area.

However, in some cases, it may be desirable for the axes to intersect at the origin. The axes may need to move inside the plot area.

ChartDirector allows you to move the primary x-axis and/or y-axis to so that they intersect with the zero point of the other axis. The following constants represent different possibilities:

Constant	Value	Description
XAxisAtOrigin	1	Move the x-axis so that it will intersect with the zero point of the y-axis, if that point exists.
YAxisAtOrigin	2	Move the y-axis so that it will intersect with the zero point of the x-axis, if that point exists.
XYAxisAtOrigin	3	Move the x-axis so that it will intersect with the zero point of the y-axis, if that point exists. Move the y-axis so that it will intersect with the zero point of the x-axis, if that point exists.

In addition to ensure the axes intersects at the origin, ChartDirector allows you to control if the axes are symmetrical about the origin with the following flags. Multiple flags can be specified by "or" them together.

Constant	Value	Description
XAxisSymmetric	1	Adjust the x-axis so that it becomes symmetrical about the zero point, that is, the positive and negative part of the x-axis will be of the same length.
XAxisSymmetricIfNeeded	2	Adjust the x-axis will be symmetrical about the zero point if the axis scale needs both positive and negative values.
YAxisSymmetric	4	Adjust the y-axis so that it becomes symmetrical about the zero point, that is, the positive and negative part of the y-axis will be of the same length.
YAxisSymmetricIfNeeded	8	Adjust the y-axis will be symmetrical about the zero point if the axis scale needs both positive and negative values.
XYAxisSymmetric	16	Adjust the x-axes and y-axes so that they become symmetrical about the zero point. The positive and negative parts of the x-axes and the y-axes will all be of the same length.
XYAxisSymmetricIfNeeded	32	Adjust the x-axes and y-axes so that they become symmetrical about the zero point. However, if an axis does not need both positive and negative values, it will not be adjusted.

Parameter	Default	Description
originMode	XYAxisAtOrigin	predefined constants to determine which axis needs to move to intersect with the zero point of the other axis.
symmetryMode	0	Flags to determine if the axes need to be symmetrical about the origin.

27.61.92 setClipping(margin as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Enables clipping on the plot area.
Notes:

In normal usage, ChartDirector will auto-scale the axis to ensure all the data points will be within the plot area.

However, if manual scaling is used (e.g. using Axis.setLinearScale), it is possible to choose an axis scale such that some data points will be outside the plot area. So some of the data representation (bars, lines, etc) will be outside the plot area.

This method can be used to clip the plot area, so that any data representation that is outside the plot area will not be drawn.

Parameter	Default	Description
margin	0	Additional margin, measured in pixels, to be added to the 4 sides of the plot area for the purpose of clipping. A positive value means the clipping region will be larger than the plot area. A negative value means the clipping region will be smaller than the plot area. The default value of 0 means the clipping region is equal to the plot area.

27.61.93 setPlotArea(x as Integer, y as Integer, width as Integer, height as Integer, bgColor as color, altBgColor as color, edgeColor as color, hGridColor as color, vGridColor as color) as CDPlotAreaMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setPlotArea method, but uses color instead of integer data type for passing color values.
See also:

- 27.61.94 setPlotArea(x as Integer, y as Integer, width as Integer, height as Integer, bgColor as Integer = & hff000000, altBgColor as Integer = -1, edgeColor as Integer = -1, hGridColor as Integer = & hc0c0c0, vGridColor as Integer = & hff000000) as CDPlotAreaMBS 5486

27.61.94 setPlotArea(x as Integer, y as Integer, width as Integer, height as Integer, bgColor as Integer = & hff000000, altBgColor as Integer = -1, edgeColor as Integer = -1, hGridColor as Integer = & hc0c0c0, vGridColor as Integer = & hff000000) as CDPlotAreaMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the position, size, background colors, edge color and grid colors of the plot area.
Notes:

Parameter	Default	Description
x	(Mandatory)	The x coordinate of the left of the plot area.
y	(Mandatory)	The y coordinate of the top of the plot area.
width	(Mandatory)	The width of the plot area in pixels.
height	(Mandatory)	The height of the plot area in pixels.
bgColor	Transparent	The background color of the plot area.
altBgColor	-1	The second background color of the plot area. -1 means there is no second background color. If there is a second background color, the two background colors will be used alternatively as horizontal bands on the background grid.
edgeColor	-1	The border color of the plot area. -1 means to use the default, which is LineColor. However, if the axes are configured in 4 quadrant mode (see XYChart.setAxisAtOrigin), the default will change to Transparent.
hGridColor	C0C0C0	The horizontal grid color.
vGridColor	Transparent	The vertical grid color.

Return Value
A PlotArea object representing the plot area.
See also:

- 27.61.93 setPlotArea(x as Integer, y as Integer, width as Integer, height as Integer, bgColor as color, altBgColor as color, edgeColor as color, hGridColor as color, vGridColor as color) as CDPlotAreaMBS 5486

27.61.95 setTrimData(startPos as Integer, len as Integer = & h7fffffff)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Uses only a subset of the data series to draw charts.
Notes:

In finance charts, "lead data" are commonly needed to plot technical indicators. For example, to show a 20-days moving average line for 30 days, one needs 50 days of data. It is because computing 20-days moving average requires 20 days of "lead data". The setTrimData method is a convenience method for trimming off these "lead data" so they will not appear on the chart.

Parameter	Default	Description
startPos	(Mandatory)	The index for the first data position to use for plotting charts.
len	7FFFFFFF	The length of the data points used for plotting charts.

27.61.96 setXAxisOnTop(value as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Interchange the position of the primary x-axis and the secondary x-axis.
Notes:

By default, the primary x-axis is the x-axis on the bottom side of the plot area (left side if XYChart.swapXY is in effect), and the secondary x-axis is on the top side of the plot area (right side if XYChart.swapXY is in effect). This method can be used to interchange their positions.

Parameter	Default	Description
b	true	A true value means to interchange the positions of the primary and secondary x-axes. A false value means using the default positions for the primary and secondary x-axes.

27.61.97 setYAxisOnRight(value as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Interchange the position of the primary y-axis and the secondary y-axis.
Notes:

By default, the primary y-axis is the y-axis on the left side of the plot area (bottom side if XYChart.swapXY is in effect), and the secondary y-axis is on the right side of the plot area (top side if XYChart.swapXY is in effect). This method can be used to interchange their positions.

Parameter	Default	Description
b	true	A true value means to interchange the positions of the primary and secondary y-axes. A false value means using the default positions for the primary and secondary y-axes.

27.61.98 swapXY(value as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Swap the position of the x and y axes, so the x-axes will become vertical, and the y-axes will become horizontal.
Notes:

After swapping the x and y axes, the charts will appear rotated. For example, the bars in a bar chart will become horizontal instead of vertical, and the area in a stacked area chart will grow from left to right (instead of bottom to top).

Parameter	Default	Description
b	true	A true value means the x and y axes will be swapped. A false value means the x and y axes not be swapped.

27.61.99 syncYAxis(slope as Double = 1, intercept as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets a linear formula to synchronize the secondary y-axis scale to the primary y-axis scale.
Notes:

The formula is in the format:

y2 = y1 * slope + intercept

This method is usually used if the two y-axes represent the same measurement using different units. Examples including temperature in Celsius and in Fahrenheit, and length in meters and feet.

Parameter	Default	Description
slope	1	The slope parameter for the formula linking the secondary y-axis to the primary y-axis.
intercept	0	The intercept parameter for the formula linking the secondary y-axis to the primary y-axis.

27.61.100 xZoneColor(threshold as Double, belowColor as color, aboveColor as color) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other xZoneColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.61.101 xZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer) as Integer 5489

27.61.101 xZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a x-zone color. A x-zone will change from one color to another depending on a threshold value on the x-axis.
Notes:

For example, if a x-zone color is used as the line color in a line layer, the line will switch from one color to another when its passes through a certain value on the x-axis. Similarly, if a x-zone color is used as the fill color in an area layer, the area will switch from one color to another when it passes through a certain value on the x-axis.

The two colors used in a x-zone color can be other dynamic colors. For example, one color could be a solid color, while the other color could be a dash line color (see !BaseChart.dashLineColor). When this x-zone color is as the line color, the line will change from a solid style to a dash line style when the line passes through a certain value on the x-axis

You may create x-zone colors with more than 2 zones by cascading multiple x-zone colors.

For a 3D chart, this method will get the zone color at the top surface of the chart. Use Layer.xZoneColor to obtain the zone color for a particular chart layer.

threshold	(Mandatory)	The x value serving as the threshold for switching between two colors.
belowColor	(Mandatory)	The color to use when the x-axis value of the pixel is smaller than the threshold.
aboveColor	(Mandatory)	The color to use when the x-axis value of the pixel is greater than the threshold.

Return Value
A 32-bit integer representing the x-zone color.
See also:

- 27.61.100 xZoneColor(threshold as Double, belowColor as color, aboveColor as color) as Integer 5489

27.61.102 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as CDAxisMBS=nil) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other yZoneColor method, but uses color instead of integer data type for passing color values.
See also:

- 27.61.103 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as CDAxisMBS=nil) as Integer 5490

27.61.103 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as CDAxisMBS=nil) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a x-zone color. A x-zone will change from one color to another depending on a threshold value on the x-axis.
Notes:

For example, if a x-zone color is used as the line color in a line layer, the line will switch from one color to another when its passes through a certain value on the x-axis. Similarly, if a x-zone color is used as the fill color in an area layer, the area will switch from one color to another when it passes through a certain value on the x-axis.

The two colors used in a x-zone color can be other dynamic colors. For example, one color could be a solid color, while the other color could be a dash line color (see !BaseChart.dashLineColor). When this x-zone color is as the line color, the line will change from a solid style to a dash line style when the line passes through a certain value on the x-axis

You may create x-zone colors with more than 2 zones by cascading multiple x-zone colors.

For a 3D chart, this method will get the zone color at the top surface of the chart. Use Layer.xZoneColor to obtain the zone color for a particular chart layer.

Parameter	Default	Description
threshold	(Mandatory)	The x value serving as the threshold for switching between two colors.
belowColor	(Mandatory)	The color to use when the x-axis value of the pixel is smaller than the threshold.
aboveColor	(Mandatory)	The color to use when the x-axis value of the pixel is greater than the threshold.

Return Value
A 32-bit integer representing the x-zone color.
See also:

- 27.61.102 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as CDAxisMBS=nil) as Integer 5490

27.61.104 Properties

27.61.105 xAxis as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Retrieves the Axis object representing primary x-axis of the XYChart.
Notes:

By default, the primary x-axis is the x-axis on the bottom side of the plot area (left side if XYChart.swapXY is in effect), and the secondary x-axis is on the top side of the plot area (right side if XYChart.swapXY is in effect). You may interchange their positions using XYChart.setXAxisOnTop.

Return Value
The Axis object representing the primary x-axis of the XYChart.
(Read only property)

27.61.106 xAxis2 as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Retrieves the Axis object representing secondary x-axis of the XYChart.
Notes:

By default, the primary x-axis is the x-axis on the bottom side of the plot area (left side if XYChart.swapXY is in effect), and the secondary x-axis is on the top side of the plot area (right side if XYChart.swapXY is in effect). You may interchange their positions using XYChart.setXAxisOnTop.

Return Value
The Axis object representing the secondary x-axis of the XYChart.
(Read only property)

27.61.107 yAxis as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Retrieves the Axis object representing primary y-axis of the XYChart.
Notes:

Return Value
The Axis object representing the primary y-axis of the XYChart.
(Read only property)

27.61.108 yAxis2 as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Retrieves the Axis object representing secondary y-axis of the XYChart.
Notes:

By default, the primary y-axis is the y-axis on the left side of the plot area (bottom side if XYChart.swapXY is in effect), and the secondary y-axis is on the right side of the plot area (top side if XYChart.swapXY is in effect). You may interchange their positions using XYChart.setYAxisOnRight.

Return Value
The Axis object representing the secondary y-axis of the XYChart.
(Read only property)

27.61.109 Screenshots

27.61.110 linefill.jpg

Function: A line chart created using ChartDirector with the CDXYChartMBS class.

27.61.111 softlightbar.jpg

Function: A bar chart created using ChartDirector with the CDXYChartMBS class.

Chapter 28

Clipboard

28.1 class ClipboardMBS

28.1.1 class ClipboardMBS

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A clipboard class for Mac OS.
Notes:

For all datatypes, the available function is faster than the size function. And the both functions are faster than the getter function.

This is older Carbon API. You may want to prefer NSPasteboardMBS class with new projects.
Only available in Mac 32 bit applications. Will not be ported to 64 bit.

28.1.2 Blog Entries

- Windows, Xojo and the Clipboard
- MBS Real Studio Plugins, version 13.1pr12

28.1.3 Methods

28.1.4 AddData(FlavorType as string,data as string)

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Adds data to the scrap.

28.1.5 AddText(Text as string)

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Adds text to the scrap.

28.1.6 AddUnicodeText(Text as string)

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Adds unicode text to the clipboard.
Notes: UTF16 encoded strings only.

28.1.7 clear

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Clears the clipboard.
Notes: You must clear before you add something.

28.1.8 close

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

28.1.9 DataAvailable(FlavorType as string) as boolean

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether data is available.

28.1.10 DataSize(FlavorType as string) as Integer

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the byte size of the selected data.

28.1.11 GetData(FlavorType as string) as string

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the data of a given type.
Example:

```
// Take PICT data from clipboard

dim c as ClipboardMBS
dim s as string

c=new ClipboardMBS

if c.DataAvailable("PICT") then

s=c.GetData("PICT")

if s<>"" then
Backdrop=BuildPictureWithPicHandleDataMBS(s)
end if
end if
```

28.1.12 GetText as string

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns text from the clipboard.

28.1.13 GetUnicodeText as string

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the unicode text from the scrap.
Notes: UTF16 encoded strings only.

28.1.14 PictAvailable as boolean

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether a pict handle picture is on the clipboard.

28.1.15 ScrapFlavorCount as Integer

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The number of flavor in the clipboard.
Example:

```
dim clip as ClipboardMBS
dim i,c,c1,c2 as Integer
dim s as string

clip=new ClipboardMBS

c=clip.ScrapFlavorCount

s=str(c)+" types: "

c1=c-1
c2=c-2

for i=0 to c2
s=S+clip.ScrapFlavorType(i)+", "
next

if c>0 then
s=S+clip.ScrapFlavorType(c1)
end if

MsgBox s
```

Notes: Calling this function recreates the internal flavor list in the Xojo clipboard object.

28.1.16 ScrapFlavorFlags(index as Integer) as Integer

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the flags of the given flavor.
Notes:

Index goes from 0 to count-1.
Returns 0 on any error.

Flags are a combination of type values:
1 - private data (Sender only)
2 - translated data

28.1.17 ScrapFlavorType(index as Integer) as string

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the type of the given flavor.
Notes:

Index goes from 0 to count-1.
Returns "" on any error.

28.1.18 TextAvailable as boolean

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether text is available.

28.1.19 TextSize as Integer

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The length of the text available on the clipboard.

28.1.20 UnicodeTextAvailable as boolean

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether unicode text is available.
Notes: UTF16 encoded strings only.

28.1.21 UnicodeTextSize as Integer

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The length of the unicode text.
Notes: UTF16 encoded strings only.

28.1.22 Properties

28.1.23 Handle as Integer

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the clipboard.
Notes:

Carbon only.
(Read only property)

28.2 class NSPasteboardItemDataProviderMBS

28.2.1 class NSPasteboardItemDataProviderMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This protocol is implemented by the data provider of a pasteboard item to provide the data for a particular UTI type.
Notes: You can specify an object as a pasteboard data provider for a pasteboard item using NSPasteboardItemMBS's setDataProviderForTypes method. The data provider must implement this protocol to provide data upon request.

28.2.2 Blog Entries

- MBS Real Studio Plugins, version 13.1pr11

28.2.3 Methods

28.2.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

28.2.5 Destructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

28.2.6 Properties

28.2.7 Handle as Integer

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

28.2.8 Events

28.2.9 Finished(Pasteboard as NSPasteboardMBS)

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the pasteboard no longer needs the data provider for any of its pasteboard items.
Notes:

One data provider can provide data for more than one pasteboard item. This method is called when the pasteboard no longer needs the data provider for any of its pasteboard items. This can be either because the data provider has fulfilled all promises, or because ownership of the pasteboard has changed.

Available in OS X v10.6 and later.

28.2.10 provideDataForType(Pasteboard as NSPasteboardMBS, item as NSPasteboardItemMBS, type as string)

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Asks the receiver to provide data for a specified type to a given pasteboard. (required)
Notes:

pasteboard: A pasteboard to which the receiver has promised to provide data.
item: A pasteboard item for which the receiver has promised to provide data
type: A UTI type string.

The receiver was previously set as the provider using setDataProviderForTypes.
Available in OS X v10.6 and later.

28.3 class NSPasteboardItemMBS

28.3.1 class NSPasteboardItemMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSPasteboardItem is a generic class to represent an item on a pasteboard.
Example:

```
dim n as new NSPasteboardItemMBS

dim type as string = NSPasteboardmbs.NSPasteboardTypeString
n.stringForType(type) = "Hello World"
MsgBox n.stringForType(type)
```

Notes:

There are three main uses for an NSPasteboardItem object:

Providing data on the pasteboard.
You can create one or more pasteboard items, set data or data providers for types, and write to them pasteboard.

Customizing data already on the pasteboard.
As a delegate or subclass, you can retrieve the pasteboard items currently on the pasteboard, read the existing types and data and set new data and data providers for types as needed.

Retrieving data from the pasteboard.
You can retrieve pasteboard items from the pasteboard then read the data for types you're interested in.

A pasteboard item can be associated with a single pasteboard. When you create an item, it can be written to any pasteboard. When you pass an item to a pasteboard in writeObjects, that item becomes bound to the pasteboard it was written to. When you retrieve items from a pasteboard using pasteboardItems, the returned items are associated with the messaged pasteboard. Passing an item that is already associated with a pasteboard into writeObjects: causes an exception to be raised.

Pasteboard items are intended to be used during a single pasteboard interaction, not held onto and used repeatedly. A pasteboard item is only valid until the owner of the pasteboard changes.

Important: If a pasteboard item is stale because the pasteboard owner has changed, it returns nil or false values from its methods.

28.3.2 Blog Entries

- MBS Real Studio Plugins, version 13.1pr11

28.3.3 Methods

28.3.4 availableTypeFromArray(types() as string) as string

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns from a given array of types the the first type contained in the pasteboard item, according to the ordering of types.
Notes:

types: An array of strings representing UTIs, arranged in order of preference (most preferred as the 0th element in the array).

Returns the first (according to the sender's ordering of types) type in types contained in the pasteboard item, or nil if the receiver does not contain any types given in types.

The method checks for UTI conformance of the requested types, preferring an exact match to conformance. Available in OS X v10.6 and later.

28.3.5 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

28.3.6 Destructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

28.3.7 setDataProviderForType(dataProvider as NSPasteboardItemDataProviderMBS, types() as string) as boolean

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the data provider for the specified types.
Notes:

dataProvider: A pasteboard data provider.
types: An array of strings indicating the UTIs for the data representations dataProvider may provide.

Returns true if the data provider was set successfully, otherwise false.

This method registers the data provider to be messaged to provide the data for any of the specified types when requested.
Available in OS X v10.6 and later.

28.3.8 types as string()

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of UTI strings of the data types supported by the receiver.
Notes: Available in OS X v10.6 and later.

28.3.9 Properties

28.3.10 dataProvider as NSPasteboardItemDataProviderMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last dataprovider used with setDataProviderForTypes.
Notes:

You should keep your dataprovider alive, so the object is not destroyed while pasteboarditem is used.
In this property we keep a reference to the data provider for you.
(Read and Write property)

28.3.11 Handle as Integer

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

28.3.12 dataForType(type as string) as memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value for a specified type as a memoryblock object.
Example:

```
dim n as new NSPasteboardItemMBS

dim data as MemoryBlock = "Hello World"
dim type as string = NSPasteboardmbs.NSPasteboardTypeString
n.dataForType(type) = data

dim d as MemoryBlock = n.dataForType(type)
MsgBox DefineEncoding(d, encodings.UTF8)
```

Notes: (Read and Write computed property)

28.3.13 propertyListForType(type as string) as Variant

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value for a specified type as a property list.
Notes:

Stores a property list object (array, dictionary, string, numbers, memoryblocks)
Available in OS X v10.6 and later.
(Read and Write computed property)

28.3.14 stringForType(type as string) as string

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value for the specified type as a string.
Example:

```
dim n as new NSPasteboardItemMBS

dim type as string = NSPasteboardmbs.NSPasteboardTypeString
n.stringForType(type) = "Hello World"
MsgBox n.stringForType(type)
```

Notes:

type: A UTI type string.

Available in OS X v10.6 and later.
(Read and Write computed property)

28.4 class NSPasteboardMBS

28.4.1 class NSPasteboardMBS

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for the clipboard access on Cocoa.
Example:

```
dim p as new NSPasteboardMBS

MsgBox join(p.types,EndOfLine)
```

Notes:

NSPasteboard objects transfer data to and from the pasteboard server. The server is shared by all running applications. It contains data that the user has cut or copied, as well as other data that one application wants to transfer to another. NSPasteboard objects are an application's sole interface to the server and to all pasteboard operations.

An NSPasteboard object is also used to transfer data between applications and service providers listed in each application's Services menu. The drag pasteboard (NSDragPboard) is used to transfer data that is being dragged by the user.

The plugin class NSPasteboardMBS does not implement all features of the NSPasteboard. If you miss something, please email us.

28.4.3 Methods

28.4.4 addType(type as string) as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds promises for the specified types to the first pasteboard item.
Notes:

types: An array of strings, each of which specifies a type of data that can be provided to the pasteboard.

Returns the new change count, or 0 if there was an error adding the types.

This method adds promises for the specified types to the first pasteboard item.

You use this methods to declare additional types of data for the first pasteboard item in the receiver. You can also use it to replace existing types added by a previous declareTypes or addTypes call.

The types parameter specifies the types of data you are promising to the pasteboard. The types should be ordered according to the preference of the source application, with the most preferred type coming first (typically, the richest representation). New types are added to the end of the list containing any existing types, if any.

If you specify a type that has already been declared, this method replaces the owner of that type with the value in newOwner. In addition, any data already already written to the pasteboard for that type is removed.

28.4.5 addTypes(types() as string) as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds promises for the specified types to the first pasteboard item.
Notes:

types: An array of strings, each of which specifies a type of data that can be provided to the pasteboard.

Returns the new change count, or 0 if there was an error adding the types.

This method adds promises for the specified types to the first pasteboard item.

You use this methods to declare additional types of data for the first pasteboard item in the receiver. You can also use it to replace existing types added by a previous declareTypes or addTypes call.

The types parameter specifies the types of data you are promising to the pasteboard. The types should

be ordered according to the preference of the source application, with the most preferred type coming first (typically, the richest representation). New types are added to the end of the list containing any existing types, if any.

If you specify a type that has already been declared, this method replaces the owner of that type with the value in newOwner. In addition, any data already already written to the pasteboard for that type is removed.

28.4.6 changeCount as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's change count.
Example:

```
dim p as new NSPasteboardMBS(NSPasteboardMBS.NSGeneralPboard)

MsgBox str(p.changeCount)
```

Notes:

The change count starts at zero when a client creates the receiver and becomes the first owner. The change count subsequently increments each time the pasteboard ownership changes.

The change count is also returned from clearContents and declareTypes. You can therefore record the change count at the time that you take ownership of the pasteboard and later compare it with the value returned from changeCount to determine whether you still have ownership.

28.4.7 clearContents as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clears the existing contents of the pasteboard.
Example:

```
dim p as new NSPasteboardMBS(NSPasteboardMBS.NSGeneralPboard)

MsgBox str(p.clearContents)
```

Notes:

Clears the existing contents of the pasteboard, preparing it for new contents. This is the first step in providing data on the pasteboard.

Available in Mac OS X v10.6 and later.

28.4.8 Constructor

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSPasteboardMBS object linked to the general NSPasteboard object.
Example:

```
dim p as new NSPasteboardMBS

MsgBox join(p.types,EndOfLine)
```

Notes: On success the handle property is not 0.
See also:

- 28.4.9 Constructor(name as string) 5510

28.4.9 Constructor(name as string)

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSPasteboardMBS object linked to the pasteboard with the specified name.
Example:

```
dim p as new NSPasteboardMBS(NSPasteboardMBS.NSFindPboard)

// shows last find string
MsgBox p.stringForType(p.NSPasteboardTypeString)
```

Notes: On success the handle property is not 0.
See also:

- 28.4.8 Constructor 5510

28.4.10 declareType(type as string) as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Prepares the receiver for a change in its contents by declaring the new types of data it will contain.
Notes:

type: An strings that specify the type of data that may be added to the new pasteboard. The types should be ordered according to the preference of the source application, with the most preferred type coming first

(typically, the richest representation).

Returns the receiver's new change count.

This method is the equivalent of invoking clearContents, implicitly writing the first pasteboard item, and then calling addTypes to promise types for the first pasteboard item.

In Mac OS X v10.5 and earlier, this method is the first step in writing data to the pasteboard and must precede the messages that actually write the data. A declareTypes message essentially changes the contents of the receiver: It invalidates the current contents of the receiver and increments its change count.

28.4.11 declareTypes(types() as string) as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Prepares the receiver for a change in its contents by declaring the new types of data it will contain.
Notes:

type: An array of Strings that specify the types of data that may be added to the new pasteboard. The types should be ordered according to the preference of the source application, with the most preferred type coming first (typically, the richest representation).

Returns the receiver's new change count.

This method is the equivalent of invoking clearContents, implicitly writing the first pasteboard item, and then calling addTypes to promise types for the first pasteboard item.

In Mac OS X v10.5 and earlier, this method is the first step in writing data to the pasteboard and must precede the messages that actually write the data. A declareTypes message essentially changes the contents of the receiver: It invalidates the current contents of the receiver and increments its change count.

28.4.12 generalPasteboard as NSPasteboardMBS

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the general NSPasteboard object.
Example:

```
dim p as NSPasteboardMBS = NSPasteboardMBS.generalPasteboard
MsgBox join(p.types,EndOfLine)
```

28.4.13 name as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's name.
Example:

```
dim p as new NSPasteboardMBS

MsgBox p.name
```

28.4.14 NSColorPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

NSColor data.
On Mac OS X v10.6 and later, use NSPasteboardTypeColor (and you read and write colors directly to and from the pasteboard).

28.4.15 NSDragPboard as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for pasteboards.
Example:

```
dim p as new NSPasteboardMBS(NSPasteboardMBS.NSDragPboard)
MsgBox p.name
```

Notes:

The pasteboard that stores data to be moved as the result of a drag operation.
For additional information on working with the drag pasteboard, see Drag and Drop Programming Topics for Cocoa.

28.4.16 NSFilenamesPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

An array of strings designating one or more filenames.
On Mac OS X v10.6 and later, use writeObjects to write file URLs to the pasteboard.

28.4.17 NSFilesPromisePboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

Promised files.
On Mac OS X v10.6 and later, use kPasteboardTypeFileURLPromise instead.
For information on promised files, see Dragging Files in Drag and Drop Programming Topics for Cocoa.

28.4.18 NSFindPboard as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for pasteboards.
Example:

```
dim p as new NSPasteboardMBS(NSPasteboardMBS.NSFindPboard)
MsgBox p.name
```

Notes:

The pasteboard that holds information about the current state of the active application's find panel.
This information permits users to enter a search string into the find panel, then switch to another application to conduct another search.

28.4.19 NSFontPboard as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for pasteboards.
Example:

```
dim p as new NSPasteboardMBS(NSPasteboardMBS.NSFontPboard)
MsgBox p.name
```

Notes: The pasteboard that holds font and character information and supports Copy Font and Paste Font commands that may be implemented in a text editor.

28.4.20 NSFontPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

Font and character information.
On Mac OS X v10.6 and later, use NSPasteboardTypeFont instead.

28.4.21 NSGeneralPboard as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for pasteboards.
Example:

```
dim p as new NSPasteboardMBS(NSPasteboardMBS.NSGeneralPboard)
MsgBox p.name
```

Notes:

The pasteboard that's used for ordinary cut, copy, and paste operations.
This pasteboard holds the contents of the last selection that's been cut or copied.

28.4.22 NSHTMLPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

HTML (which an NSTextView object can read from, but not write to).
On Mac OS X v10.6 and later, use NSPasteboardTypeHTML instead.

28.4.23 NSInkTextPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

Ink text data.
On Mac OS X v10.6 and later, use kUTTypeInkText instead.
For information on ink text objects, see Using Ink Services in Your Application.

28.4.24 NSMultipleTextSelectionPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

Multiple text selection.
On Mac OS X v10.6 and later, use NSPasteboardTypeMultipleTextSelection instead.
Available in Mac OS X v10.5 and later.

28.4.25 NSPasteboardTypeColor as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
Notes:

Color data (an NSColor object).
Available in Mac OS X v10.6 and later.

28.4.26 NSPasteboardTypeFindPanelSearchOptions as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
Notes:

Type for the Find panel metadata property list.
Available in Mac OS X v10.6 and later.

28.4.27 NSPasteboardTypeFont as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
Notes:

Font and character information.
Available in Mac OS X v10.6 and later.

28.4.28 NSPasteboardTypeHTML as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.

Notes:

HTML data.
Available in Mac OS X v10.6 and later.

28.4.29 NSPasteboardTypeMultipleTextSelection as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
Notes:

Multiple text selection.
Available in Mac OS X v10.6 and later.

28.4.30 NSPasteboardTypePDF as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
Notes:

PDF data.
Available in Mac OS X v10.6 and later.

28.4.31 NSPasteboardTypePNG as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
Notes:

PNG image data.
Available in Mac OS X v10.6 and later.

28.4.32 NSPasteboardTypeRTF as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
Notes:

Rich Text Format (RTF) data.
Available in Mac OS X v10.6 and later.

28.4.33 NSPasteboardTypeRTFD as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
Notes:

RTFD formatted file contents.
Available in Mac OS X v10.6 and later.

28.4.34 NSPasteboardTypeRuler as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
Notes:

Paragraph formatting information.
Available in Mac OS X v10.6 and later.

28.4.35 NSPasteboardTypeSound as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
Notes:

Sound data (an NSSound object).
Available in Mac OS X v10.6 and later.

28.4.36 NSPasteboardTypeString as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
Notes:

String data.
Available in Mac OS X v10.6 and later.

28.4.37 NSPasteboardTypeTabularText as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
Notes:

A string containing tab-separated fields of text.
Available in Mac OS X v10.6 and later.

28.4.38 NSPasteboardTypeTIFF as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
Notes:

Tag Image File Format (TIFF) data.
Available in Mac OS X v10.6 and later.

28.4.39 NSPDFPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

PDF data.
On Mac OS X v10.6 and later, use NSPasteboardTypePDF instead.

28.4.40 NSPICTPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

QuickDraw picture data.
The PICT format was formally deprecated in Mac OS X v10.4 along with QuickDraw. You should not be explicitly providing or looking for PICT data on the pasteboard.
To aid in this deprecation, if PICT is the only image type on the pasteboard, as is sometimes the case when copying images from 32-bit Carbon applications, a translated image type will be automatically reported and provided by NSPasteboard. The translated type is added to the types array ahead of PICT so that the deprecated PICT format is not the preferred format. In addition, when an application provides image data to NSPasteboard, the Carbon Pasteboard Manager will automatically make a PICT translation available to 32-bit Carbon applications.
Although NSPICTPboardType, and its UTI equivalent kUTTypePICT, will appear in a pasteboard's type array retrieved from the existing NSPasteboard API, it may cease to be reported in future releases.

28.4.41 NSPostScriptPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

Encapsulated PostScript (EPS) code.
On Mac OS X v10.6 and later, use @"com.adobe.encapsulated-postscript" instead.

28.4.42 NSRTFDPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

RTFD formatted file contents.
On Mac OS X v10.6 and later, use NSPasteboardTypeRTFD instead.

28.4.43 NSRTFPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

Rich Text Format (RTF) data.
On Mac OS X v10.6 and later, use NSPasteboardTypeRTF instead.

28.4.44 NSRulerPboard as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for pasteboards.
Example:

```
dim p as new NSPasteboardMBS(NSPasteboardMBS.NSRulerPboard)
MsgBox p.name
```

Notes: The pasteboard that holds information about paragraph formats in support of the Copy Ruler and Paste Ruler commands that may be implemented in a text editor.

28.4.45 NSRulerPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

Paragraph formatting information.
On Mac OS X v10.6 and later, use NSPasteboardTypeRuler instead.

28.4.46 NSStringPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

String data.
On Mac OS X v10.6 and later, use NSPasteboardTypeString instead.

28.4.47 NSTabularTextPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

A string containing tab-separated fields of text.
On Mac OS X v10.6 and later, use NSPasteboardTypeTabularText instead.

28.4.48 NSTIFFPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

Tag Image File Format (TIFF) data.
On Mac OS X v10.6 and later, use NSPasteboardTypeTIFF instead.

28.4.49 NSURLPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

NSURL data for one file or resource.
On Mac OS X v10.6 and later, use writeObjects: to write URLs directly to the pasteboard instead.
On Mac OS X v10.5 and earlier: to write an URL to a pasteboard you use writeToPasteboard: (NSURL); to get an URL from a pasteboard you use URLFromPasteboard: (NSURL).

28.4.50 NSVCardPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.
Notes:

VCard data.
On Mac OS X v10.6 and later, use kUTTypeVCard instead.

28.4.51 pasteboardItems as NSPasteboardItemMBS()

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns all the items held by the receiver.
Notes:

Returns all the items held by the receiver, or nil if there is an error retrieving pasteboard items.
Available in OS X v10.6 and later.

28.4.52 pasteboardWithName(name as string) as NSPasteboardMBS

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the pasteboard with the specified name.
Example:

```
dim p as NSPasteboardMBS = NSPasteboardMBS.pasteboardWithName(NSPasteboardMBS.NSFindPboard)

// shows last find string
MsgBox p.stringForType(p.NSPasteboardTypeString)
```

28.4.53 pasteboardWithUniqueName as NSPasteboardMBS

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a new pasteboard with a name that is guaranteed to be unique with respect to other pasteboards on the computer.
Notes: This method is useful for applications that implement their own interprocess communication using

pasteboards.

28.4.54 releaseGlobally

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Releases the receiver's resources in the pasteboard server.
Notes:

After this method is invoked, no other application can use the receiver.

A temporary, privately named pasteboard can be released this way when it is no longer needed, but a standard pasteboard should never be released globally.

28.4.55 SetPasteboardItems(items() as NSPasteboardItemMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes pasteboard items to the pasteboard.
Notes: Returns true if the array was successfully added, otherwise false.

28.4.56 types as string()

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of the receiver's supported data types.
Example:

```
dim p as new NSPasteboardMBS

MsgBox join(p.types,EndOfLine)
```

Notes:

An array of Strings containing the union of the types of data declared for all the pasteboard items on the receiver. The returned types are listed in the order they were declared.

You must send a types or availableTypeFromArray message before reading any data from an NSPasteboard object.

28.4.57 URLFromPasteboard as string

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reads the URL string off of pasteboard.
Notes: Returns "" if pasteboard does not contain data of type NSURLPboardType.

28.4.58 writeURLToPasteboard(URL as string)

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the receiver to pasteboard.
Notes: You must declare an NSURLPboardType data type for pasteboard before invoking this method; otherwise it returns without doing anything.

28.4.59 Properties

28.4.60 Handle as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSPasteBoard object.
Example:

```
dim p as new NSPasteboardMBS

MsgBox hex(p.Handle)
```

Notes: (Read and Write property)

28.4.61 dataForType(type as string) as Memoryblock

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the data for the specified type from the first item in the receiver that contains the type or sets the given data as the representation for the specified type for the first item on the receiver.
Example:

```
dim p as new NSPasteboardMBS

// may have chr(0) on the end!
MsgBox p.dataForType(p.NSPasteboardTypeString)
```

Notes:

Returns a data object containing the data for the specified type from the first item in the receiver that contains the type, or "" if the contents of the pasteboard changed since they were last checked.

This method may also return nil if the pasteboard server cannot supply the data in time—for example, if the pasteboard's owner is slow in responding to a pasteboard:provideDataForType: message and the interprocess communication times out.

Errors other than a timeout raise a NSPasteboardCommunicationException (a NSExceptionMBS in Xojo).

If "" is returned, the application should put up a panel informing the user that it was unable to carry out the paste operation.

For standard text data types such as string, RTF, and RTFD, the text data from each item is returned as one combined result separated by newlines.
(Read and Write computed property)

28.4.62 propertyListForType(type as string) as Variant

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The property list for the specified type from the first item in the receiver that contains the type.
Notes:

dataType: The pasteboard data type containing the property-list data.

The property list for the specified type from the first item in the receiver that contains the type. This object consists of NSArray, NSData, NSDictionary, or NSString objects—or any combination thereof.

This method invokes the dataForType method.
You must send types or availableTypeFromArray before invoking propertyListForType.
(Read and Write computed property)

28.4.63 stringForType(type as string) as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get/Set the given string as the representation for the specified type for the first item on the receiver.
Example:

```
dim p as new NSPasteboardMBS
```

MsgBox p.stringForType(p.NSPasteboardTypeString)

Notes:

A concatenation of the strings for the specified type from all the items in the receiver that contain the type, or nil if none of the items contain strings of the specified type.

This method invokes dataForType to obtain the string. If the string cannot be obtained, stringForType returns "". See dataForType for a description of what will cause "" to be returned.

In Mac OS X v10.6 and later, if the receiver contains multiple items that can provide string, RTF, or RTFD data, the text data from each item is returned as a combined result separated by newlines.
(Read and Write computed property)

Chapter 29

Clipper

29.1 class ClipperEngineMBS

29.1.1 class ClipperEngineMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Clipper class encapsulates boolean operations on polygons (intersection, union, difference and XOR), which is also called polygon clipping.
Notes: Input polygons, both subject and clip sets, are passed to a Clipper object by its AddPath and AddPaths methods, and the clipping operation is performed by calling its Execute method. Multiple boolean operations can be performed on the same input polygon sets by repeat calls to Execute.

29.1.2 Methods

29.1.3 AddPath(path as ClipperPathMBS, PolyType as ClipperMBS.PolyType, Closed as Boolean) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Any number of subject and clip paths can be added to a clipping task, either individually via the AddPath() method, or as groups via the AddPaths() method, or even using both methods.
Notes:

'Subject' paths may be either open (lines) or closed (polygons) or even a mixture of both, but 'clipping' paths must always be closed. Clipper allows polygons to clip both lines and other polygons, but doesn't allow lines to clip either lines or polygons.

With closed paths, orientation should conform with the filling rule that will be passed via Clippper's Execute method.

Path Coordinate range:
Path coordinates must be between ± & h3FFFFFFFFFFFFFFF (± 4.6e+18), otherwise a range error will be thrown when attempting to add the path to the Clipper object. If coordinates can be kept between ± 0x3FFFFFFF (± 1.0e+9), a modest increase in performance (approx. 15-20%) over the larger range can be achieved by avoiding large integer math.

Return Value:
The function will return false if the path is invalid for clipping. A path is invalid for clipping when:

- it has less than 2 vertices
- it has 2 vertices but is not an open path
- the vertices are all co-linear and it is not an open path

Returns true on success.

- 29.1.4 AddPath(path as ClipperPathMBS, PolyType as Integer, Closed as Boolean) as Boolean 5528

29.1.4 AddPath(path as ClipperPathMBS, PolyType as Integer, Closed as Boolean) as Boolean

MBS Tools Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Any number of subject and clip paths can be added to a clipping task, either individually via the AddPath() method, or as groups via the AddPaths() method, or even using both methods.
See also:

- 29.1.3 AddPath(path as ClipperPathMBS, PolyType as ClipperMBS.PolyType, Closed as Boolean) as Boolean 5527

29.1.5 AddPaths(paths as ClipperPathsMBS, PolyType as ClipperMBS.PolyType, Closed as Boolean) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Any number of subject and clip paths can be added to a clipping task, either individually via the AddPath() method, or as groups via the AddPaths() method, or even using both methods.
Notes:

'Subject' paths may be either open (lines) or closed (polygons) or even a mixture of both, but 'clipping' paths must always be closed. Clipper allows polygons to clip both lines and other polygons, but doesn't allow lines to clip either lines or polygons.

With closed paths, orientation should conform with the filling rule that will be passed via Clippper's Execute method.

Path Coordinate range:
Path coordinates must be between ± & h3FFFFFFFFFFFFFFF (± 4.6e+18), otherwise a range error will be thrown when attempting to add the path to the Clipper object. If coordinates can be kept between ± 0x3FFFFFFF (± 1.0e+9), a modest increase in performance (approx. 15-20%) over the larger range can be achieved by avoiding large integer math.

Return Value:
The function will return false if the path is invalid for clipping. A path is invalid for clipping when:

- it has less than 2 vertices
- it has 2 vertices but is not an open path
- the vertices are all co-linear and it is not an open path

Returns true on success.
See also:

- 29.1.6 AddPaths(paths as ClipperPathsMBS, PolyType as Integer, Closed as Boolean) as Boolean 5529

29.1.6 AddPaths(paths as ClipperPathsMBS, PolyType as Integer, Closed as Boolean) as Boolean

MBS Tools Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Any number of subject and clip paths can be added to a clipping task, either individually via the AddPath() method, or as groups via the AddPaths() method, or even using both methods.
See also:

- 29.1.5 AddPaths(paths as ClipperPathsMBS, PolyType as ClipperMBS.PolyType, Closed as Boolean) as Boolean 5528

29.1.7 Clear

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Clear method removes any existing subject and clip polygons allowing the Clipper object to be reused for clipping operations on different polygon sets.

29.1.8 Constructor(initOptions as integer = 0)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Clipper constructor creates an instance of the Clipper class.
Notes:

One or more InitOptions may be passed as a parameter to set the corresponding properties. (These properties can still be set or reset after construction.)

Options:

ReverseSolution	1
StrictlySimple	2
PreserveCollinear	4

29.1.9 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Executes the clipper engine.
See also:

- 29.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5531
- 29.1.11 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5531
- 29.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5532
- 29.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean 5532
- 29.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5534
- 29.1.15 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean 5534
- 29.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5535

29.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Executes the clipper engine.
See also:

- 29.1.9 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5530
- 29.1.11 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5531
- 29.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5532
- 29.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean 5532
- 29.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5534
- 29.1.15 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean 5534
- 29.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5535

29.1.11 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Executes the clipper engine.
See also:

- 29.1.9 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5530
- 29.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5531
- 29.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5532
- 29.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean 5532
- 29.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5534

- 29.1.15 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean 5534
- 29.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5535

29.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Executes the clipper engine.
See also:

- 29.1.9 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5530
- 29.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5531
- 29.1.11 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5531
- 29.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean 5532
- 29.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5534
- 29.1.15 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean 5534
- 29.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5535

29.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Executes the clipper engine.
Notes:

Once subject and clip paths have been assigned (via AddPath and/or AddPaths), Execute can then perform the clipping operation (intersection, union, difference or XOR) specified by the clipType parameter.

The solution parameter can be either a Paths or PolyTree. The Paths is simpler than the PolyTree. Because of this it is quicker to populate and hence clipping performance is a little better (it's roughly 10% faster).

However, the PolyTree class provides more information about the returned paths which may be important to users. Firstly, the PolyTree class preserves nested parent-child polygon relationships (ie outer polygons owning/containing holes and holes owning/containing other outer polygons etc). Also, only the PolyTree class can differentiate between open and closed paths since each PolyNode has an IsOpen property. (The Path structure has no member indicating whether it's open or closed.) For this reason, when open paths are passed to a Clipper object, the user must use a PolyTree object as the solution parameter, otherwise an exception will be raised.

When a PolyTree object is used in a clipping operation on open paths, two ancilliary functions have been provided to quickly separate out open and closed paths from the solution - ClipperMBS.OpenPathsFromPolyTree and ClipperMBS.ClosedPathsFromPolyTree. PolyTreeToPaths is also available to convert path data to a Paths structure (irrespective of whether they're open or closed).

There are several things to note about the solution paths returned:

- they aren't in any specific order
- they should never overlap or be self-intersecting (but see notes on rounding)
- holes will be oriented opposite outer polygons
- the solution fill type can be considered either EvenOdd or NonZero since it will comply with either filling rule
- polygons may rarely share a common edge (though this is now very rare as of version 6)

The subjFillType and clipFillType parameters define the polygon fill rule to be applied to the polygons (ie closed paths) in the subject and clip paths respectively. (It's usual though obviously not essential that both sets of polygons use the same fill rule.)

Execute can be called multiple times without reassigning subject and clip polygons (ie when different clipping operations are required on the same polygon sets).

- 29.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5531
- 29.1.11 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5531
- 29.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5532
- 29.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5534

- 29.1.15 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean 5534
- 29.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5535

29.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Executes the clipper engine.
See also:

- 29.1.9 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5530
- 29.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5531
- 29.1.11 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5531
- 29.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5532
- 29.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean 5532
- 29.1.15 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean 5534
- 29.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5535

29.1.15 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Executes the clipper engine.
See also:

- 29.1.9 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5530
- 29.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5531
- 29.1.11 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5531

- 29.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5532
- 29.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean 5532
- 29.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5534
- 29.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5535

29.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Executes the clipper engine.
See also:

- 29.1.9 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5530
- 29.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5531
- 29.1.11 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5531
- 29.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5532
- 29.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean 5532
- 29.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5534
- 29.1.15 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean 5534

29.1.17 GetBounds(byref left as integer, byref top as integer, byref right as integer, byref bottom as integer)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This method returns the axis-aligned bounding rectangle of all polygons that have been added to the Clipper object.
Notes: This call is more efficient than querying all bounds properties.

29.1.18 Properties

29.1.19 BoundsBottom as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Bottom of bounds.
Notes:

This method returns the bottom value of the axis-aligned bounding rectangle of all polygons that have been added to the Clipper object.
(Read only property)

29.1.20 BoundsLeft as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Left of bounds.
Notes:

This method returns the left value of the axis-aligned bounding rectangle of all polygons that have been added to the Clipper object.
(Read only property)

29.1.21 BoundsRight as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Right of bounds.
Notes:

This method returns the right value of the axis-aligned bounding rectangle of all polygons that have been added to the Clipper object.
(Read only property)

29.1.22 BoundsTop as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Top of bounds.
Notes:

This method returns the top value of the axis-aligned bounding rectangle of all polygons that have been added to the Clipper object.
(Read only property)

29.1.23 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

29.1.24 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The parent object.
Notes:

To avoid Xojo freeing the parent too quick, we keep a reference here.
(Read only property)

29.1.25 PreserveCollinear as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to preserve collinear in input polygons.
Notes:

By default, when three or more vertices are collinear in input polygons (subject or clip), the Clipper object removes the 'inner' vertices before clipping. When enabled the PreserveCollinear property prevents this default behavior to allow these inner vertices to appear in the solution.
(Read and Write property)

29.1.26 ReverseSolution as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** When this property is set to true, polygons returned in the solution parameter of the Execute() method will have orientations opposite to their normal orientations.
Notes: (Read and Write property)

29.1.27 StrictlySimple as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to do strictly simple polygon.
Notes:

Terminology:

- A simple polygon is one that does not self-intersect.
- A weakly simple polygon is a simple polygon that contains 'touching' vertices, or 'touching' edges.
- A strictly simple polygon is a simple polygon that does not contain 'touching' vertices, or 'touching' edges.

Vertices 'touch' if they share the same coordinates (and are not adjacent). An edge touches another if one of its end vertices touches another edge excluding its adjacent edges, or if they are co-linear and overlapping (including adjacent edges).

Polygons returned by clipping operations (see Clipper.Execute()) should always be simple polygons. When the StrictlySimply property is enabled, polygons returned will be strictly simple, otherwise they may be weakly simple. It's computationally expensive ensuring polygons are strictly simple and so this property is disabled by default.

Note: There's currently no guarantee that polygons will be strictly simple since 'simplifying' is still a work in progress.
(Read and Write property)

29.1.28 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The tag value.
Notes:

You can store here whatever value you like.
(Read and Write property)

29.2 class ClipperExceptionMBS

29.2.1 class ClipperExceptionMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The exception class for clipper.
Notes: Subclass of the RuntimeException class.

29.3 module ClipperMBS

29.3.1 module ClipperMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The central module for Clipper library methods.

29.3.2 Blog Entries

29.3.4 Methods

29.3.5 Area(path as ClipperPathMBS) as double

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This function returns the area of the supplied polygon.
Notes: It's assumed that the path is closed and does not self-intersect. Depending on orientation, this value may be positive or negative. If Orientation is true, then the area will be positive and conversely, if Orientation is false, then the area will be negative.

29.3.6 CleanPolygon(InPoly as ClipperPathMBS, byref OutPolys as ClipperPathsMBS, distance as double = 1.415)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a clean polygon.
Notes:

Removes vertices:
that join co-linear edges, or join edges that are almost co-linear (such that if the vertex was moved no more than the specified distance the edges would be co-linear)
that are within the specified distance of an adjacent vertex
that are within the specified distance of a semi-adjacent vertex together with their out-lying vertices

Vertices are semi-adjacent when they are separated by a single (out-lying) vertex.

The distance parameter's default value is approximately √2 so that a vertex will be removed when adjacent or semi-adjacent vertices having their corresponding X and Y coordinates differing by no more than 1 unit. (If the egdes are semi-adjacent the out-lying vertex will be removed too.)

This function is overloaded. In the first definition, the InPoly and OutPolys parameters can reference the same Path object though in that case the calling code might be clearer if the second definition (accepting a single Paths parameter) is used.
See also:

- 29.3.7 CleanPolygon(Poly as ClipperPathMBS, distance as double = 1.415) 5541

29.3.7 CleanPolygon(Poly as ClipperPathMBS, distance as double = 1.415)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a clean polygon.
Notes:

Removes vertices:
that join co-linear edges, or join edges that are almost co-linear (such that if the vertex was moved no more than the specified distance the edges would be co-linear)
that are within the specified distance of an adjacent vertex
that are within the specified distance of a semi-adjacent vertex together with their out-lying vertices
Vertices are semi-adjacent when they are separated by a single (out-lying) vertex.

The distance parameter's default value is approximately √2 so that a vertex will be removed when adjacent or semi-adjacent vertices having their corresponding X and Y coordinates differing by no more than 1 unit. (If the egdes are semi-adjacent the out-lying vertex will be removed too.)

This function is overloaded. In the first definition, the in_poly and out_poly parameters can reference the same Path object though in that case the calling code might be clearer if the second definition (accepting a single Paths parameter) is used.
See also:

- 29.3.6 CleanPolygon(InPoly as ClipperPathMBS, byref OutPolys as ClipperPathsMBS, distance as double = 1.415) 5540

29.3.8 CleanPolygons(InPoly as ClipperPathsMBS, byref OutPolys as ClipperPathsMBS, distance as double = 1.415)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates clean polygons.
Notes:

Removes vertices:
that join co-linear edges, or join edges that are almost co-linear (such that if the vertex was moved no more than the specified distance the edges would be co-linear)
that are within the specified distance of an adjacent vertex
that are within the specified distance of a semi-adjacent vertex together with their out-lying vertices
Vertices are semi-adjacent when they are separated by a single (out-lying) vertex.

The distance parameter's default value is approximately √2 so that a vertex will be removed when adjacent or semi-adjacent vertices having their corresponding X and Y coordinates differing by no more than 1 unit. (If the egdes are semi-adjacent the out-lying vertex will be removed too.)

This function is overloaded. In the first definition, the InPoly and OutPoly parameters can reference the same Paths object though in that case the calling code might be clearer if the second definition (accepting a single Paths parameter) is used.
See also:

- 29.3.9 CleanPolygons(Poly as ClipperPathsMBS, distance as double = 1.415) 5542

29.3.9 CleanPolygons(Poly as ClipperPathsMBS, distance as double = 1.415)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates clean polygons.
Notes:

Removes vertices:
that join co-linear edges, or join edges that are almost co-linear (such that if the vertex was moved no more than the specified distance the edges would be co-linear)
that are within the specified distance of an adjacent vertex
that are within the specified distance of a semi-adjacent vertex together with their out-lying vertices
Vertices are semi-adjacent when they are separated by a single (out-lying) vertex.

The distance parameter's default value is approximately √2 so that a vertex will be removed when adjacent or semi-adjacent vertices having their corresponding X and Y coordinates differing by no more than 1 unit. (If the egdes are semi-adjacent the out-lying vertex will be removed too.)

This function is overloaded. In the first definition, the InPoly and OutPoly parameters can reference the same Paths object though in that case the calling code might be clearer if the second definition (accepting a single Paths parameter) is used.
See also:

- 29.3.8 CleanPolygons(InPoly as ClipperPathsMBS, byref OutPolys as ClipperPathsMBS, distance as double = 1.415) 5541

29.3.10 ClosedPathsFromPolyTree(polytree as ClipperPolyTreeMBS, byref paths as ClipperPathsMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This function filters out open paths from the PolyTree structure and returns only closed paths in a Paths structure.

29.3.11 EllipsePoints(Left as Double, Top as Double, Right as Double, Bottom as Double) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates an ellipse as path of points with given bounding rectangle.
Example:

```
dim p as ClipperPathMBS = ClipperMBS.EllipsePoints(100,100,300,300)
```

29.3.12 MinkowskiDiff(poly1 as ClipperPathMBS, poly2 as ClipperPathMBS, byref solution as ClipperPathsMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates Minkowski Difference.
Notes:

Minkowski Difference is performed by subtracting each point in a polygon from the set of points in an open or closed path. A key feature of Minkowski Difference is that when it's applied to two polygons, the resulting polygon will contain the coordinate space origin whenever the two polygons touch or overlap. (This function is often used to determine when polygons collide.)

In the image on the left the blue polygon is the 'minkowski difference' of the two red boxes. The black dot represents the coordinate space origin.

29.3.13 MinkowskiSum(pattern as ClipperPathMBS, path as ClipperPathMBS, byref solution as ClipperPathsMBS, pathIsClosed as boolean)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates Minkowski sum.
Notes: Minkowski Addition is performed by adding each point in a polygon 'pattern' to the set of points in an open or closed path. The resulting polygon (or polygons) defines the region that the 'pattern' would pass over in moving from the beginning to the end of the 'path'.
See also:

- 29.3.14 MinkowskiSum(pattern as ClipperPathMBS, paths as ClipperPathsMBS, byref solution as ClipperPathsMBS, pathIsClosed as boolean) 5544

29.3.14 MinkowskiSum(pattern as ClipperPathMBS, paths as ClipperPathsMBS, byref solution as ClipperPathsMBS, pathIsClosed as boolean)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates Minkowski sum.
Notes: Minkowski Addition is performed by adding each point in a polygon 'pattern' to the set of points in an open or closed path. The resulting polygon (or polygons) defines the region that the 'pattern' would pass over in moving from the beginning to the end of the 'path'.
See also:

- 29.3.13 MinkowskiSum(pattern as ClipperPathMBS, path as ClipperPathMBS, byref solution as ClipperPathsMBS, pathIsClosed as boolean) 5543

29.3.15 OpenPathsFromPolyTree(polytree as ClipperPolyTreeMBS, byref paths as ClipperPathsMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This function filters out closed paths from the PolyTree structure and returns only open paths in a Paths structure.

29.3.16 Orientation(path as ClipperPathMBS) as boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries orientation of path.
Notes:

Orientation is only important to closed paths. Given that vertices are declared in a specific order, orientation refers to the direction (clockwise or counter-clockwise) that these vertices progress around a closed path.

Orientation is also dependent on axis direction:

- On Y-axis positive upward displays, Orientation will return true if the polygon's orientation is counter-clockwise.
- On Y-axis positive downward displays, Orientation will return true if the polygon's orientation is clockwise.

Notes:

- Self-intersecting polygons have indeterminate orientations in which case this function won't return a meaningful value.

- The majority of 2D graphic display libraries (eg GDI, GDI+, XLib, Cairo, AGG, Graphics32) and even the SVG file format have their coordinate origins at the top-left corner of their respective viewports with their Y axes increasing downward. However, some display libraries (eg Quartz, OpenGL) have their coordinate origins undefined or in the classic bottom-left position with their Y axes increasing upward.

- For Non-Zero filled polygons, the orientation of holes must be opposite that of outer polygons.

- For closed paths (polygons) in the solution returned by Clipper's Execute method, their orientations will always be true for outer polygons and false for hole polygons (unless the ReverseSolution property has been enabled).

29.3.17 PointInPolygon(path as ClipperPathMBS, pt as ClipperPointMBS) as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns 0 when false, -1 when pt is on poly and +1 when pt is in poly.
Notes: It's assumed that 'poly' is closed and does not self-intersect.

29.3.18 PolyTreeToPaths(polytree as ClipperPolyTreeMBS, byref paths as ClipperPathsMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This function converts a PolyTree structure into a Paths structure.

29.3.19 ReversePath(path as ClipperPathMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reverses the vertex order (and hence orientation) in the specified path.

29.3.20 ReversePaths(paths as ClipperPathsMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reverses the vertex order (and hence orientation) in each contained path.

29.3.21 SimplifyPolygon(InPoly as ClipperPathMBS, byref OutPolys as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType = ClipperMBS.PolyFillType.EvenOdd)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes self-intersections from the supplied polygon (by performing a boolean union operation using the nominated PolyFillType).
Notes:

Polygons with non-contiguous duplicate vertices (ie 'touching') will be split into two polygons.

Note: There's currently no guarantee that polygons will be strictly simple since 'simplifying' is still a work in progress.
See also:

- 29.3.22 SimplifyPolygon(InPoly as ClipperPathMBS, byref OutPolys as ClipperPathsMBS, fillType as Integer) 5546

29.3.22 SimplifyPolygon(InPoly as ClipperPathMBS, byref OutPolys as ClipperPathsMBS, fillType as Integer)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes self-intersections from the supplied polygon (by performing a boolean union operation using the nominated PolyFillType).
Notes:

Polygons with non-contiguous duplicate vertices (ie 'touching') will be split into two polygons.

Note: There's currently no guarantee that polygons will be strictly simple since 'simplifying' is still a work in progress.
See also:

- 29.3.21 SimplifyPolygon(InPoly as ClipperPathMBS, byref OutPolys as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType = ClipperMBS.PolyFillType.EvenOdd) 5546

29.3.23 SimplifyPolygons(InPolys as ClipperPathsMBS, byref OutPolys as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType = ClipperMBS.PolyFillType.EvenOdd)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes self-intersections from the supplied polygons (by performing a boolean union operation using the nominated PolyFillType).
Notes:

Polygons with non-contiguous duplicate vertices (ie 'vertices are touching') will be split into two polygons.

This function is overloaded. In the first definition, the InPolys and OutPolys parameters can reference the same Paths object though in that case the calling code might be clearer if the second definition (accepting a single Paths parameter) is used.

Note: There's currently no guarantee that polygons will be strictly simple since 'simplifying' is still a work in progress.

- 29.3.25 SimplifyPolygons(Polys as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType = ClipperMBS.PolyFillType.EvenOdd) 5548

29.3.27 TranslatePath(path as ClipperPathMBS, delta as ClipperPointMBS) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Offsets each point in path by x and y.
Notes: Returns a new path.
See also:

- 29.3.28 TranslatePath(path as ClipperPathMBS, x as Int64, y as Int64) as ClipperPathMBS 5549

29.3.28 TranslatePath(path as ClipperPathMBS, x as Int64, y as Int64) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Offsets each point in path by x and y.
Notes: Returns a new path.
See also:

- 29.3.27 TranslatePath(path as ClipperPathMBS, delta as ClipperPointMBS) as ClipperPathMBS 5549

29.3.29 Version as string

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries the version of the Clipper library used.

29.3.30 Constants

29.3.31 hiRange = & h3FFFFFFFFFFFFFFF

MBS Tools Plugin, Plugin Version: 18.0. **Function:** The higher range.

29.3.32 loRange = & h3FFFFFFF

MBS Tools Plugin, Plugin Version: 18.0. **Function:** The lower range.

29.4 class ClipperOffsetMBS

29.4.1 class ClipperOffsetMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The ClipperOffset class encapsulates the process of offsetting (inflating/deflating) both open and closed paths using a number of different join types and end types.
Notes:

Preconditions for offsetting:
1. The orientations of closed paths must be consistent such that outer polygons share the same orientation, and any holes have the opposite orientation (ie non-zero filling). Open paths must be oriented with closed outer polygons.
2. Polygons must not self-intersect.

Limitations:
When offsetting, small artefacts may appear where polygons overlap. To avoid these artefacts, offset overlapping polygons separately.

29.4.2 Blog Entries

- Did you try our new Clipper plugin classes?

29.4.3 Methods

29.4.4 AddPath(path as ClipperPathMBS, joinType as ClipperMBS.JoinType, endType as ClipperMBS.EndType)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a Path to a ClipperOffset object in preparation for offsetting.
Notes: Any number of paths can be added, and each has its own JoinType and EndType. All 'outer' Paths must have the same orientation, and any 'hole' paths must have reverse orientation. Closed paths must have at least 3 vertices. Open paths may have as few as one vertex. Open paths can only be offset with positive deltas.
See also:

- 29.4.5 AddPath(path as ClipperPathMBS, joinType as Integer, endType as Integer) 5550

29.4.5 AddPath(path as ClipperPathMBS, joinType as Integer, endType as Integer)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a Path to a ClipperOffset object in preparation for offsetting.

Notes: Any number of paths can be added, and each has its own JoinType and EndType. All 'outer' Paths must have the same orientation, and any 'hole' paths must have reverse orientation. Closed paths must have at least 3 vertices. Open paths may have as few as one vertex. Open paths can only be offset with positive deltas.
See also:

- 29.4.4 AddPath(path as ClipperPathMBS, joinType as ClipperMBS.JoinType, endType as ClipperMBS.EndType) 5550

29.4.6 AddPaths(paths as ClipperPathsMBS, joinType as ClipperMBS.JoinType, endType as ClipperMBS.EndType)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds Paths to a ClipperOffset object in preparation for offsetting.
Notes: Any number of paths can be added, and each path has its own JoinType and EndType. All 'outer' Paths must have the same orientation, and any 'hole' paths must have reverse orientation. Closed paths must have at least 3 vertices. Open paths may have as few as one vertex. Open paths can only be offset with positive deltas.
See also:

- 29.4.7 AddPaths(paths as ClipperPathsMBS, joinType as Integer, endType as Integer) 5551

29.4.7 AddPaths(paths as ClipperPathsMBS, joinType as Integer, endType as Integer)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds Paths to a ClipperOffset object in preparation for offsetting.
Notes: Any number of paths can be added, and each path has its own JoinType and EndType. All 'outer' Paths must have the same orientation, and any 'hole' paths must have reverse orientation. Closed paths must have at least 3 vertices. Open paths may have as few as one vertex. Open paths can only be offset with positive deltas.
See also:

- 29.4.6 AddPaths(paths as ClipperPathsMBS, joinType as ClipperMBS.JoinType, endType as ClipperMBS.EndType) 5551

29.4.8 Clear

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This method clears all paths from the ClipperOffset object, allowing new paths to be assigned.

29.4.9 Constructor(miterLimit as double = 2.0, roundPrecision as double = 0.25)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Initializes the clipper offset.
Notes: The ClipperOffset constructor takes 2 optional parameters: MiterLimit and ArcTolerance. Thes two parameters corresponds to properties of the same name. MiterLimit is only relevant when JoinType is jtMiter, and ArcTolerance is only relevant when JoinType is jtRound or when EndType is etOpenRound.

29.4.10 Execute(byref Paths as ClipperPathsMBS, delta as double)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Executes the clipper offset engine.
Notes:

This method takes two parameters. The first is the structure that receives the result of the offset operation (either a PolyTree or a Paths structure). The second parameter is the amount to which the supplied paths will be offset. Negative delta values shrink polygons and positive delta expand them.

This method can be called multiple times, offsetting the same paths by different amounts (ie using different deltas).
See also:

- 29.4.11 Execute(byref PolyTree as ClipperPolyTreeMBS, delta as double) 5552

29.4.11 Execute(byref PolyTree as ClipperPolyTreeMBS, delta as double)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Executes the clipper offset engine.
Notes:

This method takes two parameters. The first is the structure that receives the result of the offset operation (either a PolyTree or a Paths structure). The second parameter is the amount to which the supplied paths will be offset. Negative delta values shrink polygons and positive delta expand them.

This method can be called multiple times, offsetting the same paths by different amounts (ie using different deltas).
See also:

- 29.4.10 Execute(byref Paths as ClipperPathsMBS, delta as double) 5552

29.4.12 Properties

29.4.13 ArcTolerance as Double

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The arc tolerance.
Notes:

Firstly, this field/property is only relevant when JoinType = jtRound and/or EndType = etRound.

Since flattened paths can never perfectly represent arcs, this field/property specifies a maximum acceptable imprecision ('tolerance') when arcs are approximated in an offsetting operation. Smaller values will increase 'smoothness' up to a point though at a cost of performance and in creating more vertices to construct the arc.

The default ArcTolerance is 0.25 units. This means that the maximum distance the flattened path will deviate from the 'true' arc will be no more than 0.25 units (before rounding).

Reducing tolerances below 0.25 will not improve smoothness since vertex coordinates will still be rounded to integer values. The only way to achieve sub-integer precision is through coordinate scaling before and after offsetting (see example below).

It's important to make ArcTolerance a sensible fraction of the offset delta (arc radius). Large tolerances relative to the offset delta will produce poor arc approximations but, just as importantly, very small tolerances will substantially slow offsetting performance while providing unnecessary degrees of precision. This is most likely to be an issue when offsetting polygons whose coordinates have been scaled to preserve floating point precision.

Example:
Imagine a set of polygons (defined in floating point coordinates) that is to be offset by 10 units using round joins, and the solution is to retain floating point precision up to at least 6 decimal places.
To preserve this degree of floating point precision, and given that Clipper and ClipperOffset both operate on integer coordinates, the polygon coordinates will be scaled up by 108 (and rounded to integers) prior to offsetting. Both offset delta and ArcTolerance will also need to be scaled by this same factor. If ArcTolerance was left unscaled at the default 0.25 units, every arc in the solution would contain a fraction of 44 THOUSAND vertices while the final arc imprecision would be 0.25 × 10-8 units (ie once scaling was reversed). However, if 0.1 units was an acceptable imprecision in the final unscaled solution, then ArcTolerance should be set to 0.1 × scaling_factor (0.1 × 108). Now if scaling is applied equally to both ArcTolerance and to Delta Offset, then in this example the number of vertices (steps) defining each arc would be a fraction of 23.

The formula for the number of steps in a full circular arc is ... Pi / acos(1 - arc_tolerance / abs(delta))
(Read and Write property)

29.4.14 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

29.4.15 MiterLimit as Double

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The miter limit.
Notes:

This property sets the maximum distance in multiples of delta that vertices can be offset from their original positions before squaring is applied. (Squaring truncates a miter by 'cutting it off' at 1 × delta distance from the original vertex.)

The default value for MiterLimit is 2 (ie twice delta). This is also the smallest MiterLimit that's allowed. If mitering was unrestricted (ie without any squaring), then offsets at very acute angles would generate unacceptably long 'spikes'.
(Read and Write property)

29.4.16 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The parent object.
Notes:

To avoid Xojo freeing the parent too quick, we keep a reference here.
(Read only property)

29.4.17 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The tag value.
Notes:

You can store here whatever value you like.
(Read and Write property)

29.5 class ClipperPathMBS

29.5.1 class ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This class contains a sequence of IntPoint vertices defining a single contour (see also terminology).
Notes:

Paths may be open and represent a series of line segments bounded by 2 or more vertices, or they may be closed and represent polygons. Whether or not a path is open depends on context. Closed paths may be 'outer' contours or 'hole' contours. Which they are depends on orientation.

Multiple paths can be grouped into a Paths class: ClipperPathsMBS.

29.5.2 Methods

29.5.3 Append(item as ClipperPointMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Appends a new point to the path.
See also:

- 29.5.4 Append(X as Int64, Y as Int64) 5555

29.5.4 Append(X as Int64, Y as Int64)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Appends a new path.
Notes: Without creating intermediate Xojo ClipperPointMBS object.
See also:

- 29.5.3 Append(item as ClipperPointMBS) 5555

29.5.5 Area as double

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This function returns the area of the supplied polygon.
Example:

```
dim points() as ClipperPointMBS

points.Append new ClipperPointMBS(1,2)
points.Append new ClipperPointMBS(4,2)
```

```
points.Append new ClipperPointMBS(4,6)
points.Append new ClipperPointMBS(1,6)

dim path as new ClipperPathMBS(points)
dim area as Double = path.Area
```

Notes: It's assumed that the path is closed and does not self-intersect. Depending on orientation, this value may be positive or negative. If Orientation is true, then the area will be positive and conversely, if Orientation is false, then the area will be negative.

29.5.6 Clear

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clears the path.

29.5.7 Constructor

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new empty path.
See also:

- 29.5.8 Constructor(otherPath as ClipperPathMBS) 5556
- 29.5.9 Constructor(points() as ClipperPointMBS) 5556

29.5.8 Constructor(otherPath as ClipperPathMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new path with the copy of old path.
See also:

- 29.5.7 Constructor 5556
- 29.5.9 Constructor(points() as ClipperPointMBS) 5556

29.5.9 Constructor(points() as ClipperPointMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new path with given points.
See also:

- 29.5.7 Constructor 5556
- 29.5.8 Constructor(otherPath as ClipperPathMBS) 5556

29.5.10 Equal(otherPath as ClipperPathMBS) as boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Checks if two paths are equal.
Notes: Returns true if both are equal.

29.5.11 Insert(Index as Integer, item as ClipperPointMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Inserts a point into the path at given index.
Notes: Index = 0 adds as first path.

29.5.12 Orientation as boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries orientation of path.
Example:

```
dim points() as ClipperPointMBS

points.Append new ClipperPointMBS(1,2)
points.Append new ClipperPointMBS(4,2)
points.Append new ClipperPointMBS(4,6)
points.Append new ClipperPointMBS(1,6)

dim path as new ClipperPathMBS(points)
dim Orientation as boolean = path.Orientation
```

Notes:

Orientation is only important to closed paths. Given that vertices are declared in a specific order, orientation refers to the direction (clockwise or counter-clockwise) that these vertices progress around a closed path.

Orientation is also dependent on axis direction:

- On Y-axis positive upward displays, Orientation will return true if the polygon's orientation is counter-clockwise.

- On Y-axis positive downward displays, Orientation will return true if the polygon's orientation is clockwise.

Notes:

- Self-intersecting polygons have indeterminate orientations in which case this function won't return a meaningful value.
- The majority of 2D graphic display libraries (eg GDI, GDI+, XLib, Cairo, AGG, Graphics32) and even the SVG file format have their coordinate origins at the top-left corner of their respective viewports with their Y axes increasing downward. However, some display libraries (eg Quartz, OpenGL) have their coordinate origins undefined or in the classic bottom-left position with their Y axes increasing upward.
- For Non-Zero filled polygons, the orientation of holes must be opposite that of outer polygons.
- For closed paths (polygons) in the solution returned by Clipper's Execute method, their orientations will always be true for outer polygons and false for hole polygons (unless the ReverseSolution property has been enabled).

29.5.13 PointInPolygon(pt as ClipperPointMBS) as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns 0 when false, -1 when pt is on poly and +1 when pt is in poly.
Example:

```
dim points() as ClipperPointMBS

points.Append new ClipperPointMBS(1,2)
points.Append new ClipperPointMBS(4,2)
points.Append new ClipperPointMBS(4,6)
points.Append new ClipperPointMBS(1,6)

dim path as new ClipperPathMBS(points)

dim b1 as Integer = path.PointInPolygon(new ClipperPointMBS(2,2)) // -1 on line
dim b2 as Integer = path.PointInPolygon(new ClipperPointMBS(2,22)) // 0 outside
dim b3 as Integer = path.PointInPolygon(new ClipperPointMBS(2,3)) // 1 = inside
```

Notes: It's assumed that 'poly' is closed and does not self-intersect.

29.5.14 Remove(index as integer)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes a point.

29.5.15 ReversePath

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reverses the vertex order (and hence orientation) in the specified path.

29.5.16 TranslatePath(delta as ClipperPointMBS) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Offsets each point in path by x and y.
Notes: Returns a new path.
See also:

- 29.5.17 TranslatePath(x as Int64, y as Int64) as ClipperPathMBS 5559

29.5.17 TranslatePath(x as Int64, y as Int64) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Offsets each point in path by x and y.
Notes: Returns a new path.
See also:

- 29.5.16 TranslatePath(delta as ClipperPointMBS) as ClipperPathMBS 5559

29.5.18 Values as ClipperPointMBS()

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates copy of path as Xojo array or ClipperPointMBS.

29.5.19 ValuesToArray(dest() as ClipperPointMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds ClipperPointMBS objects for the points in the path to the Xojo array.
Notes: Mainly for older Xojo versions where the plugin can't create an array for you.

29.5.20 Properties

29.5.21 Count as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns number of points in path.
Notes: (Read only property)

29.5.22 Empty as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true if path is empty.
Notes: (Read only property)

29.5.23 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

29.5.24 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The parent object.
Notes:

To avoid Xojo freeing the parent too quick, we keep a reference here.
(Read only property)

29.5.25 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The tag value.
Notes:

You can store here whatever value you like.
(Read and Write property)

29.5.26 Value(Index as Integer) as ClipperPointMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries or sets a value in the path.
Notes:

Raises exception if out of bounds.
(Read and Write computed property)

29.6 class ClipperPathsMBS

29.6.1 class ClipperPathsMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a list of paths.
Notes:

This class is fundamental to the Clipper Library. It's a list or array of one or more Path structures. (The Path structure contains an ordered list of vertices that make a single contour.)

Paths may open (a series of line segments), or they may closed (polygons). Whether or not a path is open depends on context. Closed paths may be 'outer' contours or 'hole' contours. Which they are depends on orientation.

29.6.2 Methods

29.6.3 Append(item as ClipperPathMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Appends a new path to the paths.

29.6.4 Clear

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clears the path.

29.6.5 Constructor

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new empty path.
See also:

- 29.6.6 Constructor(otherPaths as ClipperPathsMBS) 5562

29.6.6 Constructor(otherPaths as ClipperPathsMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new paths list with the copy of old paths list.
See also:

• 29.6.5 Constructor 5562

29.6.7 Equal(otherPaths as ClipperPathsMBS) as boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Checks if two path lists are equal.
Notes: Returns true if both are equal.

29.6.8 Insert(Index as Integer, item as ClipperPathMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Inserts a path into the path list at given index.
Notes: Index = 0 adds as first point.

29.6.9 Remove(index as integer)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes a path.

29.6.10 Reverse

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reverses the vertex order (and hence orientation) in the specified paths.

29.6.11 Values as ClipperPathMBS()

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates copy of path list as Xojo array or ClipperPathMBS.

29.6.12 ValuesToArray(dest() as ClipperPathMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds ClipperPathMBS objects for the paths in the path list to the Xojo array.
Notes: Mainly for older Xojo versions where the plugin can't create an array for you.

29.6.13 Properties

29.6.14 Count as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns number of paths in paths.
Notes: (Read only property)

29.6.15 Empty as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true if path list is empty.
Notes: (Read only property)

29.6.16 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

29.6.17 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The parent object.
Notes:

To avoid Xojo freeing the parent too quick, we keep a reference here.
(Read only property)

29.6.18 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The tag value.
Notes:

You can store here whatever value you like.
(Read and Write property)

29.6.19 Value(Index as Integer) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries or sets a value in the path.
Notes:

Raises exception if out of bounds.
(Read and Write computed property)

29.7 class ClipperPointMBS

29.7.1 class ClipperPointMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a point.
Notes: All functions accept nil as a point with values 0/0.

29.7.2 Methods

29.7.3 Constructor(x as Int64 = 0, y as Int64 = 0)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new point with given values.

29.7.4 Equal(other as ClipperPointMBS) as boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compares two points.
Notes:

Returns true if both have same value.
All functions accept nil as a point with values 0/0.

29.7.5 Point(x as Int64 = 0, y as Int64 = 0) as ClipperPointMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new point with given values.

29.7.6 Properties

29.7.7 X as Int64

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The x coordinate.
Notes: (Read and Write property)

29.7.8 Y as Int64

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The y coordinate.
Notes: (Read and Write property)

29.8 class ClipperPolyNodeMBS

29.8.1 class ClipperPolyNodeMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a poly node.
Notes:

PolyNodes are encapsulated within a PolyTree container, and together provide a data structure representing the parent-child relationships of polygon contours returned by Clipper's Execute method.

A PolyNode object represents a single polygon. Its IsHole property indicates whether it's an outer or a hole. PolyNodes may own any number of PolyNode children (Childs), where children of outer polygons are holes, and children of holes are (nested) outer polygons.

29.8.2 Methods

29.8.3 Constructor

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor for a new object.

29.8.4 Properties

29.8.5 ChildCount as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the number of PolyNode Childs directly owned by the PolyNode object.
Notes: (Read only property)

29.8.6 Childs as ClipperPolyNodesMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The children.
Notes:

A read-only list of PolyNode.
Outer PolyNode childs contain hole PolyNodes, and hole PolyNode childs contain nested outer PolyNodes.
(Read only property)

29.8.7 Contour as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a path list which contains any number of vertices.
Notes: (Read and Write property)

29.8.8 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

29.8.9 IsHole as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true when the PolyNode's polygon (Contour) is a hole.
Notes:

Children of outer polygons are always holes, and children of holes are always (nested) outer polygons.
The IsHole property of a PolyTree object is undefined but its children are always top-level outer polygons.
(Read only property)

29.8.10 IsOpen as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true when the PolyNode's Contour results from a clipping operation on an open contour (path).
Notes:

Only top-level PolyNodes can contain open contours.
(Read only property)

29.8.11 NextNode as ClipperPolyNodeMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The returned Polynode will be the first child if any, otherwise the next sibling, otherwise the next sibling of the Parent etc.
Notes:

A PolyTree can be traversed very easily by calling First() followed by NextNode in a loop until the returned object is a nil reference ...

(Read only property)

29.8.12 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The parent object.
Notes:

To avoid Xojo freeing the parent too quick, we keep a reference here.
(Read only property)

29.8.13 ParentNode as ClipperPolyNodeMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the parent PolyNode.
Notes:

The PolyTree object (which is also a PolyNode) does not have a parent and will return a null pointer.
(Read only property)

29.8.14 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The tag value.
Notes:

You can store here whatever value you like.
(Read and Write property)

29.9 class ClipperPolyNodesMBS

29.9.1 class ClipperPolyNodesMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for the node list.

29.9.2 Methods

29.9.3 Append(item as ClipperPolyNodeMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Appends a new node to the node list.

29.9.4 Clear

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clears the node list.

29.9.5 Constructor

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new empty node list.
See also:

- 29.9.6 Constructor(otherPolyNodes as ClipperPolyNodesMBS) 5571

29.9.6 Constructor(otherPolyNodes as ClipperPolyNodesMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new poly node list with the copy of old poly node list.
See also:

- 29.9.5 Constructor 5571

29.9.7 Equal(otherPolyNodes as ClipperPolyNodesMBS) as boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Checks if two node lists are equal.

Notes: Returns true if both are equal.

29.9.8 Insert(Index as Integer, item as ClipperPolyNodeMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Inserts a poly node into the node list at given index.
Notes: Index = 0 adds as first node.

29.9.9 Remove(index as integer)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes a node.

29.9.10 Values as ClipperPolyNodeMBS()

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates copy of node list as Xojo array or ClipperPolyNodeMBS.

29.9.11 Properties

29.9.12 Count as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns number of nodes.
Notes: (Read only property)

29.9.13 Empty as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true if list is empty.
Notes: (Read only property)

29.9.14 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.

Notes: (Read and Write property)

29.9.15 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The parent object.
Notes:

To avoid Xojo freeing the parent too quick, we keep a reference here.
(Read only property)

29.9.16 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The tag value.
Notes:

You can store here whatever value you like.
(Read and Write property)

29.9.17 Value(Index as Integer) as ClipperPolyNodeMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries or sets a value in the node list.
Notes:

Raises exception if out of bounds.
(Read and Write computed property)

29.10 class ClipperPolyTreeMBS

29.10.1 class ClipperPolyTreeMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** PolyTree is intended as a read-only data structure that should only be used to receive solutions from clipping and offsetting operations.
Notes:

It's an alternative to the Paths data structure which also receives these solutions. PolyTree's two major advantages over the Paths structure are: it properly represents the parent-child relationships of the returned polygons; it differentiates between open and closed paths. However, since PolyTree is a more complex structure than the Paths structure, and since it's more computationally expensive to process (the Execute method being roughly 5-10% slower), it should used only be when parent-child polygon relationships are needed, or when open paths are being 'clipped'.

An empty PolyTree object can be passed as the solution parameter in ClipperEngineMBS.Execute and in ClipperOffsetMBS.Execute. Once the clipping or offseting operation is completed, the method returns with the PolyTree structure filled with data representing the solution.

A PolyTree object is a container for any number of PolyNode children, with each contained PolyNode representing a single polygon contour (either an outer or hole polygon). PolyTree itself is a specialized PolyNode whose immediate children represent the top-level outer polygons of the solution. (Its own Contour property is always empty.) The contained top-level PolyNodes may contain their own PolyNode children representing hole polygons that may also contain children representing nested outer polygons etc. Children of outers will always be holes, and children of holes will always be outers.

PolyTrees can also contain open paths. Open paths will always be represented by top level PolyNodes. Two functions are provided to quickly separate out open and closed paths from a polytree - OpenPathsFromPolyTree and ClosedPathsFromPolyTree.
Subclass of the ClipperPolyNodeMBS class.

29.10.2 Methods

29.10.3 Clear

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This method clears any PolyNode children contained by PolyTree the object.
Notes: Clear does not need to be called explicitly. The Clipper.Execute method that accepts a PolyTree parameter will automatically clear the PolyTree object before propagating it with new PolyNodes. Likewise, PolyTree's destructor will also automatically clear any contained PolyNodes.

29.10.4 Constructor

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new empty polytree.
See also:

- 29.10.5 Constructor(otherPolyNodes as ClipperPolyTreeMBS) 5575

29.10.5 Constructor(otherPolyNodes as ClipperPolyTreeMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a copy of an existing poly tree.
See also:

- 29.10.4 Constructor 5575

29.10.6 Properties

29.10.7 First as ClipperPolyNodeMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The first node.
Notes:

This method returns the first outer polygon contour if any, otherwise a null pointer.

This function is almost equivalent to calling Childs [0] except that when a PolyTree object is empty (has no children), calling Childs [0] would raise an out of range exception.
(Read only property)

29.10.8 Total as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the total number of PolyNodes (polygons) contained within the PolyTree.
Notes:

This value is not to be confused with ChildCount which returns the number of immediate children only (Childs) contained by PolyTree.
(Read only property)

Chapter 30

CloudKit

30.1 class CKAcceptSharesOperationMBS

30.1.1 class CKAcceptSharesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An operation that accepts shared records.
Notes: Subclass of the CKOperationMBS class.

30.1.2 Methods

30.1.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to process share metadata.
Notes: You can use the returned CKAcceptSharesOperation only once. When executed, this query object processes the share metadata.
See also:

- 30.1.4 Constructor(shareMetadatas() as CKShareMetadataMBS) 5577

30.1.4 Constructor(shareMetadatas() as CKShareMetadataMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to process the specified share objects.
Notes: shareMetadatas: An array of CKShareMetadataMBS objects. This parameter is used to initialize the value in the shareMetadatas property. If you specify nil, you must assign an appropriate value to the

shareMetadatas property before executing the operation.
See also:

- 30.1.3 Constructor 5577

30.1.5 setShareMetadatas(shareMetadatas() as CKShareMetadataMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the metadata of the shares that you want to process.
Notes: Use this property to view or change the metadata of the share objects you want to process. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

30.1.6 shareMetadatas as CKShareMetadataMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The metadata of the shares that you want to process.
Notes: Use this property to view or change the metadata of the share objects you want to process. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

30.1.7 Events

30.1.8 acceptSharesCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called when the operation completes.
Notes:

The Completed event of the underlying NSOperation is also called if both are set. If the error is CKErrorPartialFailure, the error's userInfo dictionary contains a dictionary of shareURL objects to errors keyed off of CKPartialErrorsByItemIDKey. This call happens as soon as the server has seen all record changes and may be invoked while the server is processing the side effects of those changes.

The event is executed serially with respect to the other progress blocks of the operation. If you intend to use this event to process results, update the value of this property before executing the operation or submitting the operation object to a queue.

30.1.9 perShareCompleted(shareMetadata as CKShareMetadataMBS, acceptedShare as CKShareMBS, error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute for each share metadata that the server has processed.
Notes:

If the error is nil the share was successfully accepted. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

30.2 class CKAssetMBS

30.2.1 class CKAssetMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for a file.

30.2.2 Methods

30.2.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.2.4 Constructor(file as FolderItem)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initialize an asset to be saved with the content at the given file.
See also:

- 30.2.5 Constructor(URL as String) 5580

30.2.5 Constructor(URL as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initialize an asset to be saved with the content at the given file URL.
See also:

- 30.2.4 Constructor(file as FolderItem) 5580

30.2.6 Properties

30.2.7 fileURL as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The URL to the file.
Notes:

Local file URL where fetched records are cached and saved records originate from.
(Read only property)

30.2.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.3 class CKContainerMBS

30.3.1 class CKContainerMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An encapsulation of content associated with an app, including content that is accessible to all users and content that is available only to a specific user.
Notes:

A container object manages all explicit and implicit attempts to access the contents of the container.

Every app has a default container object that manages its own native content. If you develop a suite of apps, you can also access any container objects for which you have the appropriate entitlements. Each new container distinguishes between publicly available data and data that is private to the current user. Private data is always stored in the appropriate container directory in the user's iCloud account.

see
https://developer.apple.com/reference/cloudkit/ckcontainer

30.3.2 Methods

30.3.3 accountStatus(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reports whether the current user's iCloud account can be accessed.
Notes: This method determines the status of the current user's iCloud account asynchronously, reporting the results to the block in the completionHandler parameter. Call this method before accessing the private database to determine whether that database is available. While your app is running, use the NSUbiquityIdentityDidChangeNotification notification to detect account changes and call this method again to retrieve the status for the new account.

30.3.4 addOperation(operation as CKOperationMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queues an operation for execution in the current container.
Notes:

operation: The CKOperationMBS to enqueue. Make sure the operation object you provide is fully configured and ready to be enqueued. Do not change the settings of this object after calling this method.

This method adds the operation object to an operation queue managed by the container itself. Operation objects in the container's queue execute concurrently with default priorities in background threads.

This method changes the operation object's container (if any) to the current container.

30.3.5 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.3.6 CKAccountChangedNotification as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The account changed notification name.

30.3.7 CKCurrentUserDefaultName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default name for the current user.

30.3.8 CKErrorDomain as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The error domain name for CloudKit.

30.3.9 CKErrorRetryAfterKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the user dictionary keys for error dictionaries.
Notes: On CKErrorServiceUnavailable or CKErrorRequestRateLimited errors the userInfo dictionary may contain a number that specifies the period of time in seconds after which the client may retry the request.

30.3.10 CKOwnerDefaultName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The user ID representing the current user. Use this value when creating zone IDs.

30.3.11 CKPartialErrorsByItemIDKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** When a CKErrorPartialFailure happens this key will be set in the error's userInfo dictionary.
Notes: The value of this key will be a dictionary, and the values will be errors for individual items with the keys being the item IDs that failed.

30.3.12 CKRecordChangedErrorAncestorRecordKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the error details keys.
Notes: If the server rejects a record save because it has been modified since the last time it was read, a CKErrorServerRecordChanged error will be returned and it will contain versions of the record in its user-Info dictionary. Apply your custom conflict resolution logic to the server record (CKServerRecordKey) and attempt a save of that record.

30.3.13 CKRecordChangedErrorClientRecordKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the error details keys.
Notes: If the server rejects a record save because it has been modified since the last time it was read, a CKErrorServerRecordChanged error will be returned and it will contain versions of the record in its user-Info dictionary. Apply your custom conflict resolution logic to the server record (CKServerRecordKey) and attempt a save of that record.

30.3.14 CKRecordChangedErrorServerRecordKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the error details keys.
Notes: If the server rejects a record save because it has been modified since the last time it was read, a CKErrorServerRecordChanged error will be returned and it will contain versions of the record in its user-Info dictionary. Apply your custom conflict resolution logic to the server record (CKServerRecordKey) and attempt a save of that record.

30.3.15 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

30.3.16 containerWithIdentifier(name as string) as CKContainerMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the container object associated with the specified identifier.
Notes:

containerIdentifier: The bundle identifier of the app whose container you want to access. The bundle identifier must be in the app's com.apple.developer.icloud-container-identifiers entitlement. This parameter must not be nil.

Returns the container object for the designated app's content, or nil if the container cannot be found.

The specified identifier must correspond to one of the ubiquity containers listed in the iCloud capabilities section of your Xcode project. Including the identifier with your app's capabilities adds the corresponding entitlements to your app. To access your app's default container, use the defaultContainer method instead.

30.3.17 defaultContainer as CKContainerMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default container object for managing the current app's content.
Notes:

Returns the container object associated with the current app's content. This method always returns a valid container object.

Use this method to retrieve the container for your app's native content. This container is the one your app typically uses to store its data. If you want the container for a different app, create and initialize that container using the containerWithIdentifier method.

During development, the returned container object points to a development version of your app's container. When you ship your app, the returned object points to the live production environment.

30.3.18 discoverAllContactUserInfos(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Retrieves information about all discoverable users that are known to the current user.
Notes:

Use this method to retrieve information about other users of the app. This method returns information about those users who meet the following criteria:

- There is contact information for the user in the current user's address book.
- The user has run the app.
- The user has granted the CKApplicationPermissionUserDiscoverability permission to your app for this container.

This method searches for the users asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverAllContactsOperationMBS object and configure the desired priority.

30.3.19 discoverAllIdentities(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fetches all user records that match an entry in the user's address book.
Notes: This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverAllContactsOperation object and configure the desired priority.

30.3.20 discoverUserIdentityWithEmailAddress(emailAddress as string, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the user record ID associated in the user's contacts with the email address.
Notes:

email: The email address used to locate the user.

Use this method to retrieve the ID of a user that is known to the current user. The user you are searching for must meet the following criteria:

- The user must be in the current user's address book.

- The user must have run the app.
- The user must have granted the userDiscoverability permission for this container.

This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverUserInfosOperationMBS object and configure the desired priority.

30.3.21 discoverUserIdentityWithPhoneNumber(phoneNumber as string, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the user record ID associated in the user's contacts with the phone number.
Notes:

phoneNumber: The phone number used to locate the user.

Use this method to retrieve the ID of a user that is known to the current user. The user you are searching for must meet the following criteria:

- The user must be in the current user's address book.
- The user must have run the app.
- The user must have granted the userDiscoverability permission for this container.

This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverUserInfosOperationMBS object and configure the desired priority.

30.3.22 discoverUserIdentityWithUserRecordID(userRecordID as CKRecordIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Retrieves information about a single user based on the ID of the corresponding user record.
Notes:

userRecordID: The ID of the user record.

Use this method to retrieve information about a user for which you already have a user record ID. The user you are searching for must meet the following criteria:

- The user must have run the app.

- The user must have granted the userDiscoverability permission for this container.

This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverUserInfosOperationMBS object and configure the desired priority.

30.3.23 discoverUserInfoWithEmailAddress(emailAddress as string, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Retrieves information about a single user based on that user's email address.
Notes:

email: The iCloud email address of the user you want to locate.

Use this method to retrieve the ID of a user that is known to the current user. The user you are searching for must meet the following criteria:

- The user must be in the current user's address book.
- The user must have run the app.
- The user must have granted the CKApplicationPermissionUserDiscoverability permission for this container.

This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverUserInfosOperationMBS object and configure the desired priority.

30.3.24 discoverUserInfoWithUserRecordID(userRecordID as CKRecordIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Retrieves information about a single user based on the ID of the corresponding user record.
Notes:

userRecordID: The ID of the user record.

Use this method to retrieve information about a user for which you already have a user record ID. The user you are searching for must meet the following criteria:

- The user must have run the app.

- The user must have granted the CKApplicationPermissionUserDiscoverability permission for this container.

This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverUserInfosOperationMBS object and configure the desired priority.

30.3.25 fetchAllLongLivedOperationIDs(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the identifiers of the running or recently completed long-lived operations.
Notes: A long-lived operation is an operation that continues to run after the app exits, described in CKOperationMBS. To get the operation object for an identifier, use the fetchLongLivedOperationWithID method.

30.3.26 fetchLongLivedOperationWithID(operationID as string, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the running or recently completed long-lived operation specified by the operation identifier.
Notes:

operationID: The identifier of the long-lived operation you want to fetch.

A long-lived operation is an operation that continues to run after the app exits, described in CKOperationMBS. To receive the callbacks for a long-lived operations, set its completion block and add it to an operation queue.

30.3.27 fetchShareParticipantWithEmailAddress(emailAddress as string, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Retrieves information about a single share participant (a person who accepted a shared record) based on that participant's email address.
Notes:

emailAddress: The iCloud email address of the share participant you want to locate.

This method searches for the share participant asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKFetchShareParticipantsOperationMBS object and configure the desired priority.

30.3.28 fetchShareParticipantWithPhoneNumber(phoneNumber as string, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Retrieves information about a single share participant (a person who accepted a shared record) based on that participant's phone number.
Notes:

phoneNumber: The phone number used to locate the share participant.

This method searches for the share participant asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKFetchShareParticipantsOperationMBS object and configure the desired priority.

30.3.29 fetchShareParticipantWithUserRecordID(userRecordID as CKRecordIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Retrieves information about a single share participant based on the ID of the corresponding user record.
Notes:

userRecordID: The ID of the user record.

This method searches for the share participant asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKFetchShareParticipantsOperationMBS object and configure the desired priority.

30.3.30 fetchUserRecordID(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the user record ID associated with the current user.
Notes: At startup time, fetching the user record ID may take longer while CloudKit makes the initial iCloud account request. After the initial fetch, accessing the user record ID should take less time. If no iCloud account is associated with the device, or if access to the user's iCloud account is restricted, this method returns an error of type CKErrorNotAuthenticated.

30.3.31 requestApplicationPermission(applicationPermission as Integer, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Requests the specified permission from the user to make the user's identity discoverable.
Notes:

applicationPermission: The requested permission. This requested permission applies to the current container only and will not impact permissions granted for other containers. For a list of possible values, see CKApplicationPermissions.

To implement social features in your app, it is possible to correlate a user record with the user's actual name, but your app must get permission from the user to do so. Making a user record discoverable to the friends (contacts) of that user involves calling the the requestApplicationPermission method and asking for the CKApplicationPermissionUserDiscoverability permission. When you call that method, CloudKit asks the user on your behalf whether the user record should be made discoverable. If the user grants the request, that user's contacts can discover that user's true identity when running the app. To discover the contacts of the current user, you use the discoverAllContactUserInfos method or one of several other methods to get the related user information.

