The main difference between this method and the corresponding moveWordBackward: method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

31.53.88 moveWordLeftAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce either end of the selection left by one whole word in display order.
Notes:

If the end being modified is the left end, this method expands the selection; if the end being modified is the right end, it reduces the selection. The first moveWordLeftAndModifySelection: or moveWordRightAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the left end becoming the mobile one if invoked first.

NSResponder declares but doesn't implement this method.

The main difference between this method and the corresponding moveWordBackwardAndModifySelection: method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

31.53.89 moveWordRight

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to move the selection or insertion point one word right.
Notes:

If there is a selection it should be deselected, and the insertion point should be placed at the beginning of the first word to the right of the former selection. NSResponder declares but doesn't implement this method.

The main difference between this method and the corresponding moveWordForward: method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

31.53.90 moveWordRightAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to expand or reduce either end of the selection to the right by one whole word.
Notes:

If the end being modified is the backward end, this method reduces the selection; if the end being modified is the forward end, it expands the selection. The first moveWordBackwardAndModifySelection: or moveWordForwardAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the forward end becoming the mobile one if invoked first. NSResponder declares but doesn't implement this method.

The main difference between this method and the corresponding moveWordForwardAndModifySelection: method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

31.53.91 otherMouseDown(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has pressed a mouse button other than the left or right one.
Notes:

The default implementation simply passes this message to the next responder.
Available in Mac OS X v10.1 and later.

31.53.92 otherMouseDragged(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has moved the mouse with a button other than the left or right button pressed.
Notes:

The default implementation simply passes this message to the next responder.
Available in Mac OS X v10.1 and later.

31.53.93 otherMouseUp(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has released a mouse button other than the left or right button.
Notes: The default implementation simply passes this message to the next responder.

31.53.94 pageDown

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the receiver down (or back) one page in its scroll view, also moving the insertion point to the top of the newly displayed page.
Notes: NSResponder declares but doesn't implement this method.

31.53.95 pageDownAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the receiver down (or back) one page in its scroll view, also moving the insertion point to the top of the newly displayed page. The selection is expanded or contracted as required.
Notes:

NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

31.53.96 pageUp

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the receiver up (or forward) one page in its scroll view, also moving the insertion point to the top of the newly displayed page.
Notes: NSResponder declares but doesn't implement this method.

31.53.97 pageUpAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the receiver up (or forward) one page in its scroll view, also moving the insertion point to the top of the newly displayed page. The selection is expanded or contracted as necessary.
Notes:

NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

31.53.98 performMnemonic(theString as string) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Overridden by subclasses to handle a mnemonic.
Notes: If the character code or codes in theString match the receiver's mnemonic, the receiver should perform the mnemonic and return true. The default implementation does nothing and returns false. Mnemonics are not supported in Mac OS X.

31.53.99 presentError(e as NSErrorMBS) as boolean

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Presents an error alert to the user as an application-modal dialog.
Notes:

e: An object containing information about an error.

The alert displays information found in the NSError object e; this information can include error description, recovery suggestion, failure reason, and button titles (all localized). The method returns true if error recovery succeeded and false otherwise. For error recovery to be attempted, an recovery-attempter object (that is, an object conforming to the NSErrorRecoveryAttempting informal protocol) must be associated with e.

The default implementation of this method sends willPresentError to self. By doing this, NSResponder gives subclasses an opportunity to customize error presentation. It then forwards the message, passing any customized error object, to the next responder; if there is no next responder, it passes the error object to NSApp, which displays a document-modal error alert. When the user dismisses the alert, any recovery attempter associated with the error object is given a chance to recover from the error. See the class description for the precise route up the responder chain (plus document and controller objects) this message might travel.

Available in OS X v10.4 and later.

31.53.100 rightMouseDown(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has pressed the right mouse button.
Notes: The default implementation simply passes this message to the next responder.

31.53.101 rightMouseDragged(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has moved the mouse with the right button pressed.

Notes: The default implementation simply passes this message to the next responder.

31.53.102 rightMouseUp(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has released the right mouse button.
Notes: The default implementation simply passes this message to the next responder.

31.53.103 rotateWithEvent(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has begun a rotation gesture.
Notes:

The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.

31.53.104 scrollLineDown

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the receiver one line down in its scroll view, without changing the selection.
Notes: NSResponder declares but doesn't implement this method.

31.53.105 scrollLineUp

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the receiver one line up in its scroll view, without changing the selection.
Notes: NSResponder declares but doesn't implement this method.

31.53.106 scrollPageDown

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the receiver one page down in its scroll view, without changing the selection.
Notes: NSResponder declares but doesn't implement this method.

31.53.107 scrollPageUp

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the receiver one page up in its scroll view, without changing the selection.
Notes: NSResponder declares but doesn't implement this method.

31.53.108 scrollToBeginningOfDocument

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the receiver to the beginning of the document, without changing the selection.
Notes:

NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

31.53.109 scrollToEndOfDocument

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to scroll the receiver to the end of the document, without changing the selection.
Notes:

NSResponder declares but doesn't implement this method.

Available in Mac OS X v10.6 and later.

31.53.110 scrollWheel(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the mouse's scroll wheel has moved.
Notes:

The default implementation simply passes this message to the next responder.
Available in Mac OS X v10.0 and later.

31.53.111 selectAll

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to select all selectable elements.
Notes: NSResponder declares but doesn't implement this method.

31.53.112 selectLine

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to select all elements in the line or lines containing the selection or insertion point.
Notes: NSResponder declares but doesn't implement this method.

31.53.113 selectParagraph

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to select all paragraphs containing the selection or insertion point.
Notes: NSResponder declares but doesn't implement this method.

31.53.114 selectToMark

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to select all items from the insertion point or selection to a previously placed mark, including the selection itself if not empty.
Notes: NSResponder declares but doesn't implement this method.

31.53.115 selectWord

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to extend the selection to the nearest word boundaries outside it (up to, but not including, word delimiters).
Notes: NSResponder declares but doesn't implement this method.

31.53.116 setMark

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to set a mark at the insertion point or selection, which is used by deleteToMark and selectToMark.
Notes: NSResponder declares but doesn't implement this method.

31.53.117 showContextHelp

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to invoke the help system, displaying information relevant to the receiver and its current state.

31.53.118 swapWithMark

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Swaps the mark and the selection or insertion point, so that what was marked is now the selection or insertion point, and what was the insertion point or selection is now the mark.
Notes: NSResponder declares but doesn't implement this method.

31.53.119 swipeWithEvent(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has begun a rotation gesture.

Notes:

The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.

31.53.120 tabletPoint(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that a tablet-point event has occurred.
Notes:

Tablet events are represented by NSEvent objects of type NSTabletPoint. They describe the current state of a transducer (that is, a pointing device) that is in proximity to its tablet, reflecting changes such as location, pressure, tilt, and rotation. See the NSEvent reference for the methods that allow you to extract this and other information from theEvent. The default implementation of NSResponder passes the message to the next responder.
Available in Mac OS X v10.4 or later.

31.53.121 tabletProximity(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that a tablet-proximity event has occurred.
Notes:

Tablet events are represented by NSEvent objects of type NSTabletProximity. Tablet devices generate proximity events when the transducer (pointing device) nears a tablet and when it moves away from a tablet. From an event object of this type you can extract information about the kind of device and its capabilities, as well as the relation of this tablet-proximity event to various tablet-point events; see the NSEvent reference for details. The default implementation passes the message to the next responder.
Available in Mac OS X v10.4 or later.

31.53.122 transpose

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Transposes the characters to either side of the insertion point and advances the insertion point past both of them. Does nothing to a selected range of text.
Notes: NSResponder declares but doesn't implement this method.

31.53.123 transposeWords

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Transposes the words to either side of the insertion point and advances the insertion point past both of them. Does nothing to a selected range of text.
Notes: NSResponder declares but doesn't implement this method.

31.53.124 undoManager as NSUndoManagerMBS

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The undo manager for this item.
Notes: Subclasses may implement this property.

31.53.125 uppercaseWord

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to make uppercase every letter in the word or words surrounding the insertion point or selection, expanding the selection if necessary.
Notes: If either end of the selection partially covers a word, that entire word is made uppercase. NSResponder declares but doesn't implement this method.

31.53.126 yank

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the insertion point or selection with text from the kill buffer.
Notes: If invoked sequentially, cycles through the kill buffer in reverse order. See "Standard Action Methods for Selecting and Editing" for more information on the kill buffer. NSResponder declares but doesn't implement this method.

31.53.127 Properties

31.53.128 Handle as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal handle of this Responder.
Notes: (Read and Write property)

31.53.129 menu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's menu.
Notes:

(On useful for NSApplication class on Mac)
(Read and Write computed property)

31.53.130 nextResponder as NSResponderMBS

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The next responder in the responder chain.
Notes: (Read and Write computed property)

31.54 class NSRunLoopMBS

31.54.1 class NSRunLoopMBS

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSRunLoop class declares the programmatic interface to objects that manage input sources. **Notes:**

An NSRunLoop object processes input for sources such as mouse and keyboard events from the window system, NSPort objects, and NSConnection objects. An NSRunLoop object also processes NSTimer events.

Your application cannot either create or explicitly manage NSRunLoop objects. Each NSThread object, including the application's main thread, has an NSRunLoop object automatically created for it as needed. If you need to access the current thread's run loop, you do so with the class method currentRunLoop.

Note that from the perspective of NSRunloop, NSTimer objects are not "input"—they are a special type, and one of the things that means is that they do not cause the run loop to return when they fire.

Warning:
The NSRunLoop class is generally not considered to be thread-safe and its methods should only be called within the context of the current thread. You should never try to call the methods of an NSRunLoop object running in a different thread, as doing so might cause unexpected results.

31.54.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.5pr1

31.54.3 Methods

31.54.4 AddDummyPort

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a dummy port as event source.
Notes: Run loops don't loop unless there is an event source, so you can add a dummy one here.

31.54.5 allModes as string()

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns array with all mode strings.

31.54.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new object using current run loop.

31.54.7 currentRunLoop as NSRunLoopMBS

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NSRunLoop object for the current thread.
Notes: If a run loop does not yet exist for the thread, one is created and returned.

31.54.8 mainRunLoop as NSRunLoopMBS

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the run loop of the main thread.
Notes:

An object representing the main thread's run loop.
Available in OS X v10.5.

31.54.9 NSDefaultRunLoopMode as string

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the runloop mode.
Notes:

The mode to deal with input sources other than NSConnection objects.
This is the most commonly used run-loop mode.

31.54.10 NSRunLoopCommonModes as string

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the runloop mode.
Notes:

Objects added to a run loop using this value as the mode are monitored by all run loop modes that have been declared as a member of the set of "common" modes; see the description of CFRunLoopAddCommonMode for details.
Available in OS X v10.5 and later.

31.54.11 run

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Puts the receiver into a permanent loop, during which time it processes data from all attached input sources.
Notes:

If no input sources or timers are attached to the run loop, this method exits immediately; otherwise, it runs the receiver in the NSDefaultRunLoopMode by repeatedly invoking runMode:beforeDate:. In other words, this method effectively begins an infinite loop that processes data from the run loop's input sources and timers.

Manually removing all known input sources and timers from the run loop is not a guarantee that the run loop will exit. OS X can install and remove additional input sources as needed to process requests targeted at the receiver's thread. Those sources could therefore prevent the run loop from exiting.

If you want the run loop to terminate, you shouldn't use this method. Instead, use one of the other run methods and also check other arbitrary conditions of your own, in a loop.
See also:

- 31.54.12 run(Seconds as Double) 6325

31.54.12 run(Seconds as Double)

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Runs the runloop for the given number of seconds.
See also:

- 31.54.11 run 6325

31.54.13 runMode(Mode as string, Seconds as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Runs the runloop for the given number of seconds in the given mode.

31.54.14 runModeUntilDate(Mode as string, limitDate as date) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Runs the loop once, blocking for input in the specified mode until a given date.
Notes:

mode: The mode in which to run. You may specify custom modes or use one of the modes listed in "Run Loop Modes."

limitDate: The date until which to block.

Returns true if the run loop ran and processed an input source or if the specified timeout value was reached; otherwise, false if the run loop could not be started.

If no input sources or timers are attached to the run loop, this method exits immediately and returns false; otherwise, it returns after either the first input source is processed or limitDate is reached. Manually removing all known input sources and timers from the run loop does not guarantee that the run loop will exit immediately. OS X may install and remove additional input sources as needed to process requests targeted at the receiver's thread. Those sources could therefore prevent the run loop from exiting.

Note: A timer is not considered an input source and may fire multiple times while waiting for this method to return

31.54.15 runUntilDate(limitDate as date)

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Runs the loop until the specified date, during which time it processes data from all attached input sources.
Notes:

limitDate: The date up until which to run.

If no input sources or timers are attached to the run loop, this method exits immediately; otherwise, it runs the receiver in the NSDefaultRunLoopMode by repeatedly invoking runMode until the specified expiration date.

Manually removing all known input sources and timers from the run loop is not a guarantee that the run loop will exit. OS X can install and remove additional input sources as needed to process requests targeted at the receiver's thread. Those sources could therefore prevent the run loop from exiting.

31.54.16 Properties

31.54.17 currentMode as String

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the receiver's current input mode.
Notes:

The receiver's current input mode. This method returns the current input mode only while the receiver is running; otherwise, it returns nil.

(Read only property)

31.54.18 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object handle.
Notes: (Read and Write property)

31.55 class NSScreenMBS

31.55.1 class NSScreenMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSScreen object describes the attributes of a computer's monitor, or screen.
Notes:

An application may use an NSScreen object to retrieve information about a screen and use this information to decide what to display upon that screen. For example, an application may use the deepestScreen method to find out which of the available screens can best represent color and then may choose to display all of its windows on that screen.

The application object should be created before you use the methods in this class, so that the application object can make the necessary connection to the window system. You can make sure the application object exists by invoking the sharedApplication method of NSApplication. If you created your application with Xcode, the application object is automatically created for you during initialization.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

31.55.4 Methods

31.55.5 backingAlignedRect(r as NSRectMBS, options as UInt64) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts a rectangle in global screen coordinates to a pixel aligned rectangle.
Notes:

r: The input rectangle in global screen coordinates.
options: Specifies the alignment options. See NSAlignmentOptions for possible values.
Returns a a pixel aligned rectangle on the target screen from the given input rectangle in global screen coordinates.

This method uses NSIntegralRectWithOptions() to produce the pixel aligned rectangle.
Available in Mac OS X v10.7 and later.

31.55.6 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

31.55.7 convertRectFromBacking(r as NSRectMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the rectangle from the device pixel aligned coordinates system of a screen.
Notes:

r: The rectangle.

Returns the rectangle converted from the device pixel aligned coordinates system of the screen.
Available in Mac OS X v10.7 and later.

31.55.8 convertRectToBacking(r as NSRectMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the rectangle to the device pixel aligned coordinates system of a screen.
Notes:

r: The rectangle.

Returns the rectangle converted to the device pixel aligned coordinates system of the screen.
Available in Mac OS X v10.7 and later.

31.55.9 NSScreenColorSpaceDidChangeNotification as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The notification name for the notification sent when the screen colorspace changed.
Notes:

The notification object is the NSScreen whose colorSpace has changed. This notification does not contain a userInfo dictionary.
Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Available in Mac OS X v10.6 and later.

31.55.10 screens as NSScreenMBS()

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of NSScreen objects representing all of the screens available on the system.
Notes:

Returns an array of the NSScreen objects available on the current system or nil if the screen information could not be obtained from the window system.

The screen at index 0 in the returned array corresponds to the primary screen of the user's system. This is the screen that contains the menu bar and whose origin is at the point (0, 0). In the case of mirroring, the first screen is the largest drawable display; if all screens are the same size, it is the screen with the highest pixel depth. This primary screen may not be the same as the one returned by the mainScreen method, which returns the screen with the active window.

The array should not be cached. Screens can be added, removed, or dynamically reconfigured at any time. When the display configuration is changed, the default notification center sends a NSApplicationDidChangeScreenParametersNotification notification.

31.55.11 supportedWindowDepths as Integer()

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a zero-terminated array of the window depths supported by the receiver.

31.55.12 Properties

31.55.13 backingScaleFactor as Double

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the backing store pixel scale factor for the screen.
Notes:

Returns the scale factor representing the number of backing store pixels corresponding to each linear unit in screen space on this NSScreen.
This method is provided for rare cases when the explicit scale factor is needed. Please use the NSView class's convert backing methods whenever possible.
Available in Mac OS X v10.7 and later.

For apps which are not enabled for retina support, the function returns 1. So you only see 2 here if app is Cocoa, display is retina and info.plist has the NSHighResolutionCapable key.
(Read only property)

31.55.14 colorSpace as Variant

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the colorSpace of the screen.
Example:

```
dim s as NSScreenMBS = NSScreenMBS.mainScreen
dim c as NSColorSpaceMBS = s.colorSpace
MsgBox c.localizedName
```

Notes:

Available in Mac OS X v10.6 and later.

Value is a NSColorSpaceMBS but declared as Variant to reduce plugin interdependencies.
(Read only property)

31.55.15 deepestScreen as NSScreenMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSScreen object representing the screen that can best represent color.
Notes:

This method always returns an object, even if there is only one screen and it is not a color screen.
(Read only property)

31.55.16 depth as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's current bit depth and colorspace information.
Notes:

Returns the window depth information. This value cannot be used directly. You must pass it to a function such as NSBitsPerPixelFromDepth or NSColorSpaceFromDepth to obtain a concrete value for the desired information.
(Read only property)

31.55.17 deviceDescription as dictionary

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the device dictionary for the screen.
Notes:

A dictionary containing the attributes of the receiver's screen.
(Read only property)

31.55.18 firstScreen as NSScreenMBS

MBS MacBase Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NSScreen object for the first screen.
Notes:

Returns nil if no display is present.
(Read only property)

31.55.19 frame as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the dimensions and location of the receiver.
Notes:

The full screen rectangle at the current resolution. This rectangle includes any space currently occupied by the menu bar and dock.
(Read only property)

31.55.20 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSScreen object.
Notes: (Read and Write property)

31.55.21 localizedName as String

MBS MacBase Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The localized name of the screen.
Notes:

Either uses on MacOS 10.15 the value Apple frameworks provides.

Or returns name from plugin, either ”Main Screen” or ”Screen ” plus index, so second screen is ”Screen 2”.
(Read only property)

31.55.22 mainScreen as NSScreenMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NSScreen object containing the window with the keyboard focus.
Notes:

The main screen is not necessarily the same screen that contains the menu bar or has its origin at (0, 0). The main screen refers to the screen containing the window that is currently receiving keyboard events. It is the main screen because it is the one with which the user is most likely interacting.

The screen containing the menu bar is always the first object (index 0) in the array returned by the screens method.
(Read only property)

31.55.23 screensHaveSeparateSpaces as Boolean

MBS MacBase Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether each screen can have its own set of spaces.
Notes:

This method reflects whether the “Displays have separate Spaces” option is enabled in Mission Control system preference. You might use the return value to determine how to present your app when in fullscreen mode.
(Read only property)

31.55.24 secondScreen as NSScreenMBS

MBS MacBase Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NSScreen object for the second screen.
Notes:

Returns nil if no second display is present.
(Read only property)

31.55.25 userSpaceScaleFactor as Double

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the scaling factor from user space to device space on the screen represented by the receiver.
Notes:

Returns the scaling factor, measured in pixels per point, where a point is always equal to 1/72 of an inch. For example, a scaling factor of 2.0 indicates the display has a resolution 2 pixels per point or 144 pixels-per-inch.

Available in Mac OS X v10.4 and later.
(Read only property)

31.55.26 visibleFrame as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current location and dimensions of the visible screen.
Notes:

The returned rectangle is always based on the current user-interface settings and does not include the area currently occupied by the dock and menu bar. Because it is based on the current user -interface settings, the returned rectangle can change between calls and should not be cached.

Note: Even when dock hiding is enabled, the rectangle returned by this method may be smaller than the full screen. The system uses a small boundary area to determine when it should display the dock.
(Read only property)

31.56 class NSServiceProviderMBS

31.56.1 class NSServiceProviderMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class to do service handlers in Cocoa applications.
Notes:

This class must be subclassed to implement services.
Use ServiceInvoked as the name of the selector when declaring service (NSMessage parameter).
Use NSUserData parameter to distinguish between all the services you offer.
This class implements NSServiceProvider for Xojo and Xojo for Cocoa applications. For Carbon, please use CarbonApplicationEventsMBS events.

31.56.3 Methods

31.56.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

31.56.5 Destructor

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

31.56.6 Properties

31.56.7 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Internal object reference.
Notes: (Read and Write property)

31.56.8 Events

31.56.9 ServiceInvoked(pboard as NSPasteboardMBS, userData as string, byref error as string)

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called when a service should perform.
Notes:

Use ServiceInvoked as the name of the selector when declaring service (NSMessage parameter).
Use NSUserData parameter to distinguish between all the services you offer.

31.57 class NSShadowMBS

31.57.1 class NSShadowMBS

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSShadow object encapsulates the attributes used to create a drop shadow during drawing operations.
Notes:

Shadows are always drawn in the default user coordinate space, regardless of any transformations applied to that space. This means that rotations, translations and other transformations of the current transformation matrix (the CTM) do not affect the resulting shadow. Another way to think about this is that changes to the CTM do not move or change the apparent position of the shadow's light source.

There are two positional parameters for a shadow: an x-offset and a y-offset. These values are expressed using a single size data type (CGSize on iOS, NSSize on OS X) and using the units of the default user coordinate space. Positive values for these offsets extend up and to the right.

In addition to its positional parameters, a shadow also contains a blur radius, which specifies how much a drawn object's image mask is blurred before it is composited onto the destination. A value of 0 means there is no blur. Larger values give correspondingly larger amounts of blurring.

An NSShadow object may be used in one of two ways. First, it may be set, like a color or a font, in which case its attributes are applied to all content drawn thereafter—or at least until another shadow is applied or a previous graphics state is restored. Second, it may be used as the value for the NSShadowAttributeName text attribute, in which case it is applied to the glyphs corresponding to the characters bearing this attribute.

31.57.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.2pr3
- MBS Xojo / Real Studio Plugins, version 16.1pr1

31.57.3 Methods

31.57.4 Constructor

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.
Notes: Initialized with 0 as its offset, 0 as its blur radius, and the default color as its color.

31.57.5 copy as NSShadowMBS

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the shadow object.

31.57.6 set

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the shadow of subsequent drawing operations to the shadow represented by the receiver.
Notes: The shadow attributes of the receiver are used until another shadow is set or until the graphics state is restored.

31.57.7 Properties

31.57.8 Handle as Integer

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

31.57.9 shadowBlurRadius as Double

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The blur radius of the shadow.
Notes:

This property contains the blur radius, as measured in the default user coordinate space. A value of 0 indicates no blur, while larger values produce correspondingly larger blurring. The default value is 0.
(Read and Write property)

31.57.10 shadowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color of the shadow.
Notes:

The default shadow color is black with an alpha of 1/3. If you set this property to nil, the shadow is not drawn.
(Read and Write property)

31.57.11 shadowOffset as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The offset values of the shadow.
Notes:

This property contains the horizontal and vertical offset values, specified using the width and height fields of the NSSize data type. These offsets are measured using the default user coordinate space and are not affected by custom transformations. This means that positive values always extend down and to the right from the user's perspective.
(Read and Write property)

31.58 class NSSizeMBS

31.58.1 class NSSizeMBS

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Xojo class for the size structure in Cocoa.
Example:

```
dim n as NSSizeMBS = NSMakeSizeMBS(500,600)
MsgBox n.String
```

31.58.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.1pr1

31.58.5 Constructor(p as Ptr)

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new instance using data at the pointer.
Notes: Make sure the pointer is valid and has the right data and size.
See also:

- 31.58.4 Constructor 6340
- 31.58.6 Constructor(s as string) 6341
- 31.58.7 Constructor(Width as Double, Height as Double) 6341

31.58.6 Constructor(s as string)

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSSize object using the given string.
Example:

```
dim p as new NSSizeMBS(" { 1,2 } ")
MsgBox p // shows { 1, 2 }
```

See also:

- 31.58.4 Constructor 6340
- 31.58.5 Constructor(p as Ptr) 6340
- 31.58.7 Constructor(Width as Double, Height as Double) 6341

31.58.7 Constructor(Width as Double, Height as Double)

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSSize object using the given values.
See also:

- 31.58.4 Constructor 6340
- 31.58.5 Constructor(p as Ptr) 6340
- 31.58.6 Constructor(s as string) 6341

31.58.8 Equal(other as NSSizeMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether two sizes are equal.

31.58.9 Operator_Convert as String

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the object to string.
Example:

```
dim p as new NSSizeMBS(1,2)
MsgBox p // shows { 1, 2 }
```

31.58.10 String as String

MBS Main Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the string representation of this size object.
Example:

```
dim p as new NSSizeMBS(1,2)
MsgBox p.String // shows { 1, 2 }
```

31.58.11 Zero as NSSizeMBS

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a size with all values being zero.

31.58.12 Properties

31.58.13 Handle as Ptr

MBS Main Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The pointer to the internal data structure.
Notes:

May be useful for passing to declares requiring a NSSize*.
Size of structure is 8 bytes for 32-bit (two singles) and 16 bytes for 64-bit (two doubles).
(Read only property)

31.58.14 Height as Double

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The height of this size.

Notes: (Read and Write property)

31.58.15 Width as Double

MBS Main Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The width of this size.
Notes: (Read and Write property)

31.59 class NSSoundDelegateMBS

31.59.1 class NSSoundDelegateMBS

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for the delegate to receive events from NSSoundMBS objects.

31.59.2 Events

31.59.3 SoundFinished(s as NSSoundMBS, didFinishPlaying as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This delegate method is called when an NSSoundMBS instance has completed playback of its sound data.
Notes:

s: The NSSound that has completed playback of its sound data.

didFinishPlaying: True when playback was successful; false otherwise.

The parameter s is not the NSSoundMBS object you used before but a new one. But it has the same handle value as the one where you called play, so you can still compare which one was affected.

31.60 class NSSoundMBS

31.60.1 class NSSoundMBS

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSSound class provides a simple interface for loading and playing audio files.
Notes:

This class supports the same audio encodings and file formats that are supported by Core Audio and QuickTime.

To use this class, initialize a new instance with the desired file or audio data. You can configure assorted aspects of the audio playback, including the volume and whether the sound loops before you play it. Depending on the type of the audio data, this class may use either Core Audio or QuickTime to handle the actual playback. (Typically, it uses Core Audio to play files in the AIFF, WAVE, NeXT, SD2, AU, and MP3 formats and may use it for other formats in the future as well.) Playback occurs asynchronously so that your application can continue doing work.

You should retain NSSound objects before initiating playback or make sure you have a strong reference to them in a garbage-collected environment. Upon deallocation, a sound object stops playback of the sound (as needed) so that it can free up the corresponding audio resources. If you want to deallocate a sound object immediately after playback, assign a delegate and use the sound:didFinishPlaying: method to deallocate it.

If you want to play the system beep sound, use the NSBeep function.

31.60.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.3pr1

31.60.3 Methods

31.60.4 availableSounds as string()

MBS MacCocoa Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of the available sounds.
Example:

```
dim sounds(-1) as string = NSSoundMBs.availableSounds

// play first sound
dim n as NSSoundMBS = NSSoundMBS.soundNamed(sounds(0))

call n.play
```

```
// show list of sounds
MsgBox Join(sounds,EndOfLine)
```

Notes: You can use the names in this array for the soundNamed function.

31.60.5 canInitWithPasteboard as boolean

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver can create an instance of itself from the data in a pasteboard.
Notes:

true when the receiver can handle the data represented by pasteboard; false otherwise.

The soundUnfilteredPasteboardTypes method is used to find out whether the class can handle the data in pasteboard.

31.60.6 channelMapping as Integer()

MBS MacCocoa Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides the receiver's channel map.
Notes:

A channel map correlates a sound's channels to the the output-device's channels. For example, a two-channel sound being played on a five-channel device should have a channel map to optimize the sound-playing experience. The default map, correlates the first sound channel to the first output channel, the second sound channel to the second output channel, and so on.

Available in OS X v10.5 and later. Deprecated in OS X v10.9.