The first time you request a permission on any of the user's devices, the user is prompted to grant or deny the request. Once the user grants or denies a permission, subsequent requests for the same permission (on the same or separate devices), do not prompt the user again.

This method runs asynchronously and delivers the results to the block you provide.

30.3.32 statusForApplicationPermission(applicationPermission as Integer, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Checks the status of the specified permission asynchronously.
Notes:

applicationPermission: The permission whose status you want to check. For a list of possible values, see CKApplicationPermissions.

Use this method to determine the extra capabilities granted to your app by the user. If your app has not yet requested a specific permission, calling this method may yield the value CKApplicationPermissionStatusInitialState for the permission. When that value is returned, call the requestApplicationPermission method to request the permission from the user.

30.3.33 Properties

30.3.34 containerIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The string that identifies the app's container.
Notes:

Use the value in this property to distinguish between different container objects in your app.
(Read only property)

30.3.35 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.3.36 privateCloudDatabase as CKDatabaseMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The database containing the user's private data.
Notes:

The database in this property is available only if the device has an active iCloud account. Access to the database is limited to the user of that iCloud account by default. The current user owns all content in the private database and is allowed to read and write that content. Data in the private database is not visible in the developer portal or to any other users.

Data stored in the private database counts against the storage quota of the current user's iCloud account.

If there is no active iCloud account on the user's device, this property still returns a valid database object, but attempts to use that object will return errors. To determine if there is an active iCloud account on the device, use the accountStatus method.
(Read only property)

30.3.37 publicCloudDatabase as CKDatabaseMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The database containing the data shared by all users.
Notes:

The database in this property is available regardless of whether the user's device has an active iCloud account. The contents of the public database are readable by all users of the app, and users have write access to the records (and other data objects) they create. Data in the public database is also visible in the developer portal, where you can assign roles to users and restrict access as needed.

Data stored in the public database counts against your app's iCloud storage quota and not against the quota of any single user.
(Read only property)

30.3.38 sharedCloudDatabase as CKDatabaseMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The database containing shared user data.
Notes:

The database in this property is available only if the device has an active iCloud account. Permissions on the database are limited to the user based on the permissions of the enclosing CKShareMBS object (representing the record that has been shared). The current user does not own the content in the shared database and is allowed to read and write that content only if that permission has been granted in the CKShareMBS. Data in the shared database is not visible in the developer portal or to any user who has not been granted access.

Data stored in the shared database does not count against the storage quota of the current user's iCloud account.

If there is no active iCloud account on the user's device, this property still returns a valid database object, but attempts to use the object will return errors. To determine whether the device has an active iCloud account use the accountStatus method.
(Read only property)

30.3.39 Events

30.3.40 accountStatusCompleted(accountStatus as Integer, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to be called when accountStatus is returned.
Notes:

accountStatus: The status of the current user's iCloud account.
error: An error object, or nil if the status is determined successfully. Use the information in the error object to determine whether the problem has a workaround.

30.3.41 discoverAllContactUserInfosCompleted(userRecordID() as CKDiscoveredUserInfoMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for discoverAllContactUserInfos method.
Notes:

Your block must be capable of executing on any thread of the app. This block returns no value and takes the following parameters:

userInfos: An array of CKDiscoveredUserInfoMBS objects. Each object in the array contains information about the user, including the ID of the corresponding user record. If no users are discovered, the provided array is empty.
error: An error object if a problem occurs, or nil if the IDs are retrieved successfully.

30.3.42 discoverAllIdentitiesWithCompleted(userRecordID() as CKUserIdentityMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for discoverAllIdentities method.
Notes:

This event returns no value and takes the following parameters:

userIdentities: An array of CKUserIdentityMBS objects that match entries in the user's contacts.
error: An error object if a problem occurs or nil if the fetch completed successfully.

30.3.43 discoverUserIdentityWithEmailAddressCompleted(emailAddress as String, userInfo as CKUserIdentityMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for discoverUserIdentityWithEmailAddress method.
Notes:

This event returns no value and takes the following parameters:

userInfo: The user (CKUserIdentityMBS object) associated with the email address, or nil if an identity could not be located.
error: An error object if a problem occurs or nil if the CKUserIdentityMBS is retrieved successfully.

30.3.44 discoverUserIdentityWithPhoneNumberCompleted(phoneNumber as String,userInfo as CKUserIdentityMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for discoverUserIdentityWithPhoneNumber method.
Notes:

This event returns no value and takes the following parameters:

userInfo: The user (CKUserIdentityMBS object) associated with the phone number, or nil if an identity could not be located.
error: An error object if a problem occurs, or nil if the CKUserIdentityMBS is retrieved successfully.

30.3.45 discoverUserIdentityWithUserRecordIDCompleted(userRecordID as CKRecordIDMBS, userInfo as CKUserIdentityMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for discoverUserIdentityWithUserRecordID.
Notes:

This event returns no value and takes the following parameters:

userInfo
An object containing information about the user, or nil if the user is not found.

error
An error object if a problem occurs, or nil if the ID is retrieved successfully.

30.3.46 discoverUserInfoWithEmailAddressCompleted(emailAddress as String, userInfo as CKDiscoveredUserInfoMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for discoverUserInfoWithEmailAddress method.
Notes:

This event returns no value and takes the following parameters:

userInfo: An object containing information about the user or nil if the user is not found.
error: An error object if a problem occurs or nil if the ID is retrieved successfully.

30.3.47 discoverUserInfoWithUserRecordIDCompleted(userRecordID as CKRecordIDMBS, userInfo as CKDiscoveredUserInfoMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The block to execute with the results for discoverUserInfoWithUserRecordID method.
Notes:

This event returns no value and takes the following parameters:

userInfo: An object containing information about the user or nil if the user is not found.
error: An error object if a problem occurs or nil if the ID is retrieved successfully.

30.3.48 fetchAllLongLivedOperationIDsCompleted(outstandingOperationIDs() as String, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called for fetchAllLongLivedOperationIDs method.
Notes:

outstandingOperationsByIDs: An array containing the identifiers for all the active long-lived operations. If a long-lived operation is canceled or completed, it is no longer an active operation, and its identifier will not be included in this array. An operation is complete if the app successfully receives the completion callback.
error: An error object, or nil if the fetch is successful.

30.3.49 fetchLongLivedOperationWithIDCompleted(operationID as String, outstandingOperation as CKOperationMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when fetchLongLivedOperationWithID finished.
Notes:

outstandingOperation: The proxy object for the corresponding long-lived operation. If a long-lived operation was canceled or completed, this is nil.
error: An error object, or nil if the fetch is successful.

30.3.50 fetchShareParticipantWithEmailAddressCompleted(emailAddress as String, shareParticipant as CKShareParticipantMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for fetchShareParticipantWithEmailAddress method.
Notes:

This event returns no value and takes the following parameters:

shareParticipant: An object containing information about the share participant, or nil if the participant is not found.
error: An error object if a problem occurs, or nil if the participant is retrieved successfully.

30.3.51 fetchShareParticipantWithPhoneNumberCompleted(phoneNumber as String,shareParticipant as CKShareParticipantMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for fetchShareParticipantWithPhoneNumber method.
Notes:

shareParticipant: An object containing information about the share participant, or nil if the participant is not found.
error: An error object if a problem occurs, or nil if the participant is retrieved successfully.

30.3.52 fetchShareParticipantWithUserRecordIDCompleted(userRecordID as CKRecordIDMBS, shareParticipant as CKShareParticipantMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called for fetchShareParticipantWithUserRecordID.
Notes:

This event returns no value and takes the following parameters:

shareParticipant: An object containing information about the share participant, or nil if the participant is not found.
error: An error object if a problem occurs, or nil if the participant is retrieved successfully.

30.3.53 fetchUserRecordIDCompleted(userRecordID as CKRecordIDMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for fetchUserRecordID method.
Notes:

recordID: The ID of the user record for the current user, or nil if the current device is not configured with an iCloud account.
error: An error object if a problem occurs, or nil if the record ID is retrieved successfully.

30.3.54 requestApplicationPermissionCompleted(applicationPermissionStatus as Integer, accountStatus as Integer, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for requestApplicationPermission method.

30.3.55 statusForApplicationPermissionCompleted(applicationPermissionStatus as Integer, accountStatus as Integer, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for statusForApplicationPermission method.

30.3.56 Constants

30.3.57 CKAccountStatusAvailable = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the availability of the user's iCloud account.
Notes: The user's iCloud account is available and may be used by this app.

30.3.58 CKAccountStatusCouldNotDetermine = 0

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the availability of the user's iCloud account.
Notes: An error occurred during an attempt to retrieve the account status. Consult the provided NSError

object for more information.

30.3.59 CKAccountStatusNoAccount = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the availability of the user's iCloud account.
Notes: The user's iCloud account is not available because no account information has been provided for this device.

30.3.60 CKAccountStatusRestricted = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the availability of the user's iCloud account.
Notes: The user's iCloud account is not available. Access was denied due to Parental Controls or Mobile Device Management restrictions.

30.3.61 CKApplicationPermissionStatusCouldNotComplete = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating whether the app has been granted a specific permission.
Notes: An error occurred during the getting or setting of the app permission. Consult the provided NSErrorMBS object for more information.

30.3.62 CKApplicationPermissionStatusDenied = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating whether the app has been granted a specific permission.
Notes: The user denied access to the permission.

30.3.63 CKApplicationPermissionStatusGranted = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating whether the app has been granted a specific permission.
Notes: The user granted access to the permission.

30.3.64 CKApplicationPermissionStatusInitialState = 0

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating whether the app has been granted a specific permission.
Notes: The user has not yet decided whether to grant this permission. Use the requestApplicationPermission method to ask the user to grant the permission.

30.3.65 CKApplicationPermissionUserDiscoverability = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** The current user is discoverable (through the user's email address) to other users of the app.

30.3.66 ErrorAlreadyShared = 30

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: A record/share cannot be saved, doing so would cause a hierarchy of records to exist in multiple shares.

30.3.67 ErrorAssetFileModified = 17

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Asset file content was modified while being saved.

30.3.68 ErrorAssetFileNotFound = 16

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Asset file was not found.

30.3.69 ErrorBadContainer = 5

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Un-provisioned or unauthorized container. Try provisioning the container before retrying the operation.

30.3.70 ErrorBadDatabase = 24

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Operation could not be completed on the given database. Likely caused by attempting to modify zones in the public database.

30.3.71 ErrorBatchRequestFailed = 22

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: One of the items in this batch operation failed in a zone with atomic updates, so the entire batch was rejected.

30.3.72 ErrorChangeTokenExpired = 21

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: The previousServerChangeToken value is too old and the client must re-sync from scratch.

30.3.73 ErrorConstraintViolation = 19

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: The server rejected the request because there was a conflict with a unique field.

30.3.74 ErrorIncompatibleVersion = 18

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: App version is less than the minimum allowed version.

30.3.75 ErrorInternalError = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: CloudKit.framework encountered an error. This is a non-recoverable error.

30.3.76 ErrorInvalidArguments = 12

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Bad client request (bad record graph, malformed predicate)

30.3.77 ErrorLimitExceeded = 27

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: The request to the server was too large. Retry this request as a smaller batch.

30.3.78 ErrorManagedAccountRestricted = 32

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Request was rejected due to a managed account restriction.

30.3.79 ErrorMissingEntitlement = 8

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Missing entitlement

30.3.80 ErrorNetworkFailure = 4

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Network error (available but CFNetwork gave us an error)

30.3.81 ErrorNetworkUnavailable = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Network not available

30.3.82 ErrorNotAuthenticated = 9

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Not authenticated (writing without being logged in, no user record)

30.3.83 ErrorOperationCancelled = 20

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: A CKOperation was explicitly cancelled.

30.3.84 ErrorPartialFailure = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Some items failed, but the operation succeeded overall. Check CKPartialErrorsByItemIDKey in the userInfo dictionary for more details.

30.3.85 ErrorParticipantMayNeedVerification = 33

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Share Metadata cannot be determined, because the user is not a member of the share. There are invited participants on the share with email addresses or phone numbers not associated with any iCloud account. The user may be able to join the share if they can associate one of those email addresses or phone numbers with their iCloud account via the system Share Accept UI. Call UIApplication's openURL on this share URL to have the user attempt to verify their information.

30.3.86 ErrorPermissionFailure = 10

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Access failure (save, fetch, or shareAccept)

30.3.87 ErrorQuotaExceeded = 25

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Saving a record would exceed quota

30.3.88 ErrorReferenceViolation = 31

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: The target of a record's parent or share reference was not found.

30.3.89 ErrorRequestRateLimited = 7

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Client is being rate limited

30.3.90 ErrorResultsTruncated = 13

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Results Truncated. Deprecated and will not be returned.

30.3.91 ErrorServerRecordChanged = 14

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: The record was rejected because the version on the server was different.

30.3.92 ErrorServerRejectedRequest = 15

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: The server rejected this request. This is a non-recoverable error.

30.3.93 ErrorServiceUnavailable = 6

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Service unavailable

30.3.94 ErrorTooManyParticipants = 29

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: A share cannot be saved because there are too many participants attached to the share.

30.3.95 ErrorUnknownItem = 11

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: Record does not exist

30.3.96 ErrorUserDeletedZone = 28

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: The user deleted this zone through the settings UI. Your client should either remove its local data or prompt the user before attempting to re-upload any data to this zone.

30.3.97 ErrorZoneBusy = 23

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: The server is too busy to handle this zone operation. Try the operation again in a few seconds.

30.3.98 ErrorZoneNotFound = 26

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
Notes: The specified zone does not exist on the server.

30.4 class CKDatabaseMBS

30.4.1 class CKDatabaseMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A conduit for accessing and for performing operations on the public and private data of an app container.
Notes:

An app container has a public database whose data is accessible to all users and a private database whose data is accessible only to the current user. A database object takes requests for data and applies them to the appropriate part of the container.

You do not create database objects yourself, nor should you subclass CKDatabaseMBS. Your app's CKContainerMBS objects provide the CKDatabaseMBS objects you use to access the associated data. Use database objects as-is to perform operations on data.

The public database is always available, regardless of whether the device has an an active iCloud account. When no iCloud account is available, your app may fetch records and perform queries on the public database, but it may not save changes. (Saving records to the public database requires an active iCloud account to identify the owner of those records.) Access to the private database always requires an active iCloud account on the device.

see
https://developer.apple.com/reference/cloudkit/ckdatabase

30.4.2 Methods

30.4.3 addOperation(operation as CKDatabaseOperationMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Executes the specified operation asynchronously against the current database.
Notes:

operation: The operation object to execute. You must configure the operation object with any dependencies and completion handlers before calling this method. If this parameter is nil, the method does nothing.

Do not change the properties of the operation object after calling this method. Prior to executing the operation, this method sets the operation object's database property to the current database, replacing any previously assigned database.

This method executes the operation object with the priority you assigned to the object through its queuePriority property.

30.4.4 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.4.5 Constructor(Container as CKContainerMBS, databaseScope as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Retrieves the database with the appropriate scope.
Notes:

databaseScope: The scope of the database you want returned.

Returns an initialized CKDatabase object with the appropriate scope.
This convenience method returns the database associated with the specified container that is of the scope requested.

30.4.6 deleteRecordWithID(recordID as CKRecordIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Deletes the specified record asynchronously, with a low priority, from the current database.
Notes:

recordID: The ID of the record you want to delete. This method throws an exception if this parameter is nil.

Deleting a record may trigger additional deletions if the record was referenced by other records. This method reports only the ID of the record you asked to delete. CloudKit does not report deletions triggered by owning relationships between records.

This method deletes the record with a low priority, which may cause the task to execute after higher-priority tasks. To delete records more urgently, create a CKModifyRecordsOperationMBS object with the desired priority. You can also use that operation object to delete multiple records simultaneously.

30.4.7 deleteRecordWithIDSync(recordID as CKRecordIDMBS, byref error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Deletes the specified record synchronously, with a low priority, from the current database.
Notes:

recordID: The ID of the record you want to delete. This method throws an exception if this parameter is nil.

Deleting a record may trigger additional deletions if the record was referenced by other records. This method reports only the ID of the record you asked to delete. CloudKit does not report deletions triggered by owning relationships between records.

This method deletes the record with a low priority, which may cause the task to execute after higher-priority tasks. To delete records more urgently, create a CKModifyRecordsOperationMBS object with the desired priority. You can also use that operation object to delete multiple records simultaneously.

30.4.8 deleteRecordZone(zoneID as CKRecordZoneIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Deletes one record zone (and its contents) asynchronously, with a low priority, from the current database.
Notes:

zoneID: The ID of the zone you want to delete. This method throws an exception if this parameter is nil.

Deleting a zone permanently deletes the zone and all records in that zone. After deleting the zone, you can use the same ID to create a new empty zone.

This method deletes the record zone with a low priority, which may cause the task to execute after higher-priority tasks. To delete the record zone more urgently, create a CKModifyRecordZonesOperationMBS object with the desired priority. You can also use that operation object to delete multiple record zones simultaneously.

30.4.9 deleteSubscriptionWithID(subscriptionID as String, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Deletes one subscription object asynchronously, with a low priority, from the current database.
Notes:

subscriptionID: The ID of the subscription object to delete. This method throws an exception if this parameter is nil.

Deleting a subscription stops the subscription from watching its changed records and sending alerts.

This method deletes the subscription object with a low priority, which may cause the task to execute after higher-priority tasks. To delete the subscription more urgently, create a CKModifySubscriptionsOperationMBS object with the desired priority. You can also use that operation object to delete multiple subscription objects simultaneously.

30.4.10 fetchAllRecordZones(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Fetches all record zones asynchronously, with a low priority, from the current database.
Notes:

Use this method to locate the record zones in this database. Record zones represent groups of records with a common purpose.

This method fetches record zones with a low priority, which may cause the task to execute after higher-priority tasks. To fetch record zones more urgently, create a CKFetchRecordZonesOperationMBS object with the desired priority.

30.4.11 fetchAllSubscriptions(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Fetches all subscription objects asynchronously, with a low priority, from the current database.
Notes:

Use this method to locate the subscriptions in the current database. Subscriptions represent persistent queries on the server. A subscription can be used to alert the app when records change.

This method fetches the subscription objects with a low priority, which may cause the task to execute after higher-priority tasks. To fetch subscriptions more urgently, create a CKFetchSubscriptionsOperationMBS object with the desired priority.

30.4.12 fetchRecordWithID(recordID as CKRecordIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Fetches one record asynchronously, with a low priority, from the current database.
Notes:

recordID: The ID of the record you want to fetch. This method throws an exception if this parameter is nil.

Use this method to fetch records that are not urgent to your app's execution. This method fetches the record with a low priority, which may cause the fetch to execute after higher-priority tasks. To fetch records more urgently, create a CKFetchRecordsOperation object with the desired priority. You can also use that operation object to fetch multiple records simultaneously.

30.4.13 fetchRecordWithIDSync(recordID as CKRecordIDMBS, byref record as CKRecordMBS, byref error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Fetches one record synchronously, with a low priority, from the current database.
Notes:

recordID: The ID of the record you want to fetch. This method throws an exception if this parameter is nil.
record: The requested record object. If no such record is found, this parameter is nil.
error: An error object, or nil if the record was fetched successfully. Use the information in the error object to determine whether a problem has a workaround.

Use this method to fetch records that are not urgent to your app's execution. This method fetches the record with a low priority, which may cause the fetch to execute after higher-priority tasks. To fetch records more urgently, create a CKFetchRecordsOperation object with the desired priority. You can also use that operation object to fetch multiple records simultaneously.

30.4.14 fetchRecordZoneWithID(zoneID as CKRecordZoneIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Fetches one record zone asynchronously, with a low priority, from the current database.
Notes:

zoneID: The ID of the record zone. This method throws an exception if this parameter is nil.

Use this method to retrieve a record zone whose ID you already know. You might retrieve a record zone object so that you can assess its capabilities.

This method fetches the record zone with a low priority, which may cause the task to execute after higher-priority tasks. To fetch the record zone more urgently, create a CKFetchRecordZonesOperationMBS object with the desired priority. You can also use that operation object to fetch multiple record zones simultaneously.

30.4.15 fetchSubscriptionWithID(subscriptionID as String, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Fetches one subscription object asynchronously, wiht a low priority, from the current database.
Notes:

subscriptionID: The ID of the subscription object. This method throws an exception if this parameter is nil.

Use this method to retrieve a subscription object whose ID you already know. You might retrieve a subscription object so that you can assess its attributes or update the notification information used to generate alerts.

This method fetches the subscription object with a low priority, which may cause the task to execute after higher-priority tasks. To fetch the subscription more urgently, create a CKFetchSubscriptionsOperationMBS object with the desired priority. You can also use that operation object to fetch multiple subscription objects simultaneously.

30.4.16 performQuery(query as CKQueryMBS, zoneID as CKRecordZoneIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Searches the specified zone asynchronously for records that match the query parameters.
Notes:

query: The query object containing the parameters for the search. This method throws an exception if this parameter is nil. For information about how to construct queries, see CKQueryMBS.
zoneID: The ID of the zone to search. Search results are limited to records in the specified zone. Specify nil to search the default zone of the database.

Use this method to execute searches against the current database. Do not use this method when the number of returned records is potentially more than a few hundred records; when more records are needed, create an execute a CKQueryOperationMBS instead of calling performQuery:inZoneWithID on the CKDatabaseMBS. For efficiency, all queries automatically limit the number of returned records based on current conditions. If your query hits the maximum value, this method returns only the first portion of the overall results. The number of returned records should be sufficient in most cases, but to get the entire set of records you must create and execute a CKQueryOperationMBS object instead. Query operations also return a maximum number of results, but when they do, they provide a cursor object that you can use to fetch the next batch of results.

You can search any content that is represented by a CKRecord object, including user records. You cannot use this method to search for CKSubscriptionMBS or CKRecordZoneMBS objects.

30.4.17 saveRecord(record as CKRecordMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Saves one record asynchronously, with a low priority, to the current database, if the record has never been saved or if it is newer than the version on the server.
Notes:

record: The record to save. This method throws an exception if this parameter is nil.

This method saves the record only if it has never been saved before or if it is newer than the version on the server. You cannot use this method to overwrite newer versions of a record on the server.

This method saves the record with a low priority, which may cause the task to execute after higher-priority tasks. To save records more urgently, create a CKModifyRecordsOperationMBS object with the desired priority. You can also use that operation object to save multiple records simultaneously.

30.4.18 saveRecordSync(record as CKRecordMBS, byref error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Saves one record synchronously, with a low priority, to the current database, if the record has never been saved or if it is newer than the version on the server.
Notes:

record: The record to save. This method throws an exception if this parameter is nil.

This method saves the record only if it has never been saved before or if it is newer than the version on the server. You cannot use this method to overwrite newer versions of a record on the server.

This method saves the record with a low priority, which may cause the task to execute after higher-priority tasks. To save records more urgently, create a CKModifyRecordsOperationMBS object with the desired priority. You can also use that operation object to save multiple records simultaneously.

30.4.19 saveRecordZone(zone as CKRecordZoneMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Saves one record zone asynchronously, with a low priority, to the current database.

Notes:

zone: The zone you want to save to the database. This method throws an exception if this parameter is nil.

Use this method to save a record zone to the database so that you can subsequently store records in it. Record zones must be saved before you attempt to save any records that reside in that zone. Because this method executes asynchronously, use the completion handler to verify that the zone was saved successfully before attempting to save any records.

This method saves the record zone with a low priority, which may cause the task to execute after higher-priority tasks. To save the record zone more urgently, create a CKModifyRecordZonesOperationMBS object with the priority you want. You can also use that operation object to save multiple record zones all at once.

30.4.20 saveSubscription(subscription as CKSubscriptionMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Saves one subscription object asynchronously, with a low priority, to the current database.
Notes:

subscription: The subscription object you want to save to the database. This method throws an exception if this parameter is nil.

Use this method to save a subscription to the database so that the subsription can begin watching for changes.

This method saves the subscription object with a low priority, which may cause the task to execute after higher-priority tasks. To save the subscription more urgently, create a CKModifySubscriptionsOperationMBS object with the desired priority. You can also use that operation object to save multiple subscription objects simultaneously.

30.4.21 Properties

30.4.22 databaseScope as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of database (public, private, or shared).
Notes: (Read only property)

30.4.23 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.4.24 Events

30.4.25 deleteRecordWithIDCompleted(recordID as CKRecordIDMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The block to execute with the results for deleteRecordWithID method.
Notes:

recordID: The ID of the record you attempted to delete.
error: An error object, or nil if the record zone was deleted successfully. Use the information in the error object to determine whether a problem has a workaround.

30.4.26 deleteRecordZoneWithIDCompleted(zoneID as CKRecordZoneIDMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The block to execute with the results for deleteRecordZone method.
Notes:

zoneID: The ID of the zone that you tried to delete.
error: An error object, or nil if the record zone was deleted successfully. Use the information in the error object to determine whether a problem has a workaround.

30.4.27 deleteSubscriptionWithIDCompleted(subscriptionID as String, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for deleteSubscriptionWithID method.
Notes:

subscriptionID: The ID of the subscription object you attempted to delete.
error: An error object, or nil if the subscription was deleted successfully. Use the information in the error object to determine whether a problem has a workaround.

30.4.28 fetchAllRecordZonesCompleted(zones() as CKRecordZoneMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for fetchAllRecordZones method.
Notes:

zones: An array of CKRecordZoneMBS objects. The returned array always contains at least one record zone corresponding to the default zone.
error: An error object, or nil if the record zones were fetched successfully. Use the information in the error object to determine whether a problem has a workaround.

30.4.29 fetchAllSubscriptionsCompleted(subscriptions() as CKSubscriptionMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for fetchAllSubscriptions.
Notes:

subscriptions: An array of CKSubscription objects. If the subscription objects cannot be retrieved, the array is empty.
error: An error object, or nil if the subscriptions were fetched successfully. Use the information in the error object to determine whether a problem has a workaround.

30.4.30 fetchRecordWithIDCompleted(recordID as CKRecordIDMBS, record as CKRecordMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results.
Notes:

record: The requested record object. If no such record is found, this parameter is nil.
error: An error object, or nil if the record was fetched successfully. Use the information in the error object to determine whether a problem has a workaround.

30.4.31 fetchRecordZoneWithIDCompleted(zoneID as CKRecordZoneIDMBS, zone as CKRecordZoneMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for fetchRecordZoneWithID method.
Notes:

zone: The requested CKRecordZone object or nil if the object is not found or cannot be retrieved.
error: An error object, or nil if the record zone was fetched successfully. Use the information in the error object to determine whether a problem has a workaround.

30.4.32 fetchSubscriptionWithIDCompleted(subscriptionID as String, subscription as CKSubscriptionMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for fetchSubscriptionWithID.
Notes:

subscription: The requested subscription object or nil if the object is not found or cannot be retrieved.
error: An error object, or nil if the subscription was fetched successfully. Use the information in the error object to determine whether a problem has a workaround.

30.4.33 performQueryCompleted(query as CKQueryMBS, zoneID as CKRecordZoneIDMBS, results() as CKRecordMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the search results.
Notes:

The event to execute with the search results for performQuery method.

results: An array containing zero or more CKRecord objects. The returned records correspond to the records in the specified zone that match the parameters of the query.

error: An error object, or nil if the query was completed successfully. Use the information in the error object to determine whether a problem has a workaround.

30.4.34 saveRecordCompleted(record as CKRecordMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for saveRecord.
Notes:

record: The record object you attempted to save.
error: An error object, or nil if the record was saved successfully. Use the information in the error object to

determine whether a problem has a workaround.

30.4.35 saveRecordZoneCompleted(zone as CKRecordZoneMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for saveRecordZone method.
Notes:

zone: The CKRecordZone object you attempted to save.
error: An error object, or nil if the record zone was saved successfully. Use the information in the error object to determine whether a problem has a workaround.

30.4.36 saveSubscriptionCompleted(subscription as CKSubscriptionMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The block to execute with the results for saveSubscription method.
Notes:

subscription: The subscription object you attempted to save.
error: An error object, or nil if the subscription was saved successfully. Use the information in the error object to determine whether a problem has a workaround.

30.4.37 Constants

30.4.38 ScopePrivate = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the database scopes.
Notes: The private database.

30.4.39 ScopePublic = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the database scopes.
Notes: The public database.

30.4.40 ScopeShared = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the database scopes.
Notes: The shared database.

30.5 class CKDatabaseNotificationMBS

30.5.1 class CKDatabaseNotificationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A notification object about a database.
Notes:

Subclass of the CKNotificationMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.5.2 Methods

30.5.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

30.5.4 Properties

30.5.5 databaseScope as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The database scope.
Notes: (Read only property)

30.6 class CKDatabaseOperationMBS

30.6.1 class CKDatabaseOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The CKDatabaseOperation class is an abstract parent class for operations that act on the public or private databases in a container.
Notes:

Database operations typically involve fetching and saving records and other database objects, as well as queries on the contents of the database. You use the property of this class to tell the operation object which database to use when executing its task. Do not subclass this class or create instances of it. Instead, create instances of one of its concrete subclasses.

Available on macOS 10.12 or newer.
Subclass of the CKOperationMBS class.

30.6.2 Methods

30.6.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

30.6.4 Properties

30.6.5 database as CKDatabaseMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The database that is the target of the operation.
Notes:

For operations you plan to execute from your own custom queue, use this property to specify the target database. Setting the database also sets the corresponding container, inherited from the CKOperationMBS parent class. If the value of this property is nil, the operation targets the private database of the app's default container.

The default value of this property is nil.
(Read and Write property)

30.7 class CKDatabaseSubscriptionMBS

30.7.1 class CKDatabaseSubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A subscription for database changes.
Notes: Subclass of the CKSubscriptionMBS class.

30.7.2 Methods

30.7.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.12 and newer in 64-bit application.

30.7.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
See also:

- 30.7.5 Constructor(subscriptionID as string) 5621

30.7.5 Constructor(subscriptionID as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.
See also:

- 30.7.4 Constructor 5621

30.7.6 copy as CKDatabaseSubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.7.7 Properties

30.7.8 recordType as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The record type.
Notes: (Read and Write property)

30.8 class CKDiscoverAllContactsOperationMBS

30.8.1 class CKDiscoverAllContactsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKDiscoverAllContactsOperation object retrieves the IDs of all discoverable users that are also in the user's address book.
Notes:

The search of the user's address book does not return any personal data about the user's contacts. The search returns only the IDs of the corresponding user records, which contain only data that your app puts there. CloudKit uses the address book information to identify users of the app that the current user knows. Because the system accesses the address book instead of your app, the system does not display a prompt to the user when that access occurs.

Users of an app must opt in to discoverability before their user records can be accessed. To opt in for a user, your app must call the requestApplicationPermission:completion: method of your container object and request the userDiscoverability permission. Calling that method prompts the user to grant or deny the permission.

If you assign a completion block to the completionBlock property of the operation object, the completion block is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.

No Address Book access dialog will be displayed.
Available in OS X 10.10 and newer. Deprecated in 10.12 in favor of CKDiscoverAllUserIdentitiesOperationMBS classes.
Subclass of the CKOperationMBS class.

30.8.2 Methods

30.8.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

30.8.4 Events

30.8.5 discoverAllContactsCompleted(userInfos() as CKDiscoveredUserInfoMBS, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to use to process the search results.
Notes:

The event has no return value and takes the following parameters:

userRecordIDs: An array of CKDiscoveredUserInfoMBS objects. Each ID corresponds to a user of the app who opts in to discovery by other known users. Use this ID to retrieve the corresponding user record.
operationError: An error object containing information about a problem, or nil if the user record IDs are retrieved successfully.

This event is executed only once, at the conclusion of the operation. If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

30.9 class CKDiscoverAllUserIdentitiesOperationMBS

30.9.1 class CKDiscoverAllUserIdentitiesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An operation that finds all discoverable users in the device's contacts.
Notes:

The operation will not generate a dialog indicating that the contacts are being accessed.

Available in OS X 10.12 and newer.
Subclass of the CKOperationMBS class.

30.9.2 Methods

30.9.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to search the device's contacts.
Notes: You can use the returned CKDiscoverAllUserIdentitiesOperationMBS only once. When executed, this query object performs a new search and returns a batch of results.

30.9.4 Events

30.9.5 discoverAllUserIdentitiesCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results.
Notes:

operationError: An error object that contains the information about a problem or nil if the results are retrieved successfully.

This event is executed only once and represents your last chance to process the operation results. It is executed after all of the individual progress blocks but before the operation's completed event. The block is executed serially with respect to the other progress blocks of the operation. If you intend to use this block to process results, update the value of this property before executing the operation or submitting the operation object to a queue.

30.9.6 userIdentityDiscovered(identity as CKUserIdentityMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute for each user identity returned.
Notes:

identity: A CKUserIdentityMBS object that was discovered in the device's contacts.

This event is executed once for each identity that is discovered. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

30.10 class CKDiscoveredUserInfoMBS

30.10.1 class CKDiscoveredUserInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKDiscoveredUserInfo object contains information about a discoverable user in a database.
Notes:

You do not create instances of this class yourself. Instead, use a CKDiscoverAllContactsOperation object or other means to retrieve these objects.

Available in OS X 10.10 and newer.
Deprecated in OS X 10.12 in favor of CKUserIdentityMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.10.2 Methods

30.10.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.10.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

30.10.5 Properties

30.10.6 displayContact as Variant

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Contains the given and family name of the user who is not associated with the local Address Book.
Notes:

DisplayContact is not associated with the local Address Book. It is a wrapper around information known to the CloudKit server, including first and last names.
Value is a CNContactMBS object.

(Read only property)

30.10.7 firstName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The first name of the user.
Notes: (Read only property)

30.10.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.10.9 lastName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last name of the user.
Notes: (Read only property)

30.10.10 userRecordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the user record.
Notes:

Use this value to retrieve the user record associated with the specified user. The user record does not contain any personal information about the user by default. Your app can add data to the user record but should not add any sensitive user data to it.
(Read only property)

30.11 class CKDiscoverUserIdentitiesOperationMBS

30.11.1 class CKDiscoverUserIdentitiesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An operation that fetches user identities.
Notes: Subclass of the CKOperationMBS class.

30.11.2 Methods

30.11.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to discover user identities.
Notes: You can use the returned CKDiscoverUserIdentitiesOperation only once. When executed, this query object processes the share metadata.
See also:

- 30.11.4 Constructor(userIdentityLookupInfos() as CKUserIdentityLookupInfoMBS) 5629

30.11.4 Constructor(userIdentityLookupInfos() as CKUserIdentityLookupInfoMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to discover all user identities associated with the specified lookup info.
Notes:

userIdentityLookupInfos: An array of CKUserIdentityLookupInfoMBS objects. This parameter is used to initialize the value in the userIdentityLookupInfos property. If you specify nil, you must assign an appropriate value to the userIdentityLookupInfos property before executing the operation.

Returns an initialized operation object.
See also:

- 30.11.3 Constructor 5629

30.11.5 setUserIdentityLookupInfos(IDs() as CKUserIdentityLookupInfoMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the lookup info (email address, phone number, or record ID) used to discover user identities.
Notes: Use this property to view or change the lookup info used to discover user identities. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation

object to a queue.

30.11.6 userIdentityLookupInfos as CKUserIdentityLookupInfoMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The lookup info (email address, phone number, or record ID) used to discover user identities.
Notes: Use this property to view or change the lookup info used to discover user identities. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

30.11.7 Events

30.11.8 discoverUserIdentitiesCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The block to execute when the operation has completed.
Notes: This block is called when the operation completes. The completionBlock of the underlying NSOperationMBS is also called if both are set. This block is executed serially with respect to the other progress blocks of the operation. If you intend to use this block to process results, update the value of this property before executing the operation or submitting the operation object to a queue.

30.11.9 userIdentityDiscovered(identity as CKUserIdentityMBS, lookupInfo as CKUserIdentityLookupInfoMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute for each user identity that has been discovered.
Notes:

Each time the event is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

30.12 class CKDiscoverUserInfosOperationMBS

30.12.1 class CKDiscoverUserInfosOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A CKDiscoverUserInfosOperation object retrieves the IDs for discoverable users whose email addresses or user record IDs you already know.
Notes:

This operation returns information about the corresponding users.

Users of an app must opt in to discoverability before their user records can be accessed. To opt in for a user, your app must call the requestApplicationPermission:completion: method of your container object and request the userDiscoverability permission. Calling that method prompts the user to grant or deny the permission.

If you assign a completed event of the operation object, the completed event is called after the operation executes and returns its results to you. You can use a completed event to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completed event you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.
Subclass of the CKOperationMBS class.

30.12.2 Methods

30.12.3 Constructor(emailAddresses() as String, userRecordIDs() as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes the operation object with the specified email addresses.
Notes:

emailAddresses: An array of strings, each of which contains a single email address to look for. The value you specify is used to initialize the value of the emailAddresses property. If you specify nil for this parameter, assign at least one email address to the emailAddresses property before executing the operation object.
userRecordIDs: An array of CKRecordIDMBS objects, each of which contains the ID of a user record to look for. The value you specify is used to initialize the value of the userRecordIDs property. If you specify nil for this parameter, assign at least one email address to the userRecordIDs property before executing the operation object.

The email addresses you specify need not belong to users in the current user's address book. The users associated with those email addresses must be discoverable for their user record ID to be returned.

30.12.4 emailAddresses as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The email addresses of the users whose information you want to retrieve.
Notes:

This property contains an array of strings, each of which corresponds to a single email address. Use this property to add or remove email addresses to the operation. If you intend to change the property value, do so before executing the operation or submitting the operation object to a queue.

The default value of this property is set to the email addresses you specify in the Constructor.

30.12.5 setEmailAddresses(emails() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the email addresses of the users whose information you want to retrieve.
Notes:

This property contains an array of strings, each of which corresponds to a single email address. Use this property to add or remove email addresses to the operation. If you intend to change the property value, do so before executing the operation or submitting the operation object to a queue.

The default value of this property is set to the email addresses you specify in the Constructor.

30.12.6 setUserRecordIDs(IDs() as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the IDs of the users whose information you want to retrieve.
Notes:

This property contains an array of CKRecordIDMBS objects, each of which corresponds to the ID of a user record. Use this property to add or remove record IDs to the operation. If you intend to change the value of this property, you must do so before executing the operation or submitting the operation object to a queue.

The default value of this property is set to the record IDs you specify in the Constructor.

30.12.7 userRecordIDs as CKRecordIDMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The IDs of the users whose information you want to retrieve.
Notes:

This property contains an array of CKRecordIDMBS objects, each of which corresponds to the ID of a user record. Use this property to add or remove record IDs to the operation. If you intend to change the value of this property, you must do so before executing the operation or submitting the operation object to a queue.

The default value of this property is set to the record IDs you specify in the Constructor.

30.12.8 Events

30.12.9 discoverUserInfosCompleted(emailsToUserInfos as Dictionary, userRecordIDsToUserInfos as Dictionary, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to use to process the search results.
Notes:

The event has no return value and takes the following parameters:

emailsToUserInfos: A dictionary whose keys are events with the email addresses you provided in the emailAddresses property. The value of each key is a CKDiscoveredUserInfo object that identifies the user associated with the email address. Use that object to get the user's name and fetch the corresponding user record.
userRecordIDsToUserInfos: A dictionary whose keys are the CKRecordIDMBS objects you provided. The value of each key is a CKDiscoveredUserInfo object that identifies the user associated with the user record. You can use that object to get the user's name.
operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

This event is executed only once, at the conclusion of the operation. If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

30.13 class CKFetchDatabaseChangesOperationMBS

30.13.1 class CKFetchDatabaseChangesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An operation that fetches changes to the database.
Notes: Subclass of the CKDatabaseOperationMBS class.

30.13.2 Methods

30.13.3 Constructor(previousServerChangeToken as CKServerChangeTokenMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured with the previous change token.
Notes:

previousServerChangeToken: The previous change token.

Returns an initialized operation object.

After initializing the operation, assign a block to the fetchDatabaseChangesCompletionBlock property to process the results.

If a change anchor from a previous CKFetchDatabaseChangesOperation is passed in, only the zones that have changed since that anchor will be returned.

This per-database CKServerChangeToken is not to be confused with the per-recordZone CKServerChangeToken from CKFetchRecordZoneChangesOperationMBS.

If this is your first fetch or if you wish to re-fetch all zones, pass nil for the change token. Change tokens are opaque and clients should not infer any behavior based on their content.

30.13.4 Properties

30.13.5 fetchAllChanges as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Configuration setting to control whether this operation makes repeated calls to the server.
Notes:

When this property is set to true, the operation sends repeated requests to the server until all record zone changes have been fetched. When this property is set to false, it is the responsibility of the caller to issue subsequent fetch-change operations when moreComing is true in a fetchDatabaseChangesCompleted invocation.

fetchAllChanges is true by default.
(Read and Write property)

30.13.6 previousServerChangeToken as CKServerChangeTokenMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The change token from a previous fetch operation.
Notes:

Assign the token you received previously from the fetchDatabaseChangesCompleted event to this property. Doing so yields only the changes that have occurred since your last fetch operation. If you specify nil for this parameter, the operation starts fetching changes at the beginning.
(Read and Write property)

30.13.7 resultsLimit as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum number of results to fetch with this operation.
Notes:

Use this property to limit the number of changes processed in one operation. When the results limit is reached, the operation object updates the original token you provided and returns it to you to let you know that more results are available.
(Read and Write property)

30.13.8 Events

30.13.9 changeTokenUpdated(serverChangeToken as CKServerChangeTokenMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when the change token has changed.
Notes: This event will be executed periodically, giving you an updated change token so that already-fetched record zone changes do not need to be re-fetched on a subsequent operation.

30.13.10 fetchDatabaseChangesCompleted(serverChangeToken as CKServerChangeTokenMBS, moreComing as Boolean, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when the operation completes.
Notes:

serverChangeToken: The current server change token to be stored and used in subsequent CKFetchDatabaseChangesOperation instances.
moreComing: Indicates if this is the last record zone change. If fetchAllChanges is false, it is the responsibility of the client to create additional CKFetchDatabaseChangesOperation instances for the additional changes.
operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

The client is responsible for saving the change token at the end of the operation and passing it into the next call to CKFetchDatabaseChangesOperationMBS. If the server returns a CKErrorChangeTokenExpired error, the previousServerChangeToken value was too old and the client should toss its local cache and re-fetch the changes in this record zone starting with a nil previousServerChangeToken.

30.13.11 recordZoneWithIDChanged(zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The block that processes a single record zone change.
Notes:

The event returns no value and takes the following parameter:

zoneID: The CKRecordZoneID corresponding to the record zone that changed.

30.13.12 recordZoneWithIDWasDeleted(zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event that processes a single record zone deletion.
Notes:

The event returns no value and takes the following parameter:

zoneID: The CKRecordZoneID corresponding to the record zone that was deleted.

30.14 class CKFetchNotificationChangesOperationMBS

30.14.1 class CKFetchNotificationChangesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A CKFetchNotificationChangesOperationMBS object retrieves unread CKNotification objects from a container.
Notes:

Notification objects contain the data associated with push notifications that have already been sent to an app. Fetch notification objects to identify changes that your app might have missed or to retrieve the complete push notification payload, which might have been truncated when it was delivered to the device.

After fetching the current notifications, you can mark some or all of them as read using a CKMarkNotificationsReadOperation object. Marking a notification as read prevents it from being returned by subsequent fetch operations.

The events to process the fetched notifications are executed serially on an internal queue that is managed by the operation object. Your events must be capable of executing on a background thread, so any tasks that require access to the main thread must be redirected accordingly.

The completion event is called after the operation executes and returns its results to you. You can use a completed event to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion event you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.
Subclass of the CKOperationMBS class.

30.14.2 Methods

30.14.3 Constructor(previousServerChangeToken as CKServerChangeTokenMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes and returns an operation object set to fetch notification changes.
Notes:

previousServerChangeToken: The change token from a previous fetch operation, or nil to fetch all changes. When you specify a change token, the operation object fetches only the changes that occurred since the change token was generated.

Returns an initialized operation object.

The first time you fetch notifications, specify nil for the previousServerChangeToken to get information about all push notifications that have been sent. When that operation finishes executing, it passes a change

token to your completion block. Save that change token and use it to initialize new operation objects that fetch only the newly generated notification objects.

If you mark one or more notifications as read using a CKMarkNotificationsReadOperationMBS object, those notifications are not returned, even if you specify nil for previousServerChangeToken.

30.14.4 Properties

30.14.5 moreComing as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating that more notifications are waiting to be delivered.
Notes:

Access this property only from your fetchNotificationChangesCompletionBlock block. When the value is true, your completed event should create another CKFetchNotificationChangesOperation object and use it to fetch the next batch of results. Use the change token passed to your completion block to configure the new operation object. Specifying the change token prevents the new operation object from returning older notifications.
(Read only property)

30.14.6 previousServerChangeToken as CKServerChangeTokenMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The change token from a previous fetch operation.
Notes:

Assign the token you received previously from the fetchNotificationChangesCompleted event to this property. Doing so yields only the notifications that have arrived since your last fetch operation. If you specify nil for this parameter, the operation starts fetching notifications at the beginning of the list and returns all but those that have already been marked as read.
(Read and Write property)

30.14.7 resultsLimit as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The maximum number of results to fetch with this operation.
Notes:

Use this property to limit the number of push notifications processed in one operation. When the results limit is reached, the operation object updates the original token you provided and returns it to you to let you know that more results are available.

(Read and Write property)

30.14.8 Events

30.14.9 fetchNotificationChangesCompleted(serverChangeToken as CKServerChangeTokenMBS, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event that is executed after all requested notifications are fetched.
Notes:

The event returns no value and takes the following parameters:

serverChangeToken: An opaque object that you can use during subsequent fetch operations to retrieve the next batch of notifications.
operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

The operation object executes this event only once, which represents your last chance to process the operation results. This event is executed after all individual progress events but before the operation's completion event. The event is executed serially with respect to the other progress events of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

In your event, check the value of the moreComing property to determine if there are more results waiting on the server. If the value of that property is treu, use the value in the serverChangeToken parameter to configure a new CKFetchNotificationChangesOperationMBS object to fetch the next batch of results.

30.14.10 notificationChanged(notification as CKNotificationMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event that processes a single push notification.
Notes:

The event returns no value and takes the following parameter:

notification: The CKNotification object corresponding to a push notification. The actual object passed to this method is a concrete subclass of CKNotification that contains specific details about the source of the change.

The operation object executes this event once for each push notification that is found. Each time the event

is executed, it is executed serially with respect to the other progress events of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

30.15 class CKFetchRecordChangesOperationMBS

30.15.1 class CKFetchRecordChangesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A CKFetchRecordChangesOperation object reports on the changed and deleted records in the specified record zone.
Notes:

Use this type of operation object to optimize fetch operations for locally managed sets of records. Specifically, use it when you maintain a local cache of your record data and need to synchronize that cache periodically with the server.

To get the most benefit out of a CKFetchRecordChangesOperation object, you must maintain a local cache of the records from the specified zone. Each time you fetch changes from that zone, the server provides a token that identifies your request. With each subsequent fetch request, you initialize the operation object with the token from the previous request, and the server returns only the records that changed since that request.

The blocks you assign to process the fetched records are executed serially on an internal queue managed by the operation. Your blocks must be capable of executing on a background thread, so any tasks that require access to the main thread must be redirected accordingly.

The completed event is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.

Available in 10.10 and newer and deprecated with 10.12.
Subclass of the CKDatabaseOperationMBS class.

30.15.2 Methods

30.15.3 Constructor(recordZoneID as CKRecordZoneIDMBS, previousServerChangeToken as CKServerChangeTokenMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes and returns an operation object configured to fetch changes in the specified record zone.
Notes:

recordZoneID: The zone containing the records you want to fetch. The zone can be a custom zone. Syncing the default zone is not supported.

previousServerChangeToken: The change token from a previous fetch operation. This is the token passed to your fetchRecordChangesCompleted event during a previous fetch operation. Use this token to limit the returned data to only those changes that have occurred since you last made the same fetch request. If you specify nil for this parameter, the operation object fetches all records and their contents.

Returns an initialized operation object.

When initializing the operation object, use the token from a previous fetch request if you have one. You can archive tokens and write them to disk for later use if needed.

The returned operation object is configured to retrieve all changed fields of the record, including any assets stored in those fields. If you want to minimize the amount of data returned even further, configure the desiredKeys property with the subset of keys whose values you want to fetch.

After initializing the operation, associate at least one progress block with the operation object (excluding the completion block) to process the results.

30.15.4 desiredKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The fields to fetch for the requested records.
Notes:

Use this property to limit the amount of data retrieved for each record during the fetch operation. This property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included in the returned record. The default value is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and include at least one field name from each record type.

If you intend to specify the desired set of keys, set the value of this property before executing the operation or submitting it to a queue.

30.15.5 setDesiredKeys(desiredKeys() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the fields to fetch for the requested records.
Notes:

Use this property to limit the amount of data retrieved for each record during the fetch operation. This

property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included in the returned record. The default value is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and include at least one field name from each record type.

If you intend to specify the desired set of keys, set the value of this property before executing the operation or submitting it to a queue.

30.15.6 Properties

30.15.7 moreComing as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating that more results are available.
Notes:

If the server is unable to deliver all of the changed results with this operation object, it sets this property to true before executing the fetchRecordChangesCompleted event. To fetch the remaining changes, create a new CKFetchRecordChangesOperationMBS object using the change token returned by the server.
(Read only property)

30.15.8 previousServerChangeToken as CKServerChangeTokenMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The token that identifies the starting point for retrieving changes.
Notes:

Each fetch request returns a unique token in addition to any changes. The token is passed as a parameter to your fetchRecordChangesCompleted event. During a subsequent fetch request, providing the previous token causes the server to return only the changes that have occurred since the last fetch request. Tokens are opaque data objects that you can write to disk safely and reuse later.

Typically, you set the value of this property when you initialize the operation object. If you intend to change the record zone, update the value of the property before executing the operation or submitting it to a queue.
(Read and Write property)

30.15.9 recordZoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the record zone whose records you want to fetch.
Notes:

Typically, you set the value of this property when you initialize the operation object. If you intend to change the record zone, update the value before executing the operation or submitting it to a queue.
(Read and Write property)

30.15.10 resultsLimit as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

The maximum number of changed records to report with this operation object.
Language
Notes:

Use this property to limit the number of results in situations where you expect the number of changed records might be large. The default value is 0, which causes the server to choose an appropriate number of results to return based on dynamic conditions.

When the number of returned results exceeds the results limit, the operation object sets the moreComing property to true before executing the fetchRecordChangesCompleted event. In your event, check the value of that property, and if it is true, create a new CKFetchRecordChangesOperationMBS object to fetch more results.
(Read and Write property)

30.15.11 Events

30.15.12 fetchRecordChangesCompleted(serverChangeToken as CKServerChangeTokenMBS, clientChangeTokenData as MemoryBlock, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when all changes have been reported.
Notes:

The block returns no value and takes the following parameters:

serverChangeToken: The new change token from the server. You can store this token locally and use it during subsequent fetch operations to limit the results to records that changed since this operation executed.

clientChangeToken: The last client change token received from this device. If this change token is not the last change token you provided, the server may not have received the associated changes.
operationError: An error object containing information about a problem, or nil if the changes are retrieved successfully.

Your implementation of this block should check the moreComing property of the operation object to ensure that the server was able to deliver all results. If that property is set to true, you must create another operation object (using the value in the serverChangeToken parameter) to fetch any remaining changes.

The operation object executes this block only once, at the conclusion of the operation. It is executed after all individual change blocks but before the operation's completed event. The block is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

30.15.13 recordChanged(record as CKRecordMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the contents of a changed record.
Notes:

The event returns no value and takes the following parameters:

record: The record that changed. If you specified a value for the desiredKeys property, the record only contains the fields specified in the desiredKeys property.

The operation object executes this event once for each record in the zone that changed since the previous fetch request. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation. If no records changed, the block is not executed.

If you intend to use this event to process results, set it before executing the operation or submitting it to a queue.

30.15.14 recordWithIDWasDeleted(recordID as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The block to execute with the ID of a record that was deleted.
Notes:

The block returns no value and takes the following parameters:

recordID: The ID of the record that was deleted.

The operation object executes this block once for each record in the zone that was deleted since the previous fetch request. Each time the event is executed, it is executed serially with respect to the other progress blocks of the operation. If no records were deleted, this event is not executed.

If you intend to use this event to process results, set it before executing the operation or submitting it to a queue.

30.16 class CKFetchRecordsOperationMBS

30.16.1 class CKFetchRecordsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A CKFetchRecordsOperation object retrieves CKRecord objects (whose IDs you already know) from iCloud.
Notes:

Use this operation to retrieve the entire contents of each record or only a subset of its contained values. As records become available, the operation object reports progress about the state of the operation to several different blocks, which you can use to process the results.

Fetching records is a common use of CloudKit, even if your app does not cache record IDs locally. For example, when you fetch a record related to the current record through a CKReference object, you use the ID in the reference to perform the fetch.

The blocks you assign to process the fetched records are executed serially on an internal queue managed by the fetch records operation. Your blocks must be capable of executing on a background thread, so any tasks that require access to the main thread must be redirected accordingly.

In addition to data records, a fetch records operation can fetch the current user record. The fetchCurrentUserRecordOperation() method returns a specially configured operation object that retrieves the current user record. That record is a standard CKRecord object whose contents are empty initially. You can add data to the user record and save it as needed. Because a discoverable user record can be accessed by other users of the app, never store sensitive personal information such as passwords in the user record. If you must store sensitive information about a user, do so in a separate record that is accessible only to that user.

The completed event is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.
Subclass of the CKDatabaseOperationMBS class.

30.16.2 Methods

30.16.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
See also:

- 30.16.4 Constructor(recordIDs() as CKRecordIDMBS) 5648

30.16.4 Constructor(recordIDs() as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to fetch the records with the specified IDs. **Notes:**

recordIDs: An array of CKRecordIDMBS objects representing the records you want to retrieve. This parameter is used to initialize the value in the recordIDs property. If specify nil, you must assign an appropriate value to the recordIDs property before executing the operation.

If any of the objects in the array are not CKRecordIDMBS objects, this method raises an exception.

Returns an initialized operation object.

The returned operation object is configured to retrieve all fields of the record, including any assets stored in those fields. If you want to minimize the amount of data returned initially, configure the desiredKeys property with the subset of keys whose values you want to retrieve.
See also:

- 30.16.3 Constructor 5647

30.16.5 desiredKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The fields to fetch for the requested records.
Notes:

Use this property to limit the amount of data retrieved for each record during the fetch operation. This property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included in the returned record. The default value of this property is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and should include at least one field name from each record type.

If you intend to specify a value other than nil, do so before executing the operation or submitting the operation object to a queue.

30.16.6 fetchCurrentUserRecordOperation as CKFetchRecordsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an operation object that can be used to fetch the current user record.

Notes: The returned operation object searches for the single record corresponding to the current user record. You must associate at least one progress block with the operation object (excluding the completed event) to process the results.

30.16.7 recordIDs as CKRecordIDMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The array of IDs corresponding to the records to fetch.
Notes:

Use this property to view or change the IDs of the records you want to retrieve. Each item in the array must be a CKRecordIDMBS object. If you used the fetchCurrentUserRecordOperation method to create the operation object, the contents of this property are ignored and the value is set to nil.

If you intend to specify a value other than nil, do so before executing the operation or submitting the operation object to a queue. The records you fetch do not need to be in the same record zone. The record ID for each record provides the zone information needed by the server to fetch the corresponding record.

30.16.8 setDesiredKeys(desiredKeys() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Set the fields to fetch for the requested records.
Notes:

Use this property to limit the amount of data retrieved for each record during the fetch operation. This property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included in the returned record. The default value of this property is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and should include at least one field name from each record type.

If you intend to specify a value other than nil, do so before executing the operation or submitting the operation object to a queue.

30.16.9 setRecordIDs(IDs() as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the array of IDs corresponding to the records to fetch.
Notes:

Use this property to view or change the IDs of the records you want to retrieve. Each item in the array must be a CKRecordIDMBS object. If you used the fetchCurrentUserRecordOperation method to create the operation object, the contents of this property are ignored and the value is set to nil.

If you intend to specify a value other than nil, do so before executing the operation or submitting the operation object to a queue. The records you fetch do not need to be in the same record zone. The record ID for each record provides the zone information needed by the server to fetch the corresponding record.

30.16.10 Events

30.16.11 fetchRecordsCompleted(recordsByRecordID as Dictionary, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute after all records are fetched or have received appropriate errors.
Notes:

The event returns no value and takes the following parameters:

recordsByRecordID: A dictionary containing the records that are retrieved successfully. Each key in the dictionary is a CKRecordID object corresponding to a record you requested. The value of each key is the corresponding CKRecord object that was retrieved from the database.
operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

The operation object executes this event only once and is your last chance to process the operation results. The event is executed after all of the individual progress events but before the operation's completed event. The event is executed serially with respect to the other progress events of the operation.

This event reports an error of type CKErrorPartialFailure when it retrieves only some of the records successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is an NSDictionary object. The keys of that dictionary are the IDs of the records that were not retrieved, and the corresponding values are error objects containing information about what happened.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

30.16.12 RecordCompleted(record as CKRecordMBS, recordID as CKRecordIDMBS, error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when the results of a single record are available.
Notes:

The event returns no value and takes the following parameters:

record: The retrieved record, or nil if the specified record cannot be retrieved.
recordID: The ID of the record. This value corresponds to one of the IDs you specified in the recordIDs property.
error: An error object containing information about a problem, or nil if the results are retrieved successfully.

The operation object executes this block once for each record ID in the recordIDs property. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

30.16.13 RecordProgress(recordID as CKRecordIDMBS, progress as Double)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with progress information for individual records.
Notes:

The event returns no value and takes the following parameters:

recordID: The ID of the record that is being retrieved.
progress: The amount of the record that has been downloaded, represented as a percentage of the total. The range of this value is 0.0 to 1.0, where 0.0 means nothing has been downloaded, and 1.0 means the download is complete.

The operation object executes this block zero or more times for each record ID in the recordIDs property. Each time the block is executed, it is executed serially with respect to the other progress events of the operation. You can use this event to track the ongoing progress of the download operation and possibly to provide feedback to the user.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

30.17 class CKFetchRecordZoneChangesOperationMBS

30.17.1 class CKFetchRecordZoneChangesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An operation that fetches record changes across the given record zone.
Notes: Subclass of the CKDatabaseOperationMBS class.

30.17.2 Methods

30.17.3 Constructor(recordZoneIDs() as CKRecordZoneIDMBS, optionsByRecordZoneID as Dictionary = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to fetch record zone changes.
Notes:

The returned operation object is configured to retrieve all record zones passed in. If you want to minimize the amount of data returned even further, configure the CKFetchRecordZoneChangesOptionsMBS property for each record zone.

After initializing the operation, associate at least one progress block with the operation object (excluding the completion block) to process the results.

optionsByRecordZoneID: The options per zone.
recordZoneIDs: The record zones that should be fetched.

30.17.4 recordZoneIDs as CKRecordZoneIDMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The IDs of the record zones whose records you want to fetch.
Notes: Typically, you set the value of this property when you initialize the operation object. If you intend to change the record zones, update the value before executing the operation or submitting it to a queue.

30.17.5 setRecordZoneIDs(IDs() as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the IDs of the record zones whose records you want to fetch.
Notes: Typically, you set the value of this property when you initialize the operation object. If you in-

tend to change the record zones, update the value before executing the operation or submitting it to a queue.

30.17.6 Properties

30.17.7 fetchAllChanges as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether repeated requests should be sent to the server.
Notes:

If true, this operation sends repeated requests to the server until CKFetchRecordZoneChangesOperationMBS is false. The server calls recordZoneFetchCompletionBlock with an incremental change token after every request. The default value is true.
(Read and Write property)

30.17.8 optionsByRecordZoneID as Dictionary

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Options for each zone that is retrieved from the server.
Notes:

Each CKRecordZoneIDMBS can have its own CKFetchRecordZoneChangesOptionsMBS object that allows you to configure what is fetched for that zone. See CKFetchRecordZoneChangesOptionsMBS for details on what options can be set.
(Read and Write property)

30.17.9 Events

30.17.10 fetchRecordZoneChangesCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to use to process the record zone changes.
Notes:

The event has no return value and takes the following parameter:

operationError: An error object containing information about a problem, or nil if the record zone changes were retrieved successfully.

30.17.11 recordChanged(record as CKRecordMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The block to execute with the contents of a changed record.
Notes:

The block returns no value and takes the following parameter:

record: The record that changed. If you specified a value for the desiredKeys property, the record only contains the fields specified in the desiredKeys property.

The operation object executes this block once for each record in the zone that changed since the previous fetch request. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation. If no records changed, the block is not executed.

If you intend to use this block to process results, set it before executing the operation or submitting it to a queue.

30.17.12 recordWithIDWasDeleted(recordID as CKRecordIDMBS, recordType as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the ID of a record that was deleted.
Notes:

The event returns no value and takes the following parameter:

recordID: The ID of the record that was deleted.

The operation object executes this block once for each record that was deleted since the previous fetch request. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation. If no records were deleted, this block is not executed.

If you intend to use this block to process results, set it before executing the operation or submitting it to a queue.

30.17.13 recordZoneChangeTokensUpdated(recordZoneID as CKRecordZoneIDMBS, serverChangeToken as CKServerChangeTokenMBS, clientChangeTokenData as MemoryBlock)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when the change token has been updated.
Notes:

The event returns no value and takes the following parameters:

recordZoneID: The ID of the zone with the updated token.
serverChangeToken: The new change token from the server. You can store this token locally and use it during subsequent fetch operations to limit the results to records that changed since this operation executed.
clientChangeTokenData: The last client change token received from this device. If this change token is not the last change token you provided, the server may not have received the associated changes.

The operation object executes this block once for each record zone. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this block to process results, set it before executing the operation or submitting it to a queue.

30.17.14 recordZoneFetchCompleted(recordZoneID as CKRecordZoneIDMBS, serverChangeToken as CKServerChangeTokenMBS, clientChangeTokenData as MemoryBlock, moreComing as boolean, recordZoneError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when the fetch for a zone has completed.
Notes:

The block returns no value and takes the following parameters:

recordZoneID: The ID of the zone with the updated token.
serverChangeToken: The current server change token to be stored and used in subsequent CKFetchRecordZoneChangesOperation instances.
clientChangeTokenData: The last client change token received from this device. If this change token is not the last change token you provided, the server may not have received the associated changes.
moreComing: Indicates if this is the last record zone change. If fetchAllChanges is false, it is the responsibility of the client to create additional CKFetchRecordZoneChangesOperationMBS instances for the additional changes.
recordZoneError: An error object containing information about a problem, or nil if the results are retrieved successfully.

The client is responsible for saving the change token at the end of the operation and passing it into the next call to CKFetchRecordZoneChangesOperationMBS. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting it to a queue.

30.18 class CKFetchRecordZoneChangesOptionsMBS

30.18.1 class CKFetchRecordZoneChangesOptionsMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Options when fetching record zone changes.

30.18.2 Methods

30.18.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

30.18.4 desiredKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The fields to fetch for the requested records.
Notes:

Use this property to limit the amount of data retrieved for each record during the fetch operation. This property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included in the returned record. The default value is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and include at least one field name from each record type.

If you intend to specify the desired set of keys, set the value of this property before executing the operation or submitting it to a queue.

30.18.5 setDesiredKeys(desiredKeys() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the fields to fetch for the requested records.
Notes:

Use this property to limit the amount of data retrieved for each record during the fetch operation. This property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included

in the returned record. The default value is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and include at least one field name from each record type.

If you intend to specify the desired set of keys, set the value of this property before executing the operation or submitting it to a queue.

30.18.6 Properties

30.18.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.18.8 previousServerChangeToken as CKServerChangeTokenMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The token that identifies the starting point for retrieving changes.
Notes:

Each fetch request returns a unique token in addition to any changes. The token is passed as a parameter to your fetchRecordChangesCompleted event. During a subsequent fetch request, providing the previous token causes the server to return only the changes that have occurred since the last fetch request. Tokens are opaque data objects that you can write to disk safely and reuse later.

Typically, you set the value of this property when you initialize the operation object. If you intend to change the record zone, update the value of the property before executing the operation or submitting it to a queue. (Read and Write property)

30.18.9 resultsLimit as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum number of changed records to report with this operation object.
Notes:

Use this property to limit the number of results in situations where you expect the number of changed records might be large. The default value is 0, which causes the server to choose an appropriate number of results to return based on dynamic conditions.

When the number of returned results exceeds the results limit, the operation object sets the moreComing property to true before executing the fetchRecordChangesCompleted event. In your block, check the value of that property, and if it is true, create a new CKFetchRecordChangesOperationMBS object to fetch more results.
(Read and Write property)

30.19 class CKFetchRecordZonesOperationMBS

30.19.1 class CKFetchRecordZonesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKFetchRecordZonesOperation object retrieves CKRecordZone objects (whose IDs you already know) from iCloud.
Notes:

Use this operation object to fetch record zones so that you can ascertain their capabilities.

The completed event is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.
Subclass of the CKDatabaseOperationMBS class.

30.19.2 Methods

30.19.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default constructor.
See also:

- 30.19.4 Constructor(recordZoneIDs() as CKRecordZoneIDMBS) 5660

30.19.4 Constructor(recordZoneIDs() as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to fetch the specified record zones.
Notes:

zoneIDs: An array of CKRecordZoneID objects representing the zones you want to retrieve. This parameter is used to initialize the value in the recordZoneIDs property. If you specify nil, you must assign a value to the recordZoneIDs property before executing the operation.

Returns an initialized operation object.
See also:

- 30.19.3 Constructor 5660

30.19.5 fetchAllRecordZonesOperation as CKFetchRecordZonesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an operation object that can be used to fetch all record zones in the current database.

30.19.6 recordZoneIDs as CKRecordZoneIDMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The IDs of the record zones you want to retrieve.
Notes:

Use this property to view or change the IDs of the record zones you want to retrieve. Each item in the array must be a CKRecordZoneID object. If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

If you used the fetchAllRecordZonesOperationMBS method to create the operation object, the contents of this property are ignored and the default value is set to nil.

30.19.7 setRecordZoneIDs(IDs() as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the IDs of the record zones you want to retrieve.
Notes:

Use this property to view or change the IDs of the record zones you want to retrieve. Each item in the array must be a CKRecordZoneID object. If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

If you used the fetchAllRecordZonesOperationMBS method to create the operation object, the contents of this property are ignored and the default value is set to nil.

30.19.8 Events

30.19.9 fetchRecordZonesCompleted(recordZonesByZoneID as Dictionary, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the fetch results.
Notes:

The event returns no value and takes the following parameters:

recordZonesByZoneID: A dictionary that maps the requested IDs to the retrieved objects. The keys in the dictionary are the CKRecordZoneID objects you requested, and the values are the corresponding CKRecordZone objects.
operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

The operation object executes this block only once and it is your only chance to process the operation results. The block is executed before the operation's completion block. Your block must be capable of executing on a background thread, so any tasks that require access to the main thread must be redirected accordingly.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

This block reports an error of type CKErrorPartialFailure when it retrieves only some of the record zones successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is a dictionary. The keys of that dictionary are the IDs of the record zones that were not retrieved, and the corresponding values are error objects containing information about what happened.

30.20 class CKFetchShareMetadataOperationMBS

30.20.1 class CKFetchShareMetadataOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An operation that fetches shared record metadata for one or more shares.
Notes:

This operation may be run in any container that the client has access to.
Subclass of the CKOperationMBS class.

30.20.2 Methods

30.20.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.12 and newer in 64-bit application.

30.20.4 Constructor(URLs() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to fetch the metadata for the specified shares.
Notes:

shareURLs: An array of URLs. This parameter is used to initialize the value in the shareURLs property. If you specify nil, you must assign an appropriate value to the shareURLs property before executing the operation.

Returns an initialized operation object.

30.20.5 rootRecordDesiredKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys to be fetched if the root record is to be fetched.
Notes:

This property declares which user-defined keys should be fetched and added to the resulting root record. This property is only consulted if shouldFetchRootRecord is set to true.

If this property is set to nil, the entire root record is downloaded.
If this property is set to an empty array, no user fields are downloaded.

This property defaults to nil.

30.20.6 setRootRecordDesiredKeys(rootRecordDesiredKeys() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the keys to be fetched if the root record is to be fetched.
Notes:

This property declares which user-defined keys should be fetched and added to the resulting root record. This property is only consulted if shouldFetchRootRecord is set to true.

If this property is set to nil, the entire root record is downloaded.
If this property is set to an empty array, no user fields are downloaded.

This property defaults to nil.

30.20.7 setShareURLs(URLs() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the URLs of the shares that you want to process.
Notes: Use this property to view or change the URLs of the share objects that you want to fetch. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

30.20.8 shareURLs as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The URLs of the shares that you want to process.
Notes: Use this property to view or change the URLs of the share objects that you want to fetch. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

30.20.9 Properties

30.20.10 shouldFetchRootRecord as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A flag to indicate whether the root record should be retrieved.
Notes:

If this property is set to true, the resulting CKShareMetadataMBS has a rootRecord object filled out.
The resulting CKShareMetadata has a rootRecordID property regardless of the value of this property.
This property defaults to false.
(Read and Write property)

30.20.11 Events

30.20.12 fetchShareMetadataCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when the operation has completed.
Notes:

This block is called when the operation completes. The Complete of the underlying NSOperation is also called if both are implemented.

The event is executed serially with respect to the other progress events of the operation. If you intend to use this event to process results, update the value of this property before executing the operation or submitting the operation object to a queue.

30.20.13 ShareMetadataFetched(shareURL as String, shareMetadata as CKShareMetadataMBS, error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute for each share metadata that has been fetched from the server.
Notes:

If error is nil then the share was successfully accepted. Each time the event is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

30.21 class CKFetchShareParticipantsOperationMBS

30.21.1 class CKFetchShareParticipantsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An operation that fetches the participants of a shared record.
Notes: Subclass of the CKOperationMBS class.

30.21.2 Methods

30.21.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to fetch share participants.
Notes:

You can use the returned CKFetchShareParticipantsOperation only once. When executed, this query object fetches the share participants.

Note
If userIdentityLookupInfos is not set prior to executing the operation, it returns immediately with no results.
See also:

- 30.21.4 Constructor(userIdentityLookupInfos() as CKUserIdentityLookupInfoMBS) 5666

30.21.4 Constructor(userIdentityLookupInfos() as CKUserIdentityLookupInfoMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to fetch the specified share participants.
Notes:

userIdentityLookupInfos: An array of CKUserIdentityLookupInfoMBS objects. This parameter is used to initialize the value in the userIdentityLookupInfos property. If you specify nil, you must assign an appropriate value to the userIdentityLookupInfosuserIdentityLookupInfos property before executing this operation.

Returns an initialized operation object.
See also:

- 30.21.3 Constructor 5666

30.21.5 setUserIdentityLookupInfos(userIdentityLookupInfos() as CKUserIdentityLookupInfoMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the user identities that are used to fetch the share participants.
Notes:

Use this property to view or change the user identities you want to fetch against. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

Note
If userIdentityLookupInfos is not set prior to executing the operation, it returns immediately with no results.

30.21.6 userIdentityLookupInfos as CKUserIdentityLookupInfoMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The user identities that are used to fetch the share participants.
Notes:

Use this property to view or change the user identities you want to fetch against. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

Note
If userIdentityLookupInfos is not set prior to executing the operation, it returns immediately with no results.

30.21.7 Events

30.21.8 fetchShareParticipantsCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when the operation has completed.
Notes:

This event is called when the operation complete. The Comepleted of the underlying NSOperation is also called if both are set.

The event is executed serially with respect to the other progress blocks of the operation. If you intend to use this event to process results, update the value of this property before executing the operation or submitting the operation object to the queue.

30.21.9 shareParticipantFetched(participant as CKShareParticipantMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute for each share participant that has been fetched from the server.
Notes:

Each time the event is executed, it is executed serially with respect to the other progress events of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

30.22 class CKFetchSubscriptionsOperationMBS

30.22.1 class CKFetchSubscriptionsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKFetchSubscriptionsOperation object retrieves CKSubscription objects (whose IDs you already know) from iCloud and can fetch all subscriptions associated with the current user.
Notes:

You might fetch subscription objects so you can examine or modify their parameters; for example, to adjust the delivery options for push notifications generated by the subscription.

The completion event is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.
Subclass of the CKDatabaseOperationMBS class.

30.22.2 Methods

30.22.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
See also:

- 30.22.4 Constructor(subscriptionIDs() as String) 5669

30.22.4 Constructor(subscriptionIDs() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to fetch the specified subscriptions.
Notes:

subscriptionIDs: An array of strings, each of which contains the ID of a subscription object you want to retrieve. This parameter is used to initialize the value in the subscriptionIDs property. If you specify nil, you must assign an appropriate value to the subscriptionIDs property before executing the operation.

Returns an initialized operation object.
See also:

- 30.22.3 Constructor 5669

30.22.5 fetchAllSubscriptionsOperation as CKFetchSubscriptionsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an operation object that retrieves all of the user's subscription objects in the current database. **Notes:** Returns a newly allocated operation object that fetches the active subscription objects operating on behalf of the current user.

30.22.6 setSubscriptionIDs(emails() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the IDs of the subscription objects you want to retrieve.
Notes:

Use this property to view or change the IDs of the subscription objects you want to retrieve. Each item in the array must be a string whose value is the ID of the subscription object you want to retrieve. If you intend to specify or change the value for this property, do so before executing the operation or submitting the operation object to a queue.

If you used the fetchAllSubscriptionsOperation method to create the operation object, the contents of this property are ignored and its value is set to nil.

30.22.7 subscriptionIDs as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The IDs of the subscription objects you want to retrieve.
Notes:

Use this property to view or change the IDs of the subscription objects you want to retrieve. Each item in the array must be a string whose value is the ID of the subscription object you want to retrieve. If you intend to specify or change the value for this property, do so before executing the operation or submitting the operation object to a queue.

If you used the fetchAllSubscriptionsOperation method to create the operation object, the contents of this property are ignored and its value is set to nil.

30.22.8 Events

30.22.9 fetchSubscriptionCompleted(subscriptionsBySubscriptionID as Dictionary, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the fetch results.
Notes:

The event returns no value and takes the following parameters:

subscriptionsBySubscriptionID: A dictionary that maps the requested IDs to the retrieved objects. The keys in the dictionary are the NSString objects with the IDs of the subscription objects you requested and the values are the corresponding CKSubscription objects.
operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

The operation object executes this block only once and it is your only chance to process the operation results. The block is executed before the operation's completion block. Your block must be capable of executing on a background thread, so any tasks that require access to the main thread must be redirected accordingly.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

This block reports an error of type CKErrorPartialFailure when it retrieves only some of the subscriptions successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is a dictionary. The keys of that dictionary are the IDs of the subscriptions that were not retrieved and the corresponding values are error objects containing information about what happened.

30.23 class CKFetchWebAuthTokenOperationMBS

30.23.1 class CKFetchWebAuthTokenOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The CKFetchWebAuthTokenOperation object fetches a web authentication token given an API token that you obtain from CloudKit Dashboard.
Notes:

Use the add method in the CKDatabase class to add this operation to the operation queue of the public database.
Subclass of the CKDatabaseOperationMBS class.

30.23.2 Methods

30.23.3 Constructor(APIToken as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a CKFetchWebAuthTokenOperationMBS object with the specified API token.
Notes: APIToken: An API token that allows access to an app's container.

30.23.4 Properties

30.23.5 APIToken as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An API token that allows access to an app's container.
Notes: (Read and Write property)

30.23.6 Events

30.23.7 fetchWebAuthTokenCompleted(webAuthToken as string, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when this CKFetchWebAuthTokenOperation object fetches the web authentication token.
Notes:

The event returns no value and takes the following parameters:

webAuthToken: If the operation is successful, the web authentication token; otherwise, nil.
operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

The operation object executes this block only once and it is your only chance to process the operation results. Your block must be capable of executing on a background thread, so any tasks that require access to the main thread must be redirected accordingly.

30.24 class CKLocationSortDescriptorMBS

30.24.1 class CKLocationSortDescriptorMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKLocationSortDescriptor object sorts records containing location data based on their distance from a location that you specify.
Notes:

You can add a location sort descriptor to your queries when searching for records. At creation time, you must provide the sort descriptor with a key whose value is a CLLocation object. The sort descriptor uses the value of that key to perform the sort.

Distances are computed by drawing a direct line between the two locations that follows the curvature of the Earth. Distances do not take into account altitude changes between the two locations.
Subclass of the NSSortDescriptorMBS class.

30.24.2 Methods

30.24.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.24.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Private constructor.
See also:

- 30.24.5 Constructor(key as string, relativeLocation as Variant) 5674

30.24.5 Constructor(key as string, relativeLocation as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a location sort descriptor object.
Notes:

key: The name of the key whose value is a CLLocationMBS object. The key must belong to the records being sorted. The sort descriptor uses this key to retrieve the corresponding value from the record.
relativeLocation: The reference location to use when sorting. Records are sorted based on their distance to

this location.

Returns an initialized location sort descriptor object, or nil if the object cannot be initialized.

During sorting, the sort descriptor computes the distance between the value in the relativeLocation parameter and the location value found in the specified key of each record. It then sorts the records in ascending order using the distance between the two points. You cannot change the sort order.

relativeLocation must be a CLLocationMBS object.
See also:

- 30.24.4 Constructor 5674

30.24.6 Properties

30.24.7 relativeLocation as Variant

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The reference location against which records are sorted.
Notes:

Value is a CLLocationMBS.
(Read only property)

30.25 class CKMarkNotificationsReadOperationMBS

30.25.1 class CKMarkNotificationsReadOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A CKMarkNotificationsReadOperation object marks push notifications as read by your app so that they do not show up in future fetch results.
Notes:

If your app uses push notifications to track changes to records, you can use this operation object to note which push notifications do not need to be processed again.

The completion event is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.
Subclass of the CKOperationMBS class.

30.25.2 Methods

30.25.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.
See also:

- 30.25.4 Constructor(IDs() as CKNotificationIDMBS) 5676

30.25.4 Constructor(IDs() as CKNotificationIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes and returns an operation object configured to mark the specified notifications as read.
Notes:

notificationIDs: An array of CKNotificationIDMBS objects representing the notifications you want to mark as read. Use this parameter to initialize the value in the notificationIDs property. If you specify nil, assign an appropriate value to the notificationIDs property before executing the operation.

If any objects in the array are not CKNotificationIDMBS objects, this method raises an exception.

Returns an initialized operation object.
See also:

• 30.25.3 Constructor 5676

30.25.5 notificationIDs as CKNotificationIDMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The array of notifications to mark as read.
Notes: Use this property to view or change the IDs of the notifications you want to mark as read. Each item in the array must be a CKNotificationIDMBS object. If you intend to specify a value for this property, do so before executing the operation or submitting the operation object to a queue.

30.25.6 setNotificationIDs(IDs() as CKNotificationIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the array of notifications to mark as read.
Notes: Use this property to view or change the IDs of the notifications you want to mark as read. Each item in the array must be a CKNotificationIDMBS object. If you intend to specify a value for this property, do so before executing the operation or submitting the operation object to a queue.

30.25.7 Events

30.25.8 markNotificationsReadCompleted(notificationIDsMarkedRead() as CKNotificationIDMBS, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when all results of the operation are known.
Notes:

The event returns no value and takes the following parameters:

notificationIDsMarkedRead: An array of CKNotificationID objects corresponding to the notifications that were successfully marked as read.
operationError: An error object containing information about a problem, or nil if all notifications are updated successfully.

The operation object executes this block only once and it is your only chance to process the operation results. If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

This block reports an error of type CKErrorPartialFailure when it is able to update only some of the notifications successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is a dictionary. The keys of that dictionary are the IDs of the notifications that were not updated, and

the corresponding values are error objects containing information about what happened.

30.26 class CKModifyBadgeOperationMBS

30.26.1 class CKModifyBadgeOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A CKModifyBadgeOperation object updates the badge value applied to the app's icon.
Notes:

This operation object can update the badge for the current device or for all of the user's devices.

The completion event is called after the operation executes and returns its results to you. You can use a completion event to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion event you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.
Subclass of the CKOperationMBS class.

30.26.2 Methods

30.26.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
See also:

- 30.26.4 Constructor(badgeValue as Integer) 5679

30.26.4 Constructor(badgeValue as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes and returns an operation object for setting the badge of the app.
Notes: badgeValue: The numerical value of the app's badge. Specify 0 to remove the badge.
See also:

- 30.26.3 Constructor 5679

30.26.5 Properties

30.26.6 badgeValue as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The numerical value to apply to the app's badge.
Notes:

The initial value of this property is set to the value you specified using the Constructor. If you intend to change the value, do so before executing the operation or submitting it to a queue.
(Read and Write property)

30.26.7 Events

30.26.8 modifyBadgeCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results of the operation.
Notes:

The event returns no value and takes the following parameters:

operationError: An error object containing information about a problem, or nil if the badge is applied successfully.

This event is executed only once and represents your only chance to process the operation results. If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

30.27 class CKModifyRecordsOperationMBS

30.27.1 class CKModifyRecordsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A CKModifyRecordsOperationMBS object saves changes to one or more CKRecordMBS objects.
Notes:

After modifying the fields of a record, use this type of operation object to save those changes to a database. You also use instances of this class to delete records permanently from a database.

see
https://developer.apple.com/reference/cloudkit/ckmodifyrecordsoperation
Subclass of the CKDatabaseOperationMBS class.

30.27.2 Methods

30.27.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
See also:

- 30.27.4 Constructor(recordsToSave() as CKRecordMBS, recordIDsToDelete() as CKRecordIDMBS) 5681

30.27.4 Constructor(recordsToSave() as CKRecordMBS, recordIDsToDelete() as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes and returns an operation object configured to save and delete the specified records.
Notes:

recordsToSave: An array of CKRecordMBS objects representing the records to save, if any. You may specify nil for this parameter.
recordIDsToDelete: An array of CKRecordIDMBS objects representing the records you want to delete, if any. You may specify nil for this parameter.

Returns an initialized operation object.

The records you intend to save or delete must all reside in the same database, which you can specify when you configure the operation object. Saving a record that is not in the current database creates it in the

database. Trying to delete a record that does not exist in the current database returns an error for that record.
See also:

- 30.27.3 Constructor 5681

30.27.5 recordIDsToDelete as CKRecordIDMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The IDs of the records to delete permanently from the database.
Notes:

This property contains the array of CKRecordID objects that identify the records to delete. The initial contents of the array are set to the records you specified in the Constructor.

If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

When deleting records, the operation object reports progress only on the records you specify in this property. Deleting records can trigger the deletion of related records if there is an owner-owned relationship between the records involving a CKReference object. When additional deletions occur, they are not reported to the progress blocks of this object. For that reason, it is important to understand the implications of the ownership model you use when you relate records to each other through a CKReference object. For more information about owner-owned relationships, see CKReference.

30.27.6 recordsToSave as CKRecordMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The records to save to the database.
Notes:

This property contains the array of CKRecordMBS objects that you want to save. The initial contents of the array are set to the records you specified in the constructor. You can modify this array as needed before executing the operation. The records must all target the same database but may belong to different zones in the database.

If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

30.27.7 setrecordIDsToDelete(IDs() as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the IDs of the records to delete permanently from the database.
Notes:

This property contains the array of CKRecordID objects that identify the records to delete. The initial contents of the array are set to the records you specified in the Constructor.

If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

When deleting records, the operation object reports progress only on the records you specify in this property. Deleting records can trigger the deletion of related records if there is an owner-owned relationship between the records involving a CKReference object. When additional deletions occur, they are not reported to the progress blocks of this object. For that reason, it is important to understand the implications of the ownership model you use when you relate records to each other through a CKReference object. For more information about owner-owned relationships, see CKReference.

30.27.8 setRecordsToSave(IDs() as CKRecordMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the records to save to the database.
Notes:

This property contains the array of CKRecordMBS objects that you want to save. The initial contents of the array are set to the records you specified in the constructor. You can modify this array as needed before executing the operation. The records must all target the same database but may belong to different zones in the database.

If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

30.27.9 Properties

30.27.10 atomic as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the entire operation fails when one or more records in the same zone cannot be written.
Notes:

Modifying records atomically prevents you from updating your data in a way that would leave it in an

inconsistent state. You use atomic updates when you want to write multiple records to the same record zone. If there is a failure to modify any of the records in a particular zone, no changes are made to the other records in that same zone. The zone itself must have the CKRecordZoneCapabilityAtomic capability for this behavior to apply. If a record zone does not support the atomic capability, setting this property has no effect.

The default value of this property is true, which causes all modifications within a single record zone to be made atomically. If your operation object contains records in multiple record zones, a failure in one zone does not prevent modifications to records in a different zone. Changing the value of this property to false causes the records to be modified individually, regardless of whether the record zone supports atomic modifications.
(Read and Write property)

30.27.11 clientChangeTokenData as MemoryBlock

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A data token used to track client-side changes to records.
Notes:

When you modify records from a fetch operation, specify a client-generated data token using this property to indicate which version of the record you last modified. Compare the data token you supplied to the data token in the next record fetch to confirm the server has successfully received the device's last modify request.

The default value is nil.

If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.
(Read and Write property)

30.27.12 savePolicy as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The policy to apply when the server contains a newer version of a specific record.
Notes:

Each record has a change tag that allows the server to track when that record was saved. When you save a record, CloudKit compares the change tag in your local copy of the record with the one on the server. If the two tags do not match—meaning that there is a potential conflict—the server uses the value in this property to determine how to proceed.

The default value of this property is CKRecordSaveIfServerRecordUnchanged. If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.
(Read and Write property)

30.27.13 Events

30.27.14 modifyRecordsCompleted(savedRecords() as CKRecordMBS, deletedRecordIDs() as CKRecordIDMBS, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute after the status of all changes is known.
Notes:

The event returns no value and takes the following parameters:

savedRecords: The array of CKRecordMBS objects you tried to save.
deletedRecordIDs: The array of CKRecordIDMBS objects corresponding to the records you tried to delete.
operationError: An error object containing information about a problem, or nil if the results are saved successfully.

This event is executed only once and represents your last chance to process the operation results. It is executed after all individual progress blocks have completed but before the operation's completion block. The block is executed serially with respect to the other progress blocks of the operation.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

This block reports an error of type CKErrorPartialFailure when it saves or deletes only some of the records successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is a dictionary. The keys of that dictionary are the IDs of the records that were not saved or deleted, and the corresponding values are error objects containing information about what happened.

30.27.15 RecordCompleted(record as CKRecordMBS, error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when the save results of a single record are known.
Notes:

The event returns no value and takes the following parameters:

record: A CKRecordMBS object that you attempted to save.
error: An error object containing information about a problem, or nil if the record was saved successfully.

This block is executed once for each record in the recordsToSave property. Each time the block is executed, it is executed serially with respect to the other progress events of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue. Use this block to take any actions after the status of saving the record is known.

30.27.16 RecordProgress(record as CKRecordMBS, progress as Double)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with progress information for an individual record.
Notes:

The block returns no value and takes the following parameters:

record: The CKRecordMBS object that is in the process of being saved.
progress: The amount of progress toward saving the record, expressed as a percentage of its total size. This value is a number between 0.0 and 1.0, where 0.0 means none of the record is saved and 1.0 means the entire record has been saved.

The operation object executes this block zero or more times for each record in the recordsToSave property. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue. Use this block to track the ongoing progress of the upload operation and possibly to provide feedback to the user.

30.27.17 Constants

30.27.18 SaveAllKeys = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the policy to apply when saving records.
Notes: A policy that saves all keys of the record (including those that have not changed) to the server, overwriting any values currently on the server. Keys present only on the server remain unchanged.

30.27.19 SaveChangedKeys = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the policy to apply when saving records.
Notes: A policy that saves only those fields of the record that actually changed, overwriting any values currently on the server. Unmodified fields are left untouched.

30.27.20 SaveIfServerRecordUnchanged = 0

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the policy to apply when saving records.
Notes: A policy that saves the record only if the local copy of the record is based on the record still on the server. The server maintains a change tag for each record automatically. When you fetch a record, that change tag is included with the rest of the record's data. If the change tag in your local record matches the change tag of the record on the server, the save operation proceeds normally. If the server record contains a newer change tag, the record is not saved and an error of type CKErrorServerRecordChanged is reported.

30.28 class CKModifyRecordZonesOperationMBS

30.28.1 class CKModifyRecordZonesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A CKModifyRecordZonesOperationMBS object saves or deletes record zones.
Notes:

After creating one or more record zones, use this operation object to save those zones to the database. You can also use it to delete existing zones and the records they contain.

The completion event is called after the operation executes and returns its results to you. You can use a completion event to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.
Subclass of the CKDatabaseOperationMBS class.

30.28.2 Methods

30.28.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.
See also:

- 30.28.4 Constructor(recordZonesToSave() as CKRecordZoneMBS, recordZoneIDsToDelete() as CKRecordZoneIDMBS) 5688

30.28.4 Constructor(recordZonesToSave() as CKRecordZoneMBS, recordZoneIDsToDelete() as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes and returns an operation object configured to save and delete the specified record zones.
Notes:

recordZonesToSave: An array of CKRecordZoneMBS objects representing the record zones to save. You may specify nil for this parameter.
recordZoneIDsToDelete: An array of CKRecordZoneIDMBS objects representing the record zones you want to delete, if any. You may specify nil for this parameter.

Returns an initialized operation object.

The record zones you intend to save or delete must all reside in the same database, which you specify when configuring the operation object. Deleting a record zone also deletes any records it contains. Trying to delete a record zone that does not exist in the current database returns an error.
See also:

- 30.28.3 Constructor 5688

30.28.5 recordZoneIDsToDelete as CKRecordZoneIDMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The IDs of the record zones to delete permanently from the database.
Notes:

This property contains an array of CKRecordZoneIDMBS objects identifying the zones you want to delete. You set the initial contents of this property with the Constructor. You can assign a new array as needed before executing the operation. The record zones must all be located in the same database. You may specify nil or an empty array for this property.

If you intend to change the value of this property, do so before executing the operation or submitting it to a queue.

30.28.6 recordZonesToSave as CKRecordZoneMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The record zones to save to the database.
Notes:

This property contains an array of CKRecordZoneMBS objects representing the zones you want to save. You set the initial contents of this property with the Constructor. You can assign a new array as needed before executing the operation. The record zones must all target the same database. You may specify nil or an empty array for this property.

If you intend to change the value of this property, do so before executing the operation or submitting it to a queue.

30.28.7 setRecordZoneIDsToDelete(IDs() as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Set the IDs of the record zones to delete permanently from the database.

30.28.8 setRecordZonesToSave(IDs() as CKRecordZoneMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the record zones to save to the database.

30.28.9 Events

30.28.10 modifyRecordZonesCompleted(savedRecordZones() as CKRecordZoneMBS, deletedRecordZoneIDs() as CKRecordZoneIDMBS, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute after the status of all changes is known.
Notes:

The event returns no value and takes the following parameters:

savedRecordZones: An array of CKRecordZone objects you tried to save.
deletedRecordZoneIDs: An array of CKRecordZoneID objects corresponding to the record zones you tried to delete.
operationError: An error object containing information about a problem, or nil if the results are saved successfully.

This block is executed only once and represents your only chance to process the operation results. If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

This event reports an error of type CKErrorPartialFailure when it saves or deletes only some of the record zones successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is a dictionary. The keys of that dictionary are the IDs of the record zones that were not saved or deleted, and the corresponding values are error objects containing information about what happened.

30.29 class CKModifySubscriptionsOperationMBS

30.29.1 class CKModifySubscriptionsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKModifySubscriptionsOperation object saves changes to one or more CKSubscription objects. **Notes:**

After creating or changing the configuration of a subscription object, use this type of operation object to save those changes to an iCloud container. You also use instances of this class to delete subscriptions permanently from a database.

The complete event is called after the operation executes and returns its results to you. You can use a completion event to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion event you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.

Available in macOS 10.10 and newer in 64-bit applications.
Subclass of the CKDatabaseOperationMBS class.

30.29.2 Methods

30.29.3 Constructor(subscriptionsToSave() as CKSubscriptionMBS, subscriptionIDsToDelete() as String = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to save and delete the specified subscriptions. **Notes:**

subscriptionsToSave: An array of CKSubscription objects representing the subscriptions to save or update. You may specify nil for this parameter.
subscriptionIDsToDelete: An array of strings representing the IDs of the subscriptions you want to delete, if any. You may specify nil for this parameter.

The subscriptions you intend to save or delete must all reside in the same container, which you must specify when configuring the operation object. Saving a subscription that is not in the current database creates it in the database. Trying to delete a subscription that does not exist in the current database returns an error for that subscription.

30.29.4 setSubscriptionIDsToDelete(SubscriptionIDsToDelete() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the IDs of the subscriptions you want to delete permanently from the database.

30.29.5 setSubscriptionsToSave(IDs() as CKSubscriptionMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the subscriptions to save to the database.

30.29.6 subscriptionIDsToDelete as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The IDs of the subscriptions you want to delete permanently from the database.
Notes:

This property contains the array of strings that identify the subscriptions to delete. The initial contents of the array are set to the records you specified with the Constructor.

If you intend to change the set of subscriptions to be deleted, update the value of this property before executing the operation or submitting the operation object to a queue.

30.29.7 subscriptionsToSave as CKSubscriptionMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The subscriptions to save to the database.
Notes:

This property contains the array of CKSubscriptionMBS objects that you want to save. The initial contents of the array are set to the subscriptions you specified with the Constructor. You can modify this array as needed before executing the operation. After saving the subscription objects, the server begins applying the criteria from those objects to the contents of the database, generating push notifications as appropriate.

If you intend to change the set of subscriptions to be saved, update the value of this property before executing the operation or submitting the operation object to a queue.

30.29.8 Events

30.29.9 modifySubscriptionsCompleted(savedSubscriptions() as CKSubscriptionMBS, deletedSubscriptionIDs() as String, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute after the status of all changes is known.
Notes:

The event returns no value and takes the following parameters:

savedSubscriptions: The array of CKSubscription objects you tried to save.
deletedSubscriptionIDs: An array of NSString objects corresponding to the subscriptions you tried to delete.
operationError: An error object containing information about a problem, or nil if the results are saved successfully.

The operation object executes this block only once and represents your last chance to process the operation results. The block is executed on a background thread of your app. If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

This block reports an error of type CKErrorPartialFailure when it saves or delete only some of the subscriptions successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is a dictionary. The keys of that dictionary are the IDs of the subscriptions that were not saved or deleted, and the corresponding values are error objects containing information about what happened.

30.30 class CKNotificationIDMBS

30.30.1 class CKNotificationIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKNotificationID object uniquely identifies a push notification sent from a container.
Notes:

You do not create notification IDs directly. The server creates them when it creates the CKNotification objects that correspond to the push notifications sent to your app. You can compare two IDs using the isEqual method to determine if two notification objects are the same. This class defines no methods or properties.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.30.2 Methods

30.30.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.30.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

30.30.5 IsEqual(Other as CKNotificationIDMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Checks if two objects are equal.

30.30.6 Properties

30.30.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.

Notes: (Read and Write property)

30.31 class CKNotificationInfoMBS

30.31.1 class CKNotificationInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKNotificationInfo object specifies the push notification data that the server sends to your app when a subscription finds a match.
Notes:

When configuring a CKSubscriptionMBS object, create one of these objects and use it to specify the type of push notifications you want generated when the subscription's trigger condition is met. You can provide a message for an alert panel, information about the sounds to play, and information about whether the app should be badged. You can also ask the server to provide information about the record that triggered the notification.

see
https://developer.apple.com/reference/cloudkit/cknotificationinfo

30.31.2 Methods

30.31.3 alertLocalizationArgs as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The array of fields to use when building an alert message.
Notes:

Use of this property is optional. This property contains an array of strings, each of which corresponds to a field of the record that triggered the push notification. Those names are used to retrieve the corresponding values from the record. The values themselves must be string, integer, double, or dates. Do not specify keys with other values. String values that are greater than 100 characters in length may be truncated when added to the push notification.

If you use % @ for your substitution variables, those variables are replaced by walking the array in order. If you use variables of the form % n$ @, where n is an integer, n represents the index (starting at 1) of the item in the array to use. Thus, the first item in the array replaces the variable % 1$ @, the second item replaces the variable % 2$ @, and so on. You can use indexed substitution variables to change the order of items in the resulting string, which might be necessary when you localize your app's messages.

30.31.4 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.

Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.31.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

30.31.6 copy as CKNotificationInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.31.7 desiredKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The names of fields to include in the push notification payload.
Notes:

This property contains an array of strings, each of which corresponds to the name of a field in the record that triggered the notification. When a push notification is delivered, the keys and their corresponding values are included in the payload of the push notification. You can include a maximum of three keys in the array.

For the keys you specify, the allowable values are string, integer, double, CLLocationMBS, date, and CKReferenceMBS. You cannot specify keys whose values contain other data types. String values that are greater than 100 characters in length may be truncated when added to the push notification.

30.31.8 setAlertLocalizationArgs(args() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the array of fields to use when building an alert message.
Notes:

Use of this property is optional. This property contains an array of strings, each of which corresponds to a field of the record that triggered the push notification. Those names are used to retrieve the corresponding values from the record. The values themselves must be string, integer, double, or dates. Do not specify keys with other values. String values that are greater than 100 characters in length may be truncated when added to the push notification.

If you use % @ for your substitution variables, those variables are replaced by walking the array in order.

If you use variables of the form % n$ @, where n is an integer, n represents the index (starting at 1) of the item in the array to use. Thus, the first item in the array replaces the variable % 1$ @, the second item replaces the variable % 2$ @, and so on. You can use indexed substitution variables to change the order of items in the resulting string, which might be necessary when you localize your app's messages.

30.31.9 setDesiredKeys(desiredKeys() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the names of fields to include in the push notification payload.
Notes:

This property contains an array of strings, each of which corresponds to the name of a field in the record that triggered the notification. When a push notification is delivered, the keys and their corresponding values are included in the payload of the push notification. You can include a maximum of three keys in the array.

For the keys you specify, the allowable values are string, integer, double, CLLocationMBS, date, and CKReferenceMBS. You cannot specify keys whose values contain other data types. String values that are greater than 100 characters in length may be truncated when added to the push notification.

30.31.10 Properties

30.31.11 alertActionLocalizationKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The key that identifies the text to use for the action button in the alert panel.
Notes:

This property identifies the text to use for the button to open your app. Specifically, it contains the name of a key to look up in the app's Localizable.strings file, the value of which is used for the button title.

Specifying a value for this property is optional. When its value is nil, the alert panel triggered by the push notification contains only an OK button to dismiss the alert. When its value is not nil, the alert panel contains one button to dismiss the alert and a second button to open your app.
(Read and Write property)

30.31.12 alertBody as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The text to use for the alert message.
Notes:

Use of this property is optional. If you set its value, the corresponding push notification causes the device to display an alert with the specified message. If you want to use a localized string for the alert message, specify a value for the alertLocalizationKey property instead.
(Read and Write property)

30.31.13 alertLaunchImage as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The filename of an image to use as a launch image.
Notes:

Use of this property is optional. If you specify a value, the string is used to locate an image file in the app bundle. That image is displayed as a launch image when the user launches the app after receiving a push notification.
(Read and Write property)

30.31.14 alertLocalizationKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The key that identifies the localized string to use for the alert message.
Notes:

Use of this property is optional. If you set its value, the corresponding push notification causes the device to display an alert on the user's device. The push notification obtains the text for the alert by looking up the specified key in your app's Localizable.strings file. If you specify a value for this property, the value in the alertBody property is ignored.

For information about localizing string resources, see Internationalization and Localization Guide.
(Read and Write property)

30.31.15 category as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Name of the action group corresponding to this notification.
Notes:

Categories allow you to present custom actions to the user on your push notifications. For more information, read UIMutableUserNotificationCategory.
(Read and Write property)

30.31.16 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.31.17 shouldBadge as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean setting that controls whether a badge value should be incremented.
Notes:

The default value of this property is false. Setting it to true causes the system to increment the current badge count for the app whenever the corresponding push notification is delivered.
(Read and Write property)

30.31.18 shouldSendContentAvailable as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the push notification should include the content-available flag.
Notes:

When this property is true, the server includes the content-available flag in the push notification's payload. That flag causes the system to wake or launch an app that is not currently running. The app is then given background execution time to download any data related to the push notification, such as the set of records that changed. If the app is already running in the foreground, the inclusion of this flag has no additional effect and the notification is delivered to the app delegate for processing as usual.

The default value of this property is false.
(Read and Write property)

30.31.19 soundName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the sound file to play when a notification arrives.
Notes:

Use of this property is optional. If you specify a value, the string is used to locate a sound file in the app bundle. That sound file is played as an alert when a push notification arrives on the user's device. If the specified sound file does not exist, or if you specify the string default for this property, the system plays the default alert sound.

(Read and Write property)

30.32 class CKNotificationMBS

30.32.1 class CKNotificationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A CKNotificationMBS object represents a push notification that was sent to your app.
Notes:

Notification objects wrap the data associated with a push notification. Use notification objects to wrap recently received push notification data or to fetch notification objects representing already delivered push notifications from a container. In both cases, the information in the notification object tells you what changed.

The CKNotificationMBS class itself is an abstract class. When you create a new notification object from a payload dictionary, the constructor instantiates a subclass of the appropriate type. Similarly, when you fetch notifications from a container, what you receive are instances of a concrete subclass. The base CKNotificationMBS class provides information about the push notification and how it was delivered. Specific subclasses contain specific data indicating what change actually occurred.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.32.2 Methods

30.32.3 alertLocalizationArgs as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The array of fields used to build the alert message
Notes:

This property contains an array of NSString objects, each of which corresponds to a field of the record that triggered the push notification. Use the field values to replace any substitution variables in the alert strings specified by the notificationFromRemoteNotificationDictionary or Identifying the Notification Object properties. The field values must be string, integer, double, or dates. String values that are greater than 100 characters in length may be truncated when added to the push notification.

If you used % @ for your substitution variables, those variables are replaced by walking the array in order. If you use variables of the form % n$ @, where n is an integer, n represents the index (starting at 1) of the item in the array to use. Thus, the first item in the array replaces the variable % 1$ @, the second item replaces the variable % 2$ @, and so on. You can use indexed substitution variables to change the order of items in the resulting string, which might be necessary when you localize your app's messages.

30.32.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

30.32.5 notificationFromRemoteNotificationDictionary(notificationDictionary as Dictionary) as CKNotificationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a new notification object using the specified payload data.
Notes:

notificationDictionary: The payload data for the push notification. This dictionary is the same one passed to your app delegate's didReceiveRemoteNotification method. This parameter must not be nil.

Returns a new notification object initialized with the payload data.

Use this method to initialize a notification object from a push notification received by your app.

30.32.6 Properties

30.32.7 alertActionLocalizationKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The key that identifies the text to use for the action button in the alert panel.
Notes:

When this property is nil, the alert panel triggered by the push notification contains only an OK button to dismiss the alert. When this property is not nil, the alert panel contains one button to dismiss the alert and a second button to open your app. This property identifies the text to use for the button to open your app. Specifically, it contains the name of a key to look up in the app's Localizable.strings file, the value of which is used for the button title.
(Read only property)

30.32.8 alertBody as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The text of the alert message.
Notes:

This property contains the nonlocalized version of the message string displayed by the alert.

(Read only property)

30.32.9 alertLaunchImage as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The filename of the launch image displayed when your app is launched from the push notification alert.
Notes:

The string in this property is used to locate an image file in the app bundle.
(Read only property)

30.32.10 alertLocalizationKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The key that identifies the localized string to use for the alert message.
Notes:

When delivered to your app, the push notification gets the text for the alert by looking up the specified key in your app's Localizable.strings file. When this property is set, the value in the notificationFromRemoteNotificationDictionary property is ignored.
(Read only property)

30.32.11 badge as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The current badge value.
Notes:

The value of this property is the integer value displayed in the app's badge at the time the push notification was sent.
(Read only property)

30.32.12 category as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Name of the action group corresponding to this notification.
Notes:

Categories allow you to present custom actions to the user on your push notifications. For more information, read UIMutableUserNotificationCategory.

(Read only property)

30.32.13 containerIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the container whose content triggered the notification.
Notes: (Read only property)

30.32.14 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.32.15 isPruned as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether some push notification content was removed prior to delivery.
Notes:

see
https://developer.apple.com/reference/cloudkit/cknotification/1428088-ispruned
(Read only property)

30.32.16 notificationID as CKNotificationIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the notification.
Notes: (Read only property)

30.32.17 notificationType as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of event that generated the notification.
Notes:

Different notification types correspond to different subclasses of CKNotificationMBS, so you can use the value in this property to determine how to handle the notification data.

(Read only property)

30.32.18 soundName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the sound file to play when a notification arrives.
Notes:

This property contains the string used to locate a sound file in your app's bundle. That sound file is played as an alert when a push notification arrives on the user's device. If the specified sound file does not exist, or if you specify the string default for this property, the system plays the default alert sound.
(Read only property)

30.32.19 subscriptionID as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identifier of the subscription that caused this notification to fire.
Notes: (Read only property)

30.32.20 Constants

30.32.21 TypeDatabase = 4

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the notification type constants.
Notes: A notification generated when the contents of a database changed.

30.32.22 TypeQuery = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the notification type constants.
Notes: A notification generated based on the conditions set forth in a subscription object.

30.32.23 TypeReadNotification = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the notification type constants.
Notes: A notification that your app previously marked as read using a CKMarkNotificationsReadOperationMBS object.

30.32.24 TypeRecordZone = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the notification type constants.
Notes: A notification generated when the contents of a record zone changed.

30.33 class CKOperationMBS

30.33.1 class CKOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The abstract base class for all operations that can be executed against a CloudKit database.
Notes:

see
https://developer.apple.com/reference/cloudkit/ckoperation

30.33.2 Blog Entries

- MBS Xojo Plugins, version 17.3pr3

30.33.3 Methods

30.33.4 cancel

MBS Mac64bit Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Advises the operation object that it should stop executing its task.
Notes:

This method does not force your operation code to stop. The code for your operation must invoke the isCancelled method periodically to determine whether the operation should be stopped. Once cancelled, an operation cannot be restarted.

If the operation is already finished executing, this method has no effect. Canceling an operation that is currently in an operation queue, but not yet executing, causes it to be removed from the queue (although not necessarily right away).

30.33.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

30.33.6 isCancelled as boolean

MBS Mac64bit Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the operation has been cancelled.

Notes:

True if the operation was explicitly cancelled by an invocation of the operation's cancel method; otherwise, false. This method may return true even if the operation is currently executing.

Discussion
Canceling an operation does not actively stop the operation's code from executing. An operation object is responsible for calling this method periodically and stopping itself if the method returns true.

30.33.7 isExecuting as boolean

MBS Mac64bit Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the operation is currently executing.
Notes: True if the operation is executing; otherwise, false if the operation has not been started or is already finished.

30.33.8 isFinished as boolean

MBS Mac64bit Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the operation is done executing.
Notes: True if the operation is no longer executing; otherwise, false.

30.33.9 start

MBS Mac64bit Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Begins the execution of the operation.
Notes: The default implementation of this method configures the execution environment for a non-concurrent operation and invokes the operation's main method. As part of the default configuration, this method performs several checks to ensure that the non-concurrent operation can actually run and generates appropriate KVO notifications for each change in the operation's state. If the operation's operation has already been performed, was cancelled, or is not yet ready to run, this method throws an NSInvalidArgumentException exception. If the operation is to be performed on a separate thread, this method may return before the operation itself completes on the other thread.

30.33.10 Properties

30.33.11 allowsCellularAccess as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the operation object may send data over the cell network.
Notes:

When you send or receive many records, or when you send records with large assets, you might set this property to false to avoid consuming too much of the user's cellular data bandwidth. For operations involving only a few records, it is fine to leave this property set to true, which is the default.

When this property is set to false, the operation executes normally but fails if Wi-Fi is not available.
(Read and Write property)

30.33.12 container as CKContainerMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The container to use for the operation.
Notes:

The container sets the context for where the operation should perform its work. The addOperation method of both the CKContainerMBS and CKDatabaseMBS classes implicitly sets the value of this property to their container.

If you execute the operation yourself, either directly or using a custom operation queue, it is recommended that you set the value of this property explicitly. If the value is nil when you execute an operation, the operation object implicitly executes against your app's default container.
(Read and Write property)

30.33.13 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the internal used NSOperation reference.
Notes: (Read and Write property)

30.33.14 longLived as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the operation is long-lived.
Notes:

To create a long-lived operation, set to true. The default value is false. If the operation is running or is a long-lived operation fetched from a CKContainer object, changing this property value has no effect.

For more information on long-lived operations, read Long-Lived Operations.
(Read and Write property)

30.33.15 operationID as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A unique identifier for a long-lived operation.
Notes:

Use this property to fetch a long-lived operation using the fetchLongLivedOperationWithID method in the CKContainer class. For more information on long-lived operations, read Long-Lived Operations.
(Read only property)

30.33.16 timeoutIntervalForRequest as Double

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The timeout interval to use when waiting for additional data.
Notes:

This property determines the request timeout interval for the operation. The request timeout interval controls how long (in seconds) the operation should wait for additional data to arrive before giving up. The timer associated with this value is reset whenever new data arrives. When the request timer reaches the specified interval without receiving any new data, it triggers a timeout.

The default value is 60 seconds.
(Read and Write property)

30.33.17 timeoutIntervalForResource as Double

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The maximum amount of time that a resource request should be allowed to take.
Notes:

This property determines the resource timeout interval for this operation. The resource timeout interval controls how long (in seconds) to wait for the entire operation to complete before giving up. The resource timer starts when the operation is initiated and counts until either the operation completes or this timeout interval is reached, whichever comes first.

The default value is 7 days.
(Read and Write property)

30.33.18 Events

30.33.19 Completed

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The operation completed.

30.33.20 LongLivedOperationWasPersisted

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when the server starts storing callbacks for this long-lived operation.
Notes:

If your app exits before this event is called, the long-lived operation identifier is not included in the results of the fetchAllLongLivedOperationIDs method.

For more information on long-lived operations, read Long-Lived Operations.

30.34 class CKQueryCursorMBS

30.34.1 class CKQueryCursorMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKQueryCursor object is an opaque data object that marks the stopping point for a query and the starting point for retrieving the remaining results.
Notes:

You do not create instances of this class yourself. When fetching records using a CKQueryOperation object, if the number of results exceeds the results limit value set for the query, the server provides you with a query cursor object. Use that cursor object to initialize a new CKQueryOperationMBS and retrieve the next batch of results for the same query.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.34.2 Methods

30.34.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.34.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

30.34.5 copy as CKQueryCursorMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.34.6 Properties

30.34.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.

Notes: (Read and Write property)

30.35 class CKQueryMBS

30.35.1 class CKQueryMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKQuery object manages the criteria to apply when searching for records in a database.
Notes:

You create a query object as the first step in the search process. The query object stores the search parameters, including the type of records to search, the match criteria (predicate) to apply, and the sort parameters to apply to the results. The second step is to use the query object to initialize a CKQueryOperation object, which you then execute to generate the results.

see
https://developer.apple.com/reference/cloudkit/ckquery

30.35.2 Methods

30.35.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.35.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
See also:

- 30.35.5 Constructor(RecordType as String, predicate as NSPredicateMBS) 5715

30.35.5 Constructor(RecordType as String, predicate as NSPredicateMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a query object with the specified parameters.
Notes:

recordType: The type of record to search. Specify the name of one of your app's supported record types. This method throws an exception if this parameter is nil or contains an empty string.
predicate: The search predicate to apply to the prospective records. Only records matching the predicate criteria are returned in the search results. For guidelines on how to construct predicates for your queries,

see Predicate Rules for Query Objects. This parameter must not be nil.

Returns an initialized query object.

Discussion
You cannot change the record type and predicate of a query object after you create it. If you want to search for a different set of records using a different set of search criteria, create a new query object. You can add sort descriptors to the query and change them later as needed.

You cannot query for user records and executing a query where the record type is set to CKRecordTypeUserRecordMBS results in an error. You must fetch user records directly using their ID.
See also:

- 30.35.4 Constructor 5715

30.35.6 setSortDescriptors(sortDescriptors() as NSSortDescriptorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the sort descriptors to use when organizing the query results.

30.35.7 sortDescriptors as NSSortDescriptorMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The sort descriptors to use when organizing the query results.
Notes:

This property contains an array of NSSortDescriptor objects. You can add sort descriptors to a query object and change them later as needed. Each sort descriptor contains a field name of the intended record type and information about whether to sort values in that field in ascending or descending order. The default value of this property is nil, which means that records are returned in an indeterminate order.

The order of the items in the array matches the order in which the sort descriptors are applied to the results. In other words, the first sort descriptor in the array is applied first, followed by the second sort descriptor if needed, and the third, and so on.

30.35.8 Properties

30.35.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.

Notes: (Read and Write property)

30.35.10 predicate as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The search criteria to use when matching records.
Notes:

A predicate contains one or more expressions that evaluate to true or false. Expressions are often value-based comparisons, but predicates support other types of operators, including string comparisons and aggregate operations. For guidelines on how to construct predicates for your queries, see Predicate Rules for Query Objects.

This property is set at initialization time and cannot be changed later.
(Read only property)

30.35.11 recordType as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The record type to search.
Notes:

Searches return only records of the specified type. This property is set at initialization time and cannot be changed later.

The record type is an app-specific string that you use to distinguish among the records of your app. The records of a given type all represent different instances of the same information. For example, an employee record type might store the employee's name, phone number, and a reference to the employee's manager.
(Read only property)

30.36 class CKQueryNotificationMBS

30.36.1 class CKQueryNotificationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKQueryNotification object represents a push notification that was generated by a subscription object.
Notes:

Subscription objects represent persistent queries on the server. When the server detects a change related to a subscription, it sends a push notification to the client that created the subscription and logs the push notification in the container. You use instances of this class to get information about the record involved in the push notification.

see
https://developer.apple.com/reference/cloudkit/ckquerynotification
Subclass of the CKNotificationMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.36.2 Methods

30.36.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

30.36.4 Properties

30.36.5 databaseScope as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The database scope.
Notes: (Read only property)

30.36.6 isPublicDatabase as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the record is in the public database.
Notes:

The value of this property is true if the record is in the public database, or false if it is in the current user's private database.
(Read only property)

30.36.7 queryNotificationReason as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The event that triggered the delivery of the push notification.
Notes:

Subscription-initiated notifications are triggered by the creation, deletion, or updating of a single record. The record in question must match the predicate specified by the subscription object for an event to be triggered.
(Read only property)

30.36.8 recordFields as Dictionary

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A dictionary of the fields that changed.
Notes:

For updated and newly created records, this property contains the desired keys requested by the subscription object. When you configure the CKNotificationInfoMBS object of a subscription object, you can specify the names of one or more fields in the desiredKeys property of that notification information object. When a push notification is triggered, the values for each of those keys is retrieved from the record and included in the push notification's payload, space permitting.

For query notification objects fetched from a container, all keys and values are present. For query notification objects generated from an incoming push notification, one or more keys and values may be missing. Push notification payloads are limited in size, and record fields are one of the first pieces of data to be excluded when that size limit is exceeded. For information about the order in which fields are removed, see the overview of this class.
(Read only property)

30.36.9 recordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The identifier of the record that was created, deleted, or updated.
Notes:

Use this identifier to fetch the record from the container. Check the value of the isPublicDatabase property to determine which database to fetch it from.

(Read only property)

30.36.10 Constants

30.36.11 ReasonRecordCreated = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the event that triggered the notification.
Notes: A record matching the subscription's predicate was created.

30.36.12 ReasonRecordDeleted = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the event that triggered the notification.
Notes: A record matching the subscription's predicate was deleted.

30.36.13 ReasonRecordUpdated = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the event that triggered the notification.
Notes: A record matching the subscription's predicate was updated.

30.37 class CKQueryOperationMBS

30.37.1 class CKQueryOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKQueryOperation object is a concrete operation that you can use to execute queries against a database.
Notes:

A query operation takes the query parameters you provide and applies those parameters to the specified database and zone, delivering any matching records asynchronously to the blocks that you provide.

see
https://developer.apple.com/reference/cloudkit/ckqueryoperation
Subclass of the CKDatabaseOperationMBS class.

30.37.2 Methods

30.37.3 CKQueryOperationMaximumResults as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A placeholder value representing the maximum number of results to retrieve.
Notes: The value of this constant does not correspond to the actual number of records. The actual maximum value is determined dynamically by the server based on various conditions.

30.37.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
See also:

- 30.37.5 Constructor(query as CKQueryMBS) 5721
- 30.37.6 Constructor(queryCursor as CKQueryCursorMBS) 5722

30.37.5 Constructor(query as CKQueryMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to search for records in the specified zone.
Notes:

query: The query to use during the search. This parameter must not be nil.

Returns an initialized operation object.

You can use the returned CKQueryOperationMBS object only once to perform a search, but the object you specify in the query parameter can be reused as needed. When executed, this query object performs a new search and returns the first batch of results. If there are more results available, you must create a separate query object using the provided cursor object.
See also:

- 30.37.4 Constructor 5721
- 30.37.6 Constructor(queryCursor as CKQueryCursorMBS) 5722

30.37.6 Constructor(queryCursor as CKQueryCursorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes and returns an operation object that returns more results from a previous search.
Notes:

cursor: The cursor object identifying the previous search. This value is passed to the completion block of the previous search.

Returns an initialized operation object ready to continue the search.

Use this method to initialize a query operation that retrieves the next batch of results from a previous search. When executing searches based on a cursor, do not cache cursor objects for a long time before using them. A cursor is not a snapshot of the previous search results; it stores a relative offset into the results list. An operation object created using a cursor performs a new search, sorts the new set of results, and uses the previous offset value to determine where the next batch of results starts.
See also:

- 30.37.4 Constructor 5721
- 30.37.5 Constructor(query as CKQueryMBS) 5721

30.37.7 desiredKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The fields to retrieve for the requested records.
Notes:

Use this property to limit the amount of data retrieved for each record during the search operation. The value is an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the specified keys are included in the returned record. If you specify nil, the operation retrieves all keys for the record. The default value of this property is nil.

If you intend to specify a value, you must do so before executing the operation or submitting the operation object to a queue.

30.37.8 setDesiredKeys(desiredKeys() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the fields to retrieve for the requested records.
Notes:

Use this property to limit the amount of data retrieved for each record during the search operation. The value is an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the specified keys are included in the returned record. If you specify nil, the operation retrieves all keys for the record. The default value of this property is nil.

If you intend to specify a value, you must do so before executing the operation or submitting the operation object to a queue.

30.37.9 Properties

30.37.10 cursor as CKQueryCursorMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The data cursor to use for continuing the search.
Notes:

You set the initial value of this property with the Constructor. When you use a cursor, the contents of the query property are ignored. The data cursor stored in this property is an opaque object that is provided to you by the server.

If you intend to specify or change the value in this property, do so before executing the operation or submitting the operation object to a queue.
(Read and Write property)

30.37.11 query as CKQueryMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The query to use for the search.
Notes:

You set the initial value of this property with the Constructor method. When the value in the cursor property is nil, the query operation uses the CKQueryMBS object in this property to execute a new search and

return the results to your completion handler. If the cursor value is not nil, the cursor is used instead.

If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.
(Read and Write property)

30.37.12 resultsLimit as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum number of records to return at one time.
Notes:

For most queries, leave the value of this property set to the default value, which is represented by the CKQueryOperationMaximumResults constant. When using that value, the server chooses a limit that aims to provide an optimal number of results that returns as many records as possible while minimizing delays in receiving those records. However, if you know that you want to process a fixed number of results, change the value of this property accordingly.
(Read and Write property)

30.37.13 zoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the zone containing the records to search.
Notes:

When set, the value of this property limits the scope of the search to the records in the specified zone. If no zone is specified, the search takes place on all zones.

When you initialize the operation object using the Constructor method, the value of this property is set to nil and any changes you make to the property are ignored. When the operation object is executed, the cursor object provides the zone information from the initial search that generated the cursor.
(Read and Write property)

30.37.14 Events

30.37.15 queryCompleted(cursor as CKQueryCursorMBS, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The block to execute with the search results.
Notes:

The block returns no value and takes the following parameters:

cursor: A CKQueryCursorMBS object that indicates there are more results to fetch or nil if the results parameter contains all of the remaining search results. Use the provided object to initialize a new query operation object when you are ready to retrieve the next batch of results.
operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

This block is executed only once and represents your last chance to process the operation results. It is executed after all of the individual progress blocks but before the operation's completion block. The block is executed serially with respect to the other progress blocks of the operation. If you intend to use this block to process results, update the value of this property before executing the operation or submitting the operation object to a queue.

When the results of a query operation are known, the operation object uses this block to deliver the available set of records to your app. If the number of records exceeds the value in resultsLimit, the operation object provides an opaque data object in the cursor parameter of your block that you can use to retrieve the next batch of results. You must create a separate operation object using that cursor to get the next batch of results.

30.37.16 recordFetched(record as CKRecordMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute for each record returned by the query.
Notes:

record: A CKRecordMBS object matching the search criteria.

After identifying and sorting the records, the operation object executes this block once for each record in the sorted results. The block is executed serially with respect to all progress blocks of the operation object, so you can expect only one block at a time to be executing for this operation object.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

Warning
Query indexes are updated asynchronously so they are not guaranteed to be current. If you query for records that you recently changed and not allow enough time for those changes to be processed, the query results may be incorrect. The results may not contain the correct records and the records may be out of order.

30.38 class CKQuerySubscriptionMBS

30.38.1 class CKQuerySubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Subscription that fires whenever a change matches the specified predicate.
Notes: Subclass of the CKSubscriptionMBS class.

30.38.2 Methods

30.38.3 Constructor(RecordType as String, predicate as NSPredicateMBS, querySubscriptionOptions as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a query-based subscription that monitors records with the specified options.
Notes:

recordType: The string that identifies the type of records to track. You are responsible for naming your app's record types. This parameter must not be nil or an empty string.
predicate: The matching criteria to apply to the records. This parameter must not be nil. For information about the operators that are supported in search predicates, see the discussion in CKQuery.
querySubscriptionOptions: A bitmask of the configuration options for the subscription. Specify at least one of the following values: CKSubscriptionOptionsFiresOnRecordCreation, CKSubscriptionOptionsFiresOnRecordUpdate, or CKSubscriptionOptionsFiresOnRecordDeletion.

Returns a subscription object initialized to track record-related changes.

The object returned by this method is configured as a query-based subscription searching records in the target dabatase. The subscription monitors the specified type of records in all of the user's record zones and generates push notifications when the search criteria are met.
See also:

- 30.38.4 Constructor(RecordType as String, predicate as NSPredicateMBS, subscriptionID as string, querySubscriptionOptions as Integer) 5726

30.38.4 Constructor(RecordType as String, predicate as NSPredicateMBS, subscriptionID as string, querySubscriptionOptions as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a query-based subscription that monitors records with the specified options.
Notes:

recordType: The string that identifies the type of records to track. You are responsible for naming your

app's record types. This parameter must not be nil or an empty string.
predicate: The matching criteria to apply to the records. This parameter must not be nil. For information about the operators that are supported in search predicates, see the discussion in CKQuery.
subscriptionID: The unique name of the subscription. This string must be unique in the specified database and must not be nil.
querySubscriptionOptions: A bitmask of the configuration options for the subscription. Specify at least one of the following values: CKSubscriptionOptionsFiresOnRecordCreation, CKSubscriptionOptionsFiresOnRecordUpdate, or CKSubscriptionOptionsFiresOnRecordDeletion.

Returns a subscription object initialized to track record-related changes.

The object returned by this method is configured as a query-based subscription searching records in the target dabatase. The subscription monitors the specified type of records in all of the user's record zones and generates push notifications when the search criteria are met.
See also:

- 30.38.3 Constructor(RecordType as String, predicate as NSPredicateMBS, querySubscriptionOptions as Integer) 5726

30.38.5 copy as CKQuerySubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.38.6 Properties

30.38.7 predicate as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The matching criteria to apply to records.
Notes:

A query-based subscription uses its search predicate to identify potential matches for records. It combines the predicate information with the value in the querySubscriptionOptions property to determine the conditions under which to send a push notification to the app.

The search predicate defines the records that the subscription object monitors for changes. The value in this property is used only if the subscriptionType property is set to CKSubscriptionTypeQueryMBS; otherwise, it is ignored.
(Read only property)

30.38.8 querySubscriptionOptions as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Option flags describing the firing behavior of the subscription
Notes:

Set the value of this property at initialization time. When configuring a query-based subscription, one of the following values must be specified:

CKQuerySubscriptionOptionsFiresOnRecordCreation
CKQuerySubscriptionOptionsFiresOnRecordUpdate
CKQuerySubscriptionsFiresOnRecordDeletion

If an option flag is not set, an NSInvalidArgumentException is thrown.
(Read only property)

30.38.9 recordType as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The record type being monitored in a query-based subscription. (read-only)
Notes:

The value of this property applies only to query-based subscriptions and is set automatically by the Constructor. For all other types of subscription objects, the value of this property is ignored and set to nil.
(Read only property)

30.38.10 zoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Zone that this query subscription is scoped to.
Notes:

The value of this property applies both to query-based subscriptions and zone-based subscriptions. Specifying a record zone limits the search scope to the records in that zone. In the case of a zone-based subscription, the search encompasses all records in the zone. For a query-based subscription, the search encompasses only records of a specific type in that zone.

For zone-based subscriptions, the value of this property is set automatically by the Constructor. For all other subscription types, the default value is nil. To apply a zone to a query-based subscriptions, you must assign a value explicitly.
(Read only property)

30.38.11 Constants

30.38.12 OptionsFiresOnce = 8

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the option values for notifications. **Notes:** Fire only once.

30.38.13 OptionsFiresOnRecordCreation = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the option values for notifications. **Notes:** Fire at record creation.

30.38.14 OptionsFiresOnRecordDeletion = 4

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the option values for notifications. **Notes:** Fire on record deletion.

30.38.15 OptionsFiresOnRecordUpdate = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the option values for notifications. **Notes:** Fire on record update.

30.39 class CKRecordIDMBS

30.39.1 class CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKRecordID object uniquely identifies a record in a database.
Notes:

Record ID objects are normally created automatically when you create a new record, but you might also create IDs in several specific situations. For example, you must create record ID objects when you want to save a record in a zone other than the default zone. You can also create record ID objects when you want to retrieve records whose IDs you know from a database.

see
https://developer.apple.com/reference/cloudkit/ckrecordid

30.39.2 Methods

30.39.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.39.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
See also:

- 30.39.5 Constructor(recordName as string) 5730
- 30.39.6 Constructor(recordName as string, zoneID as CKRecordZoneIDMBS) 5731

30.39.5 Constructor(recordName as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a new record ID with the specified name in the default zone.
Notes:

recordName: The name to use to identify the record. The string must contain only ASCII characters and must not exceed 255 characters. If you specify nil or an empty string for this parameter, this method throws

an exception.

Returns an initialized record ID object or nil if the object cannot be created.

Use this method when you are creating or searching for records in the default zone.

- 30.39.4 Constructor 5730
- 30.39.6 Constructor(recordName as string, zoneID as CKRecordZoneIDMBS) 5731

30.39.6 Constructor(recordName as string, zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a new record ID with the specified name and zone information.
Notes:

recordName: The name to use to identify the record. The string must contain only ASCII characters and must not exceed 255 characters. If you specify nil or an empty string for this parameter, this method throws an exception.
zoneID: The ID of the zone in which to place the record. This parameter must not be nil.

Returns an initialized record ID object or nil if the object cannot be created.

Use this method when you create or search for records in a zone other than the default zone. The value in the zoneID parameter must represent a zone that already exists in the database. If the record zone does not exist yet, save the corresponding CKRecordZoneMBS object to the database before attempting to save any CKRecordMBS objects in that zone.

- 30.39.4 Constructor 5730
- 30.39.5 Constructor(recordName as string) 5730

30.39.7 copy as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.39.8 IsEqual(Other as CKRecordIDMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Checks if two objects are equal.

30.39.9 Properties

30.39.10 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.39.11 recordName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The unique name of the record.
Notes: (Read only property)

30.39.12 zoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the zone containing the record.
Notes: (Read only property)

30.40 class CKRecordMBS

30.40.1 class CKRecordMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A dictionary of key-value pairs that you use to fetch and save the data of your app.
Notes:

Records are the fundamental objects you use to manage data in CloudKit. You may define any number of record types for your app, with each record type corresponding to a different type of information you need. Within a given record type, you then define one or more fields, each of which has a name and a data value. Records can contain simple data types such as strings and numbers or more complex types such as geographic locations or pointers to other records.

An important step in using CloudKit is defining the record types your app supports. Each new record object contains no keys or values initially. During development, you can add new keys and values at any time. The first time you set a value for a key and save the record, the server associates that type with the key for all records of the same type. (The CKRecordMBS class does not enforce these type constraints or do any local validation of a record's contents; those constraints are enforced by the server when you save records.)

Note

The ability to add new keys is only possible during development. When you deploy to a production environment, the server returns an error when you try to specify an unknown record type or try to save a record containing unknown keys.
Although records act like dictionaries, there are still limitations to the types of values you can assign to keys. The following are the object types that the CKRecord class supports. Attempting to specify objects of any other type is a programmer error and will fail. Fields of all types are searchable unless otherwise noted.

30.40.2 Methods

30.40.3 allKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns an array of strings corresponding to all keys currently in the record.
Notes:

Returns an array of strings. The returned array contains only the keys that have corresponding values in the record. If no keys are set for the record, this method returns an empty array.

This method may not return all possible keys in the record. Specifically, the method does not return keys whose values are nil.

30.40.4 allTokens as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of strings that you can use for full-text searches of the field's string-based values.
Notes:

Returns an array of strings containing data from the records string-based fields.

When performing your own full-text searches, you can use this method to get a list of strings for your search. The method acts only on keys whose values are NSString objects. It breaks each value string apart at whitespace boundaries, creates new strings for each word, adds the new strings to an array, and returns the array. This tokenized version of the record's string values makes it easier to do string-based comparisons of individual words.

30.40.5 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.40.6 changedKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of strings representing the keys that have changed recently.
Notes: An array of strings, each of which represents a key whose value has changed since the record was downloaded or saved. If no keys have changed, this method returns an empty array.

30.40.7 CKRecordTypeUserRecord as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The record type for an user record.

30.40.8 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.
See also:

- 30.40.9 Constructor(RecordType as String) 5735
- 30.40.10 Constructor(RecordType as String, recordID as CKRecordIDMBS) 5736
- 30.40.11 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS) 5736

30.40.9 Constructor(RecordType as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes and returns a new record of the specified type.
Example:

```
// Create a new record of type "employee".
dim myRecord as new CKRecordMBS("employee")
```

Notes:

recordType: A string reflecting the type of record that you want to create. This string becomes the type of record thereafter and cannot be changed. You define the record types that your app supports and use them to distinguish between records with different types of data. This parameter must not be nil or contain an empty string.

Record type names must consist of one or more alphanumeric characters and must start with a letter. Type names may include underscore characters as long as they do not start with that character. Spaces are not allowed in the names.

Returns an initialized record object or nil if the record cannot be created.

Use this method to initialize a new record object in the default zone of the database. The newly created record contains no data in any of its fields and is assigned a unique ID.

New records exist only in memory until you explicitly save them to iCloud. In addition, new records are sparse by default and have no values assigned to the fields you defined. (In fact, until you set the value of a key explicitly, getting the value of a key in a new record returns nil.) Even though a record has an associated type, that type information is ignored until you save the record.

Save the record using a CKModifyRecordsOperationMBS object or using the saveRecord method of CK-DatabaseMBS to transfer the record's contents to the server.

See also:

- 30.40.8 Constructor 5735
- 30.40.10 Constructor(RecordType as String, recordID as CKRecordIDMBS) 5736
- 30.40.11 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS) 5736

30.40.10 Constructor(RecordType as String, recordID as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes and returns a record using an ID that you provide.
Notes:

recordType: A string reflecting the type of record that you want to create. Define the record types that your app supports, and use them to distinguish between records with different types of data. This parameter must not be nil or contain an empty string. Record type names consist of one or more alphanumeric characters and start with a letter. Type names may include underscore characters if they do not start with that character. Spaces are not allowed in record type names.
recordID: The ID to assign to the record itself. When creating the ID, you can specify the zone in which to place the record. The ID cannot currently be in use by any other record and must not be nil.

Returns an initialized record object or nil if the record cannot be created.

Discussion
Use this method to initialize a new record object with the specified ID. The newly created record contains no data.

Upon creation, record objects exist only in memory on the local device. Save the record using a CKModifyRecordsOperationMBS object or using the saveRecord method of CKDatabaseMBS to transfer the record's contents to the server.
See also:

- 30.40.8 Constructor 5735
- 30.40.9 Constructor(RecordType as String) 5735
- 30.40.11 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS) 5736

30.40.11 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes and returns a record in the specified zone.
Notes:

recordType: A string reflecting the type of record that you want to create. Define the record types that your app supports, and use them to distinguish between records with different types of data. This parameter must not be nil or contain an empty string. Record type names consist of one or more alphanumeric characters and start with a letter. Type names may include underscore characters if they do not start with that character. Spaces are not allowed in record type names.
zoneID: The ID of the record zone in which to place the record.

Returns an initialized record object, or nil if the record cannot be created.

Use this method to initialize a new record object in the specified record zone.

Upon creation, the new record contains no data and exists only in memory on the local device. Save the record using a CKModifyRecordsOperationMBS object or using the saveRecord:completion: method of CKDatabase to transfer the record's contents to the server.

- 30.40.8 Constructor 5735
- 30.40.9 Constructor(RecordType as String) 5735
- 30.40.10 Constructor(RecordType as String, recordID as CKRecordIDMBS) 5736

30.40.12 copy as CKRecordMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.40.13 setParentReferenceFromRecord(parentRecord as CKRecordMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and sets a reference object for a parent from its record.
Notes:

parentRecord: A record that you want to set as the parent to this record.

This method creates and sets a CKReferenceMBS object for the CKRecordMBS passed in. The resulting CKReferenceMBS will have its action set to none.

30.40.14 setParentReferenceFromRecordID(parentRecordID as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets parent via Record ID.

30.40.15 Properties

30.40.16 creationDate as Date

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The time when the record was first saved to the server.
Notes:

The creation date reflects the time at which a record with the current record's ID was created on the server. For new instances of this class, the value of this property is initially set to nil. When you save the record to the server, the value is updated with the appropriate creation date for the record.
(Read only property)

30.40.17 creatorUserRecordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the user who created the record.
Notes:

Use the value in this property to retrieve the user record of the user who created this record. Every user of the app has a unique user record that is empty by default. Apps can add data to the user record on behalf of the user but should not store sensitive data in it.
(Read only property)

30.40.18 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.40.19 lastModifiedUserRecordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the user who last modified the record.
Notes:

Use the value in this property to retrieve the user record of the user who last modified this record. Every user of the app has a unique user record that is empty by default. Apps can add data to the user record on behalf of the user but should not store sensitive data in it.

(Read only property)

30.40.20 modificationDate as Date

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The time when the record was last saved to the server.
Notes:

The modification date reflects the time at which a record with the current record's ID was last saved to the server. For new instances of this class, the value of this property is initially set to nil. When you save the record to the server, the value is updated with the appropriate modification date for the record.
(Read only property)

30.40.21 parent as CKReferenceMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A reference to the parent record to this record.
Notes:

A parent reference is used to teach CloudKit about the hierarchy of your records. This hierarchy of records will be shared if the share reference is set on a record.

A parent record reference must have a none set.

The target of a parent reference must exist at save time — either already on the server, or part of the same CKModifyRecordsOperationMBS batch.

You are encouraged to set up the parent relationships as part of normal record saves, even if you are not planning on sharing records at this time. This allows you to share and unshare a hiearchy of records at a later date by only modifying the "top level" record, setting or clear its share reference.
(Read and Write property)

30.40.22 recordChangeTag as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A string containing the server change token for the record.
Notes:

When you fetch a record from the server, you get the current version of that record as it exists on the server. However, at any time after you fetch a record, other users might save a newer version of the record to the server. Every time a record is saved, the server updates the record's change token to a new value. When

you save your instance of the record to the server, the server compares the token in your record with the token on the server. If the two tokens match, the server knows that you modified the latest version of the record and that your changes can be applied right away. If the two tokens do not match, the server applies the save policy your app specified to determine how to proceed.

In your own code, you can use change tokens to distinguish between two different versions of the same record.
(Read only property)

30.40.23 recordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The unique ID of the record.
Notes:

The ID of a new record is always set at initialization time. If you use the Constructor method to initialize the record, the ID is derived from the CKRecordIDMBS object you provide. In all other cases, the record generates a UUID and bases its ID on that value. The ID of a record never changes over the lifetime of that record.

When you save a new record object to the server, the server validates the uniqueness of the record but reports an error only if the save policy calls for it. Specifically, it reports an error when the save policy is set to ifServerRecordUnchanged, which is the default. For other save policies, the server overwrites the contents of the existing record accordingly.
(Read only property)

30.40.24 recordType as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The app-defined string that identifies the type of the record.
Notes:

Use this string to differentiate between different record types in your app. The string is primarily for your benefit, so choose type names that reflect the data in the corresponding records.
(Read only property)

30.40.25 share as CKReferenceMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A reference to the share associated with the sharing of this record.
Notes:

The share property (CKReferenceMBS) on a record will be removed when the corresponding CKShare object is deleted from the server. Send this record in the same batch as the share that is being deleted, and this

record's share property will be updated.

Sharing is only supported in zones with the CKRecordZoneCapabilitySharing capability. The default zone does not support sharing.

If any records have a parent reference to this record, they are implicitly shared alongside this record.

Note

Records in a hierarchy must only exist within one share. If a child record in a hierarchy already has a share reference set, you will get a CKErrorAlreadyShared error if you try to share any of that record's parents.
(Read only property)

30.40.26 dataForKey(key as string) as MemoryBlock

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value for the given key stored in the record as data.
Notes: (Read and Write computed property)

30.40.27 objectForKey(key as string) as Variant

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value for the given key stored in the record.
Notes:

key: The string that identifies a field in the record. Key names consist of one or more alphanumeric characters and start with a letter. You may also include underscore characters if you do not use an underscore as the first character in the name. Spaces are not allowed in key names.

Returns the object associated with the specified key or nil if no such key exists in the record.

New records do not contain any keys or values initially. Values are always one of the object types listed in Supported Data Types.

You access the fields of a CKRecord object the same way you access key-value pairs in an NSMutableDictionary. The CKRecord class defines the objectForKey: and setObject:forKey: methods for getting and setting values. It also supports dictionary index notation.
(Read and Write computed property)

30.40.28 stringForKey(key as string) as string

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The value for the given key stored in the record as string.
Notes:

If field contains a number, we convert it to string for you.
(Read and Write computed property)

30.41 class CKRecordZoneIDMBS

30.41.1 class CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A CKRecordZoneID object uniquely identifies a record zone in a database.
Notes:

Zones are a way to group related records together. You create zone ID objects when you want to fetch an existing zone object or create a new zone with a specific name.

Overview
A record zone ID distinguishes one zone from another by a name string and the ID of the user that created the zone. Both strings must be ASCII strings that do not exceed 255 characters. For automatically created record zones, the ID name string is based on a UUID and is therefore guaranteed to be unique. When creating your own record zone ID objects, you are free to use names that have more meaning to your app or to the user, providing each zone name is unique within the specified database. The owner name must be either the current user name (obtained from the fetchUserRecordID method) or the name of another user.

When creating new record zones, make the name string in the record zone ID unique in the target database. Public databases do not support custom zones, and zones in a private database can only be created by the user that owns the database.

This class is not intended to be subclassed.

Interacting with Record Zone IDs
After you create a CKRecordZoneIDMBS object, interactions with that object typically include:

- Creating a CKRecordIDMBS object so that you can fetch or create records in that zone.
- Retrieving an existing CKRecordZoneMBS object from the database.

You do not need to create a CKRecordZoneIDMBS object in order to create a CKRecordZoneMBS object. The CKRecordZoneMBS class has initialization methods that create a record zone ID using the name string you provide.

Creating Record Zone IDs to Use with Records
To create a new record in a custom zone, first create a CKRecordZoneIDMBS object that specifies the zone name. Use the record zone ID to create a CKRecordID and then use the record ID to create the record itself.

Fetching a Record Zone Object from the Database
To fetch a CKRecordZoneMBS object from a database, use a CKFetchRecordZonesOperationMBS object

or the fetchRecordZoneWithID method of the CKDatabaseMBS class. Both techniques take a CKRecordZoneIDMBS object that you provide and retrieve the corresponding record zone object asynchronously. If you use the operation object, you can retrieve multiple record zones at the same time.

30.41.2 Methods

30.41.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.41.4 Constructor(zoneName as string, ownerName as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a record zone ID with the specified name and owner.
Notes:

zoneName: The name that identifies the record zone. The string must contain only ASCII characters and must not exceed 255 characters. To specify the default zone of the current database, pass the CKRecordZoneDefaultName constant for this parameter. This parameter must not be nil or the empty string.
ownerName: The user who created the record zone. To specify the current user, use the CKOwnerDefaultName constant. If you specify nil or an empty string for this parameter, this method throws an exception.

Returns an initialized record zone ID object or nil if the object cannot be created.

Use this method to create a record zone ID for use in creating or fetching a record zone.

30.41.5 copy as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.41.6 IsEqual(Other as CKRecordZoneIDMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Checks if two objects are equal.

30.41.7 Properties

30.41.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.41.9 ownerName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the user who owns the record zone.
Notes: (Read only property)

30.41.10 zoneName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The unique name of the record zone.
Notes: (Read only property)

30.42 class CKRecordZoneMBS

30.42.1 class CKRecordZoneMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A definition of a custom area for organizing related records in a database.
Notes:

Zones are an important part of how you organize your data. The public and private databases have a single default zone. In the private database you can use CKRecordZoneMBS objects to create additional custom zones as needed. Use custom zones to arrange and encapsulate groups of related records in the private database. Custom zones support other capabilities too, such as the ability to write multiple records as a single atomic transaction.

Treat each custom zone as a single unit of data that is separate from every other zone in the database. Inside the zone, you add records as you would anywhere else. You can also create links between the records inside a zone by using the CKReferenceMBS class. However, the CKReferenceMBS class does not support cross-zone linking, so each reference object must point to a record in the same zone as the current record.

Use the CKRecordZoneMBS class as-is and do not subclass.

Creating a Custom Record Zone
For the most part, you use instances of this class to create and manage custom zones. Although you can use this class to retrieve a database's default zone, most operations act on records in the default zone by default, so you rarely need to specify it explicitly.

To create a custom zone, use CKRecordZoneMBS to create the zone object, and then save that zone to the user's private database using a CKModifyRecordZonesOperationMBS object. You cannot save any records in the zone until you save it to the database. When creating records, explicitly specify the zone ID if you want the records to reside in a specific zone; otherwise, they will be saved to the default zone. You cannot create custom zones in a public database.

After creating a CKRecordZoneMBS object and saving it to the database, you do not interact with the object much. Instead, most interactions occur with its associated CKRecordZoneIDMBS object, which you use to refer to the zone when creating records.

30.42.2 Methods

30.42.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.

Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.42.4 CKRecordZoneDefaultName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the default zone.
Notes: Use this constant when you need to refer to the default zone by name, perhaps when creating a zone ID. The default zone has no special capabilities.

30.42.5 Constructor(zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a record zone object using the specified ID.
Notes:

zoneID: The ID for the new zone. This parameter must not be nil.

Returns the new custom zone, or nil if the zone cannot be created.

Use this method when you want to create a new record zone based on the information in a zone ID. After creating the zone, save it to the server using a CKModifyRecordZonesOperationMBS object or the save method of the CKDatabaseMBS class.

Do not use this method to create a CKRecordZoneMBS object corresponding to a zone that already exists in the database. If the zone exists, fetch it using a CKFetchRecordZonesOperationMBS object or the fetch method of the CKDatabaseMBS class.
See also:

- 30.42.6 Constructor(zoneName as string) 5747

30.42.6 Constructor(zoneName as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a record zone object with the specified name.
Notes:

zoneName: The name of the new zone. Zone names inside a user's private database are unique, consist of ASCII characters, are no longer than 255 characters, and do not start with an underscore (_) character. One way to ensure the uniqueness of zone names is to create a string based on a UUID, but you can also use other techniques.

If this parameter is nil or is an empty string, the method throws an exception.

Returns the new custom zone, or nil if the zone cannot be created.

Use this method to create a new record zone. The new zone has the name you provide and the zone's owner is set to the current user. After creating the zone, save it to the server using a CKModifyRecordZonesOperationMBS object or the saveRecordZone method of the CKDatabase class. You must save the zone to the server before attempting to save any records to that zone.

Do not use this method to create a CKRecordZone object corresponding to a zone that already exists in the database. If the zone exists, fetch it using a CKFetchRecordZonesOperationMBS object or the fetchRecordZoneWithID method of the CKDatabase class.
See also:

- 30.42.5 Constructor(zoneID as CKRecordZoneIDMBS) 5747

30.42.7 copy as CKRecordZoneMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.42.8 defaultRecordZone as CKRecordZoneMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default zone for records.
Notes:

The default record zone for a database.

Always use this method to retrieve the default zone for a database. The returned object can be used to specify the default zone for either the public or private database of a container. You do not need to save the returned zone object before using it. The owner of the zone is set to CKOwnerDefaultName, which corresponds to the current user.

The default zone of a database is a convenient place to store and access records. Whenever you do not explicitly assign a zone to a record, CloudKit puts the record in the default zone.

The disadvantage of using the default zone for storing records is that it does not have any special capabilities. You cannot save a group of records to iCloud atomically in the default zone. Similarly, you cannot use a CKFetchRecordChangesOperationMBS object on records in the default zone.

30.42.9 Properties

30.42.10 capabilities as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The capabilities supported by the zone.
Notes:

The server determines the capabilities of the zone and sets the value of this property when you save the record zone. Always check this property before performing tasks that require a specific capability.

Typically, default zones do not support any special capabilities. Custom zones in a private database normally support all options.

For more information about what you can do with specific capabilities, see Capabilities* constants.
(Read only property)

30.42.11 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.42.12 zoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The unique ID of the zone.
Notes:

The zone ID contains the name of the zone and the name of the user who owns the zone. Use this property to access both of those values.
(Read only property)

30.42.13 Constants

30.42.14 CapabilityAtomic = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the special capabilities supported by a zone.
Notes:

A capability that allows changes to multiple records to be made atomically.

When you use a CKModifyRecordsOperationMBS object to save records, if the server is unable to save the changes for one record, it does not save the changes for any of the records. When combined with the CKRecordSaveIfServerRecordUnchanged policy of the operation object, this behavior prevents your app from overwriting changes to a group of records if one of the records was modified elsewhere.

30.42.15 CapabilityFetchChanges = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the special capabilities supported by a zone.
Notes:

A capability that allows you to fetch only the changed values in records.

This capability makes the creation of offline caches more efficient. Instead of fetching the entire record every time, use a CKFetchRecordChangesOperationMBS object to fetch only the values that changed, and use the returned data to update your caches. Doing so minimizes the amount of data you receive from the server. You can still fetch the entire record using a CKFetchRecordsOperationMBS object if you want.

30.42.16 CapabilitySharing = 4

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the special capabilities supported by a zone.
Notes: Sharing

30.43 class CKRecordZoneNotificationMBS

30.43.1 class CKRecordZoneNotificationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A notification that is caused by changes to the contents of a record zone.
Notes:

Zone-related changes occur when existing records in the zone are modified, when new records are added, and when existing records are deleted. Use instances of this class to determine which zone triggered the notification.

You do not create instances of this class directly. When your app receives a push notification, call the notificationFromRemoteNotificationDictionary method of CKNotificationMBS to generate a notification object of the appropriate type. You can also fetch previously delivered notifications from a container using a CKFetchNotificationChangesOperationMBS object. If the notification was triggered due to a record zone change, the operation object delivers an instance of CKRecordZoneNotificationMBS with its notificationType property set to CKNotificationTypeRecordZoneMBS. Use the record zone notification object to get the record zone information and other push-related data.

If a push notification's payload is too large, pieces of data may be dropped until the payload meets the allowed size limit. The data that alerts the user is the most important and is dropped last. Data values in this class are among the first to be dropped, with values being dropped in the following order:

1. containerIdentifier—defined in the CKNotification class.
2. recordZoneID
3. Other properties of the CKNotification class.

Subclass of the CKNotificationMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.43.2 Methods

30.43.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

30.43.4 Properties

30.43.5 databaseScope as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The type of database (public, private, or shared) associated with the zone.
Notes:

For more details on the values returned, see CKDatabaseMBS.Scope* constants.
(Read only property)

30.43.6 recordZoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The ID of the zone that changed.
Notes:

Use the value of this property to fetch the corresponding zone from the database.
(Read only property)

30.44 class CKRecordZoneSubscriptionMBS

30.44.1 class CKRecordZoneSubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A subscription that causes a push notification to fire whenever any change happens in the specified record zone.
Notes: Subclass of the CKSubscriptionMBS class.

30.44.2 Methods

30.44.3 Constructor(zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a subscription object that monitors all records in the specified record zone.
Notes:

zoneID: The ID of the record zone containing the records you want to monitor. This parameter must not be nil.

Returns a subscription object initialized to track changes to the contents of the specified record zone.

The object returned by this method is configured as a zone-based subscription, which generates a push notification when any changes are made to the records in the specified zone.
See also:

- 30.44.4 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string) 5753

30.44.4 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a subscription object that monitors the specified zone and has a custom name that you provide.
Notes:

zoneID: The ID of the record zone containing the records you want to monitor. This parameter must not be nil.
subscriptionID: The unique name of the subscription object. This string must be unique for each subscription object in the container. This parameter must not be nil.

Returns a subscription object initialized to track changes to the contents of a record zone.

The CKRecordZoneSubscriptionMBS returned by this method is configured as a zone-based subscription, which generates a push notification when any changes are made to the records in the specified zone.
See also:

- 30.44.3 Constructor(zoneID as CKRecordZoneIDMBS) 5753

30.44.5 copy as CKRecordZoneSubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.44.6 Properties

30.44.7 recordType as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The record type being monitored in a query-based subscription. (read-only)
Notes:

The value of this property applies only to query-based subscriptions and is set automatically by the CKRecordZoneSubscriptionMBS and CKRecordZoneSubscriptionMBS methods. For all other types of subscription objects, the value of this property is ignored and set to nil.
(Read and Write property)

30.44.8 zoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Zone that the specified query subscription is scoped to.
Notes:

The value of this property applies both to query-based subscriptions and zone-based subscriptions. Specifying a record zone limits the search scope to the records in that zone. In the case of a zone-based subscription, the search encompasses all records in the zone. For a query-based subscription, the search encompasses only records of recordType in that zone.

For zone-based subscriptions, the value of this property is set automatically by the CKRecordZoneSubscriptionMBS or CKRecordZoneSubscriptionMBS methods. For all other subscription types, the default value is nil. To apply a zone to a query-based subscription, you must assign a value explicitly.
(Read only property)

30.45 class CKReferenceMBS

30.45.1 class CKReferenceMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKReference object creates a many-to-one relationship between records in your database.
Notes:

Each reference object stores information about the one record that is the target of the reference. You then save the reference object in the fields of one or more records to create a link from those records to the target. Both records must be located in the same zone of the same database.

see
https://developer.apple.com/reference/cloudkit/ckreference

30.45.2 Methods

30.45.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.45.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
See also:

- 30.45.5 Constructor(record as CKRecordMBS, action as Integer = 0) 5755
- 30.45.6 Constructor(recordID as CKRecordIDMBS, action as Integer = 0) 5756

30.45.5 Constructor(record as CKRecordMBS, action as Integer = 0)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a reference object that points to the specified record object.
Notes:

record: The target record of the reference.
action: The ownership options to put in place for the records. If you specify the deleteSelf option, the object referred to by the recordID parameter becomes the owner of any objects that use this reference object. For

a list of possible values, see CKReferenceAction.

Returns an initialized reference object that points to the specified record, or nil if the reference cannot be initialized.

Use this method to initialize a reference to a local record object. The local record can be one that you just created or one that you fetched previously from the server.

When you create a reference object for use in a search predicate, the predicate ignores the value in the action parameter. Search predicates use only the ID of the record during their comparison.
See also:

- 30.45.4 Constructor 5755
- 30.45.6 Constructor(recordID as CKRecordIDMBS, action as Integer = 0) 5756

30.45.6 Constructor(recordID as CKRecordIDMBS, action as Integer = 0)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes and returns a reference object that points to the record with the specified ID.
Notes:

recordID: The ID of the target record. This method throws an exception if you specify nil for this parameter.
action: The ownership option to put in place between the target record and any records that incorporate this reference object. If you specify the deleteSelf option, the record referred to by the recordID parameter owns (or acts as the parent) of any objects that use this reference object. For a list of possible values, see CKReferenceActionMBS.

Returns an initialized reference object that points to the specified record, or nil if the reference cannot be initialized.

Use this method when you have only the ID of the record that is to become the target of a link. You might use this method if you saved only the ID of the record to a local data cache.

When you create a reference object for use in a search predicate, the predicate ignores the value in the action parameter. Search predicates use only the ID of the record during their comparison.
See also:

- 30.45.4 Constructor 5755
- 30.45.5 Constructor(record as CKRecordMBS, action as Integer = 0) 5755

30.45.7 copy as CKReferenceMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.45.8 Properties

30.45.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.45.10 recordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the referenced record.
Notes:

Use the ID in this property to fetch the record on the other end of the link.
(Read only property)

30.45.11 referenceAction as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ownership behavior for the records.
Notes:

The value in this property determines what action, if any, to take when the target of the reference object—that is, the object pointed to in the recordID property—is deleted. When this property is set to deleteSelf, deleting the target object deletes any records that contain that reference in one of their fields. When this property is set to none, deleting the target object does not delete any additional objects.
(Read only property)

30.45.12 Constants

30.45.13 ActionDeleteSelf = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the actions.
Notes:

The delete action for referenced records.
Deleting a record also deletes any records containing CKReferenceMBS objects that point to that record. The deletion of the additional records may trigger a cascade deletion of more records. The deletions are asynchronous in the default zone and immediate in a custom zone.

30.45.14 ActionNone = 0

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the actions.
Notes:

No action when a referenced record is deleted.
Deleting a parent record does not delete the children that refer to that parent. The CKReference object still contains the ID of the deleted record and is not updated automatically.

30.46 class CKServerChangeTokenMBS

30.46.1 class CKServerChangeTokenMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKServerChangeTokenMBS object is an opaque data object that identifies a specific version of a record.
Notes:

You do not create instances of this class yourself. When fetching records using a CKFetchRecordChangesOperation object, the server provides one of these objects along with the record changes. The next time you fetch the records, pass the previous token to the server. Passing the previous token tells the server what portions of the records to fetch and return to your app.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.46.2 Methods

30.46.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.46.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

30.46.5 copy as CKServerChangeTokenMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.46.6 IsEqual(Other as CKServerChangeTokenMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Checks if two objects are equal.

30.46.7 Properties

30.46.8 description as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The description text.
Notes: (Read only property)

30.46.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.47 class CKShareMBS

30.47.1 class CKShareMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A reference to a shared record.
Notes:

Available in macOS 10.12 and newer.
Subclass of the CKRecordMBS class.

30.47.2 Methods

30.47.3 addParticipant(participant as CKShareParticipantMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a participant to this share.
Notes:

participant: The participant to be added to this share.

If a participant with a matching userIdentity already exists in this share, that existing participant's properties are updated; no new participant is added.

To modify the list of participants, a share must have publicPermission set to CKShareParticipantPermissionNone. You cannot mix and match private users and public users in the same share. Only certain participant types may be added via this API; see CKShareParticipantMBS.

30.47.4 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.12 and newer in 64-bit application.

30.47.5 CKRecordTypeShare as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of record for a share.

30.47.6 CKShareThumbnailImageDataKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the predefined keys in the CKRecordTypeShare schema.
Notes:

They're used by the out of process UI flow to send a share, and as part of the share acceptance flow. These are optional.

Value is a data blob suitable to pass into NSImageMBS.imageWithData.

30.47.7 CKShareTitleKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the predefined keys in the CKRecordTypeShare schema.
Notes:

They're used by the out of process UI flow to send a share, and as part of the share acceptance flow. These are optional.

Value is a string. Example for a recipe sharing app: "Pot Roast"

30.47.8 CKShareTypeKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the predefined keys in the CKRecordTypeShare schema.
Notes:

They're used by the out of process UI flow to send a share, and as part of the share acceptance flow. These are optional.

Value is a string representing a UTI. Example for a recipe sharing app: "com.mycompany.recipe"

30.47.9 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.
See also:

- 30.47.10 Constructor(RecordType as String)

- 30.47.11 Constructor(RecordType as String, recordID as CKRecordIDMBS) 5763
- 30.47.12 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS) 5763
- 30.47.13 Constructor(rootRecord as CKRecordMBS) 5764
- 30.47.14 Constructor(rootRecord as CKRecordMBS, shareID as CKRecordIDMBS) 5764

30.47.10 Constructor(RecordType as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.
See also:

- 30.47.9 Constructor 5762
- 30.47.11 Constructor(RecordType as String, recordID as CKRecordIDMBS) 5763
- 30.47.12 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS) 5763
- 30.47.13 Constructor(rootRecord as CKRecordMBS) 5764
- 30.47.14 Constructor(rootRecord as CKRecordMBS, shareID as CKRecordIDMBS) 5764

30.47.11 Constructor(RecordType as String, recordID as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.
See also:

- 30.47.9 Constructor 5762
- 30.47.10 Constructor(RecordType as String) 5763
- 30.47.12 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS) 5763
- 30.47.13 Constructor(rootRecord as CKRecordMBS) 5764
- 30.47.14 Constructor(rootRecord as CKRecordMBS, shareID as CKRecordIDMBS) 5764

30.47.12 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.
See also:

- 30.47.9 Constructor 5762
- 30.47.10 Constructor(RecordType as String) 5763

- 30.47.11 Constructor(RecordType as String, recordID as CKRecordIDMBS) 5763
- 30.47.13 Constructor(rootRecord as CKRecordMBS) 5764
- 30.47.14 Constructor(rootRecord as CKRecordMBS, shareID as CKRecordIDMBS) 5764

30.47.13 Constructor(rootRecord as CKRecordMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes and returns a share object.
Notes: When saving a newly created CKShare, you must save the share and its rootRecord in the same CKModifyRecordsOperationMBS batch.
See also:

- 30.47.9 Constructor 5762
- 30.47.10 Constructor(RecordType as String) 5763
- 30.47.11 Constructor(RecordType as String, recordID as CKRecordIDMBS) 5763
- 30.47.12 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS) 5763
- 30.47.14 Constructor(rootRecord as CKRecordMBS, shareID as CKRecordIDMBS) 5764

30.47.14 Constructor(rootRecord as CKRecordMBS, shareID as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes and returns a share object.
Notes:

rootRecord: The record being shared.
shareID: The CKRecordID associated with this share.

When saving a newly created CKShare, save the share and its rootRecord in the same CKModifyRecordsOperationMBS batch.
See also:

- 30.47.9 Constructor 5762
- 30.47.10 Constructor(RecordType as String) 5763
- 30.47.11 Constructor(RecordType as String, recordID as CKRecordIDMBS) 5763
- 30.47.12 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS) 5763
- 30.47.13 Constructor(rootRecord as CKRecordMBS) 5764

30.47.15 participants as CKShareParticipantMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array containing metadata objects for all participants in this share.
Notes: The participants array contains all participants on the share that the current user has permissions to see. At a minimum, this array includes the owner and the current user.

30.47.16 removeParticipant(participant as CKShareParticipantMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes a participant from the share.
Notes:

participant: The participant to be removed from this share.

To modify the list of participants, a share must have publicPermission set to CKShareParticipantPermissionNone. You cannot mix and match private users and public users in the same share. Only certain participant types may be added via this API; see CKShareParticipantMBS.

30.47.17 Properties

30.47.18 currentUserParticipant as CKShareParticipantMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The current user's metadata for this share.
Notes:

This computed property accesses the participants property and returns the CKShareParticipant that is associated with the current user.
(Read only property)

30.47.19 owner as CKShareParticipantMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The share owner's metadata.
Notes:

This computed property accesses the participants property and returns the CKShareParticipant that is associated with the owner of this share.
(Read only property)

30.47.20 publicPermission as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Definition of permissions new users joining this share will have initially.
Notes:

Shares with publicPermission more permissive than CKShareParticipantPermissionNone are joinable by any user with access to the share's URL. If the value is set to CKShareParticipantPermissionReadWrite, then those users can also create and modify records in the share. By default, public permission is CKShareParticipantPermissionNone. Changing the public permission to CKShareParticipantPermissionNone results in all public participants being removed when the share is saved.
(Read and Write property)

30.47.21 URL as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A URL that can be used to invite participants to this share.
Notes:

This property is only available after a share record has been saved to the server. This URL is stable and is tied to the rootRecord. If you share a rootRecord, delete the share, and then re-share the same rootRecord via a newly created share, that newly created share's URL will be identical to the prior share's URL.
(Read only property)

30.48 class CKShareMetadataMBS

30.48.1 class CKShareMetadataMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A reference to the metadata for a shared record.

30.48.2 Methods

30.48.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.12 and newer in 64-bit application.

30.48.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

30.48.5 copy as CKShareMetadataMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.48.6 Properties

30.48.7 containerIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The unique identifier for the container associated with this share.
Notes:

This read only property can be used to fetch the container associated with this share.
(Read only property)

30.48.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.48.9 ownerIdentity as CKUserIdentityMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identity of the owner of the associated share.
Notes:

This read only property is used to access the owner of the share.
(Read only property)

30.48.10 participantPermission as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Permissions associated with the user who retrieved the metadata for this share.
Notes:

This property reflects the permissions associated with the participant who invoked the CKFetchShareMetadataOperationMBS.
(Read only property)

30.48.11 participantStatus as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The participation status of the user who retrieved the metadata for this share.
Notes:

This property reflects the status of the participant who invoked the CKFetchShareMetadataOperationMBS. See CKShareParticipantMBS for the statuses available.
(Read only property)

30.48.12 participantType as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of the user who retrieved the metadata for this share.
Notes:

This property reflects the participantType of the participant who invoked the CKFetchShareMetadataOperationMBS. See CKShareParticipantMBS for the types available.
(Read only property)

30.48.13 rootRecord as CKRecordMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The root record associated with this share.
Notes:

This read only property contains a reference to the root record associated with this share. This property can be nil if the CKFetchShareMetadataOperationMBS did not set shouldFetchRootRecord to true.
(Read only property)

30.48.14 rootRecordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The unique identifier for the root record associated with this share.
Notes:

This property is populated even if shouldFetchRootRecord is set to false on the CKFetchShareMetadataOperationMBS and can be used to retrieve the rootRecord if the record was not retrieved with the metadata.
(Read only property)

30.48.15 share as CKShareMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The associated share.
Notes:

This read only property contains a reference to the CKShareMBS that this CKShareMetadataMBS is associated with.
(Read only property)

30.49 class CKShareParticipantMBS

30.49.1 class CKShareParticipantMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A reference to a person who accepted a shared record..
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.49.2 Methods

30.49.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.49.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

30.49.5 copy as CKShareParticipantMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.49.6 Properties

30.49.7 acceptanceStatus as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The current state of the user's acceptance of this share. (read-only)
Notes:

This property contains the current state of the participant's acceptance of this share. For a list of possible values, see CKShareParticipantAcceptanceStatus* constants.
(Read only property)

30.49.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.49.9 permission as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The permission level that the user has for this share.
Notes:

This property controls the permissions that the participant has for this share. For a list of possible values, see CKShareParticipantPermission* constants.
(Read and Write property)

30.49.10 type as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The participant type.
Notes:

The property controls the participant type for the share. For a list of possible values, see CKShareParticipantType* constants.
(Read and Write property)

30.49.11 userIdentity as CKUserIdentityMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identity of the participant. (read-only)
Notes:

This property contains a reference to the user identity for the share participant.
(Read only property)

30.49.12 Constants

30.49.13 CKShareParticipantAcceptanceStatusAccepted = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the status values of a participant.
Notes: The participant has accepted the share request.

30.49.14 CKShareParticipantAcceptanceStatusPending = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the status values of a participant.
Notes: The participant has not accepted the share request.

30.49.15 CKShareParticipantAcceptanceStatusRemoved = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the status values of a participant.
Notes: The participant was removed from the share.

30.49.16 CKShareParticipantAcceptanceStatusUnknown = 0

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the status values of a participant.
Notes: The participant's status is unknown.

30.49.17 CKShareParticipantPermissionNone = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the permissions granted constants for the participant.
Notes: The participant does not have any permissions for this share.

30.49.18 CKShareParticipantPermissionReadOnly = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the permissions granted constants for the participant.
Notes: The participant has read only permissions for this share.

30.49.19 CKShareParticipantPermissionReadWrite = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the permissions granted constants for the participant.
Notes: The participant has full read and write permissions for this share.

30.49.20 CKShareParticipantPermissionUnknown = 0

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the permissions granted constants for the participant.
Notes: The current status of the participant's permissions is unknown.

30.49.21 CKShareParticipantTypeOwner = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the participant types.
Notes: The participant is the owner of the share. As owner, the user can add private users to the share.

30.49.22 CKShareParticipantTypePrivateUser = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the participant types.
Notes: The participant is a private user and can access the share.

30.49.23 CKShareParticipantTypePublicUser = 4

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the participant types.
Notes: The participant is a public user. Public users are "self-added" when the participant accesses the shareURL. Owners cannot add public users.

30.49.24 CKShareParticipantTypeUnknown = 0

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the participant types.
Notes: The type of the participant cannot be determined.

30.50 class CKSubscriptionMBS

30.50.1 class CKSubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Use a CKSubscription object to track changes occurring on the server.
Notes:

A subscription acts like a persistent query on the server that can track the creation, deletion, and modification of records. When changes occur, they trigger the delivery of push notifications so that your app can respond appropriately.

see
https://developer.apple.com/reference/cloudkit/cksubscription

Available in 10.10 in 64-bit, but most is deprecated by Apple with 10.12.

30.50.2 Methods

30.50.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

30.50.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
See also:

- 30.50.5 Constructor(RecordType as String, predicate as NSPredicateMBS, querySubscriptionOptions as Integer) 5775
- 30.50.6 Constructor(RecordType as String, predicate as NSPredicateMBS, subscriptionID as string, querySubscriptionOptions as Integer) 5775
- 30.50.7 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string, subscriptionOptions as Integer) 5776
- 30.50.8 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionOptions as Integer) 5777

30.50.5 Constructor(RecordType as String, predicate as NSPredicateMBS, querySubscriptionOptions as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a query-based subscription that monitors records with the specified options.
Notes:

recordType: The string that identifies the type of records to track. You are responsible for naming your app's record types. This parameter must not be nil or an empty string.
predicate: The matching criteria to apply to the records. This parameter must not be nil. For information about the operators that are supported in search predicates, see the discussion in CKQueryMBS.
subscriptionOptions: A bitmask of the configuration options for the subscription. You must specify at least one of the following values: CKSubscriptionOptionsFiresOnRecordCreation, CKSubscriptionOptionsFiresOnRecordUpdate, or CKSubscriptionOptionsFiresOnRecordDeletion.

Returns a subscription object initialized to track record-related changes.

The object returned by this method is configured as a query-based subscription for searching records in the target database. The subscription monitors the specified type of records in all of the user's record zones and generates push notifications when the search criteria are met.
See also:

- 30.50.8 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionOptions as Integer) 5777

30.50.6 Constructor(RecordType as String, predicate as NSPredicateMBS, subscriptionID as string, querySubscriptionOptions as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a query-based subscription that monitors records with the specified options.
Notes:

recordType: The string that identifies the type of records to track. You are responsible for naming your app's record types. This parameter must not be nil or an empty string.
predicate: The matching criteria to apply to the records. This parameter must not be nil. For information about the operators that are supported in search predicates, see the discussion in CKQueryMBS.
subscriptionOptions: A bitmask of the configuration options for the subscription. You must specify at least one of the following values: CKSubscriptionOptionsFiresOnRecordCreation, CKSubscriptionOptionsFiresOnRecordUpdate, or CKSubscriptionOptionsFiresOnRecordDeletion.

Returns a subscription object initialized to track record-related changes.

The object returned by this method is configured as a query-based subscription for searching records in the target database. The subscription monitors the specified type of records in all of the user's record zones and generates push notifications when the search criteria are met.
See also:

- 30.50.4 Constructor 5774
- 30.50.5 Constructor(RecordType as String, predicate as NSPredicateMBS, querySubscriptionOptions as Integer) 5775
- 30.50.7 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string, subscriptionOptions as Integer) 5776
- 30.50.8 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionOptions as Integer) 5777

30.50.7 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string, subscriptionOptions as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes and returns a subscription object that monitors the specified zone and has a custom name that you provide.
Notes:

zoneID: The ID of the record zone containing the records you want to monitor. This parameter must not be nil.
subscriptionID: The unique name of the subscription object. This string must be unique for all other subscription objects in the container. This parameter must not be nil.
subscriptionOptions: The configuration options for the subscription. You must specify 0 for this parameter. Zone subscriptions currently do not support any options.

Returns a subscription object initialized to track changes to the contents of a record zone.

The object returned by this method is configured as a zone-based subscription, which generates a push notification when any changes are made to the records in the specified zone.
See also:

- 30.50.4 Constructor 5774
- 30.50.5 Constructor(RecordType as String, predicate as NSPredicateMBS, querySubscriptionOptions as Integer) 5775
- 30.50.6 Constructor(RecordType as String, predicate as NSPredicateMBS, subscriptionID as string, querySubscriptionOptions as Integer) 5775
- 30.50.8 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionOptions as Integer) 5777

30.50.8 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionOptions as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a subscription object that monitors all records in the specified record zone.
Notes:

zoneID: The ID of the record zone containing the records you want to monitor. This parameter must not be nil.
subscriptionOptions: The configuration options for the subscription. You must specify 0 for this parameter. Zone subscriptions currently do not support any options.

Returns a subscription object initialized to track changes to the contents of a record zone.

The object returned by this method is configured as a zone-based subscription, which generates a push notification when any changes are made to the records in the specified zone.
See also:

- 30.50.4 Constructor 5774

- 30.50.6 Constructor(RecordType as String, predicate as NSPredicateMBS, subscriptionID as string, querySubscriptionOptions as Integer) 5775
- 30.50.7 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string, subscriptionOptions as Integer) 5776

30.50.9 copy as CKSubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.50.10 Properties

30.50.11 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.50.12 notificationInfo as CKNotificationInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The configuration data for push notifications sent by the subscription.
Notes:

If you want your subscription's push notifications to alert the user to corresponding changes, assign a value to this property. The server uses the information in the CKNotificationInfoMBS object to determine the delivery options for notifications. For example, you can specify the alert text to display and the name of a special sound file to play. When a push notification involves a record, you can also specify which fields of the record to include in the push notification's payload data.

If you do not assign a value to this property, the server still sends push notifications to your app but those notifications do not cause the system to alert the user. The default value of this property is nil.
(Read only property)

30.50.13 predicate as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The matching criteria to apply to records.
Notes:

A query-based subscription uses its search predicate to identify potential matches for records. It combines the predicate information with the value in the subscriptionOptions property to determine the conditions under which to send a push notification to the app.

The search predicate defines the records that the subscription object monitors for changes. The value in this property is used only if the subscriptionTypeMBS property is set to CKSubscriptionTypeQuery; otherwise, it is ignored.
(Read only property)

30.50.14 recordType as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The record type being monitored in a query-based subscription.
Notes:

The value of this property applies only to query-based subscriptions and is set automatically by the constructors. For all other types of subscription objects, the value of this property is ignored and set to nil.
(Read only property)

30.50.15 subscriptionID as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The unique identifier for the subscription.
Notes:

If you initialize the subscription object using the constructor, the default value of this property is set to the value provided by those methods. In all other cases, an ID based on a UUID is generated for you automatically.
(Read only property)

30.50.16 subscriptionOptions as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The options for triggering notifications.
Notes:

Set the value of this property at initialization time. When configuring a query-based subscription, you must specify at least one of the following values: CKSubscriptionOptionsFiresOnRecordCreation, CKSubscriptionOptionsFiresOnRecordUpdate, or CKSubscriptionOptionsFiresOnRecordDeletion.
(Read only property)

30.50.17 subscriptionType as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The type of behavior provided by the subscription.
Notes:

The value of this property is set automatically at creation time. Use it to distinguish between query-based subscriptions and those that monitor specific types of data.
(Read only property)

30.50.18 zoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The ID of the record zone to monitor.
Notes:

The value of this property applies both to query-based subscriptions and zone-based subscriptions. Specifying a record zone limits the search scope to the records in that zone. In the case of a zone-based subscription, the search encompasses all records in the zone. For a query-based subscription, the search encompasses only records of a specific type in that zone.

For zone-based subscriptions, the value of this property is set automatically by the constructor. For all other subscription types, the default value is nil. To apply a zone to a query-based subscriptions, you must assign a value explicitly.
(Read only property)

30.50.19 Constants

30.50.20 OptionsFiresOnce = 8

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the configuration options for a subscription. **Notes:** An option for sending a push notification only one time. After sending the push notification, the server deletes the subscription object. This option applies only to query-based subscriptions.

30.50.21 OptionsFiresOnRecordCreation = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the configuration options for a subscription. **Notes:** An option for generating a push notification when a record that matches the search criteria in the predicate property is created. This option applies only to query-based subscriptions subscriptions.

30.50.22 OptionsFiresOnRecordDeletion = 4

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the configuration options for a subscription. **Notes:** An option for generating a push notification when a record that matched the search criteria in the predicate property was deleted. This option applies only to query-based subscriptions.

30.50.23 OptionsFiresOnRecordUpdate = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the configuration options for a subscription. **Notes:** An option for generating a push notification when changes are made to the fields of a record that cause the record to match the search criteria specified in the predicate property. This option applies only to query-based subscriptions.

30.50.24 TypeDatabase = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants that identify a subscription's behavior.
Notes: A constant indicating the subscription is a query-based subscription. This type of subscription

tracks the creation, modification, or deletion of a specific type of record.

30.50.25 TypeQuery = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants that identify a subscription's behavior.
Notes: A constant indicating the subscription is a query-based subscription. This type of subscription tracks the creation, modification, or deletion of a specific type of record.

30.50.26 TypeRecordZone = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants that identify a subscription's behavior.
Notes: A constant indicating the subscription is a zone-based subscription. The subscription tracks changes to records in a specific record zone.

30.51 class CKUserIdentityLookupInfoMBS

30.51.1 class CKUserIdentityLookupInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An object that represents information you use to fetch users.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.51.2 Methods

30.51.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.12 and newer in 64-bit application.

30.51.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
Notes:

Please use the shared methods to constructor instances.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

30.51.5 copy as CKUserIdentityLookupInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.51.6 lookupInfosWithEmailAddress(emailAddress as string) as CKUserIdentityLookupInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of user identity lookup objects configured with email addresses as the search criteria.
Notes:

emails: An array of strings that represent the email addresses to use to configure the CKUserIdentityLookupInfoMBS objects.

Returns an array of CKUserIdentityLookupInfoMBS objects that are configured with the email addresses that were passed in.
May return nil in case of error.

Once initialized, these objects can be passed into a CKDiscoverUserIdentitiesOperationMBS, or a CKFetchShareParticipantsOperationMBS to retrieve the CKUserIdentity objects for the user.

30.51.7 lookupInfosWithEmails(emailAddresses() as string) as CKUserIdentityLookupInfoMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns an array of user identity lookup objects configured with email addresses as the search criteria.
Notes:

emails: An array of strings that represent the email addresses to use to configure the CKUserIdentityLookupInfoMBS objects.

Returns an array of CKUserIdentityLookupInfoMBS objects that are configured with the email addresses that were passed in.
May return nil in case of error.

Once initialized, these objects can be passed into a CKDiscoverUserIdentitiesOperationMBS, or a CKFetchShareParticipantsOperationMBS to retrieve the CKUserIdentityMBS objects for the user.

30.51.8 lookupInfosWithPhoneNumbers(phoneNumbers() as string) as CKUserIdentityLookupInfoMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns an array of user identity lookup objects configured with phone numbers as the search criteria.
Notes:

phoneNumbers: An array of strings that represent the phone numbers to use to configure the CKUserIdentityLookupInfoMBS objects.

Returns an array of CKUserIdentityLookupInfoMBS objects that are configured with the phone numbers that were passed in.

May return nil in case of error.

Once initialized, these objects can be passed into a CKDiscoverUserIdentitiesOperationMBS, or a CKFetchShareParticipantsOperationMBS to retrieve the CKUserIdentityMBS objects for the user.

30.51.9 lookupInfosWithRecordIDs(userRecordIDs() as CKRecordIDMBS) as CKUserIdentityLookupInfoMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns an array of user identity lookup objects configured with phone numbers as the search criteria.
Notes:

userRecordIDs: An array of CKRecordIDMBS objects that are used to configure the CKUserIdentityLookupInfoMBS objects.

Returns an array of CKUserIdentityLookupInfoMBS objects that are configured with the CKRecordIDMBS objects that were passed in.one

30.51.10 lookupInfosWithUserRecordID(userRecordID as CKRecordIDMBS) as CKUserIdentityLookupInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes and returns a look up info object with the user record ID property configured.
Notes:

userRecordID: The user record ID to use to look up the user.

Returns an user identity lookup object initialized to look up a user by the user's record ID, or nil if the object cannot be initialized.

Once initialized, this object can be passed into CKDiscoverUserIdentitiesOperationMBS, or a CKFetchShareParticipantsOperationMBS to retrieve the CKUserIdentityMBS for the user.

30.51.11 lookupInfosWithWithPhoneNumber(phoneNumber as string) as CKUserIdentityLookupInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes and returns a look up info object with the phone number property configured.
Notes:

phoneNumber: The phone number to use to look up the user.

Returns an user identity lookup object initialized to look up a user by the user's phone number, or nil if the object cannot be initialized.

Once initialized, this object can be passed into a CKDiscoverUserIdentitiesOperationMBS, or a CKFetchShareParticipantsOperationMBS to retrieve the CKUserIdentityMBS for the user.

30.51.12 Properties

30.51.13 emailAddress as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The email address of the user whose information you want to retrieve.
Notes:

This property corresponds to a single email address associated with the user whose information you wish to look up.
(Read only property)

30.51.14 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.51.15 phoneNumber as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The phone number of the user whose information you want to retrieve.
Notes:

This property corresponds to a single phone number associated with the user whose information you wish to look up.
(Read only property)

30.51.16 userRecordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The ID of the user record.
Notes:

Use this value to retrieve the user record associated with the specified user. The user record does not contain any personal information about the user by default. Your app can add data to the user record but should not add any sensitive user data to it.
(Read only property)

30.52 class CKUserIdentityMBS

30.52.1 class CKUserIdentityMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A reference to a user.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.52.2 Methods

30.52.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.12 and newer in 64-bit application.

30.52.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

30.52.5 copy as CKUserIdentityMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.52.6 Properties

30.52.7 description as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The description text.
Notes: (Read only property)

30.52.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.52.9 hasiCloudAccount as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether this user has an iCloud account.
Notes:

The value is true if this CKUserIdentity has an iCloud account associated with it; otherwise, false.
(Read only property)

30.52.10 localizedDisplayName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The localized display name.
Notes: (Read only property)

30.52.11 lookupInfo as CKUserIdentityLookupInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The information (phone number, email address, etc.) used to retrieve this user.
Notes:

The information that is passed into a CKDiscoverUserIdentitiesOperationMBS or CKFetchShareParticipantsOperationMBS object to retrieve the user identity.
(Read only property)

30.52.12 nameComponents as NSPersonNameComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the user associated with the specified user identity object.
Notes:

This property can be used to display the name of the user associated with this CKUserIdentity object.
(Read only property)

30.52.13 userRecordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Unique identifier for this record.
Notes:

This property is the unique identifier associated with this CKUserIdentity.
(Read only property)

30.53 class NSPersonNameComponentsMBS

30.53.1 class NSPersonNameComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSPersonNameComponents object encapsulates the components of a person's name in an extendable, object-oriented manner.
Notes: It is used to specify a person's name by providing the components comprising a full name: given name, middle name, family name, prefix, suffix, nickname, and phonetic representation.

30.53.2 Methods

30.53.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Should be true for OS X 10.11 and newer.

30.53.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

30.53.5 copy as CKQueryCursorMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

30.53.6 Properties

30.53.7 familyName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Name bestowed upon an individual to denote membership in a group or family. (for example, "Appleseed").
Notes: (Read and Write property)

30.53.8 givenName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Name bestowed upon an individual to differentiate them from other members of a group that share a family name (for example, "Johnathan").
Notes: (Read and Write property)

30.53.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

30.53.10 middleName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Secondary name bestowed upon an individual to differentiate them from others that have the same given name (for example, "Maple").
Notes: (Read and Write property)

30.53.11 namePrefix as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The portion of a name's full form of address that precedes the name itself (for example, "Dr.," "Mr.," "Ms.").
Notes: (Read and Write property)

30.53.12 nameSuffix as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The portion of a name's full form of address that follows the name itself (for example, "Esq.," "Jr.," "Ph.D.").
Notes: (Read and Write property)

30.53.13 nickname as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Name substituted for the purposes of familiarity (for example, "Johnny").

Notes: (Read and Write property)

30.53.14 phoneticRepresentation as NSPersonNameComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The phonetic representation name components of the receiver.
Notes:

Each component of the receiver with a value should have a corresponding value for any value set for this property. nil by default.
(Read and Write property)

Chapter 31

Cocoa

31.1 control CocoaControlMBS

31.1.1 control CocoaControlMBS

MBS MacFrameworks Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control to embed NSViews into a Xojo window.
Notes:

Due the way Cocoa event handling works, the keydown event handler (and others) do not work with this control. To actually get an event, you'd have to use a subclass of CustomNSViewMBS and handle events there. In the CustomNSViewMBS you add the actual view you like to have. So all events not handled by this view, fall through to your CustomNSViewMBS.
On Carbon the RS framework intercepts events and calls keydown event.
Requires the window being composite for Carbon targets which is currently not available for modal windows in Xojo.

31.1.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.0pr7

31.1.3 Xojo Developer Magazine

- 14.4, page 23: NSTabula Rasa, What to do when your new sports car arrives in parts by Ulrich Bogun

31.1.4 Properties

31.1.5 Available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether this control can work.
Notes:

Returns true on Mac OS X 10.5 (or newer) and false on any other OS.
(Read only property)

31.1.6 View as NSViewMBS

MBS MacFrameworks Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The view used with this control.
Notes:

You define this view in the GetView event.
(Read only property)

31.1.7 WantsFocus as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether this control wants to have focus.
Notes:

By default this is true.
(Read and Write property)

31.1.8 Events

31.1.9 EnableMenuItems

MBS MacFrameworks Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event where you can enable menu items.

31.1.10 GetView as NSViewMBS

MBS MacFrameworks Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks your application which NSView should be used.
Example:

```
// an example on how to use this event:

Function GetView() As NSViewMBS
dim n as NSTextViewMBS

// create a textview:

n=new NSTextViewMBS(0, 0, CocoaControlMBS1.Width, CocoaControlMBS1.Height)
n.ContinuousSpellCheckingEnabled=true
Return n

End Function
```

Notes:

Return a NSView setup as you like.
You may also want to keep a reference to the view you use for easier access.

31.1.11 MenuAction(HitItem as MenuItem) As Boolean

MBS MacFrameworks Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

31.1.12 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacFrameworks Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was pressed inside the control's region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.

- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

31.1.13 MouseDrag(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

31.1.14 MouseUp(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

31.1.15 ScaleFactorChanged(NewFactor as Double)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

31.2 class ContainerControl

31.2.1 class ContainerControl

Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The container class in Xojo.

31.2.2 Methods

31.2.3 NSViewMBS as NSViewMBS

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSViewMBS object for the given container.
Example:

MsgBox ContainerControl1.NSViewMBS.className

Notes: This way you can manipulate Cocoa container controls directly.

31.3 class ContinuityCameraMBS

31.3.1 class ContinuityCameraMBS

MBS MacExtras Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The class to work with Continuity feature in MacOS Mojave.
Notes: Works also with services to receive e.g. screenshot for older versions.

31.3.4 Methods

31.3.5 Constructor

MBS MacExtras Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

31.3.6 Destructor

MBS MacExtras Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

31.3.7 Import(index as Integer)

MBS MacExtras Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Starts import.
Notes: Index is 0 for photo or 1 for document.
See also:

- 31.3.8 Import(index as Integer, Control as control) 5799
- 31.3.9 Import(index as Integer, Win as window) 5799

31.3.8 Import(index as Integer, Control as control)

MBS MacExtras Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Starts import for control.
Notes: Index is 0 for photo or 1 for document.
See also:

- 31.3.7 Import(index as Integer) 5799
- 31.3.9 Import(index as Integer, Win as window) 5799

31.3.9 Import(index as Integer, Win as window)

MBS MacExtras Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Starts import for window.
Notes: Index is 0 for photo or 1 for document.
See also:

- 31.3.7 Import(index as Integer) 5799
- 31.3.8 Import(index as Integer, Control as control) 5799

31.3.10 InstallForCanvas

MBS MacExtras Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Installs receiver for Xojo canvas controls.

31.3.11 InstallForListbox

MBS MacExtras Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Installs receiver for Xojo listbox controls.

31.3.12 InstallForWindow

MBS MacExtras Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Installs receiver for Xojo windows.

31.3.13 PopupMenu as NSMenuMBS

MBS MacExtras Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Shows the import from device popup menu.
Notes:

You can show this menu with popup method.
May return nil if unavailable.

31.3.14 SetDelegate(d as ContinuityCameraDelegateMBS)

MBS MacExtras Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets delegate to call when we got new data.

31.3.15 Properties

31.3.16 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The handle for the internal controller.
Notes:

Is zero in case the constructor failed.
(Read only property)

31.3.17 Delegates

31.3.18 ContinuityCameraDelegateMBS(Data as MemoryBlock, type as String)

MBS MacExtras Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The delegate definition for the callback.
Notes: Please define a method in app or a module and pass addressOf that method to SetDelegate method.

31.4 module DictionaryServiceMBS

31.4.1 module DictionaryServiceMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The Dictionary Services module.
Notes:

Dictionary Services provides functions that let you access dictionaries programmatically from within your application.

A dictionary is any look-up reference that is built using the Dictionary Development Kit. The contents of a dictionary can serve many purposes. The most typical use is to provide definitions for a single language, but you can create content for a thesaurus, bilingual dictionaries (such as English-Japanese), in-house glossaries, and professional dictionaries (such as legal, medical, and technical).

Available in Mac OS X v10.5 and later.

31.4.2 Methods

31.4.3 GetTermRangeInString(text as string, offset as Integer=0) as boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Determines the range of the longest word or phrase with respect to an offset.
Notes:

text: Text that contains the word or phrase to look up.
offset: A character offset in the textString parameter.

Return Value

The range that specifies the location, around the specified offset, of the word or phrase, or the value -1. The range is stored in the RangePosition and RangeLength properties and the function returns true. On any error it returns false.

You can use this function to determine the range of text that contains a word or phrase. After you determine the range, you can pass the result to the functions TextDefinition and Show.

To see how this works, follow these steps:
In Mac OS X v10.5 or later, open Text Edit.
Type It is a foggy day in San Francisco, California.
Control-click Francisco (don't select it). Then, choose "Lookup in Dictionary".

Note that the Dictionary window appears with a definition of San Francisco. The function GetTermRangeInString automatically detected the range of the phrase San Francisco, using Francisco as the text string to search for and a character offset in this string. The function expanded the range until it found a possible match.

You can also point the cursor at the word Francisco and, without making a selection or clicking, type Command-Control-D. GetTermRangeInString detects the range.

The function GetTermRangeInString only returns the range. You must call TextDefinition to copy the definition and Show to display the definition in a Dictionary window.

Available in Mac OS X v10.5 and later.

31.4.4 RangeLength as Integer

MBS MacFrameworks Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The length from the range.
Notes:

This value set by the GetTermRangeInString function.
(Read and Write computed property)

31.4.5 RangePosition as Integer

MBS MacFrameworks Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The position from the range.
Notes:

This value set by the GetTermRangeInString function.
(Read and Write computed property)

31.4.6 Show(text as string, start as Integer = 0, length as Integer = 0, textOriginX as Double = 0, textOriginY as Double = 0) as boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Displays dictionary search result in a dictionary window.
Notes:

text: Text that contains the word or phrase to look up.

start and length:
If you are using this function to show the results associated with text selected by the user, then provide the selection range of the textString parameter. If you are using this function to show the results associated with calling the DCSGetTermRangeInString function, then provide the range returned by that function.

This function opens a window to display the definition of a word or phrase.

Available in Mac OS X v10.5 and later.

31.4.7 TextDefinition(text as string, position as Integer=0, length as Integer=0) as string

MBS MacFrameworks Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the definition associated with the provided text range.
Notes:

text: Text that contains the word or phrase to look up.

position and length: A range that specifies the location of the word or phrase in the textString parameter. If text string exactly specifies the word or phrase that you want to look up, you can pass the range of the text string. For example, for the word make, you would pass (0,4) to specify the range.

If the textString parameter contains the word or phrase, but does not specify it exactly, then pass the range returned by the function GetTermRangeInString.

Return Value:
The definition of the word or phrase, as plain text. The returned text does not contain any elements that are marked with a priority attribute whose value is 2.

This function returns the description of the first matching record found in the the active dictionaries. It searches first in the default word definition dictionary which, in the English environment, is the Oxford dictionary.

Available in Mac OS X v10.5 and later.

31.5 class NSAlertMBS

31.5.1 class NSAlertMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for a standard Cocoa alert.

31.5.2 Blog Entries

- MBS Xojo / Real Studio plug-ins version 16.2
- MBS Xojo / Real Studio Plugins, version 16.2pr2
- MBS Xojo / Real Studio plug-ins in version 14.2
- MBS Xojo / Real Studio Plugins, version 14.2pr1

31.5.3 Xojo Developer Magazine

- 12.4, page 9: News

31.5.4 Methods

31.5.5 addButtonWithTitle(title as string) as Variant

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Customize the buttons in the alert panel.
Example:

```
// make dialog
dim a as NSAlertMBS = NSAlertMBS.alertWithMessageText("Hello World", "First Button", "Second Button")

// add button
dim thirdButton as NSButtonMBS = a.addButtonWithTitle("Third Button")

// and show dialog
call a.runModal
```

Notes:

Buttons are added from right to left (for left to right languages).
Returns NSButtonMBS object.