31.60.7 Constructor

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the receiver with data from a pasteboard.
Notes: NSSound expects the data to have a proper magic number, sound header, and data for the formats it supports.
See also:

- 31.60.8 Constructor(data as MemoryBlock)

- 31.60.9 Constructor(file as folderitem, ByReference as boolean) 6347
- 31.60.10 Constructor(url as string, ByReference as boolean) 6348

31.60.8 Constructor(data as MemoryBlock)

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the receiver with a given audio data.
Notes: data: Audio data with which the receiver is to be initialized. The data must have a proper magic number, sound header, and data for the formats the NSSound class supports.
See also:

- 31.60.7 Constructor 6346
- 31.60.9 Constructor(file as folderitem, ByReference as boolean) 6347
- 31.60.10 Constructor(url as string, ByReference as boolean) 6348

31.60.9 Constructor(file as folderitem, ByReference as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the receiver with the the audio data located at a given file.
Example:

```
dim s as NSSoundMBS
dim f as FolderItem

f=SpecialFolder.Desktop.Child("test.mp3")

s=new NSSoundMBS(f,true)

call s.play
```

Notes:

file: Path to the sound file.
ByReference: When true only the name of the sound is stored with the NSSound instance when archived using encodeWithCoder:; otherwise the audio data is archived along with the instance. (not used in Xojo)
See also:

- 31.60.7 Constructor 6346
- 31.60.8 Constructor(data as MemoryBlock) 6347
- 31.60.10 Constructor(url as string, ByReference as boolean) 6348

31.60.10 Constructor(url as string, ByReference as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the receiver with the audio data located at a given URL.
Notes:

url: URL to the sound file with which the receiver is to be initialized.
ByReference: When true only the name of the sound is stored with the NSSound instance when archived using encodeWithCoder:; otherwise the audio data is archived along with the instance. (not used in Xojo)
See also:

- 31.60.7 Constructor 6346
- 31.60.8 Constructor(data as MemoryBlock) 6347
- 31.60.9 Constructor(file as folderitem, ByReference as boolean) 6347

31.60.11 duration as Double

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides the duration of the receiver in seconds.
Notes: Available in Mac OS X v10.5 and later.

31.60.12 isPlaying as boolean

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver is playing its audio data.
Notes: True when the receiver is playing its audio data, false otherwise.

31.60.13 name as string

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name assigned to the receiver.
Notes: Name assigned to the receiver; "" when no name has been assigned.

31.60.14 NSSoundPboardType as string

MBS MacCocoa Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSSound class defines this common pasteboard data type.

31.60.15 pause as boolean

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Pauses audio playback.
Notes: True when playback is paused successfully, false when playback is already paused or when an error occurred.

31.60.16 play as boolean

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initiates audio playback.
Notes:

True when playback is initiated, false when playback is already in progress or when an error occurred.

This method initiates playback asynchronously and returns control to your application. Therefore, your application can continue doing work while the audio is playing.

31.60.17 resume as boolean

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Resumes audio playback.
Notes:

True when playback is resumed, false when playback is in progress or when an error occurred.

Assumes the receiver has been previously paused by sending it pause.

31.60.18 setChannelMapping(mapping() as Integer)

MBS MacCocoa Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies the receiver's channel map.
Notes:

Mapping: Audio-channel—to—device–channel mappings for the receiver.

Available in OS X v10.5 and later. Deprecated in OS X v10.9.

31.60.19 setDelegate(DelegateHandler as NSSoundDelegateMBS)

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Set the receiver's delegate.
Notes:

You can assign one delegate to several sounds.
But the delegate object is not referenced, so keep it alive with your own reference, so RB won't destroy it too early.

31.60.20 setName(name as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Registers the receiver under a given name.
Notes:

Returns True when successful; false otherwise.

If the receiver is already registered under another name, this method first unregisters the prior name.

31.60.21 soundNamed(name as string) as NSSoundMBS

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NSSound instance associated with a given name.
Example:

```
dim s as NSSoundMBS

s=NSSoundMBS.soundNamed("Submarine")

call s.play
```

Notes:

NSSound instance initialized with the sound data identified by soundName.

The returned object can be one of the following:

One that's been assigned a name with setName.

One of the named system sounds provided by the Application Kit framework If there's no known NSSound

object with soundName, this method tries to create one by searching for sound files in the application's main bundle (see NSBundle for a description of how the bundle's contents are searched). If no sound file can be located in the application main bundle, the following directories are searched in order:
textasciitilde /Library/Sounds, /Library/Sounds, /Network/Library/Sounds or /System/Library/Sounds.

If no data can be found for soundName, no object is created, and nil is returned.

The preferred way to locate a sound is to pass a name without the file extension. See the class description for a list of the supported sound file extensions.

31.60.22 soundUnfilteredFileTypes as string()

MBS MacCocoa Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Provides the list of file types the NSSound class understands.
Notes:

Returns array of strings representing the file types the NSSound class understands.
The returned array may be passed directly to the runModalForTypes method of the NSOpenPanel class.
Available in OS X v10.0 and later. Deprecated in OS X v10.5.

31.60.23 soundUnfilteredPasteboardTypes as string()

MBS MacCocoa Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Provides a list of the pasteboard types that the NSSound class can accept.
Notes:

Array of pasteboard types that the NSSound class can accept.
Available in OS X v10.0 and later. Deprecated in OS X v10.5.

31.60.24 soundUnfilteredTypes as string()

MBS MacCocoa Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Provides the file types the NSSound class understands.
Notes:

Returns array of UTIs identifying the file types the NSSound class understands.

Available in OS X v10.5 and later.

31.60.25 soundWithContentsOfFile(file as folderitem, ByReference as boolean) as NSSoundMBS

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a NSSound object with the the audio data located at a given file.
Example:

```
dim s as NSSoundMBS
dim f as FolderItem

f=SpecialFolder.Desktop.Child("test.mp3")

s=NSSoundMBS.soundWithContentsOfFile(f,true)

call s.play

// sound continues to play even after NSSoundMBS object is destroyed.
```

Notes:

file: Path to the sound file.
ByReference: When true only the name of the sound is stored with the NSSound instance when archived using encodeWithCoder:; otherwise the audio data is archived along with the instance. (not used in Xojo)

31.60.26 soundWithContentsOfURL(url as string, ByReference as boolean) as NSSoundMBS

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a NSSoundMBS object with the audio data located at a given URL.
Notes:

url: URL to the sound file with which the receiver is to be initialized.
ByReference: When true only the name of the sound is stored with the NSSound instance when archived using encodeWithCoder:; otherwise the audio data is archived along with the instance. (not used in Xojo)

31.60.27 soundWithData(data as MemoryBlock) as NSSoundMBS

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a NSSoundMBS object with a given audio data.
Notes: data: Audio data with which the receiver is to be initialized. The data must have a proper magic number, sound header, and data for the formats the NSSound class supports.

31.60.28 soundWithPasteboard as NSSoundMBS

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a NSSoundMBS object with data from a pasteboard.
Notes: NSSound expects the data to have a proper magic number, sound header, and data for the formats it supports.

31.60.29 stop as boolean

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Concludes audio playback.
Notes: True when playback is concluded successfully or if it's paused, false otherwise.

31.60.30 writeToPasteboard

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the receiver's data to a pasteboard.

31.60.31 Properties

31.60.32 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSSound object.
Notes: (Read and Write property)

31.60.33 currentTime as Double

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides the receiver's playback progress in seconds.
Notes:

Receiver's playback progress in seconds.

Sounds start with currentTime == 0 and end with currentTime == ([<sound>duration] - 1).

Available in Mac OS X v10.5 and later.
This property is not archived, copied, or stored on the pasteboard.

(Read and Write computed property)

31.60.34 loops as boolean

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver restarts playback when it reaches the end of its content.
Notes:

True when the receiver restarts playback when it finishes, false otherwise.
Default: false

Available in Mac OS X v10.5 and later.

When loops is true, the delegate does not call the SoundFinished event on the end of its content and restarts playback.
(Read and Write computed property)

31.60.35 playbackDeviceIdentifier as string

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Identifies the receiver's output device.
Notes:

Returns an unique identifier of a sound output device.
Available in Mac OS X v10.5 and later.
(Read and Write computed property)

31.60.36 volume as Double

MBS MacCocoa Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides the volume of the receiver.
Notes:

This method does not affect the systemwide volume.
Available in Mac OS X v10.5 and later.

0.0 is not sound and 1.0 is full sound.
(Read and Write computed property)

31.61 class NSStreamMBS

31.61.1 class NSStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An abstract class representing a stream.
Notes:

This class's interface is common to all Cocoa stream classes, including its concrete subclasses NSInputStream and NSOutputStream.
NSStream objects provide an easy way to read and write data to and from a variety of media in a device-independent way. You can create stream objects for data located in memory, in a file, or on a network (using sockets), and you can use stream objects without loading all of the data into memory at once.
By default, NSStream instances that are not file-based are non-seekable, one-way streams (although custom seekable subclasses are possible). Once the data has been provided or consumed, the data cannot be retrieved from the stream.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

31.61.2 Blog Entries

- MBS Xojo Plugins, version 18.2pr2

31.61.3 Methods

31.61.4 Close

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the receiver.
Notes: Closing the stream terminates the flow of bytes and releases system resources that were reserved for the stream when it was opened. If the stream has been scheduled on a run loop, closing the stream implicitly removes the stream from the run loop. A stream that is closed can still be queried for its properties.

31.61.5 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

31.61.6 Open

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Opens the receiving stream.

Notes: A stream must be created before it can be opened. Once opened, a stream cannot be closed and reopened.

31.61.7 SetPosition(pos as Int64) as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets position in a stream.
Notes: Returns true on success or false on failure.

31.61.8 Properties

31.61.9 Error as NSErrorMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSError object representing the stream error.
Notes:

An NSError object representing the stream error, or nil if no error has been encountered.
(Read only property)

31.61.10 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

31.61.11 position as Int64

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries position in file stream.
Notes: (Read only property)

31.61.12 Status as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's status.
Notes:

See kStatus* constants.
(Read only property)

31.61.13 Constants

31.61.14 kStatusAtEnd = 5

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the status constants.
Notes: There is no more data to read, or no more data can be written to the stream. When this status is returned, the stream is in a "non-blocking" mode and no data are available.

31.61.15 kStatusClosed = 6

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the status constants.
Notes: The stream is closed (close has been called on it).

31.61.16 kStatusError = 7

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the status constants.
Notes: The remote end of the connection can't be contacted, or the connection has been severed for some other reason.

31.61.17 kStatusNotOpen = 0

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the status constants.
Notes: The stream is not open for reading or writing. This status is returned before the underlying call to open a stream but after it's been created.

31.61.18 kStatusOpen = 2

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the status constants.
Notes: The stream is open, but no reading or writing is occurring.

31.61.19 kStatusOpening = 1

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the status constants.
Notes: The stream is in the process of being opened for reading or for writing. For network streams, this status might include the time after the stream was opened, but while network DNS resolution is happening.

31.61.20 kStatusReading = 3

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the status constants.
Notes:

Data is being read from the stream. This status would be returned if code on another thread were to call Status on the stream while a read() was in progress.

31.61.21 kStatusWriting = 4

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the status constants.
Notes:

Data is being written to the stream. This status would be returned if code on another thread were to call Status on the stream while a write() was in progress.

31.62 class NSTextAttachmentMBS

31.62.1 class NSTextAttachmentMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An attachment to a text.
Notes:

NSTextAttachment objects are used by the NSAttributedString class cluster as the values for attachment attributes (stored in the attributed string under the key named NSAttachmentAttributeName). The objects you create with this class are referred to as text attachment objects, or when no confusion will result, as text attachments or merely attachments.

A text attachment object contains an NSFileWrapper in NSFileWrapper Class Reference object, which in turn holds the contents of the attached file. It also uses a cell object conforming to the NSTextAttachment-Cell in NSTextAttachmentCell Protocol Reference protocol to draw and handle mouse events. Most of the behavior of a text attachment is relegated to the file wrapper and the attachment cell. See the corresponding class and protocol specifications for more information.

See the NSAttributedString in NSAttributedString Class Reference and NSTextView in NSTextView Class Reference class specifications for general information on text attachments.

- MonkeyBread Software Releases the MBS Xojo / Real Studio plug-ins in version 15.0
- MBS Xojo / Real Studio Plugins, version 14.5pr4

31.62.3 Methods

31.62.4 attributedStringWithAttachment(attachment as NSTextAttachmentMBS) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an attributed string with an attachment.
Example:

```
dim content as MemoryBlock = "Hello World"
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(content)
f.filename = "HelloWorld.txt"

dim a as new NSTextAttachmentMBS(f)
dim s as NSAttributedStringMBS = NSTextAttachmentMBS.attributedStringWithAttachment(a)
```

Notes: This is a convenience method for creating an attributed string containing an attachment using NSAttachmentCharacter as the base character.

31.62.5 Constructor(fileWrapper as NSFileWrapperMBS)

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a newly allocated NSTextAttachment object to contain the given file wrapper.
Example:

```
dim content as MemoryBlock = "Hello World"
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(content)
f.filename = "HelloWorld.txt"

dim a as new NSTextAttachmentMBS(f)

Break // inspect in debugger
```

Notes: If fileWrapper contains an image file that the receiver can interpret as an NSImage object, sets the attachment cell's image to the NSImage rather than to the icon of fileWrapper.
See also:

- 31.62.6 Constructor(image as NSImageMBS) 6360

31.62.6 Constructor(image as NSImageMBS)

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a newly allocated NSTextAttachment object with a cell and given image.
See also:

- 31.62.5 Constructor(fileWrapper as NSFileWrapperMBS) 6360

31.62.7 Properties

31.62.8 attachmentCell as Variant

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The attachment cell.
Notes:

As our plugin currently has no NSTextAttachmentCell class, we just give you a NSCell object.
This allows accessing most of the properties.
Value is a NSCellMBS declared as Variant to reduce plugin dependencies.
(Read only property)

31.62.9 fileWrapper as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The file wrapper.
Notes:

The file wrapper holds the contents of the attached file.
(Read and Write property)

31.62.10 Handle as Integer

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes:

Must not be 0 to have the object being valid.
(Read and Write property)

31.62.11 Constants

31.62.12 NSAttachmentCharacter = & hFFFC

MBS MacBase Plugin, Plugin Version: 15.0. **Function:** This character is used to denote an attachment.
Example:

```
dim s as string = encodings.UTF16.Chr(NSTextAttachmentMBS.NSAttachmentCharacter)
```

31.63 class NSTextContainerMBS

31.63.1 class NSTextContainerMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSTextContainer class defines a region where text is laid out.
Notes: An NSLayoutManager uses NSTextContainer to determine where to break lines, lay out portions of text, and so on. NSTextContainer defines rectangular regions, but you can create subclasses that define regions of other shapes, such as circular regions, regions with holes in them, or regions that flow alongside graphics.

31.63.3 Methods

31.63.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a text container with no bounds.
Notes: Returns the newly initialized text container.
See also:

- 31.63.5 Constructor(size as NSSizeMBS) 6362

31.63.5 Constructor(size as NSSizeMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a text container with a specified bounding rectangle.
Notes:

size: The size of the text container's bounding rectangle.

Returns the newly initialized text container.

The new text container must be added to an NSLayoutManager object before it can be used. The text container must also have an NSTextView object set for text to be displayed. This method is the designated

initializer for the NSTextContainer class.
See also:

- 31.63.4 Constructor 6362

31.63.6 containsPoint(p as NSPointMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Overridden by subclasses to return whether a point lies within the receiver's region or on the region's edge—not simply within its bounding rectangle.
Notes:

True if aPoint lies within the receiver's region or on the region's edge—not simply within its bounding rectangle - false otherwise.

For example, if the receiver defines a donut shape and aPoint lies in the hole, this method returns false. This method can be used for hit testing of mouse events.

The default NSTextContainer implementation merely checks that aPoint lies within its bounding rectangle.

31.63.7 isSimpleRectangularTextContainer as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Overridden by subclasses to return whether the receiver's region is a rectangle with no holes or gaps and whose edges are parallel to the text view's coordinate system axes.
Notes:

True if the receiver's region is a rectangle with no holes or gaps and whose edges are parallel to the text view's coordinate system axes, false otherwise.

A text container whose shape changes can return true if its region is currently a simple rectangle, but when its shape does change it must send textContainerChangedGeometry to its layout manager so the layout can be recalculated.

The default NSTextContainer implementation of this method returns true.

31.63.8 replaceLayoutManager(l as NSLayoutManagerMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the layout manager for the group of text system objects containing the receiver.
Notes: All text containers and text views sharing the original layout manager share the new layout manager.

This method makes all the adjustments necessary to keep these relationships intact, unlike setLayoutManager.

31.63.9 Properties

31.63.10 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

31.63.11 containerSize as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The size of the receiver's bounding rectangle.
Notes:

size: The new size of the text container's bounding rectangle.
This method also sends textContainerChangedGeometry to the text container's layout manager.
(Read and Write computed property)

31.63.12 heightTracksTextView as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Controls whether the receiver adjusts the height of its bounding rectangle when its text view is resized.
Notes:

value: True if the receiver should follow changes to the height of its text view, false otherwise.
(Read and Write computed property)

31.63.13 layoutManager as NSLayoutManagerMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The layout manager.
Notes:

This method is invoked automatically when you add a text container to a layout manager; you should never need to invoke it directly, but might want to override it. If you want to replace the layout manager for an established group of text system objects, use replaceLayoutManager.

(Read and Write computed property)

31.63.14 lineFragmentPadding as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The amount by which text is inset within line fragment rectangles.
Notes:

Value: The amount by which text is inset within line fragment rectangles, in points.

This method also sends textContainerChangedGeometry to the text container's layout manager.

Line fragment padding is not designed to express text margins. Instead, use the NSTextView method setTextContainerInset, paragraph margin attributes, or the position of the text view within a superview.
(Read and Write computed property)

31.63.15 textView as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The text view.
Notes:

This method sends setTextContainer to aTextView to complete the association of the text container and text view.

Because you usually specify a text container when you create a text view, you should rarely need to invoke this method. A text container doesn't need a text view to calculate line fragment rectangles, but must have one to display text.

You can use this method to disconnect a text view from a group of text system objects by sending this message to its text container and passing nil as aTextView.
(Read and Write computed property)

31.63.16 widthTracksTextView as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Controls whether the receiver adjusts the width of its bounding rectangle when its text view is resized.
Notes:

Returns true if the receiver adjusts the width of its bounding rectangle when its text view is resized, false otherwise.

If the receiver does track the text view width, its width is adjusted to the width of the text view minus twice the inset width (as given by NSTextView's textContainerInset method).
(Read and Write computed property)

31.63.17 Constants

31.63.18 NSLineDoesntMove = 0

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line movement constants.
Notes: Line has no movement.

31.63.19 NSLineMovesDown = 3

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line movement constants.
Notes: Lines move from top to bottom.

31.63.20 NSLineMovesLeft = 1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line movement constants.
Notes: Lines move from right to left.

31.63.21 NSLineMovesRight = 2

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line movement constants.
Notes: Lines move from left to right.

31.63.22 NSLineMovesUp = 4

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line movement constants.
Notes: Lines move from bottom to top.

31.63.23 NSLineSweepDown = 2

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line sweep direction constants. **Notes:** Characters move from top to bottom.

31.63.24 NSLineSweepLeft = 0

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line sweep direction constants. **Notes:** Characters move from right to left.

31.63.25 NSLineSweepRight = 1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line sweep direction constants. **Notes:** Characters move from left to right.

31.63.26 NSLineSweepUp = 3

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the line sweep direction constants. **Notes:** Characters move from bottom to top.

31.64 class NSTextListMBS

31.64.1 class NSTextListMBS

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A section of text that forms a single list.
Notes:

The visible elements of the list, including list markers, appear in the text as they do for lists created by hand. The list object, however, allows the list to be recognized as such by the text system. This enables automatic creation of markers and spacing. Text lists are used in HTML import and export.

Text lists appear as attributes on paragraphs, as part of the paragraph style. An NSParagraphStyle may have an array of text lists, representing the nested lists containing the paragraph, in order from outermost to innermost. For example, if list1 contains four paragraphs, the middle two of which are also in the inner list2, then the text lists array for the first and fourth paragraphs is (list1), while the text lists array for the second and third paragraphs is (list1, list2).
The methods implementing this are textLists on NSParagraphStyle, and textLists on NSMutableParagraphStyle.

In addition, NSAttributedString has convenience methods for lists, such as rangeOfTextList, which determines the range covered by a list, and itemNumberInTextList, which determines the ordinal position within a list of a particular item.

31.64.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 18.1
- MBS Xojo Plugins, version 18.1pr3

31.64.3 Methods

31.64.4 Constructor(format as String, OptionsMask as Integer = 0)

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an initialized text list.
Notes:

format: The marker format for the text list.
mask: The marker options for the text list. Values for mask are listed in Constants.

Returns an initialized text list.

The marker format is specified as a constant string, except for a numbering specifier, which takes the form { keyword } . The currently supported values for keyword include:

- box
- check
- circle
- diamond
- disc
- hyphen
- square
- lower-hexadecimal
- upper-hexadecimal
- octal
- lower-alpha or lower-latin
- upper-alpha or upper-latin
- lower-roman
- upper-roman
- decimal

Thus, for example, "({ decimal })" would specify the format for a list numbered (1), (2), (3), and so on, and @" { upper-roman } " would specify the format for a list numbered I, II, III, IV, and so on. (All of these keywords are included in the Cascading Style Sheets level 3 specification.)

31.64.5 copy as NSTextListMBS

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the text list.

31.64.6 markerForItemNumber(ItemNum as Integer) as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the computed value for a specific ordinal position in the list.
Notes:

itemNum: The ordinal position in the list whose computed marker value is desired.

Returns the computed maker value for itemNum.

31.64.7 NSTextListMarkerBox as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.8 NSTextListMarkerCheck as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.9 NSTextListMarkerCircle as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.10 NSTextListMarkerDecimal as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.11 NSTextListMarkerDiamond as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.12 NSTextListMarkerDisc as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.13 NSTextListMarkerHyphen as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.14 NSTextListMarkerLowercaseAlpha as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.15 NSTextListMarkerLowercaseHexadecimal as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.16 NSTextListMarkerLowercaseLatin as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.17 NSTextListMarkerLowercaseRoman as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.18 NSTextListMarkerOctal as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.19 NSTextListMarkerSquare as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.20 NSTextListMarkerUppercaseAlpha as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.21 NSTextListMarkerUppercaseHexadecimal as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.22 NSTextListMarkerUppercaseLatin as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.23 NSTextListMarkerUppercaseRoman as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the format texts.
Notes: Available on MacOS 10.13 or newer.

31.64.24 Properties

31.64.25 Handle as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference number.
Notes: (Read and Write property)

31.64.26 listOptions as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the list options mask value of the receiver.
Notes:

Can be NSTextListPrependEnclosingMarker.
(Read only property)

31.64.27 markerFormat as String

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the marker format string used by the receiver.
Notes: (Read only property)

31.64.28 startingItemNumber as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the starting item number for the text list.
Notes:

The default value is 1. This value will be used only for ordered lists, and ignored in other cases.
(Read and Write property)

31.64.29 Constants

31.64.30 NSTextListPrependEnclosingMarker = 1

MBS MacBase Plugin, Plugin Version: 18.1. **Function:** One of the constants for options.
Notes: Specifies that a nested list should include the marker for its enclosing superlist before its own marker.

31.65 class NSTextMBS

31.65.1 class NSTextMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class for text controls.
Notes:

You may prefer to use the NSTextViewMBS class which is a subclass from NSTextMBS.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

31.65.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.5pr6
- MBS Xojo / Real Studio Plugins, version 13.2pr7

31.65.3 Methods

31.65.4 alignCenter

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method applies center alignment to selected paragraphs (or all text if the receiver is a plain text object).

31.65.5 alignLeft

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method applies left alignment to selected paragraphs (or all text if the receiver is a plain text object).

31.65.6 alignRight

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method applies right alignment to selected paragraphs (or all text if the receiver is a plain text object).

31.65.7 changeFont

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method changes the font of the selection for a rich text object, or of all text for a plain text object.
Notes:

If the receiver doesn't use the Font panel, this method does nothing.

This method changes the font by sending a convertFont message to the shared NSFontManager and applying each NSFont returned to the appropriate text. See the NSFontManager class specification for more information on font conversion.

31.65.8 checkSpelling

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method searches for a misspelled word in the receiver's text.
Notes: The search starts at the end of the selection and continues until it reaches a word suspected of being misspelled or the end of the text. If a word isn't recognized by the spelling server, a showGuessPanel message then opens the Guess panel and allows the user to make a correction or add the word to the local dictionary.

31.65.9 Constructor

MBS MacCocoa Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new text with size 100/100 and position 0/0
Example:

```
dim t as new NSTextMBS
```

Notes: On success the handle property is not zero.
See also:

- 31.65.10 Constructor(Handle as Integer) 6376
- 31.65.11 Constructor(left as Double, top as Double, width as Double, height as Double) 6377

31.65.10 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an object based on the given NSText handle.
Example:

```
dim t as new NSTextMBS(0, 0, 100, 100)
dim v as new NSTextMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSText and the plugin retains this handle.
See also:

- 31.65.9 Constructor 6376
- 31.65.11 Constructor(left as Double, top as Double, width as Double, height as Double) 6377

31.65.11 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new text with the given size and position.
Example:

```
dim x as new NSTextMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 31.65.9 Constructor 6376
- 31.65.10 Constructor(Handle as Integer) 6376

31.65.12 copy

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method copies the selected text onto the general pasteboard, in as many formats as the receiver supports.

31.65.13 copyFont

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method copies the font information for the first character of the selection (or for the insertion point) onto the font pasteboard, as NSFontPboardType.

31.65.14 copyRuler

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method copies the paragraph style information for first selected paragraph onto the ruler pasteboard, as NSRulerPboardType, and expands the selection to paragraph boundaries.

31.65.15 cut

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method deletes the selected text and places it onto the general pasteboard, in as many formats as the receiver supports.

31.65.16 delete

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method deletes the selected text.

31.65.17 isRulerVisible as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver's enclosing scroll view shows its ruler.

31.65.18 maxSizeHeight as Double

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's maximum height.

31.65.19 maxSizeWidth as Double

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's maximum width.

31.65.20 minSizeHeight as Double

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's minimum height.

31.65.21 minSizeWidth as Double

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's maximum width.

31.65.22 paste

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method pastes text from the general pasteboard at the insertion point or over the selection.

31.65.23 pasteFont

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method pastes font information from the font pasteboard onto the selected text or insertion point of a rich text object, or over all text of a plain text object.

31.65.24 pasteRuler

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method pastes paragraph style information from the ruler pasteboard onto the selected paragraphs of a rich text object.

31.65.25 readRTFDFromFile(file as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Attempts to read the RTFD file, returning true if successful and false if not.
Notes: file should be the path for an .rtf file or an .rtfd file wrapper, not for the RTF file within an .rtfd file wrapper.

31.65.26 replaceCharactersInRangeWithRTF(start as Integer, length as Integer, rtfData as MemoryBlock)

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the characters in the given range with RTF text interpreted from the given RTF data.
Notes:

This method applies only to rich text objects.

This method does not include undo support by default. Clients must invoke shouldChangeTextInRange to include this method in an undoable action.

This method is designed for transferring text from out-of-process sources such as the pasteboard. In most cases, programmatic modification of the text is best done by operating on the text storage directly, using the general methods of NSMutableAttributedString.

31.65.27 replaceCharactersInRangeWithRTFD(start as Integer, length as Integer, rtfdData as MemoryBlock)

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the characters in the given range with RTFD text interpreted from the given RTFD data.
Notes:

This method applies only to rich text objects.

This method does not include undo support by default. Clients must invoke shouldChangeTextInRange to include this method in an undoable action.

This method is designed for transferring text from out-of-process sources such as the pasteboard. In most cases, programmatic modification of the text is best done by operating on the text storage directly, using the general methods of NSMutableAttributedString.

31.65.28 replaceCharactersInRangeWithString(start as Integer, length as Integer, text as string)

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the characters in the given range with those in the given string.
Notes:

For a rich text object, the text is assigned the formatting attributes of the first character of the text it replaces, or of the character immediately before aRange if the range's length is 0. If the range's location is 0, the formatting attributes of the first character in the receiver are used.

This method does not include undo support by default. Clients must invoke shouldChangeTextInRange to include this method in an undoable action.

In most cases, programmatic modification of the text is best done by operating on the text storage directly, using the general methods of NSMutableAttributedString.

31.65.29 RTFDFromRange(start as Integer, length as Integer) as MemoryBlock

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string that contains an RTFD stream corresponding to the characters and attributes within aRange.
Notes:

Raises an NSRangeException if any part of aRange lies beyond the end of the receiver's characters.