31.5.6 alertWithError(error as NSErrorMBS) as NSAlertMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Given an NSError, create an NSAlert that can be used to present the error to the user.
Notes: The error's localized description, recovery suggestion, and recovery options will be used to set the alert's message text, informative text, and button titles, respectively.

31.5.7 alertWithMessageText(MessageText as string, defaultButton as string = "", alternateButton as string = "", otherButton as string = "", informativeText as string = "") as NSAlertMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new alert with given property values.

31.5.8 beginSheetModalForWindow(win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Begins a sheet on the document window.
Notes:

If the alert has an alertStyle of NSCriticalAlertStyle, it will be shown as a "critical" sheet; it will otherwise be presented as a normal sheet.
Calls later SheetDidEnd event with the result.

Please keep a reference to the dialog object alive to avoid trouble.
e.g. store reference in parent window, global property or app property.
See also:

- 31.5.9 beginSheetModalForWindow(win as window) 5805

31.5.9 beginSheetModalForWindow(win as window)

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Begins a sheet on the document window.
Notes:

If the alert has an alertStyle of NSCriticalAlertStyle, it will be shown as a "critical" sheet; it will otherwise be presented as a normal sheet.
Calls later SheetDidEnd event with the result.

Please keep a reference to the dialog object alive to avoid trouble.
e.g. store reference in parent window, global property or app property.

See also:

- 31.5.8 beginSheetModalForWindow(win as NSWindowMBS) 5805

31.5.10 buttons as Variant()

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the buttons, where the rightmost button is at index 0.
Example:

```
dim a as NSAlertMBS = NSAlertMBS.alertWithMessageText("Hello World", "First Button", "Second Button")
dim buttons() as Variant = a.buttons

for each b as NSButtonMBS in buttons
MsgBox b.title
next
```

Notes: Returns NSButtonMBS array.

31.5.11 close

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the alert sheet.
Notes: The SheetDidEnd event will not run.

31.5.12 Constructor

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor for an empty alert.
Notes: Use properties to configure the dialog.

31.5.13 Destructor

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

31.5.14 layout

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Performs the layout for the dialog.
Notes: Can be used to indicate that the alert panel should do immediate layout, overriding the default behavior of laying out lazily just before showing panel. You should only call this method if you want to do your own custom layout after it returns. You should call this method only after you have finished with NSAlert customization, including setting message and informative text, and adding buttons and an accessory view if needed. You can make layout changes after this method returns, in particular to adjust the frame of an accessory view. Note that the standard layout of the alert may change in the future, so layout customization should be done with caution.

31.5.15 runModal as Integer

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Run the alert as an application-modal panel and return the result.

31.5.16 Properties

31.5.17 accessoryView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The accessory view displayed in the alert panel.
Notes:

By default, the accessory view is positioned below the informative text and the suppression button (if any) and above the alert buttons, left-aligned with the informative text. If you want to customize the location of the accessory view, you must first call layout method.
(Read and Write property)

31.5.18 alertStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The alert style.
Notes:

Value can be:

(Read and Write property)

NSWarningAlertStyle	0	Warning
NSInformationalAlertStyle	1	Information
NSCriticalAlertStyle	2	Critical Error

31.5.19 helpAnchor as String

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The help anchor to use.
Notes: (Read and Write property)

31.5.20 icon as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Custom icon for dialog.
Notes:

By default uses the image named NSApplicationIcon.
(Read and Write property)

31.5.21 informativeText as String

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The informative text.
Notes: (Read and Write property)

31.5.22 messageText as String

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The message text.
Notes: (Read and Write property)

31.5.23 showsHelp as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether to show help button.
Notes:

True adds a help button to the alert panel. When the help button is pressed, the delegate is first consulted. If the event does not implement ShowHelp event or returns false, then NSHelpManager.openHelpAnchor is

called with a nil book and the anchor specified by HelpAnchor, if any. An exception will be raised if the delegate returns false and there is no help anchor set.
(Read and Write property)

31.5.24 ShowsSuppressionButton as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Indicates whether or not the alert should contain a suppression checkbox.
Notes:

The default is false. This checkbox is typically used to give the user an option to not show this alert again. If shown, the suppression button will have a default localized title similar to @"Do not show this message again". You can customize this title using alert.suppressionButton.Title. When the alert is dismissed, you can get the state of the suppression button, using [[alert suppressionButton] state] and store the result in user defaults, for example. This setting can then be checked before showing the alert again. By default, the suppression button is positioned below the informative text, and above the accessory view (if any) and the alert buttons, and left-aligned with the informative text. However do not count on the placement of this button, since it might be moved if the alert panel user interface is changed in the future. If you need a checkbox for purposes other than suppression text, it is recommended you create your own using an accessory view.
(Read and Write property)

31.5.25 suppressionButton as Variant

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a suppression button which may be customized, including the title and the initial state.
Example:

```
// make dialog
dim a as NSAlertMBS = NSAlertMBS.alertWithMessageText("Hello World", "First Button", "Second Button")

// get button
dim suppressionButton as NSButtonMBS = a.suppressionButton

// change title
suppressionButton.title = "Hello World Button"

// want to show it
a.ShowsSuppressionButton = true

// and show dialog
call a.runModal
```

Notes:

You can also use this method to get the state of the button after the alert is dismissed, which may be stored in user defaults and checked before showing the alert again. In order to show the suppression button in the alert panel, you must set ShowsSuppressionButton to true.
Returns NSButtonMBS object.
(Read only property)

31.5.26 TimedOut as Boolean

MBS MacCocoa Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether we got a timeout.
Notes:

This is set to true when a timeout occurred.
(Read only property)

31.5.27 timeOut as Double

MBS MacCocoa Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Timeout for the dialog.
Notes:

Set this to the number of seconds after which the dialog should close.
(Read and Write property)

31.5.28 window as Variant

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the application-modal panel or the document-modal sheet corresponding to this alert.
Notes: (Read only property)

31.5.29 Events

31.5.30 SheetDidEnd(returnCode as Integer)

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The sheet did finish.

31.5.31 ShowHelp as boolean

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Show custom help.
Notes: See ShowHelp property.

31.5.32 Constants

31.5.33 NSAlertFirstButtonReturn = 1000

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** One of the button return codes.
Notes: First (rightmost) button

31.5.34 NSAlertSecondButtonReturn = 1001

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** One of the button return codes.
Notes: Second button.

31.5.35 NSAlertThirdButtonReturn = 1002

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** One of the button return codes.
Notes: Third button.

31.5.36 NSCriticalAlertStyle = 2

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** One of the alert styles.
Notes: Critical Error

31.5.37 NSInformationalAlertStyle = 1

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** One of the alert styles.
Notes: Informational Alert

31.5.38 NSWarningAlertStyle = 0

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** One of the alert styles.
Notes: Warning Alert (Default style)

31.6 class NSAnimationContextMBS

31.6.1 class NSAnimationContextMBS

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The Cocoa class for the context of a NSAnimation.
Notes: Available in Mac OS X v10.5 and later.

31.6.2 Methods

31.6.3 beginGrouping

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new animation grouping.
Notes: Available in Mac OS X v10.5 and later.

31.6.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new NSAnimationContextMBS object with the current animation context.
Notes: Available in Mac OS X v10.5 and later.

31.6.5 currentContext as NSAnimationContextMBS

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the current animation context.
Notes: Available in Mac OS X v10.5 and later.

31.6.6 endGrouping

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Ends the current animation grouping.
Notes: Available in Mac OS X v10.5 and later.

31.6.7 Properties

31.6.8 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal reference to the NSAnimationContext object.
Notes: (Read and Write property)

31.6.9 duration as Double

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The duration used when animating object properties that support animation.
Example:

NSAnimationContextMBS.currentContext.duration = 0.5

Notes:

Any animations that occur as a result of setting the values of animatable properties in the current context will run for this duration.

Available in Mac OS X v10.5 and later.
(Read and Write computed property)

31.7 class NSAnimationMBS

31.7.1 class NSAnimationMBS

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Objects of the NSAnimation class manage the timing and progress of animations in the user interface.
Notes:

The class also lets you link together multiple animations so that when one animation ends another one starts. It does not provide any drawing support for animation and does not directly deal with views, targets, or actions.

NSAnimation objects have several characteristics, including duration, frame rate, and animation curve, which describes the relative speed of the animation over its course. You can set progress marks in an animation, each of which specifies a percentage of the animation completed; when an animation reaches a progress mark, it notifies its delegate and posts a notification to any observers. Animations execute in one of three blocking modes: blocking, non-blocking on the main thread, and non-blocking on a separate thread. The non-blocking modes permit the handling of user events while the animation is running.

31.7.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.5pr11

31.7.3 Methods

31.7.4 clearStartAnimation

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Clears linkage to another animation that causes the receiver to start.

31.7.5 clearStopAnimation

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Clears linkage to another animation that causes the receiver to stop.

31.7.6 Constructor(duration as Double, animationCurve as Integer)

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes the object with the specified duration and animation-curve values.

Notes:

duration: The number of seconds over which the animation occurs. Specifying a negative number raises an exception.
animationCurve: An NSAnimationCurve constant that describes the relative speed of the animation over its course; if it is zero, the default curve (NSAnimationEaseInOut) is used.

You can always later change the duration of an NSAnimation object by sending it a setDuration: message, even while the animation is running. See "Constants" for descriptions of the NSAnimationCurve constants.

31.7.7 currentValue as Double

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the current value of the effect based on the current progress.

31.7.8 Destructor

MBS MacFrameworks Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The destructor.

31.7.9 isAnimating as boolean

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether the receiver is currently animating.
Notes: True if the receiver is animating, false otherwise.

31.7.10 startAnimation

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Starts the animation represented by the receiver.
Notes: The receiver retains itself and is then autoreleased at the end of the animation or when it receives stopAnimation. If the blocking mode is NSAnimationBlocking, the method only returns after the animation has completed or the delegate sends it stopAnimation. If the receiver has a progress of 1.0, it starts again at 0.0.

31.7.11 stopAnimation

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Stops the animation represented by the receiver.
Notes: The current progress of the receiver is not reset. When this method is sent to instances of NSViewAnimation (a subclass of NSAnimation) the receiver moves to the end frame location.

31.7.12 Properties

31.7.13 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal reference to the animation object.
Notes: (Read and Write property)

31.7.14 animationBlockingMode as Integer

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The blocking mode of the receiver.
Notes:

A constant representing the blocking mode the animation is next scheduled to run under. See "NSAnimationBlockingMode" for valid values.

If the constant is NSAnimationNonblocking, the animation runs in the main thread in one of the standard run-loop modes or in a mode returned from runLoopModesForAnimating. If animationBlockingMode is NSAnimationNonblockingThreaded, a new thread is spawned to run the animation.

The default mode is NSAnimationBlocking, which means that the animation runs on the main thread in a custom run-loop mode that blocks user events. The new blocking mode takes effect the next time the receiver is started and has no effect on an animation underway.
(Read and Write computed property)

31.7.15 animationCurve as Integer

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The animation curve the receiver is running under.
Notes:

The animation curve describes the relative frame rate over the course of the animation. See NSAnimation* constants.

(Read and Write computed property)

31.7.16 currentProgress as Double

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The current progress of the receiver.
Notes:

The current progress is a value between 0.0 and 1.0 that represents the percentage of the animation currently completed.
(Read and Write computed property)

31.7.17 duration as Double

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The duration of the animation, in seconds.
Notes: (Read and Write computed property)

31.7.18 frameRate as Double

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The frame rate of the animation.
Notes:

The frame rate is the number of updates per second. It is not guaranteed to be accurate because of differences between systems on the time needed to process a frame.
(Read and Write computed property)

31.7.19 Events

31.7.20 CurrentProgressChanged(progress as Double)

MBS MacFrameworks Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called whenever the current value changes.

31.7.21 Constants

31.7.22 NSAnimationBlocking=0

MBS MacFrameworks Plugin, Plugin Version: 10.0. **Function:** One of the constants to indicate the blocking mode of an NSAnimation object when it is running.
Notes:

Requests the animation to run in the main thread in a custom run-loop mode that blocks user input.

This is the default.

31.7.23 NSAnimationEaseIn=1

MBS MacFrameworks Plugin, Plugin Version: 10.0. **Function:** One of the constants to describe the curve of an animation—that is, the relative speed of an animation from start to finish.
Notes: Describes an animation that slows down as it reaches the end.

31.7.24 NSAnimationEaseInOut=0

MBS MacFrameworks Plugin, Plugin Version: 10.0. **Function:** One of the constants to describe the curve of an animation—that is, the relative speed of an animation from start to finish.
Notes: Describes an S-curve in which the animation slowly speeds up and then slows down near the end of the animation. This constant is the default.

31.7.25 NSAnimationEaseOut=2

MBS MacFrameworks Plugin, Plugin Version: 10.0. **Function:** One of the constants to describe the curve of an animation—that is, the relative speed of an animation from start to finish.
Notes: Describes an animation that slowly speeds up from the start.

31.7.26 NSAnimationLinear=3

MBS MacFrameworks Plugin, Plugin Version: 10.0. **Function:** One of the constants to describe the curve of an animation—that is, the relative speed of an animation from start to finish.
Notes: Describes an animation in which there is no change in frame rate.

31.7.27 NSAnimationNonblocking=1

MBS MacFrameworks Plugin, Plugin Version: 10.0. **Function:** One of the constants to indicate the blocking mode of an NSAnimation object when it is running.
Notes: Requests the animation to run in a standard or specified run-loop mode that allows user input.

31.7.28 NSAnimationNonblockingThreaded=2

MBS MacFrameworks Plugin, Plugin Version: 10.0. **Function:** One of the constants to indicate the blocking mode of an NSAnimation object when it is running.
Notes:

Requests the animation to run in a separate thread that is spawned by the NSAnimation object.

The secondary thread has its own run loop.

31.8 class NSAppearanceMBS

31.8.1 class NSAppearanceMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The appearance class.
Notes:

An NSAppearance object represents a file that specifies a standard or custom appearance that applies to a subset of UI elements in an app. An app can contain multiple appearance files and—because NSAppearance conforms to NSCoding—you can use Interface Builder to assign UI elements to an appearance.

Typically, you customize a window by using Xcode to create an appearance file that contains the views you want to customize and the custom art that should be applied to them. Xcode transforms the file's art content into a runtime format that AppKit can draw when the specified views are displayed.

If the art for a specific view can't be found, AppKit searches for the art in the appearances of the view's ancestors. A nil appearance means that a view uses the default Aqua appearance; a non-nil appearance means that the view uses an ancestor's appearance.

When AppKit draws a control, it automatically sets the current appearance on the current thread to the control's appearance. The current appearance can influence the actual drawing path and the return values you get when you access system fonts and colors. The current appearance also affects the appearance of text and images, such as the text and template images that can be displayed in a toolbar.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

31.8.2 Blog Entries

31.8.3 Methods

31.8.4 appearance(item as Variant) as NSAppearanceMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The appearance of the receiver, in an NSAppearance object.
Example:

```
dim v as NSViewMBS = PushButton1.NSViewMBS
dim a as NSAppearanceMBS = NSAppearanceMBS.appearance(v)

MsgBox a.name
```

Notes: The default value for this property is nil, which means that the receiver uses the appearance it inherits from the nearest ancestor that has set an appearance. When you set appearance to a non-nil value, the receiver and the views it contains use the specified appearance.

31.8.5 appearanceNamed(name as string) as NSAppearanceMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the NSAppearance object with the specified name.
Notes:

name: The name of a standard or custom appearance.
Returns a standard or custom appearance object.

When you specify a standard appearance name—such as NSAppearanceNameAqua—this method returns a built-in appearance. If you specify a custom appearance name, this method searches the main bundle for an appearance file that has the specified name.
Available in OS X v10.9 and later.
See also:

- 31.8.6 appearanceNamed(name as string, bundle as NSBundleMBS) as NSAppearanceMBS 5822

31.8.6 appearanceNamed(name as string, bundle as NSBundleMBS) as NSAppearanceMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSAppearance object initialized to the specified appearance file in the specified bundle.
Notes:

name: The name of the appearance file to search for, without any path information.
bundle: The bundle in which to search for the appearance file. If bundle is nil, this method searches in the main bundle.

Returns an initialized appearance object, or nil if an error occurs.
Available in OS X v10.9 and later.
See also:

- 31.8.5 appearanceNamed(name as string) as NSAppearanceMBS 5822

31.8.7 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether this class is available.

31.8.8 Constructor

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

31.8.9 currentAppearance as NSAppearanceMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the NSAppearance object that's set on the current thread.
Example:

MsgBox NSAppearanceMBS.currentAppearance.name

Notes:

When a UI element draws on the screen, it automatically sets the appearance that it's using on the current thread.
Available in OS X v10.9 and later.

31.8.10 effectiveAppearance(item as Variant) as NSAppearanceMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The appearance that will be used when the receiver is drawn onscreen, in an NSAppearance object.
Notes:

The default value for this property is provided by the nearest ancestor of the receiver that has set an appearance.
You can use this property to ensure that an offscreen view sets the appropriate current appearance when it draws onscreen.
Available in OS X v10.9 and later.

31.8.11 NSAppearanceNameAccessibilityHighContrastAqua as string

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A high-contrast version of the standard light system appearance.
Notes:

Don't assign an NSAppearanceMBS object with this type directly to one of your views. Instead, assign a light appearance to your view. AppKit then returns this type when the user enables the Increase Contrast option in the Accessibility system preferences.
Available on MacOS 10.14 or newer.

31.8.12 NSAppearanceNameAccessibilityHighContrastDarkAqua as string

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A high-contrast version of the standard dark system appearance.
Notes:

Don't assign an NSAppearanceMBS object with this type directly to one of your views. Instead, assign a dark appearance to your view. AppKit then returns this type when the user enables the Increase Contrast option in the Accessibility system preferences.
Available on MacOS 10.14 or newer.

31.8.13 NSAppearanceNameAccessibilityHighContrastVibrantDark as string

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A high-contrast version of the dark vibrant appearance.
Notes:

Don't assign an NSAppearanceMBS object with this type directly to one of your views. Instead, assign a dark appearance to your view. AppKit then returns this type when the user enables the Increase Contrast option in the Accessibility system preferences and the view's allowsVibrancy property is true.
Available on MacOS 10.14 or newer.

31.8.14 NSAppearanceNameAccessibilityHighContrastVibrantLight as string

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A high-contrast version of the light vibrant appearance.
Notes:

Don't assign an NSAppearanceMBS object with this type directly to one of your views. Instead, assign a light appearance to your view. AppKit then returns this type when the user enables the Increase Contrast option in the Accessibility system preferences and the view's allowsVibrancy property is true.

Available on MacOS 10.14 or newer.

31.8.15 NSAppearanceNameAqua as string

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The name of the standard Aqua appearance.

31.8.16 NSAppearanceNameLightContent as string

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The name of the standard appearance that can be used by controls in light content areas (not including window-frame areas).

31.8.17 NSAppearanceNameVibrantDark as string

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The name of the vibrant dark appearance.
Notes:

Available on Mac OS X 10.10 and newer.
Should only be set on an NSVisualEffectView, or one of its container subviews.

31.8.18 NSAppearanceNameVibrantLight as string

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The name of the vibrant dark appearance.
Notes:

Available on Mac OS X 10.10 and newer.
Should only be set on an NSVisualEffectView, or one of its container subviews.

31.8.19 setAppearance(item as Variant, appearance as NSAppearanceMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the appearance of the receiver, in an NSAppearance object.
Notes: The default value for this property is nil, which means that the receiver uses the appearance it inherits from the nearest ancestor that has set an appearance. When you set appearance to a non-nil value, the receiver and the views it contains use the specified appearance.

31.8.20 setCurrentAppearance(appearance as NSAppearanceMBS = nil)

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the current appearance to the specified NSAppearance object.
Notes:

appearance: The NSAppearance object that should be used for the window or view, or nil to specify the default appearance.

When you set an appearance on a window, all views in that window—including the window background and controls in both the frame and content areas—use that appearance. By default, AppKit sets the current appearance for standard windows and views during window drawing, so you don't need to use this method unless you want to change the current appearance of a specific window or view.

You can use this method to set the current appearance for an offscreen view to the appearance that will be used when the view is drawn. To do this, use the offscreen view's effectiveAppearance for the appearance parameter.

Available in OS X v10.9 and later.

31.8.21 Properties

31.8.22 allowsVibrancy as Boolean

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Query allowsVibrancy to see if the given appearance actually needs vibrant drawing.
Notes:

You may want to draw differently if the current apperance is vibrant.
(Read only property)

31.8.23 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

31.8.24 name as String

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The name of the appearance.
Example:

MsgBox NSAppearanceMBS.currentAppearance.name

Notes: (Read only property)

31.9 class NSApplicationDelegateMBS

31.9.1 class NSApplicationDelegateMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The class for an Cocoa application delegate.
Notes:

Please install in app Constructor. App.Open may be too late.

Using this class you can get application related events before (!) the app class gets it. And of course more events than just the onces the app class have.

Only for Cocoa desktop targets.

In general the plugin calls first the event. Depending on the result it may pass the event to the Xojo application delegate. If you have no code in the plugin event, everything just passes through and you should not see a difference.

The plugin application delegate is installed with the Constructor and uninstalled in the Destructor.

The original delegate from Xojo is preserved and all messages are forwarded to it. Also when this object is destroyed, the old delegate is restored.

31.9.3 Events

31.9.4 applicationDidBecomeActive(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately after the application becomes active.

31.9.5 applicationDidChangeScreenParameters(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center when the configuration of the displays attached to the computer is changed (either programmatically or when the user changes settings in the Displays control panel).

31.9.6 applicationDidDecodeRestorableState(coder as NSCoderMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event gives you the chance to restore your own state.

31.9.7 applicationDidFailToRegisterForRemoteNotificationsWithError(error as NSErrorMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Application failed to register for remote notifications.
Notes:

Check your provisioning profile for entitlements.

Available on Mac OS X 10.7 or newer.

31.9.8 applicationDidFinishLaunching(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center after the application has been launched and initialized but before it has received its first event.
Notes: Delegates can implement this method to perform further initialization. This method is called after the application's main run loop has been started but before it has processed any events. If the application was launched by the user opening a file, the delegate's applicationOpenFile method is called before this

method. If you want to perform initialization before any files are opened, implement the applicationWillFinishLaunching method in your delegate, which is called before applicationOpenFile.)

31.9.9 applicationDidHide(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately after the application is hidden.

31.9.10 applicationDidReceiveRemoteNotification(userInfo as Dictionary)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A notification was received.
Notes:

The dictionary contains payload like this:

key "aps" contains another dictionary. This secon dictionary contains keys like "alert", "badge" and "sound".

Available on Mac OS X 10.7 or newer.

31.9.11 applicationDidRegisterForRemoteNotificationsWithDeviceToken(deviceToken as memoryblock)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Application registered for remote notifications.
Notes:

Tell your server the device token ID and use it in your push notifications.
Distinguish between iOS and Mac versions of your app!

Available on Mac OS X 10.7 or newer.

31.9.12 applicationDidResignActive(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately after the application is deactivated.

31.9.13 applicationDidUnhide(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately after the application is made visible.

31.9.14 applicationDidUpdate(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately after the application object updates its windows.

31.9.15 applicationDockMenu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Allows the delegate to supply a dock menu for the application dynamically.
Notes: Return the menu to display in the dock. Or nil for having no/default menu.

31.9.16 applicationOpenFile(filename as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Tells the delegate to open a single file.
Notes:

filename: The path of the file to open.

Return yes if the file was successfully opened or false if it was not.

Sent directly by application to the delegate. The method should open the file filename, returning true if the file is successfully opened, and false otherwise. If the user started up the application by double-clicking a file, the delegate receives the applicationOpenFile message before receiving applicationDidFinishLaunching. (applicationWillFinishLaunching is sent before applicationOpenFile.)

If you return false, the plugin will pass the event to the default Xojo runtime application delegate, so the OpenDocument event can fire.

31.9.17 applicationOpenFiles(filenames() as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Tells the delegate to open multiple files.

Notes:

sender: The application object associated with the delegate.
filenames: An array of strings containing the names of the files to open..

Identical to applicationOpenFile except that the receiver opens multiple files corresponding to the file names in the filenames array. Delegates should invoke the replyToOpenOrPrint method upon success or failure, or when the user cancels the operation.

If you add code to this event, it is possible that OpenDocument event in Xojo does not fire.

31.9.18 applicationOpenFileWithoutUI(filename as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate to open a file programmatically.
Notes:

filename: The name of the file to open.

Return true if the file was successfully opened or false if it was not.

Sent directly by sender to the delegate to request that the file filename be opened as a linked file. The method should open the file without bringing up its application's user interface—that is, work with the file is under programmatic control of sender, rather than under keyboard control of the user.

If you add code to this event, it is possible that OpenDocument event in Xojo does not fire.

31.9.19 applicationOpenTempFile(filename as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate to open a temporary file.
Notes:

filename: The name of the temporary file to open.

True if the file was successfully opened or false if it was not.

Sent directly by application to the delegate. The method should attempt to open the file filename, returning true if the file is successfully opened, and false otherwise.

By design, a file opened through this method is assumed to be temporary—it's the application's responsibility to remove the file at the appropriate time.

If you add code to this event, it is possible that OpenDocument event in Xojo does not fire.

31.9.20 applicationOpenUntitledFile as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate to open an untitled file.
Notes:

Return true if the file was successfully opened or false if it was not.
Sent directly by application to the delegate to request that a new, untitled file be opened.

If you return false, the plugin will pass the event to the default Xojo runtime application delegate.

If you add code to this event, it is possible that OpenDocument event in Xojo does not fire.

31.9.21 applicationPrintFile(filename as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent when the user starts up the application on the command line with the -NSPrint option.
Notes:

filename: The name of the file to print.

Returns true if the file was successfully printed or false if it was not.

This message is sent directly by application to the delegate. The application terminates (using the terminate method) after this method returns.

If at all possible, this method should print the file without displaying the user interface. For example, if you pass the -NSPrint option to the TextEdit application, TextEdit assumes you want to print the entire contents of the specified file. However, if the application opens more complex documents, you may want to display a panel that lets the user choose exactly what they want to print.

31.9.22 applicationPrintFiles(fileNames() as string, printSettings as dictionary, showPrintPanels as boolean) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Prints a group of files.
Notes:

fileNames: An array of strings, each of which contains the name of a file to print.

printSettings: A dictionary containing NSPrintInfo-compatible print job attributes.

showPrintPanels: A Boolean that specifies whether the print panel should be displayed for each file printed. Print progress indicators will be presented even if this value is false.

Return a constant indicating whether printing was successful. For a list of possible values, see NSPrinting* constants.

Return NSPrintingReplyLater if the result of printing cannot be returned immediately, for example, if printing will cause the presentation of a sheet. If your method returns NSPrintingReplyLater it must always invoke the NSApplicationMBS method replyToOpenOrPrint when the entire print operation has been completed, successfully or not.

31.9.23 applicationShouldHandleReopen(hasVisibleWindows as boolean) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent by the application to the delegate prior to default behavior to reopen (rapp) AppleEvents.
Notes:

flag: Indicates whether the NSApplication object found any visible windows in your application. You can use this value as an indication of whether the application would do anything if you return true.

Return true if you want the application to perform its normal tasks or false if you want the application to do nothing.

These events are sent whenever the Finder reactivates an already running application because someone double-clicked it again or used the dock to activate it.

By default the Application Kit will handle this event by checking whether there are any visible NSWindow (not NSPanel) objects, and, if there are none, it goes through the standard untitled document creation (the same as it does if application is launched without any document to open). For most document-based applications, an untitled document will be created.

The application delegate will also get a chance to respond to the normal untitled document delegate methods. If you implement this method in your application delegate, it will be called before any of the default behavior happens. If you return true, then NSApplication will proceed as normal. If you return false, then NSApplication will do nothing. So, you can either implement this method with a version that does nothing, and return false if you do not want anything to happen at all (not recommended), or you can implement this method, handle the event yourself in some custom way, and return false.

Miniaturized windows, windows in the Dock, are considered visible by this method, and cause flag to return true, despite the fact that miniaturized windows return false when sent an isVisible message.

Having no code in the event will tell the plugin to return true.

31.9.24 applicationShouldOpenUntitledFile as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked immediately before opening an untitled file.
Notes:

Return true if the application should open a new untitled file or false if it should not.

Use this method to decide whether the application should open a new, untitled file. Note that applicationOpenUntitledFile is invoked if this method returns true.

If you return false here, the NewDocument event in Xojo may not fire.
Having no code in this event is the same as returning true.

31.9.25 applicationShouldTerminate as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent to notify the delegate that the application is about to terminate..
Notes:

One of the values defined in NSTerminate* constants indicating whether the application should terminate.

This method is called after the application's Quit menu item has been selected, or after the terminate method has been called. Generally, you should return NSTerminateNow to allow the termination to complete, but you can cancel the termination process or delay it somewhat as needed. For example, you might delay termination to finish processing some critical data but then terminate the application as soon as you are done by calling the replyToApplicationShouldTerminate method.

31.9.26 applicationShouldTerminateAfterLastWindowClosed as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when the user closes the last window the application has open.
Notes:

Return false if the application should not be terminated when its last window is closed; otherwise, true to terminate the application.

The application sends this message to your delegate when the application's last window is closed. It sends this message regardless of whether there are still panels open. (A panel in this case is defined as being an instance of NSPanel or one of its subclasses.)

If your implementation returns false, control returns to the main event loop and the application is not terminated. If you return true, your delegate's applicationShouldTerminate method is subsequently invoked to confirm that the application should be terminated.

Having no code in this event is the same as returning false.

31.9.27 applicationWillBecomeActive(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately before the application becomes active.

31.9.28 applicationWillEncodeRestorableState(coder as NSCoderMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Event called to give you chance to encode any additional state into the NSCoder.
Notes: If the restorable state managed by the delegate changes, you must call NSApplicationMBS.invalidateRestorableState so that it will be re-encoded.

31.9.29 applicationWillFinishLaunching(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately before the application object is initialized.

31.9.30 applicationWillHide(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately before the application is hidden.

31.9.31 applicationWillPresentError(error as NSErrorMBS) as NSErrorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent to the delegate before the specified application presents an error message to the user.
Notes:

error: The error object that is used to construct the error message. Your implementation of this method can return a new NSError object or the same one in this parameter.

Return the error object to display.

You can implement this delegate method to customize the presentation of any error presented by your application, as long as no code in your application overrides either of the NSResponder methods presentError in a way that prevents errors from being passed down the responder chain to the application object.

Your implementation of this delegate method can examine error and, if its localized description or recovery information is unhelpfully generic, return an error object with specific localized text that is more suitable for presentation in alert sheets and dialogs. If you do this, always use the domain and error code of the NSError object to distinguish between errors whose presentation you want to customize and those you do not. Don't make decisions based on the localized description, recovery suggestion, or recovery options because parsing localized text is problematic. If you decide not to customize the error presentation, just return the passed-in error object.

If you have no code in this event or you return nil, the plugin passes the given error back to the Cocoa runtime.

31.9.32 applicationWillResignActive(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately before the application is deactivated.

31.9.33 applicationWillTerminate(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately before the application terminates.

31.9.34 applicationWillUnhide(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately after the application is unhidden.

31.9.35 applicationWillUpdate(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent by the default notification center immediately before the application object updates its windows.

31.9.36 restoreWindowWithIdentifier(identifier as string, state as NSCoderMBS, byref resultWindow as Variant, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to request that a window be restored.
Notes:

If you plan to use this event, please initialize the NSApplicationDelegateMBS subclass in app.constructor.

identifier: The unique interface item identifier string that was previously associated with the window. Use this string to determine which window to create.
state: A coder object containing the window state information. This coder object contains the combined restorable state of the window, which can include the state of the window, its delegate, window controller, and document object. You can use this state to determine which window to create.

Pass back with the parameters:
The window that was created or nil if the window could not be created.
An error object if the window was not recognized or could not be created for whatever reason; otherwise, specify nil. In OS X 10.7, the error parameter is ignored.

Return true if the window was restored; otherwise false.

If the receiver knows how to restore the identified window, it should invoke the completion handler with the window, possibly creating it. It is acceptable to use a pre-existing window, though you should not pass the same window to more than one completion handler. If the receiver cannot restore the identified window (for example, the window referenced a document that has been deleted), it should invoke the completion handler with a nil window.

The receiver is application is passed the identifier of the window, which allows it to quickly check for known windows. For example, you might give your preferences window an identifier of "preferences" in the nib, and then check for that identifier in your implementation. The receiver is also passed the NSCoder instance con-

taining the combined restorable state of the window, its delegate, the window controller, and any document. The receiver may decode information previously stored in the coder to determine what window to restore.

Available in OS X v10.7 and later.

The plugin implements this method for NSApplication and forwards the message to this event.
If you return true, please set either error or resultWindow values. resultWindow must be an NSWindowMBS or a window object.

31.9.37 Constants

31.9.38 NSPrintingCancelled = 0

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constant values to reply to ApplicationPrintFiles event.
Notes: Printing was cancelled.

31.9.39 NSPrintingFailure = 3

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constant values to reply to ApplicationPrintFiles event.
Notes: Printing failed.

31.9.40 NSPrintingReplyLater = 2

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constant values to reply to ApplicationPrintFiles event.
Notes: The result of printing cannot be returned immediately, for example, if printing will cause the presentation of a sheet. If your method returns NSPrintingReplyLater it must always invoke replyToOpenOrPrint when the entire print operation has been completed, successfully or not.

31.9.41 NSPrintingSuccess = 1

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constant values to reply to ApplicationPrintFiles event.
Notes: Printing was successful.

31.9.42 NSTerminateCancel = 0

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constants to answer applicationShouldTerminate event.
Notes: The application should not be terminated.

31.9.43 NSTerminateLater = 2

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constants to answer applicationShouldTerminate event.
Notes: It may be OK to proceed with termination later. Returning this value causes Cocoa to run the run loop in the NSModalPanelRunLoopMode until your application subsequently calls replyToApplicationShouldTerminate with the value true or false. This return value is for delegates that need to provide document modal alerts (sheets) in order to decide whether to quit.

31.9.44 NSTerminateNow = 1

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constants to answer applicationShouldTerminate event.
Notes: It is OK to proceed with termination.

31.10 class NSApplicationMBS

31.10.1 class NSApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The cocoa application class.
Example:

```
dim a as NSApplicationMBS = NSApplicationMBS.sharedApplication

// set a custom picture

dim p as Picture = LogoMBS(500)
dim n as new NSImageMBS(p)
a.applicationIconImage = n

// restore
'a.applicationIconImage = nil
```

Notes:

The plugin only implements a small subset of what's available in Cocoa. If you miss something, please send us an email.

You can get an instance of this class using one of three ways:

- app.NSApplicationMBS function
- new NSApplicationMBS
- NSApplicationMBS.sharedInstance

31.10.2 Blog Entries

31.10.4 Methods

31.10.5 activateIgnoringOtherApps(flag as boolean)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Makes the receiver the active application.
Notes:

flag: If false, the application is activated only if no other application is currently active. If true, the application activates regardless.

The flag parameter is normally set to false. When the Finder launches an application, using a value of false for flag allows the application to become active if the user waits for it to launch, but the application remains unobtrusive if the user activates another application. Regardless of the setting of flag, there may be a time lag before the application activates—you should not assume the application will be active immediately after sending this message.

You rarely need to invoke this method. Under most circumstances, the Application Kit takes care of proper activation. However, you might find this method useful if you implement your own methods for inter-application communication.

You don't need to send this message to make one of the application's NSWindows key. When you send a makeKeyWindow message to an NSWindow object, you ensure that it is the key window when the application is active.

31.10.6 addWindowsItem(win as NSWindowMBS, title as string, isFilename as boolean)

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Adds an item to the Window menu for a given window.
Notes:

win: The window being added to the menu. If this window object already exists in the Window menu, this method has no effect.

Title: The string to display for the window's menu item. How the string is interpreted is dependent on the value in the isFilename parameter.
isFilename: If false, title appears literally in the menu; otherwise, title is assumed to be a converted pathname with the name of the file preceding the path (the way the NSWindow method setTitleWithRepresentedFilename shows a title)

You rarely need to invoke this method directly because Cocoa places an item in the Window menu automatically whenever you set the title of an NSWindow object.

31.10.7 arrangeInFront

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Arranges windows listed in the Window menu in front of all other windows.
Example:

```
dim a as new NSApplicationMBS
a.arrangeInFront
```

Notes: Windows associated with the application but not listed in the Window menu are not ordered to the front.

31.10.8 cancelUserAttentionRequest(request as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Cancels a previous user attention request.
Notes:

request: The request identifier returned by the requestUserAttention method.

A request is also canceled automatically by user activation of the application.

31.10.9 changeWindowsItem(win as NSWindowMBS, title as string, isFilename as boolean)

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Changes the item for a given window in the Window menu to a given string.
Notes:

win: The window whose title you want to change in the Window menu. If win is not in the Window menu, this method adds it.

title: The string to display for the window's menu item. How the string is interpreted is dependent on the value in the isFilename parameter.
isFilename: If false, title appears literally in the menu; otherwise, title is assumed to be a converted pathname with the name of the file preceding the path (the way the NSWindow method setTitleWithRepresentedFilename shows a title)

31.10.10 completeStateRestoration

MBS MacCocoa Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Completes the extended state restoration.
Notes:

This method informs the application that the extended state restoration is completed for the balancing .

If a window has some state that may take a long time to restore, such as a web page, you may use this method and methods to completeStateRestoration to extend the period of this crash protection beyond the default.

You call extendStateRestoration within your implementation of restoreWindowWithIdentifier. You would then call completeStateRestoration some time after the window is fully restored. If the app crashes in the interim, then it may offer to discard restorable state on the next launch.

The extendStateRestoration and completeStateRestoration method act as a counter. Each call to extendStateRestorationincrements the counter, and must be matched with a corresponding call to completeStateRestoration which decrements it. When the counter reaches zero, the app is considered to have been fully restored, and any further calls are silently ignored.

This method is thread safe.
Available in OS X v10.7 and later.

31.10.11 Constructor

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Example:

```
dim n as new NSApplicationMBS

n.dockTile.badgeLabel = "Hello"
n.dockTile.showsApplicationBadge = true
```

Notes: Creates an object which points to the shared NSApplication instance.

31.10.12 deactivate

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Deactivates the receiver.
Example:

```
dim a as new NSApplicationMBS

a.deactivate
```

Notes: Normally, you shouldn't invoke this method—the Application Kit is responsible for proper deactivation.

31.10.13 disableRelaunchOnLogin

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Disable relaunching this app on login, if the app was running at the time the user logged out.
Notes:

These methods increment and decrement a counter respectively; if the counter is 0 at the time the user logs out, then the app may be relaunched when the user logs back in. The counter is initially zero, so by default apps are relaunched.

If your app should not be relaunched because it launches via some other mechanism (e.g. launchd), then the recommended usage is to call disableRelaunchOnLogin once, and never pair it with an enable call.

If your app should not be relaunched because it triggers a restart (e.g. an installer), then the recommended usage is to call disableRelaunchOnLogin immediately before you attempt to trigger a restart, and enableRelaunchOnLogin immediately after. This is because the user may cancel restarting; if the user later restarts for another reason, then your app should be brought back.

These methods are thread safe.
Available on Mac OS X 10.7 or newer.

31.10.14 discardEventsMatchingMask(mask as Integer, beforeEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes all events matching the given mask and generated before the specified event.
Notes:

mask: Contains one or more flags indicating the types of events to discard. The constants section of the NSEvent class defines the constants you can add together to create this mask. The discussion section also lists some of the constants that are typically used.
lastEvent: A marker event that you use to indicate which events should be discarded. Events that occurred before this event are discarded but those that occurred after it are not.

Use this method to ignore any events that occurred before a specific event. For example, suppose your app has a tracking loop that you exit when the user releases the mouse button. You could use this method, specifying NSAnyEventMask as the mask argument and the ending mouse-up event as the lastEvent argument, to discard all events that occurred while you were tracking mouse movements in your loop. Passing the mouse-up event as lastEvent ensures that any events that might have occurred after the mouse-up event (that is, that appear in the queue after the mouse-up event) are not discarded.

Typically, you send this message to an NSWindow object, rather than to the app object. Discarding events for a window clears out all of the events for that window only, leaving events for other windows in place.

For the mask parameter, you can add together event type constants such as the following:

- NSLeftMouseDownMask
- NSLeftMouseUpMask
- NSRightMouseDownMask
- NSRightMouseUpMask
- NSMouseMovedMask
- NSLeftMouseDraggedMask
- NSRightMouseDraggedMask
- NSMouseEnteredMask
- NSMouseExitedMask
- NSKeyDownMask
- NSKeyUpMask
- NSFlagsChangedMask
- NSPeriodicMask

- NSCursorUpdateMask
- NSAnyEventMask

This method can also be called in subthreads. Events posted in subthreads bubble up in the main thread event queue.

31.10.15 enabledRemoteNotificationTypes as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns what badges you enabled.
Notes: Available on Mac OS X 10.7 or newer.

31.10.16 enableRelaunchOnLogin

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enable relaunching this app on login, if the app was running at the time the user logged out.
Notes:

These methods increment and decrement a counter respectively; if the counter is 0 at the time the user logs out, then the app may be relaunched when the user logs back in. The counter is initially zero, so by default apps are relaunched.

If your app should not be relaunched because it launches via some other mechanism (e.g. launchd), then the recommended usage is to call disableRelaunchOnLogin once, and never pair it with an enable call.

If your app should not be relaunched because it triggers a restart (e.g. an installer), then the recommended usage is to call disableRelaunchOnLogin immediately before you attempt to trigger a restart, and enableRelaunchOnLogin immediately after. This is because the user may cancel restarting; if the user later restarts for another reason, then your app should be brought back.

These methods are thread safe.
Available on Mac OS X 10.7 or newer.

31.10.17 extendStateRestoration

MBS MacCocoa Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Allows an application to extend its state restoration period.
Notes:

This method allows an application to extend the state restoration period beyond the usual. For example, the app crashes before state restoration is complete, then it may offer to discard restorable state on the next launch.

If a window has some state that may take a long time to restore, such as a web page, you may use this method and methods to completeStateRestoration to extend the period of this crash protection beyond the default.

You call extendStateRestoration within your implementation of restoreWindowWithIdentifier. You would then call completeStateRestoration some time after the window is fully restored. If the app crashes in the interim, then it may offer to discard restorable state on the next launch.

The extendStateRestoration and completeStateRestoration method act as a counter. Each call to extendStateRestoration increments the counter, and must be matched with a corresponding call to completeStateRestoration which decrements it. When the counter reaches zero, the app is considered to have been fully restored, and any further calls are silently ignored.

This method is thread safe.
Available in OS X v10.7 and later.

31.10.18 hide

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Hides all the receiver's windows, and the next application in line is activated.
Example:

NSApplicationMBS.sharedApplication.hide

Notes: This method is usually invoked when the user chooses Hide in the application's main menu. When this method begins, it posts an NSApplicationWillHideNotification to the default notification center. When it completes successfully, it posts an NSApplicationDidHideNotification.

31.10.19 hideOtherApplications

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Hides all applications, except the receiver.
Example:

NSApplicationMBS.sharedApplication.hideOtherApplications

31.10.20 invalidateRestorableState

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invalidates the restorable state.
Notes: applicationWillEncodeRestorableState event will be called soon in your NSApplicationDelegateMBS subclass to get a new state encoded.

31.10.21 miniaturizeAll

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Miniaturizes all the receiver's windows.
Example:

```
NSApplicationMBS.sharedApplication.miniaturizeAll
```

31.10.22 modalWindow as NSWindowMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the modal window that the receiver is displaying.
Example:

```
// show title of current dialog
MsgBox NSApplicationMBS.sharedApplication.modalWindow.Title
```

Notes:

Returns the modal window being displayed or nil if no modal window is being displayed.

This method returns the current standalone modal window. It does not return sheets that are attached to other windows. If you need to retrieve a sheet window, use the attachedSheet method of NSWindow.

31.10.23 nextEventMatchingMask(mask as Integer, untilDate as date, mode as String, dequeueFlag as boolean) as NSEventMBS

MBS MacCocoa Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the next event matching a given mask, or nil if no such event is found before a specified expiration date.
Example:

```
Function MouseDown(X As Integer, Y As Integer) Handles MouseDown as Boolean
// in mousedown event

dim a as NSApplicationMBS = NSApplicationMBS.sharedApplication

// check current event
dim e as NSEventMBS = a.currentEvent

// check next mouse up event
dim d as new date
d.Second = d.Second + 2 // maximum 2 seconds wait time
dim n as NSEventMBS = a.nextEventMatchingMask(NSEventMBS.NSLeftMouseUpMask, d, NSRunLoopMBS.NS-
DefaultRunLoopMode, false)

// e->mouseDown
// e->mouseUp, if already available

Break
End Function
```

Notes:

mask: Contains one or more flags indicating the types of events to return. The constants section of the NSEvent class defines the constants you can add together to create this mask. The discardEventsMatching-Mask method also lists several of these constants.
expiration: The expiration date for the current event request. Specifying nil for this parameter is equivalent to returning a date object using the distantPast method.
mode: The run loop mode in which to run while looking for events. The mode you specify also determines which timers and run-loop observers may fire while the app waits for the event.
flag: Specify true if you want the event removed from the queue.

Returns the event object whose type matches one of the event types specified by the mask parameter.

You can use this method to short circuit normal event dispatching and get your own events. For example, you may want to do this in response to a mouse-down event in order to track the mouse while its button is down. (In such an example, you would pass the appropriate event types for mouse-dragged and mouse-up events to the mask parameter and specify the NSEventTrackingRunLoopMode run loop mode.) Events that do not match one of the specified event types are left in the queue.
You can specify one of the run loop modes defined by AppKit or a custom run loop mode used specifically by your app. AppKit defines the following run-loop modes:

- NSDefaultRunLoopMode
- NSEventTrackingRunLoopMode

- NSModalPanelRunLoopMode
- NSConnectionReplyMode

31.10.24 NSAppKitVersionNumber as Double

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: This constant identifies the installed version of the Application Kit framework.
Example:

```
const NSAppKitVersionNumber10_0 = 577
const NSAppKitVersionNumber10_1 = 620
const NSAppKitVersionNumber10_2 = 663
const NSAppKitVersionNumber10_2_3 = 663.6
const NSAppKitVersionNumber10_3 = 743
const NSAppKitVersionNumber10_3_2 = 743.14
const NSAppKitVersionNumber10_3_3 = 743.2
const NSAppKitVersionNumber10_3_5 = 743.24
const NSAppKitVersionNumber10_3_7 = 743.33
const NSAppKitVersionNumber10_3_9 = 743.36
const NSAppKitVersionNumber10_4 = 824
const NSAppKitVersionNumber10_4_1 = 824.1
const NSAppKitVersionNumber10_4_3 = 824.23
const NSAppKitVersionNumber10_4_4 = 824.33
const NSAppKitVersionNumber10_4_7 = 824.41
const NSAppKitVersionNumber10_5 = 949
const NSAppKitVersionNumber10_5_2 = 949.27
const NSAppKitVersionNumber10_5_3 = 949.33
const NSAppKitVersionNumber10_6 = 1038
const NSAppKitVersionNumber10_7 = 1138
const NSAppKitVersionNumber10_7_2 = 1138.23

if NSApplicationMBS.NSAppKitVersionNumber >= NSAppKitVersionNumber10_5 then
MsgBox "This is Mac OS X 10.5 or newer."
end if
```

Notes: See NSAppKitVersionNumber* constants.

31.10.25 NSApplicationDidBecomeActiveNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted immediately after the application becomes active.
The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

31.10.26 NSApplicationDidChangeScreenParametersNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when the configuration of the displays attached to the computer is changed.
The configuration change can be made either programmatically or when the user changes settings in the Displays control panel. The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

31.10.27 NSApplicationDidFinishLaunchingNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted at the end of the finishLaunching method to indicate that the application has completed launching and is ready to run.
The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

31.10.28 NSApplicationDidFinishRestoringWindowsNotification as string

MBS MacCocoa Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Posted when the application is finished restoring windows.
Notes:

The notification is posted when the application is finished restoring windows, that is, when all the completion handlers from restoreWindowWithIdentifier have been called. This is always posted after NSApplicationWillFinishLaunchingNotification, but may be posted before or after NSApplicationDidFinishLaunchingNotification, depending on whether clients copy the completion handlers and invoke them later. If there were no windows to restore, then this notification is still posted at the corresponding point in app launch (between NSApplicationWillFinishLaunchingNotification and NSApplicationDidFinishLaunchingNotification).

The notification object is sharedApplication. This notification does not contain a userInfo dictionary.
Available in OS X v10.7 and later.

31.10.29 NSApplicationDidHideNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted at the end of the hide method to indicate that the application is now hidden.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

31.10.30 NSApplicationDidResignActiveNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted immediately after the application gives up its active status to another application.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

31.10.31 NSApplicationDidUnhideNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted at the end of the unhideWithoutActivation method to indicate that the application is now visible.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

31.10.32 NSApplicationDidUpdateNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted at the end of the updateWindows method to indicate that the application has finished updating its windows.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

31.10.33 NSApplicationLaunchIsDefaultLaunchKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the keys for the userinfo dictionary on didFinishLaunching.

Notes:

The following key is present in the userInfo of NSApplicationDidFinishLaunchingNotification or in the didFinishLaunching event. Its value is a number containing a bool. It will be false if the app was launched to open or print a file, to perform a Service, if the app had saved state that will be restored, or if the app launch was in some other sense not a "default" launch. Otherwise its value will be true.

Available on Mac OS X 10.7 or newer.

31.10.34 NSApplicationLaunchRemoteNotificationKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the keys for the userinfo dictionary on didFinishLaunching.
Notes:

User info keys for NSApplicationDidFinishLaunchingNotification.
Available on Mac OS X 10.7 or newer.

31.10.35 NSApplicationLaunchUserNotificationKey as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the user info keys for NSApplicationDidFinishLaunchingNotification.
Example:

```
Sub applicationDidFinishLaunching(Notification as NSNotificationMBS)
dim userInfo as Dictionary = Notification.userInfo
dim key as string = NSApplicationMBS.NSApplicationLaunchUserNotificationKey
dim UserNotification as NSUserNotificationMBS = userInfo.Lookup(key, nil)

if UserNotification <>nil then
MsgBox UserNotification.identifier+": "+UserNotification.informativeText
end if
End Sub
```

Notes:

This key is present in the userInfo of NSApplicationDidFinishLaunchingNotification. It will be present if your application was launched because a user activated a notification in the Notification Center. Its value is an NSUserNotification object.
Available in Mac OS X 10.8.

31.10.36 NSApplicationWillBecomeActiveNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted immediately after the application becomes active.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

31.10.37 NSApplicationWillFinishLaunchingNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted at the start of the finishLaunching method to indicate that the application has completed its initialization process and is about to finish launching.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

31.10.38 NSApplicationWillHideNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted at the start of the hide method to indicate that the application is about to be hidden.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

31.10.39 NSApplicationWillResignActiveNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted immediately before the application gives up its active status to another application.
The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

31.10.40 NSApplicationWillTerminateNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.

Notes:

Posted by the terminate method to indicate that the application will terminate.
Posted only if the delegate method applicationShouldTerminate returns true. The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

31.10.41 NSApplicationWillUnhideNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted at the start of the unhideWithoutActivation method to indicate that the application is about to become visible.
The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

31.10.42 NSApplicationWillUpdateNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted at the start of the updateWindows method to indicate that the application is about to update its windows.
The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

31.10.43 orderFrontCharacterPalette

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Opens the character palette.
Example:

```
dim a as new NSApplicationMBS
a.orderFrontCharacterPalette
```

Notes:

Available in Mac OS X v10.3 and later.
This shows the special characters palette.

31.10.44 orderFrontStandardAboutPanel

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Displays a standard About window.
Example:

```
dim a as new NSApplicationMBS

a.orderFrontStandardAboutPanel
```

Notes: This method calls orderFrontStandardAboutPanelWithOptions with a nil argument. See orderFrontStandardAboutPanelWithOptions for a description of what's displayed.

31.10.45 orderFrontStandardAboutPanelWithOptions(options as dictionary)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Displays a standard About window with information from a given options dictionary.
Example:

```
dim a as new NSApplicationMBS

// this image has no mask, so you'll see a white border
dim p as Picture = LogoMBS(500)
dim n as new NSImageMBS(p)
dim options as new Dictionary

// show window with default values
'a.orderFrontStandardAboutPanel

// we overwrite default values with new values
options.Value("Credits") = NSAttributedStringMBS.attributedStringWithString("Written by Christian Schmitz")
options.Value("ApplicationName") = "MyCoolApp"
options.Value("Version") = "1.2.3"
options.Value("Copyright") = "© 2011 Monkeybread Software"
options.Value("ApplicationIcon") = n

a.orderFrontStandardAboutPanelWithOptions(options)

Exception ex as NSExceptionMBS
MsgBox ex.message
```

Notes:

options: A dictionary whose keys define the contents of the About window. See the discussion for a descrip-

tion of the available keys.

The following strings are keys that can occur in optionsDictionary:

" "	An NSAttributedStringMBS displayed in the info area of the panel. If not specified, this method then looks for a file named "Credits.html", "Credits.rtf", and "Credits.rtfd", in that order, in the bundle returned by the NSBundle class method mainBundle. The first file found is used. If none is found, the info area is left blank.
"ApplicationName"	A string displayed as the application's name. If not specified, this method then uses the value of CFBundleName (localizable). If neither is found, this method uses the process name.
"ApplicationIcon"	A NSImageMBS object displayed as the application's icon. If not specified, this method then looks for an image named "NSApplicationIcon", using NSImageMBS.imageNamed("NSApplicationIcon"). If neither is available, this method uses the generic application icon.
"Version"	A string with the build version number of the application ("58.4"), displayed as "(v58.4)". If not specified, obtain from the CFBundleVersion key in infoDictionary; if not specified, leave blank (the "(v)" is not displayed).
"Copyright"	A string with a line of copyright information. If not specified, this method then looks for the value of NSHumanReadableCopyright in the localized version infoDictionary. If neither is available, this method leaves the space blank.
"ApplicationVersion"	A string with the application version ("Mac OS X", "3", "WebObjects 4.5", "AppleWorks 6",...). If not specified, obtain from the CFBundleShortVersionString key in infoDictionary. If neither is available, the build version, if available, is printed alone, as "Version x.x".

31.10.46 OverlayApplicationIconImage(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Overlays the image.
Example:

```
// draw a picture with a red dot on the top left

dim p as new Picture(512,512,32)

dim g as Graphics = p.Graphics
g.ForeColor = & cFF0000
g.FillRect 0,0,128,128

g = p.mask.Graphics

g.ForeColor = & cFFFFFF
```

```
g.Fillrect 0,0,512,512
g.ForeColor = & c000000
g.Filloval 0,0,128,128

Backdrop = p

// create nsimage
dim n as new NSImageMBS(p,p.mask)

// and overlay over original image
NSApplicationMBS.sharedApplication.OverlayApplicationIconImage n
```

Notes:

Same as setting applicationIconImage, but instead overlays the original image with the new image. This way you can show custom badges. For normal text badges, use NSDockTileMBS class.

Pass image = nil to reset application dock icon.

Size of the image seems to be 128 Pixel by default, but could go up to 1024 in the future. Plugin scales up or down as needed for you.

31.10.47 postEvent(e as NSEventMBS, atStart as boolean)

MBS MacCocoa Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a given event to the receiver's event queue.
Notes:

anEvent: The event object to post to the queue.
flag: Specify true to add the event to the front of the queue; otherwise, specify false to add the event to the back of the queue.

This method can also be called in subthreads. Events posted in subthreads bubble up in the main thread event queue.

31.10.48 preventWindowOrdering

MBS MacCocoa Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Suppresses the usual window ordering in handling the most recent mouse-down event.
Notes: This method is only useful for mouse-down events when you want to prevent the window that receives the event from being ordered to the front.

31.10.49 registerForRemoteNotificationTypes(type as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Registers for remote notifications.
Example:

NSApplicationMBS.sharedApplication.registerForRemoteNotificationTypes NSApplicationMBS.NSRemoteNotificationTypeBadge

Notes:

Only applications distributed through the Mac App Store may use Push notifications.

Type can only be NSRemoteNotificationTypeBadge currently for Mac OS X 10.7.0.

Available on Mac OS X 10.7 or newer.

31.10.50 removeWindowsItem(win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes the Window menu item for a given window.
Notes:

Win: The window whose menu item is to be removed.

This method doesn't prevent the item from being automatically added again. Use the excludedFromWindowsMenu method of NSWindow if you want the item to remain excluded from the Window menu.

31.10.51 replyToApplicationShouldTerminate(reply as boolean)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Responds to NSTerminateLater once the application knows whether it can terminate.
Notes:

souldTerminate: Specify true if you want the application to terminate; otherwise, specify false.

If your application delegate returns NSTerminateLater from its applicationShouldTerminate event, your code must subsequently call this method to let the NSApplication object know whether it can actually terminate

itself.

31.10.52 replyToOpenOrPrint(reply as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Handles errors that might occur when the user attempts to open or print files.
Notes:

reply: The error that occurred. For a list of possible values, see "Constants."

Delegates should invoke this method if an error is encountered in the applicationOpenFiles or applicationPrintFiles delegate methods.

31.10.53 requestUserAttention(type as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Starts a user attention request.
Example:

```
dim a as NSApplicationMBS = NSApplicationMBS.sharedApplication

if not a.isActive then // only when we are in background
call a.requestUserAttention(a.NSInformationalRequest) // dock bounces
end if
```

Notes:

requestType: The severity of the request. Can be NSInformationalRequest or NSCriticalRequest.

Returns the identifier for the request. You can use this value to cancel the request later using the cancelUserAttentionRequest method.

Activating the application cancels the user attention request. A spoken notification will occur if spoken notifications are enabled. Sending requestUserAttention to an application that is already active has no effect.

If the inactive application presents a modal panel, this method will be invoked with NSCriticalRequest automatically. The modal panel is not brought to the front for an inactive application.

31.10.54 runModalForWindow(win as NSWindowMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Starts a modal event loop for the specified window.
Notes:

win: The window to be displayed modally. If it is not already visible, the window is centered on the screen using the value in its center method and made visible and key. If it is already visible, it is simply made key.

Returns an integer indicating the reason that this method returned.

This method runs a modal event loop for the specified window synchronously. It displays the specified window, makes it key, starts the run loop, and processes events for that window. (You do not need to show the window yourself.) While the app is in that loop, it does not respond to any other events (including mouse, keyboard, or window-close events) unless they are associated with the window. It also does not perform any tasks (such as firing timers) that are not associated with the modal run loop. In other words, this method consumes only enough CPU time to process events and dispatch them to the action methods associated with the modal window.

You can exit the modal loop by calling the stopModal, stopModalWithCode, or abortModal methods from your modal window code. If you use the stopModalWithCode method to stop the modal event loop, this method returns the argument passed to stopModalWithCode. If you use stopModal instead, this method returns the constant NSModalResponseStop (-1000). If you use abortModal, this method returns the constant NSModalResponseAbort (-1001).

31.10.55 runPageLayout

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Displays the app's page layout panel, an instance of NSPageLayout.
Example:

NSApplicationMBS.sharedApplication.runPageLayout

Notes: If the NSPageLayout instance does not exist, this method creates one. This method is typically invoked when the user chooses Page Setup from the application's FIle menu.

31.10.56 sendEvent(theEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Dispatches an event to other objects.
Notes:

You rarely invoke sendEvent directly, although you might want to override this method to perform some action on every event. sendEvent messages are sent from the main event loop (the run method). sendEvent is the method that dispatches events to the appropriate responders—NSApp handles application events, the NSWindow object indicated in the event record handles window-related events, and mouse and key events are forwarded to the appropriate NSWindow object for further dispatching.

If you need to override sendEvent method, please call MBS support.

31.10.57 sharedApplication as NSApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the application instance, creating it if it doesn't exist yet.
Notes: The plugin makes sure that there is only one application object by returning the same object each time.

31.10.58 showHelp

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Shows help.
Example:

NSApplicationMBS.sharedApplication.showHelp

Notes: If your project is properly registered, and the necessary keys have been set in the property list, this method launches Help Viewer and displays the first page of your app's help book.

31.10.59 startDictation

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Starts dictation.
Example:

NSApplicationMBS.sharedApplication.startDictation

Notes: For Mac OS X 10.8.

31.10.60 stopDictation

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops dictation.
Notes: For Mac OS X 10.8.

31.10.61 terminate

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Terminates the receiver.
Example:

NSApplicationMBS.sharedApplication.terminate

Notes:

This method is typically invoked when the user chooses Quit or Exit from the application's menu.

When invoked, this method performs several steps to process the termination request. First, it asks the application's document controller (if one exists) to save any unsaved changes in its documents. During this process, the document controller can cancel termination in response to input from the user. If the document controller does not cancel the operation, this method then calls the delegate's applicationShouldTerminate method. If applicationShouldTerminate returns NSTerminateCancel, the termination process is aborted and control is handed back to the main event loop. If the method returns NSTerminateLater, the application runs its run loop in the NSModalPanelRunLoopMode mode until the replyToApplicationShouldTerminate method is called with the value true or false. If the applicationShouldTerminate method returns NSTerminateNow, this method posts a NSApplicationWillTerminateNotification notification to the default notification center.

Do not bother to put final cleanup code in your application's main() function—it will never be executed. If cleanup is necessary, perform that cleanup in the delegate's applicationWillTerminate method.

31.10.62 unhide

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Restores hidden windows to the screen and makes the receiver active.
Example:

NSApplicationMBS.sharedApplication.unhide

31.10.63 unhideAllApplications

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Unhides all applications, including the receiver.
Example:

NSApplicationMBS.sharedApplication.unhideAllApplications

Notes: This action causes each application to order its windows to the front, which could obscure the currently active window in the active application.

31.10.64 unhideWithoutActivation

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Restores hidden windows without activating their owner (the receiver).
Example:

NSApplicationMBS.sharedApplication.unhideWithoutActivation

Notes: When this method begins, it posts an NSApplicationWillUnhideNotification to the default notification center. If it completes successfully, it posts an NSApplicationDidUnhideNotification.

31.10.65 unregisterForRemoteNotifications

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Unregisters for remote notifications.
Example:

NSApplicationMBS.sharedApplication.unregisterForRemoteNotifications

Notes: Available on Mac OS X 10.7 or newer.

31.10.66 updateWindows

MBS MacCocoa Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sends an update message to each onscreen window.
Notes:

This method is invoked automatically in the main event loop after each event when running in NSDefaultRunLoopMode or NSModalRunLoopMode. This method is not invoked automatically when running in NSEventTrackingRunLoopMode.

When this method begins, it posts an NSApplicationWillUpdateNotification to the default notification center. When it successfully completes, it posts an NSApplicationDidUpdateNotification.

31.10.67 updateWindowsItem(win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Updates the Window menu item for a given window to reflect the edited status of that window.
Notes:

win: The window whose menu item is to be updated.

You rarely need to invoke this method because it is invoked automatically when the edit status of an NSWindow object is set.

31.10.68 windows as NSWindowMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns an array containing the receiver's window objects.
Example:

```
// show all window titles in message boxes
for each w as NSWindowMBS in NSApplicationMBS.sharedApplication.windows
MsgBox w.Title
next
```

Notes: Returns an array of NSWindow objects. This array includes both onscreen and offscreen windows.

31.10.69 windowWithWindowNumber(windowNumber as Integer) as NSWindowMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the window corresponding to the specified window number.
Example:

```
dim w as window = window1
w.Title = "This is our test window"
```

```
// get a window ID somewhere
dim WindowID as Integer = CGWindowMBS.GetWindowID(w)

// now find back the window
dim n as NSWindowMBS = NSApplicationMBS.sharedApplication.windowWithWindowNumber(windowid)

MsgBox n.Title
```

Notes:

windowNumber: The unique window number associated with the desired NSWindow object.

Returns the desired window object or nil if the window could not be found.

31.10.70 Properties

31.10.71 activationPolicy as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The application's activation policy.
Notes:

Currently, NSApplicationActivationPolicyNone and NSApplicationActivationPolicyAccessory may be changed to NSApplicationActivationPolicyRegular, but other modifications are not supported.

Update: Seems to work better newer MacOS versions, so between 10.6 and 10.15 Apple implemented more transitions.

Available in Mac OS X v10.6 and later.
(Read and Write property)

31.10.72 applicationIconImage as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The image used for the receiver's icon.
Example:

```
dim pic as Picture = LogoMBS(500)
dim mask as new Picture(500, 500, 32)
dim g as Graphics = mask.Graphics
```

```
g.ForeColor = & cFFFFFF
g.FillRect 0,0,g.Width, g.Height
g.ForeColor = & c000000
g.FillOval 0,0,g.Width, g.Height

dim n as new NSImageMBS(pic,mask)

NSApplicationMBS.sharedApplication.applicationIconImage = n
```

Notes:

An image containing the application's icon.

This property can set the icon in the dock application tile. This method scales the image as necessary so that it fits in the dock tile. You can use this method to change your application icon while running. To restore your application's original icon, you pass nil to this method.
(Read and Write property)

31.10.73 currentEvent as NSEventMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the current event, the last event the receiver retrieved from the event queue.
Notes:

The last event object retrieved by the application.

NSApp receives events and forwards them to the affected NSWindow objects, which then distribute them to the objects in its view hierarchy.

Only for Cocoa applications.
(Read only property)

31.10.74 currentSystemPresentationOptions as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the set of application presentation options that are currently in effect for the system.
Example:

```
dim a as new NSApplicationMBS

MsgBox "currentSystemPresentationOptions: "+str(a.currentSystemPresentationOptions)
```

Notes:

The presentation options. See NSApplicationPresentation* constants and combine them using a C bitwise OR operator.

These are the presentation options that have been put into effect by the currently active application.
(Read only property)

31.10.75 dockTile as NSDockTileMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the application's Dock tile.
Example:

```
dim a as new NSApplicationMBS

a.dockTile.badgeLabel = "Hello"
```

Notes:

Available in Mac OS X v10.5 and later.

Returns NSDockTileMBS object for the dock tile.
(Read only property)

31.10.76 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSApplication object.
Notes: (Read and Write property)

31.10.77 helpMenu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The help menu used by the application.
Notes:

If helpMenu is nil, the system will append the help to an appropriate menu and will not return a reference

to that menu when this method is called.

Available in Mac OS X v10.6 and later.

If helpMenu is a non-nil menu it is set as the Help menu, and Spotlight for Help will be installed in it. If helpMenu is nil, AppKit will install Spotlight for Help into a menu of its choosing, and that menu is not returned from helpMenu.

If you wish to completely suppress Spotlight for Help, you can set a menu that does not appear in the menu bar.

NSApplication retains its Help menu and releases it when a different menu is set.
(Read and Write property)

31.10.78 isActive as Boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value indicating whether this is the active application.
Example:

```
dim a as NSApplicationMBS = NSApplicationMBS.sharedApplication
MsgBox "isActive:" +str(a.isActive)
```

Notes:

True if this is the active application; false otherwise.
(Read only property)

31.10.79 isFullKeyboardAccessEnabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns that status of Full Keyboard Access set in the Keyboard preference pane.
Example:

```
dim a as NSApplicationMBS = NSApplicationMBS.sharedApplication
MsgBox "isFullKeyboardAccessEnabled:" +str(a.isFullKeyboardAccessEnabled)
```

Notes:

True if Full Keyboard Access is enabled, otherwise false.

You may use this status to implement your own key loop or to implement in-control tabbing behavior similar to NSTableView.

Available in Mac OS X v10.6 and later.
(Read only property)

31.10.80 isHidden as Boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value indicating whether the receiver is hidden.
Example:

MsgBox str(NSApplicationMBS.sharedApplication.isHidden)

Notes:

True if the receiver is hidden, false otherwise.
(Read only property)

31.10.81 isRunning as Boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value indicating whether the main event loop is running.
Example:

MsgBox str(NSApplicationMBS.sharedApplication.isRunning)

Notes:

True if the main event loop is running; false otherwise.
False means the stop: method was invoked.

Should always be true for a Xojo application.
(Read only property)

31.10.82 keyWindow as NSWindowMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the window that currently receives keyboard events.
Example:

```
// title of front window
MsgBox NSApplicationMBS.sharedApplication.keyWindow.Title
```

Notes:

The window object currently receiving keyboard events or nil if there is no key window.
This method might return nil if the application hasn't finished loading yet or if the receiver is not active.

Does return nil in Carbon applications.
(Read only property)

31.10.83 mainMenu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The menu object representing the application's menu bar.
Example:

```
// shows titles of the menus in a Cocoa app
dim m as NSMenuMBS = NSApplicationMBS.sharedApplication.mainMenu

if m<>nil then
dim c as Integer = m.numberOfItems-1
for i as Integer = 0 to c

MsgBox m.Item(i).Title
next
end if
```

Notes:

Returns nil on a Carbon application.
(Read and Write property)

31.10.84 mainWindow as NSWindowMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the main window.
Example:

```
// shows title in Cocoa, but not in Carbon
MsgBox NSApplicationMBS.sharedApplication.mainWindow.Title
```

Notes:

The application's main window or nil if there is no main window.
This method might return nil if the application hasn't finished loading, if the receiver is not active, or if the application is hidden.
(Read only property)

31.10.85 presentationOptions as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The presentation options that should be in effect for the system when this application is active.
Example:

```
dim a as new NSApplicationMBS

// hide dock
a.presentationOptions = NSApplicationMBS.NSApplicationPresentationAutoHideDock
```

Notes:

Available in Mac OS X v10.6 and later.

Only certain combinations of "NSApplicationPresentationOptions" flags are supported. When given an invalid combination of option flags this method raises an exception NSInvalidArgumentException exception..

See NSApplicationPresentation* constants.
(Read and Write property)

31.10.86 servicesProvider as NSServiceProviderMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Registers or queries the service provider.

Notes:

The service provider is an object that performs all services the application provides to other applications. When another application requests a service from the receiver, it sends the service request to aProvider. Service requests can arrive immediately after the service provider is set, so invoke this method only when your application is ready to receive requests.

Please keep an object reference around so the object is not going out of scope too early!
(Read and Write property)

31.10.87 userInterfaceLayoutDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The layout direction of the user interface.
Notes:

This property contains the general user interface layout flow directions. For a list of possible values, see NSUserInterfaceLayoutDirection.

NSUserInterfaceLayoutDirectionLeftToRight = 0
NSUserInterfaceLayoutDirectionRightToLeft = 1

Available in OS X v10.6 and later.
(Read only property)

31.10.88 windowsMenu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window menu or nil if such a menu does not exist or has not yet been created.
Notes: (Read and Write property)

31.10.89 Constants

31.10.90 NSApplicationActivationPolicyAccessory = 1

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the activation policy constants.
Notes:

The application does not appear in the Dock and does not have a menu bar, but it may be activated programmatically or by clicking on one of its windows. This corresponds to value of the LSUIElement key in the application's Info.plist being 1.

Available in Mac OS X v10.6 and later.

31.10.91 NSApplicationActivationPolicyProhibited = 2

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the activation policy constants.
Notes:

The application does not appear in the Dock and may not create windows or be activated. This corresponds to the value of the LSBackgroundOnly key in the application's Info.plist being 1. This is also the default for unbundled executables that do not have Info.plists.
Available in Mac OS X v10.6 and later.

31.10.92 NSApplicationActivationPolicyRegular = 0

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the activation policy constants.
Notes:

The application is an ordinary app that appears in the Dock and may have a user interface. This is the default for bundled apps, unless overridden in the Info.plist.
Available in Mac OS X v10.6 and later.

31.10.93 NSApplicationPresentationAutoHideDock = 1

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.
Example:

```
dim a as new NSApplicationMBS

// hide dock
a.presentationOptions = NSApplicationMBS.NSApplicationPresentationAutoHideDock
```

31.10.94 NSApplicationPresentationAutoHideMenuBar = 4

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

31.10.95 NSApplicationPresentationAutoHideToolbar = 2048

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.
Notes:

Fullscreen window toolbar is detached from window and hides/shows with autoHidden menuBar. May be used only when both NSApplicationPresentationFullScreen and NSApplicationPresentationAutoHideMenuBar are also set

Available on Mac OS X 10.7 or newer.

31.10.96 NSApplicationPresentationDefault = 0

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

31.10.97 NSApplicationPresentationDisableAppleMenu = 16

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

31.10.98 NSApplicationPresentationDisableForceQuit = 64

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

31.10.99 NSApplicationPresentationDisableHideApplication = 256

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

31.10.100 NSApplicationPresentationDisableMenuBarTransparency = 512

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

31.10.101 NSApplicationPresentationDisableProcessSwitching = 32

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

31.10.102 NSApplicationPresentationDisableSessionTermination = 128

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

31.10.103 NSApplicationPresentationFullScreen = 1024

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.
Notes:

Application is in fullscreen mode.
Available on Mac OS X 10.7 or newer.

31.10.104 NSApplicationPresentationHideDock = 2

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

31.10.105 NSApplicationPresentationHideMenuBar = 8

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the control constants for presentationOptions and currentSystemPresentationOptions functions.

31.10.106 NSCriticalRequest = 0

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constants for the level of severity of a user attention request.
Notes:

The user attention request is a critical request.
The dock icon will bounce until either the application becomes active or the request is canceled.

31.10.107 NSInformationalRequest = 10

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the constants for the level of severity of a user attention request.
Notes:

The user attention request is an informational request.
The dock icon will bounce for one second. The request, though, remains active until either the application becomes active or the request is canceled.

31.10.108 NSRemoteNotificationTypeAlert = 4

MBS MacCocoa Plugin, Plugin Version: 12.3. **Function:** One of the notification type constants.
Notes: Available in Mac OS X 10.8.

31.10.109 NSRemoteNotificationTypeBadge = 1

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the notification type constants.

31.10.110 NSRemoteNotificationTypeNone = 0

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the notification type constants.

31.10.111 NSRemoteNotificationTypeSound = 2

MBS MacCocoa Plugin, Plugin Version: 12.3. **Function:** One of the notification type constants.
Notes: Available in Mac OS X 10.8.

31.11 class NSAttributedStringMBS

31.11.1 class NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to represent a string in the Cocoa world with attached attributes.
Example:

```
dim a as new NSAttributedStringMBS

if a.initWithHTML("<B>Hello</B>") then
MsgBox a.htmlString
end if
```

31.11.4 Methods

31.11.5 AsCFAttributedString as Variant

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new CFAttributedStringMBS object pointing to same attributed string.
Example:

```
// make NS version
dim n as new NSAttributedStringMBS

if n.initWithString("Hello World") then
// convert
dim c as CFAttributedStringMBS = n.AsCFAttributedString

// and check content
MsgBox c.String
end if
```

Notes: For passing to functions which need a CFAttributedStringMBS.

31.11.6 attributeAtIndex(name as string, location as UInt64) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the value for an attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.
Notes:

name: The name of an attribute.
location: The index for which to return attributes. This value must not exceed the bounds of the receiver.
effectiveRange: Optional. If the named attribute exists at index, upon return aRange contains a range over which the named attribute's value applies. If the named attribute does not exist at index, upon return aRange contains the range over which the attribute does not exist.
The range isn't necessarily the maximum range covered by attributeName, and its extent is implementation-dependent. If you need the maximum range, use the other variant of this method.

Returns the value for the attribute named attributeName of the character at index index, or nil if there is no such attribute.
Raises an NSRangeException if index lies beyond the end of the receiver's characters.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.
See also:

- 31.11.7 attributeAtIndex(name as string, location as UInt64, inRange as NSRangeMBS) as Variant 5881

31.11.7 attributeAtIndex(name as string, location as UInt64, inRange as NSRangeMBS) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the value for the attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.
Notes:

name: The name of an attribute.
location: The index at which to test for attributeName.
longestEffectiveRange: Optional. If the named attribute exists at index, upon return aRange contains the full range over which the value of the named attribute is the same as that at index, clipped to rangeLimit. If the named attribute does not exist at index, upon return aRange contains the full range over which the attribute does not exist, clipped to rangeLimit.
inRange: The range over which to search for continuous presence of attributeName. This value must not exceed the bounds of the receiver.

Returns the value for the attribute named attributeName of the character at index, or nil if there is no such attribute.

Raises an NSRangeException if index or any part of rangeLimit lies beyond the end of the receiver's characters.

If you don't need the longest effective range, it's far more efficient to use the other variant method to retrieve the attribute value.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.
See also:

- 31.11.6 attributeAtIndex(name as string, location as UInt64) as Variant 5880

31.11.8 attributeAtIndex2(name as string, location as UInt64, byref effectiveRange as NSRangeMBS) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the value for an attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.
Notes:

name: The name of an attribute.

location: The index for which to return attributes. This value must not exceed the bounds of the receiver.
effectiveRange: Optional. If the named attribute exists at index, upon return aRange contains a range over which the named attribute's value applies. If the named attribute does not exist at index, upon return aRange contains the range over which the attribute does not exist.
The range isn't necessarily the maximum range covered by attributeName, and its extent is implementation-dependent. If you need the maximum range, use the other variant of this method.

Returns the value for the attribute named attributeName of the character at index index, or nil if there is no such attribute.
Raises an NSRangeException if index lies beyond the end of the receiver's characters.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.
See also:

- 31.11.9 attributeAtIndex2(name as string, location as UInt64, byref longestEffectiveRange as NSRangeMBS, inRange as NSRangeMBS) as Variant 5882

31.11.9 attributeAtIndex2(name as string, location as UInt64, byref longestEffectiveRange as NSRangeMBS, inRange as NSRangeMBS) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the value for the attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.
Notes:

name: The name of an attribute.
location: The index at which to test for attributeName.
longestEffectiveRange: Optional. If the named attribute exists at index, upon return aRange contains the full range over which the value of the named attribute is the same as that at index, clipped to rangeLimit. If the named attribute does not exist at index, upon return aRange contains the full range over which the attribute does not exist, clipped to rangeLimit.
inRange: The range over which to search for continuous presence of attributeName. This value must not exceed the bounds of the receiver.

Returns the value for the attribute named attributeName of the character at index, or nil if there is no such attribute.

Raises an NSRangeException if index or any part of rangeLimit lies beyond the end of the receiver's characters.

If you don't need the longest effective range, it's far more efficient to use the other variant method to retrieve the attribute value.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.

- 31.11.8 attributeAtIndex2(name as string, location as UInt64, byref effectiveRange as NSRangeMBS) as Variant 5881

31.11.10 attributedStringWithAttachment(attachment as NSTextAttachmentMBS) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an attributed string with an attachment.
Example:

```
dim content as MemoryBlock = "Hello World"
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(content)
f.filename = "HelloWorld.txt"

dim a as new NSTextAttachmentMBS(f)
dim s as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithAttachment(a)
```

Notes: This is a convenience method for creating an attributed string containing an attachment using NSAttachmentCharacter as the base character.

31.11.11 attributedStringWithAttributedString(text as NSAttributedStringMBS) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of the given attributed string.

31.11.12 attributedStringWithDocFormat(data as memoryblock) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given DOC file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.13 attributedStringWithDocFormat(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5884

31.11.13 attributedStringWithDocFormat(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given DOC file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.12 attributedStringWithDocFormat(data as memoryblock) as NSAttributedStringMBS 5883

31.11.14 attributedStringWithHTML(data as memoryblock) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given HTML file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.15 attributedStringWithHTML(data as memoryblock, BaseURL as string) as NSAttributedStringMBS 5884

- 31.11.17 attributedStringWithHTML(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5885

31.11.15 attributedStringWithHTML(data as memoryblock, BaseURL as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the object with html code from a given url.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.14 attributedStringWithHTML(data as memoryblock) as NSAttributedStringMBS 5884
- 31.11.16 attributedStringWithHTML(data as memoryblock, BaseURL as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5885
- 31.11.17 attributedStringWithHTML(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5885

31.11.16 attributedStringWithHTML(data as memoryblock, BaseURL as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the object with html code from a given url.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.14 attributedStringWithHTML(data as memoryblock) as NSAttributedStringMBS 5884
- 31.11.15 attributedStringWithHTML(data as memoryblock, BaseURL as string) as NSAttributedStringMBS 5884
- 31.11.17 attributedStringWithHTML(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5885

31.11.17 attributedStringWithHTML(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given HTML file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.14 attributedStringWithHTML(data as memoryblock) as NSAttributedStringMBS 5884
- 31.11.15 attributedStringWithHTML(data as memoryblock, BaseURL as string) as NSAttributedStringMBS 5884
- 31.11.16 attributedStringWithHTML(data as memoryblock, BaseURL as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5885

31.11.18 attributedStringWithHTMLOld(data as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given HTML file data.
Notes: With plugin version 9.4 the attributedStringWithHTML method uses the system function to parse html. The old plugin function is available with the name attributedStringWithHTMLOld.

31.11.19 attributedStringWithPath(file as folderitem) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given file.
Example:

```
// load rtfd file into textarea
dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
dim n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(file)
dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
t.textStorage.setAttributedString(n)
```

Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.20 attributedStringWithPath(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5886
- 31.11.21 attributedStringWithPath(path as string) as NSAttributedStringMBS 5886
- 31.11.22 attributedStringWithPath(path as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5887

31.11.20 attributedStringWithPath(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given file.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.19 attributedStringWithPath(file as folderitem) as NSAttributedStringMBS 5885
- 31.11.21 attributedStringWithPath(path as string) as NSAttributedStringMBS 5886
- 31.11.22 attributedStringWithPath(path as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5887

31.11.21 attributedStringWithPath(path as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given path string.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.19 attributedStringWithPath(file as folderitem) as NSAttributedStringMBS 5885
- 31.11.20 attributedStringWithPath(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5886
- 31.11.22 attributedStringWithPath(path as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5887

31.11.22 attributedStringWithPath(path as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given path string.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.19 attributedStringWithPath(file as folderitem) as NSAttributedStringMBS 5885
- 31.11.20 attributedStringWithPath(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5886
- 31.11.21 attributedStringWithPath(path as string) as NSAttributedStringMBS 5886

31.11.23 attributedStringWithRTF(data as memoryblock) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given RTF file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.24 attributedStringWithRTF(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5887

31.11.24 attributedStringWithRTF(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given RTF file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.23 attributedStringWithRTF(data as memoryblock) as NSAttributedStringMBS 5887

31.11.25 attributedStringWithRTFD(data as memoryblock) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given RTFD file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.26 attributedStringWithRTFD(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5888

31.11.26 attributedStringWithRTFD(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given RTFD file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.25 attributedStringWithRTFD(data as memoryblock) as NSAttributedStringMBS 5887

31.11.27 attributedStringWithString(text as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given plain text.
Example:

```
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m
```

Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.28 attributedStringWithString(text as string, withAttributes as dictionary) as NSAttributedStringMBS 5888

31.11.28 attributedStringWithString(text as string, withAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given plain text.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.27 attributedStringWithString(text as string) as NSAttributedStringMBS 5888

31.11.29 attributedStringWithURL(file as folderitem) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given file.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.30 attributedStringWithURL(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5889
- 31.11.31 attributedStringWithURL(url as string) as NSAttributedStringMBS 5889
- 31.11.32 attributedStringWithURL(url as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5890

31.11.30 attributedStringWithURL(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given file.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.29 attributedStringWithURL(file as folderitem) as NSAttributedStringMBS 5889
- 31.11.31 attributedStringWithURL(url as string) as NSAttributedStringMBS 5889
- 31.11.32 attributedStringWithURL(url as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5890

31.11.31 attributedStringWithURL(url as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given url.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.29 attributedStringWithURL(file as folderitem) as NSAttributedStringMBS 5889
- 31.11.30 attributedStringWithURL(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5889
- 31.11.32 attributedStringWithURL(url as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5890

31.11.32 attributedStringWithURL(url as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given url.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.29 attributedStringWithURL(file as folderitem) as NSAttributedStringMBS 5889
- 31.11.30 attributedStringWithURL(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 5889
- 31.11.31 attributedStringWithURL(url as string) as NSAttributedStringMBS 5889

31.11.33 attributedSubstringFromRange(range as NSRangeMBS) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSAttributedString object consisting of the characters and attributes within a given range in the receiver.
Notes:

Range: The range from which to create a new attributed string. aRange must lie within the bounds of the receiver.

Returns an NSAttributedString object consisting of the characters and attributes within aRange in the receiver.

Raises an NSRangeException if any part of aRange lies beyond the end of the receiver's characters. This method treats the length of the string as a valid range value that returns an empty string.

31.11.34 attributesAtIndex(location as UInt64) as dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the attributes for the character at a given index.
Notes:

location: The index for which to return attributes. This value must lie within the bounds of the receiver.
Range: Optional. Upon return, the range over which the attributes and values are the same as those at index. This range isn't necessarily the maximum range covered, and its extent is implementation-dependent. If you need the maximum range, use other variant of this method.

Returns the attributes for the character at index.
Raises an NSRangeException if index lies beyond the end of the receiver's characters.
See also:

- 31.11.35 attributesAtIndex(location as UInt64, inRange as NSRangeMBS) as dictionary 5891

31.11.35 attributesAtIndex(location as UInt64, inRange as NSRangeMBS) as dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the attributes for the character at a given index, and by reference the range over which the attributes apply.
Notes:

location: The index for which to return attributes. This value must not exceed the bounds of the receiver.
range: Optional. Upon return contains the maximum range over which the attributes and values are the same as those at index, clipped to range Limit.
inRange: The range over which to search for continuous presence of the attributes at index. This value must not exceed the bounds of the receiver.

Raises an NSRangeException if index or any part of rangeLimit lies beyond the end of the receiver's characters.
If you don't need the range information, it's far more efficient to use the other variant of this method to retrieve the attribute value.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.
See also:

- 31.11.34 attributesAtIndex(location as UInt64) as dictionary 5890

31.11.36 attributesAtIndex2(location as UInt64, byref range as NSRangeMBS) as dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the attributes for the character at a given index.
Notes:

location: The index for which to return attributes. This value must lie within the bounds of the receiver.
Range: Optional. Upon return, the range over which the attributes and values are the same as those at index. This range isn't necessarily the maximum range covered, and its extent is implementation-dependent. If you need the maximum range, use other variant of this method.

Returns the attributes for the character at index.

Raises an NSRangeException if index lies beyond the end of the receiver's characters.
See also:

- 31.11.37 attributesAtIndex2(location as UInt64, byref range as NSRangeMBS, inRange as NSRangeMBS) as dictionary 5892

31.11.37 attributesAtIndex2(location as UInt64, byref range as NSRangeMBS, inRange as NSRangeMBS) as dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the attributes for the character at a given index, and by reference the range over which the attributes apply.
Notes:

location: The index for which to return attributes. This value must not exceed the bounds of the receiver.
range: Optional. Upon return contains the maximum range over which the attributes and values are the same as those at index, clipped to range Limit.
inRange: The range over which to search for continuous presence of the attributes at index. This value must not exceed the bounds of the receiver.

Raises an NSRangeException if index or any part of rangeLimit lies beyond the end of the receiver's characters.
If you don't need the range information, it's far more efficient to use the other variant of this method to retrieve the attribute value.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.
See also:

- 31.11.36 attributesAtIndex2(location as UInt64, byref range as NSRangeMBS) as dictionary 5891

31.11.38 Constructor

MBS MacBase Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor to create empty attributed string.

31.11.39 Convert_Operator as string

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts to string by just returning string part.

31.11.40 copy as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the attributed string.

31.11.41 CopyToClipboard as Boolean

MBS MacBase Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies styled text to clipboard.

31.11.42 dataFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil, byref error as NSErrorMBS) as memoryblock

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an data object that contains a text stream corresponding to the characters and attributes within the given range.
Notes:

offset and length: The range.
documentAttributes: A required dictionary specifying the document attributes. The dictionary contains values from Document Types and must at least contain NSDocumentTypeDocumentAttribute.
error: An in-out variable containing an encountered error, if any.

Returns the data for the attributed string, or nil if failure. When nil, error encapsulates the error information.
Raises an NSRangeException if any part of range lies beyond the end of the receiver's characters.

31.11.43 docFormatFromRange(documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates DOC data from the whole string.
Notes:

Same as docFormatFromRange(0,length)
Returns nil on failure.
documentAttributes can optionally be a dictionary with document attributes like author or title.
See also:

- 31.11.44 docFormatFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock 5894

31.11.44 docFormatFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates DOC data from the current string range.
Notes:

Returns nil on failure.
documentAttributes can optionally be a dictionary with document attributes like author or title.
See also:

- 31.11.43 docFormatFromRange(documentAttributes as dictionary = nil) as MemoryBlock 5893

31.11.45 fileWrapperFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil, byref Error as NSErrorMBS) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSFileWrapper object that contains a text stream corresponding to the characters and attributes within the given range.
Example:

```
// get styled text from htmlviewer
dim w as WebViewMBS = HTMLViewer1.WebViewMBS
dim f as WebFrameMBS = w.mainFrame
dim v as WebFrameViewMBS = f.frameView
dim d as WebDocumentViewMBS = v.documentView
dim n as NSAttributedStringMBS = d.attributedString

// package it
dim da as new Dictionary
da.Value(n.NSDocumentTypeDocumentAttribute) = n.NSRTFDTextDocumentType

dim e as NSErrorMBS
dim fw as NSFileWrapperMBS = n.fileWrapperFromRange(0, n.Length, da, e)
if e <>nil then
MsgBox e.LocalizedDescription
Return
end if

// write to disk
dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
if fw.writeToFile(file, e) then
MsgBox "OK"
else
MsgBox e.LocalizedDescription
```

```
end if
```

Notes:

offset and length: The range.
documentAttributes: A required dictionary specifying the document attributes. The dictionary contains values from Document Types and must at least contain NSDocumentTypeDocumentAttribute.
error: An in-out variable containing an encountered error, if any.

Returns a file wrapper for the appropriate document type, or nil if failure. When nil, error encapsulates the error information.

Raises an NSRangeException if any part of range lies beyond the end of the receiver's characters.

31.11.46 FromClipboard as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries attributed string from clipboard.

31.11.47 GeneratePDF(PrintOptions as Variant = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a PDF for attributed string.
Example:

```
// read file
dim fi as FolderItem = SpecialFolder.Desktop.Child("test.docx")

dim d as new Dictionary
dim n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(fi, d)

// write pdf
dim p as MemoryBlock = n.GeneratePDF(nil)

dim fo as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim bo as BinaryStream = BinaryStream.Create(fo)
bo.Write p
```

Notes: PrintOptions is optional NSPrintInfoMBS object for print settings like margin.

31.11.48 htmlString as string

MBS MacBase Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A self made function to return the text content as html string preserving the style information.
Example:

```
dim s as NSAttributedStringMBS

s=new NSAttributedStringMBS

if s.initwithhtml("<b>Hello</b>") then
MsgBox s.htmlstring // shows "<b>Hello</b>"
MsgBox s.text // shows "Hello"
end if
```

Notes:

Does not always work well, but can help.
(Apple has no official function for this)

31.11.49 initWithAttributedString(text as NSAttributedStringMBS) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of the given attributed string.
Notes: Returns true on success.

31.11.50 initWithDocFormat(data as MemoryBlock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given DOC file data.
Notes:

Returns true on success.
documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.51 initWithDocFormat(data as memoryblock, byref documentAttributes as dictionary) as boolean

31.11.51 initWithDocFormat(data as memoryblock, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given DOC file data.
Notes:

Returns true on success.
documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.50 initWithDocFormat(data as MemoryBlock) as boolean 5896

31.11.52 initWithHTML(data as MemoryBlock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given HTML file data.
Example:

```
dim n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithHTML("<b>test</b>") then
MsgBox n.text
else
MsgBox "failed"
end if

dim attribText as new NSAttributedStringMBS
dim text as string = "<P>Hello öäü</P>"

text = ConvertEncoding(text, encodings.ISOLatin1)

If attribText.initWithHTML(text) Then
MsgBox attribText.text
End If
```

Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.

With plugin version 9.4 this uses the system function to parse html. The old plugin function is available with the name initWithHTMLOld.

On Mac OS X 10.6 the text encoding expected is ISO Latin 1 as far as I see.

See also:

- 31.11.53 initWithHTML(data as MemoryBlock, BaseURL as string) as boolean 5898
- 31.11.54 initWithHTML(data as memoryblock, BaseURL as string, byref documentAttributes as dictionary) as boolean 5898
- 31.11.55 initWithHTML(data as memoryblock, byref documentAttributes as dictionary) as boolean 5899

31.11.53 initWithHTML(data as MemoryBlock, BaseURL as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the object with html code from a given url.
Example:

```
dim n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithHTML("<b>test</b>","http://www.apple.com") then
MsgBox n.text
else
MsgBox "failed"
end if
```

Notes:

Returns true on success.
documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.52 initWithHTML(data as MemoryBlock) as boolean 5897
- 31.11.54 initWithHTML(data as memoryblock, BaseURL as string, byref documentAttributes as dictionary) as boolean 5898
- 31.11.55 initWithHTML(data as memoryblock, byref documentAttributes as dictionary) as boolean 5899

31.11.54 initWithHTML(data as memoryblock, BaseURL as string, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the object with html code from a given url.
Notes:

Returns true on success.
documentAttributes: Optional dictionary to receive the attributes.
See also:

- 31.11.52 initWithHTML(data as MemoryBlock) as boolean 5897
- 31.11.53 initWithHTML(data as MemoryBlock, BaseURL as string) as boolean 5898
- 31.11.55 initWithHTML(data as memoryblock, byref documentAttributes as dictionary) as boolean 5899

31.11.55 initWithHTML(data as memoryblock, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given HTML file data.
Notes:

Returns true on success.
documentAttributes: Optional dictionary to receive the attributes.

With plugin version 9.4 this uses the system function to parse html. The old plugin function is available with the name initWithHTMLOld.

On Mac OS X 10.6 the text encoding expected is ISO Latin 1 as far as I see.

- 31.11.54 initWithHTML(data as memoryblock, BaseURL as string, byref documentAttributes as dictionary) as boolean 5898

31.11.56 initWithHTMLOld(data as string) as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given HTML file data.
Notes: With plugin version 9.4 the initWithHTML method uses the system function to parse html. The old plugin function is available with the name initWithHTMLOld.

31.11.57 initWithPath(file as folderitem) as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given file.

Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 31.11.58 initWithPath(file as folderitem, byref documentAttributes as dictionary) as boolean 5900
- 31.11.59 initWithPath(path as string) as boolean 5900
- 31.11.60 initWithPath(path as string, byref documentAttributes as dictionary) as boolean 5901

31.11.58 initWithPath(file as folderitem, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given file.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 31.11.57 initWithPath(file as folderitem) as boolean 5899
- 31.11.59 initWithPath(path as string) as boolean 5900
- 31.11.60 initWithPath(path as string, byref documentAttributes as dictionary) as boolean 5901

31.11.59 initWithPath(path as string) as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given path string.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 31.11.57 initWithPath(file as folderitem) as boolean 5899
- 31.11.58 initWithPath(file as folderitem, byref documentAttributes as dictionary) as boolean 5900
- 31.11.60 initWithPath(path as string, byref documentAttributes as dictionary) as boolean 5901

31.11.60 initWithPath(path as string, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given path string.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 31.11.57 initWithPath(file as folderitem) as boolean 5899
- 31.11.58 initWithPath(file as folderitem, byref documentAttributes as dictionary) as boolean 5900
- 31.11.59 initWithPath(path as string) as boolean 5900

31.11.61 initWithRTF(data as MemoryBlock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given RTF file data.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 31.11.62 initWithRTF(data as memoryblock, byref documentAttributes as dictionary) as boolean 5901

31.11.62 initWithRTF(data as memoryblock, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given RTF file data.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 31.11.61 initWithRTF(data as MemoryBlock) as boolean 5901

31.11.63 initWithRTFD(data as MemoryBlock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given RTFD file data.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 31.11.64 initWithRTFD(data as memoryblock, byref documentAttributes as dictionary) as boolean 5902

31.11.64 initWithRTFD(data as memoryblock, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given RTFD file data.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 31.11.63 initWithRTFD(data as MemoryBlock) as boolean 5901

31.11.65 initWithString(text as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given plain text.
Example:

```
dim n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithHTML("test") then
MsgBox n.text
else
MsgBox "failed"
end if
```

Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 31.11.66 initWithString(text as string, withAttributes as Dictionary) as boolean 5903

31.11.66 initWithString(text as string, withAttributes as Dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of given plain text.
Example:

```
dim n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithHTML("test") then
MsgBox n.text
else
MsgBox "failed"
end if
```

Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 31.11.65 initWithString(text as string) as boolean 5902

31.11.67 initWithURL(file as folderitem) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given file.
Example:

```
dim n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithURL(SpecialFolder.Desktop.Child("testfile")) then
MsgBox n.text
else
MsgBox "failed"
end if
```

Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 31.11.68 initWithURL(file as folderitem, byref documentAttributes as dictionary) as boolean 5904
- 31.11.69 initWithURL(url as string) as boolean 5904

• 31.11.70 initWithURL(url as string, byref documentAttributes as dictionary) as boolean 5905

31.11.68 initWithURL(file as folderitem, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given file.
Example:

```
dim n as NSAttributedStringMBS
dim documentAttributes as dictionary
n=new NSAttributedStringMBS
if n.initWithURL(SpecialFolder.Desktop.Child("testfile"), documentAttributes) then
MsgBox n.text
else
MsgBox "failed"
end if
```

Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

• 31.11.67 initWithURL(file as folderitem) as boolean 5903

• 31.11.69 initWithURL(url as string) as boolean 5904

• 31.11.70 initWithURL(url as string, byref documentAttributes as dictionary) as boolean 5905

31.11.69 initWithURL(url as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given url.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

• 31.11.67 initWithURL(file as folderitem) as boolean 5903

• 31.11.68 initWithURL(file as folderitem, byref documentAttributes as dictionary) as boolean 5904

• 31.11.70 initWithURL(url as string, byref documentAttributes as dictionary) as boolean 5905

31.11.70 initWithURL(url as string, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes string with content of file at the given url.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 31.11.67 initWithURL(file as folderitem) as boolean 5903
- 31.11.68 initWithURL(file as folderitem, byref documentAttributes as dictionary) as boolean 5904
- 31.11.69 initWithURL(url as string) as boolean 5904

31.11.71 isEqualToAttributedString(other as NSAttributedStringMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Compares both strings.
Example:

```
dim n as NSAttributedStringMBS
dim m as NSAttributedStringMBS

n=new NSAttributedStringMBS
if n.initWithString("test") then
MsgBox n.text
else
MsgBox "failed"
end if

m=new NSAttributedStringMBS
if m.initWithString("test") then
MsgBox n.text
else
MsgBox "failed"
end if

if m.isEqualToAttributedString(n) then
MsgBox "Ok"
else
MsgBox "failed"
end if

m=new NSAttributedStringMBS
if m.initWithString("test2") then
```

```
MsgBox n.text
else
MsgBox "failed"
end if

if m.isEqualToAttributedString(n) then
MsgBox "failed"
else
MsgBox "Ok"
end if
```

Notes: Returns true if they are equal in content.

31.11.72 itemNumberInTextList(list as NSTextListMBS, location as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of the item at the given location within the list.
Notes:

list: The text list.
location: The location of the item.

Returns the index within the list.

31.11.73 lineRangeForRange(range as NSRangeMBS) as NSRangeMBS

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the range of characters representing the line or lines containing a given range.
Notes:

Range: A range within the receiver. The value must not exceed the bounds of the receiver.

The range of characters representing the line or lines containing aRange, including the line termination characters.

31.11.74 mutableCopy as NSMutableAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a mutable copy of the attributed string.

Example:

```
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m
```

31.11.75 NSAttachmentAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

NSTextAttachment
Default nil, no attachment

31.11.76 NSAuthorDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Example:

```
// get some attributed text:
dim t as new NSAttributedStringMBS
call t.initWithString("Hello World")

// set document attributes
dim dic as new Dictionary
dic.Value(t.NSAuthorDocumentAttribute) = "Test User"

// get rtf
dim rtf as string = t.RTFFromRange(dic)

// write to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
dim b as BinaryStream = BinaryStream.Create(f, true)
b.Write rtf
```

Notes:

string containing author name.
Available in Mac OS X v10.4 and later.

31.11.77 NSBackgroundColorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Example:

```
// add background color for text in text area:

TextArea1.Text = "Hello"

Dim tv As NSTextViewMBS = TextArea1.NSTextViewMBS
Dim ts As NSTextStorageMBS = tv.TextStorage

Dim value As Color = & cFF0000

Dim offset As Integer = 0
Dim length As Integer = 5

Dim range As NSRangeMBS = NSMakeRangeMBS( offset, length )
ts.AddAttribute( NSAttributedStringMBS.NSBackgroundColorAttributeName, value, range )
```

Notes:

NSColor
Default nil, no background

31.11.78 NSBackgroundColorDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

NSColor, representing the document-wide page background color.
Mac OS X v10.3 and earlier string constant is "BackgroundColor".
For applications linked on versions prior to Mac OS X v10.5, HTML import sets the NSBackgroundColorDocumentAttribute to NSColorMBS.whiteColor in cases in which the HTML does not specify a background color. For applications linked on Mac OS X v10.5 and later, no NSBackgroundColorDocumentAttribute is set in these cases.
Available in Mac OS X v10.4 and later.

31.11.79 NSBaselineOffsetAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

Number containing floating point value, as points offset from baseline
Default 0.0

31.11.80 NSBaseURLDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

For HTML documents; NSURL containing base URL. Previous string constant was @"BaseURL"
Available in Mac OS X v10.4 and later.

31.11.81 NSBottomMarginDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Example:

```
// get some attributed text:
dim t as new NSAttributedStringMBS
call t.initWithString("Hello World")

// set document attributes
dim dic as new Dictionary
dic.Value(t.NSBottomMarginDocumentAttribute) = 20
dic.Value(t.NSLeftMarginDocumentAttribute) = 20
dic.Value(t.NSRightMarginDocumentAttribute) = 20
dic.Value(t.NSTopMarginDocumentAttribute) = 20
dic.Value(t.NSAuthorDocumentAttribute) = "Test User"

// get rtf
dim rtf as string = t.RTFFromRange(dic)

// write to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
dim b as BinaryStream = BinaryStream.Create(f, true)
```

b.Write rtf

Notes:

Number, containing a float, in points.
Mac OS X v10.3 and earlier string constant is "BottomMargin".
Available in Mac OS X v10.4 and later.

31.11.82 NSCategoryDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

string containing the document's category.
Available in Mac OS X v10.6 and later.

31.11.83 NSCharacterEncodingDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

Number, containing an int specifying the stringEncoding for the file; for reading and writing plain text files and writing HTML; default for plain text is the default encoding; default for HTML is UTF-8.
Mac OS X v10.3 and earlier string constant is "CharacterEncoding".
Available in Mac OS X v10.4 and later.

31.11.84 NSCharacterEncodingDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

For plain text documents; Number containing the unsigned int stringEncoding to override any encoding specified in an HTML document. Previous string constant was @"CharacterEncoding".
Available in Mac OS X v10.4 and later.

31.11.85 NSCharacterShapeAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

An integer value. The value is interpreted as Apple Type Services kCharacterShapeType selector + 1.
The default value is 0 (disable). 1 is kTraditionalCharactersSelector, and so on. Refer to <ATS/SFNTLayoutTypes.h>and "Font Features" in ATSUI Programming Guide for additional information.
Available in Mac OS X v10.0 and later.

31.11.86 NSCocoaVersionDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

Number, containing a float. For RTF files only, stores the version of Cocoa with which the file was created. Absence of this value indicates RTF file not created by Cocoa or its predecessors.
Values less than 100 are pre–Mac OS X; 100 is Mac OS X v10.0 or v10.1; 102 is Mac OS X v10.2 and 10.3; values greater than 102 correspond to values of NSAppKitVersionNumber on Mac OS X v10.4 and later.
Mac OS X v10.3 and earlier string constant is "CocoaRTFVersion".
Available in Mac OS X v10.4 and later.

31.11.87 NSCommentDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

string containing document comments.
Available in Mac OS X v10.4 and later.

31.11.88 NSCompanyDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

string containing company or organization name.
Available in Mac OS X v10.4 and later.

31.11.89 NSConvertedDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

Number, containing an int. Indicates whether the file was converted by a filter service.
If missing or 0, the file was originally in the format specified by document type. If negative, the file was originally in the format specified by document type, but the conversion to NSAttributedString may have been lossy. If 1 or more, it was converted to this type by a filter service.
Mac OS X v10.3 and earlier string constant is @"Converted".
Available in Mac OS X v10.4 and later.

31.11.90 NSCopyrightDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

string containing document copyright info.
Available in Mac OS X v10.4 and later.

31.11.91 NSCreationTimeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

NSDate containing the creation date of the document; note that this is not the file system creation date of the file, but of the document.
Available in Mac OS X v10.4 and later.

31.11.92 NSCursorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

NSCursor
Default as returned by the NSCursor method IBeamCursor
Available in Mac OS X v10.3 and later.

31.11.93 NSDefaultAttributesDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the document attributes.
Notes:

NSDictionary containing attributes to be applied to plain files. Used by reader methods. This key in options can specify the default attributes applied to the entire document contents. The document attributes can contain this key indicating the actual attributes used.
Available on Mac OS X 10.11.

31.11.94 NSDefaultAttributesDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

For plain text documents; Dictionary containing attributes to be applied to plain files. Previous string constant was @"DefaultAttributes".
Available in Mac OS X v10.4 and later.

31.11.95 NSDefaultTabIntervalDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

Number containing a float. Represents the document-wide default tab stop interval.
Mac OS X v10.3 and earlier string constant is "DefaultTabInterval".
Available in Mac OS X v10.4 and later.

31.11.96 NSDocFormatTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: Microsoft Word document.

31.11.97 NSDocumentTypeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

How the document was interpreted; one of the values in "Document Types."
Mac OS X v10.3 and earlier string constant is "DocumentType".
Available in Mac OS X v10.4 and later.

31.11.98 NSDocumentTypeDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

One of the document types described in "Document Types," indicating a document type to be forced when loading the document. Previous string constant was @"DocumentType".
Available in Mac OS X v10.4 and later.

31.11.99 NSEditorDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

string containing name of person who last edited the document.
Available in Mac OS X v10.4 and later.

31.11.100 NSExcludedElementsDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString related to HTML generation.
Notes:

An Array object containing string objects, representing HTML elements not to be used in generated HTML.
Available in Mac OS X v10.4 and later.

NSExcludedElementsDocumentAttribute allows control over the tags used. The recognized values in the NSExcludedElementsDocumentAttribute array are (case-insensitive) HTML tags, plus DOCTYPE (representing a doctype declaration) and XML (representing an XML declaration). By default, if this attribute is not present, the excluded elements will be those deprecated in HTML 4 (APPLET, BASEFONT, CENTER, DIR, FONT, ISINDEX, MENU, S, STRIKE, and U) plus XML. If XML is on the list, HTML forms are

used; if XML is not on the list, XHTML forms are used where there is a distinction.

31.11.101 NSExpansionAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

Number containing floating point value, as log of expansion factor to be applied to glyphs
Default 0.0, no expansion
Available in Mac OS X v10.3 and later.

31.11.102 NSFileTypeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

string indicating which document type was used to interpret the document, specified as a UTI; for reading, this is available along with NSDocumentTypeDocumentAttribute, but for writing the two are mutually exclusive.
Available in Mac OS X v10.6 and later.

31.11.103 NSFileTypeDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

string indicating a document type to be forced when loading the document, specified as a UTI string; mutually exclusive with NSDocumentTypeDocumentOption.
Available in Mac OS X v10.6 and later.

31.11.104 NSFontAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Example:

MsgBox NSAttributedStringMBS.NSFontAttributeName

```
Dim NSGraphics as New NSGraphicsMBS()
Dim NSFont as NSFontMBS = NSFontMBS.fontWithName("Helvetica", 11.0)
Dim NSAttributes as New Dictionary

NSAttributes.value(NSAttributedStringMBS.NSFontAttributeName) = nsfont

Dim stringWidth as Double = NSGraphics.sizeWithAttributes("Hello World", NSAttributes).Width
MsgBox("StringWidth from NSGraphicsMBS: " + Str(stringWidth))
```

Notes:

NSFont
Default Helvetica 12-point

31.11.105 NSForegroundColorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Example:

```
TextArea1.Text = "Hello"

Dim tv As NSTextViewMBS = TextArea1.NSTextViewMBS
Dim ts As NSTextStorageMBS = tv.TextStorage

Dim value As Color = & cFF0000

Dim offset As Integer = 0
Dim length As Integer = 5

Dim range As NSRangeMBS = NSMakeRangeMBS( offset, length )
ts.AddAttribute( NSAttributedStringMBS.NSForegroundColorAttributeName, value, range )
```

Notes:

NSColor
Default blackColor
Available in Mac OS X v10.0 and later.

31.11.106 NSGlyphInfoAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

The name of an NSGlyphInfo object.
NSLayoutManager assigns the glyph specified by this glyph info to the entire attribute range, provided that its contents match the specified base string, and that the specified glyph is available in the font specified by NSFontAttributeName.
Available in Mac OS X v10.2 and later.

31.11.107 NSHTMLTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: Hypertext Markup Language (HTML) document.

31.11.108 NSHyphenationFactorDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

Number, containing a float; 0 = off, 1 = full hyphenation.
Mac OS X v10.3 and earlier string constant is "HyphenationFactor".
Available in Mac OS X v10.4 and later.

31.11.109 NSKernAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

Number containing floating point value, as points by which to modify default kerning
Default nil, use default kerning specified in font file; 0.0, kerning off; non-zero, points by which to modify default kerning
Available in Mac OS X v10.0 and later.

31.11.110 NSKeywordsDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

Array of string, containing keywords.
Available in Mac OS X v10.4 and later.

31.11.111 NSLeftMarginDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

Number, containing a float, in points.
Mac OS X v10.3 and earlier string constant is "LeftMargin".
Available in Mac OS X v10.4 and later.

31.11.112 NSLigatureAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

Number containing integer
Default 1, standard ligatures; 0, no ligatures; 2, all ligatures.

31.11.113 NSLinkAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

NSURL (preferred) or string
Default nil, no link
Available in Mac OS X v10.0 and later.

31.11.114 NSMacSimpleTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: Macintosh SimpleText document.

31.11.115 NSManagerDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

string containing the name of the author's manager.
Available in Mac OS X v10.6 and later.

31.11.116 NSMarkedClauseSegmentAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

Number containing an integer, as an index in marked text indicating clause segments
Available in Mac OS X v10.5 and later.

31.11.117 NSModificationTimeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

NSDate containing the modification date of the document contents.
Available in Mac OS X v10.4 and later.

31.11.118 NSObliquenessAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

Number containing floating point value, as skew to be applied to glyphs
Default 0.0, no skew
Available in Mac OS X v10.3 and later.

31.11.119 NSOfficeOpenXMLTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes:

ECMA Office Open XML text document format.
Available in Mac OS X v10.5 and later.

31.11.120 NSOpenDocumentTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes:

OASIS Open Document text document format.
Available in Mac OS X v10.5 and later.

31.11.121 NSPaperSizeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

NSValue, containing NSSize.
Mac OS X v10.3 and earlier string constant is "PaperSize".
Available in Mac OS X v10.4 and later.

31.11.122 NSParagraphStyleAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Example:

```
// change line spacing in a Label

dim n as NSTextFieldMBS = Label1.NSTextFieldMBS
dim a as NSAttributedStringMBS = n.attributedStringValue

dim p as NSParagraphStyleMBS = a.attributeAtIndex(a.NSParagraphStyleAttributeName, 0)
dim m as NSMutableParagraphStyleMBS = p.mutableCopy
m.setLineSpacing 5

dim s as NSMutableAttributedStringMBS = a.mutableCopy
s.addAttribute(a.NSParagraphStyleAttributeName, m, new NSRangeMBS(0, s.length))

n.attributedStringValue = s
```

Notes:

NSParagraphStyle
Default as returned by the NSParagraphStyle method defaultParagraphStyle

31.11.123 NSPlainTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.

Notes: Plain text document.

31.11.124 NSPrefixSpacesDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString related to HTML generation.
Notes:

An Number containing an integer (default 0) representing the number of spaces per level by which to indent certain nested HTML elements.
Available in Mac OS X v10.4 and later.

NSPrefixSpacesDocumentAttribute allows some control over formatting.

31.11.125 NSReadOnlyDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

Number, containing int. If missing or 0 or negative, not read only; 1 or more, read only.
Note that this has nothing to do with the file system protection on the file, but instead can affect how the file should be displayed to the user.
Mac OS X v10.3 and earlier string constant is "ReadOnly".
Available in Mac OS X v10.4 and later.

31.11.126 NSRightMarginDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

Number, containing a float, in points.
Mac OS X v10.3 and earlier string constant is "RightMargin".
Available in Mac OS X v10.4 and later.

31.11.127 NSRTFDTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dic-

tionary.
Notes: Rich text format with attachments document.

31.11.128 NSRTFTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: Rich text format document.

31.11.129 NSShadowAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

NSShadow
Default nil, no shadow.
Available in Mac OS X v10.3 and later.

31.11.130 NSSpellingStateAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

An integer value. Defaults to 0, indicating no grammar or spelling error. See "NSSpellingStateAttributeName Flags" for possible values.
This key is available in Mac OS X v10.2 and later, but its interpretation changed in Mac OS X v10.5. Previously, any non-zero value caused the spelling indicator to be displayed. For Mac OS X v10.5 and later, the (integer) value is treated as being composed of the spelling and grammar flags.
Available in Mac OS X v10.5 and later.

31.11.131 NSStrikethroughColorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

NSColor
Default nil, same as foreground color

Available in Mac OS X v10.3 and later.

31.11.132 NSStrikethroughStyleAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Example:

```
// underline selected text in TextArea1

dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
dim s as NSTextStorageMBS = t.textStorage

const NSUnderlineStyleSingle = 1

dim d as Dictionary = t.selectedTextAttributes
d.Value(NSAttributedStringMBS.NSStrikethroughStyleAttributeName) = NSUnderlineStyleSingle
t.selectedTextAttributes = d
```

Notes:

Number containing integer
Default 0, no strikethrough. See "Underlining Patterns", "Underlining Styles", and "Underline Masks" in Apple Documentation for mask values.
Available in Mac OS X v10.3 and later.

31.11.133 NSStrokeColorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

NSColor
Default nil, same as foreground color
Available in Mac OS X v10.3 and later.

31.11.134 NSStrokeWidthAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

Number containing floating point value, as percent of font point size
Default 0, no stroke; positive, stroke alone; negative, stroke and fill (a typical value for outlined text would be 3.0)
Available in Mac OS X v10.3 and later.

31.11.135 NSSubjectDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

string containing subject of document.
Available in Mac OS X v10.4 and later.

31.11.136 NSSuperscriptAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

Number containing integer
Default 0

31.11.137 NSTextAlternativesAttributeName as string

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names.
Notes:

An NSTextAlternatives object. Used primarily as a temporary attribute, with primaryString equal to the substring for the range to which it is attached, and alternativeStrings representing alternatives for that string that may be presented to the user.
Available on OS X 10.8 and newer.

31.11.138 NSTextEffectAttributeName as string

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names.
Notes: NSString, default nil: no text effect

31.11.139 NSTextEffectLetterpressStyle as string

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the text effect names.
Notes: Available on Mac OS X 10.10 or newer.

31.11.140 NSTextEncodingNameDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString related to HTML generation.
Notes:

An string object containing the name, IANA or otherwise, of a text encoding to be used; mutually exclusive with NSCharacterEncodingDocumentAttribute.
Available in Mac OS X v10.4 and later.

Either NSCharacterEncodingDocumentAttribute or NSTextEncodingNameDocumentAttribute may be used to control the encoding used for generated HTML; character entities are used for characters not representable in the specified encoding.

31.11.141 NSTextEncodingNameDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

string containing the name, IANA or otherwise, of a text encoding to override any encoding specified in an HTML document. Mutually exclusive with @"CharacterEncoding". Previous string constant was @"TextEncodingName".
Available in Mac OS X v10.4 and later.

31.11.142 NSTextLayoutSectionOrientation as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants used as by the NSLayoutOrientationSectionsAttribute.
Notes:

An Number containing an NSTextLayoutOrientation value. The default value is NSTextLayoutOrientationHorizontal.
Available in Mac OS X v10.7 and later.

31.11.143 NSTextLayoutSectionRange as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants used as by the NSLayoutOrientationSectionsAttribute.
Notes:

An NSValue containing an NSRange representing a character range. The default value is a range covering the entire string.
Available in Mac OS X v10.7 and later.

31.11.144 NSTextLayoutSectionsAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

An Array containing dictionarys. Each dictionary describes a layout orientation section. The dictionary can have two attributes: NSTextLayoutSectionOrientation and NSTextLayoutSectionRange. When there is a gap between sections, it's assumed to have NSTextLayoutOrientationHorizontal.
Available in Mac OS X v10.7 and later.

31.11.145 NSTextSizeMultiplierDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

Specifies a scale factor for font sizes.. Number containing float, default 1.0; for HTML only, corresponding to WebView's textSizeMultiplier.
There is no textual equivalent for Mac OS X v10.3.
Available in Mac OS X v10.4 and later.

31.11.146 NSTimeoutDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

Number containing float. Time in seconds to wait for a document to finish loading. Previous string constant was @"Timeout".
Available in Mac OS X v10.4 and later.

31.11.147 NSTitleDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

string containing document title.
Available in Mac OS X v10.4 and later.

31.11.148 NSToolTipAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

string
Default nil, no tooltip
Available in Mac OS X v10.3 and later.

31.11.149 NSTopMarginDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

Number, containing a float, in points.
Mac OS X v10.3 and earlier string constant is "TopMargin".
Available in Mac OS X v10.4 and later.

31.11.150 NSUnderlineColorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

NSColor
Default nil, same as foreground color
Available in Mac OS X v10.3 and later.

31.11.151 NSUnderlineStyleAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

Number containing integer
Default 0, no underline. See "Underlining Patterns", "Underlining Styles", and "Underline Masks" in Apple Documentation for mask values.

31.11.152 NSVerticalGlyphFormAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

An Number containing an integer value, 0 means horizontal text and 1 indicates vertical text. If no value specified, it's interpreted to determine the setting based on higher-level vertical orientation settings such as NSTextLayoutOrientation . The behavior for any other value is undefined.
Available in Mac OS X v10.7 and later.

31.11.153 NSViewModeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

NSValue, containing an int; 0 = normal; 1 = page layout (use value of "PaperSize").
Mac OS X v10.3 and earlier string constant is "ViewMode".
Available in Mac OS X v10.4 and later.

31.11.154 NSViewSizeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

NSValue, containing NSSize.
Mac OS X v10.3 and earlier string constant is "ViewSize".
Available in Mac OS X v10.4 and later.

31.11.155 NSViewZoomDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for document wide attributes in a NSAttributedString.
Notes:

Mac OS X v10.3 and earlier string constant is "ViewZoom".
NSValue, containing a float; 100 = 100% zoom.
Available in Mac OS X v10.4 and later.

31.11.156 NSWebArchiveTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: Web Kit WebArchive document.

31.11.157 NSWebPreferencesDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

WebPreferences; for HTML only, specifies a WebPreferences object. If not present, a default set of preferences is used. Previous string constant was @"WebPreferences".
Available in Mac OS X v10.4 and later.

31.11.158 NSWebResourceLoadDelegateDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Notes:

WebResourceLoadDelegateMBS; for HTML only, specifies an object to serve as the web resource loading delegate.
If not present, a default delegate is used that permits the loading of subsidiary resources but does not respond to authentication challenges. Previous string constant was @"WebResourceLoadDelegate".
Available in Mac OS X v10.4 and later.

31.11.159 NSWordMLTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: Microsoft Word XML (WordML schema) document.

31.11.160 NSWritingDirectionAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute names for NSAttributedString.
Example:

```
const NSWritingDirectionNatural = -1 // Determines direction using the Unicode Bidi Algorithm rules P2 and P3
const NSWritingDirectionLeftToRight = 0 // Left to right writing direction
const NSWritingDirectionRightToLeft = 1 // Right to left writing direction

const NSTextWritingDirectionEmbedding = 0
const NSTextWritingDirectionOverride = 2

dim t as NSTextStorageMBS = TextArea1.NSTextViewMBS.textStorage

// get hello in arabic
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

// now set attributes for right to left
m.addAttribute t.NSWritingDirectionAttributeName, array(NSWritingDirectionRightToLeft+NSTextWritingDirectionOverride), new NSRangeMBS(0,m.Length)

// and add to textarea
t.appendAttributedString m
```

Notes:

An Array of Numbers.
This provides a means to override the default bidi algorithm, equivalent to the use of bidi control characters LRE, RLE, LRO, or RLO paired with PDF, as a higher-level attribute. This is the NSAttributedString equivalent of HTML's dir attribute and/or BDO element. The array represents nested embeddings or overrides, in order from outermost to innermost. The values of the Numbers should be 0, 1, 2, or 3, for LRE, RLE, LRO, or RLO respectively; these should be regarded as NSWritingDirectionLeftToRight or NSWritingDirectionRightToLeft plus NSTextWritingDirectionEmbedding or NSTextWritingDirectionOverride.
Available in Mac OS X v10.6 and later.

31.11.161 paragraphRangeForRange(range as NSRangeMBS) as NSRangeMBS

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the range of characters representing the paragraph or paragraphs containing a given range.
Notes:

Range: A range within the receiver. The range must not exceed the bounds of the receiver.

The range of characters representing the paragraph or paragraphs containing range, including the paragraph termination characters.

A paragraph is any segment of text delimited by a carriage return (U+000D), newline (U+000A), or paragraph separator (U+2029).

31.11.162 rangeOfTextList(list as NSTextListMBS, location as Integer) as NSRangeMBS

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the range of the given text list that contains the given location.
Notes:

list: The text list.
location: The location in the text list.

Returns the range of the given text list containing the location.

31.11.163 rtf as MemoryBlock

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the content of this attributed string as a RTF string.
Example:

```
dim s as NSAttributedStringMBS

s=new NSAttributedStringMBS

if s.initWithString("Hello") then
MsgBox s.RTF
end if

// shows this text:
// { \rtf1\ansi\ansicpg1252\cocoartf949
// { \fonttbl\f0\fswiss\fcharset0 Helvetica; }
// { \colortbl;\red255\green255\blue255; }
```

// \pard\tx560\tx1120\tx1680\tx2240\tx2800\tx3360\tx3920\tx4480\tx5040\tx5600\tx6160\tx6720\ql\qnatural\pardirnatural
//
// \f0\fs24 \cf0 Hello }

Notes: Same as RTFFromRange(0,length)

31.11.164 RTFDFileWrapperFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSFileWrapper object that contains an RTFD document corresponding to the characters and attributes within the given range.
Notes:

offset and length: The range.
documentAttributes: A required dictionary specifying the document attributes. The dictionary contains values from Document Types and must at least contain NSDocumentTypeDocumentAttribute. If there are no document-level attributes, dict can be nil.

Returns a file wrapper containing the RTFD data.

The file wrapper also includes the document-level attributes in docAttributes, as explained in RTF Files and Attributed Strings.
Raises an NSRangeException if any part of aRange lies beyond the end of the receiver's characters.
You can save the file wrapper using the NSFileWrapper method writeToFile.

31.11.165 RTFDFromRange(documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates RTFD data from the current string range.
Notes:

Returns nil on failure.
Same as RTFDFromRange(0,length)
documentAttributes can optionally be a dictionary with document attributes like author or title.
See also:

- 31.11.166 RTFDFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock

31.11.166 RTFDFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates RTFD data from the current string range.
Notes:

Returns nil on failure.
documentAttributes can optionally be a dictionary with document attributes like author or title.
See also:

- 31.11.165 RTFDFromRange(documentAttributes as dictionary = nil) as MemoryBlock 5933

31.11.167 RTFFromRange(documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates RTF data from whole string.
Notes:

Returns nil on failure.
Same as RTFFromRange(0,length)
documentAttributes can optionally be a dictionary with document attributes like author or title.
See also:

- 31.11.168 RTFFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock 5934

31.11.168 RTFFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates RTF data from the current string range.
Example:

```
// get some attributed text:
dim t as new NSAttributedStringMBS
call t.initWithString("Hello World")

// set document attributes
dim dic as new Dictionary
dic.Value(t.NSBottomMarginDocumentAttribute) = 20
dic.Value(t.NSLeftMarginDocumentAttribute) = 20
dic.Value(t.NSRightMarginDocumentAttribute) = 20
dic.Value(t.NSTopMarginDocumentAttribute) = 20
dic.Value(t.NSAuthorDocumentAttribute) = "Test User"
```

```
// get rtf
dim rtf as string = t.RTFFromRange(dic)

// write to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
dim b as BinaryStream = BinaryStream.Create(f, true)
b.Write rtf
```

Notes:

Returns nil on failure.
documentAttributes can optionally be a dictionary with document attributes like author or title.
See also:

- 31.11.167 RTFFromRange(documentAttributes as dictionary = nil) as MemoryBlock 5934

31.11.169 Properties

31.11.170 containsAttachments as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this attributed string has attachments.
Notes: (Read only property)

31.11.171 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes:

Must not be nil to have the object being valid.
(Read and Write property)

31.11.172 length as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Length of text in characters.
Example:

```
dim n as NSAttributedStringMBS
```

```
n=new NSAttributedStringMBS
if n.initWithString("test") then
MsgBox str(n.length) // shows 4
else
MsgBox "failed"
end if
```

Notes: (Read only property)

31.11.173 Range as NSRangeMBS

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates range for whole text.
Notes: (Read only property)

31.11.174 text as string

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The plain text.
Notes: (Read only property)

31.11.175 Constants

31.11.176 NSSpellingStateGrammarFlag = 1

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the constants for spelling state.
Notes: Flag for grammar issues.

31.11.177 NSSpellingStateSpellingFlag = 0

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the constants for spelling state.
Notes: Flag for spelling issues.

31.11.178 NSUnderlineByWord = & h8000

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants. **Notes:** Draw the line only underneath or through words, not whitespace.

31.11.179 NSUnderlinePatternDash = & h0200

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants. **Notes:** Draw a line of dashes.

31.11.180 NSUnderlinePatternDashDot = & h0300

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants. **Notes:** Draw a line of alternating dashes and dots.

31.11.181 NSUnderlinePatternDashDotDot = & h0400

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants. **Notes:** Draw a line of alternating dashes and two dots.

31.11.182 NSUnderlinePatternDot = & h0100

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants. **Notes:** Draw a line of dots.

31.11.183 NSUnderlinePatternSolid = 0

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants. **Notes:** Draw a solid line.

31.11.184 NSUnderlineStyleDouble = 9

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants. **Notes:** Draw a double line.

31.11.185 NSUnderlineStyleNone = 0

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants.
Notes: Do not draw a line.

31.11.186 NSUnderlineStyleSingle = 1

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants.
Example:

```
// underline selected text in TextArea1

dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
dim s as NSTextStorageMBS = t.textStorage

dim d as Dictionary = t.selectedTextAttributes
d.Value(NSAttributedStringMBS.NSStrikethroughStyleAttributeName) = s.NSUnderlineStyleSingle
t.selectedTextAttributes = d
```

Notes: Draw a single line.

31.11.187 NSUnderlineStyleThick = 2

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the underline constants.
Notes: Draw a thick line.

31.11.188 NSWritingDirectionEmbedding = 0

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the writing direction constants.
Notes: Text is embedded in text with another writing direction. For example, an English quotation in the middle of an Arabic sentence could be marked as being embedded left-to-right text.

31.11.189 NSWritingDirectionOverride = 1

MBS MacBase Plugin, Plugin Version: 17.4. **Function:** One of the writing direction constants.
Notes: Enables character types with inherent directionality to be overridden when required for special cases, such as for part numbers made of mixed English, digits, and Hebrew letters to be written from right to left.

31.12 class NSAutoreleasePoolMBS

31.12.1 class NSAutoreleasePoolMBS

MBS Main Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for memory management in Cocoa.
Example:

```
dim pool as NSAutoreleasePoolMBS

sub MyThread.Run
pool=new NSAutoreleasePoolMBS
// do work
end sub
```

Notes: If you use threads, you need to create a NSAutoreleasePoolMBS on the start to have correct Cocoa memory manager.

31.12.2 Blog Entries

- REALbasic 2009r4 and MBS Plugins

31.12.3 Methods

31.12.4 Constructor

MBS Main Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor to create a new Autorelease Pool.
Example:

```
// Cleanup memory for Cocoa objects

Sub Action() // in Timer
static LastPool as NSAutoreleasePoolMBS = nil
static CurrentPool as NSAutoreleasePoolMBS = nil

LastPool = CurrentPool
CurrentPool = new NSAutoreleasePoolMBS
End Sub
```

Notes: The example code above is not needed in Xojo 2009r4 and above as the runtime does it automatically for you.

31.12.5 Properties

31.12.6 Handle as Integer

MBS Main Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the internally used NSAutoreleasePool object.
Notes: (Read and Write property)

31.13 Globals

31.13.1 NSLogMBS(message as string)

MBS Main Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes a message to the Console.app on Mac OS X.
Example:

```
Sub Log(message as string)
if TargetMacOS then
NSLogMBS message
else
System.DebugLog message
end if

End Sub
```

Notes: As with Mac OS X 10.8 the system.debugLog method does not write to Console.app. So use this function.

31.13.2 NSStringArraySortMBS(texts() as string, options as Integer) as string()

MBS Main Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sorts array of string with options.
Example:

```
// constants for the function:
const NSCaseInsensitiveSearch = 1
const NSLiteralSearch = 2
const NSBackwardsSearch = 4
const NSAnchoredSearch = 8
const NSNumericSearch = 64
const NSDiacriticInsensitiveSearch = 128
const NSWidthInsensitiveSearch = 256
const NSForcedOrderingSearch = 512

const NSOrderedAscending = -1
const NSOrderedSame = 0
const NSOrderedDescending = 1

// test array

dim a() as string = array("Test 1", "Test 2", "Test 12")
```

```
// sort with Cocoa sorting
dim r() as string = NSStringArraySortMBS(a, NSDiacriticInsensitiveSearch + _
NSWidthInsensitiveSearch + _
NSCaseInsensitiveSearch + _
NSNumericSearch)

// sort with xojo
a.sort

// show result
MsgBox "Cocoa: "+Join(r,", ")+EndOfLine+_
"Xojo: "+Join(a, ", ")
```

Notes: This function allows you to use NSStringCompareMBS for array sorting.

31.13.3 NSStringCompareMBS(s as string, t as string, options as Integer) as Integer

MBS Main Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Compares two things using the Cocoa string functions.
Example:

```
// constants for the function:
const NSCaseInsensitiveSearch = 1
const NSLiteralSearch = 2
const NSBackwardsSearch = 4
const NSAnchoredSearch = 8
const NSNumericSearch = 64
const NSDiacriticInsensitiveSearch = 128
const NSWidthInsensitiveSearch = 256
const NSForcedOrderingSearch = 512

const NSOrderedAscending = -1
const NSOrderedSame = 0
const NSOrderedDescending = 1

if NSStringCompareMBS("Hello","hello", NSCaseInsensitiveSearch)=0 then
msgbox "equal (correct)"
else
msgbox "not equal"
end if

if NSStringCompareMBS("Hello","hello", 0)=0 then
msgbox "equal"
```

```
else
msgbox "not equal (correct)"
end if

if NSStringCompareMBS("Hello","Hellö", NSDiacriticInsensitiveSearch)=0 then
msgbox "equal (correct)"
else
msgbox "not equal"
end if
```

Notes:

Following constants can be used for the compare:

NSCaseInsensitiveSearch	1	Case Insensitive
NSLiteralSearch	2	Exact character-by-character equivalence
NSBackwardsSearch	4	Search from end of source string
NSAnchoredSearch	8	Search is limited to start (or end, if NSBackwardsSearch) of source string
NSNumericSearch	64	Added in 10.2; Numbers within strings are compared using numeric value, that is, Foo2.txt <Foo7.txt <Foo25.txt; only applies to compare methods, not find
NSDiacriticInsensitiveSearch	128	If specified, ignores diacritics (o-umlaut = o)
NSWidthInsensitiveSearch	256	If specified, ignores width differences ('a' = UFF41)
NSForcedOrderingSearch	512	If specified, comparisons are forced to return either NSOrderedAscending or NSOrderedDescending if the strings are equivalent but not strictly equal, for stability when sorting (e.g. "aaa" >"AAA" with NSCaseInsensitiveSearch specified)

The constants NSDiacriticInsensitiveSearch, NSWidthInsensitiveSearch and NSForcedOrderingSearch are only for Mac OS X 10.5 and newer versions.

Returns value constants:

NSOrderedAscending	-1
NSOrderedSame	0
NSOrderedDescending	1

31.13.4 NSMakePointMBS(x as Double, y as Double) as NSPointMBS

MBS Main Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSPoint object based on coordinates.

31.13.5 NSMakeRangeMBS(location as UInt32, length as UInt32) as NSRangeMBS

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new range with the given values.

31.13.6 NSMakeRectMBS(x as Double, y as Double, w as Double, h as Double) as NSRectMBS

MBS Main Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSRect object based on coordinates and size.

31.13.7 NSMakeSizeMBS(w as Double, h as Double) as NSSizeMBS

MBS Main Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSSize object based on a size.

31.13.8 CenterResizeAddWindowMBS(win as window)

MBS MacExtras Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Adds a window to the list of center resizing windows.
Notes: Please call in open event of window.

31.13.9 CenterResizeInstallMBS

MBS MacExtras Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Installs the center resize function.
Notes:

The plugin can provide for Xojo and Xojo the center based window resizing.
Call this method early in app.open to prepare everything.

Than register windows with CenterResizeAddWindowMBS in window open event and unregister with CenterResizeRemoveWindowMBS in window close event. This works for all windows you register.

31.13.10 CenterResizeRemoveWindowMBS(win as window)

MBS MacExtras Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Removes a window from the list of center resizing windows.
Notes: Please call in Close event of window.

31.14 class NSBundleMBS

31.14.1 class NSBundleMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSBundle object represents a location in the file system that groups code and resources that can be used in a program.
Example:

MsgBox NSBundleMBS.mainBundle.bundlePath

Notes:

NSBundle objects locate program resources, dynamically load and unload executable code, and assist in localization. You build a bundle in Xcode using one of these project types: Application, Framework, plug-ins. Although bundle structures vary depending on the target platform and the type of bundle you are building, the NSBundle class hides this underlying structure in most (but not all) cases. Many of the methods you use to load resources from a bundle automatically locate the appropriate starting directory and look for resources in known places.

31.14.2 Blog Entries

- NSBundleMBS and NSDirectoryEnumeratorMBS

31.14.3 Methods

31.14.4 allBundles as NSBundleMBS()

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of all the application's non-framework bundles.
Example:

```
dim a(-1) as NSBundleMBS = NSBundleMBS.allBundles
dim lines(-1) as string
```

```
for each n as NSBundleMBS in a
lines.Append n.bundlePath
next

MsgBox Join(lines,EndOfLine)
```

Notes: The returned array includes the main bundle and all bundles that have been dynamically created but doesn't contain any bundles that represent frameworks.

31.14.5 allFrameworks as NSBundleMBS()

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of all of the application's bundles that represent frameworks.
Example:

```
dim a(-1) as NSBundleMBS = NSBundleMBS.allFrameworks
dim lines(-1) as string

for each n as NSBundleMBS in a
lines.Append n.bundlePath
next

MsgBox Join(lines,EndOfLine)
```

Notes:

Returns an array of all of the application's bundles that represent frameworks. Only frameworks with one or more Objective-C classes in them are included.

The returned array includes frameworks that are linked into an application when the application is built and bundles for frameworks that have been dynamically created.

31.14.6 builtInPlugInsFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver's subdirectory containing plug-ins.
Example:

```
MsgBox NSBundleMBS.mainBundle.builtInPlugInsFolder.DisplayName
```

Notes: This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

31.14.7 builtInPlugInsPath as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver's subdirectory containing plug-ins.
Example:

```
MsgBox NSBundleMBS.mainBundle.builtInPlugInsPath
```

Notes: This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

31.14.8 bundleFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver's bundle directory.
Example:

```
MsgBox NSBundleMBS.mainBundle.bundleFolder.DisplayName
```

31.14.9 bundleIdentifier as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's bundle identifier.
Example:

```
dim n as NSBundleMBS = NSBundleMBS.mainBundle
MsgBox n.bundleIdentifier
```

Notes: Returns the receiver's bundle identifier, which is defined by the CFBundleIdentifier key in the bundle's information property list.

31.14.10 bundlePath as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver's bundle directory.
Example:

```
MsgBox NSBundleMBS.mainBundle.bundlePath
```

31.14.11 bundleWithIdentifier(identifier as string) as NSBundleMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the previously created NSBundle instance that has the specified bundle identifier.
Example:

```
// create with path
dim x as NSBundleMBS = NSBundleMBS.bundleWithPath(SpecialFolder.Applications.Child("iTunes.app"))
MsgBox x.bundlePath

// once the bundle is known it will be in the allBundles array and be found with bundleWithIdentifier:
dim n as NSBundleMBS = NSBundleMBS.bundleWithIdentifier("com.apple.iTunes")
MsgBox n.bundlePath
```

Notes:

The previously created NSBundle instance that has the bundle identifier identifier. Returns nil if the requested bundle is not found.

This method is typically used by frameworks and plug-ins to locate their own bundle at runtime. This method may be somewhat more efficient than trying to locate the bundle using the bundleForClass method.

31.14.12 bundleWithPath(path as folderitem) as NSBundleMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSBundle object that corresponds to the specified directory.
Example:

```
// create with path
dim x as NSBundleMBS = NSBundleMBS.bundleWithPath(SpecialFolder.Applications.Child("iTunes.app"))
MsgBox x.bundlePath
```

Notes:

Returns the NSBundle object that corresponds to fullPath, or nil if fullPath does not identify an accessible bundle directory.

This method allocates and initializes the returned object if there is no existing NSBundle associated with fullPath, in which case it returns the existing object.
See also:

- 31.14.13 bundleWithPath(path as string) as NSBundleMBS 5949

31.14.13 bundleWithPath(path as string) as NSBundleMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSBundle object that corresponds to the specified directory.
Example:

```
// create with path
dim x as NSBundleMBS = NSBundleMBS.bundleWithPath("/Applications/iTunes.app")
MsgBox x.bundlePath
```

Notes:

Returns the NSBundle object that corresponds to fullPath, or nil if fullPath does not identify an accessible bundle directory.

This method allocates and initializes the returned object if there is no existing NSBundle associated with fullPath, in which case it returns the existing object.
See also:

- 31.14.12 bundleWithPath(path as folderitem) as NSBundleMBS 5948

31.14.14 Constructor(path as folderitem)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSBundle object that corresponds to the specified directory.
Example:

```
dim n as new NSBundleMBS(SpecialFolder.Applications.Child("iTunes.app"))
dim d as Dictionary = n.infoDictionary
MsgBox d.Value("CFBundleName")
```

Notes:

Creates the NSBundle object that corresponds to fullPath, or fails if fullPath does not identify an accessible bundle directory. On failure the handle property is 0.

This method allocates and initializes the returned object if there is no existing NSBundle associated with fullPath, in which case it returns the existing object.
See also:

- 31.14.15 Constructor(path as string) 5950

31.14.15 Constructor(path as string)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSBundle object that corresponds to the specified directory.
Example:

```
dim n as new NSBundleMBS("/Applications/iTunes.app")
dim d as Dictionary = n.infoDictionary
MsgBox d.Value("CFBundleName")
```

Notes:

Creates the NSBundle object that corresponds to fullPath, or fails if fullPath does not identify an accessible bundle directory. On failure the handle property is 0.

This method allocates and initializes the returned object if there is no existing NSBundle associated with fullPath, in which case it returns the existing object.
See also:

- 31.14.14 Constructor(path as folderitem) 5949

31.14.16 developmentLocalization as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the localization used to create the bundle.
Example:

```
MsgBox NSBundleMBS.mainBundle.developmentLocalization
```

Notes: The returned localization corresponds to the value in the CFBundleDevelopmentRegion key of the bundle's property list (Info.plist).

31.14.17 executableArchitectures as Integer()

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of numbers indicating the architecture types supported by the bundle's executable.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.app")
dim b as new NSBundleMBS(f)

dim lines(-1) as string

for each e as Integer in b.executableArchitectures
dim s as string
Select case e
case NSBundleMBS.NSBundleExecutableArchitectureI386
s="i386"
case NSBundleMBS.NSBundleExecutableArchitecturePPC
s="PPC"
case NSBundleMBS.NSBundleExecutableArchitecturePPC64
s="PPC 64-bit"
case NSBundleMBS.NSBundleExecutableArchitectureX86_64
s="x86 64-bit"
case 12
s="iPhone"
else
s=Str(e)
end Select
lines.Append hex(e)+": "+s
next

MsgBox Join(lines,EndOfLine)
```

Notes: This method scans the bundle's Mach-O executable and returns all of the architecture types it finds. Because they are taken directly from the executable, the returned values may not always correspond to one of the well-known CPU types defined in "Mach-O Architecture."

31.14.18 executableFile as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver's executable file.
Example:

```
MsgBox NSBundleMBS.mainBundle.executableFile.NativePath
```

31.14.19 executablePath as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver's executable file.
Example:

```
MsgBox NSBundleMBS.mainBundle.executablePath
```

31.14.20 infoDictionary as dictionary

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a dictionary that contains information about the receiver.
Example:

```
dim n as new NSBundleMBS(SpecialFolder.Applications.Child("iTunes.app"))
dim d as Dictionary = n.infoDictionary
dim lines(-1) as string

for each key as Variant in d.keys
dim value as Variant = d.Value(key)

// special handle folderitems
if value isa FolderItem then
dim f as FolderItem = value
value = f.Name
end if

lines.Append key.StringValue + " ->"+value.StringValue
next

MsgBox Join(lines,EndOfLine)
```

Notes: Returns a dictionary, constructed from the bundle's Info.plist file, that contains information about the receiver. If the bundle does not contain an Info.plist file, a valid dictionary is returned but this dictionary contains only private keys that are used internally by the NSBundle class. The NSBundle class may add extra keys to this dictionary for its own use.

31.14.21 isLoaded as boolean

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Obtains information about the load status of a bundle.
Example:

```
MsgBox str(NSBundleMBS.mainBundle.isLoaded) // mainbundle is always loaded
```

Notes: Returns true if the bundle's code is currently loaded, otherwise false.

31.14.22 load as boolean

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Dynamically loads the bundle's executable code into a running program, if the code has not already been loaded.
Notes:

Returns true if the method successfully loads the bundle's code or if the code has already been loaded, otherwise false.

You can use this method to load the code associated with a dynamically loaded bundle, such as a plug-in or framework. Prior to Mac OS X version 10.5, a bundle would attempt to load its code—if it had any—only once. Once loaded, you could not unload that code. In Mac OS X version 10.5 and later, you can unload a bundle's executable code using the unload method.
You don't need to load a bundle's executable code to search the bundle's resources.

31.14.23 localizations as string()

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a list of all the localizations contained within the receiver's bundle.
Example:

```
MsgBox join(NSBundleMBS.mainBundle.localizations,EndOfLine)
```

Notes: Returna an array, containing strings, that specifies all the localizations contained within the receiver's bundle.

31.14.24 localizedInfoDictionary as dictionary

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a dictionary with the keys from the bundle's localized property list.
Example:

```
dim n as new NSBundleMBS(SpecialFolder.Applications.Child("iTunes.app"))
dim d as Dictionary = n.localizedInfoDictionary
```

```
dim lines(-1) as string

for each key as Variant in d.keys
dim value as Variant = d.Value(key)

// special handle folderitems
if value isa FolderItem then
dim f as FolderItem = value
value = f.Name
end if

lines.Append key.StringValue + " ->"+value.StringValue
next

MsgBox Join(lines,EndOfLine)
```

Notes:

Returns a dictionary with the keys from the bundle's localized property list (InfoPlist.strings).

This method uses the preferred localization for the current user when determining which resources to return. If the preferred localization is not available, this method chooses the most appropriate localization found in the bundle.

31.14.25 localizedStringForKey(key as string, value as string="", tableName as string="") as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a localized version of the string designated by the specified key and residing in the specified table.
Notes:

key: The key for a string in the table identified by tableName.
value: The value to return if key is "" or if a localized string for key can't be found in the table.
tableName: The receiver's string table to search. If tableName is an empty string, the method attempts to use the table in Localizable.strings.

Returns a localized version of the string designated by key in table tableName. If value is nil or an empty string, and a localized string is not found in the table, returns key. If key and value are both nil, returns the empty string.

For more details about string localization and the specification of a .strings file, see "Working With Localized Strings."
Using the user default NSShowNonLocalizedStrings, you can alter the behavior of localizedStringForKey to

log a message when the method can't find a localized string. If you set this default to true (in the global domain or in the application's domain), then when the method can't find a localized string in the table, it logs a message to the console and capitalizes key before returning it.
The following example cycles through a static array of keys when a button is clicked, gets the value for each key from a strings table named Buttons.strings, and sets the button title with the returned value:

31.14.26 mainBundle as NSBundleMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NSBundle object that corresponds to the directory where the current application executable is located.
Example:

MsgBox NSBundleMBS.mainBundle.bundlePath

Notes:

Returns the NSBundle object that corresponds to the directory where the application executable is located, or nil if a bundle object could not be created.

This method allocates and initializes a bundle object if one doesn't already exist. The new object corresponds to the directory where the application executable is located. Be sure to check the return value to make sure you have a valid bundle. This method may return a valid bundle object even for unbundled applications.
In general, the main bundle corresponds to an application file package or application wrapper: a directory that bears the name of the application and is marked by a ".app" extension.

31.14.27 pathForImageResource(name as string) as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the location of the specified image resource file.
Notes:

name: The name of the image resource file, without any pathname information. Including a filename extension is optional.

Returns the absolute pathname of the resource file or nil if the file was not found.

Image resources are those files in the bundle that are recognized by the NSImage class, including those that can be converted using the Image IO framework.

31.14.28 pathForResource(name as string, extension as string) as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname for the resource identified by the specified name and file extension.
Notes:

name: The name of the resource file.
extension: If extension is an empty string, the extension is assumed not to exist and the file URL is the first file encountered that exactly matches name.

Returns the full pathname for the resource file or nil if the file could not be located.

The method first looks for a matching resource file in the non-localized resource directory of the specified bundle. (In Mac OS X, this directory is typically called Resources but in iPhone OS, it is the main bundle directory.) If a matching resource file is not found, it then looks in the top level of any available language-specific ".lproj" directories. (The search order for the language-specific directories corresponds to the user's preferences.) It does not recurse through other subdirectories at any of these locations. For more details see Bundles and Localization.
The following code fragment gets the path to a plist within the bundle, and loads it into a dictionary.
See also:

- 31.14.29 pathForResource(name as string, extension as string, subpath as string) as folderitem 5956
- 31.14.30 pathForResource(name as string, extension as string, subpath as string, localizationName as string) as folderitem 5957

31.14.29 pathForResource(name as string, extension as string, subpath as string) as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname for the resource identified by the specified name and file extension and located in the specified bundle subdirectory.
Notes:

name: The name of the resource file.
extension: If extension is an empty string, the extension is assumed not to exist and the file URL is the first file encountered that exactly matches name.
subpath: The name of the bundle subdirectory.

Returns the full pathname for the resource file or nil if the file could not be located.

If subpath is "", this method searches the top-level nonlocalized resource directory and the top-level of any language-specific directories. (In Mac OS X, the top-level nonlocalized resource directory is typically called Resources but in iPhone OS, it is the main bundle directory.) For example, suppose you have a Mac OS X application with a modern bundle and you specify "Documentation" for the subpath parameter. This

method would first look in the Contents/Resources/Documentation directory of the bundle, followed by the Documentation subdirectories of each language-specific .lproj directory. (The search order for the language-specific directories corresponds to the user's preferences.) This method does not recurse through any other subdirectories at any of these locations. For more details see Bundles and Localization.

- 31.14.28 pathForResource(name as string, extension as string) as folderitem 5956
- 31.14.30 pathForResource(name as string, extension as string, subpath as string, localizationName as string) as folderitem 5957

31.14.30 pathForResource(name as string, extension as string, subpath as string, localizationName as string) as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname for the resource identified by the specified name and file extension, located in the specified bundle subdirectory, and limited to global resources and those associated with the specified localization.
Notes:

name: The name of the resource file.
extension: If extension is an empty string, the extension is assumed not to exist and the file URL is the first file encountered that exactly matches name.
subpath: The name of the bundle subdirectory to search.
localizationName: The name of the localization. This parameter should correspond to the name of one of the bundle's language-specific resource directories without the .lproj extension.

Returns the full pathname for the resource file or nil if the file could not be located.

This method is equivalent to pathForResource:ofType, except that only nonlocalized resources and those in the language-specific .lproj directory specified by localizationName are searched.

There should typically be little reason to use this method—see Getting the Current Language and Locale.
See also:

- 31.14.28 pathForResource(name as string, extension as string) as folderitem 5956
- 31.14.29 pathForResource(name as string, extension as string, subpath as string) as folderitem 5956

31.14.31 pathForSoundResource(name as string) as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the location of the specified sound resource file.
Notes:

name: The name of the sound resource file, without any pathname information. Including a filename extension is optional

Returns the folderitme of the resource file or nil if the file was not found.

Sound resources are those files in the bundle that are recognized by the NSSound class. The types of sound files can be determined by calling the soundUnfilteredFileTypes method of NSSound.

31.14.32 preferredLocalizations as string()

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of strings indicating the actual localizations contained in the receiver's bundle.
Notes: An array of strings, each of which identifies the a localization in the receiver's bundle. The localizations in the array are not returned in any particular order.

31.14.33 privateFrameworksFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver's subdirectory containing frameworks.
Notes: This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

31.14.34 privateFrameworksPath as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver's subdirectory containing frameworks.
Notes: This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

31.14.35 resourceFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiving bundle's subdirectory containing resources.

31.14.36 resourcePath as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiving bundle's subdirectory containing resources.

31.14.37 sharedFrameworksFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver's subdirectory containing shared frameworks.
Notes: This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

31.14.38 sharedFrameworksPath as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver's subdirectory containing shared frameworks.
Notes: This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

31.14.39 sharedSupportFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver's subdirectory containing shared support files.
Notes: This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

31.14.40 sharedSupportPath as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full pathname of the receiver's subdirectory containing shared support files.
Notes: This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

31.14.41 unload as boolean

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Unloads the code associated with the receiver.
Notes:

Returns true if the bundle was successfully unloaded or was not already loaded; otherwise, false if the bundle could not be unloaded.

This method attempts to unload a bundle's executable code using the underlying dynamic loader (typically dyld). You may use this method to unload plug-in and framework bundles when you no longer need the code they contain. You should use this method to unload bundles that were loaded using the methods of the NSBundle class only. Do not use this method to unload bundles that were originally loaded using the bundle-manipulation functions in Core Foundation.
It is the responsibility of the caller to ensure that no in-memory objects or data structures refer to the code being unloaded. For example, if you have an object whose class is defined in a bundle, you must release that object prior to unloading the bundle. Similarly, your code should not attempt to access any symbols defined in an unloaded bundle.

Prior to Mac OS X version 10.5, code could not be unloaded once loaded, and this method would always return false. In Mac OS X version 10.5 and later, you can unload a bundle's executable code using this method.

Available in Mac OS X v10.5 and later.

31.14.42 Properties

31.14.43 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSBundle object.
Example:

MsgBox hex(NSBundleMBS.mainBundle.Handle)

Notes: (Read and Write property)

31.14.44 Constants

31.14.45 NSBundleExecutableArchitectureI386 = 7

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** One of the constants describe the CPU types that a bundle's executable code may support.
Notes:

Specifies the 32-bit Intel architecture.
Available in Mac OS X v10.5 and later.

31.14.46 NSBundleExecutableArchitecturePPC = & h12

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** One of the constants describe the CPU types that a bundle's executable code may support.
Notes:

Specifies the 32-bit PowerPC architecture.
Available in Mac OS X v10.5 and later.

31.14.47 NSBundleExecutableArchitecturePPC64 = & h01000012

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** One of the constants describe the CPU types that a bundle's executable code may support.
Notes:

Specifies the 64-bit PowerPC architecture.
Available in Mac OS X v10.5 and later.

31.14.48 NSBundleExecutableArchitectureX86_64 = & h01000007

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** One of the constants describe the CPU types that a bundle's executable code may support.
Notes:

Specifies the 64-bit Intel architecture.
Available in Mac OS X v10.5 and later.

31.15 class NSCalendarMBS

31.15.1 class NSCalendarMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The calendar class for Cocoa.
Notes:

see also
https://developer.apple.com/library/mac/# documentation/Cocoa/Reference/Foundation/Classes/NSCalendar_Class/Reference/NSCalendar.html

31.15.2 Blog Entries

- MBS Xojo Plugins, version 20.1pr1
- MBS Real Studio Plugins, version 12.3pr11

31.15.3 Methods

31.15.4 autoupdatingCurrentCalendar as NSCalendarMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current logical calendar for the current user.
Notes:

Settings you get from this calendar do change as the user's settings change (contrast with currentCalendar).

Note that if you cache values based on the calendar or related information those caches will of course not be automatically updated by the updating of the calendar object.

Available in Mac OS X v10.5 and later.

31.15.5 calendarIdentifier as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the identifier for the receiver.

31.15.6 componentsInTimeZone(timezone as NSTimeZoneMBS, date as Date) as NSDateComponentsMBS

MBS MacBase Plugin, Plugin Version: 20.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns all the date components of a date, as if in a given time zone (instead of the receiving calendar's time zone).
Notes:

timezone: The time zone to use when returning the components. This value overrides the time zone of the receiving NSCalendar.
date: The date for which to perform the calculation.

Returns an NSDateComponents object containing all the components from the given date, calculated using the given time zone.

31.15.7 Constructor

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates new calendar object with current calendar.
See also:

- 31.15.8 Constructor(identifier as string) 5963

31.15.8 Constructor(identifier as string)

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a newly-allocated NSCalendar object for the calendar specified by a given identifier.
See also:

- 31.15.7 Constructor 5963

31.15.9 copy as NSCalendarMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a copy of the calendar object.

31.15.10 currentCalendar as NSCalendarMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the logical calendar for the current user.
Notes: The returned calendar is formed from the settings for the current user's chosen system locale overlaid

with any custom settings the user has specified in System Preferences. Settings you get from this calendar do not change as System Preferences are changed, so that your operations are consistent (contrast with autoupdatingCurrentCalendar).

31.15.11 dateByAddingComponents(components as NSDateComponentsMBS, toDate as Date, Options as Integer = 0) as Date

MBS MacBase Plugin, Plugin Version: 20.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a date representing the absolute time calculated by adding given components to a given date.
Notes:

components: The components to add to date.
date: The date to which comps are added.
options: Options for the calculation. See NSCalendarOptions in Apple documentation for possible values.

If you specify no options, overflow in a unit carries into the higher units (as in typical addition).

Returns a new date representing the absolute time calculated by adding to date the calendrical components specified by comps using the options specified by opts. Returns nil if date falls outside the defined range of the receiver or if the computation cannot be performed.

31.15.12 dateFromComponents(components as NSDateComponentsMBS) as Date

MBS MacBase Plugin, Plugin Version: 20.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a date representing the absolute time calculated from given components.
Notes:

components: The components from which to calculate the returned date.

Returns a new Date object representing the absolute time calculated from comps. Returns nil if the receiver cannot convert the components given in comps into an NSDate object.

31.15.13 description as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The description for this timezone.

31.15.14 Print

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the calendar to debug output.
Notes: This may help for debugging and you see output in console app.

31.15.15 Properties

31.15.16 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

31.15.17 firstWeekday as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The index of the first weekday.
Notes: (Read and Write computed property)

31.15.18 locale as NSLocaleMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The locale.
Notes: (Read and Write computed property)

31.15.19 minimumDaysInFirstWeek as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minimum number of days in the first week.
Notes: (Read and Write computed property)

31.15.20 timeZone as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The time zone.

Notes: (Read and Write computed property)

31.16 class NSCharacterSetMBS

31.16.1 class NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSCharacterSet object represents a set of Unicode-compliant characters.
Example:

```
// get the Symbol font
dim n as NSFontMBS = NSFontMBS.fontWithName("Symbol",10)

// what characters are defined for this font?
dim c as NSCharacterSetMBS = n.coveredCharacterSet

// display a string with all the characters
MsgBox c.StringValue
```

Notes:

NSString and NSScanner objects use NSCharacterSet objects to group characters together for searching operations, so that they can find any of a particular set of characters during a search. The cluster's two public classes, NSCharacterSet and NSMutableCharacterSet, declare the programmatic interface for static and dynamic character sets, respectively.

The objects you create using these classes are referred to as character set objects (and when no confusion will result, merely as character sets). Because of the nature of class clusters, character set objects aren't actual instances of the NSCharacterSet or NSMutableCharacterSet classes but of one of their private subclasses. Although a character set object's class is private, its interface is public, as declared by these abstract superclasses, NSCharacterSet and NSMutableCharacterSet. The character set classes adopt the NSCopying and NSMutableCopying protocols, making it convenient to convert a character set of one type to the other.

The NSCharacterSet class declares the programmatic interface for an object that manages a set of Unicode characters (see the NSString class cluster specification for information on Unicode). NSCharacterSet's principal primitive method, characterIsMember:, provides the basis for all other instance methods in its interface. A subclass of NSCharacterSet needs only to implement this method, plus mutableCopyWithZone:, for proper behavior. For optimal performance, a subclass should also override bitmapRepresentation, which otherwise works by invoking characterIsMember: for every possible Unicode value.

NSCharacterSet is "toll-free bridged" with its Cocoa Foundation counterpart, CFCharacterSet Reference. This means that the Core Foundation type is interchangeable in function or method calls with the bridged Foundation object. Therefore, in a method where you see an NSCharacterSet * parameter, you can pass a CFCharacterSetRef, and in a function where you see a CFCharacterSetRef parameter, you can pass an NSCharacterSet instance (you cast one type to the other to suppress compiler warnings). See Interchangeable Data Types for more information on toll-free bridging.

The mutable subclass of NSCharacterSet is NSMutableCharacterSet.

31.16.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.1pr7
- Nearly 2000 new Functions in the 9.6 prerelease of MBS

31.16.3 Xojo Developer Magazine

- 7.6, page 8: News

31.16.4 Methods

31.16.5 alphanumericCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the categories Letters, Marks, and Numbers.
Example:

```
dim n as NSCharacterSetMBS = NSCharacterSetMBS.alphanumericCharacterSet
MsgBox left(n,200) // show only first 200 chars
```

Notes: Informally, this set is the set of all characters used as basic units of alphabets, syllabaries, ideographs, and digits.

31.16.6 bitmapRepresentation as MemoryBlock

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a memoryblock object encoding the receiver in binary format.
Notes:

This format is suitable for saving to a file or otherwise transmitting or archiving.
A raw bitmap representation of a character set is a byte array of 2^16 bits (that is, 8192 bytes). The value of the bit at position n represents the presence in the character set of the character with decimal Unicode value n.

31.16.7 capitalizedLetterCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the category of Titlecase Letters.
Example:

```
dim n as NSCharacterSetMBS = NSCharacterSetMBS.capitalizedLetterCharacterSet
MsgBox n
```

31.16.8 characterIsMember(Character as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether a given character is in the receiver.
Example:

```
// get the Symbol font
dim n as NSFontMBS = NSFontMBS.fontWithName("Arial",10)

// what characters are defined for this font?
dim c as NSCharacterSetMBS = n.coveredCharacterSet

// is letter A part of this font?
MsgBox "A included: "+str(c.characterIsMember(asc("A")))
```

31.16.9 characterSetWithBitmapRepresentation(data as MemoryBlock) as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing characters determined by a given bitmap representation.
Notes:

This method is useful for creating a character set object with data from a file or other external data source.

A raw bitmap representation of a character set is a byte array of 2^16 bits (that is, 8192 bytes). The value of the bit at position n represents the presence in the character set of the character with decimal Unicode value n.

31.16.10 characterSetWithCharactersInString(aString as string) as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in a given string.
Example:

```
dim n as NSCharacterSetMBS = NSCharacterSetMBS.characterSetWithCharactersInString("Hello World")
MsgBox n
```

Notes: A character set containing the characters in aString. Returns an empty character set if aString is empty.

31.16.11 characterSetWithContentsOfFile(aString as string) as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set read from the bitmap representation stored in the file a given path.
Notes:

To read a bitmap representation from any file, use the NSData methoddataWithContentsOfFile and pass the result to characterSetWithBitmapRepresentation.

This method doesn't use filenames to check for the uniqueness of the character sets it creates. To prevent duplication of character sets in memory, cache them and make them available through an API that checks whether the requested set has already been loaded.
See also:

- 31.16.12 characterSetWithContentsOfFile(file as folderitem) as NSCharacterSetMBS 5970

31.16.12 characterSetWithContentsOfFile(file as folderitem) as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set read from the bitmap representation stored in the file a given path.
Notes:

To read a bitmap representation from any file, use the NSData.methoddataWithContentsOfFile and pass the result to characterSetWithBitmapRepresentation.

This method doesn't use filenames to check for the uniqueness of the character sets it creates. To prevent duplication of character sets in memory, cache them and make them available through an API that checks

whether the requested set has already been loaded.
See also:

- 31.16.11 characterSetWithContentsOfFile(aString as string) as NSCharacterSetMBS 5970

31.16.13 characterSetWithRange(r as NSRangeMBS) as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing characters with Unicode values in a given range.
Example:

```
dim r as NSRangeMBS = NSMakeRangeMBS(asc("a"),26) // all small letters
dim n as NSCharacterSetMBS = NSCharacterSetMBS.characterSetWithRange(r)
MsgBox n
```

Notes:

r: A range of Unicode values.

r.location is the value of the first character to return; aRange.location + r.length-1 is the value of the last.

Returns a character set containing characters whose Unicode values are given by aRange. If aRange.length is 0, returns an empty character set.

This code excerpt creates a character set object containing the lowercase English alphabetic characters:

31.16.14 componentsSeparatedByCharactersInSet(s as string) as String()

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array containing substrings from the receiver that have been divided by characters in a given set.
Notes:

self: A character set containing the characters to to use to split the receiver. Must not be nil.
s: The text to process.

Returns an array of string containing substrings from the receiver that have been divided by characters in separator.

The substrings in the array appear in the order they did in the receiver. Adjacent occurrences of the separator characters produce empty strings in the result. Similarly, if the string begins or ends with separator

characters, the first or last substring, respectively, is empty.

31.16.15 Constructor

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor to create an empty character set.

31.16.16 controlCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the categories of Control or Format Characters.
Notes: These characters are specifically the Unicode values U+0000 to U+001F and U+007F to U+009F.

31.16.17 copy as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the character set.

31.16.18 decimalDigitCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the category of Decimal Numbers.
Example:

```
dim n as NSCharacterSetMBS = NSCharacterSetMBS.decimalDigitCharacterSet
MsgBox n
```

Notes: Informally, this set is the set of all characters used to represent the decimal values 0 through 9. These characters include, for example, the decimal digits of the Indic scripts and Arabic.

31.16.19 decomposableCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing all individual Unicode characters that can also be represented as composed character sequences.
Notes:

Returns a character set containing all individual Unicode characters that can also be represented as composed character sequences (such as for letters with accents), by the definition of "standard decomposition" in version 3.2 of the Unicode character encoding standard.

These characters include compatibility characters as well as pre-composed characters.

Note: This character set doesn't currently include the Hangul characters defined in version 2.0 of the Unicode standard.

31.16.20 hasMemberInPlane(thePlane as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver has at least one member in a given character plane.
Notes: This method makes it easier to find the plane containing the members of the current character set. The Basic Multilingual Plane is plane 0.

31.16.21 illegalCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing values in the category of Non-Characters or that have not yet been defined in version 3.2 of the Unicode standard.

31.16.22 invertedSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing only characters that don't exist in the receiver.
Notes: Inverting an immutable character set is much more efficient than inverting a mutable character set.

31.16.23 isSupersetOfSet(theOtherSet as NSCharacterSetMBS) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver is a superset of another given character set.
Notes:

Returns true if the receiver is a superset of theOtherSet, otherwise false.
Available in Mac OS X v10.2 and later.

31.16.24 letterCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the categories Letters and Marks.
Example:

```
dim n as NSCharacterSetMBS = NSCharacterSetMBS.letterCharacterSet
MsgBox n
```

Notes: Informally, this set is the set of all characters used as letters of alphabets and ideographs.

31.16.25 longCharacterIsMember(theLongChar as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether a given long character is a member of the receiver.
Notes:

Returns true if theLongChar is in the receiver, otherwise false.
This method supports the specification of 32-bit characters.
Available in Mac OS X v10.2 and later.

31.16.26 lowercaseLetterCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the category of Lowercase Letters.
Example:

```
dim n as NSCharacterSetMBS = NSCharacterSetMBS.lowercaseLetterCharacterSet
MsgBox n
```

Notes: Informally, this set is the set of all characters used as lowercase letters in alphabets that make case distinctions.

31.16.27 mutableCopy as NSMutableCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a mutable copy of the characterset.

31.16.28 newlineCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the newline characters.
Example:

```
dim n as NSCharacterSetMBS = NSCharacterSetMBS.newlineCharacterSet
MsgBox n
```

Notes:

A character set containing the newline characters (U+000A–U+000D, U+0085).
Available in Mac OS X v10.5 and later.

31.16.29 nonBaseCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the category of Marks.
Example:

```
dim n as NSCharacterSetMBS = NSCharacterSetMBS.nonBaseCharacterSet
MsgBox n
```

Notes: This set is also defined as all legal Unicode characters with a non-spacing priority greater than 0. Informally, this set is the set of all characters used as modifiers of base characters.

31.16.30 Operator_Convert as string

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string containing all characters in this set.
Example:

```
dim r as NSRangeMBS = NSMakeRangeMBS(asc("a"),26) // all small letters
dim n as NSCharacterSetMBS = NSCharacterSetMBS.characterSetWithRange(r)
MsgBox n
```

Notes: This way you can use a characterset directly with functions expecting a string like msgbox.

31.16.31 punctuationCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the category of Punctuation.
Example:

```
dim n as NSCharacterSetMBS = NSCharacterSetMBS.punctuationCharacterSet
MsgBox n
```

Notes: Informally, this set is the set of all non-whitespace characters used to separate linguistic units in scripts, such as periods, dashes, parentheses, and so on.

31.16.32 rangeOfCharacterFromSet(s as string, options as Integer = 0, searchRange as NSRangeMBS = nil) as NSRangeMBS

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Finds and returns the range in the receiver of the first character from a given character set found in a given range with given options.
Notes:

self: A character set. This value must not be nil.
s: The text to process:
options: A mask specifying search options. The following options may be specified by combining them with bitwise OR operator: NSAnchoredSearch (8), NSBackwardsSearch (4).
searchRange: Optional, the range in which to search. The range must not exceed the bounds of the receiver.

Raises a NSException if search range is invalid.

Returns the range in the receiver of the first character found from set within search range. Returns a range of { NSNotFound, 0 } if none of the characters in aSet are found.

Because pre-composed characters in set can match composed character sequences in the receiver, the length of the returned range can be greater than 1. For example, if you search for "ü" in the string "stru¨del", the returned range is { 3,2 } .

Special Considerations
This method detects all invalid ranges (including those with negative lengths). For applications linked against OS X v10.6 and later, this error causes an exception; for applications linked against earlier releases, this error causes a warning, which is displayed just once per application execution.

31.16.33 stringByTrimmingCharactersInSet(s as string) as String

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new string made by removing from both ends of the receiver characters contained in a given character set.
Notes:

Retruns a new string made by removing from both ends of the receiver characters contained in set. If the receiver is composed entirely of characters from set, the empty string is returned.

Use whitespaceCharacterSet or whitespaceAndNewlineCharacterSet to remove whitespace around strings.

31.16.34 StringValue as string

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string containing all characters in this set.
Example:

```
// get the Symbol font
dim n as NSFontMBS = NSFontMBS.fontWithName("Symbol",10)

// what characters are defined for this font?
dim c as NSCharacterSetMBS = n.coveredCharacterSet

// display a string with all the characters
MsgBox c.StringValue
```

31.16.35 symbolCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the category of Symbols.
Example:

```
dim n as NSCharacterSetMBS = NSCharacterSetMBS.symbolCharacterSet
MsgBox n
```

Notes:

These characters include, for example, the dollar sign ($) and the plus (+) sign.
Available in Mac OS X v10.3 and later.

31.16.36 uppercaseLetterCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing the characters in the categories of Uppercase Letters and Titlecase Letters.
Example:

```
dim n as NSCharacterSetMBS = NSCharacterSetMBS.uppercaseLetterCharacterSet
MsgBox n
```

Notes: Informally, this set is the set of all characters used as uppercase letters in alphabets that make case distinctions.

31.16.37 whitespaceAndNewlineCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing only the whitespace characters space (U+0020) and tab (U+0009) and the newline and nextline characters (U+000A–U+000D, U+0085).
Example:

```
dim n as NSCharacterSetMBS = NSCharacterSetMBS.whitespaceAndNewlineCharacterSet
MsgBox n
```

31.16.38 whitespaceCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a character set containing only the in-line whitespace characters space (U+0020) and tab (U+0009).
Example:

```
dim n as NSCharacterSetMBS = NSCharacterSetMBS.whitespaceCharacterSet
MsgBox n
```

Notes: This set doesn't contain the newline or carriage return characters.

31.16.39 Properties

31.16.40 Handle as Integer

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

31.16.41 Constants

31.16.42 NSOpenStepUnicodeReservedBase=& hF400

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** A constant to specify lower bound for a Unicode character range reserved for Apple's corporate use.
Notes: Specifies lower bound for a Unicode character range reserved for Apple's corporate use (the range is 0xF400–0xF8FF).

31.17 class NSCoderMBS

31.17.1 class NSCoderMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The plugin class for NSCoder.
Example:

```
// make archiver
dim a as new NSKeyedArchiverMBS

// add a string
a.encodeString "Hello World", "Greeting"

// finish
a.finishEncoding

// query data
dim m as MemoryBlock = a.archiverData

// start unarchiver
dim u as new NSKeyedUnarchiverMBS(m)

// query and display a value
dim s as string = u.decodeString("Greeting")
MsgBox s
```

Notes:

The NSCoder abstract class declares the interface used by concrete subclasses to transfer objects and other Objective-C data items between memory and some other format. This capability provides the basis for archiving (where objects and data items are stored on disk) and distribution (where objects and data items are copied between different processes or threads). The concrete subclasses provided by Foundation for these purposes are NSArchiver, NSUnarchiver, NSKeyedArchiver, NSKeyedUnarchiver, and NSPortCoder. Concrete subclasses of NSCoder are referred to in general as coder classes, and instances of these classes as coder objects (or simply coders). A coder object that can only encode values is referred to as an encoder object, and one that can only decode values as a decoder object.

NSCoder operates on objects, scalars, C arrays, structures, and strings, and on pointers to these types. It does not handle types whose implementation varies across platforms, such as union, void *, function pointers, and long chains of pointers. A coder object stores object type information along with the data, so an object decoded from a stream of bytes is normally of the same class as the object that was originally encoded into the stream. An object can change its class when encoded, however; this is described in Archives and Serializations Programming Guide.

For details of how to create a subclass of NSCoder, see "Subclassing NSCoder" in Archives and Serializations Programming Guide.

The plugin implements this class because it is needed to encode and decode the window state.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

31.17.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr1
- MBS Real Studio Plugins, version 11.3pr2
- MBS Real Studio Plugins, version 11.2pr11

31.17.3 Methods

31.17.4 allowsKeyedCoding as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver supports keyed coding of objects.
Notes: The default implementation returns false. Concrete subclasses that support keyed coding, such as NSKeyedArchiver, need to override this method to return true.

31.17.5 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

31.17.6 containsValueForKey(key as string) as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether an encoded value is available for a string.

31.17.7 decodeBool(key as string) as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes and returns a boolean value that was previously encoded with encodeBool and associated with the string key.

31.17.8 decodeBytes(key as string) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes a buffer of data whose types are unspecified.

31.17.9 decodeCFObjectMBS(key as string) as Variant

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes CFObject object.
Notes:

This is a special convenience methods to decode CF* classes which are bridged to Cocoa objects.
Like CFDictionary, CFURL, CFData, CFString, CFNumber, CFArray and a few others.

31.17.10 decodeDictionary(key as string) as Dictionary

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes a dictionary.

31.17.11 decodeDouble(key as string) as Double

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes and returns a double value that was previously encoded with either encodeFloat or encodeDouble and associated with the string key.

31.17.12 decodeFloat(key as string) as single

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes and returns a float value that was previously encoded with encodeFloat or encodeDouble and associated with the string key.

31.17.13 decodeInt32(key as string) as Int32

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes and returns a 32-bit integer value that was previously encoded with encodeInt, encodeInteger, encodeInt32, or encodeInt64 and associated with the string key.
Notes: If the encoded integer does not fit into a 32-bit integer, the method raises an NSRangeException.

31.17.14 decodeInt64(key as string) as Int64

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes and returns a 64-bit integer value that was previously encoded with encodeInt, encodeInteger, encodeInt32, or encodeInt64 and associated with the string key.

31.17.15 decodeNSURLFile(key as string) as folderitem

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes an NSURL and returns folderitem.

31.17.16 decodeNSURLString(key as string) as String

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes an NSURL and returns string.

31.17.17 decodePoint(key as string) as NSPointMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes a point object.

31.17.18 decodeRect(key as string) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes a rectangle.

31.17.19 decodeSize(key as string) as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes a size object.

31.17.20 decodeString(key as string) as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decodes a string.

31.17.21 encodeBool(value as boolean, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes value and associates it with the string key.

31.17.22 encodeBytes(value as MemoryBlock, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a buffer of data whose types are unspecified.

31.17.23 encodeCFObjectMBS(value as Variant, key as string)

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a CFObject.
Notes:

This is a special convenience methods to encode CF* classes which are bridged to Cocoa objects.
Like CFDictionary, CFURL, CFData, CFString, CFNumber, CFArray and a few others.

31.17.24 encodeDictionary(value as Dictionary, key as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a dictionary.
Notes:

Not all objects can be inside the dictionary.
Cocoa objects, string, booleans and numbers are okay.

31.17.25 encodeDouble(value as Double, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes value and associates it with the string key.

31.17.26 encodeFloat(value as single, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes value and associates it with the string key.

31.17.27 encodeInt32(value as Int32, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes the 32-bit integer value and associates it with the string key.

31.17.28 encodeInt64(value as Int64, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes the 64-bit integer value and associates it with the string key.

31.17.29 encodeNSURLFile(value as folderitem, key as string)

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a folderitem as NSURL.

31.17.30 encodeNSURLString(value as String, key as string)

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a string with URL as NSURL object.

31.17.31 encodePoint(value as NSPointMBS, key as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a point object.

31.17.32 encodeRect(value as NSRectMBS, key as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a rectangle.

31.17.33 encodeSize(value as NSSizeMBS, key as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a size object.

31.17.34 encodeString(value as string, key as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Encodes a string.

31.17.35 systemVersion as Integer

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** During encoding, this method should return the system version currently in effect.
Notes:

During decoding, this method should return the version that was in effect when the data was encoded.

By default, this method returns the current system version, which is appropriate for encoding but not for decoding. Subclasses that implement decoding must override this method to return the system version of the data being decoded.

31.17.36 Properties

31.17.37 Handle as Integer

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference for this object.
Notes: (Read and Write property)

31.18 class NSCursorMBS

31.18.1 class NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Instances of the NSCursor class manage the appearance of the cursor.
Example:

```
Dim im As NSImageMBS
Dim p As Picture
Dim m As Picture
Dim theCursor As NSCursorMBS
Dim test As Boolean

// create a blue ball picture
p = New Picture(16,16,32)
p.Graphics.ForeColor = & c0000FF
p.Graphics.FillRect 0,0,16,16

m = New Picture(16,16,32)
m.Graphics.ForeColor = & c000000
m.Graphics.Filloval 0,0,16,16

// Create a new NSImage
im=New NSImageMBS(p,m)

// Create a cursor from the NSImage
theCursor=New NSCursorMBS(im, 10, 10)

Title = Str(theCursor.Handle)

// Make this the active cursor
theCursor.set

// display picture
p.Mask.Graphics.DrawPicture m,0,0
Backdrop = p

// so you see it for a second before RB resets the cursor
DelayMBS 1.0
```

Notes:

In Cocoa, you can change the currently displayed cursor based on the position of the mouse over one of your views. You might use this technique to provide visual feedback about what actions the user can take with the mouse. For example, you might display one of the resize cursors whenever the mouse moves over

a portion of your view that acts as a custom resizing handle. To set this up, you associate a cursor object with one or more cursor rectangles in the view.

Cursor rectangles are a specialized type of tracking rectangles, which are used to monitor the mouse location in a view. Views implement cursor rectangles using tracking rectangles but provide methods for setting and refreshing cursor rectangles that are distinct from the generic tracking rectangle interface. For information on how to set up cursor rectangles, see "Handling Tracking-Rectangle and Cursor-Update Events in Views".

31.18.2 Blog Entries

- MBS Xojo Plugins, version 20.1pr3
- MBS Real Studio Plugins, version 11.2pr9

31.18.3 Methods

31.18.4 arrowCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default cursor, the arrow cursor.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.arrowCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes: The default cursor, a slanted arrow with its hot spot at the tip. The arrow cursor is the one you're used to seeing over buttons, scrollers, and many other objects in the window system.

31.18.5 closedHandCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the closed-hand system cursor.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.closedHandCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

31.18.6 Constructor(image as NSImageMBS, foregroundColorHint as NSColorMBS, backgroundColorHint as NSColorMBS, HotSpotX as Double, HotSpotY as Double)

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the cursor with the specified image and hot spot.
See also:

- 31.18.7 Constructor(image as NSImageMBS, HotSpotX as Double, HotSpotY as Double) 5989

31.18.7 Constructor(image as NSImageMBS, HotSpotX as Double, HotSpotY as Double)

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the cursor with the specified image and hot spot.
See also:

- 31.18.6 Constructor(image as NSImageMBS, foregroundColorHint as NSColorMBS, backgroundColorHint as NSColorMBS, HotSpotX as Double, HotSpotY as Double) 5989

31.18.8 contextualMenuCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the contextual menu system cursor.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.contextualMenuCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes: Available in Mac OS X v10.6 and later.

31.18.9 crosshairCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the cross-hair system cursor.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.crosshairCursor
dim i as NSImageMBS = c.image
```

```
window1.Backdrop=i.CopyPictureWithMask
```

Notes: This cursor is used for situations when precise location is required (where the lines cross is the hot spot).

31.18.10 currentCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the application's current cursor.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.currentCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes: The top cursor on the application's cursor stack. This cursor may not be the visible cursor on the screen if a different application is currently active.

31.18.11 currentSystemCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current system cursor.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.currentSystemCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes:

Returns a cursor whose image and hot spot match those of the currently-displayed cursor on the system.
This method returns the current system cursor regardless of which application set the cursor, and whether Cocoa or Carbon APIs were used to set it.
This method replaces the now deprecated QDGetCursorData function.
Available in Mac OS X v10.6 and later.

31.18.12 disappearingItemCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a cursor indicating that the current operation will result in a disappearing item.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.disappearingItemCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes:

The system cursor that indicates that the current operation will result in a disappearing item (for example, when dragging an item from the dock or a toolbar).

Available in Mac OS X v10.3 and later.

31.18.13 dragCopyCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a cursor indicating that the current operation will result in a copy action.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.dragCopyCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes: Available in Mac OS X v10.6 and later.

31.18.14 dragLinkCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a cursor indicating that the current operation will result in a link action.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.dragLinkCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes: Available in Mac OS X v10.6 and later.

31.18.15 hide

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Makes the current cursor invisible.
Notes:

If another cursor becomes current, that cursor will be invisible, too. It will remain invisible until you invoke the unhide method.

hide overrides setHiddenUntilMouseMoves.

31.18.16 hotSpotX as Double

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the position of the cursor's hot spot.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.arrowCursor

MsgBox str(c.hotSpotX)+"/"+str(c.hotSpotY)
```

Notes:

The point describing the position of the hot spot, specified according to the cursor's flipped coordinate system.

For a more complete explanation, see the class description.

Note that an NSCursor object is immutable: you cannot change its hot spot after it's created. Instead, use the Constructor to create a new cursor with the new settings.

31.18.17 hotSpotY as Double

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the position of the cursor's hot spot.

Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.arrowCursor

MsgBox str(c.hotSpotX)+"/"+str(c.hotSpotY)
```

Notes:

The point describing the position of the hot spot, specified according to the cursor's flipped coordinate system.

For a more complete explanation, see the class description.

Note that an NSCursor object is immutable: you cannot change its hot spot after it's created. Instead, use the Constructor to create a new cursor with the new settings.

31.18.18 IBeamCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a cursor that looks like a capital I with a tiny crossbeam at its middle.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.IBeamCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes: The I-beam cursor. This is the cursor that you're used to seeing over editable or selectable text. The I-beam cursor's default hot spot is where the crossbeam intersects the I.

31.18.19 IBeamCursorForVerticalLayout as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a cursor that looks like a capital I with a tiny crossbeam at its middle.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.IBeamCursorForVerticalLayout
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes: Available in Mac OS X 10.7.

31.18.20 image as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's image.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.arrowCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes:

The cursor image or nil if none exists

Note that an NSCursor object is immutable: you cannot change its image after it's created. Instead, use the constructor to create a new cursor with the new settings.

31.18.21 isSetOnMouseEntered as boolean

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the receiver becomes current on receiving a mouseEntered message.
Notes:

True if the receiver will become current when it receives a mouseEntered message; otherwise, false.

To receive such a message, the receiver must first be assigned a cursor rectangle. This assignment can be made using the NSView method addCursorRect. For a more complete explanation, see the class description.

31.18.22 isSetOnMouseExited as boolean

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the receiver becomes current when it receives a mouseExited: message.
Notes:

True if the receiver becomes current when it receives a mouseExited: message; otherwise, false.

To receive such a message, the receiver must first be assigned a cursor rectangle. This assignment can be made using the NSView method addCursorRect. For a more complete explanation, see the class description.

31.18.23 mouseEntered(e as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Automatically sent to the receiver when the cursor enters a cursor rectangle owned by the receiver.
Notes:

If used after setOnMouseEntered has been called with an argument of true, mouseEntered can make the receiver the current cursor.

In your programs, you won't invoke mouseEntered explicitly. It's only included in the class interface so you can override it.

For a more complete explanation, see "Handling Tracking-Rectangle and Cursor-Update Events in Views" and the NSView method addTrackingRect

31.18.24 mouseExited(e as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Automatically sent to the receiver when the cursor exits a cursor rectangle owned by the receiver.
Notes:

Like mouseEntered, this message is part of the class interface only so you can override it.

For a more complete explanation, see "Handling Tracking-Rectangle and Cursor-Update Events in Views" and the NSView method addTrackingRect.

31.18.25 openHandCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the open-hand system cursor.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.openHandCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes: Available in Mac OS X v10.3 and later.

31.18.26 operationNotAllowedCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the operation not allowed cursor.
Notes:

This cursor indicates that the operation that is being attempted, perhaps dragging to an item that can't accept the drag type, is being denied.

Available in Mac OS X v10.6 and later.

31.18.27 pointingHandCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the pointing-hand system cursor.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.pointingHandCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes: The pointing-hand cursor. The tip of the pointing finger is the hot spot.

31.18.28 pop

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Pops the current cursor off the top of the stack.
Notes: The new object on the top of the stack becomes the current cursor. If the current cursor is the only cursor on the stack, this method does nothing.
See also:

- 31.18.29 pop

31.18.29 pop

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sends a pop message to the receiver's class.
See also:

- 31.18.28 pop 5996

31.18.30 push

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Puts the receiver on top of the cursor stack and makes it the current cursor.

31.18.31 resizeDownCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the resize-down system cursor.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.resizeDownCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes:

The resize-down cursor. This cursor is used when moving or resizing an object to indicate that the user can move only in the indicated direction.

Available in Mac OS X v10.3 and later.

31.18.32 resizeLeftCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the resize-left system cursor.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.resizeLeftCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes:

The resize-left cursor. This cursor is used when moving or resizing an object to indicate that the user can move only in the indicated direction.

Available in Mac OS X v10.3 and later.

31.18.33 resizeLeftRightCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the resize-left-and-right system cursor.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.resizeLeftRightCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes:

The resize-left-and-right cursor. This cursor is used when moving or resizing an object and the object can be moved left or right.

Available in Mac OS X v10.3 and later.

31.18.34 resizeRightCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the resize-right system cursor.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.resizeRightCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes:

The resize-right cursor. This cursor is used when moving or resizing an object to indicate that the user can

move only in the indicated direction.

Available in Mac OS X v10.3 and later.

31.18.35 resizeUpCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the resize-up system cursor.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.resizeUpCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes:

The resize-up cursor. This cursor is used when moving or resizing an object to indicate that the user can move only in the indicated direction.

Available in Mac OS X v10.3 and later.

31.18.36 resizeUpDownCursor as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the resize-up-and-down system cursor.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.resizeUpDownCursor
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

Notes:

The resize-up-and-down cursor. This cursor is used when moving or resizing an object and the object can be moved up or down.

Available in Mac OS X v10.3 and later.

31.18.37 ringCursorWithDiameter(diameter as Double) as NSCursorMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a ring cursor with the given size.
Example:

```
// shows cursor in window
dim c as NSCursorMBS = NSCursorMBS.ringCursorWithDiameter(20)
dim i as NSImageMBS = c.image
window1.Backdrop=i.CopyPictureWithMask
```

31.18.38 set

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Makes the receiver the current cursor.
Notes: If your application is not the front application, the system will ignore this set message!

31.18.39 setHiddenUntilMouseMoves(value as boolean)

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets whether the cursor is hidden until the mouse moves.
Notes:

value: True to hide the cursor until one of the following occurs:
The mouse moves.
You invoke the method again, with flag set to false.

Do not try to counter this method by invoking unhide. The results are undefined.

31.18.40 setOnMouseEntered(flag as boolean)

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** pecifies whether the receiver accepts mouseEntered: events.
Notes:

True if the receiver accepts future mouseEntered event messages; otherwise it ignores them.

Accepting mouseEntered event messages allows the cursor to be made the current cursor when the cursor enters a view's cursor rectangle.

31.18.41 setOnMouseExited(flag as boolean)

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets whether the receiver accepts mouseExited events.
Notes:

flag: True if the receiver accepts future mouseExited: event messages; otherwise it ignores them.

Accepting mouseExited event messages allows the cursor to be made the current cursor when the cursor exits a view's cursor rectangle.

31.18.42 unhide

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Negates an earlier call to hide by showing the current cursor.

31.18.43 Properties

31.18.44 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal used NSCursor reference.
Notes: (Read and Write property)

31.19 class NSDateComponentsMBS

31.19.1 class NSDateComponentsMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSDateComponents encapsulates the components of a date in an extendable, object-oriented manner. **Notes:** It is used to specify a date by providing the temporal components that make up a date and time: hour, minutes, seconds, day, month, year, and so on. It can also be used to specify a duration of time, for example, 5 hours and 16 minutes. An NSDateComponents object is not required to define all the component fields. When a new instance of NSDateComponents is created the date components are set to NSUndefined-DateComponent.

31.19.2 Blog Entries

- MBS Xojo Plugins, version 20.1pr1
- MBS Real Studio Plugins, version 12.3pr11

31.19.3 Methods

31.19.4 Constructor

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates new date components object.

31.19.5 copy as NSDateComponentsMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a copy of the date component object.

31.19.6 isValidDateInCalendar(calendar as NSCalendarMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 20.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the current combination of properties represents a date which exists in the specified calendar.
Notes:

calendar: The calendar for which to use in the calculation.

Returns yes if the date corresponding to the receiver's values is valid and exists in the given calendar, otherwise no.

If the timeZone property is set on the receiver, the time zone property value is used.
This property should not be used for NSDateComponents objects that represent relative quantities of calendar components.

31.19.7 NSUndefinedDateComponent as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This constant specifies that an NSDateComponents component is undefined.

31.19.8 Print

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the date components to debug output.
Notes: This may help for debugging and you see output in console app.

31.19.9 Properties

31.19.10 calendar as NSCalendarMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The calendar.
Notes: (Read and Write property)

31.19.11 date as date

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The date.
Notes:

Available in Mac OS X v10.7 and later.
(Read only property)

31.19.12 day as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of day units.
Notes: (Read and Write property)

31.19.13 description as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns description of the calendar object.
Notes: (Read only property)

31.19.14 era as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of era units.
Notes: (Read and Write property)

31.19.15 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

31.19.16 hour as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of hour units.
Notes: (Read and Write property)

31.19.17 isLeapMonth as Boolean

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether it is leap month.
Notes:

Available on Mac OS X 10.8.
(Read and Write property)

31.19.18 isValidDate as Boolean

MBS MacBase Plugin, Plugin Version: 20.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the current combination of properties represents a date which exists in the current calendar.
Notes:

If the timeZone property is set on the receiver, the time zone property value is used. If the calendar property is not set on the receiver, nil is returned.
(Read only property)

31.19.19 minute as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of minute units.
Notes: (Read and Write property)

31.19.20 month as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of month units.
Notes: (Read and Write property)

31.19.21 quarter as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of quarters.
Notes: (Read and Write property)

31.19.22 second as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of second units.
Notes: (Read and Write property)

31.19.23 timeZone as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The time zone.
Notes: (Read and Write property)

31.19.24 week as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of week units.
Notes: (Read and Write property)

31.19.25 weekday as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of weekday units.
Notes:

Weekday units are the numbers 1 through n, where n is the number of days in the week. For example, in the Gregorian calendar, n is 7 and Sunday is represented by 1.
(Read and Write property)

31.19.26 weekdayOrdinal as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ordinal number of weekday units.
Notes:

Weekday ordinal units represent the position of the weekday within the next larger calendar unit, such as the month. For example, 2 is the weekday ordinal unit for the second Friday of the month.
(Read and Write property)

31.19.27 weekOfMonth as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The week of the month.
Notes: (Read and Write property)

31.19.28 weekOfYear as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The week of the year.
Notes: (Read and Write property)

31.19.29 year as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of year unit.
Notes: (Read and Write property)

31.19.30 yearForWeekOfYear as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The year for the week of the year.
Notes: (Read and Write property)

31.20 class NSDirectoryEnumeratorMBS

31.20.1 class NSDirectoryEnumeratorMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSDirectoryEnumerator object enumerates the contents of a directory, returning the pathnames of all files and directories contained within that directory.
Example:

```
dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
dim f as string = d.nextObject

while len(f)>0
List.AddRow f

f=d.nextObject
wend
```

Notes:

These pathnames are relative to the directory.