When writing data to the pasteboard, you can use the memoryblock object as the first argument to NSPasteboard's setDataForType method, with a second argument of NSRTFDPboardType.

31.65.30 RTFFromRange(start as Integer, length as Integer) as MemoryBlock

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** eturns a string object that contains an RTF stream corresponding to the characters and attributes within aRange, omitting any attachment characters and attributes.
Notes:

Raises an NSRangeException if any part of aRange lies beyond the end of the receiver's characters.

When writing data to the pasteboard, you can use the memoryblock as the first argument to NSPasteboard's setDataForType method, with a second argument of NSRTFPboardType.

31.65.31 scrollRangeToVisible(start as Integer, length as Integer)

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Scrolls the receiver in its enclosing scroll view so the first characters of aRange are visible.

31.65.32 selectAll

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method selects all of the receiver's text.

31.65.33 setFontForRange(font as NSFontMBS, start as Integer, length as Integer)

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the font of characters within the given range to font.
Notes:

This method applies only to a rich text object.

This method does not include undo support by default. Clients must invoke shouldChangeTextInRanges to include this method in an undoable action.

31.65.34 setMaxSize(width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the receiver's maximum size.

31.65.35 setMinSize(width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the receiver's minimum size.

31.65.36 setTextColorForRange(colorValue as NSColorMBS, start as Integer, length as Integer)

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the text color of characters within the given range to colorValue.
Notes:

Removes the text color attribute if colorValue is nil. This method applies only to rich text objects.

This method does not include undo support by default. Clients must invoke shouldChangeTextInRange to include this method in an undoable action.

31.65.37 showGuessPanel

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method opens the Spelling panel, allowing the user to make a correction during spell

checking.

31.65.38 sizeToFit

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Resizes the receiver to fit its text.
Notes: The text view will not be sized any smaller than its minimum size, however.

31.65.39 subscript

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method applies a subscript attribute to selected text (or all text if the receiver is a plain text object), lowering its baseline offset by a predefined amount.

31.65.40 superscript

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method applies a superscript attribute to selected text (or all text if the receiver is a plain text object), raising its baseline offset by a predefined amount.

31.65.41 textLength as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the length of the text in unicode chars.

31.65.42 toggleRuler

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method shows or hides the ruler, if the receiver is enclosed in a scroll view.

31.65.43 underline

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds the underline attribute to the selected text attributes if absent; removes the attribute if present.
Notes:

If there is a selection and the first character of the selected range has any form of underline on it, or if there is no selection and the typing attributes have any form of underline, then underline is removed; otherwise a single simple underline is added.

Operates on the selected range if the receiver contains rich text. For plain text the range is the entire contents of the receiver.

31.65.44 unscript

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method removes any superscripting or subscripting from selected text (or all text if the receiver is a plain text object).

31.65.45 writeRTFDToFile(file as folderitem, atomically as boolean) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the receiver's text as RTF with attachments to a file or directory at file.
Notes: Returns true on success and false on failure. If atomically is true, attempts to write the file safely so that an existing file at path is not overwritten, nor does a new file at path actually get created, unless the write is successful.

31.65.46 Properties

31.65.47 alignment as Integer

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The text alignment.
Notes: (Read and Write computed property)

31.65.48 backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The background color.
Notes: (Read and Write computed property)

31.65.49 baseWritingDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The initial writing direction used to determine the actual writing direction for text.
Notes:

The Text system uses this value as a hint for calculating the actual direction for displaying Unicode characters. You should not need to call this method directly. If no writing direction is set, returns NSWritingDirectionNatural.

Available in Mac OS X v10.4 and later.
(Read and Write computed property)

31.65.50 drawsBackground as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the scrollview draws its background.
Notes: (Read and Write computed property)

31.65.51 Enabled as boolean

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enables/disables the control.
Notes:

If enabled, text is in default text color.
if disabled, you can't edit or select and the text color is gray.
(Read and Write computed property)

31.65.52 font as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The font of the first character in the receiver's text, or of the insertion point if there's no text.
Notes: (Read and Write computed property)

31.65.53 importsGraphics as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver allows the user to import files by dragging.

Notes: (Read and Write computed property)

31.65.54 isEditable as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver allows the user to edit text, false if it doesn't.
Notes:

You can change the receiver's text programmatically regardless of this setting.

If the receiver is editable, it's also selectable.
(Read and Write computed property)

31.65.55 isFieldEditor as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver interprets Tab, Shift-Tab, and Return (Enter) as cues to end editing and possibly to change the first responder.
Notes:

True if the receiver interprets Tab, Shift-Tab, and Return (Enter) as cues to end editing and possibly to change the first responder; false if it accepts them as text input.

See the NSWindow class specification for more information on field editors. By default, NSText objects don't behave as field editors.
(Read and Write computed property)

31.65.56 isHorizontallyResizable as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if the receiver automatically changes its width to accommodate the width of its text, false if it doesn't.
Notes:

By default, an NSText object is not horizontally resizable.
(Read and Write computed property)

31.65.57 isRichText as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the NSText allows the user to apply attributes to specific ranges of the text.
Notes: (Read and Write computed property)

31.65.58 isSelectable as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the text allows the user to select text, false if it doesn't.
Notes: (Read and Write computed property)

31.65.59 isVerticallyResizable as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if the receiver automatically changes its height to accommodate the height of its text, false if it doesn't.
Notes:

By default, an NSText object is vertically resizable.
(Read and Write computed property)

31.65.60 selectedRange as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The range of selected characters.
Example:

```
dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
dim s as NSTextStorageMBS = t.textStorage

const NSUnderlineStyleSingle = 1

dim r as NSRangeMBS = t.selectedRange
s.addAttribute NSAttributedStringMBS.NSStrikethroughStyleAttributeName, NSUnderlineStyleSingle, r
```

Notes: (Read and Write computed property)

31.65.61 text as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The characters of the text.
Notes:

For performance reasons, this method returns the current backing store of the text object. If you want to maintain a snapshot of this as you manipulate the text storage, you should make a copy of the appropriate substring.
(Read and Write computed property)

31.65.62 textColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The text color.
Notes: (Read and Write computed property)

31.65.63 usesFontPanel as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver uses the Font panel.
Notes: (Read and Write computed property)

31.65.64 Events

31.65.65 textDidBeginEditing

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Informs you that the text object has begun editing (that the user has begun changing it).

31.65.66 textDidChange

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Informs you that the text object has changed its characters or formatting attributes.

31.65.67 textDidEndEditing

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Informs you that the text object has finished editing (that it has resigned first responder status).

31.65.68 textShouldBeginEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when a text object begins to change its text, this method requests permission to begin editing. **Notes:** If the delegate returns false, the text object proceeds to make changes. If the delegate returns true, the text object abandons the editing operation. This method is also invoked when the user drags and drops a file onto the text object.

31.65.69 textShouldEndEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked from a text object's implementation of resignFirstResponder, this method requests permission to end editing.
Notes: If the delegate returns false, the text object proceeds to finish editing and resign first responder status. If the delegate returns true, the text object selects all of its text and remains the first responder.

31.65.70 Constants

31.65.71 NSBackspaceCharacter=8

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

31.65.72 NSBackTabCharacter=& h19

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

31.65.73 NSBacktabTextMovement=& h12

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?"

Notes: The Backtab (Shift-Tab) key was pressed.

31.65.74 NSCancelTextMovement=& h17

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?"
Notes:

The user cancelled the completion.
Available in Mac OS X v10.3 and later.

31.65.75 NSCarriageReturnCharacter=13

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

31.65.76 NSCenterTextAlignment=2

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the text alignment constants for the alignment property.
Notes: Visually centered

31.65.77 NSDeleteCharacter=& h7F

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

31.65.78 NSDownTextMovement=& h16

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?"
Notes: The down arrow key was pressed.

31.65.79 NSEnterCharacter=3

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

31.65.80 NSFormFeedCharacter=12

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

31.65.81 NSIllegalTextMovement=0

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?"
Notes: Currently unused.

31.65.82 NSJustifiedTextAlignment=3

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the text alignment constants for the alignment property.
Notes: Fully-justified. The last line in a paragraph is natural-aligned.

31.65.83 NSLeftTextAlignment=0

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the text alignment constants for the alignment property.
Notes: Visually left aligned

31.65.84 NSLeftTextMovement=& h13

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?"
Notes: The left arrow key was pressed.

31.65.85 NSLineSeparatorCharacter=& h2028

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

31.65.86 NSNaturalTextAlignment=4

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the text alignment constants for the alignment property.
Notes: Indicates the default alignment for script.

31.65.87 NSNewlineCharacter=10

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

31.65.88 NSOtherTextMovement=0

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?"
Notes:

The user performed some undefined action.

Available in Mac OS X v10.3 and later.

31.65.89 NSParagraphSeparatorCharacter=& h2029

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

31.65.90 NSReturnTextMovement=& h10

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?"
Notes: The Return key was pressed.

31.65.91 NSRightTextAlignment=1

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the text alignment constants for the alignment property.
Notes: Visually right aligned

31.65.92 NSRightTextMovement=& h14

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?"
Notes: The right arrow key was pressed.

31.65.93 NSTabCharacter=9

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify commonly used Unicode characters.

31.65.94 NSTabTextMovement=& h11

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?"
Notes: The Tab key was pressed.

31.65.95 NSTextWritingDirectionEmbedding=0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** An additional constant to specify the writing direction.
Notes:

Direction is embedded.
Available in Mac OS X v10.6 and later.

31.65.96 NSTextWritingDirectionOverride=1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** An additional constant to specify the writing direction.
Notes:

Direction override
Available in Mac OS X v10.6 and later.

31.65.97 NSUpTextMovement=& h15

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants used to specify the reason for a change of editing focus among text fields, in essence answering the question "why am I leaving the field?"
Notes: The up arrow key was pressed.

31.65.98 NSWritingDirectionLeftToRight=0

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the writing directions.
Notes:

The writing direction is left to right.

Available in Mac OS X v10.2 and later.

31.65.99 NSWritingDirectionNatural=-1

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the writing directions.
Notes:

The writing direction is determined using the Unicode Bidi Algorithm rules P2 and P3. Default.

Available in Mac OS X v10.4 and later.

31.65.100 NSWritingDirectionRightToLeft=1

MBS MacCocoa Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the writing directions.
Example:

```
const NSWritingDirectionNatural = -1 // Determines direction using the Unicode Bidi Algorithm rules P2 and P3
const NSWritingDirectionLeftToRight = 0 // Left to right writing direction
const NSWritingDirectionRightToLeft = 1 // Right to left writing direction
```

```
const NSTextWritingDirectionEmbedding = 0
const NSTextWritingDirectionOverride = 2

dim t as NSTextStorageMBS = TextArea1.NSTextViewMBS.textStorage

// get hello in arabic
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

// now set attributes for right to left
m.addAttribute t.NSWritingDirectionAttributeName, array(NSWritingDirectionRightToLeft+NSTextWritingDirectionOverride), new NSRangeMBS(0,m.Length)

// and add to textarea
t.appendAttributedString m
```

Notes:

The writing direction is right to left.

Available in Mac OS X v10.2 and later.

31.66 class NSTextStorageMBS

31.66.1 class NSTextStorageMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for the text storage of a text view.
Notes:

NSTextStorage is a semiconcrete subclass of NSMutableAttributedString that manages a set of client NSLayoutManager objects, notifying them of any changes to its characters or attributes so that they can relay and redisplay the text as needed. NSTextStorage defines the fundamental storage mechanism of the Application Kit's extended text-handling system.

NSTextStorage also defines a set of methods, listed under "Getting and setting scriptable properties" in the Method Types section, useful for getting and setting scriptable properties of NSTextStorage objects. Unless you are dealing with scriptability, you do not normally need to invoke these methods directly. In particular, using the characters, words or paragraphs methods or their corresponding setter methods is an inefficient way to manipulate the text storage, since these methods create and return many objects. Instead, use the text access methods defined by NSMutableAttributedString, NSAttributedString, NSMutableString, and NSString to perform character-level manipulation.
Subclass of the NSMutableAttributedStringMBS class.

31.66.2 Blog Entries

- MBS Real Studio Plugins, version 12.2pr4

31.66.3 Methods

31.66.4 addLayoutManager(l as NSLayoutManagerMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a layout manager to the receiver's set of layout managers.
Notes: l: The layout manager to add.

31.66.5 changeInLength as Integer

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the difference between the current length of the edited range and its length before editing began.
Notes:

Returns the difference between the current length of the edited range and its length before editing began.

That is, before the receiver was sent the first beginEditing message or a single edited:range:changeInLength: message.

This difference is accumulated with each invocation of edited:range:changeInLength:, until a final message processes the changes.

The receiver's delegate and layout managers can use this information to determine the nature of edits in their respective notification methods.

31.66.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor to create a new empty text storage object.

31.66.7 editedMask as Integer

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the kinds of edits pending for the receiver.
Notes: Returns a mask describing the kinds of edits pending for the receiver.

31.66.8 editedRange as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** eturns the range of the receiver to which pending changes have been made, whether of characters or of attributes.
Notes: The receiver's delegate and layout managers can use this information to determine the nature of edits in their respective notification methods.

31.66.9 ensureAttributesAreFixedInRange(Range as NSRangeMBS)

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Ensures that attributes are fixed in the given range.
Notes:

range: The range of characters whose attributes might be examined.

An NSTextStorage object using lazy attribute fixing is required to call this method before accessing any attributes within range. This method gives attribute fixing a chance to occur if necessary. NSTextStorage

subclasses wishing to support laziness must call this method from all attribute accessors they implement.

31.66.10 fixesAttributesLazily as boolean

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether the receiver fixes attributes lazily.
Notes: By default, custom NSTextStorage subclasses are not lazy, but the provided concrete subclass is lazy by default.

31.66.11 invalidateAttributesInRange(Range as NSRangeMBS)

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invalidates attributes in the specified range.
Notes:

range: The range of characters whose attributes should be invalidated.

Called from processEditing to invalidate attributes when the text storage changes. If the receiver is not lazy, this method simply calls fixAttributesInRange. If lazy attribute fixing is in effect, this method instead records the range needing fixing.

31.66.12 processEditing

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Cleans up changes made to the receiver and notifies its delegate and layout managers of changes.

31.66.13 removeLayoutManager(l as NSLayoutManagerMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes a layout manager from the receiver's set of layout managers.
Notes: l: The layout manager to remove.

31.66.14 Constants

31.66.15 NSTextStorageEditedAttributes=1

MBS MacCocoa Plugin, Plugin Version: 8.6. **Function:** The constants for text messages.
Notes: Attributes were added, removed, or changed.

31.66.16 NSTextStorageEditedCharacters=2

MBS MacCocoa Plugin, Plugin Version: 8.6. **Function:** The constants for text messages.
Notes: Characters were added, removed, or replaced.

31.67 class NSTextTabMBS

31.67.1 class NSTextTabMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSTextTab object represents a tab in an NSParagraphStyle object, storing an alignment type and location.
Notes:

NSTextTab objects are most frequently used with the Application Kit's text system and with NSRulerView and NSRulerMarker objects. See the appropriate class specifications for more information on these uses.

The text system supports four alignment types: left, center, right, and decimal (based on the decimal separator character of the locale in effect). These alignment types are absolute, not based on the line sweep direction of text. For example, tabbed text is always positioned to the left of a right-aligned tab, whether the line sweep direction is left to right or right to left. A tab's location, on the other hand, is relative to the back margin. A tab set at 1.5", for example, is at 1.5" from the right in right to left text.

31.67.7 copy as NSTextTabMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the text tab.

31.67.8 Properties

31.67.9 alignment as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the text alignment of the receiver.
Notes: (Read only property)

31.67.10 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

31.67.11 location as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's ruler location relative to the back margin.
Notes: (Read only property)

31.67.12 options as Dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the dictionary of attributes associated with the receiver.
Notes: (Read only property)

31.67.13 tabStopType as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's tab stop type.
Notes: (Read only property)

31.67.14 Constants

31.67.15 NSCenterTabStopType = 2

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the type constants for tab stops.
Notes: A center-aligned tab stop.

31.67.16 NSDecimalTabStopType = 3

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the type constants for tab stops.
Notes: Aligns columns of numbers by the decimal point.

31.67.17 NSLeftTabStopType = 0

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the type constants for tab stops.
Notes: A left-aligned tab stop.

31.67.18 NSRightTabStopType = 1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the type constants for tab stops.
Notes: A right-aligned tab stop.

31.68 class NSTimerMBS

31.68.1 class NSTimerMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The cocoa timer class.
Example:

```
dim n as new NSTimerMBS(5, true)
```

Notes:

You use the NSTimer class to create timer objects or, more simply, timers. A timer waits until a certain time interval has elapsed and then fires, calling the action event. For example, you could create an NSTimer object that calls the action event, telling it to update itself after a certain time interval.

A timer is not a real-time mechanism; it fires only when one of the run loop modes to which the timer has been added is running and able to check if the timer's firing time has passed. Because of the various input sources a typical run loop manages, the effective resolution of the time interval for a timer is limited to on the order of 50-100 milliseconds. If a timer's firing time occurs during a long callout or while the run loop is in a mode that is not monitoring the timer, the timer does not fire until the next time the run loop checks the timer. Therefore, the actual time at which the timer fires potentially can be a significant period of time after the scheduled firing time.

Repeating Versus Non-Repeating Timers
You specify whether a timer is repeating or non-repeating at creation time. A non-repeating timer fires once and then invalidates itself automatically, thereby preventing the timer from firing again. By contrast, a repeating timer fires and then reschedules itself on the same run loop.

A repeating timer always schedules itself based on the scheduled firing time, as opposed to the actual firing time. For example, if a timer is scheduled to fire at a particular time and every 5 seconds after that, the scheduled firing time will always fall on the original 5 second time intervals, even if the actual firing time gets delayed. If the firing time is delayed so far that it passes one or more of the scheduled firing times, the timer is fired only once for that time period; the timer is then rescheduled, after firing, for the next scheduled firing time in the future.

Scheduling Timers in Run Loops
A timer object can be registered in only one run loop at a time, although it can be added to multiple run loop modes within that run loop. There are three ways to create a timer:

Use the Constructor to create the timer and schedule it on the current run loop in the default mode.

Once scheduled, the timer fires at the specified interval until it is invalidated. A non-repeating timer invali-

dates itself immediately after it fires. However, for a repeating timer, you must invalidate the timer object yourself by calling its invalidate method. Calling this method requests the removal of the timer from the current run loop; as a result, you should always call the invalidate method from the same thread on which the timer was installed. Invalidating the timer immediately disables it so that it no longer affects the run loop. The run loop then removes and releases the timer, either just before the invalidate method returns or at some later point. Once invalidated, timer objects cannot be reused.

31.68.4 Methods

31.68.5 Constructor(fireDate as date, timeInterval as Double, repeats as boolean)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes a new NSTimer.
Example:

```
dim d as new date
d.hour = d.hour + 1 // start in one hour

dim n as new NSTimerMBS(d, 5, true)
```

Notes:

fireDate: The time at which the timer should first fire.

timeInterval: For a repeating timer, this parameter contains the number of seconds between firings of the timer. If seconds is less than or equal to 0.0, this method chooses the nonnegative value of 0.1 milliseconds instead.
repeats: If true, the timer will repeatedly reschedule itself until invalidated. If false, the timer will be invalidated after it fires.

The time is initialized such that, when added to a run loop, it will fire at date and then, if repeats is true, every seconds after that.
See also:

- 31.68.6 Constructor(fireDate as date, timeInterval as Double, repeats as boolean, runloop as NSRunLoopMBS, runloopMode as string) 6405
- 31.68.7 Constructor(timeInterval as Double, repeats as boolean) 6405

31.68.6 Constructor(fireDate as date, timeInterval as Double, repeats as boolean, runloop as NSRunLoopMBS, runloopMode as string)

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes a new NSTimer.
Notes:

fireDate: The time at which the timer should first fire.

timeInterval: For a repeating timer, this parameter contains the number of seconds between firings of the timer. If seconds is less than or equal to 0.0, this method chooses the nonnegative value of 0.1 milliseconds instead.
repeats: If true, the timer will repeatedly reschedule itself until invalidated. If false, the timer will be invalidated after it fires.

The time is initialized such that, when added to a run loop, it will fire at date and then, if repeats is true, every seconds after that.

Schedules the timer to run on the given runloop in the given mode.
See also:

- 31.68.5 Constructor(fireDate as date, timeInterval as Double, repeats as boolean) 6404
- 31.68.7 Constructor(timeInterval as Double, repeats as boolean) 6405

31.68.7 Constructor(timeInterval as Double, repeats as boolean)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates and returns a new NSTimer object and schedules it on the current run loop in the default mode.
Example:

```
dim n as new NSTimerMBS(5, true)
MsgBox str(n.timeInterval)
```

Notes:

timeInterval: The number of seconds between firings of the timer. If seconds is less than or equal to 0.0, this method chooses the nonnegative value of 0.1 milliseconds instead.
repeats: If true, the timer will repeatedly reschedule itself until invalidated. If false, the timer will be invalidated after it fires.

After seconds seconds have elapsed, the timer fires, calling the Action event.
See also:

- 31.68.5 Constructor(fireDate as date, timeInterval as Double, repeats as boolean) 6404
- 31.68.6 Constructor(fireDate as date, timeInterval as Double, repeats as boolean, runloop as NSRunLoopMBS, runloopMode as string) 6405

31.68.8 fire

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Causes the receiver's message to be sent to its target.
Notes: You can use this method to fire a repeating timer without interrupting its regular firing schedule. If the timer is non-repeating, it is automatically invalidated after firing, even if its scheduled fire date has not arrived.

31.68.9 invalidate

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops the receiver from ever firing again and requests its removal from its run loop.
Example:

```
dim n as new NSTimerMBS(5, true)

// later

n.invalidate
```

Notes:

The destructor calls invalide automatically for you.

This method is the only way to remove a timer from an NSRunLoop object. The NSRunLoop object removes and releases the timer, either just before the invalidate method returns or at some later point.

You must send this message from the thread on which the timer was installed. If you send this message from

another thread, the input source associated with the timer may not be removed from its run loop, which could prevent the thread from exiting properly.

31.68.10 isValid as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether the receiver is currently valid.
Example:

```
dim n as new NSTimerMBS(5, true)
MsgBox str(n.isValid)
```

Notes: True if the receiver is still capable of firing or false if the timer has been invalidated and is no longer capable of firing.

31.68.11 timeInterval as Double

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The receiver's time interval.
Example:

```
dim n as new NSTimerMBS(5, true)
MsgBox str(n.timeInterval)
```

Notes: The receiver's time interval. If the receiver is a non-repeating timer, returns 0 (even if a time interval was set).

31.68.12 Timer(t as timer) as NSTimerMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a NSTimerMBS object referencing the given timer object.
Example:

```
dim n as NSTimerMBS = NSTimerMBS.timer(timer1)
n.tolerance = 0.1
```

Notes:

Only for Cocoa 32bit currently.
Works fine in Xojo 2012 and Xojo 2014r1 in Cocoa target.

31.68.13 Properties

31.68.14 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal reference to the NSTimer object.
Example:

```
dim n as new NSTimerMBS(5, true)
MsgBox str(n.Handle)
```

Notes: (Read and Write property)

31.68.15 fireDate as date

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The date at which the receiver will fire.
Example:

```
dim d as new date
d.hour = d.hour + 1 // start in one hour

dim n as new NSTimerMBS(d, 5, true)
MsgBox n.fireDate.ShortDate+" "+n.fireDate.ShortTime
```

Notes:

The date at which the receiver will fire. If the timer is no longer valid, this method returns the last date at which the timer fired.

Use the isValid method to verify that the timer is valid.

You typically use this method to adjust the firing time of a repeating timer. Although resetting a timer's next firing time is a relatively expensive operation, it may be more efficient in some situations. For example, you could use it in situations where you want to repeat an action multiple times in the future, but at irregular time intervals. Adjusting the firing time of a single timer would likely incur less expense than creating multiple timer objects, scheduling each one on a run loop, and then destroying them.

You should not call this method on a timer that has been invalidated, which includes non-repeating timers that have already fired. You could potentially call this method on a non-repeating timer that had not yet fired, although you should always do so from the thread to which the timer is attached to avoid potential race conditions.
(Read and Write computed property)

31.68.16 tag as Variant

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A value you can use in your app however you like.
Example:

```
dim n as new NSTimerMBS(5, true)
n.tag = window1 // some value you may later use
```

Notes: (Read and Write computed property)

31.68.17 tolerance as Double

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The tolerance for this timer.
Notes:

Requires Mac OS X 10.9.

Setting a tolerance for a timer allows it to fire later than the scheduled fire date, improving the ability of the system to optimize for increased power savings and responsiveness. The timer may fire at any time between its scheduled fire date and the scheduled fire date plus the tolerance. The timer will not fire before the scheduled fire date. For repeating timers, the next fire date is calculated from the original fire date regardless of tolerance applied at individual fire times, to avoid drift. The default value is zero, which means no additional tolerance is applied. The system reserves the right to apply a small amount of tolerance to certain timers regardless of the value of this property.

As the user of the timer, you will have the best idea of what an appropriate tolerance for a timer may be. A general rule of thumb, though, is to set the tolerance to at least 10% of the interval, for a repeating timer. Even a small amount of tolerance will have a significant positive impact on the power usage of your application. The system may put a maximum value of the tolerance.
(Read and Write computed property)

31.68.18 Events

31.68.19 Action

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the timer fires.

31.69 class NSTimeZoneMBS

31.69.1 class NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSTimeZone is an abstract class that defines the behavior of time zone objects.
Notes:

Time zone objects represent geopolitical regions. Consequently, these objects have names for these regions. Time zone objects also represent a temporal offset, either plus or minus, from Greenwich Mean Time (GMT) and an abbreviation (such as PST for Pacific Standard Time).

NSTimeZone provides several class methods to get time zone objects: timeZoneWithName, timeZoneWithAbbreviation, and timeZoneForSecondsFromGMT. The class also permits you to set the default time zone within your application (setDefaultTimeZone). You can access this default time zone at any time with the defaultTimeZone class method, and with the localTimeZone class method, you can get a relative time zone object that decodes itself to become the default time zone for any locale in which it finds itself.

Cocoa does not provide any API to change the time zone of the computer, or of other applications.

Some NSCalendarDate methods return date objects that are automatically bound to time zone objects. These date objects use the functionality of NSTimeZone to adjust dates for the proper locale. Unless you specify otherwise, objects returned from NSCalendarDate are bound to the default time zone for the current locale.

Note that, strictly, time zone database entries such as "America/Los_Angeles" are IDs not names. An example of a time zone name is "Pacific Daylight Time". Although many NSTimeZone method names include the word "name", they refer to IDs.

31.69.2 Blog Entries

- MBS Xojo Plugins, version 17.5pr4
- MBS Xojo / Real Studio Plugins, version 13.4pr4
- MBS Real Studio Plugins, version 12.3pr11

31.69.3 Methods

31.69.4 Constructor

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new timezone.

See also:

- 31.69.5 Constructor(name as string) 6412

31.69.5 Constructor(name as string)

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a time zone initialized with a given ID.
Example:

```
dim t as NSTimeZoneMBS = new NSTimeZoneMBS("Europe/Berlin")
MsgBox t.name
```

Notes:

If name is a known ID, this method calls initWithName:data: with the appropriate data object.

In Mac OS X v10.4 and earlier providing nil for the parameter would have caused a crash. In Mac OS X v10.5 and later, this now raises an invalid argument exception.
See also:

- 31.69.4 Constructor 6411

31.69.6 copy as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the timezone object.
Example:

```
dim t as NSTimeZoneMBS = NSTimeZoneMBS.systemTimeZone
dim c as NSTimeZoneMBS = t.copy

MsgBox c.name
```

31.69.7 defaultTimeZone as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default time zone for the current application.
Example:

```
MsgBox NSTimeZoneMBS.defaultTimeZone.name
```

Notes:

The default time zone for the current application. If no default time zone has been set, this method invokes systemTimeZone and returns the system time zone.

Discussion
The default time zone is the one that the application is running with, which you can change (so you can make the application run as if it were in a different time zone).

If you get the default time zone and hold onto the returned object, it does not change if a subsequent invocation of setDefaultTimeZone changes the default time zone—you still have the specific time zone you originally got. Contrast this behavior with the object returned by localTimeZone.