An enumeration is recursive, including the files of all subdirectories, and crosses device boundaries. An enumeration does not resolve symbolic links, or attempt to traverse symbolic links that point to directories. Subclass of the NSEnumeratorMBS class.

31.20.2 Blog Entries

- NSBundleMBS and NSDirectoryEnumeratorMBS

31.20.3 Methods

31.20.4 Constructor(folder as folderitem)

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSDirectoryEnumerator object that enumerates the contents of the directory at a given path.
Example:

```
dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)

MsgBox d.nextObject // shows ".DS_Store" or some other file name
```

Notes:

An NSDirectoryEnumerator object that enumerates the contents of the directory at path.
If path is a filename, the method returns an enumerator object that enumerates no files—the first call to nextObject will return nil.

Because the enumeration is deep—that is, it lists the contents of all subdirectories—this enumerator object is useful for performing actions that involve large file-system subtrees. This method does not resolve symbolic links encountered in the traversal process, nor does it recurse through them if they point to a directory.
See also:

- 31.20.5 Constructor(path as string) 6009

31.20.5 Constructor(path as string)

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSDirectoryEnumerator object that enumerates the contents of the directory at a given path.
Example:

```
dim d as new NSDirectoryEnumeratorMBS("/Applications")
dim f as FolderItem = d.nextFile

while f<>Nil
List.AddRow f.Name

// if this is a folder, we skip the sub folders
d.skipDescendents

f=d.nextFile
wend
```

Notes:

An NSDirectoryEnumerator object that enumerates the contents of the directory at path.
If path is a filename, the method returns an enumerator object that enumerates no files—the first call to nextObject will return nil.

Because the enumeration is deep—that is, it lists the contents of all subdirectories—this enumerator object is useful for performing actions that involve large file-system subtrees. This method does not resolve symbolic links encountered in the traversal process, nor does it recurse through them if they point to a directory.

• 31.20.4 Constructor(folder as folderitem) 6008

31.20.6 Destructor

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor for this class.

31.20.7 directoryAttributes as dictionary

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an Dictionary object that contains the attributes of the directory at which enumeration started.

31.20.8 fileAttributes as dictionary

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an object that contains the attributes of the most recently returned file or subdirectory (as referenced by the pathname).
Example:

```
dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
dim f as FolderItem = d.nextFile

while f<>Nil
List.AddRow f.Name

dim di as Dictionary = d.fileAttributes
dim size as int64 = di.Value(d.NSFileSize)

List.AddRow f.Name+" ("+str(size)+" Bytes)"

f=d.nextFile
wend
```

31.20.9 level as Integer

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of levels deep the current object is in the directory hierarchy being enumerated.
Example:

```
dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
dim f as FolderItem = d.nextFile

while f<>Nil
List.AddRow f.Name+" "+str(d.level)

f=d.nextFile
wend
```

Notes: Available in Mac OS X v10.6 and later.

31.20.10 nextFile as folderitem

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the next folderitem from the collection being enumerated.
Example:

```
dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
dim f as string = d.nextObject

while len(f)>0
List.AddRow f

f=d.nextObject
wend
```

Notes:

The next folderitem from the collection being enumerated, or nil when all objects have been enumerated.

Same as nextObject, but returns a folderitem.

31.20.11 NSFileAppendOnly as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates whether the file is read-only.

31.20.12 NSFileBusy as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates whether the file is busy.

31.20.13 NSFileCreationDate as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's creation date.

31.20.14 NSFileDeviceIdentifier as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the identifier for the device on which the file resides.

31.20.15 NSFileExtensionHidden as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: he key in a file attribute dictionary whose value indicates whether the file's extension is hidden.

31.20.16 NSFileGroupOwnerAccountID as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's group ID.

31.20.17 NSFileGroupOwnerAccountName as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the group name of the file's owner.

31.20.18 NSFileHFSCreatorCode as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's HFS creator code.

31.20.19 NSFileHFSTypeCode as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's HFS type code.

31.20.20 NSFileImmutable as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates whether the file is mutable.

31.20.21 NSFileModificationDate as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's last modified date.

31.20.22 NSFileOwnerAccountID as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's owner's account ID.

31.20.23 NSFileOwnerAccountName as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the name of the file's owner.

31.20.24 NSFilePosixPermissions as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's Posix permissions.

31.20.25 NSFileReferenceCount as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's reference count.

31.20.26 NSFileSize as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Example:

```
dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
dim f as FolderItem = d.nextFile

while f<>Nil
List.AddRow f.Name

dim di as Dictionary = d.fileAttributes
dim size as int64 = di.Value(d.NSFileSize)

List.AddRow f.Name+" ("+str(size)+" Bytes)"

f=d.nextFile
wend
```

Notes: The key in a file attribute dictionary whose value indicates the file's size in bytes.

31.20.27 NSFileSystemFileNumber as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's filesystem file number.

31.20.28 NSFileSystemFreeNodes as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file system attribute dictionary dictionary whose value indicates the number of free nodes in the file system.

31.20.29 NSFileSystemFreeSize as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file system attribute dictionary whose value indicates the amount of free space on the file system.

31.20.30 NSFileSystemNodes as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file system attribute dictionary dictionary whose value indicates the number of free nodes in the file system.

31.20.31 NSFileSystemNumber as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file system attribute dictionary dictionary whose value indicates the filesystem number of the file system.

31.20.32 NSFileSystemSize as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.
Notes: The key in a file system attribute dictionary whose value indicates the size of the file system.

31.20.33 NSFileType as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the attributes dictionaries.

Notes: The key in a file attribute dictionary whose value indicates the file's type.

31.20.34 NSFileTypeBlockSpecial as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the file type property.
Notes: Block special file

31.20.35 NSFileTypeCharacterSpecial as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the file type property.
Notes: Character special file

31.20.36 NSFileTypeDirectory as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the file type property.
Notes: Directory

31.20.37 NSFileTypeRegular as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the file type property.
Notes: Regular file

31.20.38 NSFileTypeSocket as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the file type property.
Notes: Socket

31.20.39 NSFileTypeSymbolicLink as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the file type property.

Notes: Symbolic link

31.20.40 NSFileTypeUnknown as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the file type property.
Notes: Unknown

31.20.41 Path as string

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path used in the constructor.

31.20.42 skipDescendents

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Causes the receiver to skip recursion into the most recently obtained subdirectory.

31.21 class NSDockTileMBS

31.21.1 class NSDockTileMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The cocoa class to customize the dock tile.
Notes:

The NSDockTile class lets you customize the visual representation for your application's miniaturized windows and application icon as they appear in the Dock. You do not create Dock tile objects explicitly in your application. Instead, you retrieve the Dock tile for an existing window or for the application by calling that object's dockTile method.

Typically, you do not subclass the NSDockTile class. Instead, you use the methods of the class to make the following customizations:

- Badge the tile with a custom string.
- Remove or show the application icon badge.
- Draw the tile content yourself.

If you decide to draw the tile content yourself, you must provide a custom content view to handle the drawing.

Application Dock Tiles

An application Dock tile defaults to display the application's applicationIconImage.

The application Dock tile never shows a smaller application icon badge.

Whether using the default or custom view, the application Dock tile may be badged with a short custom string.

Window Dock Tiles

A window Dock tile defaults to display a miniaturized version of the windows contents with a badge derived from the application Dock icon, including any customized application Dock icon. The default window Dock tile image may not be badged with a custom string.

A window Dock tile can use a custom view to draw the Dock icon. If a custom view is used, no application badge will be added, but the text label will be overlaid on top of the icon.

Available in Mac OS X v10.5 and later.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

31.21.2 Blog Entries

- MBS Real Studio Plugins, version 11.2pr9

31.21.3 Methods

31.21.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

31.21.5 display

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Redraws the dock tile's content.
Notes:

If a custom content view is provided, Cocoa calls the drawRect method of that view (and its subviews) to draw the tile's content.

You can call this method to force the redrawing of the dock tile contents. You might do this if the contents of the underlying application or window change in a way that would require a refreshing of the tile. Some types of system activity, such as resizing the dock, may trigger automatic redraws of the tile. In most cases, however, your application is responsible for triggering redraws.

Cocoa does not automatically redraw the contents of your dock tile. Instead, your application must explicitly send display messages to the dock tile object whenever the contents of your view change and need to be redrawn.

31.21.6 owner as Variant

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the object represented by the dock tile.
Example:

```
dim d as NSDockTileMBS = NSApplicationMBS.sharedApplication.dockTile
```

```
if d<>nil then
dim t as Introspection.TypeInfo = Introspection.GetType(d.owner)
MsgBox t.FullName // shows NSApplicationMBS
end if
```

Notes: The object represented by the dock tile. This is either the NSApplicationMBS object or one of your application's NSWindowMBS objects.

31.21.7 size as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the size of the tile.
Example:

```
dim d as NSDockTileMBS = NSApplicationMBS.sharedApplication.dockTile

if d<>nil then
MsgBox str(D.size.Width)+" x "+str(d.size.Height)
// 128 x 128 in Mac OS X 10.5 and 10.6
end if
```

Notes: The size returned by this method corresponds to the size of the backing store in the dock, which may be bigger than the actual tile displayed on the screen.

31.21.8 Properties

31.21.9 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the docktile object.
Notes: (Read and Write property)

31.21.10 badgeLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The tile's current badge label.
Example:

```
dim d as NSDockTileMBS = NSApplicationMBS.sharedApplication.dockTile

if d<>nil then
// this works in Carbon and Cocoa applications :-)

d.badgeLabel = "Hello"
d.showsApplicationBadge = true
end if
```

Notes:

The localized string to be displayed in the tile's badging area. This string may be empty.
(Read and Write computed property)

31.21.11 contentView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The view used to draw the dock tile contents.
Notes:

The view you specify should be height and width resizable.

Cocoa does not automatically redraw the contents of your dock tile. Instead, your application must explicitly send display messages to the dock tile object whenever the contents of your view change and need to be redrawn. Your dock tile view is responsible for drawing the entire contents of the dock tile. Your view does not need to draw the application or custom string badges.
(Read and Write computed property)

31.21.12 showsApplicationBadge as boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the tile should be badged with the application's icon.
Example:

```
dim d as NSDockTileMBS = NSApplicationMBS.sharedApplication.dockTile

if d<>nil then
// this works in Carbon and Cocoa applications :-)

d.badgeLabel = "Hello"
d.showsApplicationBadge = true
end if
```

Notes:

Miniaturized windows include the application badge by default to convey the associated application to the user. In Mac OS X v10.5 and later, application tiles do not support the application badge. A miniaturized window with a custom view does not draw the application badge.

The application icon is positioned automatically in the tile by the NSDockTile object.
(Read and Write computed property)

31.22 class NSEnumeratorMBS

31.22.1 class NSEnumeratorMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSEnumerator is an abstract class, instances of whose subclasses enumerate collections of other objects, such as arrays and dictionaries.
Example:

```
dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
MsgBox d.nextObject
```

Notes:

You send nextObject repeatedly to a newly created NSEnumerator object to have it return the next object in the original collection. When the collection is exhausted, nil is returned. You cannot "reset" an enumerator after it has exhausted its collection. To enumerate a collection again, you need a new enumerator.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

31.22.2 Blog Entries

- NSBundleMBS and NSDirectoryEnumeratorMBS

31.22.3 Methods

31.22.4 allObjects as Variant()

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of objects the receiver has yet to enumerate.
Example:

```
dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)

dim a(-1) as Variant = d.allObjects
dim lines(-1) as string

for each v as Variant in a
lines.Append v
next

MsgBox Join(lines, EndOfLine) // shows all stuff on desktop
```

Notes:

Put another way, the array returned by this method does not contain objects that have already been enumerated with previous nextObject messages.
Invoking this method exhausts the enumerator's collection so that subsequent invocations of nextObject return nil.

31.22.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

31.22.6 nextObject as Variant

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the next object from the collection being enumerated.
Example:

```
dim d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)

MsgBox d.nextObject // shows ".DS_Store" or some other file name
```

Notes: The next object from the collection being enumerated, or nil when all objects have been enumerated.

31.22.7 Properties

31.22.8 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSEnumerator object.
Notes: (Read and Write property)

31.23 class NSErrorMBS

31.23.1 class NSErrorMBS

MBS Main Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for error information in the Cocoa World.

31.23.4 Methods

31.23.5 Constructor(Domain as String, Code as Integer, UserInfo as dictionary = nil)

MBS Main Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes error for a given domain and code with a given userInfo dictionary.
Notes:

domain: The error domain—this can be one of the predefined NSError domains, or an arbitrary string describing a custom domain. domain must not be nil.
code: The error code for the error.
dict: The userInfo dictionary for the error. userInfo may be nil.

Returns an NSErrorMBS object initialized for domain with the specified error code and the dictionary of arbitrary data userInfo.
See also:

- 31.23.6 Constructor(Handle as Integer) 6026

31.23.6 Constructor(Handle as Integer)

MBS Main Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor for a handle value of NSError.
Notes:

Retains reference number and destructor later releases it.
Handle must be a NSError reference number and should not be zero.
See also:

- 31.23.5 Constructor(Domain as String, Code as Integer, UserInfo as dictionary = nil) 6025

31.23.7 error(Domain as String, Code as Integer, UserInfo as dictionary = nil) as NSErrorMBS

MBS Main Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and initializes an NSError object for a given domain and code with a given userInfo dictionary.
Notes:

domain: The error domain—this can be one of the predefined NSError domains, or an arbitrary string describing a custom domain. domain must not be nil.
code: The error code for the error.
dict: The userInfo dictionary for the error. userInfo may be nil.

Returns an NSErrorMBS object for domain with the specified error code and the dictionary of arbitrary data userInfo.

31.23.8 NSCocoaErrorDomain as String

MBS Main Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The cocoa error domain.

31.23.9 NSFilePathErrorKey as String

MBS Main Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the user info dictionary keys.

Notes: Contains the file path of the error.

31.23.10 NSLocalizedDescriptionKey as String

MBS Main Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the user info dictionary keys.
Notes: The corresponding value is a localized string representation of the error that, if present, will be returned by localizedDescription.

31.23.11 NSLocalizedFailureReasonErrorKey as String

MBS Main Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the user info dictionary keys.
Notes: The corresponding value is a localized string representation containing the reason for the failure that, if present, will be returned by localizedFailureReason.

31.23.12 NSLocalizedRecoveryOptionsErrorKey as String

MBS Main Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the user info dictionary keys.
Notes:

The corresponding value is an array containing the localized titles of buttons appropriate for displaying in an alert panel.

The first string is the title of the right-most and default button, the second the one to the left, and so on. The recovery options should be appropriate for the recovery suggestion returned by localizedRecoverySuggestion.

31.23.13 NSLocalizedRecoverySuggestionErrorKey as String

MBS Main Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the user info dictionary keys.
Notes:

The corresponding value is a string containing the localized recovery suggestion for the error.

This string is suitable for displaying as the secondary message in an alert panel.

31.23.14 NSMachErrorDomain as String

MBS Main Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Error domain for Mach errors.

31.23.15 NSOSStatusErrorDomain as String

MBS Main Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Error domain for Mac OS 9/Carbon errors.

31.23.16 NSPOSIXErrorDomain as String

MBS Main Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Error domain for unix errors.

31.23.17 NSRecoveryAttempterErrorKey as String

MBS Main Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the user info dictionary keys.
Notes:

The corresponding value is an object that conforms to the NSErrorRecoveryAttempting informal protocol.

The recovery attempter must be an object that can correctly interpret an index into the array returned by recoveryAttempter.

31.23.18 NSStringEncodingErrorKey as String

MBS Main Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the user info dictionary keys.
Notes: The corresponding value is an NSNumber object containing the NSStringEncoding value.

31.23.19 NSUnderlyingErrorKey as String

MBS Main Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the user info dictionary keys.
Notes: The corresponding value is an error that was encountered in an underlying implementation and

caused the error that the receiver represents to occur.

31.23.20 NSURLErrorKey as String

MBS Main Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the user info dictionary keys.
Notes: The corresponding value is an NSURL object.

31.23.21 Properties

31.23.22 code as Integer

MBS Main Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This is a domain specific error code.
Notes: (Read only property)

31.23.23 description as string

MBS Main Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the description for this object.
Notes: (Read only property)

31.23.24 domain as string

MBS Main Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The error domain.
Notes:

Domains are described by names that are arbitrary strings used to differentiate groups of codes; for custom domain using reverse-DNS naming will help avoid conflicts.
(Read only property)

31.23.25 Handle as Integer

MBS Main Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal used handle for the NSError reference.
Notes: (Read and Write property)

31.23.26 localizedDescription as string

MBS Main Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The localized error description.
Example:

```
dim f as FolderItem=SpecialFolder.Desktop.Child("test.mov")
dim q as new QTKitMovieMBS(f)
dim e as NSErrorMBS

f=SpecialFolder.Desktop.Child("test2.aif")

MsgBox str(q.Handle)

if q.exportToFile(f,e,"AIFF","soun","") then
MsgBox "ok"
else
MsgBox "Fail"
end if

if e<>Nil then
MsgBox e.localizedDescription
end if
```

Notes:

The primary user-presentable message for the error. This method can be overridden by subclassers wishing to present better error strings. By default this looks for NSLocalizedDescriptionKey in the user info. If not present, it manufactures a string from the domain and code. Also, for some of the built-in domains it knows about, it might try to fetch an error string by calling a domain-specific function. In the absence of a custom error string, the manufactured one might not be suitable for presentation to the user, but can be used in logs or debugging.
(Read only property)

31.23.27 localizedFailureReason as string

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string containing the localized explanation of the reason for the error.
Notes:

A string containing the localized explanation of the reason for the error. By default this method returns the object in the user info dictionary for the key NSLocalizedFailureReasonErrorKey.
This method can be overridden by subclasses to present customized error strings.
Available in Mac OS X v10.4 and later.

(Read only property)

31.23.28 localizedRecoverySuggestion as string

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string containing the localized recovery suggestion for the error.
Notes:

Returns a string containing the localized recovery suggestion for the error. By default this method returns the object in the user info dictionary for the key NSLocalizedRecoverySuggestionErrorKey. If the user info dictionary doesn't contain a value for NSLocalizedRecoverySuggestionErrorKey, nil is returned.

The returned string is suitable for displaying as the secondary message in an alert panel.

This method can be overridden by subclasses to present customized recovery suggestion strings.

Available in Mac OS X v10.4 and later.
(Read only property)

31.23.29 userInfo as dictionary

MBS Main Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's user info dictionary.
Notes:

The receiver's user info dictionary, or nil if the user info dictionary has not been set.
(Read only property)

31.24 class NSEventMBS

31.24.1 class NSEventMBS

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class for an user event.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

31.24.2 Blog Entries

- MBS Xojo Plugins, version 18.2pr1

- MBS Real Studio Plugins, version 13.1pr16
- MBS Real Studio Plugins, version 11.3pr8
- Gestures on Mac OS X
- MBS REALbasic Plugins, version 10.6pr4

31.24.3 Methods

31.24.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

31.24.5 doubleClickInterval as Double

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the time, in seconds, in which a second mouse click must occur in order to be considered a double click.
Notes:

This is a system setting, overriding this method will have no effect.
Available in Mac OS X v10.6 and later.

31.24.6 eventWithCGEvent(CGEventRef as Integer) as NSEventMBS

MBS MacBase Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an event object that is based on a Core Graphics type of event.
Notes: The returned object retains the CGEventRef object (cgEvent) until it (the Xojo and Objective-C object) is freed—it then releases the CGEventRef object. If no Cocoa event corresponds to the CGEventRef object, this method returns nil.

31.24.7 isMouseCoalescingEnabled as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether mouse-movement event coalescing is enabled.
Notes: Available in Mac OS X v10.5 and later.

31.24.8 keyRepeatDelay as Double

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the length of time a key must be held down in order to generate the first key repeat event.
Notes:

This is a system setting, overriding this method will have no effect.
Available in Mac OS X v10.6 and later.

31.24.9 keyRepeatInterval as Double

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the length between subsequent key repeat events being posted.
Notes:

This is a system setting, overriding this method will have no effect.
Available in Mac OS X v10.6 and later.

31.24.10 modifierFlagsGlobal as UInt32

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the currently pressed modifier flags.
Notes:

This returns the state of devices combined with synthesized events at the moment, independent of which events have been delivered via the event stream.

Available in Mac OS X v10.6 and later.

31.24.11 mouseLocation as NSPointMBS

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reports the current mouse position in screen coordinates.
Notes:

This method is similar to the NSWindow method mouseLocationOutsideOfEventStream. It returns the location regardless of the current event or pending events. The difference between these methods is that mouseLocationOutsideOfEventStream returns a point in the receiving window's coordinates and mouseLocation returns the same information in screen coordinates.

Note: The y coordinate in the returned point starts from a base of 1, not 0.

31.24.12 pressedMouseButtons as UInt32

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the indices of the currently depressed mouse buttons.
Notes:

The indices of the currently depressed mouse buttons.

A return value of 1 «0 corresponds to left the mouse, 1 «1 corresponds to the right mouse, 1«n, n >=2 to other mouse buttons.

This returns the state of devices combined with synthesized events at the moment, independent of which events have been delivered via the event stream, so this method is not suitable for tracking.

Available in Mac OS X v10.6 and later.

31.24.13 setMouseCoalescingEnabled(Value as boolean)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether mouse-movement event coalescing is enabled.
Notes:

This method affects mouse-moved, mouse-dragged, and tablet events. Mouse-movement event coalescing is enabled by default.

Available in Mac OS X v10.5 and later.

31.24.14 Properties

31.24.15 absoluteX as Integer

MBS MacBase Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reports the absolute x coordinate of a pointing device on its tablet at full tablet resolution.
Notes:

For the coordinate to be valid, the receiver should represent an event generated by a tablet pointing device (otherwise 0 is returned). This method is valid only for mouse events with a subtype of NSTabletPointEventSubtype and for events of type NSTabletPoint. Use this value if you want to scale from tablet location to screen location yourself; otherwise use the class method mouseLocation or the instance method locationInWindow.

Available in Mac OS X v10.4 and later.
(Read only property)

31.24.16 absoluteY as Integer

MBS MacBase Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reports the absolute y coordinate of a pointing device on its tablet at full tablet resolution.
Notes:

For the coordinate to be valid, the receiver should represent an event generated by a tablet pointing device (otherwise 0 is returned). This method is valid only for mouse events with a subtype of NSTabletPointEventSubtype and for events of type NSTabletPoint. Use this value if you want to scale from tablet location to screen location yourself; otherwise use the class method mouseLocation or the instance method locationInWindow.

Available in Mac OS X v10.4 and later.
(Read only property)

31.24.17 absoluteZ as Integer

MBS MacBase Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reports the absolute z coordinate of pointing device on its tablet at full tablet resolution.
Notes:

For the coordinate to be valid, the receiver should represent an event generated by a tablet pointing device (otherwise 0 is returned). The z coordinate does not represent pressure. It registers the depth coordinate

returned by some tablet devices with wheels; if the device is something other than these, 0 is returned. This method is valid only for mouse events with a subtype of NSTabletPointEventSubtype and for events of type NSTabletPoint.

Available in Mac OS X v10.4 and later.
(Read only property)

31.24.18 associatedEventsMask as Integer

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The event mask describing the various events that you may also get during this event sequence.
Notes:

This message is valid for Mouse events. Useful for determining if the input device issuing this mouse event can also simultaneously issue NSEventTypePressure events.
(Read only property)

31.24.19 buttonMask as Integer

MBS MacBase Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a bit mask identifying the buttons pressed when the tablet event represented by the receiver was generated.
Notes:

Use one or more of the button-mask constants described in Constants to determine which buttons of the pointing device are pressed. This method is valid only for mouse events with a subtype of NSTabletPointEventSubtype and for events of type NSTabletPoint.

Available in Mac OS X v10.4 and later.

Constants to use:

NSPenTipMask=1	The pen tip is activated.
NSPenLowerSideMask=2	The button on the lower side of the device is activated.
NSPenUpperSideMask=4	The button on the upper side of the device is activated.

(Read only property)

31.24.20 buttonNumber as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the button number for the mouse button that generated an NSOtherMouse... event.
Notes:

This method is intended for use with the NSOtherMouseDown, NSOtherMouseUp, and NSOtherMouseDragged events, but will return values for NSLeftMouse... and NSRightMouse... events also.
(Read only property)

31.24.21 capabilityMask as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a mask whose set bits indicate the capabilities of the tablet device that generated the event represented by the receiver.
Notes:

These bits are vendor-defined. This method is valid only for mouse events with a subtype of NSTabletProximityEventSubtype and for events of type NSTabletProximity.

Available in Mac OS X v10.4 and later.
(Read only property)

31.24.22 CGEventRef as Integer

MBS MacBase Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Core Graphics event object corresponding to this event.
Notes:

The CGEventRef opaque type returned. If no CGEventRef object corresponding to the NSEvent object can be created, this method returns 0.
(Read only property)

31.24.23 characters as string

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the characters associated with the receiving key-up or key-down event.
Notes:

These characters are derived from a keyboard mapping that associates various key combinations with Unicode characters. Raises an NSInternalInconsistencyException if sent to any other kind of event object.

This method returns an empty string for dead keys, such as Option-e. However, for a key combination such as Option-Shift-e this method returns the standard accent (”’”).
(Read only property)

31.24.24 charactersIgnoringModifiers as string

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the characters generated by the receiving key event as if no modifier key (except for Shift) applies.
Notes:

Raises an NSInternalInconsistencyException if sent to a nonkey event.

This method returns the non-modifier key character pressed for dead keys, such as Option-e. For example, Option-e (no shift key) returns an ”e” for this method, whereas the characters method returns an empty string.

This method is useful for determining ”basic” key values in a hardware-independent manner, enabling such features as keyboard equivalents defined in terms of modifier keys plus character keys. For example, to determine if the user typed Alt-S, you don't have to know whether Alt-S generates a German double ess, an integral sign, or a section symbol. You simply examine the string returned by this method along with the event's modifier flags, checking for ”s” and NSAlternateKeyMask.
(Read only property)

31.24.25 clickCount as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of mouse clicks associated with the receiver, which represents a mouse-down or mouse-up event.
Notes:

Raises an NSInternalInconsistencyException if sent to a nonmouse event.

Returns 0 for a mouse-up event if a time threshold has passed since the corresponding mouse-down event. This is because if this time threshold passes before the mouse button is released, it is no longer considered a mouse click, but a mouse-down event followed by a mouse-up event.

The return value of this method is meaningless for events other than mouse-down or mouse-up events.
(Read only property)

31.24.26 data1 as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns additional data associated with the receiver.
Notes:

The value returned by this method is dependent on the event type, and is defined by the originator of the event. Raises an NSInternalInconsistencyException if sent to an event not of type NSAppKitDefined, NSSystemDefined, NSApplicationDefined, or NSPeriodic.

NSPeriodic events don't use this attribute.
(Read only property)

31.24.27 data2 as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns additional data associated with the receiver.
Notes:

The value returned by this method is dependent on the event type, and is defined by the originator of the event. Raises an NSInternalInconsistencyException if sent to an event not of type NSAppKitDefined, NSSystemDefined, NSApplicationDefined, or NSPeriodic.

NSPeriodic events don't use this attribute.
(Read only property)

31.24.28 deltaX as Double

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the x-coordinate change for a scroll wheel, mouse-move, or mouse-drag event.
Notes: (Read only property)

31.24.29 deltaY as Double

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the y-coordinate change for a scroll wheel, mouse-move, or mouse-drag event.
Notes:

The behavior of this method may seem counter-intuitive: as the mouse moves up the screen, the value is negative; and as it moves down the screen, the value is positive. The reason for this behavior is that NSEvent computes this delta value in device space, which is flipped, but both the screen and the window's base coordinate system are not flipped.

(Read only property)

31.24.30 deltaZ as Double

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the z-coordinate change for a scroll wheel, mouse-move, or mouse-drag event.
Notes: (Read only property)

31.24.31 description as string

MBS MacBase Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the description for this object.
Notes: (Read only property)

31.24.32 deviceID as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a special identifier that is used to match tablet-pointer events with the tablet-proximity event represented by the receiver.
Notes:

All tablet-pointer events generated in the period between the device entering and leaving tablet proximity have the same device ID. This message is valid only for mouse events with subtype NSTabletPointEventSubtype or NSTabletProximityEventSubtype, and for NSTabletPoint and NSTabletProximity events.
Available in Mac OS X v10.4 and later.
(Read only property)

31.24.33 eventNumber as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the counter value of the latest mouse or tracking-rectangle event object; every system-generated mouse and tracking-rectangle event increments this counter.
Notes:

Raises an NSInternalInconsistencyException if sent to any other type of event object.
(Read only property)

31.24.34 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the internal used NSEvent class.
Notes: (Read and Write property)

31.24.35 hasPreciseScrollingDeltas as boolean

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether there are precise scrolling deltas available.
Notes:

Returns true if precise scrolling deltas are available; false otherwise.

This method is valid for NSScrollWheel events. A generic scroll wheel issues rather coarse scroll deltas. Some mice and trackpads provide much more precise delta. This method determines how the values of the scrollingDeltaX and scrollingDeltaY should be interpreted.
Available in OS X v10.7 and later.
(Read only property)

31.24.36 isARepeat as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the receiving key event is a repeat caused by the user holding the key down, false if the key event is new.
Notes:

Raises an NSInternalInconsistencyException if sent to an NSFlagsChanged event or other nonkey event.
(Read only property)

31.24.37 isDirectionInvertedFromDevice as boolean

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether the user has changed the device inversion.
Notes:

This method valid for NSEventScrollWheel and NSEventTypeSwipe events. The user may choose to change the scrolling behavior such that it feels like they are moving the content instead of the scroll bar.

To accomplish this, deltaX and deltaY and scrollingDeltaX and scrollingDeltaY values are automatically inverted for NSEventScrollWheel events according to the user's preferences.

The direction of fluid swipes matches the direction of scrolling and as such for NSEventTypeSwipe events gestureAmount is inverted. However, for some uses of NSEventScrollWheel and NSEventTypeSwipe events, the behavior should not respect the user preference. This method allows you to determine when the event has been inverted and compensate by multiplying -1 if needed.

Available in OS X v10.7 and later.
(Read only property)

31.24.38 isEnteringProximity as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true to indicate that a pointing device is entering the proximity of its tablet and false when it is leaving it.
Notes:

This method is valid for mouse events with subtype NSTabletProximityEventSubtype and for NSTabletProximity events.
Available in Mac OS X v10.4 and later.
(Read only property)

31.24.39 keyCode as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the virtual key code for the keyboard key associated with the receiving key event.
Notes:

The virtual key code. The returned value is hardware-independent. The value returned is the same as the value returned in the kEventParamKeyCode when using Carbon Events.

Raises an NSInternalInconsistencyException if sent to a non-key event.
(Read only property)

31.24.40 locationInWindow as NSPointMBS

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's location in the base coordinate system of the associated window.
Notes:

For nonmouse events the return value of this method is undefined.

With NSMouseMoved and possibly other events, the receiver can have a nil window (that is, window returns

nil). In this case, locationInWindow returns the event location in screen coordinates.
(Read only property)

31.24.41 magnification as Double

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the change in magnification.
Notes:

The change in magnification that should be added to the current scaling of an item to achieve the new scale factor.
This message is valid for events of type NSEventTypeMagnify.
Available in Mac OS X v10.6 and later.
(Read only property)

31.24.42 modifierFlags as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an integer bit field indicating the modifier keys in effect for the receiver.
Notes:

You can examine individual flag settings using the C bitwise AND operator with the predefined key masks. The lower 16 bits of the modifier flags are reserved for device-dependent bits.
(Read only property)

31.24.43 pointingDeviceID as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of the pointing device currently in proximity with the tablet.
Notes:

This index is significant for multimode (or Dual Tracking) tablets that support multiple concurrent pointing devices; the index is incremented for each pointing device that comes into proximity. Otherwise, zero is always returned. The receiver of this message should be a mouse event object with subtype NSTabletProximityEventSubtype or an event of type NSTabletProximity.

Available in Mac OS X v10.4 and later.
(Read only property)

31.24.44 pointingDeviceSerialNumber as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the vendor-assigned serial number of a pointing device of a certain type.
Notes:

Devices of different types, such as a puck and a pen, may have the same serial number. The receiver of this message should be a mouse event object with subtype NSTabletProximityEventSubtype or an event of type NSTabletProximity.

Available in Mac OS X v10.4 and later.
(Read only property)

31.24.45 pointingDeviceType as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a NSPointingDeviceType constant indicating the kind of pointing device associated with the receiver.
Notes:

For example, the device could be a pen, eraser, or cursor pointing device. This method is valid for mouse events with subtype NSTabletProximityEventSubtype and for NSTabletProximity events. See "Constants" for descriptions of valid NSPointingDeviceType constants.

Available in Mac OS X v10.4 and later.
(Read only property)

31.24.46 pressure as Double

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a value from 0.0 through 1.0 indicating the pressure applied to the input device (used for appropriate devices).
Notes:

For devices that aren't pressure-sensitive, the value is either 0.0 or 1.0. Raises an NSInternalInconsistencyException if sent to a nonmouse event.

For tablet pointing devices that are in proximity, the pressure value is 0.0 if they are not actually touching the tablet. As the device is pressed into the tablet, the value is increased.
(Read only property)

31.24.47 rotation as Double

MBS MacBase Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the rotation in degrees of the tablet pointing device associated with the receiver.
Notes:

Many devices do not support rotation, in which case the returned value is 0.0. This method is valid only for mouse events with subtype NSTabletPointEventSubtype and for NSTabletPoint events.

Available in Mac OS X v10.4 and later.
(Read only property)

31.24.48 scrollingDeltaX as Double

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the scroll wheel horizontal delta.
Notes:

This is the preferred method for accessing NSScrollWheel delta values. When hasPreciseScrollingDeltas returns false, your application may which to modify this value.

Available in OS X v10.7 and later.
(Read only property)

31.24.49 scrollingDeltaY as Double

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the scroll wheel vertical delta.
Notes:

This is the preferred method for accessing NSScrollWheel delta values. When hasPreciseScrollingDeltas returns false, multiply the value returned by this method by the line or row height. Otherwise scroll by the returned amount.

Available in OS X v10.7 and later.
(Read only property)

31.24.50 stage as Integer

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The stage of pressure events.

Notes:

This message is valid for NSEventTypePressure events.
Pressure gesture events go through multiple stages.
(Read only property)

31.24.51 stageTransition as Double

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The stage transition for pressure events.
Notes:

This message is valid for NSEventTypePressure events. Positive stageTransition describes approaching the next stage of the pressure gesture. Negative stageTransition describes approaching release of the current stage.
(Read only property)

31.24.52 subtype as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the subtype of the receiving event object.
Notes:

Raises an NSInternalInconsistencyException if sent to an event not of type NSAppKitDefined, NSSystemDefined, NSApplicationDefined, or NSPeriodic.

NSPeriodic events don't use this attribute.

This method is also valid for mouse events on Mac OS X v10.4 and later. See the predefined mouse and tablet subtypes.
(Read only property)

31.24.53 systemTabletID as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of the tablet device connected to the system.
Notes:

If multiple tablets are connected to the system, the system-tablet ID is incremented for each subsequent one. If there is only one tablet device, its system-tablet ID is zero. The receiver of this message should be a mouse event object with subtype NSTabletProximityEventSubtype or an event of type NSTabletProximity.

Available in Mac OS X v10.4 and later.
(Read only property)

31.24.54 tabletID as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the USB model identifier of the tablet device associated with the receiver.
Notes:

This method is valid for mouse events with subtype NSTabletProximityEventSubtype and for NSTabletProximity events.
Available in Mac OS X v10.4 and later.
(Read only property)

31.24.55 tangentialPressure as Double

MBS MacBase Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reports the tangential pressure on the device that generated the event represented by the receiver.
Notes:

The value returned can range from -1.0 to 1.0. Tangential pressure is also known as barrel pressure. Only some pointing devices support tangential pressure. This method is valid for mouse events with subtype NSTabletPointEventSubtype and for NSTabletPoint events.

Available in Mac OS X v10.4 and later.
(Read only property)

31.24.56 tilt as NSPointMBS

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reports the scaled tilt values of the pointing device that generated the event represented by the receiver.
Notes:

The value returned can range from -1.0 to 1.0 for both axes. An x-coordinate value that is negative indicates a tilt to the left and a positive value indicates a tilt to the right; a y-coordinate value that is negative indicates a tilt to the top and a positive value indicates a tilt to the bottom. If the device is perfectly perpendicular to the table surface, the values are 0.0 for both axes. This method is valid for mouse events with subtype NSTabletPointEventSubtype and for NSTabletPoint events.

Available in Mac OS X v10.4 and later.
(Read only property)

31.24.57 timestamp as Double

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the time the receiver occurred in seconds since system startup.
Notes: (Read only property)

31.24.58 trackingNumber as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the identifier of a mouse-tracking event.
Notes:

This method returns either an NSTrackingArea object or a NSTrackingRectTag constant depending on whether the event was generated from an NSTrackingArea object or a call to addTrackingRect:owner:user-Data:assumeInside:. Valid mouse-tracking methods are of types NSMouseEntered, NSMouseExited, and NSCursorUpdate. This method raises an NSInternalInconsistencyException if sent to any other type of event.

The NSTrackingArea class is new with Mac OS X version 10.5
(Read only property)

31.24.59 type as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of the receiving event.
Notes:

The type must be one of the following:

NSLeftMouseDown
NSLeftMouseUp
NSRightMouseDown
NSRightMouseUp
NSOtherMouseDown
NSOtherMouseUp
NSMouseMoved
NSLeftMouseDragged
NSRightMouseDragged
NSOtherMouseDragged
NSMouseEntered
NSMouseExited
NSKeyDown
NSKeyUp

NSFlagsChanged
NSAppKitDefined
NSSystemDefined
NSApplicationDefined
NSPeriodic
NSCursorUpdate
NSScrollWheel
(Read only property)

31.24.60 uniqueID as UInt64

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the unique identifier of the pointing device that generated the event represented by the receiver.
Notes:

Also known as tool ID, this is a unique number recorded in the chip inside every pointing device. The unique ID makes it possible to assign a specific pointing device to a specific tablet. You can also use it to "sign" documents or to restrict access to document layers to a specific pointing device. This method is valid for mouse events with subtype NSTabletProximityEventSubtype and for NSTabletProximity events.
Available in Mac OS X v10.4 and later.
(Read only property)

31.24.61 vendorID as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the vendor identifier of the tablet associated with the receiver.
Notes:

The tablet is typically a USB device. This method is valid only for mouse events with subtype NSTabletProximityEventSubtype and for NSTabletProximity events.
Available in Mac OS X v10.4 and later.
(Read only property)

31.24.62 vendorPointingDeviceType as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a coded bit field whose set bits indicate the type of pointing device (within a vendor selection) associated with the receiver.
Notes:

See the vendor documentation for an interpretation of significant bits. This method is valid only for mouse events with subtype NSTabletProximityEventSubtype and for NSTabletProximity events.
Available in Mac OS X v10.4 and later.

(Read only property)

31.24.63 window as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the window object associated with the receiver.
Notes:

A periodic event, however, has no window; in this case the return value is undefined.
(Read only property)

31.24.64 windowNumber as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the identifier for the window device associated with the receiver.
Notes:

A periodic event, however, has no window; in this case the return value is undefined.
(Read only property)

31.24.65 Constants

31.24.66 NSAlphaShiftKeyMask = & h10000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing device-independent bits found in event modifier flags.
Notes: Set if Caps Lock key is pressed.

31.24.67 NSAlternateKeyMask = & h80000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing device-independent bits found in event modifier flags.
Notes: Set if Option or Alternate key is pressed.

31.24.68 NSAnyEventMask = & hFFFFFFFF

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action

message.

31.24.69 NSAppKitDefined=13

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.70 NSAppKitDefinedMask = & h2000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.71 NSApplicationActivatedEventType = 1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing the types of events defined by the Application Kit.
Notes: The application has been activated.

31.24.72 NSApplicationDeactivatedEventType = 2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing the types of events defined by the Application Kit.
Notes: The application has been deactivated.

31.24.73 NSApplicationDefined=15

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.74 NSApplicationDefinedMask = & h8000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.75 NSAWTEventType = 16

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing the types of events defined by the Application Kit.
Notes: An event type used to support Java applications.

31.24.76 NSBeginFunctionKey = & hF72A

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Begin key. Not on most Macintosh keyboards.

31.24.77 NSBreakFunctionKey = & hF732

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Break key. Not on most Macintosh keyboards.

31.24.78 NSClearDisplayFunctionKey = & hF73A

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Clear Display key. Not on most Macintosh keyboards.

31.24.79 NSClearLineFunctionKey = & hF739

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Clear/Num Lock key.

31.24.80 NSCommandKeyMask = & h100000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing device-independent bits found in event modifier flags.
Notes: Set if Command key is pressed.

31.24.81 NSControlKeyMask = & h40000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing device-independent bits found in event modifier flags.
Notes: Set if Control key is pressed.

31.24.82 NSCursorPointingDevice=2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants represent pointing-device types for NSTabletProximity events or mouse events with subtype NSTabletProximityEventSubtype.
Notes:

The pointingDeviceType method returns one of these constants.
Represents a cursor (or puck-like) pointing device.
Available in Mac OS X v10.4 and later.

31.24.83 NSCursorUpdate=17

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.84 NSCursorUpdateMask = & h20000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.85 NSDeleteCharFunctionKey = & hF73E

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Delete Character key. Not on most Macintosh keyboards.

31.24.86 NSDeleteFunctionKey = & hF728

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Forward Delete key.

31.24.87 NSDeleteLineFunctionKey = & hF73C

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Delete Line key. Not on most Macintosh keyboards.

31.24.88 NSDeviceIndependentModifierFlagsMask = & hffff0000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** The mask for all device indepenend modifier flags.
Notes:

Used to retrieve only the device-independent modifier flags, allowing applications to mask off the device-dependent modifier flags, including event coalescing information.

Available in Mac OS X v10.4 and later.

31.24.89 NSDownArrowFunctionKey = & hF701

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Down Arrow key.

31.24.90 NSEndFunctionKey = & hF72B

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: End key.

31.24.91 NSEraserPointingDevice=3

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants represent pointing-device types for NSTabletProximity events or mouse events with subtype NSTabletProximityEventSubtype.
Notes:

The pointingDeviceType method returns one of these constants.
Represents the eraser end of a stylus-like pointing device.
Available in Mac OS X v10.4 and later.

31.24.92 NSEventMaskBeginGesture = & h80000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes:

Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message. Available in Mac OS X v10.6 and later.

31.24.93 NSEventMaskEndGesture = & h100000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes:

Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message. Available in Mac OS X v10.6 and later.

31.24.94 NSEventMaskGesture = & h20000000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes:

Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message. Available in Mac OS X v10.6 and later.

31.24.95 NSEventMaskMagnify = & h40000000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes:

Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message. Available in Mac OS X v10.6 and later.

31.24.96 NSEventMaskRotate = & h40000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes:

Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message. Available in Mac OS X v10.6 and later.

31.24.97 NSEventMaskSwipe = & h80000000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes:

Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.
Available in Mac OS X v10.6 and later.

31.24.98 NSEventTypeBeginGesture=19

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for events.
Notes:

An event that represents a gesture beginning.
Available in Mac OS X v10.6 and later.

31.24.99 NSEventTypeEndGesture=20

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for events.
Notes:

An event that represents some type of gesture such as NSEventTypeMagnify, NSEventTypeSwipe, NSEventTypeRotate, NSEventTypeBeginGesture, or NSEventTypeEndGesture.
Available in Mac OS X v10.6 and later.

31.24.100 NSEventTypeGesture=29

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the event types.
Notes:

An event that represents some type of gesture such as NSEventTypeMagnify, NSEventTypeSwipe, NSEventTypeRotate, NSEventTypeBeginGesture, or NSEventTypeEndGesture.
Available in Mac OS X v10.6 and later.

31.24.101 NSEventTypeMagnify=30

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the event types.
Notes:

An event representing a pinch open or pinch close gesture.
Available in Mac OS X v10.6 and later.

31.24.102 NSEventTypePressure = 34

MBS MacBase Plugin, Plugin Version: 15.1. **Function:** One of the event types.
Notes: A force touch pressure event.

31.24.103 NSEventTypeQuickLook = 33

MBS MacBase Plugin, Plugin Version: 15.1. **Function:** One of the event types.
Notes: The quicklook event.

31.24.104 NSEventTypeRotate=18

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the event types.
Notes:

An event representing a rotation gesture.
Available in Mac OS X v10.6 and later.

31.24.105 NSEventTypeSmartMagnify = 32

MBS MacBase Plugin, Plugin Version: 15.1. **Function:** One of the event types.
Notes: The smart magnify event.

31.24.106 NSEventTypeSwipe=31

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the event types.
Notes:

An event representing a swipe gesture.
Available in Mac OS X v10.6 and later.

31.24.107 NSExecuteFunctionKey = & hF742

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Execute key. Not on most Macintosh keyboards.

31.24.108 NSF10FunctionKey = & hF70D

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F10 key.

31.24.109 NSF11FunctionKey = & hF70E

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F11 key.

31.24.110 NSF12FunctionKey = & hF70F

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F12 key.

31.24.111 NSF13FunctionKey = & hF710

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F13 key.

31.24.112 NSF14FunctionKey = & hF711

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F14 key.

31.24.113 NSF15FunctionKey = & hF712

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F15 key.

31.24.114 NSF16FunctionKey = & hF713

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F16 key.

31.24.115 NSF17FunctionKey = & hF714

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F17 key.

31.24.116 NSF18FunctionKey = & hF715

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F18 key.

31.24.117 NSF19FunctionKey = & hF716

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F19 key.

31.24.118 NSF1FunctionKey = & hF704

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F1 key.

31.24.119 NSF20FunctionKey = & hF717

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F20 key.

31.24.120 NSF21FunctionKey = & hF718

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F21 key. Not on most Macintosh keyboards.

31.24.121 NSF22FunctionKey = & hF719

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F22 key. Not on most Macintosh keyboards.

31.24.122 NSF23FunctionKey = & hF71A

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F23 key. Not on most Macintosh keyboards.

31.24.123 NSF24FunctionKey = & hF71B

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F24 key. Not on most Macintosh keyboards.

31.24.124 NSF25FunctionKey = & hF71C

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F25 key. Not on most Macintosh keyboards.

31.24.125 NSF26FunctionKey = & hF71D

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F26 key. Not on most Macintosh keyboards.

31.24.126 NSF27FunctionKey = & hF71E

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F27 key. Not on most Macintosh keyboards.

31.24.127 NSF28FunctionKey = & hF71F

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F28 key. Not on most Macintosh keyboards.

31.24.128 NSF29FunctionKey = & hF720

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F29 key. Not on most Macintosh keyboards.

31.24.129 NSF2FunctionKey = & hF705

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F2 key.

31.24.130 NSF30FunctionKey = & hF721

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F30 key. Not on most Macintosh keyboards.

31.24.131 NSF31FunctionKey = & hF722

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F31 key. Not on most Macintosh keyboards.

31.24.132 NSF32FunctionKey = & hF723

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F32 key. Not on most Macintosh keyboards.

31.24.133 NSF33FunctionKey = & hF724

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F33 key. Not on most Macintosh keyboards.

31.24.134 NSF34FunctionKey = & hF725

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F34 key. Not on most Macintosh keyboards.

31.24.135 NSF35FunctionKey = & hF726

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F35 key. Not on most Macintosh keyboards.

31.24.136 NSF3FunctionKey = & hF706

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F3 key.

31.24.137 NSF4FunctionKey = & hF707

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F4 key.

31.24.138 NSF5FunctionKey = & hF708

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F5 key.

31.24.139 NSF6FunctionKey = & hF709

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F6 key.

31.24.140 NSF7FunctionKey = & hF70A

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F7 key.

31.24.141 NSF8FunctionKey = & hF70B

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F8 key.

31.24.142 NSF9FunctionKey = & hF70C

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: F9 key.

31.24.143 NSFindFunctionKey = & hF745

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Find key. Not on most Macintosh keyboards.

31.24.144 NSFlagsChanged=12

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.145 NSFlagsChangedMask = & h1000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.146 NSFunctionKeyMask = & h800000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing device-independent bits found in event modifier flags.
Notes: Set if any function key is pressed. The function keys include the F keys at the top of most keyboards (F1, F2, and so on) and the navigation keys in the center of most keyboards (Help, Forward Delete, Home, End, Page Up, Page Down, and the arrow keys).

31.24.147 NSHelpFunctionKey = & hF746

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Help key.

31.24.148 NSHelpKeyMask = & h400000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing device-independent bits found in event modifier flags.
Notes: Set if the Help key is pressed.

31.24.149 NSHomeFunctionKey = & hF729

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Home key.

31.24.150 NSInsertCharFunctionKey = & hF73D

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Insert Character key. Not on most Macintosh keyboards.

31.24.151 NSInsertFunctionKey = & hF727

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Insert key. Not on most Macintosh keyboards.

31.24.152 NSInsertLineFunctionKey = & hF73B

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Insert Line key. Not on most Macintosh keyboards.

31.24.153 NSKeyDown=10

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.154 NSKeyDownMask = & h400

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.155 NSKeyUp=11

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.156 NSKeyUpMask = & h800

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.157 NSLeftArrowFunctionKey = & hF702

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Left Arrow key.

31.24.158 NSLeftMouseDown=1

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.159 NSLeftMouseDownMask = 2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.160 NSLeftMouseDragged=6

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.161 NSLeftMouseDraggedMask = 64

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.162 NSLeftMouseUp=2

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.163 NSLeftMouseUpMask = 4

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.164 NSMenuFunctionKey = & hF735

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Menu key. Not on most Macintosh keyboards.

31.24.165 NSModeSwitchFunctionKey = & hF747

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Mode Switch key. Not on most Macintosh keyboards.

31.24.166 NSMouseEntered=8

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.167 NSMouseEnteredMask = & h100

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action

message.

31.24.168 NSMouseEventSubtype = 0

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing mouse-event subtypes for mouse and tablet events (accessed with the subtype method).
Notes:

Indicates a purely mouse event.
Available in Mac OS X v10.4 and later.

31.24.169 NSMouseExited=9

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.170 NSMouseExitedMask = & h200

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.171 NSMouseMoved=5

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.172 NSMouseMovedMask = 32

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.173 NSNextFunctionKey = & hF740

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.

Notes: Next key. Not on most Macintosh keyboards.

31.24.174 NSNumericPadKeyMask = & h200000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing device-independent bits found in event modifier flags.
Notes: Set if any key in the numeric keypad is pressed. The numeric keypad is generally on the right side of the keyboard. This is also set if any of the arrow keys are pressed (NSUpArrowFunctionKey, NSDownArrowFunctionKey, NSLeftArrowFunctionKey, and NSRightArrowFunctionKey).

31.24.175 NSOtherMouseDown=25

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.176 NSOtherMouseDownMask = & h2000000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.177 NSOtherMouseDragged=27

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.178 NSOtherMouseDraggedMask = & h8000000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.179 NSOtherMouseUp=26

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.180 NSOtherMouseUpMask = & h4000000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.181 NSPageDownFunctionKey = & hF72D

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Page Down key.

31.24.182 NSPageUpFunctionKey = & hF72C

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Page Up key.

31.24.183 NSPauseFunctionKey = & hF730

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Pause key. Not on most Macintosh keyboards.

31.24.184 NSPenLowerSideMask=2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.185 NSPenPointingDevice=1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants represent pointing-device types for NSTabletProximity events or mouse events with subtype NSTabletProximityEventSubtype.
Notes:

The pointingDeviceType method returns one of these constants.
Represents the tip end of a stylus-like pointing device.

Available in Mac OS X v10.4 and later.

31.24.186 NSPenTipMask=1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.187 NSPenUpperSideMask=4

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.188 NSPeriodic=16

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.189 NSPeriodicMask = & h10000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.190 NSPowerOffEventType = 1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** This constant denotes that the user is turning off the computer.
Notes: Specifies that the user is turning off the computer.

31.24.191 NSPrevFunctionKey = & hF73F

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Previous key. Not on most Macintosh keyboards.

31.24.192 NSPrintFunctionKey = & hF738

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Print key. Not on most Macintosh keyboards.

31.24.193 NSPrintScreenFunctionKey = & hF72E

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Print Screen key. Not on most Macintosh keyboards.

31.24.194 NSRedoFunctionKey = & hF744

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Redo key. Not on most Macintosh keyboards.

31.24.195 NSResetFunctionKey = & hF733

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Reset key. Not on most Macintosh keyboards.

31.24.196 NSRightArrowFunctionKey = & hF703

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Right Arrow key.

31.24.197 NSRightMouseDown=3

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.198 NSRightMouseDownMask = 8

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.199 NSRightMouseDragged=7

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.200 NSRightMouseDraggedMask = 128

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.201 NSRightMouseUp=4

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.202 NSRightMouseUpMask = 16

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.203 NSScreenChangedEventType = 8

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing the types of events defined by the Application Kit.
Notes: An NSWindow has changed screens.

31.24.204 NSScrollLockFunctionKey = & hF72F

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.

Notes: Scroll Lock key. Not on most Macintosh keyboards.

31.24.205 NSScrollWheel=22

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.206 NSScrollWheelMask = & h400000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.207 NSSelectFunctionKey = & hF741

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Select key. Not on most Macintosh keyboards.

31.24.208 NSShiftKeyMask = & h20000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing device-independent bits found in event modifier flags.
Notes: Set if Shift key is pressed.

31.24.209 NSStopFunctionKey = & hF734

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Stop key. Not on most Macintosh keyboards.

31.24.210 NSSysReqFunctionKey = & hF731

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: System Request key. Not on most Macintosh keyboards.

31.24.211 NSSystemDefined=14

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.212 NSSystemDefinedMask = & h4000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.213 NSSystemFunctionKey = & hF737

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: System key. Not on most Macintosh keyboards.

31.24.214 NSTabletPoint=23

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.215 NSTabletPointEventSubtype = 1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing mouse-event subtypes for mouse and tablet events (accessed with the subtype method).
Notes:

Indicates a tablet-pointer event; see description of NSTabletPoint.
Available in Mac OS X v10.4 and later.

31.24.216 NSTabletPointMask = & h800000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes: Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.

31.24.217 NSTabletProximity=24

MBS MacBase Plugin, Plugin Version: 7.7. **Function:** One of the event types.

31.24.218 NSTabletProximityEventSubtype = 2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing mouse-event subtypes for mouse and tablet events (accessed with the subtype method).
Notes:

Indicates a tablet-proximity event; see description of NSTabletProximity.
Available in Mac OS X v10.4 and later.

31.24.219 NSTabletProximityMask = & h1000000

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for masks for the events.
Notes:

Pass them to the NSCell method sendActionOn to specify when an NSCell should send its action message.
Available in Mac OS X v10.4 and later.

31.24.220 NSTouchEventSubtype = 3

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing mouse-event subtypes for mouse and tablet events (accessed with the subtype method).
Notes:

Indicates a touch event subtype.
Available in Mac OS X v10.6 and later.

31.24.221 NSUndoFunctionKey = & hF743

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Undo key. Not on most Macintosh keyboards.

31.24.222 NSUnknownPointingDevice=0

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants represent pointing-device types for NSTabletProximity events or mouse events with subtype NSTabletProximityEventSubtype.
Notes:

The pointingDeviceType method returns one of these constants.
Represents an unknown type of pointing device.
Available in Mac OS X v10.4 and later.

31.24.223 NSUpArrowFunctionKey = & hF700

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: Up Arrow key.

31.24.224 NSUserFunctionKey = & hF736

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing Unicode characters (0xF700–0xF8FF) that are reserved for function keys on the keyboard.
Notes: User key. Not on most Macintosh keyboards.

31.24.225 NSWindowExposedEventType = 0

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing the types of events defined by the Application Kit.
Notes: A non-retained NSWindow has been exposed.

31.24.226 NSWindowMovedEventType = 4

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants representing the types of events defined by the Application Kit.
Notes: An NSWindow has moved.

31.25 class NSEventMonitorMBS

31.25.1 class NSEventMonitorMBS

MBS MacFrameworks Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The class for watching events in Cocoa.
Notes: For Mac OS X 10.5 compatibility, please use CarbonMonitorEventsMBS class.

31.25.2 Blog Entries

- MBS Real Studio Plugins, version 12.4pr9

31.25.3 Methods

31.25.4 addGlobalMonitorForEventsMatchingMask(mask as UInt64) as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Installs an event monitor that receives copies of events posted to other applications.
Notes:

mask: An event mask specifying which events you wish to monitor. See NSEventMBS constants for possible values.

Events are delivered asynchronously to your app and you can only observe the event; you cannot modify or otherwise prevent the event from being delivered to its original target application.

Key-related events may only be monitored if accessibility is enabled or if your application is trusted for accessibility access (see AXIsProcessTrusted).

Note that your handler will not be called for events that are sent to your own application.

Special Considerations
In OS X v 10.6, event monitors are only able to monitor the following event types:

NSLeftMouseDragged
NSRightMouseDragged
NSOtherMouseDragged
NSLeftMouseUp
NSRightMouseUp
NSOtherMouseUp
NSLeftMouseDown

NSRightMouseDown
NSOtherMouseDown
NSMouseMoved
NSFlagsChanged
NSScrollWheel
NSTabletPoint
NSTabletProximity
NSKeyDown (Key repeats are determined by sending the event an isARepeat message.)

Available in OS X v10.6 and later.

31.25.5 addLocalMonitorForEventsMatchingMask(mask as UInt64) as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Installs an event monitor that receives copies of events posted to this application before they are dispatched.
Notes:

mask: An event mask specifying which events you wish to monitor. See NSEventMBS constants for possible values.

Calls the LocalEvent event. You can return the event unmodified, create and return a new NSEventMBS object, or return nil to stop the dispatching of the event.

Your handler will not be called for events that are consumed by nested event-tracking loops such as control tracking, menu tracking, or window dragging; only events that are dispatched through the applications sendEvent method will be passed to your handler.

Note: The monitor Block is called for all future events that match mask.

Special Considerations
In OS X v 10.6, event monitors are only able to monitor the following event types:

NSFlagsChanged
NSLeftMouseDragged
NSRightMouseDragged
NSOtherMouseDragged
NSLeftMouseUp
NSRightMouseUp
NSOtherMouseUp
NSLeftMouseDown
NSRightMouseDown
NSOtherMouseDown

NSMouseMoved
NSFlagsChanged
NSScrollWheel
NSTabletPoint
NSTabletProximity
NSKeyDown (Key repeats are determined by sending the event an isARepeat message.)

Available in OS X v10.6 and later.

31.25.6 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether event monitoring is available.
Notes: Returns true on Mac OS X 10.6 and newer.

31.25.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: Initializes the object.

31.25.8 Destructor

MBS MacFrameworks Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The destructor.
Notes: Remove all event monitors you added.

31.25.9 Properties

31.25.10 Count as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns number of event monitors you added.
Notes: (Read only property)

31.25.11 Events

31.25.12 GlobalEvent(e as NSEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event is called for global system events.
Notes:

It is passed the event to monitor. You are unable to change the event, merely observe it.

Events are delivered asynchronously to your app and you can only observe the event; you cannot modify or otherwise prevent the event from being delivered to its original target application.

31.25.13 LocalEvent(e as NSEventMBS) as NSEventMBS

MBS MacFrameworks Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event is called for local application events.
Notes: You can return the event unmodified, create and return a new NSEventMBS object, or return nil to stop the dispatching of the event.

31.26 class NSExceptionHandlerMBS

31.26.1 class NSExceptionHandlerMBS

MBS Main Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for a global handler to catch unhandled cocoa exceptions.
Notes:

Previous plugin versions tried to show a dialog to inform you. Now you can intercept that.
If code is in this event, we do not show the dialog from the plugin.

31.26.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 17.0pr4
- MBS Xojo / Real Studio Plugins, version 13.2pr3

31.26.3 Methods

31.26.4 Disable

MBS Main Plugin, Plugin Version: 17.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Disables the global exception handler.

31.26.5 Enable

MBS Main Plugin, Plugin Version: 17.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enables the global exception handler.
Notes: By default the MBS Plugin automatically enables it when you use Cocoa classes.

31.26.6 Events

31.26.7 CaughtException(e as NSExceptionMBS, IsMainThread as boolean)

MBS Main Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An exception was caught.
Notes: If IsMainThread is true, you can show a dialog/window. But if it's false, you may be in trouble on a worker thread and showing a dialog can cause more trouble.

31.27 class NSExceptionMBS

31.27.1 class NSExceptionMBS

MBS Main Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa exception class.
Example:

```
dim m1 as new NSMenuMBS
dim m2 as new NSMenuMBS
dim n as new NSMenuItemMBS

n.CreateMenuItem

m1.addItem n
m2.addItem n // raises an exception as a menuitem can't be in two menus.

Exception e as NSExceptionMBS
MsgBox e.Message

// e.reason: "Item to be inserted into menu already is in another menu"
// e.name: "NSInternalInconsistencyException"
// e.message: "A Cocoa NSInternalInconsistencyException was not handled: Item to be inserted into menu already is in another menu"
```

Notes:

The plugin installs exception handling code. If you use the NSExceptionMBS class somewhere in your code, the NSException plugin part will be included and a NSExceptionMBS object will be
Subclass of the RuntimeException class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

31.27.4 Methods

31.27.5 callStackSymbols as string()

MBS Main Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array containing the current call symbols.
Notes:

This method returns an array of strings describing the call stack backtrace at the moment the exception was first raised. The format of each string is non-negotiable and is determined by the backtrace symbols API. (like BacktraceMBS function)

Available in OS X v10.6 and later. On older versions this array is empty.

31.27.6 Constructor

MBS Main Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

31.27.7 RaiseException(name as string, reason as string, userInfo as dictionary)

MBS Main Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Raises an exception.
Notes: The plugin does not catch it right away here, so this is a way to pass back an exception to the Cocoa frameworks.

31.27.8 Properties

31.27.9 Name as string

MBS Main Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the exception. (Its type)
Notes: (Read only property)

31.27.10 Reason as string

MBS Main Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reason the exception was raised.

Notes: (Read only property)

31.27.11 UserInfo as Dictionary

MBS Main Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Dictionary object containing application-specific data pertaining to the receiver.
Notes:

Returns nil if no application-specific data exists. As an example, if a method's return value caused the exception to be raised, the return value might be available to the exception handler through this method. (Read only property)

31.27.12 Constants

31.27.13 NSDestinationInvalidException = "NSDestinationInvalidException"

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

31.27.14 NSGenericException = "NSGenericException"

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

31.27.15 NSInternalInconsistencyException = "NSInternalInconsistencyException"

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

31.27.16 NSInvalidArgumentException = "NSInvalidArgumentException"

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

31.27.17 NSInvalidReceivePortException = "NSInvalidReceivePortException"

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

31.27.18 NSInvalidSendPortException = "NSInvalidSendPortException"

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

31.27.19 NSMallocException = "NSMallocException"

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

31.27.20 NSObjectInaccessibleException = "NSObjectInaccessibleException"

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

31.27.21 NSObjectNotAvailableException = "NSObjectNotAvailableException"

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

31.27.22 NSPortReceiveException = "NSPortReceiveException"

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

31.27.23 NSPortSendException = "NSPortSendException"

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

31.27.24 NSPortTimeoutException = "NSPortTimeoutException"

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

31.27.25 NSRangeException = "NSRangeException"

MBS Main Plugin, Plugin Version: 7.4. **Function:** One of the exception names.

31.28 class NSFileWrapperMBS

31.28.1 class NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSFileWrapper class provides access to the attributes and contents of file-system nodes.
Example:

```
// insert a file to textview

Public Sub InsertFile(textview as NSTextViewMBS, f as FolderItem)
// read to file
dim b as BinaryStream = BinaryStream.Open(f)
dim s as string = b.Read(b.Length)

// build wrapper
dim fileWrapper as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(s)
fileWrapper.preferredFilename = f.name

// make attachment
dim fileAttachment as new NSTextAttachmentMBS(fileWrapper)
dim attributedString as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithAttachment(fileAttachment)

// add to a NSTextViewMBS
textview.insertText attributedString

End Sub
```

Notes:

A file-system node is a file, directory, or symbolic link. Instances of this class are known as file wrappers.

File wrappers represent a file-system node as an object that can be displayed as an image (and possibly edited in place), saved to the file system, or transmitted to another application.

There are three types of file wrappers:

- Regular-file file wrapper: Represents a regular file.
- Directory file wrapper: Represents a directory.
- Symbolic-link file wrapper: Represents a symbolic link.

A file wrapper has these attributes:

- Filename. Name of the file-system node the file wrapper represents.
- file-system attributes. See NSFileManager Class Reference for information on the contents of the attributes dictionary.
- Regular-file contents. Applicable only to regular-file file wrappers.
- File wrappers. Applicable only to directory file wrappers.
- Destination node. Applicable only to symbolic-link file wrappers.

31.28.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.5pr4

31.28.3 Methods

31.28.4 addFileWrapper(child as NSFileWrapperMBS) as String

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a child file wrapper to the receiver, which must be a directory file wrapper.
Notes:

child: File wrapper to add to the directory.

Returns Dictionary key used to store fileWrapper in the directory's list of file wrappers. The dictionary key is a unique filename, which is the same as the passed-in file wrapper's preferred filename unless that name is already in use as a key in the directory's dictionary of children. See Working with Directory Wrappers in File System Programming Guide for more information about the file-wrapper list structure.

Use this method to add an existing file wrapper as a child of a directory file wrapper. If the file wrapper does not have a preferred filename, set the preferredFilename property to give it one before calling addFileWrapper. To create a new file wrapper and add it to a directory, use the addRegularFileWithContents method.

Special Considerations
This method raises NSInternalInconsistencyException if the receiver is not a directory file wrapper.
This method raises NSInvalidArgumentException if the child file wrapper doesn't have a preferred name.

31.28.5 addRegularFileWithContents(Data as MemoryBlock, preferredFilename as string) as String

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a regular-file file wrapper with the given contents and adds it to the receiver, which must be a directory file wrapper.
Notes:

data: Contents for the new regular-file file wrapper.
filename: Preferred filename for the new regular-file file wrapper.

Returns Dictionary key used to store the new file wrapper in the directory's list of file wrappers. The dictionary key is a unique filename, which is the same as the passed-in file wrapper's preferred filename unless that name is already in use as a key in the directory's dictionary of children. See Working with Directory Wrappers in File System Programming Guide for more information about the file-wrapper list structure.

This is a convenience method. The default implementation allocates a new file wrapper, initializes it with initRegularFileWithContents, set its preferredFilename property, adds it to the directory with addFileWrapper, and returns what addFileWrapper returned.

This method raises NSInternalInconsistencyException if the receiver is not a directory file wrapper.
This method raises NSInvalidArgumentException if you pass nil or an empty value for filename.

Available in OS X v10.0 and later.

31.28.6 Constructor

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

31.28.7 initDirectoryWithFileWrappers(childrenByPreferredName as Dictionary) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the receiver as a directory file wrapper, with a given file-wrapper list.
Notes:

childrenByPreferredName: Key-value dictionary of file wrappers with which to initialize the receiver. The dictionary must contain entries whose values are the file wrappers that are to become children and whose keys are filenames. See Working with Directory Wrappers in File System Programming Guide for more information about the file-wrapper list structure.

Returns initialized file wrapper for fileWrappers.

After initialization, the file wrapper is not associated with a file-system node until you save it using writeToURL:options:originalContentsURL:.

The receiver is initialized with open permissions: anyone can read, write, or modify the directory on disk.

If any file wrapper in the directory doesn't have a preferred filename, its preferred name is automatically set to its corresponding key in the childrenByPreferredName dictionary.

31.28.8 initRegularFileWithContents(data as MemoryBlock) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the receiver as a regular-file file wrapper.
Example:

```
dim content as MemoryBlock = "Hello World"
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(content)
f.filename = "HelloWorld.txt"
```

Notes:

After initialization, the file wrapper is not associated with a file-system node until you save it using writeToURL.
The file wrapper is initialized with open permissions: anyone can write to or read the file wrapper.

31.28.9 initWithFile(File as folderItem, Options as Integer, byref error as NSErrorMBS) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a file wrapper instance whose kind is determined by the type of file-system node located by the folderitem.
Example:

```
dim file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
dim e as NSErrorMBS
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)

if e <>nil then
MsgBox e.localizedDescription
```

```
else
dim dic as Dictionary = f.fileAttributes
Break // read dic in debugger
end if
```

Notes:

File: Folderitem of the file-system node the file wrapper is to represent.
options: Option flags for reading the node located at folderitem. Can be NSFileWrapperReadingImmediate and/or NSFileWrapperReadingWithoutMapping.
Error: If an error occurs, upon return contains an NSErrorMBS object that describes the problem.

Returns File wrapper for the file-system node at folderitem. May be a directory, file, or symbolic link, depending on what is located at the folderitem. Returns nil if reading is not successful.

If folderitem is a directory, this method recursively creates file wrappers for each node within that directory. Use the fileWrappers property to get the file wrappers of the nodes contained by the directory.

Available in OS X v10.6 and later.

31.28.10 initWithSerializedRepresentation(data as MemoryBlock) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the receiver as a regular-file file wrapper from given serialized data.
Example:

```
// get a wrapper
dim file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
dim e as NSErrorMBS
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)
dim data as MemoryBlock = f.serializedRepresentation

// later restore it
dim other as NSFileWrapperMBS = NSFileWrapperMBS.initWithSerializedRepresentation(data)
MsgBox other.preferredFilename
```

Notes:

serializedRepresentation: Serialized representation of a file wrapper in the format used for the NSFileContentsPboardType pasteboard type. Data of this format is returned by such methods as serializedRepresentation and RTFDFromRange (in NSAttributedString).

Returns regular-file file wrapper initialized from serializedRepresentation.
The file wrapper is not associated with a file-system node until you save it using writeToURL.

31.28.11 initWithURL(URL as string, Options as Integer, byref error as NSErrorMBS) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a file wrapper instance whose kind is determined by the type of file-system node located by the URL.
Notes:

url: URL of the file-system node the file wrapper is to represent.
options: Option flags for reading the node located at url. Can be NSFileWrapperReadingImmediate and/or NSFileWrapperReadingWithoutMapping.
Error: If an error occurs, upon return contains an NSErrorMBS object that describes the problem.

Returns File wrapper for the file-system node at url. May be a directory, file, or symbolic link, depending on what is located at the URL. Returns nil if reading is not successful.

If url is a directory, this method recursively creates file wrappers for each node within that directory. Use the fileWrappers property to get the file wrappers of the nodes contained by the directory.

Available in OS X v10.6 and later.

31.28.12 keyForFileWrapper(child as NSFileWrapperMBS) as String

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the dictionary key used by a directory to identify a given file wrapper.
Notes:

child: The child file wrapper for which you want the key.

Returns Dictionary key used to store the file wrapper in the directory's list of file wrappers. The dictionary key is a unique filename, which may not be the same as the passed-in file wrapper's preferred filename if more than one file wrapper in the directory's dictionary of children has the same preferred filename. See Working with Directory Wrappers in File System Programming Guide for more information about the file-wrapper list structure. Returns nil if the file wrapper specified in child is not a child of the directory.

Special Considerations
This method raises NSInternalInconsistencyException if the receiver is not a directory file wrapper.

31.28.13 matchesContentsOfFile(File as Folderitem) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the contents of a file wrapper matches a directory, regular file, or symbolic link on disk.
Notes:

file: Folderitem of the file-system node with which to compare the file wrapper.

Returns true when the contents of the file wrapper match the contents of url, false otherwise.

The contents of files are not compared; matching of regular files is based on file modification dates. For a directory, children are compared against the files in the directory, recursively.

Because children of directory file wrappers are not read immediately by the initWithURL:options:error: method unless the NSFileWrapperReadingImmediate reading option is used, even a newly-created directory file wrapper might not have the same contents as the directory on disk. You can use this method to determine whether the file wrapper's contents in memory need to be updated.

If the file wrapper needs updating, use the readFromURL:options:error: method with the NSFileWrapperReadingImmediate reading option.

This table describes which attributes of the file wrapper and file-system node are compared to determine whether the file wrapper matches the node on disk:

File-wrapper type	Comparison determinants
Regular file	Modification date and access permissions.
Directory	Children (recursive).
Symbolic link	Destination pathname.

Available in OS X v10.6 and later.

31.28.14 matchesContentsOfURL(URL as String) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the contents of a file wrapper matches a directory, regular file, or symbolic link on disk.
Notes:

url: URL of the file-system node with which to compare the file wrapper.

Returns true when the contents of the file wrapper match the contents of url, false otherwise.

The contents of files are not compared; matching of regular files is based on file modification dates. For a directory, children are compared against the files in the directory, recursively.

Because children of directory file wrappers are not read immediately by the initWithURL:options:error: method unless the NSFileWrapperReadingImmediate reading option is used, even a newly-created directory file wrapper might not have the same contents as the directory on disk. You can use this method to determine whether the file wrapper's contents in memory need to be updated.

If the file wrapper needs updating, use the readFromURL:options:error: method with the NSFileWrapperReadingImmediate reading option.

This table describes which attributes of the file wrapper and file-system node are compared to determine whether the file wrapper matches the node on disk:

File-wrapper type	Comparison determinants
Regular file	Modification date and access permissions.
Directory	Children (recursive).
Symbolic link	Destination pathname.

Available in OS X v10.6 and later.

31.28.15 readFromFile(File as Folderitem, Options as Integer = 0, byref Error as NSErrorMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Recursively rereads the entire contents of a file wrapper from the specified location on disk.
Notes:

File: Folderitem of the file-system node corresponding to the file wrapper.
options: Option flags for reading the node located at url.
Error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns true if successful. If not successful, returns false after setting outError to an NSErrorMBS object that describes the reason why the file wrapper could not be reread.

When reading a directory, children are added and removed as necessary to match the file system.

Available in OS X v10.6 and later.

31.28.16 readFromURL(URL as String, Options as Integer = 0, byref Error as NSErrorMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Recursively rereads the entire contents of a file wrapper from the specified location on disk.
Notes:

url: URL of the file-system node corresponding to the file wrapper.
options: Option flags for reading the node located at url.
Error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns true if successful. If not successful, returns false after setting outError to an NSErrorMBS object that describes the reason why the file wrapper could not be reread.

When reading a directory, children are added and removed as necessary to match the file system.
Available in OS X v10.6 and later.

31.28.17 removeFileWrapper(child as NSFileWrapperMBS)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes a child file wrapper from the receiver, which must be a directory file wrapper.
Notes: This method raises NSInternalInconsistencyException if the receiver is not a directory file wrapper.

31.28.18 writeToFile(File as Folderitem, Options as Integer = 0, originalContentsURL as FolderItem = nil, byref Error as NSErrorMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Recursively writes the entire contents of a file wrapper to a given file-system URL.
Example:

```
// get styled text from htmlviewer
dim w as WebViewMBS = HTMLViewer1.WebViewMBS
dim f as WebFrameMBS = w.mainFrame
dim v as WebFrameViewMBS = f.frameView
dim d as WebDocumentViewMBS = v.documentView
dim n as NSAttributedStringMBS = d.attributedString

// package it
```

```
dim da as new Dictionary
da.Value(n.NSDocumentTypeDocumentAttribute) = n.NSRTFDTextDocumentType

dim e as NSErrorMBS
dim fw as NSFileWrapperMBS = n.fileWrapperFromRange(0, n.Length, da, e)
if e <>nil then
MsgBox e.LocalizedDescription
Return
end if

// write to disk
dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
if fw.writeToFile(file, e) then
MsgBox "OK"
else
MsgBox e.LocalizedDescription
end if
```

Notes:

File: Folderitem of the file-system node to which the file wrapper's contents are written.
options: Option flags for writing to the node located at url.
originalContentsURL: The location of a previous revision of the contents being written. The default implementation of this method attempts to avoid unnecessary I/O by writing hard links to regular files instead of actually writing out their contents when the contents have not changed. The child file wrappers must return accurate values when its filename property is accessed for this to work. Use the NSFileWrapperWritingWithNameUpdating writing option to increase the likelihood of that. Specify nil for this parameter if there is no earlier version of the contents or if you want to ensure that all the contents are written to files.
Error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns true when the write operation is successful. If not successful, returns false after setting outError to an NSError object that describes the reason why the file wrapper's contents could not be written.

Available in OS X v10.6 and later.

31.28.19 writeToURL(URL as String, Options as Integer = 0, originalContentsURL as String = "", byref Error as NSErrorMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Recursively writes the entire contents of a file wrapper to a given file-system URL.
Notes:

url: URL of the file-system node to which the file wrapper's contents are written.
options: Option flags for writing to the node located at url.

originalContentsURL: The location of a previous revision of the contents being written. The default implementation of this method attempts to avoid unnecessary I/O by writing hard links to regular files instead of actually writing out their contents when the contents have not changed. The child file wrappers must return accurate values when its filename property is accessed for this to work. Use the NSFileWrapperWritingWithNameUpdating writing option to increase the likelihood of that. Specify nil for this parameter if there is no earlier version of the contents or if you want to ensure that all the contents are written to files.
Error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns true when the write operation is successful. If not successful, returns false after setting outError to an NSError object that describes the reason why the file wrapper's contents could not be written.

Available in OS X v10.6 and later.

31.28.20 Properties

31.28.21 Directory as Boolean

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This property contains a boolean value indicating whether the file wrapper is a directory file wrapper. (read-only)
Notes:

This property will contain true when the file wrapper is a directory file wrapper, otherwise it contains false. Invocations of readFromURL may change the value of this property, if the type of the file on disk has changed. (Read only property)

31.28.22 fileAttributes as Dictionary

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A dictionary of file attributes.
Example:

```
dim file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
dim e as NSErrorMBS
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)

if e <>nil then
MsgBox e.localizedDescription
else
dim dic as Dictionary = f.fileAttributes
Break // read dic in debugger
end if
```

Notes:

The file attributes' dictionary is the same format as that returned by attributesOfItemAtPath (see NSFileManagerMBS).
(Read and Write property)

31.28.23 filename as String

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The filename of the file wrapper object.
Example:

```
dim content as MemoryBlock = "Hello World"
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(content)
f.filename = "HelloWorld.txt"
```

Notes:

This property contains the file wrapper's filename, or nil when the file wrapper has no corresponding file-system node.

The filename is used for record-keeping purposes only and is set automatically when the file wrapper is created from the file system using initWithURL and when it's saved to the file system using writeToURL (although this method allows you to request that the filename not be updated).

The filename is usually the same as the preferred filename, but might instead be a name derived from the preferred filename. You can use this method to get the name of a child that's just been read. Don't use this method to get the name of a child that's about to be written, because the name might be about to change; send keyForFileWrapper to the parent instead.
(Read and Write property)

31.28.24 fileWrappers as Dictionary

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The file wrappers contained by a directory file wrapper.
Notes:

The dictionary contains entries whose values are the file wrappers and whose keys are the unique filenames that have been assigned to each one. See Working with Directory Wrappers in File System Programming Guide for more information about the file-wrapper list structure.

This property may contain nil if the user modifies the directory after you call readFromURL or initWithURL but before NSFileWrapper has read the contents of the directory. Use the NSFileWrapperReadingImmediate reading option to reduce the likelihood of that problem.

This property raises NSInternalInconsistencyException if the file wrapper object is not a directory file wrapper.
(Read only property)

31.28.25 Handle as Integer

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes:

Must not be 0 to have the object being valid.
(Read and Write property)

31.28.26 icon as NSImageMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An image that can be used to represent the file wrapper to the user.
Example:

```
dim file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
dim e as NSErrorMBS
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)
dim img as NSImageMBS = f.icon
dim pic as Picture = img.CopyPictureWithMask
window1.Backdrop = pic
```

Notes:

An application does not have to use this icon; for example, a file viewer typically looks up icons automatically based on file extensions, and so wouldn't need this one. Similarly, if a file wrapper represents an image file, an application can display the image directly rather than a file icon.

This method may return nil if the file wrapper is a child created when its parent was read from the file system, and the child was modified before it was read. Use the NSFileWrapperReadingImmediate reading option to reduce the likelihood of that problem.

Because the NSImage object that's returned might be shared by many NSFileWrapper objects, you must not mutate it. If you need to mutate the returned object, make a copy first and mutate the copy instead.

(Read and Write property)

31.28.27 preferredFilename as String

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The preferred filename for the file wrapper object.
Example:

```
// get a wrapper
dim file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
dim e as NSErrorMBS
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)
dim data as MemoryBlock = f.serializedRepresentation

// later restore it
dim other as NSFileWrapperMBS = NSFileWrapperMBS.initWithSerializedRepresentation(data)
MsgBox other.preferredFilename
```

Notes:

This name is normally used as the dictionary key when a child file wrapper is added to a directory file wrapper. However, if another file wrapper with the same preferred name already exists in the directory file wrapper when this object is added, the filename assigned as the dictionary key may differ from the preferred filename.

When you change the preferred filename, the default implementation of this property causes the existing parent directory file wrappers to remove and re-add the child to accommodate the change. Preferred filenames of children are not preserved when you write a file wrapper to disk and then later instantiate another file wrapper by reading the file from disk. If you need to preserve the user-visible names of attachments, you have to store the names yourself.
(Read and Write property)

31.28.28 RegularFile as Boolean

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This property contains a boolean value that indicates whether the file wrapper object is a regular-file. (read-only)
Notes:

This property contains true when the file wrapper object is a regular-file wrapper, otherwise it contains false. Invocations of readFromURL may change the value of this property if the type of the file on disk has changed.
(Read only property)

31.28.29 regularFileContents as MemoryBlock

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The contents of the file-system node associated with a regular-file file wrapper. (read-only)
Notes:

This property may contain nil if the user modifies the file after you call readFromURL or initWithURL but before NSFileWrapper has read the contents of the file. Use the NSFileWrapperReadingImmediate reading option to reduce the likelihood of that problem.
This property raises NSInternalInconsistencyException if the file wrapper object is not a regular-file file wrapper.
(Read only property)

31.28.30 serializedRepresentation as MemoryBlock

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The contents of the file wrapper as an opaque collection of data. (read-only)
Example:

```
// get a wrapper
dim file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
dim e as NSErrorMBS
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)
dim data as MemoryBlock = f.serializedRepresentation

// later restore it
dim other as NSFileWrapperMBS = NSFileWrapperMBS.initWithSerializedRepresentation(data)
MsgBox other.preferredFilename
```

Notes:

This property contains an MemoryBlock in the format used by the pasteboard type NSFileContentsPboardType. This MemoryBlock is also suitable for passing to initWithSerializedRepresentation.

This property may contain nil if the user modifies the contents of the file-system node after you call readFromURL or initWithURL/File but before NSFileWrapper has read the contents of the file. Use the NSFileWrapperReadingImmediate reading option to reduce the likelihood of that problem.
(Read only property)

31.28.31 SymbolicLink as Boolean

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A boolean that indicates whether the file wrapper object is a symbolic-link file wrapper. (read-only)
Notes:

This property contains true when the file wrapper object is a symbolic-link file wrapper, false otherwise.
Invocations of readFromURL may change the value contained by this property, if the type of the file on disk has changed.
(Read only property)

31.28.32 symbolicLinkDestinationURL as String

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The URL referenced by the file wrapper object, which must be a symbolic-link file wrapper. (read-only)
Notes:

This property may contain nil if the user modifies the symbolic link after you call readFromURL or initWithURL but before NSFileWrapper has read the contents of the link. Use the NSFileWrapperReadingImmediate reading option to reduce the likelihood of that problem.
This property raises NSInternalInconsistencyException if the file wrapper object is not a symbolic-link file wrapper.
(Read only property)

31.28.33 Constants

31.28.34 NSFileWrapperReadingImmediate = 1

MBS MacBase Plugin, Plugin Version: 15.0. **Function:** One of the reading options.
Notes:

If reading with this option succeeds, then subsequent uses of fileWrappers, regularFileContents, symbolicLinkDestinationURL, and serializedRepresentation sent to the file wrapper and all its child file wrappers will fail and return nil only if an actual error occurs (for example, the volume has disappeared or the file server is unreachable)—not as a result of the user moving or deleting files.

For performance reasons, NSFileWrapper may not read the contents of some file packages immediately even when this option is chosen. For example, because the contents of bundles (not all file packages are bundles) are immutable to the user, NSFileWrapper may read the children of such a directory lazily.

You can use this option to take a snapshot of a file or folder for writing later. For example, an application like TextEdit can use this option when creating new file wrappers to represent attachments that the user creates by copying and pasting or dragging and dropping from the Finder to a TextEdit document. Don't use

this option when reading a document file package, because that would cause unnecessarily bad performance. For example, an application wouldn't use this option when creating file wrappers to represent attachments as it's opening a document stored in a file package.

Available in OS X v10.6 and later.

31.28.35 NSFileWrapperReadingWithoutMapping = 2

MBS MacBase Plugin, Plugin Version: 15.0. **Function:** One of the reading options.
Notes:

Whether file mapping for regular file wrappers is disallowed.

You can use this option to keep NSFileWrapper from memory-mapping files. This is useful if you want to make sure your application doesn't hold files open (mapped files are open files), therefore preventing the user from ejecting DVDs, unmounting disk partitions, or unmounting disk images. In OS X v10.6 and later, NSFileWrapper memory-maps files that are on internal drives only. It never memory-maps files on external drives or network volumes, regardless of whether this option is used.

Available in OS X v10.6 and later.

31.28.36 NSFileWrapperWritingAtomic = 1

MBS MacBase Plugin, Plugin Version: 15.0. **Function:** One of the writing options.
Notes:

Whether writing is done atomically.

You can use this option to ensure that, when overwriting a file package, the overwriting either completely succeeds or completely fails, with no possibility of leaving the file package in an inconsistent state. Because this option causes additional I/O, you shouldn't use it unnecessarily. For example, don't use this option in an override of - [NSDocument writeToURL] , because NSDocument safe-saving is already done atomically.

Available in OS X v10.6 and later.

31.28.37 NSFileWrapperWritingWithNameUpdating = 2

MBS MacBase Plugin, Plugin Version: 15.0. **Function:** One of the writing options.
Notes:

Whether descendant file wrappers'filename properties are set if the writing succeeds.

This option is necessary when your application passes a URL in the originalContentsURL parameter to the writeToURL method. Without using this option (and reusing child file wrappers properly), subsequent invocations of writeToURL would not be able to reliably create hard links in a new file package, because the record of names in the old file package would be out of date.

Available in OS X v10.6 and later.

31.29 class NSFontDescriptorMBS

31.29.1 class NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class for a font descriptor.
Notes:

NSFontDescriptor objects provide a mechanism to describe a font with a dictionary of attributes. This font descriptor can be used later to create or modify an NSFont object. Mac OS X v10.4 and later provides a font matching capability, so that you can partially describe a font by creating a font descriptor with, for example, just a family name. You can then find all the available fonts on the system with a matching family name using matchingFontDescriptorsWithMandatoryKeys.

There are several ways to create a new NSFontDescriptor object. You can use the Constructor, fontDescriptorWithFontAttributes or fontDescriptorWithName. to create a font descriptor based on either your custom attributes dictionary or on a specific font's name and size. Alternatively you can use one of the fontDescriptor… instance methods (such as fontDescriptorWithFace) to create a modified version of an existing descriptor. The latter methods are useful if you have an existing descriptor and simply want to change one aspect.

All attributes in the attributes dictionary are optional.

31.29.2 Blog Entries

- CocoaBase needs MacOSXCG
- MBS Real Studio Plugins, version 12.1pr10

31.29.3 Methods

31.29.4 Constructor(AttributesDic as Dictionary)

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a new font descriptor with the specified attributes.
Notes: attributes: The attributes for the new font descriptor. If nil, the font descriptor's attribute dictionary will be empty.

31.29.5 copy as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the object.

31.29.6 fontAttributes as Dictionary

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's dictionary of attributes.

31.29.7 fontDescriptorByAddingAttributes(AttributesDic as Dictionary) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new font descriptor that is the same as the receiver but with the specified attributes taking precedence over the existing ones.

31.29.8 fontDescriptorWithFace(newFace as string) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new font descriptor that is the same as the receiver but with the specified face.
Notes:

newFace: The new font face.

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.

31.29.9 fontDescriptorWithFamily(newFamily as string) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new font descriptor whose attributes are the same as the receiver but from the specified family.
Notes:

newFamily: The new font family.

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.

31.29.10 fontDescriptorWithFontAttributes(AttributesDic as Dictionary) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a font descriptor with a dictionary of attributes.
Notes:

attributes: The attributes for the font descriptor. If nil, the font descriptor's dictionary will be empty.

Returns the new font descriptor.

31.29.11 fontDescriptorWithMatrix(matrix as Variant) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new font descriptor that is the same as the receiver but with the specified matrix.
Notes:

matrix: The new font matrix. Must be a NSAffineTransformMBS object.

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.

31.29.12 fontDescriptorWithName(fontName as string, matrix as Variant) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a font descriptor with the NSFontNameAttribute and NSFontMatrixAttribute dictionary attributes set to the given values.
Notes:

fontName: The value for NSFontNameAttribute.
matrix: The value for NSFontMatrixAttribute. Must be a NSAffineTransformMBS object or nil!

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.
See also:

- 31.29.13 fontDescriptorWithName(fontName as string, size as Double) as NSFontDescriptorMBS 6108

31.29.13 fontDescriptorWithName(fontName as string, size as Double) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a font descriptor with the NSFontNameAttribute and NSFontSizeAttribute dictionary attributes set to the given values.
Notes:

fontName: The value for NSFontNameAttribute.
size: The value for NSFontSizeAttribute.

Returns the new font descriptor.
Available in Mac OS X v10.3 and later.
See also:

- 31.29.12 fontDescriptorWithName(fontName as string, matrix as Variant) as NSFontDescriptorMBS 6107

31.29.14 fontDescriptorWithSize(newPointSize as Double) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new font descriptor that is the same as the receiver but with the specified point size.
Notes:

newPointSize: The new point size.

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.

31.29.15 fontDescriptorWithSymbolicTraits(SymbolicTraits as Integer) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new font descriptor that is the same as the receiver but with the specified symbolic traits taking precedence over the existing ones.
Example:

```
// get a bold font
dim n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(13)
dim f as NSFontDescriptorMBS = n.fontDescriptor
dim w as Integer = f.symbolicTraits

// find similar font without bold
```

```
f = f.fontDescriptorWithSymbolicTraits( BitwiseAnd(w, Bitwise.OnesComplement(f.NSFontBoldTrait)))

// now check it
dim d as Dictionary = f.fontAttributes
w = f.symbolicTraits

if BitwiseAnd(w, f.NSFontBoldTrait) <>0 then
MsgBox "bold"
else
MsgBox "not bold"
end if
```

Notes:

symbolicTraits: The new symbolic traits.

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.

31.29.16 matchingFontDescriptorsWithMandatoryKeys as NSFontDescriptorMBS()

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns all the fonts available on the system whose specified attributes match those of the receiver.
Notes:

mandatoryKeys: Optional, keys that must be identical to be matched. Can be nil.

Returns the matching font descriptors.

For example, suppose there are two versions of a given font installed that differ in the number of glyphs covered (the new version has more glyphs). If you explicitly specify NSFontNameAttribute as the only mandatory key, then a font descriptor that specifies a font name and character set by default matches both versions, since the character set attribute is not used for matching. If you specify that font name and character set keys are mandatory, the returned array contains only the font that matches both keys.

Available in Mac OS X v10.4 and later.
See also:

- 31.29.17 matchingFontDescriptorsWithMandatoryKeys(mandatoryKeys() as string) as NSFontDescriptorMBS() 6110

31.29.17 matchingFontDescriptorsWithMandatoryKeys(mandatoryKeys() as string) as NSFontDescriptorMBS()

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns all the fonts available on the system whose specified attributes match those of the receiver.
Notes:

mandatoryKeys: Optional, keys that must be identical to be matched. Can be nil.

Returns the matching font descriptors.

For example, suppose there are two versions of a given font installed that differ in the number of glyphs covered (the new version has more glyphs). If you explicitly specify NSFontNameAttribute as the only mandatory key, then a font descriptor that specifies a font name and character set by default matches both versions, since the character set attribute is not used for matching. If you specify that font name and character set keys are mandatory, the returned array contains only the font that matches both keys.

Available in Mac OS X v10.4 and later.
See also:

- 31.29.16 matchingFontDescriptorsWithMandatoryKeys as NSFontDescriptorMBS() 6109

31.29.18 matchingFontDescriptorWithMandatoryKeys as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a normalized font descriptor whose specified attributes match those of the receiver.
Notes:

mandatoryKeys: Optional, keys that must be identical to be matched. Can be nil.

Returns the matching font descriptor.
The returned font descriptor is the first element returned from matchingFontDescriptorsWithMandatoryKeys.
See also:

- 31.29.19 matchingFontDescriptorWithMandatoryKeys(mandatoryKeys() as string) as NSFontDescriptorMBS 6110

31.29.19 matchingFontDescriptorWithMandatoryKeys(mandatoryKeys() as string) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a normalized font descriptor whose specified attributes match those of the receiver.
Notes:

mandatoryKeys: Optional, keys that must be identical to be matched. Can be nil.

Returns the matching font descriptor.
The returned font descriptor is the first element returned from matchingFontDescriptorsWithMandatoryKeys.
See also:

- 31.29.18 matchingFontDescriptorWithMandatoryKeys as NSFontDescriptorMBS 6110

31.29.20 matrix as Variant

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current transform matrix of the receiver.
Notes: Must be a NSAffineTransformMBS object or nil!

31.29.21 NSFontCascadeListAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys.
Notes:

An array with sub-descriptors.
The default value is the system default cascading list for user's locale.
Available in Mac OS X v10.4 and later.

31.29.22 NSFontCharacterSetAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys.
Notes:

An NSCharacterSetMBS instance that represents the set of Unicode characters covered by the font.
The default value is supplied by the font.
Available in Mac OS X v10.4 and later.

31.29.23 NSFontColorAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys.
Notes:

An optional memoryblock that specifies the font color.
(Deprecated. Use NSForegroundColorAttributeName instead.)
Available in Mac OS X v10.3 and later.
Deprecated in Mac OS X v10.4.

31.29.24 NSFontFaceAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys.
Notes: An optional string that specifies the font face.

31.29.25 NSFontFamilyAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys.
Notes: An optional string that specifies the font family.

31.29.26 NSFontFeatureSelectorIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for font descriptor attributes.
Notes:

A number specifying a font feature selector such as common ligature off, traditional character shape, and so on. See "Font Features" in ATSUI Programming Guide for predefined feature selectors.
Available in Mac OS X v10.5 and later.

31.29.27 NSFontFeatureTypeIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for font descriptor attributes.
Notes:

A number specifying a font feature type such as ligature, character shape, and so on. See "Font Features" in ATSUI Programming Guide for predefined feature types.
Available in Mac OS X v10.5 and later.

31.29.28 NSFontFixedAdvanceAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys.
Notes:

A number containing a float value that overrides the glyph advancement specified by the font.
The default value is 0.0.

31.29.29 NSFontMatrixAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys.
Notes:

An NSAffineTransformMBS instance that specifies the font's transformation matrix.
The default value is the identity matrix.
Available in Mac OS X v10.4 and later.

31.29.30 NSFontNameAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys.
Notes: An optional string that specifies the font name.

31.29.31 NSFontSizeAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys.
Notes: An optional string, containing a float value, that specifies the font size.

31.29.32 NSFontSlantTrait as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its trait dictionary.
Notes:

The relative slant angle value as a number.
The valid value range is from -1.0 to 1.0. The value of 0.0 corresponds to 0 degree clockwise rotation from the vertical and 1.0 corresponds to 30 degrees clockwise rotation.

Available in Mac OS X v10.4 and later.

31.29.33 NSFontSymbolicTrait as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its trait dictionary.
Notes:

The symbolic traits value as a number.
Available in Mac OS X v10.4 and later.

31.29.34 NSFontTraitsAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys.
Notes:

A Dictionary instance instance fully describing font traits.
The default value is supplied by the font. See "Font traits dictionary keys" for dictionary keys.
Available in Mac OS X v10.4 and later.

31.29.35 NSFontVariationAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys.
Notes:

A dictionary instance that describes the font's variation axis.
The default value is supplied by the font. See "Font variation axis dictionary keys" for dictionary keys.
Available in Mac OS X v10.4 and later.

31.29.36 NSFontVariationAxisDefaultValueKey as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its variation axis dictionary.
Notes:

The default axis value as a number.
Available in Mac OS X v10.4 and later.

31.29.37 NSFontVariationAxisIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its variation axis dictionary.
Notes:

The axis identifier value as a number.
Available in Mac OS X v10.4 and later.

31.29.38 NSFontVariationAxisMaximumValueKey as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its variation axis dictionary.
Notes:

The maximum axis value as a number.
Available in Mac OS X v10.4 and later.

31.29.39 NSFontVariationAxisMinimumValueKey as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its variation axis dictionary.
Notes:

The minimum axis value as a number.
Available in Mac OS X v10.4 and later.

31.29.40 NSFontVariationAxisNameKey as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its variation axis dictionary.
Notes:

The localized variation axis name.
Available in Mac OS X v10.4 and later.

31.29.41 NSFontVisibleNameAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the attribute keys.

Notes: An optional string that specifies the font's visible name.

31.29.42 NSFontWeightTrait as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its trait dictionary.
Notes:

The normalized weight value as a number.
The valid value range is from -1.0 to 1.0. The value of 0.0 corresponds to the regular or medium font weight.
Available in Mac OS X v10.4 and later.

31.29.43 NSFontWidthTrait as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to retrieve information about a font descriptor from its trait dictionary.
Notes:

The relative inter-glyph spacing value as a number.
The valid value range is from -1.0 to 1.0. The value of 0.0 corresponds to the regular glyph spacing.
Available in Mac OS X v10.4 and later.

31.29.44 pointSize as Double

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the point size of the receiver.
Example:

```
dim f as NSFontMBS = NSFontMBS.fontWithName("Arial", 12)
dim d as NSFontDescriptorMBS = f.fontDescriptor
MsgBox str(d.pointSize)
```

31.29.45 postscriptName as string

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the PostScript name of the receiver.
Example:

```
dim f as NSFontMBS = NSFontMBS.fontWithName("Arial", 12)
dim d as NSFontDescriptorMBS = f.fontDescriptor
```

MsgBox d.postscriptName

31.29.46 symbolicTraits as Integer

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a bit mask that describes the traits of the receiver.
Example:

```
dim n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(13)
dim f as NSFontDescriptorMBS = n.fontDescriptor
dim w as Integer = f.symbolicTraits

if BitwiseAnd(w, f.NSFontBoldTrait) <>0 then
MsgBox "bold"
else
MsgBox "not bold"
end if
```

Notes:

Typeface information is specified by the lower 16 bits of system trait value.

The font family class constants classify certain stylistic qualities of the font. These values correspond closely to the font class values in the OpenType OS/2 table. The class values are bundled in the upper four bits of the NSFontSymbolicTraits and can be accessed via NSFontFamilyClassMask. For more information about the specific meaning of each identifier, refer to the OpenType specification.

31.29.47 variantForKey(key as string) as Variant

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font attribute specified by the given key.

31.29.48 Properties

31.29.49 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference.

Notes: (Read and Write property)

31.29.50 Constants

31.29.51 NSFontBoldTrait = 2

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the typeface constants for symbolic traits.
Notes:

The font's typestyle is boldface.
Available in Mac OS X v10.4 and later.

31.29.52 NSFontClarendonSerifsClass = & h40000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.
Notes:

The font's style is a variation of the Oldstyle Serifs and the Transitional Serifs.
Available in Mac OS X v10.4 and later.

31.29.53 NSFontCondensedTrait = 64

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the typeface constants for symbolic traits.
Notes:

The font's typestyle is condensed. Expanded and condensed traits are mutually exclusive.
Available in Mac OS X v10.4 and later.

31.29.54 NSFontExpandedTrait = 32

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the typeface constants for symbolic traits.
Notes:

The font's typestyle is expanded. Expanded and condensed traits are mutually exclusive.
Available in Mac OS X v10.4 and later.

31.29.55 NSFontFamilyClassMask = & hF0000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** The font family class mask used to access NSFontFamilyClass values.
Notes:

Available in Mac OS X v10.4 and later.
This constant is used to access NSFontFamilyClass values in the upper four bits of NSFontSymbolicTraits.

31.29.56 NSFontFreeformSerifsClass = & h70000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.
Notes:

The font's style includes serifs, but it expresses a design freedom that does not generally fit within the other serif design classifications.
Available in Mac OS X v10.4 and later.

31.29.57 NSFontItalicTrait = 1

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the typeface constants for symbolic traits.
Notes:

The font's typestyle is italic.
Available in Mac OS X v10.4 and later.

31.29.58 NSFontModernSerifsClass = & h30000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.
Notes:

The font's style is based on the Latin printing style of the 20th century.
Available in Mac OS X v10.4 and later.

31.29.59 NSFontMonoSpaceTrait = 1024

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the typeface constants for symbolic traits.
Notes:

The font uses fixed-pitch glyphs if available. The font may have multiple glyph advances (many CJK glyphs contain two spaces).

Available in Mac OS X v10.4 and later.

31.29.60 NSFontOldStyleSerifsClass = & h10000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.
Notes:

The font's style is based on the Latin printing style of the 15th to 17th century.
Available in Mac OS X v10.4 and later.

31.29.61 NSFontOrnamentalsClass = & h90000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.
Notes:

The font's style includes highly decorated or stylized character shapes such as those typically used in headlines.
Available in Mac OS X v10.4 and later.

31.29.62 NSFontSansSerifClass = & h80000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.
Notes:

The font's style includes most basic letter forms (excluding Scripts and Ornamentals) that do not have serifs on the strokes.
Available in Mac OS X v10.4 and later.

31.29.63 NSFontScriptsClass = & hA0000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.
Notes:

The font's style is among those typefaces designed to simulate handwriting.
Available in Mac OS X v10.4 and later.

31.29.64 NSFontSlabSerifsClass = & h50000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.
Notes:

The font's style is characterized by serifs with a square transition between the strokes and the serifs (no brackets).
Available in Mac OS X v10.4 and later.

31.29.65 NSFontSymbolicClass = & hC0000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.
Notes:

The font's style is generally design independent, making it suitable for special characters (icons, dingbats, technical symbols, and so on) that may be used equally well with any font.
Available in Mac OS X v10.4 and later.

31.29.66 NSFontTransitionalSerifsClass = & h20000000

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.
Notes:

The font's style is based on the Latin printing style of the 18th to 19th century.
Available in Mac OS X v10.4 and later.

31.29.67 NSFontUIOptimizedTrait = 4096

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the typeface constants for symbolic traits.
Notes:

The font synthesizes appropriate attributes for user interface rendering, such as control titles, if necessary.
Available in Mac OS X v10.4 and later.

31.29.68 NSFontUnknownClass = 0

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the font family class constants.
Notes:

The font has no design classification.
Available in Mac OS X v10.4 and later.

31.29.69 NSFontVerticalTrait = 2048

MBS MacBase Plugin, Plugin Version: 12.1. **Function:** One of the typeface constants for symbolic traits.
Notes:

The font uses vertical glyph variants and metrics.
Available in Mac OS X v10.4 and later.

31.30 class NSFontManagerMBS

31.30.1 class NSFontManagerMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSFontManager is the center of activity for the font conversion system.
Example:

```
// pick some font
dim n1 as NSFontMBS = nsfontmbs.fontWithName("Book Antiqua bold", 12)
dim fm as new NSFontManagerMBS

// remove all font traits
dim n2 as NSFontMBS = fm.convertFontToNotHaveTrait(n1, fm.traitsOfFont(n1))

// show name of base font
MsgBox n2.fontName
```

Notes:

It records the currently selected font, updates the Font panel and Font menu to reflect the selected font, initiates font changes, and converts fonts in response to requests from text-bearing objects. In a more prosaic role, NSFontManager can be queried for the fonts available to the application and for the particular attributes of a font, such as whether it's condensed or extended.

As of Mac OS X version 10.3, font collections are managed by NSFontManager.

31.30.2 Blog Entries

- MBS Xojo Plugins, version 17.3pr5
- MBS Releases the MBS Xojo / Real Studio plug-ins in version 16.4
- MBS Xojo / Real Studio Plugins, version 16.4pr9
- MBS Xojo / Real Studio Plugins, version 15.4pr5
- MBS Xojo / Real Studio Plugins, version 13.2pr1
- MBS Real Studio Plugins, version 12.0pr6
- MBS Real Studio Plugins, version 11.3pr14

31.30.3 Methods

31.30.4 addCollection(collectionName as String, Options as Integer = 0) as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Adds a specified font collection to the font manager with a given set of options.
Notes:

collectionName: The collection to add.
Options: Pass NSFontCollectionApplicationOnlyMask to make the collection available only to the application.
Return true if the font collection was successfully added; otherwise, false.

31.30.5 addFontDescriptorsToCollection(descriptors() as NSFontDescriptorMBS, collectionName as String)

MBS MacCocoa Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Adds an array of font descriptors to the specified font collection.
Example:

```
dim fontManager as NSFontManagerMBS = NSFontManagerMBS.sharedFontManager

dim collectionNames() as string = fontManager.collectionNames
dim collectionName as string = collectionNames(collectionNames.Ubound) // get last one

dim fonts() as NSFontDescriptorMBS = fontManager.fontDescriptorsInCollection(collectionName)

// add Helvetica to this collection

dim font as NSFontMBS = NSFontMBS.fontWithName("Helvetica", 12)
dim fontDescriptor as NSFontDescriptorMBS = font.fontDescriptor

fontManager.addFontDescriptorsToCollection(array(fontDescriptor), collectionName)

dim fonts2() as NSFontDescriptorMBS = fontManager.fontDescriptorsInCollection(collectionName)

// fonts2 should have one more entry than fonts
Break
```

Notes:

descriptors: The font descriptors to add.
collectionName: The font collection to which descriptors are added.

31.30.6 availableFontFamilies as string()

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the names of the font families available in the system.
Example:

```
dim n as new NSFontManagerMBS
dim names() as string = n.availableFontFamilies

MsgBox Join(names,EndOfLine)
```

Notes: These fonts are in various system font directories.

31.30.7 availableFontNamesMatchingFontDescriptor(descriptor as NSFontDescriptorMBS) as String()

MBS MacCocoa Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the names of the fonts that match the attributes in the given font descriptor.

31.30.8 availableFontNamesWithTraits(traits as Integer) as string()

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the names of the fonts available in the system whose traits are described exactly by the given font trait mask (not the NSFont objects themselves).
Example:

```
dim n as new NSFontManagerMBS
dim names() as string = n.availableFontNamesWithTraits(n.NSBoldFontMask)

MsgBox str(UBound(names)+1)+" fonts: "+Join(names,", ")
```

Notes:

traits: The font traits for which to return font names. You specify the desired traits by combining the font trait mask values described in Constants using the bitwiseor operator.

Returns the names of the corresponding fonts.

These fonts are in various system font directories.

If fontTraitMask is 0, this method returns all fonts that are neither italic nor bold. This result is the same one you'd get if fontTraitMask were NSUnitalicFontMask | NSUnboldFontMask.

31.30.9 availableFonts as string()

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the names of the fonts available in the system (not the NSFont objects themselves).
Example:

```
dim n as new NSFontManagerMBS
dim names() as string = n.availableFonts

MsgBox Join(names,EndOfLine)
```

Notes: These fonts are in various system font directories.

31.30.10 availableMembersOfFontFamily(FontFamily as string) as Variant()

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns an array with one entry for each available member of a font family.
Example:

```
dim n as new NSFontManagerMBS
dim members() as Variant = n.availableMembersOfFontFamily("Times")

for each m as Variant in members
dim member() as Variant = m

MsgBox "Postscript name: "+member(0)+EndOfLine+"Suffix: "+member(1)+EndOfLine+"Font weight: "+member(2)+EndOfLine+"Font trait: "+member(3)
next
```

Notes:

family: The name of a font family, like one that availableFontFamilies returns.

Returns the available members of family.

Each entry of the returned variant array is another variant array with four members, as follows:

0. The PostScript font name, as a string.
1. The part of the font name used in the font panel that's not the font name, as a string. This value is not localized—for example, "Roman", "Italic", or "Bold".
2. The font's weight, as a double.
3. The font's traits, as a double.

The members of the family are arranged in the font panel order (narrowest to widest, lightest to boldest, plain to italic).

31.30.11 collectionNames as string()

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the names of the currently loaded font collections.
Example:

```
dim n as new NSFontManagerMBS
dim names() as string = n.collectionNames

MsgBox Join(names,EndOfLine)
```

Notes: The names of the current font collections.

31.30.12 Constructor

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the object with the shared instance of the font manager for the application, creating it if necessary.

31.30.13 convertAttributes(dic as dictionary) as dictionary

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts attributes in response to an object initiating an attribute change, typically the Font panel or Font menu.

31.30.14 convertFont(font as NSFontMBS) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the given font according to the object that initiated a font change, typically the Font panel or Font menu.

31.30.15 convertFontToFace(font as NSFontMBS, face as string) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a font whose traits are as similar as possible to those of the given font except for the typeface, which is changed to the given typeface.
Example:

```
dim fontManager as new NSFontManagerMBS
// you have a font
dim font as NSFontMBS = NSFontMBS.fontWithName("Helvetica", 12)

// change font face
font = fontManager.convertFontToFace(font, "Helvetica-BoldOblique")

MsgBox font.fontName // shows Helvetica-BoldOblique
```

Notes:

Font: The font whose traits are matched.
face: The new typeface; a fully specified family-face name, such as Helvetica-BoldOblique or Times-Roman.

Returns a font with matching traits and the given typeface, or aFont if it can't be converted.

This method attempts to match the weight and posture of aFont as closely as possible. Italic is mapped to Oblique, for example. Weights are mapped based on an approximate numeric scale of 0 to 15.

31.30.16 convertFontToFamily(font as NSFontMBS, family as string) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a font whose traits are as similar as possible to those of the given font except for the font family, which is changed to the given family.
Example:

```
dim fontManager as new NSFontManagerMBS
// you have a font
```

```
dim font as NSFontMBS = NSFontMBS.fontWithName("Helvetica", 12)

// change font family
font = fontManager.convertFontToFamily(font, "Arial")

MsgBox font.fontName // shows ArialMT
```

Notes:

Font: The font whose traits are matched.
family: The new font famliy; a generic font name, such as Helvetica or Times.

Returns a font with matching traits and the given family, or aFont if it can't be converted.

This method attempts to match the weight and posture of aFont as closely as possible. Italic is mapped to Oblique, for example. Weights are mapped based on an approximate numeric scale of 0 to 15.

31.30.17 convertFontToHaveTrait(font as NSFontMBS, trait as Integer) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a font whose traits are the same as those of the given font, except that the traits are changed to include the single specified trait.
Example:

```
dim n as new NSFontManagerMBS
dim f as NSFontMBS = NSFontMBS.fontWithName("Times", 12.0)
dim g as NSFontMBS = n.convertFontToHaveTrait(f, n.NSBoldFontMask)

MsgBox g.fontName // Times-Bold
```

Notes:

Font: The font whose traits are matched.
Trait: The new trait; may be any one of the traits described in Constants. Using NSUnboldFontMask or NSUnitalicFontMask removes the bold or italic trait, respectively.

Returns a font with matching traits including the given trait, or font if it can't be converted.
Using NSUnboldFontMask or NSUnitalicFontMask removes the bold or italic trait, respectively.

31.30.18 convertFontToNotHaveTrait(font as NSFontMBS, trait as Integer) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSFont object with the same traits as the given font, except for the traits in the given font trait mask, which are removed.
Example:

```
dim n as new NSFontManagerMBS
dim f as NSFontMBS = NSFontMBS.fontWithName("Times-Bold", 12.0)
dim g as NSFontMBS = n.convertFontToHaveTrait(f, n.NSUnBoldFontMask)

MsgBox g.fontName // Times-Roman
```

Notes:

Font: The font whose traits are matched.
trait: The mask for the traits to remove, created using the bitwiseOr operator to combine the traits described in Constants. Using NSUnboldFontMask or NSUnitalicFontMask removes the bold or italic trait, respectively.
Returns a font with matching traits minus the given traits, or font if it can't be converted.

31.30.19 convertFontToSize(font as NSFontMBS, size as Double) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSFont object whose traits are the same as those of the given font, except for the size, which is changed to the given size.
Example:

```
dim fontManager as new NSFontManagerMBS
// you have a font
dim font as NSFontMBS = NSFontMBS.fontWithName("Helvetica", 12)

// change font size
font = fontManager.convertFontToSize(font, 20)

MsgBox str(font.pointSize)
```

Notes:

Font: The font whose traits are matched.
size: The new font size.

Returns a font with matching traits except in the new size, or aFont if it can't be converted.

31.30.20 convertFontTraits(traits as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Converts font traits to a new traits mask value.
Notes:

traits: The current font traits.

Returns the new traits mask value to be used by convertFont:.

This method is intended to be invoked to query the font traits while the action message (usually changeFont:) is being invoked when the current font action is either NSAddTraitFontAction or NSRemoveTraitFontAction.

Available in Mac OS X v10.5 and later.

31.30.21 convertWeightOfFont(font as NSFontMBS, up as boolean) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns an NSFont object whose weight is greater or lesser than that of the given font, if possible.
Example:

```
dim n as new NSFontManagerMBS
dim f as NSFontMBS = NSFontMBS.fontWithName("Times", 12.0)
dim g as NSFontMBS = n.convertWeightOfFont(f, true)

MsgBox g.fontName // Times-Bold
```

Notes:

up: If true, a heavier font is returned; if it's false, a lighter font is returned.
Font: The font whose weight is increased or decreased.

Returns a font with matching traits except for the new weight, or font if it can't be converted.

31.30.22 fontDescriptorsInCollection(collectionName as String) as NSFontDescriptorMBS()

MBS MacCocoa Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns an array of the font descriptors in the collection specified by the given collection name.
Example:

```
dim fontManager as NSFontManagerMBS = NSFontManagerMBS.sharedFontManager
dim collectionNames() as string = fontManager.collectionNames
dim collectionName as string = collectionNames(collectionNames.Ubound) // get last one
dim fonts() as NSFontDescriptorMBS = fontManager.fontDescriptorsInCollection(collectionName)
Break
```

31.30.23 fontHasTraits(fontName as string, Traits as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Indicates whether the given font has all the specified traits.
Example:

```
dim n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(12)
dim m as new NSFontManagerMBS

dim isBold as Boolean = m.fontHasTraits(n.fontName, m.NSBoldFontMask)
dim isItalic as Boolean = m.fontHasTraits(n.fontName, m.NSItalicFontMask)

MsgBox "is bold: "+str(isBold)+_
EndOfLine+"is italic: "+str(isItalic)
```

Notes:

typeface: The name of the font.
fontTraitMask: The font traits to test, specified by combining the font trait mask values described in Constants using the bitwiseOR operation.

Returns true if the font named typeface has all the traits specified in fontTraitMask; false if it doesn't.

Using NSUnboldFontMask returns true if the font is not bold, false otherwise. Using NSUnitalicFontMask returns true if the font is not italic, false otherwise.

31.30.24 isMultiple as boolean

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the last font selection recorded has multiple fonts.
Notes: Returns true if the last font selection recorded has multiple fonts; false if it's a single font.

31.30.25 orderFrontFontPanel

MBS MacCocoa Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method opens the Font panel by sending it an orderFront message, creating the Font panel if necessary.

31.30.26 orderFrontStylesPanel

MBS MacCocoa Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method opens the Font styles panel.

31.30.27 removeCollection(collectionName as String) as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the specified font collection.
Notes: Returns true on success and false on failure.

31.30.28 removeFontDescriptorFromCollection(descriptor as NSFontDescriptorMBS, collectionName as String)

MBS MacCocoa Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the specified font descriptor from the specified collection.
Notes:

descriptor: The font descriptor to remove.
collection: The font collection from which to remove the descriptor.

31.30.29 selectedFont as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the last font recorded.

31.30.30 setSelectedAttributes(dic as dictionary, isMultiple as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the paragraph and character formatting panels when text in a selection has changed attributes.
Notes:

dic: The new attributes.
isMultiple: If true, informs the panel that multiple fonts or attributes are enclosed within the selection.

This method is used primarily by NSTextView.
Available in Mac OS X v10.3 and later.

31.30.31 setSelectedFont(font as NSFontMBS, isMultiple as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Records the given font as the currently selected font and updates the Font panel to reflect this.
Notes:

font: The font to set as selected.
isMultiple: If true, the Font panel indicates that more than one font is contained in the selection; if false, it does not.

An object that manipulates fonts should invoke this method whenever it becomes first responder and whenever its selection changes. It shouldn't invoke this method in the process of handling a changeFont message, as this causes the font manager to lose the information necessary to effect the change. After all fonts have been converted, the font manager itself records the new selected font.

31.30.32 sharedFontManager as NSFontManagerMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the shared instance of the font manager for the application, creating it if necessary.

31.30.33 traitsOfFont(font as NSFontMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the traits of the given font.
Example:

```
dim n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(12)
dim m as new NSFontManagerMBS

// shows 2 which is m.NSBoldFontMask
```

```
MsgBox str(m.traitsOfFont(n))
```

Notes:

Font: The font whose traits are returned.
Returns the font traits, returned as a mask created by combining values listed in Constants with the bitwiseOR operation.

31.30.34 weightOfFont(font as NSFontMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a rough numeric measure the weight of the given font.
Example:

```
dim n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(12)
dim m as new NSFontManagerMBS

MsgBox str(m.weightOfFont(n))
```

Notes:

Font: The font whose weight is returned.

A rough numeric measure the weight of the given font, where 0 indicates the lightest possible weight, 5 indicates a normal or book weight, and 9 or more indicates a bold or heavier weight.

31.30.35 Properties

31.30.36 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

31.30.37 Enabled as boolean

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the font conversion system's user interface items (the Font panel and Font menu items) are

enabled.
Notes:

True if the font conversion system's user interface items (the Font panel and Font menu items) are enabled; false if they're not.
(Read and Write computed property)

31.30.38 Constants

31.30.39 NSAddTraitFontAction = 2

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with modifyFont method.
Notes: Converts the font to have an additional trait using convertFonttoHaveTrait.

31.30.40 NSBoldFontMask = 2

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
Notes: A mask that specifies a bold font.

31.30.41 NSCompressedFontMask = & h00000200

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
Notes: A mask that specifies a compressed font.

31.30.42 NSCondensedFontMask = & h00000040

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
Notes: A mask that specifies a condensed font.

31.30.43 NSExpandedFontMask = & h00000020

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.

Notes: A mask that specifies an expanded font.

31.30.44 NSFixedPitchFontMask = & h00000400

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
Notes: A mask that specifies a fixed pitch font.

31.30.45 NSFontCollectionApplicationOnlyMask = 1

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for options accepted by addCollection.
Notes: akes the collection available only to the application. This option is not yet implemented.

31.30.46 NSHeavierFontAction = 5

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with modifyFont method.
Notes: Converts the font to a heavier weight using convertWeightofFont.

31.30.47 NSItalicFontMask = 1

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
Notes: A mask that specifies an italic font.

31.30.48 NSLighterFontAction = 6

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with modifyFont method.
Notes: Converts the font to a lighter weight using convertWeightofFont.

31.30.49 NSNarrowFontMask = & h00000010

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.

Notes: A mask that specifies a narrow font.

31.30.50 NSNoFontChangeAction = 0

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with modifyFont method.
Notes: No action; the font is returned unchanged.

31.30.51 NSNonStandardCharacterSetFontMask = 8

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
Notes: A mask that specifies a font that uses a non-standard character set.

31.30.52 NSPosterFontMask = & h00000100

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
Notes: A mask that specifies a poster-style font.

31.30.53 NSRemoveTraitFontAction = 7

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with modifyFont method.
Notes: Converts the font to remove a trait using convertFonttoNotHaveTrait.

31.30.54 NSSizeDownFontAction = 4

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with modifyFont method.
Notes: Converts the font to a smaller size using convertFonttoSize.

31.30.55 NSSizeUpFontAction = 3

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with modifyFont method.

Notes: Converts the font to a larger size using convertFonttoSize.

31.30.56 NSSmallCapsFontMask = & h00000080

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
Notes: A mask that specifies a small-caps font.

31.30.57 NSUnboldFontMask = 4

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
Notes: A mask that specifies a font that is not bold.

31.30.58 NSUnitalicFontMask = & h01000000

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with mask of traits assigned to a font.
Notes: A mask that specifies a font that is not italic.

31.30.59 NSViaPanelFontAction = 1

MBS MacCocoa Plugin, Plugin Version: 9.8. **Function:** One of the constants for use with modifyFont method.
Notes: Converts the font according to the NSFontPanel method panelConvertFont.

31.31 class NSFontMBS

31.31.1 class NSFontMBS

MBS MacBase Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a font in the Cocoa world.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

31.31.4 Methods

31.31.5 advancementForGlyph(aGlyph as Integer) as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the nominal spacing for the given glyph—the distance the current point moves after showing the glyph—accounting for the receiver's size.
Notes: This spacing is given according to the glyph's movement direction, which is either strictly horizontal or strictly vertical.

31.31.6 boldSystemFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Aqua system font used for standard interface items that are rendered in boldface type in the specified size.
Example:

```
dim n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(12)

MsgBox n.description
// shows: "LucidaGrande-Bold 12.00 pt. P [ ] (0x1c082c0) fobj=0x1c09d30, spc=3.96"
```

Notes: If fontSize is 0 or negative, returns the boldface system font at the default size.

31.31.7 boundingRectForGlyph(aGlyph as Integer) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bounding rectangle for the specified glyph, scaled to the receiver's size.
Notes: Japanese fonts encoded with the scheme "EUC12-NJE-CFEncoding" do not have individual metrics or bounding boxes available for the glyphs above 127. For those glyphs, this method returns the bounding rectangle for the font instead.

31.31.8 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

31.31.9 controlContentFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used for the content of controls in the specified size.
Example:

```
dim n as NSFontMBS = NSFontMBS.controlContentFontOfSize(12)

MsgBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x16017750) fobj=0x160175c0, spc=3.80"
```

Notes: For example, in a table, the user's input uses the control content font, and the table's header uses another font. If fontSize is 0 or negative, returns the control content font at the default size.

31.31.10 file as folderitem

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries the folderitem for this font.
Notes: One file may give several font faces.

31.31.11 fontDescriptor as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's font descriptor.
Notes:

A font descriptor object that describes the receiver.

The font descriptor contains a mutable dictionary of optional attributes for creating an NSFont object. See documentation on NSFontDescriptor for more information.

31.31.12 fontWithDescriptor(fontDescriptor as NSFontDescriptorMBS, fontSize as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a font object for the specified font descriptor and font size.
Notes:

fontDescriptor: A font descriptor object.
fontSize: The size in points to which the font is scaled.

Returns a font object for the specified descriptor and size.

In most cases, you can simply use fontWithName to create standard scaled fonts.
Available in Mac OS X v10.4 and later.
See also:

- 31.31.13 fontWithDescriptor(fontDescriptor as NSFontDescriptorMBS, TextTransform as Variant) as NSFontMBS 6142

31.31.13 fontWithDescriptor(fontDescriptor as NSFontDescriptorMBS, TextTransform as Variant) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a font object for the specified font descriptor and text transform.

Notes:

fontDescriptor: The font descriptor object describing the font to return.
textTransform: An affine transformation applied to the font. Must be a NSAffineTransformMBS object or nil!

Returns a font object for the specified name and transform.

In most cases, you can simply use fontWithName to create standard scaled fonts. If textTransform is non-nil, it has precedence over NSFontMatrixAttribute in fontDescriptor.

Available in Mac OS X v10.4 and later.
See also:

- 31.31.12 fontWithDescriptor(fontDescriptor as NSFontDescriptorMBS, fontSize as Double) as NSFontMBS 6142

31.31.14 fontWithName(fontName as string, fontSize as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a font object for the specified font name and font size.
Example:

```
dim n as NSFontMBS = NSFontMBS.fontWithName("Monaco", 12)

MsgBox n.description
// shows: "Monaco 12.00 pt. P [ ] (0x1805020) fobj=0x168114b0, spc=7.20"
```

Notes:

The fontName is a fully specified family-face name, such as Helvetica-BoldOblique or Times-Roman. The fontSize is equivalent to using a font matrix of [fontSize 0 0 fontSize 0 0] . If you use a fontSize of 0.0, this method uses the default User Font size.

Fonts created with this method automatically flip themselves in flipped views. This method is the preferred means for creating fonts.

31.31.15 glyphWithName(name as string) as UInt32

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the named encoded glyph, or –1 if the receiver contains no such glyph.
Notes:

Returns –1 if the glyph named glyphName isn't encoded.
Glyph names in fonts do not always accurately identify the glyph. If possible, look up the appropriate glyph on your own.

31.31.16 labelFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Aqua font used for standard interface labels in the specified size.
Example:

```
dim n as NSFontMBS = NSFontMBS.labelFontOfSize(12)

MsgBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x1829350) fobj=0x18293f0, spc=3.80"
```

Notes: If fontSize is 0 or negative, returns the label font with the default size.

31.31.17 labelFontSize as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the size of the standard label font.
Example:

```
MsgBox str(NSFontMBS.labelFontSize) // shows 10
```

31.31.18 menuBarFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used for menu bar items, in the specified size.
Example:

```
dim n as NSFontMBS = NSFontMBS.menuBarFontOfSize(12)

MsgBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x17e00c00) fobj=0x17e00ca0, spc=3.80"
```

Notes:

If fontSize is 0 or negative, returns the menu bar font with the default size.

Available in Mac OS X v10.3 and later.

31.31.19 menuFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used for menu items, in the specified size.
Example:

```
dim n as NSFontMBS = NSFontMBS.menuFontOfSize(12)

MsgBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x1da6d80) fobj=0x1da6e20, spc=3.80"
```

Notes: If fontSize is 0 or negative, returns the menu items font with the default size.

31.31.20 messageFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used for standard interface items, such as button labels, menu items, and so on, in the specified size.
Example:

```
dim n as NSFontMBS = NSFontMBS.messageFontOfSize(12)

MsgBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x1c11520) fobj=0x1c11790, spc=3.80"
```

Notes: If fontSize is 0 or negative, returns this font at the default size. This method is equivalent to systemFontOfSize().

31.31.21 paletteFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used for palette window title bars, in the specified size.
Example:

```
dim n as NSFontMBS = NSFontMBS.paletteFontOfSize(12)

MsgBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x18800c00) fobj=0x18800ca0, spc=3.80"
```

Notes: If fontSize is 0 or negative, returns the palette title font at the default size.

31.31.22 screenFontWithRenderingMode(renderingMode as Integer) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a bitmapped screen font, when sent to a font object representing a scalable PostScript font, with the specified rendering mode, matching the receiver in typeface and matrix (or size), or nil if such a font can't be found.
Notes:

For valid rendering modes, see NSFontRenderingMode.
Screen fonts are for direct use with the window server only. Never use them with Application Kit objects, such as in setFont: methods. Internally, the Application Kit automatically uses the corresponding screen font for a font object as long as the view is not rotated or scaled.
Available in Mac OS X v10.4 and later.

31.31.23 setUserFixedPitchFont(font as NSFontMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the font used by default for documents and other text under the user's control, when that font should be fixed-pitch, to the specified font.
Notes: Specifying font as nil causes the default to be removed from the application domain.

31.31.24 setUserFont(font as NSFontMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the font used by default for documents and other text under the user's control to the specified font.
Notes: Specifying font as nil causes the default to be removed from the application domain.

31.31.25 smallSystemFontSize as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the size of the standard small system font.
Example:

```
MsgBox str(NSFontMBS.smallSystemFontSize) // shows 11
```

31.31.26 systemFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Aqua system font used for standard interface items, such as button labels, menu items, and so on, in the specified size.
Example:

```
dim n as NSFontMBS = NSFontMBS.systemFontOfSize(12)

MsgBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x17e009d0) fobj=0x17e00ca0, spc=3.80"
```

Notes: If fontSize is 0 or negative, returns the system font at the default size.

31.31.27 systemFontSize as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the size of the standard system font.
Example:

```
MsgBox str(NSFontMBS.systemFontSize) // shows 13
```

31.31.28 systemFontSizeForControlSize(controlSize as Integer) as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font size used for the specified control size.
Example:

```
MsgBox str(NSFontMBS.systemFontSizeForControlSize(0)) // 13
MsgBox str(NSFontMBS.systemFontSizeForControlSize(1)) // 11
```

Notes:

If controlSize does not correspond to a valid NSControlSize, returns the size of the standard system font.
Available in Mac OS X v10.3 and later.

31.31.29 titleBarFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used for window title bars, in the specified size.
Example:

```
dim n as NSFontMBS = NSFontMBS.titleBarFontOfSize(12)

MsgBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x1a31b20) fobj=0x1a31bc0, spc=3.80"
```

Notes: If fontSize is 0 or negative, returns the title bar font at the default size. This method is equivalent to boldSystemFontOfSize.

31.31.30 toolTipsFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used for tool tips labels, in the specified size.
Example:

```
dim n as NSFontMBS = NSFontMBS.toolTipsFontOfSize(12)

MsgBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x1828db0) fobj=0x1828e50, spc=3.80"
```

Notes: If fontSize is 0 or negative, returns the tool tips font at the default size.

31.31.31 userFixedPitchFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used by default for documents and other text under the user's control (that is, text whose font the user can normally change), when that font should be fixed-pitch, in the specified size.
Example:

```
dim n as NSFontMBS = NSFontMBS.userFixedPitchFontOfSize(12)

MsgBox n.description
// shows: "Monaco 12.00 pt. P [ ] (0x1ad13a0) fobj=0x1ac2bd0, spc=7.20"
```

Notes:

If fontSize is 0 or negative, returns the fixed-pitch font at the default size.

The system does not guarantee that all the glyphs in a fixed-pitch font are the same width. For example, certain Japanese fonts are dual-pitch, and other fonts may have nonspacing marks that can affect the display of other glyphs.

31.31.32 userFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font used by default for documents and other text under the user's control (that is, text whose font the user can normally change), in the specified size.
Example:

```
dim n as NSFontMBS = NSFontMBS.userFontOfSize(12)

MsgBox n.description
// shows: "Helvetica 12.00 pt. P [ ] (0x19019b0) fobj=0x181fd00, spc=3.33"
```

Notes: If fontSize is 0 or negative, returns the user font at the default size.

31.31.33 Properties

31.31.34 ascender as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the top y-coordinate, offset from the baseline, of the receiver's longest ascender.
Notes: (Read only property)

31.31.35 boundingRectForFont as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's bounding rectangle, scaled to the font's size.
Notes:

The bounding rectangle is the union of the bounding rectangles of every glyph in the font.
(Read only property)

31.31.36 capHeight as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's cap height.
Notes: (Read only property)

31.31.37 coveredCharacterSet as Variant

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSCharacterSet object containing all of the nominal characters renderable by the receiver, which is all of the entries mapped in the receiver's 'cmap' table.
Example:

```
// get the Symbol font
dim n as NSFontMBS = NSFontMBS.fontWithName("Symbol",10)

// what characters are defined for this font?
dim c as NSCharacterSetMBS = n.coveredCharacterSet

// display a string with all the characters
MsgBox c.StringValue
```

Notes:

Value is a NSCharacterSetMBS object. Returned as Variant to reduce plugin dependencies.
The number of glyphs supported by a given font is often larger than the number of characters contained in the character set returned by this method.
(Read only property)

31.31.38 descender as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bottom y coordinate, offset from the baseline, of the receiver's longest descender.
Notes:

Thus, if the longest descender extends 2 points below the baseline, descender will return –2.
(Read only property)

31.31.39 description as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The description of the font.
Example:

```
dim n as NSFontMBS = NSFontMBS.systemFontOfSize(12)
MsgBox n.description
```

Notes: (Read only property)

31.31.40 displayName as string

MBS MacBase Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The (localized) display name of the font.
Example:

```
dim n as NSFontMBS = NSFontMBS.fontWithName("Monaco", 12)

MsgBox n.displayName // shows "Monaco"
```

Notes: (Read only property)

31.31.41 familyName as string

MBS MacBase Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The family name of the font.
Example:

```
dim n as NSFontMBS = NSFontMBS.fontWithName("Monaco", 12)

MsgBox n.familyName // shows "Monaco"
```

Notes: (Read only property)

31.31.42 fontName as string

MBS MacBase Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the font.
Example:

```
dim n as NSFontMBS = NSFontMBS.fontWithName("Monaco", 12)

MsgBox n.fontName // shows "Monaco"
```

Notes: (Read only property)

31.31.43 Handle as Integer

MBS MacBase Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSFont object.
Notes: (Read and Write property)

31.31.44 isFixedPitch as boolean

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether all glyphs in the receiver have the same advancement.
Notes:

Returns true if all glyphs in the receiver have the same advancement; false if any advancements differ.

Some Japanese fonts encoded with the scheme "EUC12-NJE-CFEncoding" return that they have the same advancement, but actually encode glyphs with one of two advancements, for historical compatibility. You may need to handle such fonts specially for some applications.
(Read only property)

31.31.45 italicAngle as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's italic angle, the amount that the font is slanted in degrees counterclockwise from the vertical, as read from its AFM file.
Notes:

Because the slant is measured counterclockwise, English italic fonts typically return a negative value.
(Read only property)

31.31.46 leading as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's leading.
Notes:

Available in Mac OS X v10.4 and later.
(Read only property)

31.31.47 maximumAdvancement as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the greatest advancement of any of the receiver's glyphs.
Notes:

This advancement is always either strictly horizontal or strictly vertical.
(Read only property)

31.31.48 mostCompatibleStringEncoding as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the string encoding that works best with the receiver, where there are the fewest possible unmatched characters in the string encoding and glyphs in the font.
Notes:

You can use NSString's dataUsingEncoding method to convert the string to this encoding.
If this method returns NSASCIIStringEncoding, it could not determine the correct encoding and assumed that the font can render only ASCII characters.
This method works heuristically using well-known font encodings, so for nonstandard encodings it may not in fact return the optimal string encoding.
(Read only property)

31.31.49 numberOfGlyphs as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of glyphs in the receiver.
Example:

```
dim n as NSFontMBS = NSFontMBS.fontWithName("Monaco", 12)

MsgBox str(n.numberOfGlyphs) // 1678
```

Notes:

Glyphs are numbered starting at 0.
(Read only property)

31.31.50 pointSize as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's point size, or the effective vertical point size for a font with a nonstandard matrix.
Notes: (Read only property)

31.31.51 printerFont as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the scalable PostScript font corresponding to itself.
Notes:

When sent to a font object representing a scalable PostScript font, returns self. When sent to a font object representing a bitmapped screen font, returns its corresponding scalable PostScript font.
(Read only property)

31.31.52 renderingMode as Integer

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the rendering mode of the receiver.
Notes:

Available in Mac OS X v10.4 and later.
(Read only property)

31.31.53 screenFont as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bitmapped screen font corresponding to itself.
Notes:

When sent to a font object representing a scalable PostScript font, returns a bitmapped screen font matching the receiver in typeface and matrix (or size), or nil if such a font can't be found. When sent to a font object representing a bitmapped screen font, returns nil.

Screen fonts are for direct use with the window server only. Never use them with Application Kit objects, such as in setFont: methods. Internally, the Application Kit automatically uses the corresponding screen font for a font object as long as the view is not rotated or scaled.
(Read only property)

31.31.54 textTransform as Variant

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current transformation matrix for the receiver.
Notes:

Available in Mac OS X v10.4 and later.

Returns NSAffineTransformMBS. Returned as Variant to reduce plugin dependencies.
(Read only property)

31.31.55 underlinePosition as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the baseline offset that should be used when drawing underlines with the receiver, as determined by the font's AFM file.
Notes:

This value is usually negative, which must be considered when drawing in a flipped coordinate system.
(Read only property)

31.31.56 underlineThickness as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the thickness that should be used when drawing underlines with the receiver, as determined by the font's AFM file.
Notes: (Read only property)

31.31.57 xHeight as Double

MBS MacBase Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the x-height of the font.
Notes: (Read only property)

31.31.58 Constants

31.31.59 NSControlGlyph=& hFFFFFF

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants define reserved glyph codes.
Notes: NSGlyphGenerator generates NSControlGlyph for all characters in the Unicode General Category C* and U200B (ZERO WIDTH SPACE).

31.31.60 NSFontAntialiasedIntegerAdvancementsRenderingMode=3

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the font rendering mode.
Notes:

Specifies antialiased, integer advancements rendering mode.
Available in Mac OS X v10.4 and later.

31.31.61 NSFontAntialiasedRenderingMode=1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the font rendering mode.
Notes:

Specifies antialiased, floating-point advancements rendering mode (synonymous with printerFont).
Available in Mac OS X v10.4 and later.

31.31.62 NSFontDefaultRenderingMode=0

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the font rendering mode.
Notes:

Determines the actual mode based on the user preference settings.
Available in Mac OS X v10.4 and later.

31.31.63 NSFontIntegerAdvancementsRenderingMode=2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the font rendering mode.
Notes:

Specifies integer advancements rendering mode.
Available in Mac OS X v10.4 and later.

31.31.64 NSNativeShortGlyphPacking=5

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** A constant for glyph packing.
Notes:

The native format for Mac OS X.

ocoa stores all text data as Unicode. The text system converts Unicode into glyph IDs and places them in 1-, 2-, or 4-byte storage depending on the context. To render text, you must convert the storage into a format the text engine understands. The following constants describe the glyph packing schemes the text rendering engine can use. They are used to extract glyphs from a font for making a multibyte (or single-byte) array of glyphs for passing to an interpreter, such as the window server, which expects a big-endian multibyte stream (that is, "packed glyphs") instead of a pure NSGlyph stream. They're used by glyphPacking. With Quartz, the engine always expects the format to be in 2-byte short array, so NSNativeShortGlyphPacking is the only format currently in use.

31.31.65 NSNullGlyph=0

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants define reserved glyph codes.
Notes: A null glyph.

31.32 class NSFontPanelMBS

31.32.1 class NSFontPanelMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSFontPanel class implements the Font panel—a user interface object that displays a list of available fonts, letting the user preview them and change the font used to display text.
Example:

NSFontPanelMBS.sharedFontPanel.Show

Notes:

The actual changes are made through conversion messages sent to the shared NSFontManager instance. There's only one Font panel for each application.
Subclass of the NSPanelMBS class.

31.32.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr6

31.32.3 Methods

31.32.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Constructor.

31.32.5 convertAttributes(old as dictionary) as dictionary

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts attributes in response to an object initiating an attribute change, typically the Font panel.
Notes: Call this function only in the changeAttributes event.

31.32.6 convertFont(oldFont as NSFontMBS) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the given font according to the object that initiated a font change, typically the Font panel.

Notes: Call this function only in the ChangeFont event.

31.32.7 Destructor

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

31.32.8 panelConvertFont(font as NSFontMBS) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the specified font using the settings in the receiver, with the aid of the shared NSFontManager if necessary.
Notes:

Font: The font to be converted.

Returns the converted font, or aFont itself if it can't be converted.

For example, if aFont is Helvetica Oblique 12.0 point and the user has selected the Times font family (and nothing else) in the Font panel, the font returned is Times Italic 12.0 point.

31.32.9 reloadDefaultFontFamilies

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Triggers a reload to the default state, so that the delegate is called.
Notes: This reloading provides the delegate opportunity to scrutinize the default list of fonts to be displayed in the panel.

31.32.10 setPanelFont(font as NSFontMBS, isMultiple as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the selected font in the receiver to the specified font.
Notes:

Font: The font to be selected.
flag: If false, selects the specified font; otherwise selects no font and displays a message in the preview area indicating that multiple fonts are selected.

You normally don't use this method directly; instead, you send setSelectedFont to the shared NSFontManager, which in turn invokes this method.

31.32.11 sharedFontPanel as NSFontPanelMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the single NSFontPanel instance for the application, creating it if necessary.
Example:

NSFontPanelMBS.sharedFontPanel.Show

31.32.12 sharedFontPanelExists as boolean

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the shared Font panel has been created, false if it hasn't.

31.32.13 worksWhenModal as boolean

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver allows fonts to be changed in modal windows and panels.

31.32.14 Properties

31.32.15 accessoryView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The accessory view.
Notes:

Establishes the specified view as the receiver's accessory view, allowing you to add custom controls to your application's Font panel without having to create a subclass.
(Read and Write computed property)

31.32.16 Enabled as boolean

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver's Set button is enabled.

Notes:

The receiver continues to reflect the font of the selection for cooperating text objects regardless of this setting.
(Read and Write computed property)

31.32.17 Events

31.32.18 changeAttributes

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called whenever attributes in the font panel changed.
Notes: Use convertAttributes to know what changed.

31.32.19 changeFont

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called whenever the font in the font panel changed.
Notes: Use ConvertFont to know what changed.

31.32.20 validModesForFontPanel as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the mode mask corresponding to the expected font panel mode.
Notes:

The mode masks are defined in constants.
By default the plugin returns NSFontPanelAllModesMask.

31.32.21 Constants

31.32.22 NSFontPanelAllEffectsModeMask = & hFFF00

MBS MacCocoa Plugin, Plugin Version: 12.5. **Function:** One of the constants to define what is available in NSFontPanel.
Notes: Display all the effects user interface items.

31.32.23 NSFontPanelAllModesMask = & hFFFFFFFF

MBS MacCocoa Plugin, Plugin Version: 12.5. **Function:** One of the constants to define what is available in NSFontPanel.
Notes: Display all the available adornments.

31.32.24 NSFontPanelCollectionModeMask = 4

MBS MacCocoa Plugin, Plugin Version: 12.5. **Function:** One of the constants to define what is available in NSFontPanel.
Notes: Display the font collections column.

31.32.25 NSFontPanelDocumentColorEffectModeMask = 2048

MBS MacCocoa Plugin, Plugin Version: 12.5. **Function:** One of the constants to define what is available in NSFontPanel.
Notes: Display the document color button.

31.32.26 NSFontPanelFaceModeMask = 1

MBS MacCocoa Plugin, Plugin Version: 12.5. **Function:** One of the constants to define what is available in NSFontPanel.
Notes: Display the typeface column.

31.32.27 NSFontPanelShadowEffectModeMask = 4096

MBS MacCocoa Plugin, Plugin Version: 12.5. **Function:** One of the constants to define what is available in NSFontPanel.
Notes: Display the shadow effects button.

31.32.28 NSFontPanelSizeModeMask = 2

MBS MacCocoa Plugin, Plugin Version: 12.5. **Function:** One of the constants to define what is available in NSFontPanel.
Notes: Display the font size column.

31.32.29 NSFontPanelStandardModesMask = & hFFFF

MBS MacCocoa Plugin, Plugin Version: 12.5. **Function:** One of the constants to define what is available in NSFontPanel.
Notes: Display the standard default font panel—that is, including the collections, typeface, and size columns.

31.32.30 NSFontPanelStrikethroughEffectModeMask = 512

MBS MacCocoa Plugin, Plugin Version: 12.5. **Function:** One of the constants to define what is available in NSFontPanel.
Notes: Display the strike-through popup menu.

31.32.31 NSFontPanelTextColorEffectModeMask = 1024

MBS MacCocoa Plugin, Plugin Version: 12.5. **Function:** One of the constants to define what is available in NSFontPanel.
Notes: Display the text color button.

31.32.32 NSFontPanelUnderlineEffectModeMask = 256

MBS MacCocoa Plugin, Plugin Version: 12.5. **Function:** One of the constants to define what is available in NSFontPanel.
Notes: Display the underline popup menu.

31.33 class NSHelpManagerMBS

31.33.1 class NSHelpManagerMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSHelpManager class provides an approach to displaying online help.
Notes: An application contains one NSHelpManager object.

31.33.2 Blog Entries

- MBS Xojo Plugins, version 19.3pr2
- MBS REALbasic Plugins, version 11.1pr5

31.33.3 Methods

31.33.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSHelpManagerMBS object in Xojo which points to the shared NSHelpManager object.

31.33.5 findString(query as string, book as string)

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Performs a search for the specified string in the specified book.
Notes:

query: String to search for.
book: Localized help book to search. When "", all installed help books are searched.

31.33.6 isContextHelpModeActive as boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether context-sensitive help mode is active.
Notes:

Returns true when the application is in context-sensitive help mode, false otherwise.

In context-sensitive help mode, when a user clicks a user interface item, help for that item is displayed in a small window just below the cursor.

31.33.7 NSContextHelpModeDidActivateNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names to be used with NSNotificationObserverMBS class.
Notes:

Posted when the application enters context-sensitive help mode. This typically happens when the user holds down the Help key.
The notification object is the help manager. This notification does not contain a userInfo dictionary.

31.33.8 NSContextHelpModeDidDeactivateNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names to be used with NSNotificationObserverMBS class.
Notes:

Posted when the application exits context-sensitive help mode. This happens when the user clicks the mouse button while the cursor is anywhere on the screen after displaying a context-sensitive help topic.
The notification object is the help manager. This notification does not contain a userInfo dictionary.

31.33.9 openHelpAnchor(anchor as string, book as string)

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Finds and displays the text at the given anchor location in the given book.
Notes:

anchor: Location of the desired text.
book: Help book containing the anchor. When "", all installed help books are searched.

31.33.10 registerBooksInBundle(bundle as NSBundleMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Registers one or more help books in the given bundle.
Notes:

bundle: The bundle for additional help books. Books in the main bundle are automatically registered.

Returns true if registration is successful, false if if the bundle doesn't contain any help books or if registration fails.

You use registerBooksInBundle to register help books in, for example, a plug-in bundle. The Info.plist in the bundle should contain a help book directory path, which specifies one or more folders containing help

books.

The main bundle is automatically registered by openHelpAnchor and findString.

31.33.11 setContextHelpModeActive(active as boolean)

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies whether context-sensitive help mode is active.
Notes:

active: True turns on context-sensitive help, false turns it off.

You never send this message directly; instead, the NSApplication method activateContextHelpMode activates context-sensitive help mode, and the first mouse click after displaying the context-sensitive help window deactivates it.

When the application enters context-sensitive help mode, the help manager posts an NSContextHelpModeDidActivateNotification to the default notification center. When the application returns to normal operation, the help manager posts an NSContextHelpModeDidDeactivateNotification.

31.33.12 Properties

31.33.13 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference to the NSHelpManager object.
Notes: (Read and Write property)

31.34 class NSIndexSetMBS

31.34.1 class NSIndexSetMBS

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSIndexSet class represents an immutable collection of unique unsigned integers, known as indexes because of the way they are used.
Example:

```
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox str(n.firstIndex)+" "+str(n.lastIndex)
```

Notes:

This collection is referred to as a index set.

You use index sets in your code to store indexes into some other data structure. For example, given an array, you could use an index set to identify a subset of objects in that array.

Each index value can appear only once in the index set. This is an important concept to understand and is why you would not use index sets to store an arbitrary collection of integer values. To illustrate how this works, if you created an NSIndexSet object with the values 4, 5, 2, and 5, the resulting set would only have the values 4, 5, and 2 in it. Because index values are always maintained in sorted order, the actual order of the values when you created the set would be 2, 4, and then 5.

In most cases, using an index set is more efficient than storing a collection of individual integers. Internally, the NSIndexSet class represents indexes using ranges. For maximum performance and efficiency, overlapping ranges in an index set are automatically coalesced—that is, ranges merge rather than overlap. Thus, the more contiguous the indexes in the set, the fewer ranges are required to specify those indexes.

You must not subclass the NSIndexSet class.

The mutable subclass of NSIndexSet is NSMutableIndexSet.

31.34.2 Blog Entries

- MBS Real Studio Plugins, version 13.0pr7

31.34.3 Methods

31.34.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an allocated NSIndexSet object.
Example:

```
dim x as new NSIndexSetMBS
```

See also:

- 31.34.5 Constructor(index as Integer) 6168
- 31.34.6 Constructor(indexes as NSIndexSetMBS) 6168
- 31.34.7 Constructor(StartIndex as Integer, Length as Integer) 6169

31.34.5 Constructor(index as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an allocated NSIndexSet object with an index.
Example:

```
dim n as new NSIndexSetMBS(5)
MsgBox str(n.firstIndex)+" "+str(n.lastIndex)
```

See also:

- 31.34.4 Constructor 6168
- 31.34.6 Constructor(indexes as NSIndexSetMBS) 6168
- 31.34.7 Constructor(StartIndex as Integer, Length as Integer) 6169

31.34.6 Constructor(indexes as NSIndexSetMBS)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an allocated NSIndexSet object with an index set.
Example:

```
dim n as new NSIndexSetMBS(5)
dim x as new NSIndexSetMBS(n)
MsgBox str(x.firstIndex)
```

See also:

- 31.34.4 Constructor 6168
- 31.34.5 Constructor(index as Integer) 6168
- 31.34.7 Constructor(StartIndex as Integer, Length as Integer) 6169

31.34.7 Constructor(StartIndex as Integer, Length as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an allocated NSIndexSet object with an index range.
Example:

```
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
```

Notes: This method raises an NSRangeException when indexRange would add an index that exceeds the maximum allowed value for unsigned integers.
See also:

- 31.34.4 Constructor 6168
- 31.34.5 Constructor(index as Integer) 6168
- 31.34.6 Constructor(indexes as NSIndexSetMBS) 6168

31.34.8 containsIndex(index as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver contains a specific index.
Example:

```
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10

if n.containsIndex(6) then
MsgBox "OK"
else
MsgBox "Error."
end if

if n.containsIndex(11) then
MsgBox "Error."
else
```

```
MsgBox "OK"
end if
```

Notes: Returns true when the receiver contains index, false otherwise.

31.34.9 containsIndexes(indexes as NSIndexSetMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver contains a superset of the indexes in another index set.
Example:

```
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
dim m as new NSIndexSetMBS(6,2)

if n.containsIndexes(m) then
MsgBox "OK"
else
MsgBox "Error."
end if
```

Notes: True when the receiver contains a superset of the indexes in indexSet, false otherwise.

31.34.10 containsIndexesInRange(StartIndex as Integer, Length as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver contains the indexes represented by an index range.
Example:

```
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
if n.containsIndexesInRange(6,2) then
MsgBox "OK"
else
MsgBox "Error."
end if
```

Notes: Returns true when the receiver contains the indexes in indexRange, false otherwise.

31.34.11 copy as NSIndexSetMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the Cocoa and RB object.

31.34.12 count as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of indexes in the receiver.
Example:

```
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox str(n.count) // shows 6
```

31.34.13 countOfIndexesInRange(StartIndex as Integer, Length as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of indexes in the receiver that are members of a given range.
Example:

```
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox str(n.countOfIndexesInRange(1,8)) // shows 4
```

Notes: Available in Mac OS X v10.5 and later.

31.34.14 firstIndex as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns either the first index in the receiver or the not-found indicator.
Example:

```
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox str(n.firstIndex)+" "+str(n.lastIndex)
```

Notes: First index in the receiver or NSNotFound (& h7fffffff) when the receiver is empty.

31.34.15 indexGreaterThanIndex(index as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns either the closest index in the receiver that is greater than a specific index or the not-found indicator.
Example:

```
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox str(n.indexGreaterThanIndex(1)) // shows(5)
```

Notes: Returns the losest index in the receiver greater than index; NSNotFound (& h7FFFFFFF) when the receiver contains no qualifying index.

31.34.16 indexGreaterThanOrEqualToIndex(index as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns either the closest index in the receiver that is greater than or equal to a specific index or the not-found indicator.
Example:

```
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox str(n.indexGreaterThanOrEqualToIndex(1)) // shows(5)
```

Notes: Returns closest index in the receiver greater than or equal to index; NSNotFound (& h7FFFFFFF) when the receiver contains no qualifying index.

31.34.17 indexLessThanIndex(index as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns either the closest index in the receiver that is less than a specific index or the not-found indicator.
Example:

```
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox str(n.indexLessThanIndex(20)) // shows 10
MsgBox str(n.indexLessThanIndex(1)) // shows 2147483647 for not found
```

Notes: Returns closest index in the receiver less than index; NSNotFound (& h7FFFFFFF) when the receiver contains no qualifying index.

31.34.18 indexLessThanOrEqualToIndex(index as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns either the closest index in the receiver that is less than or equal to a specific index or the not-found indicator.
Example:

```
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox str(n.indexLessThanOrEqualToIndex(20)) // shows 10
```

Notes: Returns closest index in the receiver less than or equal to index; NSNotFound (& h7FFFFFFF) when the receiver contains no qualifying index.

31.34.19 indexSet as NSIndexSetMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an empty index set.
Example:

```
dim n as NSIndexSetMBS = NSIndexSetMBS.indexSet
MsgBox str(n.count) // 0 ->empty
```

Notes: Available in Mac OS X v10.3 and later.

31.34.20 indexSetWithIndex(index as Integer) as NSIndexSetMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an index set with an index.
Example:

```
dim n as NSIndexSetMBS = NSIndexSetMBS.indexSetWithIndex(3)
MsgBox str(n.count) // 1
```

Notes: Available in Mac OS X v10.3 and later.

31.34.21 indexSetWithIndexesInRange(StartIndex as Integer, Length as Integer) as NSIndexSetMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an index set with an index range.
Example:

```
dim n as NSIndexSetMBS = NSIndexSetMBS.indexSetWithIndexesInRange(3,2)
MsgBox str(n.count) // 2 and contains 3,4
```

Notes: Available in Mac OS X v10.3 and later.

31.34.22 intersectsIndexesInRange(StartIndex as Integer, Length as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver contains any of the indexes in a range.
Example:

```
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10

if n.intersectsIndexesInRange(1,4) then
MsgBox "Error"
else
MsgBox "OK"
end if

if n.intersectsIndexesInRange(1,6) then
MsgBox "OK"
else
MsgBox "Error"
end if
```

31.34.23 isEqualToIndexSet(other as NSIndexSetMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the indexes in the receiver are the same indeces contained in another index set.
Example:

```
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
dim m as NSIndexSetMBS = n.mutableCopy
```

```
if m.isEqualToIndexSet(n) then
MsgBox "OK"
else
MsgBox "Failed."
end if
```

31.34.24 lastIndex as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns either the last index in the receiver or the not-found indicator.
Example:

```
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox str(n.firstIndex)+" "+str(n.lastIndex)
```

Notes: Returns Last index in the receiver or NSNotFound (& h7FFFFFFF) when the receiver is empty.

31.34.25 mutableCopy as NSMutableIndexSetMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an editable copy of the indexset.
Example:

```
dim n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
dim m as NSMutableIndexSetMBS = n.mutableCopy

m.addIndex 20

MsgBox str(n.lastIndex)+" "+str(m.lastIndex)
```

31.34.26 Operator_Convert as string

MBS MacCocoa Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts an indexset to string for display.
Example:

```
dim n as NSIndexSetMBS = NSIndexSetMBS.indexSetWithIndexesInRange(10,40)
MsgBox n
```

Notes:

This is for having str() function and msgbox work with NSIndexSetMBS class.
If more than 20 values, you get only 20 values followed with dots and last value on the end.

31.34.27 Values as Integer()

MBS MacCocoa Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns all values in array.
Example:

```
dim n1 as NSIndexSetMBS = NSIndexSetMBS.indexSetWithIndexesInRange(10,10)
dim n2 as NSIndexSetMBS = NSIndexSetMBS.indexSetWithIndexesInRange(30,5)
dim n3 as new NSMutableIndexSetMBS
n3.addIndexes n1
n3.addIndexes n2
dim count1 as Integer = n1.count // 10
dim count2 as Integer = n2.count // 5
dim count3 as Integer = n3.count // 15
dim values1() as Integer = n1.Values
dim values2() as Integer = n2.Values
dim values3() as Integer = n3.Values
break // look in debugger
```

31.34.28 Properties

31.34.29 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference for the NSIndexSex.
Notes: (Read and Write property)

31.35 class NSInputStreamMBS

31.35.1 class NSInputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A stream that provides read-only stream functionality.
Notes: Subclass of the NSStreamMBS class.

31.35.2 Blog Entries

- MBS Xojo Plugins, version 18.2pr2

31.35.3 Methods

31.35.4 Constructor(filePath as string)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSInputStream object that reads data from the file at a given path.
Notes: The stream must be opened before it can be used.

31.35.5 inputStreamWithData(data as Memoryblock) as NSInputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an initialized NSInputStream object for reading from a given NSData object.
Notes:

data: The data object from which to read. The contents of data are copied.

Returns an initialized NSInputStream object for reading from data. If data is not an NSData object, this method returns nil.

The stream must be opened before it can be used.

31.35.6 inputStreamWithFileAtPath(path as string) as NSInputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSInputStream object that reads data from the file at a given path.
Notes:

path: The path to the file.

Returns an initialized NSInputStream object that reads data from the file at path.

The stream must be opened before it can be used.

31.35.7 inputStreamWithURL(URL as string) as NSInputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an initialized NSInputStream object that reads data from the file at a given URL.
Notes:

url: The URL to the file.

Returns an initialized NSInputStream object that reads data from the URL at url.

The stream must be opened before it can be used.

31.35.8 LookAHead as MemoryBlock

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns copy of read buffer.
Notes: Allows looking into data before reading it.

31.35.9 Read(maxLength as Integer) as MemoryBlock

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reads up to a given number of bytes into a given buffer.

31.35.10 Properties

31.35.11 hasBytesAvailable as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver has bytes available to read.
Notes:

True if the receiver has bytes available to read, otherwise false. May also return true if a read must be attempted in order to determine the availability of bytes.
(Read only property)

31.36 class NSKeyedArchiverMBS

31.36.1 class NSKeyedArchiverMBS

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The plugin class for archiving objects.
Example:

```
// make archiver
dim a as new NSKeyedArchiverMBS

// add a string
a.encodeString "Hello World", "Greeting"

// finish
a.finishEncoding

// query data
dim m as MemoryBlock = a.archiverData

// start unarchiver
dim u as new NSKeyedUnarchiverMBS(m)

// query and display a value
dim s as string = u.decodeString("Greeting")
MsgBox s
```

Notes:

NSKeyedArchiver, a concrete subclass of NSCoder, provides a way to encode objects (and scalar values) into an architecture-independent format that can be stored in a file. When you archive a set of objects, the class information and instance variables for each object are written to the archive. NSKeyedArchiver's companion class, NSKeyedUnarchiver, decodes the data in an archive and creates a set of objects equivalent to the original set.

A keyed archive differs from a non-keyed archive in that all the objects and values encoded into the archive are given names, or keys. When decoding a non-keyed archive, values have to be decoded in the same order in which they were encoded. When decoding a keyed archive, because values are requested by name, values can be decoded out of sequence or not at all. Keyed archives, therefore, provide better support for forward and backward compatibility.

The keys given to encoded values must be unique only within the scope of the current object being encoded. A keyed archive is hierarchical, so the keys used by object A to encode its instance variables do not conflict with the keys used by object B, even if A and B are instances of the same class. Within a single object, however, the keys used by a subclass can conflict with keys used in its superclasses.

Subclass of the NSCoderMBS class.

31.36.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr1

31.36.3 Methods

31.36.4 archiverData as memoryblock

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the archived data.

31.36.5 Constructor

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver, initialized for encoding an archive.

31.36.6 finishEncoding

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Instructs the receiver to construct the final data stream.
Notes: No more values can be encoded after this method is called. You must call this method when finished.

31.36.7 Properties

31.36.8 outputFormat as Integer

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets or queries the format in which the receiver encodes its data.
Example:

```
// make archiver
dim a as new NSKeyedArchiverMBS
a.outputFormat = a.kCFPropertyListXMLFormat_v1_0

// add a string
a.encodeString "Hello World", "Greeting"
```

```
// finish
a.finishEncoding

// query data and show
dim m as MemoryBlock = a.archiverData
dim s as string = DefineEncoding(m, encodings.UTF8)
MsgBox s
```

Notes: (Read and Write computed property)

31.36.9 Constants

31.36.10 kCFPropertyListBinaryFormat_v1_0 = 200

MBS MacBase Plugin, Plugin Version: 13.2. **Function:** One of the possible formats.
Notes: Specifies the binary property list format.

31.36.11 kCFPropertyListXMLFormat_v1_0 = 100

MBS MacBase Plugin, Plugin Version: 13.2. **Function:** One of the possible formats.
Notes: Specifies the XML property list format.

31.37 class NSKeyedUnarchiverMBS

31.37.1 class NSKeyedUnarchiverMBS

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The plugin class for unarchiving objects.
Example:

```
// make archiver
dim a as new NSKeyedArchiverMBS

// add a string
a.encodeString "Hello World", "Greeting"

// finish
a.finishEncoding

// query data
dim m as MemoryBlock = a.archiverData

// start unarchiver
dim u as new NSKeyedUnarchiverMBS(m)

// query and display a value
dim s as string = u.decodeString("Greeting")
MsgBox s
```

Notes:

NSKeyedUnarchiver, a concrete subclass of NSCoder, defines methods for decoding a set of named objects (and scalar values) from a keyed archive. Such archives are produced by instances of the NSKeyedArchiver class.

A keyed archive is encoded as a hierarchy of objects. Each object in the hierarchy serves as a namespace into which other objects are encoded. The objects available for decoding are restricted to those that were encoded within the immediate scope of a particular object. Objects encoded elsewhere in the hierarchy, whether higher than, lower than, or parallel to this particular object, are not accessible. In this way, the keys used by a particular object to encode its instance variables need to be unique only within the scope of that object.

If you invoke one of the decode... methods of this class using a key that does not exist in the archive, a non-positive value is returned. This value varies by decoded type. For example, if a key does not exist in an archive, decodeBoolForKey returns false, decodeIntForKey returns 0, and decodeObjectForKey returns nil.

NSKeyedUnarchiver supports limited type coercion. A value encoded as any type of integer, whether a standard int or an explicit 32-bit or 64-bit integer, can be decoded using any of the integer decode methods. Likewise, a value encoded as a float or double can be decoded as either a float or a double value. If an encoded value is too large to fit within the coerced type, the decoding method raises an NSRangeException. Further, when trying to coerce a value to an incompatible type, for example decoding an int as a float, the decoding method raises an NSInvalidUnarchiveOperationException.
Subclass of the NSCoderMBS class.

31.37.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr1

31.37.3 Methods

31.37.4 Constructor(data as memoryblock)

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the receiver for decoding an archive previously encoded by NSKeyedArchiverMBS.
Notes:

When you finish decoding data, you should invoke finishDecoding.
This method raises an NSExceptionMBS if data is not a valid archive.

31.37.5 finishDecoding

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Tells the receiver that you are finished decoding objects.
Notes: Invoking this method allows the receiver to notify its delegate and to perform any final operations on the archive. Once this method is invoked, the receiver cannot decode any further values.

31.38 class NSKeyValueObserverMBS

31.38.1 class NSKeyValueObserverMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Plugin class to use a key value observer.
Notes:

The NSKeyValueObserving (KVO) informal protocol defines a mechanism that allows objects to be notified of changes to the specified properties of other objects.

You can observe any object properties including simple attributes, to-one relationships, and to-many relationships. Observers of to-many relationships are informed of the type of change made — as well as which objects are involved in the change.

NSObject provides an implementation of the NSKeyValueObserving protocol that provides an automatic observing capability for all objects. You can further refine notifications by disabling automatic observer notifications and implementing manual notifications using the methods in this protocol.

This class implements an observer with event for use in Xojo.

31.38.2 Blog Entries

- MBS Real Studio Plugins, version 13.1pr13

31.38.3 Methods

31.38.4 addObserver(keyPath as string, options as Integer = 5, context as Variant = nil)

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Registers observer to receive KVO notifications for the specified key-path relative to the receiver.
Notes:

keyPath: The key path, relative to the receiver, of the property to observe. This value must not be nil.
options: A combination of the option constants that specifies what is included in observation notifications.
context: Arbitrary data that is passed to anObserver in observeValueForKeyPath.

This class holds a strong references to context and a weak reference to target.
Available in OS X v10.3 and later.

31.38.5 Constructor(TargetHandle as Integer)

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.
Notes:

Please pass the handle of the target Cocoa object.
Like NSWindowMBS.handle or CALayerMBS.

31.38.6 Destructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

31.38.7 NSKeyValueChangeIndexesKey as string

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the dictionary passed to observedValueForKeyPathChanged event.
Notes:

If the value of the NSKeyValueChangeKindKey entry is NSKeyValueChangeInsertion, NSKeyValueChangeRemoval, or NSKeyValueChangeReplacement, the value of this key is an NSIndexSetMBS object that contains the indexes of the inserted, removed, or replaced objects.
Available in OS X v10.3 and later.

31.38.8 NSKeyValueChangeKindKey as string

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the dictionary passed to observedValueForKeyPathChanged event.

31.38.9 NSKeyValueChangeNewKey as string

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the dictionary passed to observedValueForKeyPathChanged event.
Notes:

If the value of the NSKeyValueChangeKindKey entry is NSKeyValueChangeSetting, and NSKeyValueObservingOptionNew was specified when the observer was registered, the value of this key is the new value for the attribute.
For NSKeyValueChangeInsertion or NSKeyValueChangeReplacement, if NSKeyValueObservingOptionNew was specified when the observer was registered, the value for this key is an NSArray instance that contains

the objects that have been inserted or replaced other objects, respectively.
Available in OS X v10.3 and later.

31.38.10 NSKeyValueChangeNotificationIsPriorKey as string

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the dictionary passed to observedValueForKeyPathChanged event.
Notes:

If the option NSKeyValueObservingOptionPrior was specified when the observer was registered this notification is sent prior to a change.
The change dictionary contains an NSKeyValueChangeNotificationIsPriorKey entry whose value is a boolean.
Available in OS X v10.5 and later.

31.38.11 NSKeyValueChangeOldKey as string

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the dictionary passed to observedValueForKeyPathChanged event.
Notes:

If the value of the NSKeyValueChangeKindKey entry is NSKeyValueChangeSetting, and NSKeyValueObservingOptionOld was specified when the observer was registered, the value of this key is the value before the attribute was changed.
For NSKeyValueChangeRemoval or NSKeyValueChangeReplacement, if NSKeyValueObservingOptionOld was specified when the observer was registered, the value is an NSArray instance that contains the objects that have been removed or have been replaced by other objects, respectively.
Available in OS X v10.3 and later.

31.38.12 removeObserver(keyPath as string, context as Variant = nil)

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops a given object from receiving change notifications for the property specified by a given key-path relative to the receiver and a context.
Notes:

keyPath: A key-path, relative to the receiver, for which observer is registered to receive KVO change notifications.
context: Arbitrary data that more specifically identifies the observer to be removed.

Examining the value in context you are able to determine precisely which addObserver method was used to create the observation relationship. When the same observer is registered for the same key-path multiple times, but with different context pointers, an application can determine specifically which object to stop

observing.

The context object is only used in OS X v10.7 and later.

31.38.13 Properties

31.38.14 Handle as Integer

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

31.38.15 Events

31.38.16 observedValueForKeyPathChanged(keyPath as string, target as Variant, change as dictionary, context as Variant, ChangeNSDictionaryRef as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called when the value at the specified key path relative to the given object has changed.
Notes:

keyPath: The key path, relative to object, to the value that has changed.
object: The source object of the key path keyPath.
change: A dictionary that describes the changes that have been made to the value of the property at the key path keyPath relative to object. Entries are described in Keys used by the change dictionary.
context: The value that was provided when the receiver was registered to receive key-value observation notifications.

The receiver must be registered as an observer for the specified keyPath and object.
ChangeNSDictionaryRef provides for debugging the reference to the original NSDictionary object.

31.38.17 Constants

31.38.18 kChangeInsertion = 2

MBS MacBase Plugin, Plugin Version: 13.1. **Function:** One of the kind constants used with NSKeyValueChangeKindKey.
Notes: Indicates that an object has been inserted into the to-many relationship that is being observed.

31.38.19 kChangeRemoval = 3

MBS MacBase Plugin, Plugin Version: 13.1. **Function:** One of the kind constants used with NSKeyValueChangeKindKey.
Notes: Indicates that an object has been removed from the to-many relationship that is being observed.

31.38.20 kChangeReplacement = 4

MBS MacBase Plugin, Plugin Version: 13.1. **Function:** One of the kind constants used with NSKeyValueChangeKindKey.
Notes: Indicates that an object has been replaced in the to-many relationship that is being observed.

31.38.21 kChangeSetting = 1

MBS MacBase Plugin, Plugin Version: 13.1. **Function:** One of the kind constants used with NSKeyValueChangeKindKey.
Notes: Indicates that the value of the observed key path was set to a new value. This change can occur when observing an attribute of an object, as well as properties that specify to-one and to-many relationships.

31.38.22 kOptionInitial = 4

MBS MacBase Plugin, Plugin Version: 13.1. **Function:** One of the constants to be passed to addObserver and determine the values that are returned as part of the change dictionary passed to observedValueForKeyPathChanged.
Notes:

If specified, a notification should be sent to the observer immediately, before the observer registration method even returns.
The change dictionary in the notification will always contain an NSKeyValueChangeNewKey entry if kOptionNew is also specified but will never contain an NSKeyValueChangeOldKey entry. (In an initial notification the current value of the observed property may be old, but it's new to the observer.) You can use this option instead of explicitly invoking, at the same time, code that is also invoked by the observer's observedValueForKeyPathChanged method. When this option is used with addObserver a notification will be sent for each indexed object to which the observer is being added.
Available in OS X v10.5 and later.

31.38.23 kOptionNew = 1

MBS MacBase Plugin, Plugin Version: 13.1. **Function:** One of the constants to be passed to addObserver and determine the values that are returned as part of the change dictionary passed to observedValueForKey-

PathChanged.
Notes:

Indicates that the change dictionary should provide the new attribute value, if applicable.
Available in OS X v10.3 and later.

31.38.24 kOptionOld = 2

MBS MacBase Plugin, Plugin Version: 13.1. **Function:** One of the constants to be passed to addObserver and determine the values that are returned as part of the change dictionary passed to observedValueForKeyPathChanged.
Notes:

Indicates that the change dictionary should contain the old attribute value, if applicable.
Available in OS X v10.3 and later.

31.38.25 kOptionPrior = 8

MBS MacBase Plugin, Plugin Version: 13.1. **Function:** One of the constants to be passed to addObserver and determine the values that are returned as part of the change dictionary passed to observedValueForKeyPathChanged.
Notes:

Whether separate notifications should be sent to the observer before and after each change, instead of a single notification after the change.
The change dictionary in a notification sent before a change always contains an NSKeyValueChangeNotificationIsPriorKey entry whose value is true, but never contains an NSKeyValueChangeNewKey entry. When this option is specified the change dictionary in a notification sent after a change contains the same entries that it would contain if this option were not specified. You can use this option when the observer's own key-value observing-compliance requires it to invoke one of the -willChange... methods for one of its own properties, and the value of that property depends on the value of the observed object's property. (In that situation it's too late to easily invoke -willChange... properly in response to receiving an observedValueForKeyPathChanged message after the change.)
Available in OS X v10.5 and later.

31.39 class NSLayoutManagerMBS

31.39.1 class NSLayoutManagerMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An NSLayoutManager object coordinates the layout and display of characters held in an NSTextStorage object.
Notes:

It maps Unicode character codes to glyphs, sets the glyphs in a series of NSTextContainer objects, and displays them in a series of NSTextView objects. In addition to its core function of laying out text, an NSLayoutManager object coordinates its NSTextView objects, provides services to those text views to support NSRulerView instances for editing paragraph styles, and handles the layout and display of text attributes not inherent in glyphs (such as underline or strikethrough). You can create a subclass of NSLayoutManager to handle additional text attributes, whether inherent or not.

Text Antialiasing
NSLayoutManager provides the threshold for text antialiasing. It looks at the AppleAntiAliasingThreshold default value. If the font size is smaller than or equal to this threshold size, the text is rendered aliased by NSLayoutManager. You can change the threshold value from the Appearance pane of System Preferences.

Thread Safety of NSLayoutManager
Generally speaking, a given layout manager (and associated objects) should not be used in more than one block, operation, or thread at a time. Most layout managers are used on the main thread, since it is the main thread on which their text views are displayed, and since background layout occurs on the main thread. If it is intended that a layout manager should be used on a background thread, first make sure that text views associated with that layout manager (if any) are not displayed while the layout manager is being used on the background thread, and, second, turn off background layout for that layout manager while it is being used on the background thread.

Noncontiguous Layout
Noncontiguous layout is an optional layout manager behavior new in Mac OS X v10.5. Previously, both glyph generation and layout were always performed, in order, from the beginning to the end of the document. When noncontiguous layout is turned on, however, the layout manager gains the option of performing glyph generation or layout for one portion of the document without having done so for previous sections. This can provide significant performance improvements for large documents.

Noncontiguous layout is not turned on automatically because direct clients of NSLayoutManager typically have relied on the previous behavior—for example, by forcing layout for a given glyph range, and then assuming that previous glyphs would therefore be laid out. Clients who use NSLayoutManager only indirectly—for example, those who use NSTextView without directly calling the underlying layout manager—can usually turn on noncontiguous layout without difficulty. Clients using NSLayoutManager directly need to examine their usage before turning on noncontiguous layout.

To turn on noncontiguous layout, use AllowsNonContiguousLayout. In addition, see the other methods in "Managing Noncontiguous Layout," many of which enable you to ensure that glyph generation and layout are performed for specified portions of the text. The behavior of a number of other layout manager methods is affected by the state of noncontiguous layout, as noted in the discussion sections of those method descriptions.

So far the plugin implements a small subset of the functions in NSLayoutManager. If you miss a function, please email us and we can check whether we can add it for you.

31.39.3 Methods

31.39.4 addTextContainer(container as NSTextContainerMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Appends the given text container to the series of text containers where the receiver arranges text.
Notes:

container: The text container to append.

Invalidates glyphs and layout as needed, but doesn't perform glyph generation or layout.

31.39.5 characterIndexForPoint(point as NSPointMBS, container as NSTextContainerMBS, byref partialFraction as Double) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the character falling under the given point, expressed in the given container's

coordinate system.
Notes:

point: The point to test.
container: The text container within which the point is tested.
partialFraction: A fraction of the distance from the insertion point, logically before the given character to the next one.

Returns the index of the character falling under point.

Analogous to glyphIndexForPoint:inTextContainer, but expressed in character index terms. The method returns the index of the character falling under point, expressed in coordinate system of container; if no character is under the point, the nearest character is returned, where nearest is defined according to the requirements of selection by mouse. However, this is not simply equivalent to taking the result of the corresponding glyph index method and converting it to a character index, because in some cases a single glyph represents more than one selectable character, for example an fi ligature glyph. In that case, there is an insertion point within the glyph, and this method returns one character or the other, depending on whether the specified point lies to the left or the right of that insertion point.

In general, this method returns only character indexes for which there is an insertion point. The partialFraction is a fraction of the distance from the insertion point, logically before the given character to the next one, which may be either to the right or to the left depending on directionality.

Available in OS X v10.6 and later.

31.39.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates new NSLayoutManager object.

31.39.7 glyphIndexForPoint(point as NSPointMBS, container as NSTextContainerMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This method is a primitive for glyphIndexForPoint. You should always call the main method, not the primitives.
See also:

- 31.39.8 glyphIndexForPoint(point as NSPointMBS, container as NSTextContainerMBS, byref partialFraction as Double) as Integer 6194

31.39.8 glyphIndexForPoint(point as NSPointMBS, container as NSTextContainerMBS, byref partialFraction as Double) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the glyph falling under the given point, expressed in the given container's coordinate system.
Notes:

point: The point for which to return the glyph, in coordinates of container.
container: The container in which the returned glyph is laid out.
partialFraction: On output, the fraction of the distance between the location of the glyph returned and the location of the next glyph.

Returns the index of the glyph falling under the given point, expressed in the given container's coordinate system.

If no glyph is under point, the nearest glyph is returned, where nearest is defined according to the requirements of selection by mouse. Clients who wish to determine whether the the point actually lies within the bounds of the glyph returned should follow this with a call to boundingRectForGlyphRange and test whether the point falls in the rectangle returned by that method. If partialFraction is non-NULL, it returns by reference the fraction of the distance between the location of the glyph returned and the location of the next glyph.

For purposes such as dragging out a selection or placing the insertion point, a partial percentage less than or equal to 0.5 indicates that point should be considered as falling before the glyph index returned; a partial percentage greater than 0.5 indicates that it should be considered as falling after the glyph index returned. If the nearest glyph doesn't lie under point at all (for example, if point is beyond the beginning or end of a line), this ratio is 0 or 1.

If the glyph stream contains the glyphs "A" and "b", with the width of "A" being 13 points, and the user clicks at a location 8 points into "A", partialFraction is 8/13, or 0.615. In this case, the point given should be considered as falling between "A" and "b" for purposes such as dragging out a selection or placing the insertion point.

Performs glyph generation and layout if needed.

As part of its implementation, this method calls fractionOfDistanceThroughGlyphForPoint and glyphIndexForPoint. To change this method's behavior, override those two methods instead of this one.
See also:

- 31.39.7 glyphIndexForPoint(point as NSPointMBS, container as NSTextContainerMBS) as Integer 6193

31.39.9 glyphRangeForTextContainer(container as NSTextContainerMBS) as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the range of glyphs laid out within the given text container.
Notes:

This is a less efficient method than the similar textContainerForGlyphAtIndex.
Performs glyph generation and layout if needed.

31.39.10 lineFragmentRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the rectangle for the line fragment in which the given glyph is laid out and (optionally), by reference, the whole range of glyphs that are in that fragment.
Notes:

glyphIndex: The glyph for which to return the line fragment rectangle.
effectiveGlyphRange: On output, the range for all glyphs in the line fragment.

Retuns the line fragment in which the given glyph is laid out.

This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, for all of the text up to and including that line fragment.

Line fragment rectangles are always in container coordinates.

Overriding this method is not recommended. If the the line fragment rectangle needs to be modified, that should be done at the typesetter level or by calling setLineFragmentRect:forGlyphRange.
See also:

- 31.39.11 lineFragmentRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS, withoutAdditionalLayout as boolean) as NSRectMBS 6195

31.39.11 lineFragmentRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS, withoutAdditionalLayout as boolean) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the line fragment rectangle containing the glyph at the given glyph index.
Notes:

glyphIndex: The glyph for which to return the line fragment rectangle.
effectiveGlyphRange: On output, the range for all glyphs in the line fragment.
withoutAdditionalLayout: If true, glyph generation and layout are not performed, so this option should not be used unless layout is known to be complete for the range in question, or unless noncontiguous layout is enabled; if false, both are performed as needed.

Returns the line fragment in which the given glyph is laid out.

This method is primarily for use from within NSTypesetter, after layout is complete for the range in question, but before the layout manager's call to NSTypesetter has returned. In that case glyph and layout holes have not yet been recalculated, so the layout manager does not yet know that layout is complete for that range, and this variant must be used.

Overriding this method is not recommended. If the the line fragment rectangle needs to be modified, that should be done at the typesetter level or by calling setLineFragmentRect.
See also:

- 31.39.10 lineFragmentRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS) as NSRectMBS 6195

31.39.12 lineFragmentUsedRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the usage rectangle for the line fragment in which the given glyph is laid and (optionally) by reference the whole range of glyphs that are in that fragment.
Notes:

glyphIndex: The glyph for which to return the line fragment used rectangle.
effectiveGlyphRange: On output, the range for all glyphs in the line fragment.

Returns the used rectangle for the line fragment in which the given glyph is laid out.

This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, up to and including that line fragment.

Line fragment used rectangles are always in container coordinates.

Overriding this method is not recommended. If the the line fragment used rectangle needs to be modified, that should be done at the typesetter level or by calling setLineFragmentRect.
See also:

- 31.39.13 lineFragmentUsedRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS,

withoutAdditionalLayout as boolean) as NSRectMBS 6197

31.39.13 lineFragmentUsedRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS, withoutAdditionalLayout as boolean) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the usage rectangle for the line fragment in which the given glyph is laid and (optionally) by reference the whole range of glyphs that are in that fragment.
Notes:

glyphIndex: The glyph for which to return the line fragment used rectangle.
effectiveGlyphRange: On output, the range for all glyphs in the line fragment.
withoutAdditionalLayout: If true, glyph generation and layout are not performed, so this option should not be used unless layout is known to be complete for the range in question, or unless noncontiguous layout is enabled; if false, both are performed as needed.

Returns the used rectangle for the line fragment in which the given glyph is laid out.

This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, up to and including that line fragment.

Line fragment used rectangles are always in container coordinates.

Overriding this method is not recommended. If the the line fragment used rectangle needs to be modified, that should be done at the typesetter level or by calling setLineFragmentRect.
See also:

- 31.39.12 lineFragmentUsedRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS) as NSRectMBS 6196

31.39.14 locationForGlyphAtIndex(glyphIndex as Integer) as NSPointMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the location for the given glyph within its line fragment.
Notes:

glyphIndex: The glyph whose location is returned.

Returns the location of the given glyph.

If the given glyph does not have an explicit location set for it (for example, if it is part of (but not first in) a sequence of nominally spaced characters), the location is calculated by glyph advancements from the

location of the most recent preceding glyph with a location set.

Glyph locations are relative to their line fragment rectangle's origin. The line fragment rectangle in turn is defined in the coordinate system of the text container where it resides.

This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, up to and including that line fragment.

31.39.15 rangeOfNominallySpacedGlyphsContainingIndex(glyphIndex as Integer) as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the range for the glyphs around the given glyph that can be displayed using only their advancements from the font, without pairwise kerning or other adjustments to spacing.
Notes:

glyphIndex: Index of the glyph to test.

Returns the range of nominally spaced glyphs.

The range returned begins with the first glyph, counting back from glyphIndex, that has a location set, and it continues up to, but does not include, the next glyph that has a location set.

Performs glyph generation and layout if needed.

31.39.16 rectArrayForCharacterRange(charRange as NSRangeMBS, selCharRange as NSRangeMBS, container as NSTextContainerMBS, byref rectCount as Integer) as NSRectMBS()

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns an array of rectangles and, by reference, the number of such rectangles, that define the region in the given container enclosing the given character range.
Notes:

charRange: The character range for which to return rectangles.
selCharRange: Selected characters within charRange, which can affect the size of the rectangles; it must be equal to or contain charRange. If the caller is interested in this more from an enclosing point of view rather than a selection point of view, pass { NSNotFound, 0 } as the selected range.
container: The text container in which the text is laid out.
rectCount: The number of rectangles returned.

Returns the array of rectangles enclosing the given range.

These rectangles can be used to draw the text background or highlight for the given range of characters. If a selected range is given in selCharRange, the rectangles returned are correct for drawing the selection. Selection rectangles are generally more complicated than enclosing rectangles and supplying a selected range is the clue this method uses to determine whether to go to the trouble of doing this special work.

The number of rectangles returned isn't necessarily the number of lines enclosing the specified range. Contiguous lines can share an enclosing rectangle, and lines broken into several fragments have a separate enclosing rectangle for each fragment.

These rectangles don't necessarily enclose glyphs that draw outside their line fragment rectangles; use boundingRectForGlyphRange to determine the area that contains all drawing performed for a range of glyphs.

Performs glyph generation and layout if needed.

31.39.17 rectArrayForGlyphRange(glyphRange as NSRangeMBS, selGlyphRange as NSRangeMBS, container as NSTextContainerMBS, byref rectCount as Integer) as NSRectMBS()

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns an array of rectangles and, by reference, the number of such rectangles, that define the region in the given container enclosing the given glyph range.
Notes:

glyphRange: The glyph range for which to return rectangles.
selGlyphRange: Selected glyphs within glyphRange, which can affect the size of the rectangles; it must be equal to or contain glyphRange. If the caller is interested in this more from an enclosing point of view rather than a selection point of view, pass { NSNotFound, 0 } as the selected range.
container: The text container in which the text is laid out.
rectCount: The number of rectangles returned.

Returns the array of rectangles enclosing the given range.

These rectangles can be used to draw the text background or highlight for the given range of characters. If a selected range is given in selGlyphRange, the rectangles returned are correct for drawing the selection. Selection rectangles are generally more complicated than enclosing rectangles and supplying a selected range is the clue this method uses to determine whether to go to the trouble of doing this special work.

The number of rectangles returned isn't necessarily the number of lines enclosing the specified range. Contiguous lines can share an enclosing rectangle, and lines broken into several fragments have a separate enclosing rectangle for each fragment.

The purpose of this method is to calculate line rectangles for drawing the text background and highlighting. These rectangles don't necessarily enclose glyphs that draw outside their line fragment rectangles; use boundingRectForGlyphRange to determine the area that contains all drawing performed for a range of glyphs.

Performs glyph generation and layout if needed.

31.39.18 removeTextContainerAtIndex(index as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the text container at the given index and invalidates the layout as needed.
Notes:

index: The index of the text container to remove.

This method invalidates glyph information as needed.

31.39.19 replaceGlyphAtIndex(glyphIndex as Integer, newGlyph as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the glyph at the given index with a new glyph.
Notes:

glyphIndex: Index of the glyph to replace.
newGlyph: The new glyph.

Doesn't alter the glyph-to-character mapping or invalidate layout information. The character index of the glyph is assumed to remain the same (although it can, of course, be set explicitly if needed).

This method is for use by the glyph-generation mechanism and doesn't perform any invalidation or generation of the glyphs or layout. This method should be invoked only during glyph generation and typesetting, in almost all cases only by the glyph generator or typesetter. For example, a custom glyph generator or typesetter might invoke it.

31.39.20 replaceTextStorage(newTextStorage as NSTextStorageMBS)

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the NSTextStorage object for the group of text-system objects containing the receiver with the given text storage object.
Notes: All NSLayoutManager objects sharing the original NSTextStorage object then share the new one.

This method makes all the adjustments necessary to keep these relationships intact, unlike setting textStorage property.

31.39.21 setCharacterIndex(charIndex as Integer, glyphIndex as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the index of the character corresponding to the glyph at the given glyph index.
Notes:

charIndex: The index to set.
glyphIndex: The glyph corresponding to the character whose index is set. The glyph must already be present.

This method is for use by the glyph-generation mechanism and doesn't perform any invalidation or generation of the glyphs or layout. This method should be invoked only during glyph generation and typesetting, in almost all cases only by the glyph generator or typesetter. For example, a custom glyph generator or typesetter might invoke it.

31.39.22 setExtraLineFragmentRect(fragmentRect as NSRectMBS, usedRect as NSRectMBS, TextContainer as NSTextContainerMBS)

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the bounds and container for the extra line fragment.
Notes:

fragmentRect: The rectangle to set.
usedRect: Indicates where the insertion point is drawn.
TextContainer: The text container where the rectangle is to be laid out.

The extra line fragment is used when the text backing ends with a hard line break or when the text backing is totally empty, to define the extra line which needs to be displayed at the end of the text. If the text backing is not empty and does not end with a hard line break, this should be set to NSRectMBS.Zero and nil.

Line fragment rectangles and line fragment used rectangles are always in container coordinates.

This method is used by the layout mechanism and should be invoked only during typesetting, in almost all cases only by the typesetter. For example, a custom typesetter might invoke it.

31.39.23 setLineFragmentRect(fragmentRect as NSRectMBS, glyphRange as NSRangeMBS, usedRect as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Associates the given line fragment bounds with the given range of glyphs.
Notes:

fragmentRect: The rectangle of the line fragment.
glyphRange: The range of glyphs to be associated with fragmentRect.
usedRect: The portion of fragmentRect that actually contains glyphs or other marks that are drawn (including the text container's line fragment padding. Must be equal to or contained within fragmentRect.

The typesetter must specify the text container first with setTextContainer, and it sets the exact positions of the glyphs afterwards with setLocation.

In the course of layout, all glyphs should end up being included in a range passed to this method, but only glyphs that start a new line fragment should be at the start of such ranges.

Line fragment rectangles and line fragment used rectangles are always in container coordinates.

This method is used by the layout mechanism and should be invoked only during typesetting, in almost all cases only by the typesetter. For example, a custom typesetter might invoke it.

31.39.24 usedRectForTextContainer(container as NSTextContainerMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the bounding rectangle for the glyphs laid out in the given text container.
Notes:

Returns the text container's currently used area, which determines the size that the view would need to be in order to display all the glyphs that are currently laid out in the container. This causes neither glyph generation nor layout.
Used rectangles are always in container coordinates.

31.39.25 Properties

31.39.26 allowsNonContiguousLayout as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether noncontiguous layout is enabled.
Notes:

Setting to true allows but does not require the layout manager to use noncontiguous layout, and the layout manager may in fact not do so, depending on its configuration.
(Read and Write property)

31.39.27 attributedString as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the text storage object from which the NSGlyphGenerator object procures characters for glyph generation.
Notes:

This method is part of the NSGlyphStorage protocol, for use by the glyph generator. For NSLayoutManager the attributed string is equivalent to the text storage.
Available in Mac OS X v10.5 and later.
(Read only property)

31.39.28 backgroundLayoutEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver generates glyphs and lays them out when the application's run loop is idle.
Notes:

If true, background layout is enabled; if false, the receiver performs glyph generation and layout only when necessary.
(Read and Write property)

31.39.29 font as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The font for the invisible character drawing.
Notes:

Use nil font for using the font of the current text.
This method is only available if the NSLayoutManagerMBS object has been created with new NSLayoutManagerMBS, so the plugin can use the special NSLayoutManager subclass with support for invisible character drawing.
(Read and Write property)

31.39.30 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

31.39.31 hasNonContiguousLayout as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the layout manager currently has any areas of noncontiguous layout.
Notes:

There may be times at which there is no noncontiguous layout, such as when layout is complete; this method enables the layout manager to report that to clients.
(Read only property)

31.39.32 hyphenationFactor as Double

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The threshold controlling when hyphenation is done.
Notes:

factor: The hyphenation factor, ranging from 0.0 to 1.0. By default, the value is 0.0, meaning hyphenation is off. A factor of 1.0 causes hyphenation to be attempted always.