31.69.8 isEqualToTimeZone(timeZone as NSTimeZoneMBS) as boolean

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver has the same name and data as another given time zone.
Example:

```
if NSTimeZoneMBS.systemTimeZone.isEqualToTimeZone(NSTimeZoneMBS.localTimeZone) then
MsgBox "equal"
else
MsgBox "not equal"
end if
```

Notes:

TimeZone: The time zone to compare with the receiver.
Returns true if TimeZone and the receiver have the same name and data, otherwise false.

31.69.9 knownTimeZoneNames as string()

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of strings listing the IDs of all the time zones known to the system.
Example:

```
MsgBox join(NSTimeZoneMBS.knownTimeZoneNames, EndOfLine)
```

31.69.10 localTimeZone as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an object that forwards all messages to the default time zone for the current application.
Example:

MsgBox NSTimeZoneMBS.localTimeZone.name

Notes:

An object that forwards all messages to the default time zone for the current application.

Discussion
The local time zone represents the current state of the default time zone at all times. If you get the default time zone (using defaultTimeZone) and hold onto the returned object, it does not change if a subsequent invocation of setDefaultTimeZone changes the default time zone—you still have the specific time zone you originally got. The local time zone adds a level of indirection, it acts as if it were the current default time zone whenever you invoke a method on it.

31.69.11 Print

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the time zone to debug output.
Example:

NSTimeZoneMBS.localTimeZone.print

Notes: This may help for debugging and you see output in console app.

31.69.12 systemTimeZone as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the time zone currently used by the system.
Example:

MsgBox NSTimeZoneMBS.systemTimeZone.name

Notes:

The time zone currently used by the system. If the current time zone cannot be determined, returns the

GMT time zone.

Special Considerations
If you get the system time zone, it is cached by the application and does not change if the user subsequently changes the system time zone. The next time you invoke systemTimeZone, you get back the same time zone you originally got. You have to invoke resetSystemTimeZone to clear the cached object.

31.69.13 timeZoneForSecondsFromGMT(seconds as Integer) as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates time zone object based on a delta from GMT.
Notes: Time zones created with this never have daylight savings and the offset is constant no matter the date; the name and abbreviation do NOT follow the POSIX convention (of minutes-west).

31.69.14 timeZoneWithName(name as string) as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the time zone object identified by a given ID.
Example:

```
dim t as NSTimeZoneMBS = NSTimeZoneMBS.timeZoneWithName("Europe/Berlin")
MsgBox t.name
```

Notes:

Name: The ID for the time zone.

Returns the time zone in the information directory with a name matching name.
Returns nil if there is no match for the name.

31.69.15 Properties

31.69.16 abbreviation as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the abbreviation for the receiver.
Example:

```
MsgBox NSTimeZoneMBS.localTimeZone.Abbreviation
```

Notes:

The abbreviation for the receiver, such as "EDT" (Eastern Daylight Time).
Invokes abbreviationForDate with the current date as the argument.
(Read only property)

31.69.17 DaylightSavingTimeOffset as Double

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current daylight saving time offset of the receiver.
Example:

MsgBox str(NSTimeZoneMBS.localTimeZone.DaylightSavingTimeOffset)

Notes:

Available in OS X v10.5 and later.
(Read only property)

31.69.18 description as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the description of the receiver.
Example:

MsgBox NSTimeZoneMBS.localTimeZone.Description

Notes:

The description of the receiver, including the name, abbreviation, offset from GMT, and whether or not daylight savings time is currently in effect.
(Read only property)

31.69.19 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

31.69.20 isDaylightSavingTime as Boolean

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver is currently using daylight saving time.
Example:

MsgBox str(NSTimeZoneMBS.localTimeZone.isDaylightSavingTime)

Notes:

Returns true if the receiver is currently using daylight savings time, otherwise false.
(Read only property)

31.69.21 name as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the geopolitical region ID that identifies the receiver.
Example:

MsgBox NSTimeZoneMBS.localTimeZone.Name

Notes: (Read only property)

31.69.22 SecondsFromGMT as Double

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current difference in seconds between the receiver and Greenwich Mean Time.
Example:

MsgBox str(NSTimeZoneMBS.localTimeZone.SecondsFromGMT)

Notes:

The current difference in seconds between the receiver and Greenwich Mean Time.
(Read only property)

31.69.23 abbreviationDictionary as Dictionary

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a dictionary holding the mappings of time zone abbreviations to time zone names.
Notes:

Note that more than one time zone may have the same abbreviation—for example, US/Pacific and Canada/Pacific both use the abbreviation "PST." In these cases, abbreviationDictionary chooses a single name to map the abbreviation to.
(Read and Write computed property)

31.70 class NSTokenFieldMBS

31.70.1 class NSTokenFieldMBS

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: NSTokenField is a subclass of NSTextField that provides tokenized editing similar to the address field in the Mail application.
Notes:

NSTokenField uses an NSTokenFieldCell to implement much of the control's functionality. NSTokenField provides cover methods for most methods of NSTokenFieldCell, which invoke the corresponding cell method.

In MBS Plugin the objects must be strings or numbers. With plugin version 12.5, you can also use normal Xojo objects.

In OS X v10.4, NSTokenField trims whitespace around tokens but it does not trim whitespace in OS X versions 10.5.0 and 10.5.1. In OS X v10.5.2, you get whitespace-trimming behavior by either linking against the v10.4 binary or linking against the v10.5 binary and not implementing the representedObjectForEditingString event. If you do not want the whitespace-trimming behavior, link against the v10.5 binary and implement this method, returning the editing string if you have no represented object.

Please note: Due to the way the plugin is implemented the Action, textShouldEndEditing and textShouldBeginEditing events do nothing, so please use tokenFieldAction, tokenFieldTextShouldEndEditing and tokenFieldTextShouldBeginEditing.
Subclass of the NSTextFieldMBS class.

31.70.3 Methods

31.70.4 Constructor

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new control with size 100/100 and position 0/0
Example:

```
dim t as new NSTokenFieldMBS
```

Notes: On success the handle property is not zero.
See also:

- 31.70.5 Constructor(Handle as Integer) 6420
- 31.70.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6420

31.70.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSControl handle.
Example:

```
dim t as new NSTokenFieldMBS(0, 0, 100, 100)
dim v as new NSTokenFieldMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSControl and the plugin retains this handle.
See also:

- 31.70.4 Constructor 6419
- 31.70.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6420

31.70.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new control with the given size and position.
Example:

```
dim x as new NSTokenFieldMBS(0, 0, 100, 20)
```

Notes: On success the handle property is not zero.
See also:

- 31.70.4 Constructor 6419
- 31.70.5 Constructor(Handle as Integer) 6420

31.70.7 defaultCompletionDelay as Double

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the default completion delay.
Notes: The default completion delay is 0.

31.70.8 defaultTokenizingCharacterSet as NSCharacterSetMBS

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the default tokenizing character set.
Notes: The default tokenizing character set is ",".

31.70.9 objects as Variant()

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Queries list of represented objects.

31.70.10 setObjects(objects() as Variant)

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets current objects.

31.70.11 Properties

31.70.12 completionDelay as Double

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The completion delay.
Notes: (Read and Write computed property)

31.70.13 tokenizingCharacterSet as NSCharacterSetMBS

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The tokenizing character set.
Notes: (Read and Write computed property)

31.70.14 tokenStyle as Integer

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The token style.
Notes: (Read and Write computed property)

31.70.15 Events

31.70.16 completionsForSubstring(substring as string, tokenIndex as Integer, byref selectedIndex as Integer) as Variant()

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to provide an array of appropriate completions for the contents of the receiver.
Notes:

substring: The partial string that is to be completed.
tokenIndex: The index of the token being edited.
selectedIndex: Optionally, you can return by-reference an index into the returned array that specifies which of the completions should be initially selected. If none are to be selected, return by reference -1.

Returns an array of strings that are possible completions.
If the delegate does not implement this method, no completions are provided.

31.70.17 displayStringForRepresentedObject(representedObject as Variant) as string

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to provide a string to be displayed as a proxy for the given represented object.
Notes:

representedObject: A represented object of the token field.

Returns the string to be used as a proxy for representedObject. If you return nil or do not implement this method, then representedObject is displayed as the string.

31.70.18 editingStringForRepresentedObject(representedObject as Variant) as string

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to provide a string to be edited as a proxy for a represented object.
Notes:

representedObject: A represented object of the token field.

Returns a string that's an editable proxy of the represented object, or nil if the token should not be editable.

31.70.19 hasMenuForRepresentedObject(representedObject as Variant) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to specify whether the given represented object provides a menu.
Notes:

representedObject: A represented object of the token field.

Returns true if the represented object has a menu, false otherwise.
By default tokens in a token field have no menus.

31.70.20 menuForRepresentedObject(representedObject as Variant) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to provide a menu for the specified represented object.
Notes:

representedObject: A represented object of the token field.

Returns the menu associated with the represented object.
By default tokens in a token field do not return menus.

31.70.21 readFromPasteboard(pboard as NSPasteboardMBS) as Variant()

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to return an array of objects representing the data read from the specified pasteboard.
Notes:

pboard: The pasteboard from which to read the represented objects.

Returns an array of represented objects created from the pasteboard data.

31.70.22 representedObjectForEditingString(editingString as string) as Variant

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to provide a represented object for the given editing string.
Notes:

editingString: The edited string representation of a represented object.

Returns a represented object that is displayed rather than the editing string.

Note: In OS X v10.4, NSTokenField trims whitespace around tokens but it does not trim whitespace in OS X versions 10.5.0 and 10.5.1. In OS X v10.5.2, you get whitespace-trimming behavior by either linking against the v10.4 binary or linking against the v10.5 binary and not implementing the this method. If you do not want the whitespace-trimming behavior, link against the v10.5 binary and implement this method, returning the editing string if you have no represented object.

31.70.23 shouldAddObjects(tokens() as Variant, index as Integer) as Variant()

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows to validate the tokens to be added to the receiver at a particular location.
Notes:

tokens: An array of tokens to be inserted in the receiver at index.
index: The index of the receiver in which the array of tokens to be validated (tokens) will be inserted.

Returns an array of validated tokens.

The event can return the array unchanged or return a modified array of tokens. To reject the add completely, return an empty array. Returning nil causes an error.

31.70.24 styleForRepresentedObject(representedObject as Variant) as Integer

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to return the token style for editing the specified represented object.
Notes:

representedObject: A represented object of the token field.

Returns the style that should be used to display the representedObject. Possible values are shown in NSTokenStyle Values.

If the event implements this method and returns an NSTokenStyle that differs from the style set by setTokenStyle:, the value the event returns is preferred.

If you don't implement this method, the token field's tokenStyle is used.

31.70.25 tokenFieldAction

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control's action was triggered.
Notes: For a button if it was pressed.

31.70.26 tokenFieldTextShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow text editing.

31.70.27 tokenFieldTextShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow text editing.

31.70.28 writeRepresentedObjects(objects() as Variant, pboard as NSPasteboardMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent so the delegate can write represented objects to the pasteboard corresponding to a given array of display strings.
Notes:

objects: An array of represented objects associated with the token field.
pboard: The pasteboard to which to write the represented objects.

Return true if you writes the represented objects to the pasteboard, false otherwise. If false, the token field writes the display strings to the NSStringPboardType pasteboard.

31.70.29 Constants

31.70.30 NSDefaultTokenStyle = 0

MBS MacControls Plugin, Plugin Version: 12.5. **Function:** One of the token styles.
Notes:

Style best used for keyword type tokens.
Available in OS X v10.4 and later.

31.70.31 NSPlainTextTokenStyle = 1

MBS MacControls Plugin, Plugin Version: 12.5. **Function:** One of the token styles.
Notes:

Style to use for data you want represented as plain-text and without any token background.
Available in OS X v10.4 and later.

31.70.32 NSRoundedTokenStyle = 2

MBS MacControls Plugin, Plugin Version: 12.5. **Function:** One of the token styles.
Notes:

Style best used for address type tokens.
Available in OS X v10.4 and later.

31.71 class NSUndoManagerMBS

31.71.1 class NSUndoManagerMBS

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSUndoManager is a general-purpose recorder of operations for undo and redo.
Notes:

You register an undo operation by specifying the object that's changing (or the owner of that object), along with a method to invoke to revert its state, and the arguments for that method. When performing undo an NSUndoManager saves the operations reverted so that you can redo the undos. If used in a Cocoa Application Kit-based application, NSUndoManager groups all operations within a single cycle of the run loop, so that performing an undo reverts all changes that occurred during the cycle.

NSUndoManager is implemented as a class of the Foundation framework because executables other than applications might want to revert changes to their states. For example, you might have an interactive command-line tool with undo and redo commands, or there could be distributed object implementations that can revert operations "over the wire." However, users typically see undo and redo as application features. The Application Kit implements undo and redo in its NSTextView object and makes it easy to implement it in objects along the responder chain.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

31.71.2 Methods

31.71.3 beginUndoGrouping

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Marks the beginning of an undo group.
Notes: All individual undo operations before a subsequent endUndoGrouping message are grouped together and reversed by a later undo message. By default undo groups are begun automatically at the start of the event loop, but you can begin your own undo groups with this method, and nest them within other groups.

31.71.4 canRedo as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver has any actions to redo.

31.71.5 canUndo as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver has any actions to undo.

Notes: The return value does not mean you can safely invoke undo or undoNestedGroup—you may have to close open undo groups first.

31.71.6 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

31.71.7 disableUndoRegistration

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Disables the recording of undo operations.
Notes: This method can be invoked multiple times by multiple clients. The enableUndoRegistration method must be invoked an equal number of times to re-enable undo registration.

31.71.8 enableUndoRegistration

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enables the recording of undo operations.
Notes: Because undo registration is enabled by default, it is often used to balance a prior disableUndoRegistration message. Undo registration isn't actually re-enabled until an enable message balances the last disable message in effect. Raises an NSInternalInconsistencyException if invoked while no disableUndoRegistration message is in effect.

31.71.9 endUndoGrouping

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Marks the end of an undo group.
Notes: All individual undo operations back to the matching beginUndoGrouping message are grouped together and reversed by a later undo or undoNestedGroup message. Undo groups can be nested, thus providing functionality similar to nested transactions. Raises an NSInternalInconsistencyException if there's no beginUndoGrouping message in effect.

31.71.10 groupingLevel as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of nested undo groups (or redo groups, if Redo was invoked last) in the current event loop.

Notes: An integer indicating the number of nested groups. If 0 is returned, there is no open undo or redo group.

31.71.11 isRedoing as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver is in the process of performing its redo method.
Notes: True if the method is being performed, otherwise false.

31.71.12 isUndoing as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver is in the process of performing its undo or undoNestedGroup method.
Notes: True if the method is being performed, otherwise false.

31.71.13 isUndoRegistrationEnabled as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the recording of undo operations is enabled.
Notes:

True if registration is enabled; otherwise, false.
Undo registration is enabled by default.

31.71.14 redo

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Performs the operations in the last group on the redo stack, if there are any, recording them on the undo stack as a single group.
Notes: Raises an NSInternalInconsistencyException if the method is invoked during an undo operation.

31.71.15 redoActionName as string

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name identifying the redo action.
Notes:

The redo action name. Returns an empty string if no action name has been assigned or if there is nothing to redo.

For example, if the menu title is "Redo Delete," the string returned is "Delete."

31.71.16 redoMenuItemTitle as string

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the complete title of the Redo menu command, for example, "Redo Paste."
Notes: Returns "Redo" if no action name has been assigned or an empty string if there is nothing to redo.

31.71.17 redoMenuTitleForUndoActionName(actionName as string) as string

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the complete, localized title of the Redo menu command for the action identified by the given name.
Notes:

Override this method if you want to customize the localization behavior. This method is invoked by redoMenuItemTitle.

Available in Mac OS X v10.0 and later.

31.71.18 removeAllActions

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clears the undo and redo stacks and re-enables the receiver.

31.71.19 setActionName(actionName as string)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the name of the action associated with the Undo or Redo command.
Notes: If actionName is an empty string, the action name currently associated with the menu command is removed. There is no effect if actionName is "".

31.71.20 undo

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the top-level undo group if necessary and invokes undoNestedGroup.
Notes: This method also invokes endUndoGrouping if the nesting level is 1. Raises an NSInternalInconsistencyException if more than one undo group is open (that is, if the last group isn't at the top level).

31.71.21 undoActionName as string

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name identifying the undo action.
Notes:

The undo action name. Returns an empty string if no action name has been assigned or if there is nothing to undo.

For example, if the menu title is "Undo Delete," the string returned is "Delete."

31.71.22 undoMenuItemTitle as string

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the complete title of the Undo menu command, for example, "Undo Paste."
Notes: Returns "Undo" if no action name has been assigned or "" if there is nothing to undo.

31.71.23 undoMenuTitleForUndoActionName(actionName as string) as string

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the complete, localized title of the Undo menu command for the action identified by the given name.
Notes: Override this method if you want to customize the localization behavior. This method is invoked by undoMenuItemTitle.

31.71.24 undoNestedGroup

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Performs the undo operations in the last undo group (whether top-level or nested), recording the operations on the redo stack as a single group.
Notes: Raises an NSInternalInconsistencyException if any undo operations have been registered since the last enableUndoRegistration message.

31.71.25 Properties

31.71.26 Handle as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal uses reference to the NSUndoManager object.
Notes: (Read and Write property)

31.71.27 groupsByEvent as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver automatically creates undo groups around each pass of the run loop.
Notes:

True if the receiver automatically creates undo groups around each pass of the run loop, otherwise false.
(Read and Write computed property)

31.71.28 levelsOfUndo as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the maximum number of top-level undo groups the receiver holds.
Notes:

An integer specifying the number of undo groups. A limit of 0 indicates no limit, so old undo groups are never dropped.

When ending an undo group results in the number of groups exceeding this limit, the oldest groups are dropped from the stack. The default is 0.
(Read and Write computed property)

31.72 class NSUserDefaultsMBS

31.72.1 class NSUserDefaultsMBS

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class to handle preferences.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setStringValue "test", "Hello World"
MsgBox u.stringForKey("test")
```

Notes:

The NSUserDefaults class provides a programmatic interface for interacting with the defaults system. The defaults system allows an application to customize its behavior to match a user's preferences. For example, you can allow users to determine what units of measurement your application displays or how often documents are automatically saved. Applications record such preferences by assigning values to a set of parameters in a user's defaults database. The parameters are referred to as defaults since they're commonly used to determine an application's default state at startup or the way it acts by default.

At runtime, you use an NSUserDefaults object to read the defaults that your application uses from a user's defaults database. NSUserDefaults caches the information to avoid having to open the user's defaults database each time you need a default value. The synchronize method, which is automatically invoked at periodic intervals, keeps the in-memory cache in sync with a user's defaults database.

The NSUserDefaults class provides convenience methods for accessing common types such as floats, doubles, integers, Booleans, and URLs. A default object must be a property list, that is, an instance of (or for collections a combination of instances of): NSData, NSString, NSNumber, NSDate, NSArray, or NSDictionary. If you want to store any other type of object, you should typically archive it to create an instance of NSData.

Values returned from NSUserDefaults are immutable, even if you set a mutable object as the value. For example, if you set a mutable string as the value for "MyStringDefault", the string you later retrieve using stringForKey will be immutable.

A defaults database is created automatically for each user. The NSUserDefaults class does not currently support per-host preferences. To do this, you must use the CFPreferencesMBS class. However, NSUserDefaults correctly reads per-host preferences, so you can safely mix CFPreferencesMBS code with NSUserDefaultsMBS code.

If your application supports managed environments, you can use an NSUserDefaults object to determine which preferences are managed by an administrator for the benefit of the user. Managed environments correspond to computer labs or classrooms where an administrator or teacher may want to configure the

systems in a particular way. In these situations, the teacher can establish a set of default preferences and force those preferences on users. If a preference is managed in this manner, applications should prevent users from editing that preference by disabling any appropriate controls.

The NSUserDefaults class is thread-safe.

31.72.2 Blog Entries

- Important note for Webkit enabled applications in the Mac App Store
- MBS REALbasic Plugins, version 10.3pr6

31.72.3 Methods

31.72.4 addSuiteNamed(suiteName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts the specified domain name into the receiver's search list.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.addSuiteNamed "testsuite"
```

Notes:

suiteName: The domain name to insert. This domain is inserted after the application domain.

The suiteName domain is similar to a bundle identifier string, but is not tied to a particular application or bundle. A suite can be used to hold preferences that are shared between multiple applications.

31.72.5 arrayForKey(key as string) as Variant()

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the array associated with the specified key.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
dim t(-1) as Variant
t.Append "Hello"
t.Append "World"

u.setArrayValue "test", t
```

```
dim a(-1) as Variant = u.ArrayForKey("test")

for each v as Variant in a
MsgBox v
next
```

Notes: The array associated with the specified key, or an empty array if the key does not exist or its value is not an array.

31.72.6 Constructor

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new user defaults object initialized with the defaults for the current user account.
Example:

```
dim u as new NSUserDefaultsMBS
u.setURLValue "test", "http://www.apple.de/"
MsgBox u.URLForKey("test")
```

Notes: This method does not put anything in the search list.
See also:

- 31.72.7 Constructor(username as string) 6435

31.72.7 Constructor(username as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSUserDefaultsMBS object initialized with the defaults for the specified user account.
Notes:

username: The name of the user account.

Returns an initialized NSUserDefaultsMBS object whose argument and registration domains are already set up. If the current user does not have access to the specified user account, the object is invalid.

This method does not put anything in the search list. Invoke it only if you've allocated your own NSUserDefaults instance instead of using the shared one.

You do not normally use this method to initialize an instance of NSUserDefaults. Applications used by a superuser might use this method to update the defaults databases for a number of users. The user who

started the application must have appropriate access (read, write, or both) to the defaults database of the new user, or this method returns nil.
See also:

- 31.72.6 Constructor 6435

31.72.8 dictionaryRepresentation as dictionary

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a dictionary that contains a union of all key-value pairs in the domains in the search list.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
dim d as Dictionary = u.dictionaryRepresentation

break // "Look here in the dictionary in the debugger."
```

Notes:

Returns a dictionary containing the keys. The keys are names of defaults and the value corresponding to each key is a property list object as Variant.

As with variantForKey, key-value pairs in domains that are earlier in the search list take precedence. The combined result does not preserve information about which domain each entry came from.

31.72.9 NSArgumentDomain as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants to specify the domain.
Notes: The domain consisting of defaults parsed from the application's arguments. These are one or more pairs of the form -default value included in the command-line invocation of the application.

31.72.10 NSGlobalDomain as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants to specify the domain.
Notes: The domain consisting of defaults meant to be seen by all applications.

31.72.11 NSRegistrationDomain as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants to specify the domain.
Notes: The domain consisting of a set of temporary defaults whose values can be set by the application to ensure that searches will always be successful.

31.72.12 NSUserDefaultsDidChangeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The notification name for a did change notification.
Notes: Use with the NSNotification* objects.

31.72.13 objectIsForcedForKey(key as string) as boolean

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the specified key is managed by an administrator.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
MsgBox str(u.objectIsForcedForKey("test"))
```

Notes:

key: The key whose status you want to check.

Returns true if the value of the specified key is managed by an administrator, otherwise false.

This method assumes that the key is a preference associated with the current user and application. For managed keys, the application should disable any user interface that allows the user to modify the value of key.

Available in Mac OS X v10.2 and later.
See also:

- 31.72.14 objectIsForcedForKey(key as string, domain as string) as boolean 6438

31.72.14 objectIsForcedForKey(key as string, domain as string) as boolean

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the key in the specified domain is managed by an administrator.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
MsgBox str(u.objectIsForcedForKey("test", u.NSGlobalDomain))
```

Notes:

key: The key whose status you want to check.
domain: The domain of the key.

Returns true if the key is managed by an administrator in the specified domain, otherwise false.

This method assumes that the key is a preference associated with the current user. For managed keys, the application should disable any user interface that allows the user to modify the value of key.

Available in Mac OS X v10.2 and later.
See also:

- 31.72.13 objectIsForcedForKey(key as string) as boolean 6437

31.72.15 persistentDomainForName(domainName as string) as dictionary

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a dictionary containing the keys and values in the specified persistent domain.
Notes: Returns a dictionary containing the keys. The keys are names of defaults and the value corresponding to each key is a property list object (NSData, NSString, NSNumber, NSDate, NSArray, or NSDictionary).

31.72.16 persistentDomainNames as string()

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of the current persistent domain names.
Notes: You can get the keys and values for each domain by passing the returned domain names to the persistentDomainForName method.

31.72.17 registerDefaults(dic as dictionary)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds the contents the specified dictionary to the registration domain.
Notes:

dic: The dictionary of keys and values you want to register.

If there is no registration domain, one is created using the specified dictionary, and NSRegistrationDomain is added to the end of the search list.

The contents of the registration domain are not written to disk; you need to call this method each time your application starts. You can place a plist file in the application's Resources directory and call registerDefaults with the contents that you read in from that file.

31.72.18 removeObjectForKey(defaultName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the value of the specified default key in the standard application domain.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setBoolValue("test", true)
u.removeObjectForKey "test"
MsgBox str(u.boolForKey("test")) // shows false as key does not exist
```

Notes:

defaultName: The key whose value you want to remove.

Removing a default has no effect on the value returned by the variantForKey method if the same key exists in a domain that precedes the standard application domain in the search list.

31.72.19 removePersistentDomainForName(domainName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the contents of the specified persistent domain from the user's defaults.
Notes:

domainName: The domain whose keys and values you want. This value should be equal to your application's bundle identifier.

When a persistent domain is changed, an NSUserDefaultsDidChangeNotification is posted.

31.72.20 removeSuiteNamed(suiteName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the specified domain name from the receiver's search list.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.removeSuiteNamed "testsuite"
```

Notes: suiteName: The domain name to remove.

31.72.21 removeVolatileDomainForName(domainName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the specified volatile domain from the user's defaults.
Notes: domainName: The volatile domain you want to remove.

31.72.22 resetStandardUserDefaults

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Synchronizes any changes made to the shared user defaults object and releases it from memory.
Example:

```
NSUserDefaultsMBS.resetStandardUserDefaults
```

Notes: A subsequent invocation of standardUserDefaults creates a new shared user defaults object with the standard search list.

31.72.23 setArrayValue(key as string, values() as Variant)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified array.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
dim t(-1) as Variant
```

```
t.Append "Hello"
t.Append "World"

u.setArrayValue "test", t

dim a(-1) as Variant = u.ArrayForKey("test")

for each v as Variant in a
MsgBox v
next
```

31.72.24 setBoolValue(key as string, value as boolean)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified Boolean value.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setBoolValue("test", true)
MsgBox str(u.boolForKey("test"))
```

31.72.25 setDataValue(key as string, value as memoryblock)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified binary string.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults

u.setDataValue("test", "Hello äöü")

MsgBox u.dataForKey("test") // shows no umlauts as encoding is away in binary string
```

Notes: setStringValue is for text with encoding and setDataValue is for strings containing binary data.

31.72.26 setDictionaryValue(key as string, value as dictionary)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified dictionary.

Example:

```
dim u as new NSUserDefaultsMBS
dim d as new Dictionary

d.Value("First")="Hello"
d.Value("Second")=1234.5678
u.setDictionaryValue "test", d

dim e as Dictionary = u.dictionaryForKey("test")
for each key as Variant in e.keys
dim value as Variant = e.Value(key)
MsgBox key+": "+value
next
```

31.72.27 setDoubleValue(key as string, value as Double)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the double value.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setDoubleValue("test", 5)
MsgBox str(u.DoubleForKey("test"))
```

Notes: Available in Mac OS X v10.5 and later. On Mac OS X 10.4 the plugin will call setFloatValue for you to avoid an exception.

31.72.28 setFileValue(key as string, value as folderitem)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified URL.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
dim f as FolderItem = SpecialFolder.Desktop

// write
u.setFileValue "test", f

// read
MsgBox u.fileForKey("test").NativePath
```

Notes: Available in Mac OS X v10.6 and later.

31.72.29 setFloatValue(key as string, value as single)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified floating-point value.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setFloatValue("test", 5)
MsgBox str(u.FloatForKey("test"))
```

31.72.30 setIntegerValue(key as string, value as Integer)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified integer value.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setIntegerValue("test", 5)
MsgBox str(u.integerForKey("test"))
```

31.72.31 setPersistentDomain(domain as dictionary, domainName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the dictionary for the specified persistent domain.
Notes:

domain: The dictionary of keys and values you want to assign to the domain.
domainName: The domain whose keys and values you want to set. This value should be equal to your application's bundle identifier.

When a persistent domain is changed, an NSUserDefaultsDidChangeNotification is posted.

31.72.32 setStringArrayValue(key as string, values() as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified string array.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
dim t(-1) as string = array("Hello","World")

u.setStringArrayValue "test", t

dim a(-1) as string = u.stringArrayForKey("test")

MsgBox Join(a) // shows "Hello World"
```

31.72.33 setStringValue(key as string, value as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified text string.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults

u.setStringValue "test", "Hello äöü"

MsgBox u.stringForKey("test")
```

Notes: setStringValue is for text with encoding and setDataValue is for strings containing binary data.

31.72.34 setURLValue(key as string, value as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key to the specified URL.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setURLValue "test", "http://www.apple.de/"
MsgBox u.URLForKey("test")
```

Notes: Available in Mac OS X v10.6 and later.

31.72.35 setVariantValue(key as string, value as Variant)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the value of the specified default key in the standard application domain.
Example:

```
dim u as new NSUserDefaultsMBS
u.setVariantValue "test", "Hello World"
MsgBox u.variantForKey("test")
```

Notes:

The value parameter can be only property list objects: String, Number, Date, an Array of variant, or Dictionary. For Arrays and Dictionaries, their contents must be property list objects.

Setting a default has no effect on the value returned by the objectForKey: method if the same key exists in a domain that precedes the application domain in the search list.

31.72.36 setVolatileDomain(domain as dictionary, domainName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the dictionary for the specified volatile domain.
Notes:

domain: The dictionary of keys and values you want to assign to the domain.
domainName: The domain whose keys and values you want to set.

This method raises an NSInvalidArgumentException if a volatile domain with the specified name already exists.

31.72.37 standardUserDefaults as NSUserDefaultsMBS

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the shared defaults object.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
```

Notes:

If the shared defaults object does not exist yet, it is created with a search list containing the names of the

following domains, in this order:

NSArgumentDomain, consisting of defaults parsed from the application's arguments. A domain identified by the application's bundle identifier
NSGlobalDomain, consisting of defaults meant to be seen by all applications. Separate domains for each of the user's preferred languages
NSRegistrationDomain, a set of temporary defaults whose values can be set by the application to ensure that searches will always be successful

The defaults are initialized for the current user. Subsequent modifications to the standard search list remain in effect even when this method is invoked again—the search list is guaranteed to be standard only the first time this method is invoked. The shared instance is provided as a convenience—you can create custom instances using the Constructor.

31.72.38 stringArrayForKey(key as string) as string()

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the array of strings associated with the specified key.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
dim t(-1) as string = array("Hello","World")

u.setStringArrayValue "test", t

dim a(-1) as string = u.stringArrayForKey("test")

MsgBox Join(a) // shows "Hello World"
```

Notes: Returns an array with strings. The array is empty if the value for the key is not an array.

31.72.39 synchronize as boolean

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes any modifications to the persistent domains to disk and updates all unmodified persistent domains to what is on disk.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults

// do something
```

```
if u.synchronize then
MsgBox "Saved preferences."
else
MsgBox "Failed to save preferences."
end if
```

Notes:

Returns true if the data was saved successfully to disk, otherwise false.

Because this method is automatically invoked at periodic intervals, use this method only if you cannot wait for the automatic synchronization (for example, if your application is about to exit) or if you want to update the user defaults to what is on disk even though you have not made any changes.

31.72.40 volatileDomainForName(domainName as string) as dictionary

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the dictionary for the specified volatile domain.
Notes: Returns the dictionary of keys and values belonging to the domain. The keys in the dictionary are names of defaults, and the value corresponding to each key is a property list object (String, Number, Date, Array, or Dictionary).

31.72.41 volatileDomainNames as string()

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of the current volatile domain names.
Notes: You can get the contents of each domain by passing the returned domain names to the volatileDomainForName method.

31.72.42 Properties

31.72.43 boolForKey(key as string) as boolean

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Boolean value associated with the specified key.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.boolForKey("test") = true
MsgBox str(u.boolForKey("test"))
```

Notes:

If a boolean value is associated with defaultName in the user defaults, that value is returned. Otherwise, false is returned.
(Read and Write computed property)

31.72.44 dataForKey(key as string) as memoryblock

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The data string associated with the specified key.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults

u.dataForKey("test")="Hello äöü"

MsgBox u.dataForKey("test") // shows no umlauts as encoding is away in binary string
```

Notes:

Returns the memoryblock or nil if there is no value for this key.

dataForKey is for any string and does not store encoding. stringForKey does store encoding and works only for text strings.
(Read and Write computed property)

31.72.45 dictionaryForKey(key as string) as dictionary

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The dictionary object associated with the specified key.
Example:

```
dim u as new NSUserDefaultsMBS
dim d as new Dictionary

d.Value("First")="Hello"
d.Value("Second")=1234.5678
u.setDictionaryValue "test", d

dim e as Dictionary = u.dictionaryForKey("test")
for each key as Variant in e.keys
```

```
dim value as Variant = e.Value(key)
MsgBox key+": "+value
next
```

Notes:

Returns dictionary object associated with the specified key, or nil if the key does not exist or its value is not an dictionary.
(Read and Write computed property)

31.72.46 doubleForKey(key as string) as Double

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The double value associated with the specified key.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.doubleForKey("test") = 5
MsgBox str(u.doubleForKey("test"))
```

Notes:

Returns the double value associated with the specified key. If the key does not exist, this method returns 0. Available in Mac OS X v10.5 and later. On Mac OS X 10.4 the plugin will call floatForKey for you to avoid an exception.
(Read and Write computed property)

31.72.47 fileForKey(key as string) as folderitem

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSURL instance associated with the specified key.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
dim f as FolderItem = SpecialFolder.Desktop

// write
u.fileForKey("test")=f

// read
MsgBox u.fileForKey("test").NativePath
```

Notes:

Available in Mac OS X v10.6 and later.
(Read and Write computed property)

31.72.48 floatForKey(key as string) as single

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The floating-point value associated with the specified key.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.floatForKey("test") = 5
MsgBox str(u.floatForKey("test"))
```

Notes:

Returns the floating-point value associated with the specified key. If the key does not exist, this method returns 0.
(Read and Write computed property)

31.72.49 integerForKey(key as string) as Integer

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The integer value associated with the specified key.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.IntegerForKey("test") = 5
MsgBox str(u.integerForKey("test"))
```

Notes:

The integer value associated with the specified key. If the specified key does not exist, this method returns 0.
(Read and Write computed property)

31.72.50 stringForKey(key as string) as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The string associated with the specified key.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults

u.setStringValue "test", "Hello äöü"

MsgBox u.stringForKey("test")
```

Notes:

Returns the string or "" if there is no value for this key.

dataForKey is for any string and does not store encoding. stringForKey does store encoding and works only for text strings.
(Read and Write computed property)

31.72.51 URLForKey(key as string) as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSURL instance associated with the specified key.
Example:

```
dim u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setURLValue "test", "http://www.apple.de/"
MsgBox u.URLForKey("test")
```

Notes:

Available in Mac OS X v10.6 and later.
(Read and Write computed property)

31.72.52 variantForKey(key as string) as Variant

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The object associated with the first occurrence of the specified default.
Example:

```
dim u as new NSUserDefaultsMBS
u.setVariantValue "test", "Hello World"
MsgBox u.variantForKey("test")
```

Notes:

This method searches the domains included in the search list in the order they are listed.
(Read and Write computed property)

31.73 class NSUUIDMBS

31.73.1 class NSUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An object representing a universally unique value that bridges to UUID; use NSUUID when you need reference semantics or other Foundation-specific behavior.
Notes:

UUIDs (Universally Unique Identifiers), also known as GUIDs (Globally Unique Identifiers) or IIDs (Interface Identifiers), are 128-bit values. UUIDs created by NSUUID conform to RFC 4122 version 4 and are created with random bytes.
The standard format for UUIDs represented in ASCII is a string punctuated by hyphens, for example 68753A44-4D6F-1226-9C60-0050E4C00067. The hex representation looks, as you might expect, like a list of numerical values preceded by 0x. For example, 0xD7, 0x36, 0x95, 0x0A, 0x4D, 0x6E, 0x12, 0x26, 0x80, 0x3A, 0x00, 0x50, 0xE4, 0xC0, 0x00, 0x67. Because a UUID is expressed simply as an array of bytes, there are no endianness considerations for different platforms.

31.73.2 Blog Entries

- MBS Xojo Plugins, version 18.2pr2

31.73.3 Methods

31.73.4 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Notes: Returns true on macOS 10.8 or newer.

31.73.5 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a new UUID with RFC 4122 version 4 random bytes.
See also:

- 31.73.6 Constructor(UUID as MemoryBlock) 6454
- 31.73.7 Constructor(UUID as String) 6454

31.73.6 Constructor(UUID as MemoryBlock)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a new UUID with the given bytes.
See also:

- 31.73.5 Constructor 6453
- 31.73.7 Constructor(UUID as String) 6454

31.73.7 Constructor(UUID as String)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a new UUID with the formatted string.
See also:

- 31.73.5 Constructor 6453
- 31.73.6 Constructor(UUID as MemoryBlock) 6454

31.73.8 copy as NSUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies the UUID.

31.73.9 isEqual(other as NSUUIDMBS) as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Compares two UUIDs.
Example:

```
dim u1 as new NSUUIDMBS
dim s1 as string = u1.UUIDString

// make new object with same UUID
dim u2 as NSUUIDMBS = new NSUUIDMBS(s1)
dim s2 as string = u2.UUIDString

// other uuid
dim o as new NSUUIDMBS
dim so as string = o.UUIDString

dim e1 as Boolean = u1.isEqual(u2)
dim e2 as Boolean = u1.isEqual(o)
```

Break

Notes: Returns true if both are equal.

31.73.10 Operator_Compare(other as NSUUIDMBS) as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Compares two UUIDs.
Example:

```
dim u1 as new NSUUIDMBS
dim s1 as string = u1.UUIDString

// make new object with same UUID
dim u2 as NSUUIDMBS = new NSUUIDMBS(s1)
dim s2 as string = u2.UUIDString

// other uuid
dim o as new NSUUIDMBS
dim so as string = o.UUIDString

if u1 = u2 then
MsgBox "u1 and u2 are equal."
else
MsgBox "u1 and u2 are not equal. Problem?"
end if

if u1 = o then
MsgBox "u1 and o are equal. Problem?"
else
MsgBox "u1 and o are not equal."
end if
```

31.73.11 UUID as NSUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create and returns a new UUID with RFC 4122 version 4 random bytes.

31.73.12 Properties

31.73.13 data as MemoryBlock

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries copy of the bytes as memory block.
Notes: (Read only property)

31.73.14 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

31.73.15 UUIDString as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The UUID as a string.
Notes: (Read only property)

31.74 class NSViewControllerMBS

31.74.1 class NSViewControllerMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The plugin class for a NSViewController.
Notes:

Available in Mac OS X v10.5 and later.
Subclass of the NSResponderMBS class.

31.74.2 Blog Entries

31.74.4 Methods

31.74.5 available as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
Example:

MsgBox str(NSViewControllerMBS.available)

Notes: Returns true on Mac OS X 10.5 or newer.

31.74.6 Constructor

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor creating a new view controller.

31.74.7 contentViewController(window as NSWindowMBS) as NSViewControllerMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries content view's content view controller for the window.
Notes:

Returns nil if the window has no controller.

The main content view controller for the window.

The value of this property provides the content view of the window. Setting this value removes the existing value of contentView and makes the contentViewController.view the main content view for the window. By default, the value of this property is nil.

31.74.8 dismissViewController(ViewController as NSViewControllerMBS)

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Dismisses a presented view controller, using the same animator that presented it.
Notes: In macOS, this is the universal way to dismiss a view controller, no matter how it was presented.

31.74.9 loadView

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Explicitly load the view now.
Notes:

This method connects an instantiated view from a nib file to the view property of the view controller. This method is called by the system, and is exposed in this class so you can override it to add behavior immediately before or after nib loading.
Do not call this method. If you require this method to be called, access the view property.

Do not invoke this method from other objects unless you take care to avoid redundant invocations. The default implementation of the loadView method handles redundant invocations correctly, but a view controller subclass might not. To be safe, other objects should instead access a view controller's view property.

The loadView method first obtains the values of the view controller's nibName and nibBundle properties. It then employs the NSNib class to instantiate the specified nib file via the instantiateWithOwner:topLevelObjects: method, providing the view controller object as the owner parameter.

For this method to work correctly, you need to have specified the file's owner of the nib file, in Interface Builder, to be NSViewController. You also need to have correctly connected the view outlet of the file's owner to the intended view in the nib file. Then, at runtime, the nib loading machinery sets the value of the view controller's view property to the nib file's instantiated view.

Prior to OS X v10.10, the loadView method did not provide well-defined behavior if the nibName property's value was nil. In macOS 10.10 and later, however, you get correct behavior without specifying a nib name as long as the nib file's name is the same as that of the view controller. For example, if you have a view controller subclass called MyViewController and a nib file with the same name, you can employ the convenient initialization pattern [[MyViewController alloc] init] .

31.74.10 presentViewControllerAsModalWindow(ViewController as NSViewControllerMBS)

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Presents another view controller as a modal window, also known as an alert.
Notes: To dismiss the modal window, call the dismissViewController: method on self (the presenting view controller).

31.74.11 presentViewControllerAsPopover(ViewController as NSViewControllerMBS, RelativeToRect as NSRectMBS, positioningView as NSViewMBS, preferredEdge as Integer, behavior as Integer)

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Presents another view controller as a popover.
Notes:

viewController: The other view controller to present as a popover.
RelativeToRect: The content size of the popover.
positioningView: The view relative to which the popover should be positioned. Must not be nil, or else the view controller raises an NSInvalidArgumentException exception.
preferredEdge: The edge of positioningView that the popover should prefer to be anchored to.
behavior: The popover's closing behavior. See the NSPopoverBehavior enumeration.

To dismiss the popover, call the dismissViewController: method on self (the presenting view controller).

31.74.12 presentViewControllerAsSheet(ViewController as NSViewControllerMBS)

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Presents a new sheet window with the given view controller.
Notes:

The presented view controller is the delegate and the content view controller of its sheet.
To dismiss the sheet, call the dismissViewController: method on self (the presenting view controller).

31.74.13 windowWithContentViewController(ViewController as NSViewControllerMBS) as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a titled window that contains the specified content view controller.
Notes:

ViewController: The view controller that provides the main content view for the window. The window's contentView property is set to contentViewController.view.

Returns a window with the content view controller set to the passed-in view controller object.

This method creates a basic window object that is titled, closable, resizable, and miniaturizable. By default, the window's title is automatically bound to the title of contentViewController. You can control the size of the window by using Auto Layout and applying size constraints to the view or its subviews. The initial size of the window is set to the initial size of contentView (that is, the size of contentViewController.view). The newly created window has releasedWhenClosed set to NO, and it must be explicitly retained to keep the window instance alive.

31.74.14 Properties

31.74.15 className as string

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of this NSViewController class.
Notes: (Read only property)

31.74.16 classPath as string

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path of this NSViewController class.
Notes:

Useful for debugging to know what super classes the view controller has.
(Read only property)

31.74.17 representedObject as Variant

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The object whose value is presented in the receiver's primary view.
Notes: (Read and Write property)

31.74.18 Title as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The localized title of the receiver's view.
Notes:

NSViewController does not use the title property directly. This property is here because so many anticipated uses of this class will involve letting the user choose among multiple named views using a pulldown menu or some other user interface.
(Read and Write property)

31.74.19 view as NSViewMBS

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The view belonging to this view controller.
Notes: (Read and Write property)

31.74.20 viewLoaded as Boolean

MBS MacBase Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether view is already loaded.
Notes: (Read only property)

31.74.21 Constants

31.74.22 NSMaxXEdge = 2

MBS MacBase Plugin, Plugin Version: 18.4. **Function:** One of the Cocoa edge constants.
Notes: the maximum X edge. Typically right side.

31.74.23 NSMaxYEdge = 3

MBS MacBase Plugin, Plugin Version: 18.4. **Function:** One of the Cocoa edge constants.
Notes: The maximum Y edge. Topically the top edge of a window.

31.74.24 NSMinXEdge = 0

MBS MacBase Plugin, Plugin Version: 18.4. **Function:** One of the Cocoa edge constants.
Notes: the minimum X edge. Typically left side.

31.74.25 NSMinYEdge = 1

MBS MacBase Plugin, Plugin Version: 18.4. **Function:** One of the Cocoa edge constants.
Notes: Minimum Y. As coordinates are upside down in the Cocoa world, this is the bottom edge of a window.

31.74.26 PopoverBehaviorApplicationDefined = 0

MBS MacBase Plugin, Plugin Version: 18.4. **Function:** One of the behavior modes.
Notes: Your application assumes responsibility for closing the popover. AppKit will still close the popover in a limited number of circumstances. For instance, AppKit will attempt to close the popover when the window of its positioningView is closed. The exact interactions in which AppKit will close the popover are not guaranteed. You may consider implementing -cancel: to close the popover when the escape key is pressed.

31.74.27 PopoverBehaviorSemitransient = 2

MBS MacBase Plugin, Plugin Version: 18.4. **Function:** One of the behavior modes.
Notes: AppKit will close the popover when the user interacts with user interface elements in the window containing the popover's positioning view. Semi-transient popovers cannot be shown relative to views in other popovers, nor can they be shown relative to views in child windows. The exact interactions that cause semi-transient popovers to close are not specified.

31.74.28 PopoverBehaviorTransient = 1

MBS MacBase Plugin, Plugin Version: 18.4. **Function:** One of the behavior modes.
Notes: AppKit will close the popover when the user interacts with a user interface element outside the popover. Note that interacting with menus or panels that become key only when needed will not cause a transient popover to close. The exact interactions that will cause transient popovers to close are not specified.

31.75 class NSViewMBS

31.75.1 class NSViewMBS

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class for a view.
Notes:

To draw into a NSView, use either CustomNSViewMBS class with drawRect event or NSGraphicsMBS class. Subclass of the NSResponderMBS class.

31.75.3 Methods

31.75.4 addSubview(subview as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a view to the subviews so it's displayed above its siblings.
Example:

```
// create a button
dim n as new NSButtonMBS(100, 100, 50, 24)

n.bezelStyle = n.NSRoundedBezelStyle
n.Title = "Test"

// add directly to window's content view
```

window1.NSWindowMBS.contentView.addSubview n

See also:

- 31.75.5 addSubview(subview as NSViewMBS, positioned as Integer, relativeToView as NSViewMBS) 6464

31.75.5 addSubview(subview as NSViewMBS, positioned as Integer, relativeToView as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts a view among the receiver's subviews so it's displayed immediately above or below another view.
Example:

```
// create a button
dim n as new NSButtonMBS(100, 100, 50, 24)

n.bezelStyle = n.NSRoundedBezelStyle
n.Title = "Test"

// add directly to window's super view, below the content view
// so it is behind all RB controls
window1.NSWindowMBS.contentView.superview.addSubview n, NSWindowMBS.NSWindowBelow, window1.NSWindowMBS.contentView
```

Notes:

subView: The view object to add to the receiver as a subview.
positioned: A constant specifying the position of the aView relative to otherView. Valid values are NSWindowAbove or NSWindowBelow.
relativeToView: The other view subView is to be positioned relative to. If relativeToView is nil (or isn't a subview of the receiver), subView is added above or below all of its new siblings.

This method also sets the receiver as the next responder of aView.
See also:

- 31.75.4 addSubview(subview as NSViewMBS) 6463

31.75.6 addToolTipRect(rect as NSRectMBS, tooltip as NSViewTooltipMBS)

MBS MacBase Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a tooltip for a defined area the view and returns a tag that identifies the tooltip rectangle.

Notes:

Rect: A rectangle defining the region of the view to associate the tooltip with.
tooltip: The object to provide text.

Please keep reference of tooltip object as the tooltip is removed by it's destructor.

31.75.7 ancestorSharedWithView(view as NSViewMBS) as NSViewMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The closest ancestor shared by the receiver and a given view.
Notes: The closest ancestor or nil if there's no such object. Returns self if aView is identical to the receiver.

31.75.8 animator as NSViewMBS

MBS MacBase Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the proxy object for this view which animates.
Example:

```
dim v as NSViewMBS // your NSViewMBS object

v.alphaValue = 0.5 // switch alpha directly
v.animator.alphaValue = 0.5 // switch alpha animated
```

31.75.9 backgroundFilters as variant()

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array of Core Image filters to apply to the view's background.
Notes:

This property contains an array of CIFilterMBS objects. This array represents the background filters stored in the backgroundFilters property of the view's layer. If the view does not have a layer, setting the value of this property has no effect.
The default value of this property is an empty array.

We use variant here to reduce plugin dependencies. Please use with array of variants containing CIFilterMBS.

31.75.10 beginDraggingSessionWithItems(items() as Variant, e as NSEventMBS, source as NSViewMBS) as Variant

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initiates a dragging session with a group of dragging items.
Notes:

items: The dragging items (array of variant containing NSDraggingItemMBS objects). The frame property of each NSDraggingItem must be in the view's coordinate system.
event: The mouse-down event object from which to initiate the drag operation. In particular, its mouse location is used for the offset of the icon being dragged.
source: An object that serves as the controller of the dragging operation. It must conform to the NSDraggingSource informal protocol and is typically the receiver itself or its NSWindow object.

Returns the dragging session for the drag (NSDraggingSessionMBS object). Returned as Variant to reduce plugin dependencies.

A basic drag starts by calling beginDraggingSessionWithItems.

The caller can take the returned NSDraggingSession and continue to modify its properties such as slidesBackOnCancelOrFail. When the drag actually starts, the source is sent a draggingSessionWillBeginAtPoint message followed by multiple draggingSessionMovedToPoint messages as the user drags.

Once the drag is ended or cancelled, the source receives a draggingSessionEndedAtPoint:operation and the drag is complete.

Available in OS X v10.7 and later.

31.75.11 Constructor

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new control with size 100/100 and position 0/0
Notes: On success the handle property is not zero.
See also:

- 31.75.12 Constructor(Handle as Integer) 6467
- 31.75.13 Constructor(left as Double, top as Double, width as Double, height as Double) 6467

31.75.12 Constructor(Handle as Integer)

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an object based on the given NSView handle.
Example:

```
dim t as new NSTextViewMBS(0, 0, 100, 100)
dim v as new NSTextViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSView and the plugin retains this handle.
See also:

- 31.75.11 Constructor 6466
- 31.75.13 Constructor(left as Double, top as Double, width as Double, height as Double) 6467

31.75.13 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor to create a new NSView.
Notes:

On success handle is set.

For a toolbar, please get the view directly: self.NSToolbarMBS.toolbarView.
See also:

- 31.75.11 Constructor 6466
- 31.75.12 Constructor(Handle as Integer) 6467

31.75.14 contentFilters as variant()

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array of Core Image filters to apply to the contents of the view and its sublayers.
Notes:

This property contains an array of CIFilterMBS objects. This array represents the filters stored in the filters property of the view's layer. If the view does not have a layer, setting the value of this property has no effect.
The default value of this property is an empty array.

We use variant here to reduce plugin dependencies. Please use with array of variants containing CIFilterMBS.

31.75.15 convertPointFromView(point as NSPointMBS, View as NSViewMBS) as NSPointMBS

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts a point from the coordinate system of a given view to that of the receiver.
Notes:

point: A point specifying a location in the coordinate system of aView.
View: The view with aPoint in its coordinate system. If View is nil, this method instead converts from window base coordinates. Otherwise, both View and the receiver must belong to the same NSWindow object.

Returns the point converted to the coordinate system of the receiver.

31.75.16 convertPointToView(point as NSPointMBS, View as NSViewMBS) as NSPointMBS

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts a point from the receiver's coordinate system to that of a given view.
Notes:

point: A point specifying a location in the coordinate system of the receiver.
View: The view into whose coordinate system point is to be converted. If View is nil, this method instead converts to window base coordinates. Otherwise, both View and the receiver must belong to the same NSWindow object.

Returns the point converted to the coordinate system of View.

31.75.17 convertRectFromView(rect as NSRectMBS, View as NSViewMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts a rectangle from the coordinate system of another view to that of the receiver.
Notes:

rect: The rectangle in aView's coordinate system.
view: The view with aRect in its coordinate system. If view is nil, this method instead converts from window base coordinates. Otherwise, both view and the receiver must belong to the same NSWindow object.

Returns the converted rectangle.

31.75.18 convertRectToView(rect as NSRectMBS, View as NSViewMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts a rectangle from the receiver's coordinate system to that of another view.
Notes:

rect: A rectangle in the receiver's coordinate system.
View: The view that is the target of the conversion operation. If View is nil, this method instead converts from window base coordinates. Otherwise, both View and the receiver must belong to the same NSWindow object.

Returns the converted rectangle.

31.75.19 convertSizeFromView(Size as NSSizeMBS, View as NSViewMBS) as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts a size from another view's coordinate system to that of the receiver.
Notes:

Size: The size (width and height) in aView's coordinate system.
View: The view with Size in its coordinate system. If View is nil, this method instead converts from window base coordinates. Otherwise, both View and the receiver must belong to the same NSWindow object.

Returns the converted size, as an NSSize structure.

31.75.20 convertSizeToView(Size as NSSizeMBS, View as NSViewMBS) as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts a size from the receiver's coordinate system to that of another view.
Notes:

Size: The size (width and height) in the receiver's coordinate system.
View: The view that is the target of the conversion operation. If View is nil, this method instead converts from window base coordinates. Otherwise, both View and the receiver must belong to the same NSWindow object.

Returns the converted size, as an NSSize structure.

31.75.21 dataWithEPSInsideRect(left as Double, top as Double, width as Double, height as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns EPS data that draws the region of the receiver within a specified rectangle.
Example:

```
dim n as new NSProgressIndicatorMBS
n.sizeToFit

dim data as string = n.dataWithEPSInsideRect(0, 0, n.frameWidth, n.frameHeight)
dim f as FolderItem = SpecialFolder.Desktop.Child("test.ps")
dim b as BinaryStream = f.CreateBinaryFile("")

b.Write data
f.Launch
```

31.75.22 dataWithPDFInsideRect(left as Double, top as Double, width as Double, height as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns PDF data that draws the region of the receiver within a specified rectangle.
Example:

```
dim n as new NSProgressIndicatorMBS
n.sizeToFit

dim data as string = n.dataWithPDFInsideRect(0, 0, n.frameWidth, n.frameHeight)
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim b as BinaryStream = f.CreateBinaryFile("")

b.Write data
f.Launch
```

See also:

- 31.75.23 dataWithPDFInsideRect(r as NSRectMBS) as Memoryblock 6471

31.75.23 dataWithPDFInsideRect(r as NSRectMBS) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns PDF data that draws the region of the receiver within a specified rectangle.
See also:

- 31.75.22 dataWithPDFInsideRect(left as Double, top as Double, width as Double, height as Double) as Memoryblock 6470

31.75.24 dragImage(image as NSImageMBS, viewLocation as NSPointMBS, offset as NSSizeMBS, NSEvent as NSEventMBS, pboard as NSPasteboardMBS, source as NSViewMBS, slideFlag as boolean)

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initiates a dragging operation from the receiver, allowing the user to drag arbitrary data with a specified icon into any application that has window or view objects that accept dragged data.
Notes:

Image: The NSImage object to be dragged.
viewLocation: The location of the image's lower-left corner, in the receiver's coordinate system. It determines the placement of the dragged image under the cursor. When determining the image location you should use the mouse down coordinate, provided in theEvent, rather than the current mouse location.
offset: This parameter is ignored.
NSEvent: The left mouse-down event that triggered the dragging operation (see discussion below).
pboard: The pasteboard that holds the data to be transferred to the destination (see discussion below).
source: An object that serves as the controller of the dragging operation. It must conform to the NSDraggingSource protocol and is typically the receiver itself or its NSWindow object.
slideBack: A Boolean that determines whether the drag image should slide back if it's rejected. The image slides back to imageLoc if slideBack is true and the image isn't accepted by the dragging destination. If false the image doesn't slide back.

This method must be invoked only within an implementation of the mouseDown or mouseDragged methods. Before invoking this method, you must place the data to be transferred on pboard. To do this, get the drag pasteboard object (NSDragPboard), declare the types of the data, and then put the data on the pasteboard.