Whenever (width of the real contents of the line) / (the line fragment width) is below factor, hyphenation is attempted when laying out the line. Hyphenation slows down text layout and increases memory usage, so it should be used sparingly.

May be overridden on a per-paragraph basis by the NSParagraphStyle method hyphenationFactor.
(Read and Write property)

31.39.33 showInvisibleCharacters as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether to show invisible characters.
Notes:

This method is only available if the NSLayoutManagerMBS object has been created with new NSLayoutManagerMBS, so the plugin can use the special NSLayoutManager subclass with support for invisible character drawing. (from MBS Plugin)

(Read and Write property)

31.39.34 showsControlCharacters as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether to substitute visible glyphs for control characters in layout.
Example:

```
if TargetCocoa then

dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
dim l as NSLayoutManagerMBS = t.layoutManager

l.showsControlCharacters = true

else
// not supported
break
end if
```

Notes:

If true, the receiver substitutes visible glyphs for control characters if the font and script support it; if false, it doesn't. The default is false.
(Read and Write property)

31.39.35 showsInvisibleCharacters as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether to substitute visible glyphs for whitespace and other typically invisible characters in layout.
Example:

```
if TargetCocoa then

dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
dim l as NSLayoutManagerMBS = t.layoutManager

l.showsInvisibleCharacters = true

else
// not supported
break
```

end if

Notes:

If true, the receiver substitutes visible glyphs for invisible characters if the font and script support it; if false, it doesn't. The default is false. (from Apple framework)
(Read and Write property)

31.39.36 textColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The text color for drawing invisible characters.
Notes:

This method is only available if the NSLayoutManagerMBS object has been created with new NSLayoutManagerMBS, so the plugin can use the special NSLayoutManager subclass with support for invisible character drawing.
(Read and Write property)

31.39.37 textStorage as NSTextStorageMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The text storage.
Notes: (Read and Write property)

31.39.38 usesFontLeading as Boolean

MBS MacCocoa Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver uses the leading provided in the font.
Notes: (Read and Write property)

31.39.39 usesScreenFonts as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether screen fonts to calculate layout and display text.
Notes:

If true, the receiver uses screen fonts; if false, it doesn't.
(Read and Write property)

31.39.40 InvisibleCharMapping(character as Integer) as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets/gets character mapping for invisible character.
Example:

```
dim l as new NSLayoutManagerMBS
// ...
// set tab to map to plus sign
l.InvisibleCharMapping(9) = "+"
// set space to map to star sign
l.InvisibleCharMapping(asc(" ")) = "*"
```

Notes:

By default characters are set for endofline, tab and spaces.
Set showInvisibleCharacters to true and put here all the characters you need.
(Read and Write computed property)

31.40 class NSLevelIndicatorMBS

31.40.1 class NSLevelIndicatorMBS

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: NSLevelIndicatorMBS is a subclass of NSControlMBS that displays a value on a linear scale.
Notes:

Level indicators provide a visual representation of a level or amount of something, using discrete values. While similar to NSSlider, it provides a more customized visual feedback to the user. Level indicators do not have a "knob" indicating the current setting or allowing the user to adjust settings. The supported indicator styles include:

- A capacity style level indicator. The continuous mode for this style is often used to indicate conditions such as how much data is on hard disk. The discrete mode is similar to audio level indicators in audio playback applications. You can specify both a warning value and a critical value that provides additional visual feedback to the user.
- A ranking style level indicator. This is similar to the star ranking displays provided in iTunes and iPhoto. You can also specify your own ranking image.
- A relevancy style level indicator. This style is used to display the relevancy of a search result, for example in Mail.

NSLevelIndicator uses an NSLevelIndicatorCell to implement much of the control's functionality. NSLevelIndicator provides cover methods for most of NSLevelIndicatorCell's methods, which invoke the corresponding cell method.
Subclass of the NSControlMBS class.

31.40.2 Blog Entries

- MBS Real Studio Plugins, version 12.2pr6

31.40.3 Methods

31.40.4 Constructor

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new level indicator with size 100/100 and position 0/0
Example:

```
dim t as new NSLevelIndicatorMBS
```

Notes: On success the handle property is not zero.
See also:

- 31.40.5 Constructor(Handle as Integer) 6209
- 31.40.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6209

31.40.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSLevelIndicator handle.
Example:

```
dim t as new NSLevelIndicatorMBS(0, 0, 100, 100)
dim v as new NSLevelIndicatorMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSLevelIndicator and the plugin retains this handle.
See also:

- 31.40.4 Constructor 6208
- 31.40.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6209

31.40.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new level indicator with the given size and position.
Example:

```
dim x as new NSLevelIndicatorMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 31.40.4 Constructor 6208
- 31.40.5 Constructor(Handle as Integer) 6209

31.40.7 rectOfTickMarkAtIndex(index as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the bounding rectangle of the tick mark identified by index (the minimum-value tick mark is at index 0).
Notes: If no tick mark is associated with index, the method raises a NSExceptionMBS.

31.40.8 tickMarkValueAtIndex(index as Integer) as Double

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the receiver's value represented by the tick mark at index (the minimum-value tick mark has an index of 0).

31.40.9 Properties

31.40.10 criticalValue as Double

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The critical value.
Notes: (Read and Write computed property)

31.40.11 levelIndicatorStyle as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Set style of the indicator.
Notes: (Read and Write computed property)

31.40.12 maxValue as Double

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The maximum value the level indicator can represent.
Notes: (Read and Write computed property)

31.40.13 minValue as Double

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The minimum value.

Notes: (Read and Write computed property)

31.40.14 numberOfMajorTickMarks as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The number of major tick marks displayed.
Notes:

The count must be less than or equal to the number of tick marks returned by numberOfTickMarks. For example, if the number of tick marks is 11 and you specify 3 major tick marks, the resulting level indicator will display 3 major tickmarks alternating with 8 minor tick marks.
(Read and Write computed property)

31.40.15 numberOfTickMarks as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The number of tick marks displayed by the receiver (which include those assigned to the minimum and maximum values) to count.
Notes:

By default, this value is 0, and no tick marks appear. The number of tick marks assigned to a slider, along with the slider's minimum and maximum values, determines the values associated with the tick marks.
(Read and Write computed property)

31.40.16 tickMarkPosition as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Where tick marks appear relative to the indicator.
Notes:

This method has no effect if no tick marks have been assigned (that is, numberOfTickMarks returns 0).
(Read and Write computed property)

31.40.17 warningValue as Double

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The warning value.
Notes: (Read and Write computed property)

31.40.18 Constants

31.40.19 NSContinuousCapacityLevelIndicatorStyle = 1

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the style constants.
Notes: A style that is often used to indicate conditions such as how much data is on a hard disk.

31.40.20 NSDiscreteCapacityLevelIndicatorStyle = 2

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the style constants.
Notes: A style similar to audio level indicators in iTunes.

31.40.21 NSRatingLevelIndicatorStyle = 3

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the style constants.
Notes: A style similar to the star ranking displays provided in iTunes and iPhoto.

31.40.22 NSRelevancyLevelIndicatorStyle = 0

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the style constants.
Notes: A style similar to the rank column displayed when searching in Mail.app.

31.40.23 NSTickMarkAbove = 1

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the tick mark constants.
Notes: Tick marks above (for horizontal sliders).

31.40.24 NSTickMarkBelow = 0

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the tick mark constants.
Notes: Tick marks below (for horizontal sliders); the default for horizontal sliders.

31.40.25 NSTickMarkLeft = 0

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the tick mark constants. **Notes:** Tick marks to the left (for vertical sliders); the default. for vertical sliders

31.40.26 NSTickMarkRight = 1

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the tick mark constants. **Notes:** Tick marks to the right (for vertical sliders).

31.41 class NSMutableAttributedStringMBS

31.41.1 class NSMutableAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSMutableAttributedString declares the programmatic interface to objects that manage mutable attributed strings.
Notes:

You can add and remove characters (raw strings) and attributes separately or together as attributed strings. See the class description for NSAttributedString for more information about attributed strings.
Subclass of the NSAttributedStringMBS class.

31.41.4 Methods

31.41.5 addAttribute(name as string, value as Variant, range as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds an attribute with the given name and value to the characters in the specified range.
Example:

```
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m
```

Notes:

name: A string specifying the attribute name. Attribute keys can be supplied by another framework or can be custom ones you define. For information about where to find the system-supplied attribute keys, see the overview section in NSAttributedString Class Reference.
value: The attribute value associated with name.
Range: The range of characters to which the specified attribute/value pair applies.

You may assign any name/value pair you wish to a range of characters, in addition to the standard attributes described in the "Constants" section of NSAttributedString Additions. Raises an NSInvalidArgumentException if name or value is nil and an NSRangeException if any part of range lies beyond the end of the receiver's characters.

Plugin version 16.0 or newer ignores calls here with value = nil or empty name to avoid exceptions.

31.41.6 addAttributes(attrs as Dictionary, range as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds the given collection of attributes to the characters in the specified range.
Example:

```
TextArea1.Text = "Hello"

Dim tv As NSTextViewMBS = TextArea1.NSTextViewMBS
Dim ts As NSTextStorageMBS = tv.TextStorage

Dim value As Color = & cFF0000

Dim offset As Integer = 0
Dim length As Integer = 5

Dim range As NSRangeMBS = NSMakeRangeMBS( offset, length )
ts.AddAttribute( NSAttributedStringMBS.NSForegroundColorAttributeName, value, range )
```

Notes:

attributes: A dictionary containing the attributes to add. Attribute keys can be supplied by another framework or can be custom ones you define. For information about where to find the system-supplied attribute keys, see the overview section in NSAttributedString Class Reference.
Range: The range of characters to which the specified attributes apply.

You may assign any name/value pair you wish to a range of characters, in addition to the standard attributes described in the "Constants" section of NSAttributedString Additions. Raises an NSInvalidArgumentException if attributes is nil and an NSRangeException if any part of range lies beyond the end of the receiver's characters.

31.41.7 appendAttributedString(attrString as NSAttributedStringMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds the characters and attributes of a given attributed string to the end of the receiver.
Example:

```
const NSWritingDirectionNatural = -1 // Determines direction using the Unicode Bidi Algorithm rules P2
and P3
const NSWritingDirectionLeftToRight = 0 // Left to right writing direction
const NSWritingDirectionRightToLeft = 1 // Right to left writing direction

const NSTextWritingDirectionEmbedding = 0
const NSTextWritingDirectionOverride = 2

dim t as NSTextStorageMBS = TextArea1.NSTextViewMBS.textStorage

// get hello in arabic
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

// now set attributes for right to left
m.addAttribute t.NSWritingDirectionAttributeName, array(NSWritingDirectionRightToLeft+NSTextWrit-
ingDirectionOverride), new NSRangeMBS(0,m.Length)

// and add to textarea
t.appendAttributedString m
```

Notes: attributedString: The string whose characters and attributes are added.

31.41.8 appendString(attrString as String)

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds the text to the end of the receiver.

31.41.9 applyFontTraits(FontTraitMask as Integer, offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Applies the font attributes specified by mask to the characters in a range.
Notes: See the NSFontManager class specification for a description of the font traits available. Raises an NSRangeException if any part of aRange lies beyond the end of the receiver's characters.

31.41.10 AsCFMutableAttributedString as Variant

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new CFMutableAttributedStringMBS object pointing to same mutable attributed string.
Example:

```
// make NS version
dim n as new NSAttributedStringMBS

if n.initWithString("Hello World") then

dim m as NSMutableAttributedStringMBS = n.mutableCopy

// convert
dim c as CFMutableAttributedStringMBS = m.AsCFMutableAttributedString

// and check content
MsgBox c.String
end if
```

Notes: For passing to functions which need a CFMutableAttributedStringMBS.

31.41.11 beginEditing

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Overridden by subclasses to buffer or optimize a series of changes to the receiver's characters or attributes, until it receives a matching endEditing message, upon which it can consolidate changes and notify any ob-

servers that it has changed.
Notes: You can nest pairs of beginEditing and endEditing messages.

31.41.12 Constructor

MBS MacBase Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor to create empty mutable attributed string.

31.41.13 containsAttachmentsInRange(offset as Integer, length as Integer) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the receiver contains a property configured (NSAttachmentAttributeName with NSAttachmentCharacter) in range.

31.41.14 deleteCharactersInRange(range as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Deletes the characters in the given range along with their associated attributes.
Notes: Raises an NSRangeException if any part of aRange lies beyond the end of the receiver's characters.

31.41.15 endEditing

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Overridden by subclasses to consolidate changes made since a previous beginEditing message and to notify any observers of the changes.
Notes: The NSMutableAttributedString implementation does nothing. NSTextStorage, for example, overrides this method to invoke fixAttributesInRange and to inform its NSLayoutManager objects that they need to re-lay the text.

31.41.16 fixAttachmentAttributeInRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Cleans up attachment attributes in a range, removing all attachment attributes assigned to characters other than NSAttachmentCharacter.
Notes: Raises an NSRangeException if any part of aRange lies beyond the end of the receiver's characters.

31.41.17 fixAttributesInRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invokes the other fix... methods, allowing you to clean up an attributed string with a single message.
Notes:

Raises an NSRangeException if any part of aRange lies beyond the end of the receiver's characters.

NSTextStorage subclasses that return YES from the fixesAttributesLazily method should avoid directly calling fixAttributesInRange: or else bracket such calls with beginEditing and endEditing messages.

31.41.18 fixFontAttributeInRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fixes the font attribute in aRange, assigning default fonts to characters with illegal fonts for their scripts and otherwise correcting font attribute assignments.
Notes: For example, Kanji characters assigned a Latin font are reassigned an appropriate Kanji font. Raises an NSRangeException if any part of aRange lies beyond the end of the receiver's characters.

31.41.19 fixParagraphStyleAttributeInRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fixes the paragraph style attributes in a range, assigning the first paragraph style attribute value in each paragraph to all characters of the paragraph.
Notes:

This method extends the range as needed to cover the last paragraph partially contained. A paragraph is delimited by any of these characters, the longest possible sequence being preferred to any shorter:

- U+000D (\r or CR)
- U+000A (\n or LF)
- U+2029 (Unicode paragraph separator) \r\n, in that order (also known as CRLF)

Raises an NSRangeException if any part of aRange lies beyond the end of the receiver's characters.

31.41.20 fontAttributesInRange(offset as Integer, length as Integer) as Dictionary

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Attributes which should be copied/pasted with "copy font".

31.41.21 insertAttributedString(attrString as NSAttributedStringMBS, location as UInt64)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts the characters and attributes of the given attributed string into the receiver at the given index.
Notes:

attributedString: The string whose characters and attributes are inserted.
index: The index at which the characters and attributes are inserted.

The new characters and attributes begin at the given index and the existing characters and attributes from the index to the end of the receiver are shifted by the length of the attributed string. Raises an NSRangeException if index lies beyond the end of the receiver's characters.

31.41.22 insertString(attrString as String, location as UInt64)

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts the text into the receiver at the given index.

31.41.23 removeAttribute(name as string, range as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the named attribute from the characters in the specified range.
Notes:

name: A string specifying the attribute name to remove. Attribute keys can be supplied by another framework or can be custom ones you define. For information about where to find the system-supplied attribute keys, see the overview section in NSAttributedString Class Reference.
Range: The range of characters from which the specified attribute is removed.

Raises an NSRangeException if any part of range lies beyond the end of the receiver's characters.

31.41.24 replaceCharactersInRange(range as NSRangeMBS, attrString as NSAttributedStringMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the characters and attributes in a given range with the characters and attributes of the given attributed string.
Notes:

Range: The range of characters and attributes replaced.
attributedString: The attributed string whose characters and attributes replace those in the specified range.

Raises an NSRangeException if any part of range lies beyond the end of the receiver's characters.
See also:

- 31.41.25 replaceCharactersInRange(range as NSRangeMBS, text as string) 6221

31.41.25 replaceCharactersInRange(range as NSRangeMBS, text as string)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the characters in the given range with the characters of the given string.
Notes:

Range: A range specifying the characters to replace.
text: A string specifying the characters to replace those in range.

The new characters inherit the attributes of the first replaced character from range. Where the length of range is 0, the new characters inherit the attributes of the character preceding range if it has any, otherwise of the character following range.

Raises an NSRangeException if any part of range lies beyond the end of the receiver's characters.
See also:

- 31.41.24 replaceCharactersInRange(range as NSRangeMBS, attrString as NSAttributedStringMBS) 6221

31.41.26 rulerAttributesInRange(offset as Integer, length as Integer) as Dictionary

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Attributes which should be copied/pasted with "copy ruler".

31.41.27 setAlignment(alignment as Integer, offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the alignment characteristic of the paragraph style attribute for the characters in aRange to alignment.
Notes: When attribute fixing takes place, this change will affect only paragraphs whose first character was included in aRange. Raises an NSRangeException if any part of a range lies beyond the end of the receiver's characters.

31.41.28 setAttributedString(attrString as NSAttributedStringMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the receiver's entire contents with the characters and attributes of the given attributed string.
Example:

```
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m
```

Notes: attributedString: The attributed string whose characters and attributes replace those in the receiver.

31.41.29 setAttributes(attrs as Dictionary, range as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the attributes for the characters in the specified range to the specified attributes.
Notes:

attributes: A dictionary containing the attributes to set. Attribute keys can be supplied by another framework or can be custom ones you define. For information about where to find the system-supplied attribute keys, see the overview section in NSAttributedString Class Reference.
Range: The range of characters whose attributes are set.

These new attributes replace any attributes previously associated with the characters in range. Raises an NSRangeException if any part of range lies beyond the end of the receiver's characters.

To set attributes for a zero-length NSMutableAttributedString displayed in a text view, use the NSTextView method setTypingAttributes.

31.41.30 setBaseWritingDirection(writingDirection as Integer, offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the base writing direction for the characters in range to writingDirection.

31.41.31 setString(attrString as String)

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the receiver's entire contents with the given string.

31.41.32 subscriptRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decrements the value of the superscript attribute for characters in a range by 1.
Example:

```
TextArea1.Text = "Hello World"

dim n as NSTextViewMBS = TextArea1.NSTextViewMBS
dim s as NSTextStorageMBS = n.textStorage

s.subscriptRange(6,5)
```

31.41.33 superscriptRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Increments the value of the superscript attribute for characters in a range by 1.

31.41.34 unscriptRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the superscript attribute from the characters in a range.

31.41.35 updateAttachmentsFromPath(file as folderitem)

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates all attachments based on files contained in the RTFD file package at path.
See also:

- 31.41.36 updateAttachmentsFromPath(path as string) 6224

31.41.36 updateAttachmentsFromPath(path as string)

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates all attachments based on files contained in the RTFD file package at path.
See also:

- 31.41.35 updateAttachmentsFromPath(file as folderitem) 6224

31.42 class NSMutableCharacterSetMBS

31.42.1 class NSMutableCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSMutableCharacterSet class declares the programmatic interface to objects that manage a modifiable set of Unicode characters.
Notes:

You can add or remove characters from a mutable character set as numeric values in NSRange structures or as character values in strings, combine character sets by union or intersection, and invert a character set.

Mutable character sets are less efficient to use than immutable character sets. If you don't need to change a character set after creating it, create an immutable copy with copy and use that.

NSMutableCharacterSet defines no primitive methods. Subclasses must implement all methods declared by this class in addition to the primitives of NSCharacterSet. They must also implement mutableCopy.
Subclass of the NSCharacterSetMBS class.

31.42.2 Blog Entries

- Nearly 2000 new Functions in the 9.6 prerelease of MBS

31.42.3 Xojo Developer Magazine

- 7.6, page 8: News

31.42.4 Methods

31.42.5 addCharactersInRange(aRange as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds to the receiver the characters whose Unicode values are in a given range.
Example:

```
dim m as new NSMutableCharacterSetMBS
dim r as new NSRangeMBS(65,3)
m.addCharactersInRange r
MsgBox m // shows "ABC"
```

Notes:

aRange: The range of characters to add.

aRange.location is the value of the first character to add; aRange.location + aRange.length– 1 is the value of the last. If aRange.length is 0, this method has no effect.

31.42.6 addCharactersInString(aString as string)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds to the receiver the characters in a given string.
Example:

```
dim m as new NSMutableCharacterSetMBS
m.addCharactersInString "Hello"
MsgBox m // shows "Helo"
```

Notes: This method has no effect if aString is empty.

31.42.7 Constructor

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an empty mutable character set.

31.42.8 formIntersectionWithCharacterSet(otherset as NSMutableCharacterSetMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Modifies the receiver so it contains only characters that exist in both the receiver and otherSet.

31.42.9 formUnionWithCharacterSet(otherset as NSMutableCharacterSetMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Modifies the receiver so it contains all characters that exist in either the receiver or otherSet.

31.42.10 invert

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces all the characters in the receiver with all the characters it didn't previously contain.

Notes: Inverting a mutable character set, whether by invert or by invertedSet, is much less efficient than inverting an immutable character set with invertedSet.

31.42.11 removeCharactersInRange(aRange as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes from the receiver the characters whose Unicode values are in a given range.
Example:

```
dim m as new NSMutableCharacterSetMBS
dim r as new NSRangeMBS(65,3)
m.addCharactersInRange new NSRangeMBS(65,6)
m.removeCharactersInRange r
MsgBox m // shows "DEF"
```

Notes:

aRange: The range of characters to remove.

aRange.location is the value of the first character to remove; aRange.location + aRange.length− 1 is the value of the last. If aRange.length is 0, this method has no effect.

31.42.12 removeCharactersInString(aString as string)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes from the receiver the characters in a given string.
Example:

```
dim m as new NSMutableCharacterSetMBS
m.addCharactersInString "Hello"
m.removeCharactersInString "World"
MsgBox m // shows "He"
```

Notes: This method has no effect if aString is empty.

31.43 class NSMutableIndexSetMBS

31.43.1 class NSMutableIndexSetMBS

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSMutableIndexSet class represents a mutable collection of unique unsigned integers, known as indexes because of the way they are used.
Example:

```
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox str(n.firstIndex)+" "+str(n.lastIndex)
```

Notes:

This collection is referred to as a mutable index set.

The values in a mutable index set are always sorted, so the order in which values are added is irrelevant.

You must not subclass the NSMutableIndexSet class.
Subclass of the NSIndexSetMBS class.

31.43.2 Methods

31.43.3 addIndex(index as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds an index to the receiver.
Example:

```
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
n.addIndex 12
MsgBox str(n.count)
```

31.43.4 addIndexes(indexes as NSIndexSetMBS)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds the indexes in an index set to the receiver.
Example:

```
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
dim x as new NSIndexSetMBS(12,5)
```

```
n.addIndexes x
MsgBox str(n.count)
```

31.43.5 addIndexesInRange(StartIndex as Integer, Length as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds the indexes in an index range to the receiver.
Example:

```
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
n.addIndexesInRange 12,5
MsgBox str(n.count)
```

Notes:

Index range to add. Must include only indexes representable as unsigned integers.

This method raises an NSRangeException when indexRange would add an index that exceeds the maximum allowed value for unsigned integers.

31.43.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an allocated NSMutableIndexSet object.
Example:

```
dim x as new NSMutableIndexSetMBS
```

See also:

- 31.43.7 Constructor(index as Integer) 6229
- 31.43.8 Constructor(indexes as NSIndexSetMBS) 6230
- 31.43.9 Constructor(StartIndex as Integer, Length as Integer) 6230

31.43.7 Constructor(index as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an allocated NSMutableIndexSet object with an index.

Example:

```
dim n as new NSMutableIndexSetMBS(5)
MsgBox str(n.firstIndex)+" "+str(n.lastIndex)
```

See also:

- 31.43.6 Constructor 6229
- 31.43.8 Constructor(indexes as NSIndexSetMBS) 6230
- 31.43.9 Constructor(StartIndex as Integer, Length as Integer) 6230

31.43.8 Constructor(indexes as NSIndexSetMBS)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an allocated NSIndexSet object with an index set.
Example:

```
dim n as new NSMutableIndexSetMBS(5)
dim x as new NSMutableIndexSetMBS(n)
MsgBox str(x.firstIndex)
```

See also:

- 31.43.6 Constructor 6229
- 31.43.7 Constructor(index as Integer) 6229
- 31.43.9 Constructor(StartIndex as Integer, Length as Integer) 6230

31.43.9 Constructor(StartIndex as Integer, Length as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an allocated NSIndexSet object with an index range.
Example:

```
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
```

Notes: This method raises an NSRangeException when indexRange would add an index that exceeds the maximum allowed value for unsigned integers.
See also:

- 31.43.6 Constructor 6229

- 31.43.7 Constructor(index as Integer) 6229
- 31.43.8 Constructor(indexes as NSIndexSetMBS) 6230

31.43.10 removeAllIndexes

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the receiver's indexes.
Example:

```
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
n.removeAllIndexes
MsgBox str(n.count)
```

31.43.11 removeIndex(index as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes an index from the receiver.
Example:

```
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MsgBox str(n.count)
n.removeIndex 8
MsgBox str(n.count)
```

31.43.12 removeIndexes(indexes as NSIndexSetMBS)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the indexes in an index set from the receiver.
Example:

```
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
dim x as new NSIndexSetMBS(5,2)
n.removeIndexes x
MsgBox str(n.firstIndex)+" "+str(n.lastIndex)
```

31.43.13 removeIndexesInRange(StartIndex as Integer, Length as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the indexes in an index range from the receiver.

Example:

```
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
n.removeIndexesInRange 5,2
MsgBox str(n.firstIndex)+" "+str(n.lastIndex)
```

31.43.14 shiftIndexes(StartingAtIndex as Integer, delta as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Shifts a group of indexes to the left or the right within the receiver.
Example:

```
dim n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
n.shiftIndexes 7,3
MsgBox str(n.firstIndex)+" "+str(n.lastIndex)
```

Notes:

startIndex: Head of the group of indexes to shift.
delta: Amount and direction of the shift. Positive integers shift the indexes to the right. Negative integers shift the indexes to the left.

The group of indexes shifted is made up by startIndex and the indexes that follow it in the receiver.

A left shift deletes the indexes in the range (startIndex-delta,delta) from the receiver.

A right shift inserts empty space in the range (indexStart,delta) in the receiver.

31.44 class NSMutableParagraphStyleMBS

31.44.1 class NSMutableParagraphStyleMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSMutableParagraphStyle adds methods to its superclass, NSParagraphStyle, for changing the values of the subattributes in a paragraph style attribute.
Example:

```
dim n as NSParagraphStyleMBS = NSParagraphStyleMBS.defaultParagraphStyle
MsgBox str(n.alignment) // 4 = natural

dim m as NSMutableParagraphStyleMBS = n.mutableCopy
m.setAlignment NSParagraphStyleMBS.NSCenterTextAlignment
MsgBox str(m.alignment) // 2 = center
```

Notes:

See the NSParagraphStyle and NSAttributedString specifications for more information.

Important A paragraph style object should not be mutated after adding it to an attributed string; doing so can cause your program to crash.
Subclass of the NSParagraphStyleMBS class.

31.44.2 Blog Entries

- MBS Xojo Plugins, version 18.1pr3
- MBS Xojo / Real Studio Plugins, version 13.5pr9
- MBS Real Studio Plugins, version 12.4pr1

31.44.3 Methods

31.44.4 addTabStop(tabstop as NSTextTabMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds tabStop to the receiver.

31.44.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

31.44.6 removeTabStop(tabstop as NSTextTabMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the first text tab whose location and type are equal to those of tabStop.

31.44.7 setAlignment(alignment as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the alignment of the receiver to alignment.
Example:

```
dim n as NSParagraphStyleMBS = NSParagraphStyleMBS.defaultParagraphStyle
MsgBox str(n.alignment) // 4 = natural

dim m as NSMutableParagraphStyleMBS = n.mutableCopy
m.setAlignment NSParagraphStyleMBS.NSCenterTextAlignment
MsgBox str(m.alignment) // 2 = center
```

Notes:

alignment may be one of:

NSLeftTextAlignment
NSRightTextAlignment
NSCenterTextAlignment
NSJustifiedTextAlignment
NSNaturalTextAlignment

31.44.8 setBaseWritingDirection(writingDirection as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the base writing direction for the receiver.
Notes: It can be NSWritingDirectionNaturalDirection, NSWritingDirectionLeftToRight, or NSWritingDirectionRightToLeft. If you specify NSWritingDirectionNaturalDirection, the receiver resolves the writing direction to either NSWritingDirectionLeftToRight or NSWritingDirectionRightToLeft, depending on the

direction for the user's language preference setting.

31.44.9 setDefaultTabInterval(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the default tab interval for the receiver.
Notes: Tabs after the last specified in tabStops are placed at integral multiples of this distance. This value must be nonnegative.

31.44.10 setFirstLineHeadIndent(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the distance in points from the leading margin of a text container to the beginning of the paragraph's first line to value.
Notes: This value must be nonnegative.

31.44.11 setHeaderLevel(level as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies whether the paragraph is to be treated as a header for purposes of HTML generation.
Notes: Should be set to 0 (the default value) if the paragraph is not a header, or from 1 through 6 if the paragraph is to be treated as a header.

31.44.12 setHeadIndent(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the distance in points from the leading margin of a text container to the beginning of lines other than the first to value.
Notes: This value must be nonnegative.

31.44.13 setHyphenationFactor(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies the threshold for hyphenation.
Notes: Valid values lie between 0.0 and 1.0 inclusive. The default value is 0.0. Hyphenation is attempted when the ratio of the text width (as broken without hyphenation) to the width of the line fragment is less

than the hyphenation factor. When the paragraph's hyphenation factor is 0.0, the layout manager's hyphenation factor is used instead. When both are 0.0, hyphenation is disabled.

31.44.14 setLineBreakMode(mode as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the mode used to break lines in a layout container to mode.
Notes:

The mode parameter may be one of:

NSLineBreakByWordWrapping
NSLineBreakByCharWrapping
NSLineBreakByClipping
NSLineBreakByTruncatingHead
NSLineBreakByTruncatingTail
NSLineBreakByTruncatingMiddle
See the description of lineBreakMode in the NSParagraphStyle class specification for descriptions of these values.

31.44.15 setLineHeightMultiple(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the line height multiple for the receiver.
Notes: The natural line height of the receiver is multiplied by this factor before being constrained by minimum and maximum line height. This value must be nonnegative.

31.44.16 setLineSpacing(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the space in points added between lines within the paragraph to value.
Example:

```
// works for Labels, TextArea and TextFields

// control is either a textfield or a textview
dim n as NSTextFieldMBS = me.NSTextFieldMBS
dim v as NSTextViewMBS = me.NSTextViewMBS

// get text with attributes
dim a as NSAttributedStringMBS
```

```
if n<>Nil then
a = n.attributedStringValue
elseif v<>nil then
a = v.textStorage
end if

// get style
dim p as NSParagraphStyleMBS

try
p = a.attributeAtIndex(a.NSParagraphStyleAttributeName, 0)
catch ex as NSExceptionMBS
// we have none, so make one
p = new NSParagraphStyleMBS
end try

// modify it
dim m as NSMutableParagraphStyleMBS = p.mutableCopy
m.setLineSpacing 5

// add back to styled text
dim s as NSMutableAttributedStringMBS = a.mutableCopy
s.addAttribute(a.NSParagraphStyleAttributeName, m, new NSRangeMBS(0, s.length))

// and apply to control
if n<>Nil then
n.attributedStringValue = s
elseif v<>nil then
v.textStorage.setAttributedString s
end if
```

Notes: This value must be nonnegative.

31.44.17 setMaximumLineHeight(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the maximum height that any line in the paragraph style will occupy, regardless of the font size or size of any attached graphic, to value.
Notes:

Glyphs and graphics exceeding this height will overlap neighboring lines; however, a maximum height of 0 implies no line height limit. This value must be nonnegative.

Although this limit applies to the line itself, line spacing adds extra space between adjacent lines.

31.44.18 setMinimumLineHeight(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the minimum height that any line in the paragraph style will occupy, regardless of the font size or size of any attached graphic, to value.
Notes: This value must be nonnegative.

31.44.19 setParagraphSpacing(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the space added at the end of the paragraph to separate it from the following paragraph to value.
Notes: This value must be nonnegative.

31.44.20 setParagraphSpacingBefore(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the distance between the paragraph's top and the beginning of its text content.
Notes: This value must be nonnegative.

31.44.21 setParagraphStyle(ParagraphStyle as NSParagraphStyleMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the subattributes of the receiver with those in ParagraphStyle.

31.44.22 setTabStops(tabStops() as NSTextTabMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the tab stops in the receiver with tabStops.

31.44.23 setTailIndent(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the distance in points from the margin of a text container to the end of lines to value.
Notes:

If positive, this is the distance from the leading margin (for example, the left margin in left-to-right text). That is, it's the absolute line width. If 0 or negative, it's the distance from the trailing margin—the value is added to the line width.

For example, to create a paragraph style that fits exactly in a 2-inch wide container, set its head indent to 0.0 and its tail indent to 0.0. To create a paragraph style with quarter-inch margins, set its head indent to 0.25 and its tail indent to –0.25.

31.44.24 setTextLists(TextLists() as NSTextListMBS)

MBS MacCocoa Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the text lists containing the paragraph.

31.44.25 setTighteningFactorForTruncation(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies the threshold for using tightening as an alternative to truncation.
Notes: When the line break mode specifies truncation, the text system attempts to tighten intercharacter spacing as an alternative to truncation, provided that the ratio of the text width to the line fragment width does not exceed 1.0 + the value returned by tighteningFactorForTruncation. Otherwise the text is truncated at a location determined by the line break mode. The default value is 0.05. This method accepts positive and negative values. Values less than or equal to 0.0 result in not tightening.

31.45 class NSMutableURLRequestMBS

31.45.1 class NSMutableURLRequestMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class for a mutable URL Request.
Notes:

NSMutableURLRequest is a subclass of NSURLRequest provided to aid developers who may find it more convenient to mutate a single request object for a series of URL load requests instead of creating an immutable NSURLRequest for each load.

This programming model is supported by the following contract between NSMutableURLRequest and NSURLConnection: NSURLConnection makes a deep copy of each NSMutableURLRequest object passed to one of its initializers.
Subclass of the NSURLRequestMBS class.

31.45.4 Methods

31.45.5 addValue(value as string, field as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds an HTTP header to the receiver's HTTP header dictionary.
Example:

```
dim m as new NSMutableURLRequestMBS("http://test.test")

m.addValue "Hello", "test"
m.addValue "World", "test"

MsgBox m.valueForHTTPHeaderField("test")
```

Notes:

value: The value for the header field.
field: The name of the header field. In keeping with the HTTP RFC, HTTP header field names are case-insensitive

This method provides the ability to add values to header fields incrementally. If a value was previously set for the specified field, the supplied value is appended to the existing value using the appropriate field delimiter. In the case of HTTP, this is a comma.

31.45.6 Constructor(url as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSURLRequest with the given URL.
Example:

```
dim m as new NSMutableURLRequestMBS("http://test.test")

MsgBox m.URL
```

Notes:

Default values are used for cache policy (NSURLRequestUseProtocolCachePolicy) and timeout interval (60 seconds).
On success, handle property is not zero.
See also:

- 31.45.7 Constructor(url as string, cachePolicy as Integer, timeoutInterval as Double) 6241

31.45.7 Constructor(url as string, cachePolicy as Integer, timeoutInterval as Double)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSURLRequest with the given URL.
See also:

- 31.45.6 Constructor(url as string) 6241

31.45.8 setAllHTTPHeaderFields(headerFields as Dictionary)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the receiver's header fields with the passed values.
Notes: headerFields: A dictionary with the new header fields. HTTP header fields must be string values; therefore, each object and key in the headerFields dictionary must be a String. If either the key or value for a key-value pair is not a string, the key-value pair is skipped.

31.45.9 setCachePolicy(policy as Integer)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the cache policy of the receiver.
Notes:

policy: The new cache policy.

Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

These constants are used to specify interaction with the cached responses.
NSURLRequestUseProtocolCachePolicy = 0,
NSURLRequestReloadIgnoringLocalCacheData = 1,
NSURLRequestReloadIgnoringLocalAndRemoteCacheData = 4,
NSURLRequestReturnCacheDataElseLoad = 2,
NSURLRequestReturnCacheDataDontLoad = 3,
NSURLRequestReloadRevalidatingCacheData = 5

31.45.10 setHTTPBody(data as MemoryBlock)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the request body of the receiver to the specified data.
Notes: data: The new request body for the receiver. This is sent as the message body of the request, as in an HTTP POST request.

31.45.11 setHTTPMethod(HTTPMethod as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the receiver's HTTP request method.
Example:

```
dim m as new NSMutableURLRequestMBS("http://test.test")
m.setHTTPMethod "PUT"
MsgBox m.HTTPMethod
```

Notes: HTTPMethod: The new HTTP request method. The default HTTP method is "GET".

31.45.12 setHTTPShouldHandleCookies(should as boolean)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets whether the receiver should use the default cookie handling for the request.
Example:

```
dim r as NSURLRequestMBS = NSURLRequestMBS.requestWithURL("http://www.apple.de")
Dim m as NSMutableURLRequestMBS = r.mutableCopy
m.setHTTPShouldHandleCookies(false)
HTMLViewer1.LoadRequest m
```

Notes: handleCookies: True if the receiver should use the default cookie handling for the request, false otherwise. The default is true.

31.45.13 setHTTPShouldUsePipelining(shouldUsePipelining as boolean)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets whether the request should not wait for the previous response before transmitting.
Notes:

True if the receiver should transmit before the previous response is received. False to wait for the previous response before transmitting.

Calling this method with a true value does not guarantee HTTP pipelining behavior. HTTP 1.1 allows the client to send multiple requests to the server without waiting for a response.
Though HTTP 1.1 requires support for pipelining, some servers report themselves as being HTTP 1.1 but do not support pipelining. To maintain compatibility with these servers, requests may have to wait for the previous response before transmitting.

Available on Mac OS X 10.7 or newer.

31.45.14 setMainDocumentURL(url as string)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the main document URL for the receiver.
Example:

```
dim m as new NSMutableURLRequestMBS("http://test.test/test.jpg")
m.setMainDocumentURL "http://test.test/"
MsgBox m.mainDocumentURL
```

Notes:

url: The new main document URL. Can be nil.

The caller should set the main document URL to an appropriate main document, if known. For example, when loading a web page the URL of the HTML document for the top-level frame would be appropriate. This URL will be used for the "only from same domain as main document" cookie accept policy.
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

31.45.15 setNetworkServiceType(networkServiceType as Integer)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the NSURLRequestNetworkServiceType to associate with this request.
Notes:

networkServiceType: The service type to associate with the request.
This method is used to provide the network layers with a hint as to the purpose of the request. Most clients should not need to use this method. See NSURLNetworkServiceType* constants.
Available in Mac OS X 10.7 or newer.

31.45.16 setTimeoutInterval(seconds as Double)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the receiver's timeout interval, in seconds.
Notes:

seconds: The timeout interval, in seconds. If during a connection attempt the request remains idle for longer than the timeout interval, the request is considered to have timed out. The default timeout interval is 60 seconds.

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

31.45.17 setURL(url as string)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the URL of the receiver.
Notes:

Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

31.45.18 setValue(value as string, field as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the specified HTTP header field.
Example:

```
dim m as new NSMutableURLRequestMBS("http://test.test")
m.setValue("just a test", "test")
MsgBox m.valueForHTTPHeaderField("test")
```

Notes:

value: The new value for the header field. Any existing value for the field is replaced by the new value.
field: The name of the header field to set. In keeping with the HTTP RFC, HTTP header field names are case-insensitive.

31.46 class NSOutputStreamMBS

31.46.1 class NSOutputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A stream that provides write-only stream functionality.
Notes: Subclass of the NSStreamMBS class.

31.46.2 Blog Entries

- MBS Xojo Plugins, version 18.2pr2

31.46.3 Methods

31.46.4 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an initialized output stream that will write stream data to memory.
Notes:

Returns an initialized output stream that will write stream data to memory.

The stream must be opened before it can be used.

You retrieve the contents of the memory stream by OutputData property.
See also:

- 31.46.5 Constructor(filePath as string, append as boolean) 6246

31.46.5 Constructor(filePath as string, append as boolean)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an initialized output stream for writing to a specified file.
Notes:

path: The path to the file the output stream will write to.
append: True if newly written data should be appended to any existing file contents, otherwise false.

Returns an initialized output stream that can write to path.

The stream must be opened before it can be used.
See also:

• 31.46.4 Constructor 6246

31.46.6 OutputData as MemoryBlock

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The output of the memory stream.

31.46.7 outputStreamToFileAtPath(filePath as string, append as boolean) as NSOutputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an initialized output stream for writing to a specified file.
Notes:

path: The path to the file the output stream will write to.
append: True if newly written data should be appended to any existing file contents, otherwise false.

Returns an initialized output stream that can write to path.

The stream must be opened before it can be used.

31.46.8 outputStreamToMemory as NSOutputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an initialized output stream that will write stream data to memory.
Notes:

Returns an initialized output stream that will write stream data to memory.

The stream must be opened before it can be used.

You retrieve the contents of the memory stream by OutputData property.

31.46.9 outputStreamWithURL(fileURL as string, append as boolean) as NSOutputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an initialized output stream for writing to a specified URL.
Notes:

fileURL: The URL to the file the output stream will write to.
append: True if newly written data should be appended to any existing file contents, otherwise false.

Returns an initialized output stream that can write to url.

The stream must be opened before it can be used.

31.46.10 write(data as MemoryBlock) as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Writes the contents of a provided data buffer to the receiver.
Notes:

Returns a number indicating the outcome of the operation:
A positive number indicates the number of bytes written.
0 indicates that a fixed-length stream and has reached its capacity.
-1 means that the operation failed; more information about the error can be obtained with streamError.

31.46.11 Properties

31.46.12 hasSpaceAvailable as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A boolean value that indicates whether the receiver can be written to.
Notes:

True if the receiver can be written to or if a write must be attempted in order to determine if space is available, false otherwise.
(Read only property)

31.47 class NSPanelMBS

31.47.1 class NSPanelMBS

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSPanel class implements a special kind of window (known as a panel), typically performing an auxiliary function.
Example:

```
static n as NSPanelMBS

dim style as Integer = NSPanelMBS.NSClosableWindowMask + NSPanelMBS.NSTitledWindowMask +
NSPanelMBS.NSUtilityWindowMask + NSPanelMBS.NSHUDWindowMask + NSPanelMBS.NSResizableWin-
dowMask

n = new NSPanelMBS(100,100,200,200, style, NSPanelMBS.NSWindowBackingLocationDefault, false)

n.Title = "Hello World"
n.Show
```

Notes: Subclass of the NSWindowMBS class.

31.47.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr8
- HUD Windows in REALbasic

31.47.3 Methods

31.47.4 Constructor(x as Double, y as Double, w as Double, h as Double, styleMask as Integer, BackingStoreType as Integer, deferCreation as boolean)

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor to create a new Cocoa Windows.
Example:

```
static n as NSPanelMBS

dim style as Integer = NSPanelMBS.NSClosableWindowMask + NSPanelMBS.NSTitledWindowMask +
NSPanelMBS.NSUtilityWindowMask + NSPanelMBS.NSHUDWindowMask + NSPanelMBS.NSResizableWin-
dowMask
```

```
n = new NSPanelMBS(100,100,200,200, style, NSPanelMBS.NSWindowBackingLocationDefault, false)

n.Title = "Hello World"
n.Show
```

Notes:

x,y,w,h:
Location and size of the window's content area in screen coordinates. Note that the window server limits window position coordinates to ±16,000 and sizes to 10,000.

styleMask:
The window's style. Either it can be NSBorderlessWindowMask, or it can contain any of the options described in the constants, combined using the bitwiseOR function. Borderless windows display none of the usual peripheral elements and are generally useful only for display or caching purposes; you should normally not need to create them. Also, note that a window's style mask should include NSTitledWindowMask if it includes any of the others.

bufferingType:
Specifies how the drawing done in the window is buffered by the window device, and possible values are described in "Constants."

deferCreation:
Specifies whether the window server creates a window device for the window immediately. When true, the window server defers creating the window device until the window is moved onscreen. All display messages sent to the window or its views are postponed until the window is created, just before it's moved onscreen.

Initialized NSWindow object.

This method is the designated initializer for the NSWindow class.

Deferring the creation of the window improves launch time and minimizes the virtual memory load on the window server.

The new window creates a view to be its default content view. You can replace it with your own object by using the ContentView property.

31.47.5 RunAlertPanel(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Runs an alert panel.

31.47.6 RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Run an alert panel.
See also:

- 31.47.7 RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer 6251

31.47.7 RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Run an alert panel.
See also:

- 31.47.6 RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer 6251

31.47.8 RunCriticalAlertPanel(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Runs a critical alert panel.

31.47.9 RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Runs a critical alert panel.

See also:

- 31.47.10 RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer 6252

31.47.10 RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Runs a critical alert panel.
See also:

- 31.47.9 RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer 6251

31.47.11 RunInformationalAlertPanel(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Run an informational alert panel.

31.47.12 RunInformationalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Run an informational alert panel.
See also:

- 31.47.13 RunInformationalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer 6252

31.47.13 RunInformationalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Run an informational alert panel.

See also:

- 31.47.12 RunInformationalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer 6252

31.47.14 Properties

31.47.15 becomesKeyOnlyIfNeeded as boolean

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** whether the panel becomes the key window only when needed.
Notes:

By default, this attribute is set to false, indicating that the panel becomes key as other windows do.
(Read and Write computed property)

31.47.16 isFloatingPanel as boolean

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the panel is a floating panel.
Notes:

True when the receiver is a floating panel, false otherwise.

By default, panels do not float above other windows. It's appropriate for an panel to float above other windows only if all of the following conditions are true:

- It is small enough not to obscure whatever is behind it.
- It is oriented more to the mouse than to the keyboard—that is, if it doesn't become the key window or becomes so only when needed.
- It needs to remain visible while the user works in the application's normal windows—for example, if the user must frequently move the cursor back and forth between a normal window and the panel (such as a tool palette), or if the panel gives information relevant to the user's actions in a normal window.
- It hides when the application is deactivated (the default behavior for panels).

(Read and Write computed property)

31.47.17 worksWhenModal as boolean

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver receives keyboard and mouse events even when some other window is being run modally. **Notes:**

True when the receiver receives keyboard and mouse events even when some other window is being run modally, false otherwise.

By default, this attribute is set to false, indicating a panel's ineligibility for events during a modal loop or session.
(Read and Write computed property)

31.47.18 Constants

31.47.19 NSAlertAlternateReturn=0

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the possible return values for the alert panels. **Notes:** The user pressed the alternate button.

31.47.20 NSAlertDefaultReturn=1

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the possible return values for the alert panels. **Notes:** The user pressed the default button.

31.47.21 NSAlertErrorReturn=-2

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the possible return values for the alert panels. **Notes:** The alert cannot identify the reason it was closed; it may have been closed by an external source or by a button other than those listed above.

31.47.22 NSAlertOtherReturn=-1

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the possible return values for the alert panels. **Notes:** The user pressed a second alternate button.

31.47.23 NSCancelButton=0

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the modal panel return values.
Notes: The Cancel button.

31.47.24 NSDocModalWindowMask=64

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.
Notes: The panel is created as a modal sheet.

31.47.25 NSHUDWindowMask=8192

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.

31.47.26 NSNonactivatingPanelMask=128

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.
Notes: The panel can receive keyboard input without activating the owning application.

31.47.27 NSOKButton=1

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the modal panel return values.
Notes: The OK button.

31.47.28 NSUtilityWindowMask=16

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.
Notes: The panel is created as a floating window.

31.48 class NSParagraphStyleMBS

31.48.1 class NSParagraphStyleMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSParagraphStyle and its subclass NSMutableParagraphStyle encapsulate the paragraph or ruler attributes used by the NSAttributedString classes.
Example:

```
dim n as NSParagraphStyleMBS = NSParagraphStyleMBS.defaultParagraphStyle
MsgBox str(n.alignment) // 4 = natural
```

Notes:

Instances of these classes are often referred to as paragraph style objects or, when no confusion will result, paragraph styles.
The mutable subclass of NSParagraphStyle is NSMutableParagraphStyle.

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

31.48.5 copy as NSParagraphStyleMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the paragraph style.

31.48.6 defaultParagraphStyle as NSParagraphStyleMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default paragraph style.
Example:

```
dim n as NSParagraphStyleMBS = NSParagraphStyleMBS.defaultParagraphStyle
MsgBox str(n.alignment) // 4 = natural
```

Notes:

The default paragraph style has the following default values:

Subattribute	Default Value
Alignment	NSNaturalTextAlignment
Tab stops	12 left-aligned tabs, spaced by 28.0 points
Line break mode	NSLineBreakByWordWrapping
All others	0.0

31.48.7 defaultWritingDirectionForLanguage(languageName as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default writing direction for the specified language.
Notes: languageName: The language specified in ISO language region format. Can be nil to return a default writing direction derived from the user's defaults database.

31.48.8 mutableCopy as NSMutableParagraphStyleMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a mutable copy of the paragraph style.

31.48.9 tabStops as NSTextTabMBS()

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's tab stops.
Notes: The NSTextTab objects, sorted by location, that define the tab stops for the paragraph style.

31.48.10 textLists as NSTextListMBS()

MBS MacCocoa Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array specifying the text lists containing the paragraph.

31.48.11 Properties

31.48.12 alignment as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the text alignment of the receiver.
Example:

```
dim n as NSParagraphStyleMBS = NSParagraphStyleMBS.defaultParagraphStyle
MsgBox str(n.alignment) // 4 = natural

dim m as NSMutableParagraphStyleMBS = n.mutableCopy
m.setAlignment NSParagraphStyleMBS.NSCenterTextAlignment
MsgBox str(m.alignment) // 2 = center
```

Notes:

Natural text alignment is realized as left or right alignment depending on the line sweep direction of the first script contained in the paragraph.
(Read only property)

31.48.13 baseWritingDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the base writing direction for the receiver.
Notes: (Read only property)

31.48.14 defaultTabInterval as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the document-wide default tab interval.
Notes:

The default tab interval in points. Tabs after the last specified in tabStops are placed at integer multiples of this distance (if positive). Default return value is 0.0.

(Read only property)

31.48.15 firstLineHeadIndent as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the indentation of the first line of the receiver.
Notes:

The distance in points from the leading margin of a text container to the beginning of the paragraph's first line. This value is always nonnegative.
(Read only property)

31.48.16 firstTabStop as NSTextTabMBS

MBS MacCocoa Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The first tab stop entry.
Notes:

For debugging.
(Read only property)

31.48.17 firstTextList as NSTextListMBS

MBS MacCocoa Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The first text list entry.
Notes:

For debugging.
(Read only property)

31.48.18 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

31.48.19 headerLevel as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Specifies whether the paragraph is to be treated as a header for purposes of HTML generation.
Notes:

Returns 0 (the default value), if the paragraph is not a header, or from 1 through 6 if the paragraph is to be treated as a header.
(Read only property)

31.48.20 headIndent as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the indentation of the receiver's lines other than the first.
Notes:

The distance in points from the leading margin of a text container to the beginning of lines other than the first. This value is always nonnegative.
(Read only property)

31.48.21 hyphenationFactor as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the paragraph's threshold for hyphenation.
Notes:

A value between 0.0 and 1.0 inclusive. The default value is 0.0.

Hyphenation is attempted when the ratio of the text width (as broken without hyphenation) to the width of the line fragment is less than the hyphenation factor. When the paragraph's hyphenation factor is 0.0, the layout manager's hyphenation factor is used instead. When both are 0.0, hyphenation is disabled.
(Read only property)

31.48.22 lineBreakMode as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the mode that should be used to break lines in the receiver.
Notes:

The line break mode to be used laying out the paragraph's text.
(Read only property)

31.48.23 lineHeightMultiple as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the line height multiple.
Notes:

The line height multiple. The natural line height of the receiver is multiplied by this factor (if positive) before being constrained by minimum and maximum line height. Default return value is 0.0.
(Read only property)

31.48.24 lineSpacing as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the space between lines in the receiver (commonly known as leading).
Notes:

The space in points added between lines within the paragraph. This value is always nonnegative.
(Read only property)

31.48.25 maximumLineHeight as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the receiver's maximum line height.
Notes:

The maximum height in points that any line in the receiver will occupy, regardless of the font size or size of any attached graphic. This value is always nonnegative. The default value is 0.

Glyphs and graphics exceeding this height will overlap neighboring lines; however, a maximum height of 0 implies no line height limit. Although this limit applies to the line itself, line spacing adds extra space between adjacent lines.
(Read only property)

31.48.26 minimumLineHeight as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the receiver's minimum height.
Notes:

The minimum height in points that any line in the receiver will occupy, regardless of the font size or size of any attached graphic. This value is always nonnegative.
(Read only property)

31.48.27 paragraphSpacing as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the space after the end of the paragraph.
Notes:

The space in points added at the end of the paragraph to separate it from the following paragraph. This value is always nonnegative.

This value is determined by adding the previous paragraph's paragraphSpacing and the current paragraph's paragraphSpacingBefore.
(Read only property)

31.48.28 paragraphSpacingBefore as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the distance between the paragraph's top and the beginning of its text content.
Notes:

The distance in points between the paragraph's top and the beginning of its text content. Default return value is 0.0.
(Read only property)

31.48.29 tailIndent as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the trailing indentation of the receiver.
Notes:

The distance in points from the margin of a text container to the end of lines.

If positive, this value is the distance from the leading margin (for example, the left margin in left-to-right text). If 0 or negative, it's the distance from the trailing margin.

For example, a paragraph style designed to fit exactly in a 2-inch wide container has a head indent of 0.0 and a tail indent of 0.0. One designed to fit with a quarter-inch margin has a head indent of 0.25 and a tail indent of –0.25.
(Read only property)

31.48.30 tighteningFactorForTruncation as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the threshold for using tightening as an alternative to truncation.
Notes:

The tightening threshold value. The default value is 0.05.

When the line break mode specifies truncation, the text system attempts to tighten intercharacter spacing as an alternative to truncation, provided that the ratio of the text width to the line fragment width does not exceed 1.0 + the tightening factor returned by this method. Otherwise the text is truncated at a location determined by the line break mode.
(Read only property)

31.48.31 Constants

31.48.32 NSCenterTextAlignment=2

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the text alignment constants for the alignment property.
Notes: Visually centered

31.48.33 NSJustifiedTextAlignment=3

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the text alignment constants for the alignment property.
Notes: Fully-justified. The last line in a paragraph is natural-aligned.

31.48.34 NSLeftTextAlignment=0

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the text alignment constants for the alignment property.
Notes: Visually left aligned

31.48.35 NSLineBreakByCharWrapping = 1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify what happens when a line is too long for its container.

Notes: Wrapping occurs before the first character that doesn't fit.

31.48.36 NSLineBreakByClipping = 2

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify what happens when a line is too long for its container.
Notes: Lines are simply not drawn past the edge of the text container.

31.48.37 NSLineBreakByTruncatingHead = 3

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify what happens when a line is too long for its container.
Notes: Each line is displayed so that the end fits in the container and the missing text is indicated by some kind of ellipsis glyph.

31.48.38 NSLineBreakByTruncatingMiddle = 5

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify what happens when a line is too long for its container.
Notes: Each line is displayed so that the beginning and end fit in the container and the missing text is indicated by some kind of ellipsis glyph in the middle.

31.48.39 NSLineBreakByTruncatingTail = 4

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify what happens when a line is too long for its container.
Notes: Each line is displayed so that the beginning fits in the container and the missing text is indicated by some kind of ellipsis glyph.

31.48.40 NSLineBreakByWordWrapping = 0

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify what happens when a line is too long for its container.
Notes: Wrapping occurs at word boundaries, unless the word itself doesn't fit on a single line.

31.48.41 NSNaturalTextAlignment=4

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the text alignment constants for the alignment property.
Notes: Indicates the default alignment for script.

31.48.42 NSRightTextAlignment=1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the text alignment constants for the alignment property.
Notes: Visually right aligned

31.48.43 NSWritingDirectionLeftToRight=0

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify the writing directions.
Notes:

The writing direction is left to right.

Available in Mac OS X v10.2 and later.

31.48.44 NSWritingDirectionNatural=-1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify the writing directions.
Notes:

The writing direction is determined using the Unicode Bidi Algorithm rules P2 and P3. Default.

Available in Mac OS X v10.4 and later.

31.48.45 NSWritingDirectionRightToLeft=1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the constants to specify the writing directions.
Notes:

The writing direction is right to left.

Available in Mac OS X v10.2 and later.

31.49 class NSPointMBS

31.49.1 class NSPointMBS

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Xojo class for the point structure in Cocoa.
Example:

```
dim n as NSPointMBS = NSMakePointMBS(500,600)
MsgBox n.String
```

31.49.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.1pr1

31.49.3 Methods

31.49.4 Constructor

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an empty point.
Example:

```
dim p as new NSPointMBS
MsgBox p // shows { 0 ,0 }
```

See also:

- 31.49.5 Constructor(p as Ptr) 6267
- 31.49.6 Constructor(s as string) 6268
- 31.49.7 Constructor(x as Double, y as Double) 6268

31.49.5 Constructor(p as Ptr)

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new instance using data at the pointer.
Notes: Make sure the pointer is valid and has the right data and size.
See also:

- 31.49.4 Constructor 6267

- 31.49.6 Constructor(s as string) 6268
- 31.49.7 Constructor(x as Double, y as Double) 6268

31.49.6 Constructor(s as string)

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSPoint object using the given string.
Example:

```
dim p as new NSPointMBS(" { 3,4 } ")
MsgBox p // shows { 3 ,4 }
```

See also:

- 31.49.4 Constructor 6267
- 31.49.5 Constructor(p as Ptr) 6267
- 31.49.7 Constructor(x as Double, y as Double) 6268

31.49.7 Constructor(x as Double, y as Double)

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSPoint object using the given values.
See also:

- 31.49.4 Constructor 6267
- 31.49.5 Constructor(p as Ptr) 6267
- 31.49.6 Constructor(s as string) 6268

31.49.8 Equal(other as NSPointMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether two points are equal.

31.49.9 Operator_Convert as String

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the object to string.
Example:

```
dim p as new NSPointMBS(1,2)

MsgBox p // shows { 1 ,2 }
```

31.49.10 String as String

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the string representation of this point.
Example:

```
dim p as new NSPointMBS(1,2)

MsgBox p.String // shows { 1,2 }
```

31.49.11 Zero as NSPointMBS

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a point with all values being zero.

31.49.12 Properties

31.49.13 Handle as Ptr

MBS Main Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The pointer to the internal data structure.
Notes:

May be useful for passing to declares requiring a NSPoint*.
Size of structure is 8 bytes for 32-bit (two singles) and 16 bytes for 64-bit (two doubles).
(Read only property)

31.49.14 X as Double

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The horizontal coordinate.
Notes: (Read and Write property)

31.49.15 Y as Double

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The vertical coordinate.
Notes: (Read and Write property)

31.50 class NSPopoverMBS

31.50.1 class NSPopoverMBS

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The Xojo class for a pop-over.
Notes:

A popover is a unit of content that is positioned relative to some other content on the screen. An anchor is used to express the relation between these two units of content. Each popover has an appearance that specifies its visual characteristics, as well as a behavior that determines which user interactions will cause the popover to close. A transient popover is closed in response to most user interactions, whereas a semi-transient popovers is closed when the user interacts with the window containing the popover's positioning view. Popovers with application-defined behavior are not usually closed on the developer's behalf. AppKit automatically positions each popover relative to its positioning view and moves the popover whenever its positioning view moves. A positioning rectangle within the positioning view can be specified for additional granularity. Popovers can be detached to become a separate window when they are dragged by implementing the appropriate delegate method.

Please also check the documentation from Apple for the NSPopover class.
Available in Mac OS X v10.7 and later.

31.50.2 Blog Entries

- Lion features for Real Studio

31.50.3 Methods

31.50.4 available as boolean

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether pop-overs are available.
Example:

```
msgbox "NSPopover available: "+str(NSPopoverMBS.available)
```

Notes: Returns true on Mac OS X 10.7.

31.50.5 Close

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Forces the popover to close without calling events.
Notes: Any popovers nested within the popovers will also receive a close message. When a window is closed in response to the close message being sent, all of its popovers will be closed. The popover will animate out when closed (unless the animates property is set to false).

31.50.6 Constructor

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new popover.

31.50.7 Destructor

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The destructor.

31.50.8 isShown as boolean

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether popover is visible.
Notes: True if the popover is being shown, false otherwise. The popover is considered to be shown from the point when showRelativeToRect is invoked until the popover is closed in response to an invocation of either close or performClose.

31.50.9 NSPopoverCloseReasonDetachToWindow as string

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the constant for the close reason.
Notes: Specifies that the popover has been closed because it is being detached to a window; a possible value for NSPopoverCloseReasonKey.

31.50.10 NSPopoverCloseReasonKey as string

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the constants for the close notification parameter dictionary.

Notes: Specifies the close reason. Currently used only as the userInfo key for the NSPopoverWillCloseNotification.

31.50.11 NSPopoverCloseReasonStandard as string

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the constant for the close reason.
Notes: Specifies that the popover is being closed in a standard way; a possible value for NSPopoverCloseReasonKey.

31.50.12 NSPopoverDidCloseNotification as string

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names you can use with NSNotificationObserverMBS class.
Notes: Sent after the popover has finished animating offscreen. This notification has the same user info keys as NSPopoverWillCloseNotification.

31.50.13 NSPopoverDidShowNotification as string

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names you can use with NSNotificationObserverMBS class.
Notes: Sent after the popover has finished animating onscreen.

31.50.14 NSPopoverWillCloseNotification as string

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names you can use with NSNotificationObserverMBS class.
Notes: Sent before the popover is closed. The userInfo key NSPopoverCloseReasonKey specifies the reason for closing. It can currently be either NSPopoverCloseReasonStandard or NSPopoverCloseReasonDetachToWindow, although more reasons for closing may be added in the future.

31.50.15 NSPopoverWillShowNotification as string

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names you can use with NSNotificationObserverMBS class.
Notes: Sent before the popover is shown.

31.50.16 performClose

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Attempts to close the popover.
Notes: The popover will not be closed if popoverShouldClose event returns false. The operation will fail if it is displaying a nested popover, or if it has a child window. A window will attempt to close its popovers when it receives a performClose message. The popover will animate out when closed (unless the animates property is set to false).

31.50.17 showRelativeToRect(positioningRect as NSRectMBS, view as NSViewMBS, edge as Integer)

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Shows the popover positioned relative to positioningRect of positioningView (see the description of positioningRect).
Notes: The common case is to pass positioningView.bounds for positioningRect, in which case the popover will be placed adjacent to the positioningView and there is no need to update positioningRect (AppKit will detect the the bounds of the positioning view was specified and automatically update the positioningView). preferredEdge is a hint to AppKit about the desired placement of the anchor of the popover towards the positioningRect, and is with respect to the isFlipped state of the positioningView. Also, if positioningRect is an empty rect, the view.bounds will automatically be used. The current (but not guaranteed) behavior is that AppKit will place the anchor towards the preferredEdge of the positioningRect unless such a placement would cause the popover not to fit on the screen of positioningView. If the anchor cannot be placed towards the preferredEdge, AppKit will (in the current implementation) attempt to place the anchor on the opposite side of the positioningRect. If that cannot be done, AppKit will attempt to place the anchor on a remaining sides of the popover, and failing that will center the popover on the screen, causing it to (at least temporarily) lose its anchor. The popover will animate onscreen and eventually animate offscreen when it is closed (unless the property animates is set to false). This method will throw a NSInvalidArgumentException if view is nil or if view is not in a window, or if the popover's behavior is NSPopoverBehaviorSemitransient and the popover's positioningView is in a popover or child window. It will throw a NSInternalInconsistencyException if the popover's content view controller (or the view controller's view) is nil. If the popover is already being shown, this method will update to be associated with the new view and positioningRect passed. If the positioning view is not visible, this method does nothing.

31.50.18 Properties

31.50.19 Handle as Integer

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal reference to the NSPopover object.
Notes: (Read and Write property)

31.50.20 Tag as Variant

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The tag.
Notes:

You can use this property for whatever you like.
e.g. to keep the reference to the NSViewControllerMBS object.
(Read and Write property)

31.50.21 animates as boolean

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Should the popover be animated when it shows, closes, or appears to transition to a detachable window.
Notes:

This property also controls whether the popover animates when the content view or content size changes. AppKit does not guarantee which behaviors will be animated or that this property will be respected; it is regarded as a hint. The default value is true.
(Read and Write computed property)

31.50.22 appearance as Integer

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The appearance of the popover.
Notes:

The default appearance is NSPopoverAppearanceMinimal. See the declaration of NSPopoverAppearance* constants for more information about appearances.
(Read and Write computed property)

31.50.23 behavior as Integer

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The behavior of the popover.
Notes:

The default behavior is NSPopoverBehaviorApplicationDefined. See the declaration of NSPopoverBehavior* constants for more information about popover behaviors.
(Read and Write computed property)

31.50.24 contentSize as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The content size of the popover.
Notes:

The popover's content size is set to match the size of the content view when the content view controller is set. Changes to the content size of the popover will animate while the popover is shown (provided animates is true).
(Read and Write computed property)

31.50.25 contentViewController as NSViewControllerMBS

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The view controller that manages the content of the popover.
Notes:

Please use with NSViewControllerMBS class.
The default value is nil. You must set the content view controller of the popover to a non-nil value before the popover is shown. Changes to the popover's content view controller while the popover is shown will animate (provided animates is true).
(Read and Write computed property)

31.50.26 positioningRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The positioning rectangle.
Notes:

Popovers are positioned relative to a positioning view and are automatically moved when the location or size of the positioning view changes. Sometimes it is desirable to position popovers relative to a rectangle within the positioning view. In this case, you must update the positioningRect binding whenever this rectangle changes, or use the positioningRect binding so AppKit can re-position the popover when appropriate.
(Read and Write computed property)

31.50.27 Events

31.50.28 detachableWindowForPopover as NSWindowMBS

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Detaches the popover creating a window containing the content.
Notes:

You return a window instance to which the popover should be detached.

You should not remove the popover's content view as part of your implementation of this method.

The popover and the detachable window may be shown at the same time and therefore cannot share a content view (or a content view controller).

If the popover and the detachable window should have the same content, you should define the content with a separate view and use a view controller to instantiate separate copies of the content for the popover and the detachable window.

The popover will animate to appear as though it morphs into the detachable window (unless the popover animates property is set to false. The exact animation used is not guaranteed.

If you do not implement this event or it returns nil, the default behavior is that the popup is not detached.

31.50.29 popoverDidClose(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the popover did close.
Notes: Invoked on the delegate when the NSPopoverDidCloseNotification notification is sent.

31.50.30 popoverDidShow(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the popover has been shown.
Notes: Invoked on the delegate when the NSPopoverDidShowNotification notification is sent.

31.50.31 popoverShouldClose as boolean

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows a delegate to override a close request.
Notes:

Return true if the popover should close, false otherwise.

The popover invokes this method on its delegate whenever it is about to close. This gives you a chance to override the close.

If you do not implement this method the default behavior is that the popover will close.

31.50.32 popoverWillClose(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the popover is about to close.
Notes: Invoked on the delegate when the NSPopoverWillCloseNotification notification is sent.

31.50.33 popoverWillShow(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the popover will show.
Notes: Invoked on the delegate when the NSPopoverWillShowNotification notification is sent.

31.50.34 Constants

31.50.35 MaxXEdge = 2

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the edge constants.
Notes: right

31.50.36 MaxYEdge = 3

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the edge constants.
Notes:

top
(Cocoa coordinates have 0 on bottom of screen)

31.50.37 MinXEdge = 0

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the edge constants.
Notes: left

31.50.38 MinYEdge = 1

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the edge constants.
Notes:

bottom
(Cocoa coordinates have 0 on bottom of screen)

31.50.39 NSPopoverAppearanceHUD = 1

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the appearance mode constants.
Notes: The popover will draw with a HUD appearance.

31.50.40 NSPopoverAppearanceMinimal = 0

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the appearance mode constants.
Notes: The popover will use a minimal appearance, currently a solid color border and a solid color fill (although this may change in the future). This is the default appearance.

31.50.41 NSPopoverBehaviorApplicationDefined = 0

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the behavior modes.
Notes: Your application assumes responsibility for closing the popover. AppKit will still close the popover in a limited number of circumstances. For instance, AppKit will attempt to close the popover when the window of its positioningView is closed. The exact interactions in which AppKit will close the popover are not guaranteed. You may consider implementing -cancel: to close the popover when the escape key is pressed.

31.50.42 NSPopoverBehaviorSemitransient = 2

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the behavior modes.
Notes: AppKit will close the popover when the user interacts with user interface elements in the window containing the popover's positioning view. Semi-transient popovers cannot be shown relative to views in other popovers, nor can they be shown relative to views in child windows. The exact interactions that cause semi-transient popovers to close are not specified.

31.50.43 NSPopoverBehaviorTransient = 1

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the behavior modes.
Notes: AppKit will close the popover when the user interacts with a user interface element outside the popover. Note that interacting with menus or panels that become key only when needed will not cause a transient popover to close. The exact interactions that will cause transient popovers to close are not specified.

31.51 class NSRangeMBS

31.51.1 class NSRangeMBS

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This is the Cocoa class for a Range.

31.51.4 Methods

31.51.5 Constructor

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an empty range.
Example:

```
dim r as new NSRangeMBS
MsgBox r // { 0, 0 }
```

See also:

- 31.51.6 Constructor(Location as UInt32, Length as UInt32) 6282
- 31.51.7 Constructor(p as Ptr) 6282
- 31.51.8 Constructor(s as string) 6282

31.51.6 Constructor(Location as UInt32, Length as UInt32)

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new range with the given values.
See also:

- 31.51.5 Constructor 6281
- 31.51.7 Constructor(p as Ptr) 6282
- 31.51.8 Constructor(s as string) 6282

31.51.7 Constructor(p as Ptr)

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new instance using data at the pointer.
Notes: Make sure the pointer is valid and has the right data and size.
See also:

- 31.51.5 Constructor 6281
- 31.51.6 Constructor(Location as UInt32, Length as UInt32) 6282
- 31.51.8 Constructor(s as string) 6282

31.51.8 Constructor(s as string)

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSRange object using the given string.
Example:

```
dim r as new NSRangeMBS(" { 3, 4 } ")
MsgBox r // { 3, 4 }
```

See also:

- 31.51.5 Constructor 6281

31.51.9 Equal(other as NSRangeMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether two ranges are equal.

31.51.10 Intersection(other as NSRangeMBS) as NSRangeMBS

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the intersection of the two ranges.

31.51.11 LocationInRange(location as UInt32) as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the location is in the range.

31.51.12 Operator_Convert as String

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the object to string.
Example:

```
dim r as new NSRangeMBS(" { 3, 4 } ")
MsgBox r // { 3, 4 }
```

31.51.13 String as String

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the string representation of this range.
Example:

```
dim r as new NSRangeMBS(" { 3, 4 } ")
MsgBox r.String // { 3, 4 }
```

31.51.14 Union(other as NSRangeMBS) as NSRangeMBS

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates the union of two ranges.

31.51.15 Properties

31.51.16 Handle as Ptr

MBS Main Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The pointer to the internal data structure.
Notes:

May be useful for passing to declares requiring a NSRange*.
(Read only property)

31.51.17 Length as UInt32

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The length of the range.
Example:

```
dim r as new NSRangeMBS(" { 3, 4 } ")
MsgBox str(R.Length) // 4
```

Notes: (Read and Write property)

31.51.18 Location as UInt32

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The position of the range.
Notes: (Read and Write property)

31.51.19 MaxRange as UInt32

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum value of the range.
Notes:

Same as location+length.
(Read only property)

31.52 class NSRectMBS

31.52.1 class NSRectMBS

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Xojo class for the rect structure in Cocoa.
Example:

```
dim n as NSRectMBS = NSMakeRectMBS(100,200,500,600)
MsgBox n.String
```

31.52.2 Blog Entries

31.52.3 Methods

31.52.4 Constructor

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an empty rectangle.
Example:

```
dim p as new NSRectMBS
MsgBox p // shows { { 0 ,0 } , { 0 ,0 } }
```

See also:

- 31.52.5 Constructor(p as Ptr) 6285
- 31.52.6 Constructor(s as string) 6286
- 31.52.7 Constructor(X as Double, Y as Double, W as Double, H as Double) 6286

31.52.5 Constructor(p as Ptr)

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new instance using data at the pointer.

Notes: Make sure the pointer is valid and has the right data and size.
See also:

- 31.52.4 Constructor 6285
- 31.52.6 Constructor(s as string) 6286
- 31.52.7 Constructor(X as Double, Y as Double, W as Double, H as Double) 6286

31.52.6 Constructor(s as string)

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSRect object using the given string.
Example:

```
dim p as new NSRectMBS(" { { 1,2 } , { 3,4 } } ")
MsgBox p // shows { { 1, 2 } , { 3, 4 } }
```

See also:

- 31.52.4 Constructor 6285
- 31.52.5 Constructor(p as Ptr) 6285
- 31.52.7 Constructor(X as Double, Y as Double, W as Double, H as Double) 6286

31.52.7 Constructor(X as Double, Y as Double, W as Double, H as Double)

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSRect object using the given values.
See also:

- 31.52.4 Constructor 6285
- 31.52.5 Constructor(p as Ptr) 6285
- 31.52.6 Constructor(s as string) 6286

31.52.8 Contains(other as NSPointMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the rectangle contains the given point.
See also:

- 31.52.9 Contains(other as NSRectMBS) as boolean 6287

31.52.9 Contains(other as NSRectMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the rectangle contains the given rectangle.
See also:

- 31.52.8 Contains(other as NSPointMBS) as boolean 6286

31.52.10 Equal(other as NSRectMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether two rectangles are equal.

31.52.11 Inset(dx as Double, dy as Double) as NSRectMBS

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Insets the rectangle by the given delta.
Example:

```
dim p as new NSRectMBS(1.1,2.2,3.3,4.4)
dim r as NSRectMBS = p.Inset(2,3)
MsgBox r.String // shows { { 3.1, 5.2 } , { -0.7, -1.6 } }
```

31.52.12 Integral as NSRectMBS

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the integral of the rectangle.
Example:

```
dim p as new NSRectMBS(1.1,2.2,3.3,4.4)
dim r as NSRectMBS = p.Integral
MsgBox r.String // shows { { 1, 2 } , { 4, 5 } }
```

31.52.13 Intersection(other as NSRectMBS) as NSRectMBS

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the intersection of two rectangles.

31.52.14 Intersects(other as NSRectMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the intersection of the rectangle with the other rectangle.

31.52.15 Operator_Convert as String

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the object to string.
Example:

```
dim p as new NSRectMBS(1,2,3,4)
MsgBox p // shows { { 1, 2 } , { 3, 4 } }
```

31.52.16 String as String

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the string representation of this point.
Example:

```
dim p as new NSRectMBS(1,2,3,4)
MsgBox p.String // shows { { 1, 2 } , { 3, 4 } }
```

31.52.17 Union(other as NSRectMBS) as NSRectMBS

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the union of two rectangles.

31.52.18 Zero as NSRectMBS

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a rect with all values being zero.

31.52.19 Properties

31.52.20 Handle as Ptr

MBS Main Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The pointer to the internal data structure.
Notes:

May be useful for passing to declares requiring a NSRect*.
Size of structure is 16 bytes for 32-bit (four singles) and 32 bytes for 64-bit (four doubles).
(Read only property)

31.52.21 Height as Double

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The height of this rectangle.
Notes: (Read and Write property)

31.52.22 IsEmpty as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the rectangle is empty.
Notes: (Read only property)

31.52.23 MaxX as Double

MBS Main Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns maximum x coordinate.
Notes:

return x + width.
(Read only property)

31.52.24 MaxY as Double

MBS Main Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns maximum y coordinate.
Notes:

return y + height.

(Read only property)

31.52.25 MidX as Double

MBS Main Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns center x coordinate.
Notes: (Read only property)

31.52.26 MidY as Double

MBS Main Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns center y coordinate.
Notes: (Read only property)

31.52.27 MinX as Double

MBS Main Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns x coordinate.
Notes: (Read only property)

31.52.28 MinY as Double

MBS Main Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns y coordinate.
Notes: (Read only property)

31.52.29 Origin as NSPointMBS

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The origin of the rectangle.
Notes: (Read and Write property)

31.52.30 Size as NSSizeMBS

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The size of the rectangle.

Notes: (Read and Write property)

31.52.31 Width as Double

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The width of this rectangle.
Notes: (Read and Write property)

31.52.32 X as Double

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The horizontal coordinate.
Notes: (Read and Write property)

31.52.33 Y as Double

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The vertical coordinate.
Notes: (Read and Write property)

31.53 class NSResponderMBS

31.53.1 class NSResponderMBS

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSResponder is an abstract class that forms the basis of event and command processing in the Application Kit.
Notes:

See the Cocoa documentation for more details.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

31.53.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr4
- MBS Real Studio Plugins, version 12.4pr8

31.53.3 Methods

31.53.4 beginGestureWithEvent(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has begun a touch gesture.
Notes:

The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.

31.53.5 cancelOperation

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to cancel the current operation.
Notes:

This method is bound to the Escape and Command-. (period) keys. The key window first searches the view hierarchy for a view whose key equivalent is Escape or Command-., whichever was entered. If none of these views handles the key equivalent, the window sends a default action message of cancelOperation: to the first responder and from there the message travels up the responder chain.

If no responder in the responder chain implements cancelOperation:, the key window searches the view hierarchy for a view whose key equivalent is Escape (note that this may be redundant if the original key equivalent was Escape). If no such responder is found, then a cancel: action message is sent to the first

responder in the responder chain that implements it.

NSResponder declares but does not implement this method.

31.53.6 capitalizeWord

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to capitalize the word or words surrounding the insertion point or selection, expanding the selection if necessary.
Notes: If either end of the selection partially covers a word, that entire word is made lowercase. The sender argument is typically the object that invoked this method. NSResponder declares but doesn't implement this method.

31.53.7 centerSelectionInVisibleArea

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the selection, whatever it is, inside its visible area.
Notes: NSResponder declares but doesn't implement this method.

31.53.8 changeCaseOfLetter

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to change the case of a letter or letters in the selection, perhaps by opening a panel with capitalization options or by cycling through possible case combinations.
Notes: NSResponder declares but doesn't implement this method.

31.53.9 complete

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to complete an operation in progress or a partially constructed element.
Notes: This method can be interpreted, for example, as a request to attempt expansion of a partial word, such as for expanding a glossary shortcut, or to close a graphics item being drawn. NSResponder declares but doesn't implement this method.

31.53.10 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

31.53.11 cursorUpdate(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the mouse cursor has moved into a cursor rectangle.
Notes:

Override this method to set the cursor image. The default implementation uses cursor rectangles, if cursor rectangles are currently valid. If they are not, it calls super to send the message up the responder chain.

If the responder implements this method, but decides not to handle a particular event, it should invoke the superclass implementation of this method.
Available in Mac OS X v10.5 and later.

31.53.12 deleteBackward

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or a single element backward from the insertion point (a letter or character in text, for example).
Notes: NSResponder declares but doesn't implement this method.

31.53.13 deleteBackwardByDecomposingPreviousCharacter

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or a single character backward from the insertion point.
Notes: If the previous character is canonically decomposable, this method should try to delete only the last character in the grapheme cluster (for example, deleting "a"+ "'" results in "a"). NSResponder declares but does not implement this method.

31.53.14 deleteForward

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or a single element forward from the insertion point (a letter or character in text, for example).

Notes: NSResponder declares but doesn't implement this method.

31.53.15 deleteToBeginningOfLine

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the beginning of a line (typically of text).
Notes: Also places the deleted text into the kill buffer. NSResponder declares but doesn't implement this method.

31.53.16 deleteToBeginningOfParagraph

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the beginning of a paragraph of text.
Notes: Also places the deleted text into the kill buffer. NSResponder declares but doesn't implement this method.

31.53.17 deleteToEndOfLine

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the end of a line (typically of text).
Notes: Also places the deleted text into the kill buffer. NSResponder declares but doesn't implement this method.

31.53.18 deleteToEndOfParagraph

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the end of a paragraph of text.
Notes: Also places the deleted text into the kill buffer. NSResponder declares but doesn't implement this method.

31.53.19 deleteToMark

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or all items from the insertion point to a

previously placed mark, including the selection itself if not empty.
Notes: Also places the deleted text into the kill buffer. NSResponder declares but doesn't implement this method.

31.53.20 deleteWordBackward

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or a single word backward from the insertion point.
Notes: NSResponder declares but doesn't implement this method.

31.53.21 deleteWordForward

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to delete the selection, if there is one, or a single word forward from the insertion point.
Notes: NSResponder declares but doesn't implement this method.

31.53.22 endGestureWithEvent(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has ended a touch gesture.
Notes: Available in Mac OS X v10.6 and later.

31.53.23 flagsChanged(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has pressed or released a modifier key (Shift, Control, and so on).
Notes: The default implementation simply passes this message to the next responder.

31.53.24 flushBufferedKeyEvents

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Overridden by subclasses to clear any unprocessed key events.

31.53.25 helpRequested(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Displays context-sensitive help for the receiver if such exists; otherwise passes this message to the next responder.
Notes: NSWindow invokes this method automatically when the user clicks for help—while processing theEvent. Subclasses need not override this method, and application code shouldn't directly invoke it.

31.53.26 indent

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to indent the selection or the insertion point if there is no selection.
Notes: NSResponder declares but doesn't implement this method.

31.53.27 insertBacktab

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to handle a backward tab.
Notes: A field editor might respond to this method by selecting the field before it, while a regular text object either doesn't respond to or ignores such a message. NSResponder declares but doesn't implement this method.

31.53.28 insertContainerBreak

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to insert a container break (typically a page break) at the insertion point or selection, deleting the selection if there is one.
Notes: NSResponder declares but doesn't implement this method. NSTextView implements it to insert an NSFormFeedCharacter character (0x000c).

31.53.29 insertDoubleQuoteIgnoringSubstitution

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to insert a double quote character at the insertion point without interference by automatic quote correction.
Notes:

NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

31.53.30 insertLineBreak

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to insert a line break (as distinguished from a paragraph break) at the insertion point or selection, deleting the selection if there is one.
Notes: NSResponder declares but doesn't implement this method. NSTextView implements it to insert an NSLineSeparatorCharacter character (0x2028).

31.53.31 insertNewline

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to insert a newline character at the insertion point or selection, deleting the selection if there is one, or to end editing if the receiver is a text field or other field editor.
Notes: NSResponder declares but doesn't implement this method.

31.53.32 insertNewlineIgnoringFieldEditor

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to insert a line-break character at the insertion point or selection, deleting the selection if there is one.
Notes: Unlike insertNewline:, this method always inserts a line-break character and doesn't cause the receiver to end editing. NSResponder declares but doesn't implement this method.

31.53.33 insertParagraphSeparator

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to insert a paragraph separator at the insertion point or selection, deleting the selection if there is one.
Notes: NSResponder declares but doesn't implement this method.

31.53.34 insertSingleQuoteIgnoringSubstitution

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to insert a single quote character at the insertion point without interference by automatic quote correction.
Notes:

NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

31.53.35 insertTab

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to insert a tab character at the insertion point or selection, deleting the selection if there is one, or to end editing if the receiver is a text field or other field editor.
Notes: NSResponder declares but doesn't implement this method.

31.53.36 insertTabIgnoringFieldEditor

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to insert a tab character at the insertion point or selection, deleting the selection if there is one.
Notes: Unlike insertTab:, this method always inserts a tab character and doesn't cause the receiver to end editing. NSResponder declares but doesn't implement this method.

31.53.37 keyDown(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has pressed a key.
Notes: The receiver can interpret theEvent itself, or pass it to the system input manager using interpretKeyEvents. The default implementation simply passes this message to the next responder.

31.53.38 keyUp(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has released a key.
Notes: The default implementation simply passes this message to the next responder.

31.53.39 lowercaseWord

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to make lowercase every letter in the word or words surrounding the insertion point or selection, expanding the selection if necessary.
Notes: If either end of the selection partially covers a word, that entire word is made lowercase. NSResponder declares, but doesn't implement this method.

31.53.40 magnifyWithEvent(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has begun a pinch gesture.
Notes:

The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.

31.53.41 makeBaseWritingDirectionLeftToRight

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the paragraph base writing direction to be left to right.
Notes:

Sets the NSAttributedString key NSWritingDirectionAttributeName to NSWritingDirectionLeftToRight.

This action method is intended to be used both as the target of a menu item and for key bindings. The base writing direction methods should be the target of three menu items in a submenu, under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Available in Mac OS X v10.6 and later.

31.53.42 makeBaseWritingDirectionNatural

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the paragraph base writing direction to be natural.
Notes:

Natural directionality is determined from the text in accordance with the Unicode bi-di algorithm. For more information see NSParagraphStyle.

Sets the NSAttributedStringkey NSWritingDirectionAttributeName to NSTextWritingDirectionEmbedding.

This action method is intended to be used both as the target of a menu item and for key bindings. The base writing direction methods should be the target of three menu items in a submenu, under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Available in Mac OS X v10.6 and later.

31.53.43 makeBaseWritingDirectionRightToLeft

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the paragraph base writing direction to be right to left.
Notes:

Sets the NSAttributedString key NSWritingDirectionAttributeName to NSWritingDirectionRightToLeft.

This action method is intended to be used both as the target of a menu item and for key bindings. The base writing direction methods should be the target of three menu items in a submenu, under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Available in Mac OS X v10.6 and later.

31.53.44 makeTextWritingDirectionLeftToRight

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the character level attributed string direction attribute for left to right text.
Notes:

Sets the NSAttributedString NSWritingDirectionAttributeName to NSWritingDirectionLeftToRight.

This action method is intended to be used both as the target of a menu item and for key bindings. The text writing directions should be the target of three similar menu items in a submenu under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Available in Mac OS X v10.6 and later.

31.53.45 makeTextWritingDirectionNatural

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the character-level writing direction attribute.
Notes:

Removes the NSWritingDirectionAttributeName from an NSAttributedString.

This action method is intended to be used both as the target of a menu item and for key bindings. The text writing directions should be the target of three similar menu items in a submenu under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Available in Mac OS X v10.6 and later.

31.53.46 makeTextWritingDirectionRightToLeft

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the character-level writing direction attribute to a single right-to-left embedding.
Notes:

Sets the NSAttributedString key NSWritingDirectionAttributeName to NSWritingDirectionRightToLeft.

This action method is intended to be used both as the target of a menu item and for key bindings. The text writing directions should be the target of three similar menu items in a submenu under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Available in Mac OS X v10.6 and later.

31.53.47 mouseDown(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has pressed the left mouse button.
Notes: The default implementation simply passes this message to the next responder.

31.53.48 mouseDragged(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has moved the mouse with the left button pressed.
Notes: The default implementation simply passes this message to the next responder.

31.53.49 mouseEntered(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the cursor has entered a tracking rectangle.
Notes:

The default implementation simply passes this message to the next responder.
Available in Mac OS X v10.0 and later.

31.53.50 mouseExited(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the cursor has exited a tracking rectangle.
Notes: The default implementation simply passes this message to the next responder.

31.53.51 mouseMoved(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the mouse has moved.
Notes: The default implementation simply passes this message to the next responder.

31.53.52 mouseUp(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has released the left mouse button.
Notes: The default implementation simply passes this message to the next responder.

31.53.53 moveBackward

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one element or character backward.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed at

the beginning of the former selection. NSResponder declares but doesn't implement this method.

31.53.54 moveBackwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce either end of the selection backward by one element or character.
Notes:

If the end being modified is the backward end, this method expands the selection; if the end being modified is the forward end, it reduces the selection. The first moveBackwardAndModifySelection: or moveForwardAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the backward end becoming the mobile one if invoked first. By default, moveLeftAndModifySelection: is bound to the left arrow key.

NSResponder declares but doesn't implement this method.

31.53.55 moveDown

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one element or character down.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed below the beginning of the former selection. NSResponder declares but doesn't implement this method.

31.53.56 moveDownAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce the top or bottom end of the selection downward by one element, character, or line (whichever is appropriate for text direction).
Notes:

If the end being modified is the bottom, this method expands the selection; if the end being modified is the top, it reduces the selection. The first moveDownAndModifySelection: or moveUpAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the bottom end becoming the mobile one if invoked first.

NSResponder declares but doesn't implement this method.

31.53.57 moveForward

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one element or character forward.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed at the end of the former selection. NSResponder declares but doesn't implement this method.

31.53.58 moveForwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce either end of the selection forward by one element or character.
Notes:

If the end being modified is the backward end, this method reduces the selection; if the end being modified is the forward end, it expands the selection. The first moveBackwardAndModifySelection: or moveForwardAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the forward end becoming the mobile one if invoked first. By default, moveRightAndModifySelection: is bound to the right arrow key.

NSResponder declares but doesn't implement this method.

31.53.59 moveLeft

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one element or character to the left.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed at the left end of the former selection. NSResponder declares but doesn't implement this method.

31.53.60 moveLeftAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce either end of the selection to the left (display order) by one element or character.
Notes:

If the end being modified is the left end, this method expands the selection; if the end being modified is the right end, it reduces the selection. The first moveLeftAndModifySelection: or moveRightAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the left end becoming the mobile one if invoked first. By default, this method is bound to the left arrow key.

NSResponder declares but doesn't implement this method.

The essential difference between this method and the corresponding moveBackwardAndModifySelection: is that the latter method moves in logical order, which can differ in bidirectional text, whereas this method moves in display order.

31.53.61 moveParagraphBackwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the beginning of the previous paragraph, expanding or reducing the current selection.
Notes:

If the cursor is already at the beginning of a paragraph, the selection moves backward to the beginning of the previous paragraph.
NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

31.53.62 moveParagraphForwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the beginning of the next paragraph, expanding or reducing the current selection.
Notes:

If the cursor is already at the end of a paragraph, the selection moves forward to the end of the next paragraph.

NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

31.53.63 moveRight

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one element or character to the right.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed at the right end of the former selection. NSResponder declares but doesn't implement this method.

31.53.64 moveRightAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce either end of the selection to the right (display order) by one element or character.
Notes:

If the end being modified is the left end, this method reduces the selection; if the end being modified is the right end, it expands the selection. The first moveLeftAndModifySelection: or moveRightAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the right end becoming the mobile one if invoked first. By default, this method is bound to the right arrow key.

NSResponder declares but doesn't implement this method.

The essential difference between this method and the corresponding moveForwardAndModifySelection: is that the latter method moves in logical order, which can differ in bidirectional text, whereas this method moves in display order.

31.53.65 moveToBeginningOfDocument

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection to the first element of the document or the insertion point to the beginning.
Notes: NSResponder declares but doesn't implement this method.

31.53.66 moveToBeginningOfDocumentAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the beginning of the document, expanding or reducing the current selection.
Notes: Available in Mac OS X v10.6 and later.

31.53.67 moveToBeginningOfLine

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection to the first element of the selected line or the insertion point to the beginning of the line.
Notes: NSResponder declares but doesn't implement this method.

31.53.68 moveToBeginningOfLineAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the beginning of the line, expanding or reducing the current selection.
Notes:

NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

31.53.69 moveToBeginningOfParagraph

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the insertion point to the beginning of the selected paragraph.
Notes: NSResponder declares but doesn't implement this method.

31.53.70 moveToBeginningOfParagraphAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the beginning of the current paragraph, expanding or reducing the current selection.
Notes:

NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

31.53.71 moveToEndOfDocument

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection to the last element of the document or the insertion point to the end.
Notes: NSResponder declares but doesn't implement this method.

31.53.72 moveToEndOfDocumentAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the end of the document, expanding or reducing the current selection.
Notes: Available in Mac OS X v10.6 and later.

31.53.73 moveToEndOfLine

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection to the last element of the selected line or the insertion point to the end of the line.
Notes: NSResponder declares but doesn't implement this method.

31.53.74 moveToEndOfLineAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection to the last element of the selected line or the insertion point to the end of the line.
Notes:

NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.0 and later.

31.53.75 moveToEndOfParagraph

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the insertion point to the end of the selected paragraph.
Notes: NSResponder declares but doesn't implement this method.

31.53.76 moveToEndOfParagraphAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the end of the line, expanding or reducing the current selection.
Notes:

NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

31.53.77 moveToLeftEndOfLine

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the left end of the line.
Notes:

In text, if there is a selection it should be deselected, and the insertion point should be placed at left end of the line. NSResponder declares but doesn't implement this method.

Available in Mac OS X v10.6 and later.

31.53.78 moveToLeftEndOfLineAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the left end of the line, expanding or contracting the selection as required.
Notes: Available in Mac OS X v10.6 and later.

31.53.79 moveToRightEndOfLine

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the right end of the line.
Notes: Available in Mac OS X v10.6 and later.

31.53.80 moveToRightEndOfLineAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point to the right end of the line, expanding or contracting the selection as required.
Notes: Available in Mac OS X v10.6 and later.

31.53.81 moveUp

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one element or character up.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed above the beginning of the former selection. NSResponder declares but doesn't implement this method.

31.53.82 moveUpAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce the top or bottom end of the selection upward by one element, character, or line (whichever is appropriate for text direction).
Notes:

If the end being modified is the bottom, this method reduces the selection; if the end being modified is the top, it expands the selection. The first moveDownAndModifySelection: or moveUpAndModifySelection:

method in a series determines the end being modified by always expanding. Hence, this method results in the top end becoming the mobile one if invoked first.

NSResponder declares but doesn't implement this method.

31.53.83 moveWordBackward

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one word backward.
Notes: If there is a selection it should be deselected, and the insertion point should be placed at the end of the first word preceding the former selection. NSResponder declares but doesn't implement this method.

31.53.84 moveWordBackwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce either end of the selection backward by one whole word.
Notes:

If the end being modified is the backward end, this method expands the selection; if the end being modified is the forward end, it reduces the selection. The first moveWordBackwardAndModifySelection: or moveWordForwardAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the backward end becoming the mobile one if invoked first.

NSResponder declares but doesn't implement this method.

31.53.85 moveWordForward

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one word forward, in logical order.
Notes: If there is a selection it should be deselected, and the insertion point should be placed at the beginning of the first word following the former selection. NSResponder declares but doesn't implement this method.

31.53.86 moveWordForwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce either end of the selection forward by one whole word.
Notes: If the end being modified is the backward end, this method reduces the selection; if the end being modified is the forward end, it expands the selection. The first moveWordBackwardAndModifySelection:

or moveWordForwardAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the forward end becoming the mobile one if invoked first. NSResponder declares but doesn't implement this method.

31.53.87 moveWordLeft

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one word to the left, in display order.
Notes:

If there is a selection it should be deselected, and the insertion point should be placed at the end of the first word to the left of the former selection. NSResponder declares but doesn't implement this method.