31.75.25 drawFocusRingMask

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws the focus ring mask for the view.
Notes:

This method provides the shape of the focus ring mask by drawing the focus ring mask. An implementation of this method should draw in the view's interior (bounds) coordinate space, that the focus ring style has been set (it will be set it to NSFocusRingOnly to capture the focus ring itself), and that the fill and stroke

colors have been set to an arbitrary fully opaque color.

Subclasses that find the default behavior insufficient should only draw the focus ring shape.

The NSView implementation of this method simply fills self.bounds.
Available in Mac OS X v10.7 and later.

31.75.26 enclosingMenuItem as Variant

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the menu item containing the receiver or any of its superviews in the view hierarchy.
Notes:

Returns the menu item containing the receiver or any of its superviews in the view hierarchy, or nil if the receiver's view hierarchy is not in a menu item

Available in Mac OS X v10.5 and later.

Declared as a variant to reduce plugin dependencies.
Please assign to a NSScrollViewMBS variable.

31.75.27 enclosingScrollView as Variant

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the nearest ancestor NSScrollView object containing the receiver (not including the receiver itself); otherwise returns nil.
Notes:

Declared as a variant to reduce plugin dependencies.
Please assign to a NSScrollViewMBS variable.

31.75.28 focusRingMaskBounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the focus ring mask bounds.
Notes:

Returns a rectangle containing the mask in the view's interior (bounds) coordinate space.

The mask bounds allows the focus ring's overall size and position to be determined before it is drawn.

Subclasses must override this method if they require the display of a focus ring.
The NSView implementation of this method simply returns NSRectMBS.Zero.

Note: The information provided by focusRingMaskBounds will enable Accessibility to identify selected subelements for zoom tracking, so it is important that this method provide a reasonably tight bounding box and that noteFocusRingMaskChanged is invoked as described.

31.75.29 isDescendantOf(view as NSViewMBS) as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if the receiver is a subview of a given view or if it's identical to that view; otherwise, it returns false.

31.75.30 makeBackingLayer as Variant

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates the view's backing layer.
Notes:

Value is a CALayerMBS object.
Available in OS X v10.6 and later.

31.75.31 nextValidKeyView as NSViewMBS

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the closest view object in the key view loop that follows the receiver and accepts first responder status.
Notes:

This method ignores hidden views when it determines the next valid key view.
Returns nil on any error.

31.75.32 noteFocusRingMaskChanged

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invoked to notify the view that the focus ring mask requires updating.
Notes:

It is important to note that it is only necessary for developers to invoke this method when some internal state change of their application, that the Application Kit can't determine, affects the shape of the focus ring mask.

It is assumed that if the view is marked as needing display, or is resized, its focus ring shape is likely to have changed, and there is no need for clients to explicitly send this message in such cases, they are handled automatically.

If, however, a view is showing a focus ring around some part of its content (an NSImage, perhaps), and that content changes, the client must provide notification by invoking this method so that focusRingMaskBounds and drawFocusRingMask will be invoked to redraw the focus ring.
Available in Mac OS X v10.7 and later.

31.75.33 NSViewBoundsDidChangeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names to use with the NSView class.
Notes:

Posted whenever the NSView's bounds rectangle changes independently of the frame rectangle, if the NSView is configured using setPostsBoundsChangedNotifications to post such notifications.

The notification object is the NSView object whose bounds rectangle has changed. This notification does not contain a userInfo dictionary.

The following methods can result in notification posting

- setBounds
- setBoundsOrigin
- setBoundsRotation
- setBoundsSize
- translateOriginToPoint
- scaleUnitSquareToSize
- rotateByAngle

Note that the bounds rectangle resizes automatically to track the frame rectangle. Because the primary change is that of the frame rectangle, however, setFrame and setFrameSize don't result in a bounds-changed notification.

31.75.34 NSViewDidUpdateTrackingAreasNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names to use with the NSView class.
Notes:

Posted whenever an NSView object recalculates its tracking areas. It is sent after the view receives updateTrackingAreas.

Available in Mac OS X v10.5 and later.

31.75.35 NSViewFocusDidChangeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names to use with the NSView class.
Notes: Sent when focus changed. Object for this notification is the view.

31.75.36 NSViewFrameDidChangeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names to use with the NSView class.
Notes:

Posted whenever the view's frame rectangle changes, if the view is configured using setPostsFrameChangedNotifications to post such notifications.

The notification object is the NSView object whose frame rectangle has changed. This notification does not contain a userInfo dictionary.

The following methods can result in notification posting:

- setFrame
- setFrameOrigin
- setFrameRotation
- setFrameSize

31.75.37 NSViewGlobalFrameDidChangeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names to use with the NSView class.
Notes: Posted whenever an NSView object that has attached surfaces (that is, NSOpenGLContext objects) moves to a different screen, or other cases where the NSOpenGLContext object needs to be updated. The notification object is the surface's view. This notification does not contain a userInfo dictionary.

31.75.38 pageFooter as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a default footer string that includes the current page number and page count.
Notes:

A printable view class can override this method to substitute its own content in place of the default value. You should not need to call this method directly. The printing system calls it once per page during printing.

Footers are generated only if the user defaults contain the key NSPrintHeaderAndFooter with the value true.

31.75.39 pageHeader as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a default header string that includes the print job title and date.
Notes:

Typically, the print job title is the same as the window title. A printable view class can override this method to substitute its own content in place of the default value. You should not need to call this method directly. The printing system calls it once per page during printing.

Headers are generated only if the user defaults contain the key NSPrintHeaderAndFooter with the value true.

31.75.40 previousKeyView as NSViewMBS

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the view object preceding the receiver in the key view loop.
Notes:

This view should, if possible, be made first responder when the user navigates backward from the receiver using keyboard interface control.
Returns nil on any error.

31.75.41 previousValidKeyView as NSViewMBS

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the closest view object in the key view loop that precedes the receiver and accepts first responder status.
Notes:

This method ignores hidden views when it determines the previous valid key view.
Returns nil on any error.

31.75.42 print

MBS MacBase Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method opens the Print panel, and if the user chooses an option other than canceling, prints the receiver and all its subviews to the device specified in the Print panel.

31.75.43 registeredDraggedTypes as string()

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the array of pasteboard drag types that the view can accep
Example:

```
// we register some types
Listbox1.AcceptPictureDrop
Listbox1.AcceptTextDrop

// and query them:
MsgBox Join(Listbox1.NSViewMBS.registeredDraggedTypes, EndOfLine)

' shows:
'NeXT TIFF v4.0 pasteboard type
'com.apple.traditional-mac-plain-text
'NSStringPboardType
```

Notes: This method returns the types registered by calling registerForDraggedTypes:. Each element of the array is a uniform type identifier. The returned elements are in no particular order, but the array is guaranteed not to contain duplicate entries.

31.75.44 registerForDraggedTypes(Types() as string)

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Registers the pasteboard types that the receiver will accept as the destination of an image-dragging session.
Notes:

Types: An array of uniform type identifiers. See Types for Standard Data (Mac OS X 10.6 and later) for descriptions of the pasteboard type identifiers.

Registering an NSView object for dragged types automatically makes it a candidate destination object for a dragging session. As such, it must properly implement some or all of the NSDraggingDestination protocol methods. As a convenience, NSView provides default implementations of these methods. See the NSDraggingDestination protocol specification for details.

Xojo with Cocoa target implements the methods listed above. So this method is useful to change the allowed types for the case the framework has a bug.

31.75.45 removeAllToolTips

MBS MacBase Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all tool tips assigned to the receiver.

31.75.46 removeFromSuperview

MBS MacBase Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Unlinks the view from its superview and its window, removes it from the responder chain, and invalidates its cursor rectangles.

31.75.47 removeFromSuperviewWithoutNeedingDisplay

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Unlinks the receiver from its superview and its window and removes it from the responder chain, but does not invalidate its cursor rectangles to cause redrawing.
Notes:

The receiver is also released; if you plan to reuse it, be sure to retain it before sending this message and to release it as appropriate when adding it as a subview of another view.

Unlike its counterpart, removeFromSuperview, this method can be safely invoked during display.

31.75.48 RenderImage(subviews as boolean=false) as Variant

MBS MacBase Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Renders a picture of the view.
Example:

```
dim n as new NSProgressIndicatorMBS
n.sizeToFit

dim image as NSImageMBS = n.RenderImage
dim pic as Picture = image.CopyPicture

Backdrop = pic
```

Notes:

May return nil on any error.
The value of this variant must be an object of class NSImageMBS.

31.75.49 replaceSubview(oldView as NSViewMBS, newView as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces one of the receiver's subviews with another view.
Notes:

oldView: The view to be replaced by newView. May not be nil.
newView: The view to replace oldView. May not be nil.

This method does nothing if oldView is not a subview of the receiver.
Neither oldView nor newView may be nil, and the behavior is undefined if either of these parameters is nil.

31.75.50 rotateByAngle(angle as Double)

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Rotates the receiver's bounds rectangle by a specified degree value around the origin of the coordinate system, (0.0, 0.0).
Notes:

angle: A float value specifying the angle of rotation, in degrees.

See the BoundsRotation property description for more information. This method neither redisplays the receiver nor marks it as needing display. You must do this yourself with display or NeedsDisplay.

This method posts an NSViewBoundsDidChangeNotification to the default notification center if the receiver is configured to do so.

31.75.51 scaleUnitSquareToSize(size as NSSizeMBS)

MBS MacBase Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Scales the receiver's coordinate system so that the unit square scales to the specified dimensions.
Notes:

For example, a newUnitSize of (0.5, 1.0) causes the receiver's horizontal coordinates to be halved, in turn doubling the width of its bounds rectangle. Note that scaling is performed from the origin of the coordinate system, (0.0, 0.0), not the origin of the bounds rectangle; as a result, both the origin and size of the bounds rectangle are changed. The frame rectangle remains unchanged.

This method neither redisplays the receiver nor marks it as needing display. You must do this yourself with display or setNeedsDisplay.

This method posts an NSViewBoundsDidChangeNotification to the default notification center if the receiver is configured to do so.

31.75.52 setBackgroundFilters(Filters() as variant)

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets an array of Core Image filters to apply to the view's background.
Notes:

This property contains an array of CIFilterMBS objects. This array represents the background filters stored in the backgroundFilters property of the view's layer. If the view does not have a layer, setting the value of this property has no effect.
The default value of this property is an empty array.

We use variant here to reduce plugin dependencies. Please use with array of variants containing CIFilterMBS.

31.75.53 setBoundsOrigin(origin as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the bounds origin.
See also:

• 31.75.54 setBoundsOrigin(x as Double, y as Double) 6481

31.75.54 setBoundsOrigin(x as Double, y as Double)

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the bounds origin.
See also:

• 31.75.53 setBoundsOrigin(origin as NSPointMBS) 6480

31.75.55 setBoundsSize(size as NSSizeMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the bounds size of the nsview.
See also:

• 31.75.56 setBoundsSize(width as Double, height as Double) 6481

31.75.56 setBoundsSize(width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the bounds size of the nsview.
See also:

• 31.75.55 setBoundsSize(size as NSSizeMBS) 6481

31.75.57 setContentFilters(Filters() as variant)

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets an array of Core Image filters to apply to the contents of the view and its sublayers.
Notes:

This property contains an array of CIFilterMBS objects. This array represents the filters stored in the filters property of the view's layer. If the view does not have a layer, setting the value of this property has no effect.
The default value of this property is an empty array.

We use variant here to reduce plugin dependencies. Please use with array of variants containing CIFilterMBS.

31.75.58 setFocus

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Convenience function to set the focus to this view.
Notes: Calls internally makeFirstResponder on NSWindow.

31.75.59 setFrameOrigin(origin as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the frame origin.
See also:

- 31.75.60 setFrameOrigin(x as Double, y as Double) 6482

31.75.60 setFrameOrigin(x as Double, y as Double)

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the frame origin.
See also:

- 31.75.59 setFrameOrigin(origin as NSPointMBS) 6482

31.75.61 setFrameSize(size as NSSizeMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the frame size.
See also:

- 31.75.62 setFrameSize(width as Double, height as Double) 6482

31.75.62 setFrameSize(width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the frame size.
See also:

- 31.75.61 setFrameSize(size as NSSizeMBS) 6482

31.75.63 subviews(recursive as boolean = false) as NSViewMBS()

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The immediate subviews.

Notes:

The order of the subviews may be considered as being back-to-front, but this does not imply invalidation and drawing behavior. The order is based on the order of the receiver's subviews as specified in the nib file from which they were unarchived or the programmatic interface for modifying the receiver's subview list. This ordering is also the reverse of the order in which hit-testing is done.

If recursive is true, we include all subviews of all subviews. (new in 14.2)

31.75.64 unregisterDraggedTypes

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Unregisters the receiver as a possible destination in a dragging session.

31.75.65 Properties

31.75.66 acceptsTouchEvents as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the view will accept touch events.
Notes:

Available in Mac OS X v10.6 and later.
(Read and Write property)

31.75.67 allowsVibrancy as Boolean

MBS MacBase Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** allowsVibrancy is queried when a vibrant appearance is used on a view hierarchy.
Notes:

When allowsVibrancy returns YES, the view will have an appropriate measure taken to ensure it is vibrant on top of its given material.
Specific subclasses, such as NSControl, will answer this question based on the artwork they draw for a given appearance.
(Read only property)

31.75.68 alphaValue as Double

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** the opacity of the view.
Example:

```
// makes a checkbox half transparent on Cocoa target:
CheckBox1.NSViewMBS.alphaValue = 0.5
```

Notes:

This method returns the value of the opacity property of the view's layer. Possible values are between 0.0 (transparent) and 1.0 (opaque). The default is 1.0.

Sending this message to a view that is not managing a Core Animation layer causes an exception.
(Read and Write property)

31.75.69 autoresizesSubviews as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if the receiver automatically resizes its subviews using resizeSubviewsWithOldSize whenever its frame size changes, false otherwise.
Notes: (Read and Write property)

31.75.70 autoresizingMask as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's autoresizing mask, which determines how it's resized by the resizeWithOldSuperviewSize method.
Notes:

If the autoresizing mask is equal to NSViewNotSizable (that is, if none of the options are set), then the receiver doesn't resize at all in resizeWithOldSuperviewSize.

NSViewNotSizable = 0	The receiver cannot be resized.
NSViewMinXMargin = 1	The left margin between the receiver and its superview is flexible.
NSViewWidthSizable = 2	The receiver's width is flexible.
NSViewMaxXMargin = 4	The right margin between the receiver and its superview is flexible.
NSViewMinYMargin = 8	The bottom margin between the receiver and its superview is flexible.
NSViewHeightSizable = 16	The receiver's height is flexible.
NSViewMaxYMargin = 32	The top margin between the receiver and its superview is flexible.

(Read and Write property)

31.75.71 bounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's bounds rectangle, which expresses its location and size in its own coordinate system.
Example:

```
dim n as new NSProgressIndicatorMBS
n.sizeToFit

MsgBox n.bounds.String
```

Notes:

The bounds rectangle may be rotated; use the boundsRotation method to check this.
(Read and Write property)

31.75.72 boundsRotation as Double

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The angle, in degrees, of the view's bounds rectangle relative to its frame rectangle.
Notes: (Read and Write property)

31.75.73 canBecomeKeyView as boolean

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether the receiver can become key view.
Notes:

Returns true if the receiver can become key view, false otherwise.
(Read only property)

31.75.74 canDraw as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if drawing commands will produce any result, false otherwise.
Notes:

Use this method when invoking a draw method directly along with lockFocus and unlockFocus, bypassing the display... methods (which test drawing ability and perform locking for you). If this method returns false, you shouldn't invoke lockFocus or perform any drawing.

A view object can draw on-screen if it is not hidden, it is attached to a view hierarchy in a window (NSWindow), and the window has a corresponding window device. A view object can draw during printing if it is a descendant of the view being printed.

To draw into a NSView, use either CustomNSViewMBS class with drawRect event or NSGraphicsMBS class.
(Read only property)

31.75.75 canDrawConcurrently as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the view's drawRect: method can be invoked on a background thread.
Notes:

Available in Mac OS X v10.6 and later.
(Read and Write property)

31.75.76 className as string

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of this NSView class.
Example:

```
// shows RBNSButton
MsgBox checkbox1.NSViewMBS.className
```

Notes: (Read only property)

31.75.77 classPath as string

MBS MacBase Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path of this NSView class.
Example:

```
MsgBox TextArea1.NSViewMBS.classPath
// shows "RBNSScrollView:NSScrollView:NSView:NSResponder:NSObject"
```

Notes:

Useful for debugging to know what super classes the view has.
(Read only property)

31.75.78 focusRingType as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of focus ring to be drawn around the receiver.
Notes:

This method only sets the desired focus ring type and does not cause the view to draw the actual focus ring. You are responsible for drawing the focus ring in your view's drawRect method whenever your view is made the first responder.

possible values:

NSFocusRingTypeDefault	0
NSFocusRingTypeNone	1
NSFocusRingTypeExterior	2

(Read and Write property)

31.75.79 frame as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the frame size and position of the view.
Example:

```
dim n as new NSProgressIndicatorMBS
n.sizeToFit

MsgBox n.frame.String
```

Notes: (Read and Write property)

31.75.80 frameCenterRotation as Double

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's rotation about the layer's position.
Notes:

If the application has altered the layer's anchorPoint property, the behavior is undefined. Sending this message to a view that is not managing a Core Animation layer causes an exception.

Available in Mac OS X v10.5 and later.
(Read and Write property)

31.75.81 frameHeight as Double

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The height of the view frame.
Example:

```
dim n as new NSProgressIndicatorMBS
MsgBox str(n.frameHeight)
```

Notes:

This is a convenience property which calls the frame function to get the current rectangle, changes the value and sets the frame to the new rectangle.
(Read and Write property)

31.75.82 frameLeft as Double

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The left position of the view frame.
Example:

```
dim n as new NSProgressIndicatorMBS
MsgBox str(n.frameLeft)
```

Notes:

This is a convenience property which calls the frame function to get the current rectangle, changes the value and sets the frame to the new rectangle.
(Read and Write property)

31.75.83 frameRotation as Double

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The angle, in degrees, of the view's frame relative to its superview's coordinate system.
Notes:

dim n as new NSProgressIndicatorMBS
n.frameRotation=10
MsgBox str(n.frameRotation)
(Read and Write property)

31.75.84 frameTop as Double

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The top position of the view frame.
Example:

dim n as new NSProgressIndicatorMBS
MsgBox str(n.frameTop)

Notes:

This is a convenience property which calls the frame function to get the current rectangle, changes the value and sets the frame to the new rectangle.
(Read and Write property)

31.75.85 frameWidth as Double

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The width of the view frame.
Example:

dim n as new NSProgressIndicatorMBS
MsgBox str(n.frameWidth)

Notes:

This is a convenience property which calls the frame function to get the current rectangle, changes the value and sets the frame to the new rectangle.
(Read and Write property)

31.75.86 identifier as string

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A string that identifies this user interface item.
Notes:

It should be set to a unique value on NSViews when they are intended to be used inside a view-based NSTableView. Identifiers should be unique per-window. For programmatically created user interface items, you would typically set this value in code after creating a control but before adding it to a window. You may also want to set an identifier on a window, after creating it programmatically, to identify the window easily when it is reopened. You should not change the identifier after a control is added to a window. Identifiers beginning with an underscore are reserved for the system. In framework classes that implement this protocol, the accessor methods are not intended to be overridden.

To help avoid collision of identifiers, it is recommended that identifiers use the same prefix as is used for the framework or application. For example, identifiers for standard AppKit interface items, such as the open panel, will begin with "NS".

The slash '/', backslash '\', and colon ':' characters are reserved and should not be used in identifiers.
(Read and Write property)

31.75.87 isFlipped as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if the nsview uses flipped drawing coordinates or false if it uses native coordinates.
Notes: (Read only property)

31.75.88 isHidden as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver is marked as hidden.
Notes: (Read and Write property)

31.75.89 isHiddenOrHasHiddenAncestor as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if the nsview is marked as hidden or has an ancestor in the view hierarchy that is marked as hidden; returns false otherwise.
Notes: (Read only property)

31.75.90 isOpaque as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Overridden by subclasses to return true if the view is opaque, false otherwise.
Notes: (Read only property)

31.75.91 isRotatedFromBase as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if the nsview or any of its ancestors has ever set a FrameRotation or BoundsRotation properties; otherwise returns false.
Notes: (Read only property)

31.75.92 isRotatedOrScaledFromBase as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if the nsview or any of its ancestors has ever had a nonzero frame or bounds rotation, or has been scaled from the window's base coordinate system; otherwise returns false.
Notes:

The intent of this information is to optimize drawing and coordinate calculation, not necessarily to reflect the exact state of the receiver's coordinate system, so it may not reflect the actual rotation or scaling. For example, if an NSView object is rotated to 45 degrees and later back to 0, this method still returns true.
(Read only property)

31.75.93 layer as Variant

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns or sets the Core Animation layer that the receiver uses as its backing store.
Notes:

Value is a CALayerMBS object.
Available in OS X v10.5 and later.
(Read and Write property)

31.75.94 layerUsesCoreImageFilters as Boolean

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the view's layer uses Core Image filters and needs in-process

rendering.
Notes:

If your view uses a custom layer and you assigned Core Image to that layer directly, you must set this property to YES to let AppKit know of that fact. In macOS 10.9 and later, AppKit prefers to render layer trees out-of-process but cannot do so if any layers have Core Image filters attached to them. Specifying true for property lets AppKit know that it must move rendering of the layer hierarchy back into your app's process. If the value of this property is false, adding a filter to the view's layer triggers an exception.

You do not need to modify this property if you assigned the filters using the backgroundFilters, compositingFilter, or contentFilters properties of the view. Those methods automatically let AppKit know that it needs to render the layer hierarchy in-process. Set it only if you set the filters on the layer directly.
(Read and Write property)

31.75.95 needsDisplay as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** whether the view needs to be displayed.
Notes: (Read and Write property)

31.75.96 nextKeyView as NSViewMBS

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The view object following the receiver in the key view loop.
Notes:

Returns the view object following the receiver in the key view loop, or nil if there is none.
On setting inserts a specified view object after the receiver in the key view loop of the receiver's window.
This view should, if possible, be made first responder when the user navigates forward from the receiver using keyboard interface control.
Returns nil on any error.
(Read and Write property)

31.75.97 opaqueAncestor as NSViewMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's closest opaque ancestor (including the receiver itself).
Notes: (Read only property)

31.75.98 RetainCount as Integer

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The retain count for the NSView object.
Notes:

Useful for debugging. Should always be >0.
(Read only property)

31.75.99 superview as NSViewMBS

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's superview, or nil if it has none.
Notes: (Read only property)

31.75.100 toolTip as string

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The tooltip text for this view.
Example:

```
dim n as new NSProgressIndicatorMBS
n.toolTip = "Hello"
MsgBox n.toolTip
```

Notes: (Read and Write property)

31.75.101 visibleRect as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the portion of the receiver not clipped by its superviews.
Notes:

Visibility for this method is defined quite simply and doesn't account for whether other NSView objects (or windows) overlap the receiver or whether the receiver has a window at all. This method returns an empty rectangle if the receiver is effectively hidden.

During a printing operation the visible rectangle is further clipped to the page being imaged.
(Read only property)

31.75.102 wantsDefaultClipping as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether the Application Kit's default clipping provided to drawRect implementations is in effect.
Notes:

Subclasses may override this method to return false if they want to suppress the default clipping. They may want to do this in situations where drawing performance is critical to avoid the cost of setting up, enforcing, and cleaning up the clip path

A view that overrides this method to refuse the default clipping must either set up whatever clipping it requires or constrain its drawing exactly to the list of rectangles returned by getRectsBeingDrawn. Failing to do so could result in corruption of other drawing in the view's window.
(Read only property)

31.75.103 wantsLayer as Boolean

MBS MacBase Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver and its subviews use a Core Animation layer as a backing store.
Notes:

True if the view and its subviews should use a Core Animation layer as its backing store, otherwise false.

Requires Mac OS X 10.5.
(Read and Write property)

31.75.104 wantsRestingTouches as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the view wants resting touches.
Notes:

A resting touch occurs when a user rests their thumb on a device (for example, the glass trackpad of a MacBook).

By default, these touches are not delivered and are not included in the event's set of touches. Touches may transition in and out of resting at any time. Unless the view wants restingTouches, began / ended events are simulated as touches transition from resting to active and vice versa.

In general resting touches should be ignored.

Available in Mac OS X v10.6 and later.

(Read and Write property)

31.75.105 window as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's window object, or nil if it has none.
Notes: (Read only property)

31.75.106 compositingFilter as variant

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Core Image filter used to composite the view's contents with its background.
Notes:

This property contains the compositing filter stored in the compositingFilter property of the view's layer. If the view does not have a layer, setting the value of this property has no effect.
The default value of this property is nil, which causes content to be rendered without any special compositing effects.

We use variant here to reduce plugin dependencies. Please use with variant containing CIFilterMBS.
(Read and Write computed property)

31.75.107 Constants

31.75.108 NSBezelBorder = 2

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the type of a view's border.
Notes: A concave border that makes the view look sunken.

31.75.109 NSFocusRingTypeDefault = 0

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the focusringtype property.
Notes: The default focus ring type for NSView or NSCell.

31.75.110 NSFocusRingTypeExterior = 2

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the focusringtype property.
Notes: The standard Aqua focus ring.

31.75.111 NSFocusRingTypeNone = 1

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the focusringtype property.
Notes: No focus ring. If you set the focus ring type to this value, NSView and NSCell will not draw any focus ring.

31.75.112 NSGrooveBorder = 3

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the type of a view's border.
Notes: A thin border that looks etched around the image.

31.75.113 NSLineBorder = 1

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the type of a view's border.
Notes: A black line border around the view.

31.75.114 NSNoBorder = 0

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the type of a view's border.
Notes: No border.

31.75.115 NSViewHeightSizable = 16

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the autoresizingMask property.
Notes: The receiver's height is flexible.

31.75.116 NSViewLayerContentsRedrawBeforeViewResize = 3

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the view layer content redraw policy constants.

31.75.117 NSViewLayerContentsRedrawDuringViewResize = 2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the view layer content redraw policy constants.

31.75.118 NSViewLayerContentsRedrawNever = 0

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the view layer content redraw policy constants.

31.75.119 NSViewLayerContentsRedrawOnSetNeedsDisplay = 1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the view layer content redraw policy constants.

31.75.120 NSViewMaxXMargin = 4

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the autoresizingMask property.
Notes: The right margin between the receiver and its superview is flexible.

31.75.121 NSViewMaxYMargin = 32

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the autoresizingMask property.
Notes: The top margin between the receiver and its superview is flexible.

31.75.122 NSViewMinXMargin = 1

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the autoresizingMask property.
Notes: The left margin between the receiver and its superview is flexible.

31.75.123 NSViewMinYMargin = 8

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the autoresizingMask property.
Notes: The bottom margin between the receiver and its superview is flexible.

31.75.124 NSViewNotSizable = 0

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the autoresizingMask property.
Notes: The receiver cannot be resized.

31.75.125 NSViewWidthSizable = 2

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants for the autoresizingMask property.
Notes: The receiver's width is flexible.

31.75.126 NSWindowAbove=1

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the window order constants to specify how a window is ordered relative to another window.
Notes: Moves the window above the indicated window.

31.75.127 NSWindowBelow=-1

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the window order constants to specify how a window is ordered relative to another window.
Notes: Moves the window below the indicated window.

31.75.128 NSWindowOut=0

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the window order constants to specify how a window is ordered relative to another window.
Notes: Moves the window off the screen.

31.76 class NSViewTooltipMBS

31.76.1 class NSViewTooltipMBS

MBS MacBase Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for a dynamical NSView tooltip.
Notes: Can be used for customized helptags with event to return current text.

31.76.4 Methods

31.76.5 Constructor

MBS MacBase Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

31.76.6 Properties

31.76.7 Text as String

MBS MacBase Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The text for the tooltip.
Notes:

If event is not implemented, we use this default text.
(Read and Write property)

31.76.8 Events

31.76.9 stringForToolTip(point as NSPointMBS) as string

MBS MacBase Plugin, Plugin Version: 18.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Queries string for tooltip at position.
Notes:

The point allows you to customize the tooltip for the location.
Please return the text to display.

31.77 class NSVisualEffectViewMBS

31.77.1 class NSVisualEffectViewMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The class to use visual effect view.
Notes:

The NSVisualEffectView is the basis for all visual effects, including "vibrant" appearances. You can optionally set the appearance to NSAppearanceMBS.appearanceNamed(NSAppearanceNameVibrantDark) (or Light) to get the desired light or dark appearance. Combine this with an appropriate light or dark material to get the desired vibrant look. Combining NSAppearanceNameVibrantDark with a light material will look bad, and should not be done.

Requires Mac OS X 10.10 or newer.

Please review Apple's documentation on this for details.
Subclass of the NSViewMBS class.

31.77.2 Blog Entries

- New for Mac OS X 10.10 in MBS Xojo Plugins

31.77.3 Methods

31.77.4 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether this class is available.
Notes: Only available on Mac OS X 10.10 or later.

31.77.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor for a new NSVisualEffectViewMBS object.
See also:

- 31.77.6 Constructor(Handle as Integer) 6503
- 31.77.7 Constructor(left as Double, top as Double, width as Double, height as Double) 6503

31.77.6 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSVisualEffectView handle.
Example:

```
dim t as new NSVisualEffectViewMBS(0, 0, 100, 100)
dim v as new NSVisualEffectViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSVisualEffectView and the plugin retains this handle.
See also:

- 31.77.7 Constructor(left as Double, top as Double, width as Double, height as Double) 6503

31.77.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor for a new NSVisualEffectViewMBS object.
See also:

- 31.77.5 Constructor 6502
- 31.77.6 Constructor(Handle as Integer) 6503

31.77.8 Properties

31.77.9 blendingMode as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: How this backdrop view blurs its contents.
Notes:

It can either blend with the contents behind the window (NSVisualEffectBlendingModeBehindWindow – the default), or within the current window (NSVisualEffectBlendingModeWithinWindow). The blending mode for the material NSVisualEffectMaterialTitlebar can only be NSVisualEffectBlendingModeWithinWindow.

The blendingMode NSVisualEffectBlendingModeWithinWindow requires WantsLayer = true to be done on the parent view that you desire to blend with.
(Read and Write property)

31.77.10 interiorBackgroundStyle as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The interior background style.
Notes:

Returns "Light" or "Dark" depending on the material selected.
(Read only property)

31.77.11 maskImage as NSImageMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The mask image masks this view.
Notes: (Read and Write property)

31.77.12 material as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The material used.
Notes:

The default value is NSVisualEffectMaterialAppearanceBased; the material is updated to be the correct material based on the appearance set on this view.
(Read and Write property)

31.77.13 state as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The current state.
Notes:

The state defaults to NSVisualEffectStateFollowsWindowActiveState.
(Read and Write property)

31.77.14 Constants

31.77.15 NSBackgroundStyleDark = 1

MBS MacFrameworks Plugin, Plugin Version: 14.3. **Function:** One of the background style constants.
Notes: Dark

31.77.16 NSBackgroundStyleLight = 0

MBS MacFrameworks Plugin, Plugin Version: 14.3. **Function:** One of the background style constants.
Notes: Light

31.77.17 NSVisualEffectBlendingModeBehindWindow = 0

MBS MacFrameworks Plugin, Plugin Version: 14.3. **Function:** One of the blending modes.
Notes: Blends and blurs with the contents behind the window (such as the desktop or other windows). These can overlap, and the view lower in the hierarchy will "win".

31.77.18 NSVisualEffectBlendingModeWithinWindow = 1

MBS MacFrameworks Plugin, Plugin Version: 14.3. **Function:** One of the blending modes.
Notes: Blends and blurs with contents behind the view in the current window only. For now, these cannot overlap each other. This mode REQUIRES layer-backing with view.wantsLayer = true.

31.77.19 NSVisualEffectMaterialAppearanceBased = 0

MBS MacFrameworks Plugin, Plugin Version: 14.3. **Function:** One of the material constants.
Notes: When NSVisualEffectMaterialAppearanceBased is set, the material color is determined by the current effectiveAppearance that is on the view.

31.77.20 NSVisualEffectMaterialDark = 2

MBS MacFrameworks Plugin, Plugin Version: 14.3. **Function:** One of the material constants.
Notes: Dark

31.77.21 NSVisualEffectMaterialLight = 1

MBS MacFrameworks Plugin, Plugin Version: 14.3. **Function:** One of the material constants.
Notes: Light

31.77.22 NSVisualEffectMaterialTitlebar = 3

MBS MacFrameworks Plugin, Plugin Version: 14.3. **Function:** One of the material constants.
Notes: Title bar

31.77.23 NSVisualEffectStateActive = 1

MBS MacFrameworks Plugin, Plugin Version: 14.3. **Function:** The state constants.
Notes: The backdrop is explicitly active, always.

31.77.24 NSVisualEffectStateFollowsWindowActiveState = 0

MBS MacFrameworks Plugin, Plugin Version: 14.3. **Function:** The state constants.
Notes: The backdrop automatically appears active when the window is active, and inactive when it is not active.

31.77.25 NSVisualEffectStateInactive = 2

MBS MacFrameworks Plugin, Plugin Version: 14.3. **Function:** The state constants.
Notes: The backdrop is explicitly inactive.

31.78 class NSWindowControllerMBS

31.78.1 class NSWindowControllerMBS

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSWindowController object manages a window, usually a window stored in a nib file.
Notes:

Please read Apple's documentation for details:
https://developer.apple.com/library/mac/documentation/Cocoa/Reference/ApplicationKit/Classes/NSWindowController_Class/Reference/Reference.html
Subclass of the NSResponderMBS class.

31.78.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.5pr6

31.78.3 Methods

31.78.4 close

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the window if it was loaded.
Notes: Because this method closes the window without asking the user for confirmation, you usually do not invoke it when the Close menu command is chosen. Instead invoke NSWindow's performClose on the receiver's window.

31.78.5 Constructor(win as NSWindowMBS)

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a window controller initialized with a given window.
Notes:

window: The window object to manage; can be nil.
Returns a newly initialized window controller.
This method is the designated initializer for NSWindowController.

This initializer is useful when a window has been loaded but no window controller is assigned. The default initialization turns on cascading, sets the shouldCloseDocument flag to NO, and sets the window frame autosave name to an empty string. As a side effect, the created window controller is added as an observer of the NSWindowWillCloseNotifications posted by that window object (which is handled by a private method). If

you make the window controller a delegate of the window, you can implement NSWindow's windowShouldClose delegate method.
See also:

- 31.78.6 Constructor(windowNibName as string) 6508

31.78.6 Constructor(windowNibName as string)

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a window controller initialized with a nib file.
Notes:

windowNibName: The name of the nib file (minus the ".nib" extension) that archives the receiver's window; cannot be empty.

Sets the owner of the nib file to the receiver. The default initialization turns on cascading, sets the shouldCloseDocument flag to false, and sets the autosave name for the window's frame to an empty string.
See also:

- 31.78.5 Constructor(win as NSWindowMBS) 6507

31.78.7 showWindow

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Displays the window associated with the receiver.
Notes: If the window is an NSPanel object and has its becomesKeyOnlyIfNeeded flag set to true, the window is displayed in front of all other windows but is not made key; otherwise it is displayed in front and is made key. This method is useful for menu actions.

31.78.8 synchronizeWindowTitleWithDocumentName

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Synchronizes the displayed window title and the represented filename with the information in the associated document.
Notes: Does nothing if the window controller has no associated document or loaded window. This method queries the window controller's document to get the document's display name and full filename path, then calls windowTitleForDocumentDisplayName to get the display name to show in the window title.

31.78.9 Properties

31.78.10 className as string

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of this NSWindowController class.
Notes: (Read only property)

31.78.11 classPath as string

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path of this NSWindowController class.
Notes:

Useful for debugging to know what super classes the window controller has.
(Read only property)

31.78.12 shouldCascadeWindows as boolean

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver should necessarily close the associated document when the window it manages is closed.
Notes:

True if the receiver necessarily closes the associated document when the window it manages is closed, false otherwise.
If false, the document is closed only when the last remaining window of the document is closed.
The default is false.
(Read and Write property)

31.78.13 shouldCloseDocument as boolean

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver should necessarily close the associated document when the window it manages is closed.
Notes:

True if the receiver necessarily closes the associated document when the window it manages is closed, false otherwise.
If false, the document is closed only when the last remaining window of the document is closed.
The default is false.
(Read and Write property)

31.78.14 window as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window owned by the controller.
Notes:

If the window has not yet been loaded, this method attempts to load the window's nib file using loadWindow. Before it loads the window, it invokes windowWillLoad, and if the window controller has a document, it invokes the document's corresponding method windowControllerWillLoadNib (if implemented). After loading the window, this method invokes windowDidLoad and, if there is a document, the NSDocument method windowControllerDidLoadNib (if implemented).
(Read and Write property)

31.78.15 windowFrameAutosaveName as string

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name under which the frame rectangle of the window owned by the receiver is stored in the defaults database.
Notes:

By default, name is an empty string, causing no information to be stored in the defaults database.
(Read and Write property)

31.78.16 windowNibName as string

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name of the nib file that stores the window associated with the receiver.
Notes: (Read only property)

31.78.17 windowNibPath as string

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full path of the nib file that stores the window associated with the receiver.
Notes:

The full path of the nib file that stores the window associated with the receiver; "" if it cannot be located.
(Read only property)

31.79 class NSWindowDelegateMBS

31.79.1 class NSWindowDelegateMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Xojo class for a cocoa windows delegate.
Notes:

The NSWindowDelegate protocol defines the methods that a delegate of NSWindow should implement. All methods in this protocol are optional.

By implementing these methods, the delegate may respond to window resizing, moving, exposing, minimizing, and a number of other window events.

31.79.2 Blog Entries

31.79.3 Methods

31.79.4 Constructor(win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes the delegate class pointing to the Cocoa window.
Notes: The original delegate on the window is preserved and all messages are forwarded to it. Also when this object is destroyed, the old delegate is restored.
See also:

- 31.79.5 Constructor(win as window) 6511

31.79.5 Constructor(win as window)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Initializes the delegate class pointing to the Xojo window.
Notes:

This class does not keep a reference to the window, so you can keep this delegate as a property of the window without a memory leak.

The original delegate from Xojo is preserved and all messages are forwarded to it. Also when this object is destroyed, the old delegate is restored.
See also:

- 31.79.4 Constructor(win as NSWindowMBS) 6511

31.79.6 InstallRestoreEvents

MBS MacCocoa Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Activates plugin code to catch events restoreStateWithCoder and encodeRestorableStateWithCoder.

31.79.7 Events

31.79.8 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

31.79.9 customWindowsToEnterFullScreenForWindow(win as NSWindowMBS) as NSWindowMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the window is about to enter full screen mode.
Notes:

win: The window to enter to full screen mode.

Return an array of windows involved in the animation to fullscreen for window; otherwise nil.

This method lets a window delegate to customize the animation by providing a custom window or windows containing layers or other effects. If you do not want to perform custom animation, you can omit the implementation of this method, or it can return nil.

Available in Mac OS X v10.7 and later.

31.79.10 customWindowsToExitFullScreenForWindow(win as NSWindowMBS) as NSWindowMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The system has started its animation out of fullscreen, including transitioning back to the desktop space.
Notes:

win: The window to exit fullscreen.

Return true if the window wants to run a custom animation; otherwise false if the default NSWindow animation should be used.

This method lets the window delegate customize the animation when the window is about to exit fullscreen. If an you do not want to perform custom animation, you can omit the implementation of this method, or it can return nil.

Available in Mac OS X v10.7 and later.

31.79.11 didDecodeRestorableState(win as NSWindowMBS, state as NSCoderMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate the window is has extracted its restorable state from a given archiver.
Notes:

win: The window extracting its restorable state from an archive.
state: The coder extracting the archive.

This method is invoked during the window's restoreStateWithCoder method.

Available in Mac OS X v10.7 and later.

31.79.12 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

31.79.13 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

31.79.14 draggingExited(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

31.79.15 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

31.79.16 encodeRestorableStateWithCoder(win as NSWindowMBS, coder as NSCoderMBS)

MBS MacCocoa Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Method called to save the restorable state.
Notes:

The receiver is passed an NSCoderMBS that supports keyed encoding (but not decoding), and should encode its restorable state. If you override this method, you should call through to super. You should not otherwise invoke this method. If you encode an object that implements the NSUserInterfaceItemIdentification protocol, the object itself is not archived; only its identifier is stored. Thus, for example, a window may efficiently store its firstResponder as restorable state.

Called only if you called InstallRestoreEvents at least ones.

31.79.17 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

31.79.18 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this method.

31.79.19 restoreStateWithCoder(win as NSWindowMBS, coder as NSCoderMBS)

MBS MacCocoa Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Method called to restore state.
Notes:

The receiver is passed an NSCoder that supports keyed decoding (but not encoding). The receiver should decode any previously stored state. If you override this method, you should call through to super. You should not otherwise invoke this method.
Called only if you called InstallRestoreEvents at least ones.

31.79.20 shouldDragDocumentWithEvent(win as NSWindowMBS, evnt as NSEventMBS, dragImageLocation as NSPointMBS, pasteboard as Variant) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks the delegate whether a user can drag the document icon from the window's title bar.
Notes:

win: The window containing the document icon the user wants to drag.
evnt: The left-mouse down event that triggered the dragging operation.
dragImageLocation: The location at which the user started the dragging operation.
pasteboard: The pasteboard containing the contents of the document, which the delegate can modify. This is a NSPasteboardMBS object.

Return true to allow the drag to proceed; false to prevent it. Before turning no the delegate can implement its own dragging behavior as described below.

Implementing this method allows an application to customize the process of dragging the window's document icon.implement its own dragging process, the delegate can perform the dragging operation and return false.

The delegate can prohibit the drag by returning false. Before returning false, the delegate may implement its own dragging behavior.

Available in Mac OS X v10.5 and later.

31.79.21 shouldPopUpDocumentPathMenu(win as NSWindowMBS, menu as NSMenuMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks the delegate whether the window displays the title pop-up menu in response to a Command-click or Control-click on its title.
Notes:

win: The window whose title the user Command-clicked or Control-clicked.
menu: The menu the window will display, if allowed. By default, its items are the path components of the file represented by window.

Returns true to allow the display of the title pop-up menu; false to prevent it.

Available in Mac OS X v10.5 and later.

31.79.22 startCustomAnimationToEnterFullScreenWithDuration(win as NSWindowMBS, duration as Double)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the window is about to enter fullscreen mode.
Notes:

win: The window to enter to full screen mode.
duration: The duration of the presentation change.

This method is called to start the window animation into fullscreen, including transitioning to a new space. You can implement this method to perform custom animation with the given duration to be in sync with the system animation.

Special Considerations
This method is called only if customWindowsToEnterFullScreenForWindow returned non-nil.

Available in Mac OS X v10.7 and later.

31.79.23 startCustomAnimationToExitFullScreenWithDuration(win as NSWindowMBS, duration as Double)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the delegate that the window is about to enter fullscreen mode.
Notes:

win: The window to exit to fullscreen.
duration: The duration of the presentation change.

Special Considerations
This method is called only if customWindowsToExitFullScreenForWindow returned non-nil.

Available in Mac OS X v10.7 and later.

31.79.24 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging images should be changed.
Notes:

sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

31.79.25 wantsPeriodicDraggingUpdates as boolean

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes:

Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes.

Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

31.79.26 willEncodeRestorableState(win as NSWindowMBS, state as NSCoderMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate the window is about to add its restorable state to a given archiver.
Notes:

win: The window adding its restorable state to an archive.
state: The coder creating the archive.

This method is invoked during the window's encodeRestorableStateWithCoder method.

Available in Mac OS X v10.7 and later.

31.79.27 willPositionSheet(win as NSWindowMBS, sheet as NSWindowMBS, rect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that the window is about to show a sheet at the specified location, giving it the opportunity to return a custom location for the attachment of the sheet to the window.
Notes:

win: The window containing the sheet to be animated.
sheet: The sheet to be shown.
rect: The default sheet location, just under the title bar of the window, aligned with the left and right edges of the window.

Return the custom location specified.

This method is also invoked whenever the user resizes window while sheet is attached.

This method is useful in many situations. If your window has a toolbar, for example, you can specify a location for the sheet that is just below it. If you want the sheet associated with a certain control or view, you could position the sheet so that it appears to originate from the object (through animation) or is positioned next to it.

Neither the rect parameter nor the returned NSRect value define the boundary of the sheet. They indicate where the top-left edge of the sheet is attached to the window. The origin is expressed in window coordinates;

the default origin.y value is the height of the content view and the default origin.x value is 0. The size.width value indicates the width and behavior of the initial animation; if size.width is narrower than the sheet, the sheet genies out from the specified location, and if size.width is wider than the sheet, the sheet slides out. You cannot affect the size of the sheet through the size.width and size.height fields. It is recommended that you specify zero for the size.height value as this field may have additional meaning in a future release.

Available in Mac OS X v10.3 and later.

31.79.28 willResizeForVersionBrowser(win as NSWindowMBS, maxPreferredFrameSize as NSSizeMBS, maxAllowedFrameSize as NSSizeMBS) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate the the window will resize for presentation during version browsing.
Notes:

win: The window being presented in a version browser.
maxPreferredSize: The maximum size the version browser would prefer the window to be.
maxAllowedSize: The maximum allowed size for the window (the full screen frame minus the margins required to ensure the Versions controls are still visible).

Returns the size that the window should be.

Windows entering the version browser will be resized to the size returned by this method. If either dimension of the returned size is larger than the maxPreferredFrameSize, the window will also be scaled down to ensure it fits properly in the version browser.

If this method is not implemented, the version browser will use windowWillUseStandardFrame to determine the resulting window frame size.

Available in Mac OS X v10.7 and later.

31.79.29 willUseFullScreenContentSize(win as NSWindowMBS, proposedSize as NSSizeMBS) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the delegate to modify the fullscreen content size.
Notes:

win: The window to enter to full screen mode.
proposedSize: The proposed window size.

Returns the window size to actually use when displaying content size.

Available in Mac OS X v10.7 and later.

31.79.30 willUseFullScreenPresentationOptions(win as NSWindowMBS, proposedOptions as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the presentation options the window will use when transitioning to fullscreen.
Notes:

win: The window to enter to full screen mode.
proposedOptions: The proposed options. See NSApplicationPresentationOptions for the possible values.

Return the options the window should use when transitioning to fullscreen. These may be the same as the proposedOptions or may be modified.

Available in Mac OS X v10.7 and later.

31.79.31 windowDidBecomeKey(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the delegate that the window has become the key window.
Notes:

notification: A notification named NSWindowDidBecomeKeyNotification.

You can retrieve the window object in question by sending object to notification.

Available in Mac OS X v10.0 and later.

31.79.32 windowDidBecomeMain(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the delegate that the window has become main.
Notes:

notification: A notification named NSWindowDidBecomeMainNotification.

You can retrieve the window object in question by sending object to notification.

Available in Mac OS X v10.0 and later.

31.79.33 windowDidChangeScreen(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that the window has changed screens.
Notes:

notification: A notification named NSWindowDidChangeScreenNotification.

You can retrieve the NSWindow object in question by sending object to notification.

Available in Mac OS X v10.0 and later.

31.79.34 windowDidChangeScreenProfile(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that the window has changed screen display profiles.
Notes:

notification: A notification named NSWindowDidChangeScreenProfileNotification.

You can retrieve the NSWindow object in question by sending object to notification.

Available in Mac OS X v10.4 and later.

31.79.35 windowDidDeminiaturize(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that the window has been deminimized.
Notes:

notification: A notification named NSWindowDidDeminiaturizeNotification

You can retrieve the NSWindow object in question by sending object to notification.

Available in Mac OS X v10.0 and later.

31.79.36 windowDidEndLiveResize(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the delegate that a live resize operation on the window has ended.
Notes:

notification: A notification named NSWindowDidEndLiveResizeNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.6 and later.

31.79.37 windowDidEndSheet(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that the window has closed a sheet.
Notes:

notification: A notification named NSWindowDidEndSheetNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.1 and later.

31.79.38 windowDidEnterFullScreen(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The window just entered fullscreen mode.
Notes:

notification: A notification named NSWindowDidEnterFullScreenNotification.
Available in Mac OS X v10.7 and later.

31.79.39 windowDidEnterVersionBrowser(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate the the window just entered version browsing.
Notes:

notification: An NSWindowDidEnterVersionBrowserNotification notification.

Available in Mac OS X v10.7 and later.

31.79.40 windowDidExitFullScreen(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The window is about to enter fullscreen mode.
Notes:

notification: A notification named NSWindowDidExitFullScreenNotification.
Available in Mac OS X v10.7 and later.

31.79.41 windowDidExitVersionBrowser(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate the the window is about to leave version browsing.
Notes:

notification: An NSWindowDidExitVersionBrowserNotification notification.
Available in Mac OS X v10.7 and later.

31.79.42 windowDidExpose(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that the window has been exposed.
Notes:

notification: A notification named NSWindowDidExposeNotification.
You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

31.79.43 windowDidFailToEnterFullScreen(win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked if the window failed to enter fullscreen.
Notes:

win: The window that failed to enter to full screen mode.

In some cases, the transition to enter fullscreen will fail, due to being in the midst of handling some other animation or user gesture. This method indicates that there was an error, and you should clean up any work you may have done to prepare to enter fullscreen.

This message is sent whether or not the delegate indicated a custom animation by returning non-nil from customWindowsToEnterFullScreenForWindow.

Available in Mac OS X v10.7 and later.

31.79.44 windowDidFailToExitFullScreen(win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked if the window failed to exit fullscreen.
Notes:

win: The window that failed to exit to fullscreen.

In some cases, the transition to exit fullscreen will fail, due to being in the midst of handling some other animation or user gesture. This method indicates that there was an error, and you should clean up any work you may have done to prepare to enter fullscreen.

This message is sent whether or not the delegate indicated a custom animation by returning non-nil from customWindowsToExitFullScreenForWindow.

Available in Mac OS X v10.7 and later.

31.79.45 windowDidMiniaturize(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that the window has been minimized.
Notes:

notification: A notification named NSWindowDidMiniaturizeNotification.

You can retrieve the NSWindow object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

31.79.46 windowDidMove(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that the window has moved.
Notes:

notification: A notification named NSWindowDidMoveNotification.

You can retrieve the NSWindow object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

31.79.47 windowDidResignKey(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the delegate that the window has resigned key window status.
Notes:

notification: A notification named NSWindowDidResignKeyNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

31.79.48 windowDidResignMain(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the delegate that the window has resigned main window status.
Notes:

notification: A notification named NSWindowDidResignMainNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

31.79.49 windowDidResize(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the delegate that the window has been resized.
Notes:

notification: A notification named NSWindowDidResizeNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

31.79.50 windowDidUpdate(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that the window received an update message.
Notes:

notification: A notification named NSWindowDidUpdateNotification

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

31.79.51 windowShouldClose as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that the user has attempted to close a window or the window has received a performClose message.
Notes:

Return true to allow sender to be closed; otherwise, false.

This method may not always be called during window closing. Specifically, this method is not called when a user quits an application.

Available in Mac OS X v10.0 and later.

31.79.52 windowShouldZoom(win as NSWindowMBS, newFrame as NSRectMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks the delegate whether the specified window should zoom to the specified frame.
Notes:

win: The window being zoomed.
newFrame: The rectangle to which the specified window is being zoomed.

Return true to allow window's frame to become newFrame; otherwise, false.

Available in Mac OS X v10.0 and later.

31.79.53 windowWillBeginSheet(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Notifies the delegate that the window is about to open a sheet.
Notes:

notification: A notification named NSWindowWillBeginSheetNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.1 and later.

31.79.54 windowWillClose(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that the window is about to close.
Notes:

notification: A notification named NSWindowWillCloseNotification.

You can retrieve the NSWindow object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

31.79.55 windowWillEnterFullScreen(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The window is about to enter fullscreen mode.
Notes:

notification: A notification named NSWindowWillEnterFullScreenNotification.

Available in Mac OS X v10.7 and later.

31.79.56 windowWillEnterVersionBrowser(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate the the window is about to enter version browsing.
Notes:

notification: An NSWindowWillEnterVersionBrowserNotification notification.
Available in Mac OS X v10.7 and later.

31.79.57 windowWillExitFullScreen(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The window is about to exit fullscreen mode.
Notes:

notification: A notification named NSWindowWillExitFullScreenNotification.
Available in Mac OS X v10.7 and later.

31.79.58 windowWillExitVersionBrowser(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate the the window just left version browsing.
Notes:

notification: An NSWindowWillExitVersionBrowserNotification notification.
Available in Mac OS X v10.7 and later.

31.79.59 windowWillMiniaturize(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that the window is about to be minimized.
Notes:

notification: A notification named NSWindowWillMiniaturizeNotification.
You can retrieve the NSWindow object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

31.79.60 windowWillMove(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that the window is about to move.
Notes:

notification: A notification named NSWindowWillMoveNotification.
You can retrieve the NSWindow object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

31.79.61 windowWillResize(win as NSWindowMBS, newFrameSize as NSSizeMBS, newSize as NSSizeMBS) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that the window is being resized (whether by the user or through one of the setFrame... methods other than setFrame:display:).
Notes:

The plugin first passes the event to Xojo runtime. In the newSize parameter you get the result from the runtime. Now you can decide. If you return nil, the newSize value is used.

win: The window being resized.
frameSize: The size to which the specified window is being resized.
newSize: The size Xojo wants to use.

Return a custom size to which the specified window will be resized.

The frameSize contains the size (in screen coordinates) sender will be resized to. To resize to a different size, simply return the desired size from this method; to avoid resizing, return the current size. sender's minimum and maximum size constraints have already been applied when this method is invoked.

While the user is resizing a window, the delegate is sent a series of windowWillResize messages as the window's outline is dragged. The window's outline is displayed at the constrained size as set by this method.

Available in Mac OS X v10.0 and later.

31.79.62 windowWillReturnUndoManager(win as NSWindowMBS) as NSUndoManagerMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that the window's undo manager has been requested. Returns the appropriate undo manager for the window.
Notes:

win: The window whose undo manager is being requested.

Return the appropriate undo manager for the specified window.

If this method is not implemented by the delegate, the window creates an NSUndoManager for window.

Available in Mac OS X v10.0 and later.

31.79.63 windowWillStartLiveResize(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the delegate that the window is about to be live resized.
Notes:

notification: A notification named NSWindowWillStartLiveResizeNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.6 and later.

31.79.64 windowWillUseStandardFrame(win as NSWindowMBS, newFrame as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked by NSWindow's zoom: method while determining the frame a window may be zoomed to.
Notes:

win: The window whose frame size is being determined.
newFrame: The size of the current screen, which is the screen containing the largest part of the window's current frame, possibly reduced on the top, bottom, left, or right, depending on the current interface style. The frame is reduced on the top to leave room for the menu bar.

Return the specified window's standard frame.

The standard frame for a window should supply the size and location that are "best" for the type of information shown in the window, taking into account the available display or displays. For example, the best width for a window that displays a word-processing document is the width of a page or the width of the display, whichever is smaller. The best height can be determined similarly. On return from this method, the zoom: method modifies the returned standard frame, if necessary, to fit on the current screen.

Available in Mac OS X v10.0 and later.

31.80 class NSWindowMBS

31.80.1 class NSWindowMBS

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class for a window.
Notes: Subclass of the NSResponderMBS class.

31.80.4 Methods

31.80.5 addChildWindow(win as NSWindowMBS, order as Integer)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a given window as a child window of the window.
Notes:

win: The child window to order.
order: Either NSWindowAbove: childWindow is ordered immediately in front of the window, or NSWindowBelow: childWindow is ordered immediately behind the window.

After the childWindow is added as a child of the window, it is maintained in relative position indicated by order mode for subsequent ordering operations involving either window. While this attachment is active, moving childWindow will not cause the window to move (as in sliding a drawer in or out), but moving the window will cause childWindow to move.

Note that you should not create cycles between parent and child windows. For example, you should not add window B as child of window A, then add window A as a child of window B.
See also:

- 31.80.6 addChildWindow(win as window, order as Integer) 6534

31.80.6 addChildWindow(win as window, order as Integer)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Adds a given window as a child window of the window.
Notes:

win: The child window to order.
order: Either NSWindowAbove: childWindow is ordered immediately in front of the window, or NSWindowBelow: childWindow is ordered immediately behind the window.

After the childWindow is added as a child of the window, it is maintained in relative position indicated by order mode for subsequent ordering operations involving either window. While this attachment is active, moving childWindow will not cause the window to move (as in sliding a drawer in or out), but moving the window will cause childWindow to move.

Note that you should not create cycles between parent and child windows. For example, you should not add window B as child of window A, then add window A as a child of window B.
See also:

- 31.80.5 addChildWindow(win as NSWindowMBS, order as Integer) 6533

31.80.7 addTabbedWindow(win as NSWindowMBS, ordered as Integer)

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Allows creating a group of tabbed windows, or adding a new window to an existing tabbed window group.
Example:

```
dim n as NSWindowMBS = window1.NSWindowMBS

n.addTabbedWindow(Window2, n.NSWindowAbove)
```

Notes:

The 'window' will be added to the receiver's tabbed window group, or create a group if needed. The tabbingIdentifier for the entire group should be the same for all the windows, otherwise an exception will be thrown. Use the ordered parameter with "NSWindowAbove" and "NSWindowBelow" to place the new window before or after the receiver's tab. Passing "NSWindowOut" will thrown an exception. Currently this method is not animatable, but that may change in the future.
Raises an exception when used on OS X 10.11 and older.

31.80.8 animator as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the proxy object for this window which animates.
Example:

```
dim v as NSWindowMBS // your NSWindowMBS object

v.alphaValue = 0.5 // switch alpha directly
v.animator.alphaValue = 0.5 // switch alpha animated
```

31.80.9 areCursorRectsEnabled as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the window's cursor rectangles are enabled.
Notes: Available in Mac OS X v10.0 and later.

31.80.10 attachedSheet as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the sheet attached to the window.
Notes:

The sheet attached to the window; nil when the window doesn't have a sheet attached.

Available in Mac OS X v10.1 and later.

31.80.11 autorecalculatesContentBorderThicknessForEdge(edge as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window calculates the thickness of a given border automatically.
Notes:

edge: Border whose thickness autorecalculation status to set:

NSMaxYEdge: Top border.
NSMinYEdge: Bottom border.

Returns true when the window auto-recalculates the given border's thickness; otherwise, false.

Requires Mac OS X 10.5.

31.80.12 becomeKeyWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invoked automatically to inform the window that it has become the key window; never invoke this method directly.
Notes: This method reestablishes the window's first responder, sends the becomeKeyWindow message to that object if it responds, and posts an NSWindowDidBecomeKeyNotification to the default notification center.

31.80.13 becomeMainWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invoked automatically to inform the window that it has become the main window; never invoke this method directly.

31.80.14 cacheImageInRect(r as NSRectMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stores the window's raster image from a given rectangle expressed in the window's base coordinate system.
Notes:

This method allows the window to perform temporary drawing, such as a band around the selection as the user drags the mouse, and to quickly restore the previous image by invoking restoreCachedImage and flushWindowIfNeeded. The next time the window displays, it discards its cached image rectangles. You can

also explicitly use discardCachedImage to free the memory occupied by cached image rectangles. aRect is made integral before caching the image to avoid antialiasing artifacts.

Only the last cached rectangle is remembered and can be restored.

31.80.15 Center

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the window's location to the center of the screen.
Notes:

The window is placed exactly in the center horizontally and somewhat above center vertically. Such a placement carries a certain visual immediacy and importance. This method doesn't put the receiver onscreen, however; use makeKeyAndOrderFront (show) to do that.

You typically use this method to place a window—most likely an alert dialog—where the user can't miss it. This method is invoked automatically when a panel is placed on the screen by the runModalForWindow method of the NSApplication class.

31.80.16 childWindows as NSWindowMBS()

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of the window's attached child windows.

31.80.17 ClearFocus

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clears the focus.
Notes: Moves the focus back to the window.

31.80.18 Close

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the window.

31.80.19 Constructor(w as window)

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSWindow for the given Xojo window.
Example:

```
dim w as new NSWindowMBS(window1)

MsgBox w.Title
```

Notes:

In plugin version 9.4 and newer this works only with Cocoa windows.
In plugin version 9.7 and newer you can use it also for Carbon windows.
See also:

- 31.80.20 Constructor(x as Double, y as Double, w as Double, h as Double, styleMask as Integer, BackingStoreType as Integer = 0, deferCreation as boolean = false, canBecomeKeyWindow as boolean = false) 6538

31.80.20 Constructor(x as Double, y as Double, w as Double, h as Double, styleMask as Integer, BackingStoreType as Integer = 0, deferCreation as boolean = false, canBecomeKeyWindow as boolean = false)

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor to create a new Cocoa Windows.
Notes:

x,y,w,h:
Location and size of the window's content area in screen coordinates. Note that the window server limits window position coordinates to ±16,000 and sizes to 10,000.

styleMask:
The window's style. Either it can be NSBorderlessWindowMask, or it can contain any of the options described in the constants, combined using the bitwiseOR function. Borderless windows display none of the usual peripheral elements and are generally useful only for display or caching purposes; you should normally not need to create them. Also, note that a window's style mask should include NSTitledWindowMask if it includes any of the others.

bufferingType:
Specifies how the drawing done in the window is buffered by the window device, and possible values are described in "Constants."

deferCreation:

Specifies whether the window server creates a window device for the window immediately. When true, the window server defers creating the window device until the window is moved onscreen. All display messages sent to the window or its views are postponed until the window is created, just before it's moved onscreen.

Initialized NSWindow object.

This method is the designated initializer for the NSWindow class.

Deferring the creation of the window improves launch time and minimizes the virtual memory load on the window server.

The new window creates a view to be its default content view. You can replace it with your own object by using the ContentView property.

Parameter canBecomeKeyWindow (in 11.3 plugin) controls whether we use a special NSWindow subclass which returns true for the canBecomeKeyWindow function. This way you can create windows which can take key focus.
See also:

- 31.80.19 Constructor(w as window) 6538

31.80.21 contentBorderThicknessForEdge(edge as Integer) as Double

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates the thickness of a given border of the window.
Notes:

edge: The border whose thickness to get:

NSMaxYEdge: Top border.
NSMinYEdge: Bottom border.

Requires Mac OS X 10.5.

31.80.22 contentRectForFrameRect(windowFrame as NSRectMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the window's content rectangle with a given frame rectangle.
Example:

```
dim w as NSWindowMBS = window1.NSWindowMBS
dim fr as NSRectMBS = w.frame
dim cr as NSRectMBS = w.contentRectForFrameRect(fr)

MsgBox "Title height: "+str(fr.Height-cr.Height)
```

Notes:

windowFrame: The frame rectangle for the window expressed in screen coordinates.

Returns the window's content rectangle, expressed in screen coordinates, with windowFrame.

The window uses its current style mask in computing the content rectangle. See Window Style Mask constants for a list of style mask values. The main advantage of this instance-method counterpart to contentRectForFrameRect (With styleMask) is that it allows you to take toolbars into account when converting between content and frame rectangles. (The toolbar is not included in the content rectangle.)
See also:

- 31.80.23 contentRectForFrameRect(windowFrame as NSRectMBS, styleMask as UInt32) as NSRectMBS 6540

31.80.23 contentRectForFrameRect(windowFrame as NSRectMBS, styleMask as UInt32) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the content rectangle used by a window with a given frame rectangle and window style.
Notes:

windowFrame: The frame rectangle for the window expressed in screen coordinates.
windowStyle: The window style for the window. See constants for a list of style mask values.

Returns the content rectangle, expressed in screen coordinates, used by the window with windowFrame and windowStyle.
When a NSWindowMBS instance is available, you should use contentRectForFrameRect instead of this method.
See also:

- 31.80.22 contentRectForFrameRect(windowFrame as NSRectMBS) as NSRectMBS 6539

31.80.24 convertBaseToScreen(p as NSPointMBS) as NSPointMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts a given point from the window's base coordinate system to the screen coordinate system.

31.80.25 convertScreenToBase(p as NSPointMBS) as NSPointMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts a given point from the screen coordinate system to the window's base coordinate system.

31.80.26 dataWithEPSInsideRect(r as NSRectMBS) as Memoryblock

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns EPS data that draws the region of the window within a given rectangle.
Notes: This data can be placed on a pasteboard, written to a file, or used to create an NSImage object.

31.80.27 dataWithPDFInsideRect(r as NSRectMBS) as Memoryblock

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns PDF data that draws the region of the window within a given rectangle.
Notes: This data can be placed on a pasteboard, written to a file, or used to create an NSImage object.

31.80.28 deminiaturize

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method deminimizes the receiver.
Notes: Invoke this method to programmatically deminimize a minimized window in the Dock.

31.80.29 disableCursorRects

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Disables all cursor rectangle management within the window.
Notes: Use this method when you need to do some special cursor manipulation and you don't want the Application Kit interfering.

31.80.30 disableFlushWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Disables the flushWindow method for the window.
Notes:

If the window is buffered, disabling flushWindow prevents drawing from being automatically flushed by the NSView display... methods from the window's backing store to the screen. This method permits several views to be drawn before the results are shown to the user.

Flushing should be disabled only temporarily, while the window's display is being updated. Each disableFlushWindow message must be paired with a subsequent enableFlushWindow message. Invocations of these methods can be nested; flushing isn't reenabled until the last (unnested) enableFlushWindow message is sent.

31.80.31 disableScreenUpdatesUntilFlush

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Disables the window's screen updates until the window is flushed.
Notes:

This method can be invoked to synchronize hardware surface flushes with the window's flushes. The window immediately disables screen updates using the NSDisableScreenUpdates function and reenables screen updates when the window flushes. Sending this message multiple times during a window update cycle has no effect.

Available in Mac OS X v10.4 and later.

31.80.32 disableSnapshotRestoration

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Disable snapshot restoration.
Notes:

While snapshot restoration is disabled, the window will not be snapshotted for restorable state.
Available in OS X v10.7 and later.

31.80.33 discardCachedImage

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Discards all of the window's cached image rectangles.
Notes: An NSWindow object automatically discards its cached image rectangles when it displays.

31.80.34 discardCursorRects

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invalidates all cursor rectangles in the window.
Notes: This method is invoked by resetCursorRects to clear out existing cursor rectangles before resetting them. You shouldn't invoke it in the code you write, but you might want to override it to change its behavior.

31.80.35 display

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Passes a display message down the window's view hierarchy, thus redrawing all views within the window, including the frame view that draws the border, title bar, and other peripheral elements.
Notes: You rarely need to invoke this method. NSWindow objects normally record which of their views need display and display them automatically on each pass through the event loop.

31.80.36 displayIfNeeded

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Passes a displayIfNeeded message down the window's view hierarchy, thus redrawing all views that need to be displayed, including the frame view that draws the border, title bar, and other peripheral elements.
Notes:

This method is useful when you want to modify some number of views and then display only the ones that were modified.

You rarely need to invoke this method. NSWindow objects normally record which of their views need display and display them automatically on each pass through the event loop.

31.80.37 dockTile as Variant

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides the application's Dock tile.
Notes:

Available in Mac OS X v10.5 and later.

Returns NSDockTileMBS object for the dock tile.

31.80.38 dragImage(image as NSImageMBS, viewLocation as NSPointMBS, offset as NSSizeMBS, NSEvent as NSEventMBS, pboard as NSPasteboardMBS, source as NSViewMBS, slideFlag as boolean)

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Begins a dragging session.
Notes:

image: The object to be dragged.
imageLocation: Location of the image's bottom-left corner in the window's coordinate system. It determines the placement of the dragged image under the pointer.
offset: The pointer's location relative to the mouse-down location. Not used in OS X v10.4 and later.
NSEvent: The left-mouse down event that triggered the dragging operation.
pasteboard: The pasteboard that holds the data to be transferred to the destination.
source: The object serving as the controller of the dragging operation. It must conform to the NSDraggingSource protocol.
slideBack: Specifies whether the drag image should slide back to imageLocation if it's rejected by the drag destination. Pass true to specify slide back behavior or false to specify that it should not.

This method should be invoked only from within a view's implementation of the mouseDown or mouseDragged methods (which overrides the version defined in NSResponder class). Essentially the same as the NSView method of the same name, except that imageLocation is given in the NSWindow object's base coordinate system.

31.80.39 enableCursorRects

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reenables cursor rectangle management within the window after a disableCursorRects message.

31.80.40 enableFlushWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reenables the flushWindow method for the window after it was disabled through a previous disableFlushWindow message.

31.80.41 enableSnapshotRestoration

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enable snapshot restoration.
Notes:

While snapshot restoration is enabled, the window will be snapshotted for restorable state.
Available in OS X v10.7 and later.

31.80.42 endEditingFor(anObject as object = nil)

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Forces the field editor to give up its first responder status and prepares it for its next assignment.
Notes:

anObject: The object that is using the window's field editor.

If the field editor is the first responder, it's made to resign that status even if its resignFirstResponder method returns false. This registration forces the field editor to send a textDidEndEditing message to its delegate. The field editor is then removed from the view hierarchy, its delegate is set to nil, and it's emptied of any text it may contain.

This method is typically invoked by the object using the field editor when it's finished. Other objects normally change the first responder by simply using makeFirstResponder, which allows a field editor or other object to retain its first responder status if, for example, the user has entered an invalid value. The endEditingFor: method should be used only as a last resort if the field editor refuses to resign first responder status. Even in this case, you should always allow the field editor a chance to validate its text and take whatever other action it needs first. You can do this by first trying to make the NSWindow object the first responder.

31.80.43 fieldEditor(createFlag as boolean = True, forObject as object = nil) as Variant

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the window's field editor, creating it if requested.
Notes:

Returns NSTextMBS object. Returned as Variant to reduce plugin dependencies.

createWhenNeeded: If true, creates a field editor if one doesn't exist; if false, does not create a field editor. A freshly created NSWindow object doesn't have a field editor. After a field editor has been created for a window, the createWhenNeeded argument is ignored. By passing false for createWhenNeeded and testing the return value, however, you can predicate an action on the existence of the field editor.
forObject: A text-displaying object for which the delegate (in windowWillReturnFieldEditor) assigns a custom field editor. Pass nil to get the default field editor, which can be the NSWindow field editor or a custom field editor returned by the delegate.

Returns the field editor for the designated object (anObject) or, if anObject is nil, the default field editor. Returns nil if createFlag is false and if the field editor doesn't exist.

The field editor is a single NSTextView object that is shared among all the controls in a window for light text-editing needs. It is automatically instantiated when needed, and it can be used however your application sees fit. Typically, the field editor is used by simple text-bearing objects—for example, an NSTextField object uses its window's field editor to display and manipulate text. The field editor can be shared by any number of objects, and so its state may be constantly changing. Therefore, it shouldn't be used to display text that demands sophisticated layout (for this you should create a dedicated NSTextView object).

The field editor may be in use by some view object, so be sure to properly dissociate it from that object before actually using it yourself (the appropriate way to do this is illustrated in the description of endEditingFor:). Once you retrieve the field editor, you can insert it in the view hierarchy, set a delegate to interpret text events, and have it perform whatever editing is needed. Then, when it sends a textDidEndEditing message to the delegate, you can get its text to display or store and remove the field editor using endEditingFor.

The window's delegate can substitute a custom field editor in place of the window's field editor by implementing windowWillReturnFieldEditor. The custom field editor can become the default editor (common to all text-displaying objects) or specific to a particular text-displaying object (anObject). The window sends this message to its delegate with itself and anObject as the arguments; if the delegate returns a non-nil value, the window returns that object instead of its field editor in fieldEditor. However, note the following:

If the window's delegate is identical to anObject, windowWillReturnFieldEditor isn't sent to the delegate. The object returned by the delegate method, though it may become first responder, does not become the window's default field editor. Other objects continue to use the window's default field editor.

31.80.44 firstResponder as NSResponderMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window's first responder.
Notes:

The first responder is usually the first object in a responder chain to receive an event or action message. In most cases, the first responder is a view object in that the user selects or activates with the mouse or keyboard.

You can use the firstResponder method in custom subclasses of responder classes (NSWindow, NSApplication, NSView, and subclasses) to determine if an instance of the subclass is currently the first responder. You can also use it to help locate a text field that currently has first-responder status. For more on this subject, see Event Handling Basics (on developer.apple.com).

31.80.45 flushWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Flushes the window's offscreen buffer to the screen if the window is buffered and flushing is enabled.
Notes: Does nothing for other display devices, such as a printer. This method is automatically invoked by the NSWindow display and displayIfNeeded methods and the corresponding NSView display and display-IfNeeded methods.

31.80.46 flushWindowIfNeeded

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Flushes the window's offscreen buffer to the screen if flushing is enabled and if the last flushWindow message had no effect because flushing was disabled.
Notes: To avoid unnecessary flushing, use this method rather than flushWindow to flush an NSWindow object after flushing has been reenabled.

31.80.47 frame as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window's frame rectangle.

31.80.48 frameRectForContentRect(windowContent as NSRectMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the window's frame rectangle with a given content rectangle.
Notes:

windowContent: The content rectangle for the window expressed in screen coordinates.

Returns the window's frame rectangle, expressed in screen coordinates, with windowContent.

The window uses its current style mask in computing the frame rectangle. See "Window Style Masks" for a list of style mask values. The major advantage of this instance-method counterpart to frameRectForContentRect (with styleMask) is that it allows you to take toolbars into account when converting between content and frame rectangles. (The toolbar is included in the frame rectangle but not the content rectangle.)
See also:

- 31.80.49 frameRectForContentRect(windowContentRect as NSRectMBS, styleMask as UInt32) as NSRectMBS 6548

31.80.49 frameRectForContentRect(windowContentRect as NSRectMBS, styleMask as UInt32) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the frame rectangle used by a window with a given content rectangle and window style.
Notes:

windowContentRect: The content rectangle for a window expressed in screen coordinates.
windowStyle: The window style for the window. See Window Style Mask constants for a list of style mask values.

Returns the frame rectangle, expressed in screen coordinates, used by the window with windowContentRect and windowStyle.
When a NSWindowMBS instance is available, you should use frameRectForContentRect instead of this method.
See also:

- 31.80.48 frameRectForContentRect(windowContent as NSRectMBS) as NSRectMBS 6547

31.80.50 GetFrame(byref left as Double, byref top as Double, byref width as Double, byref height as Double)

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Asks for the current window dimensions.
Notes: The point 0/0 is on the left bottom position.

31.80.51 gState as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the window's graphics state object.
Notes: This graphics state is used by default for all NSView objects in the window's view hierarchy, but individual views can be made to use their own with the NSView method allocateGState.

31.80.52 Hide

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Hides the window.

31.80.53 inLiveResize as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window is being resized by the user.
Notes: Available in Mac OS X v10.6 and later.

31.80.54 invalidateCursorRectsForView(View as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Marks as invalid the cursor rectangles of a given NSView object in the window's view hierarchy, so they'll be set up again when the window becomes key (or immediately if the window is key).

31.80.55 invalidateRestorableState

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Method that you may call to indicate that the restorable state is invalid.
Notes: At some point in the future, encodeRestorableStateWithCoder: will be called to encode the restorable state. You should not override this method.

31.80.56 invalidateShadow

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invalidates the window shadow so that it is recomputed based on the current window shape.

31.80.57 keyDown(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Handles a given keyboard event that may need to be interpreted as changing the key view or triggering a keyboard equivalent.
Notes: event: The keyboard event to process.

31.80.58 makeFirstResponder(r as NSResponderMBS) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Attempts to make a given responder the first responder for the window.
Example:

```
dim MySearchField as NSViewMBS // your control to move focus to
dim w as new NSWindowMBS(window1)
call w.makeFirstResponder(MySearchField)
```

Notes:

responder: The responder to set as the window's first responder. nil makes the window its first responder.

Returns true when the operation is successful; otherwise, false.

If responder isn't already the first responder, this method first sends a resignFirstResponder message to the object that is the first responder. If that object refuses to resign, it remains the first responder, and this method immediately returns false. If the current first responder resigns, this method sends a becomeFirstResponder message to responder. If responder does not accept first responder status, the NSWindow object becomes first responder; in this case, the method returns true even if responder refuses first responder status.

If responder is nil, this method still sends resignFirstResponder to the current first responder. If the current first responder refuses to resign, it remains the first responder and this method immediately returns false. If the current first responder returns true from resignFirstResponder, the window is made its own first responder and this method returns true.

The Application Kit framework uses this method to alter the first responder in response to mouse-down events; you can also use it to explicitly set the first responder from within your program. The responder object is typically an NSView object in the window's view hierarchy. If this method is called explicitly, first send acceptsFirstResponder to responder, and do not call makeFirstResponder if acceptsFirstResponder returns false.

Use setInitialFirstResponder to the set the first responder to be used when the window is brought onscreen for the first time.

31.80.59 makeKeyAndOrderFront

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Moves the window to the front of the screen list, within its level, and makes it the key window; that is, it shows the window.
Notes: More or less the same as Xojo's show command on the window class.

31.80.60 makeKeyWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Makes the window the key window.

31.80.61 makeMainWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Makes the window the main window.

31.80.62 mergeAllWindows

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Merges all windows into one window.
Example:

```
dim n as NSWindowMBS = window1.NSWindowMBS
n.mergeAllWindows
```

Notes: Raises an exception when used on OS X 10.11 and older.

31.80.63 minFrameWidthWithTitle(WindowTitle as string, styleMask as UInt32) as Double

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the minimum width a window's frame rectangle must have for it to display a title, with a given window style.
Example:

```
// shows 84.77588
MsgBox str(NSWindowMBS.minFrameWidthWithTitle("Hello World",0))
```

Notes:

windowTitle: The title for the window.
windowStyle: The window style for the window. See Window Style Mask constants for a list of style mask values.

The minimum width of the window's frame, using windowStyle, in order to display windowTitle.

31.80.64 miniaturize

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method removes the receiver from the screen list and displays the minimized window in the Dock.

31.80.65 moveTabToNewWindow

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Moves current tab to a new window.
Example:

```
dim n as NSWindowMBS = window1.NSWindowMBS
n.moveTabToNewWindow
```

Notes: Raises an exception when used on OS X 10.11 and older.

31.80.66 NSDockWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X.
Notes: The level for the doc. (Deprecated. There is no replacement.)

31.80.67 NSFloatingWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X.
Notes: Useful for floating palettes.

31.80.68 NSMainMenuWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X.
Notes: Reserved for the application's main menu.

31.80.69 NSModalPanelWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X.
Notes: The level for a modal panel.

31.80.70 NSNormalWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X.
Notes: The default level for NSWindow objects.

31.80.71 NSPopUpMenuWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X.
Notes: The level for a pop-up menu.

31.80.72 NSScreenSaverWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X.
Notes: The level for a screen saver.

31.80.73 NSStatusWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X.
Notes: The level for a status window.

31.80.74 NSSubmenuWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X.
Notes: Reserved for submenus. Synonymous with NSTornOffMenuWindowLevel, which is preferred.

31.80.75 NSTornOffMenuWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the standard window levels in Mac OS X.
Notes: The level for a torn-off menu. Synonymous with NSSubmenuWindowLevel.

31.80.76 NSWindowDidBecomeKeyNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted whenever an NSWindow object becomes the key window.

The notification object is the NSWindow object that has become key. This notification does not contain a userInfo dictionary.

31.80.77 NSWindowDidBecomeMainNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted whenever an NSWindow object becomes the main window.

The notification object is the NSWindow object that has become main. This notification does not contain a userInfo dictionary.

31.80.78 NSWindowDidChangeScreenNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted whenever a portion of an NSWindow object's frame moves onto or off of a screen.

The notification object is the NSWindow object that has changed screens. This notification does not contain a userInfo dictionary.

This notification is not sent in Mac OS X versions earlier than 10.4.

31.80.79 NSWindowDidChangeScreenProfileNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted whenever the display profile for the screen containing the window changes.

This notification is sent only if the window returns true from displaysWhenScreenProfileChanges. This notification may be sent when a majority of the window is moved to a different screen (whose profile is also different from the previous screen) or when the ColorSync profile for the current screen changes.

The notification object is the NSWindow object whose profile changed. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.4 and later.

31.80.80 NSWindowDidDeminiaturizeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted whenever an NSWindow object is deminimized.

The notification object is the NSWindow object that has been deminimized. This notification does not contain a userInfo dictionary.

31.80.81 NSWindowDidEndLiveResizeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted after the user resizes a window.

This notification is sent only once for a series of window resize operations.

The notification object is the NSWindow object that was resized. This notification does not contain a user-Info dictionary.

Available in Mac OS X v10.6 and later.

31.80.82 NSWindowDidEndSheetNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted whenever an NSWindow object closes an attached sheet.

The notification object is the NSWindow object that contained the sheet. This notification does not contain a userInfo dictionary.

31.80.83 NSWindowDidEnterFullScreenNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted when the window entered full screen mode.
The notification object is the NSWindow object entered full screen mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

31.80.84 NSWindowDidEnterVersionBrowserNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted when the window will exit full screen mode.
The notification object is the NSWindow object that will exit full screen mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

31.80.85 NSWindowDidExitFullScreenNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted when the window will exit full screen mode.
The notification object is the NSWindow object that will exit full screen mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

31.80.86 NSWindowDidExitVersionBrowserNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted when the window did exit version browser mode.
The notification object is the NSWindow object that did exit version browser mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

31.80.87 NSWindowDidExposeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted whenever a portion of a nonretained NSWindow object is exposed, whether by being ordered in front of other windows or by other windows being removed from in front of it.

The notification object is the NSWindow object that has been exposed. The userInfo dictionary contains the following information:

Key	Value
NSExposedRect	The rectangle that has been exposed (NSRect).

31.80.88 NSWindowDidMiniaturizeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted whenever an NSWindow object is minimized.

The notification object is the NSWindow object that has been minimized. This notification does not contain a userInfo dictionary.

31.80.89 NSWindowDidMoveNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted whenever an NSWindow object is moved.

The notification object is the NSWindow object that has moved. This notification does not contain a user-Info dictionary.

Note: This notification is sent when the window that moved didn't also change size. See NSWindowDidReSizeNotification for more information.

31.80.90 NSWindowDidResignKeyNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted whenever an NSWindow object resigns its status as key window.

The notification object is the NSWindow object that has resigned its key window status. This notification does not contain a userInfo dictionary.

31.80.91 NSWindowDidResignMainNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.

Notes:

Posted whenever an NSWindow object resigns its status as main window.

The notification object is the NSWindow object that has resigned its main window status. This notification does not contain a userInfo dictionary.

31.80.92 NSWindowDidResizeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted whenever an NSWindow object's size changes.

The notification object is the NSWindow object whose size has changed. This notification does not contain a userInfo dictionary.

31.80.93 NSWindowDidUpdateNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted whenever an NSWindow object receives an update message.

The notification object is the NSWindow object that received the update message. This notification does not contain a userInfo dictionary.

31.80.94 NSWindowWillBeginSheetNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted whenever an NSWindow object is about to open a sheet.

The notification object is the NSWindow object that is about to open the sheet. This notification does not contain a userInfo dictionary.

31.80.95 NSWindowWillCloseNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted whenever an NSWindow object is about to close.

The notification object is the NSWindow object that is about to close. This notification does not contain a userInfo dictionary.

31.80.96 NSWindowWillEnterFullScreenNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted when the window will enter full screen mode.
The notification object is the NSWindow object will enter full screen mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

31.80.97 NSWindowWillEnterVersionBrowserNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted when the window will enter version browser mode.
The notification object is the NSWindow object that will enter version browser mode. This notification does not contain a userInfo dictionary.
Available in Mac OS X v10.7 and later.

31.80.98 NSWindowWillExitFullScreenNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted when the window will exit full screen mode.
The notification object is the NSWindow object that will exit full screen mode. This notification does not

contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

31.80.99 NSWindowWillExitVersionBrowserNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted when the window will exit version browser mode.
The notification object is the NSWindow object that will exit version browser mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

31.80.100 NSWindowWillMiniaturizeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted whenever an NSWindow object is about to be minimized.

The notification object is the NSWindow object that is about to be minimized. This notification does not contain a userInfo dictionary.

31.80.101 NSWindowWillMoveNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted whenever an NSWindow object is about to move.

The notification object is the NSWindow object that is about to move. This notification does not contain a userInfo dictionary.

31.80.102 NSWindowWillStartLiveResizeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings you can use with the NSNotification* classes.
Notes:

Posted before the user resizes a window.
This notification is sent only once for a series of window resize operations.
The notification object is the NSWindow object that is about to be live resized. This notification does not contain a userInfo dictionary.
Available in Mac OS X v10.6 and later.

31.80.103 orderBack

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Moves the window to the back of its level in the screen list, without changing either the key window or the main window.

31.80.104 orderFront

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Moves the window to the front of its level in the screen list, without changing either the key window or the main window.

31.80.105 orderFrontRegardless

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Moves the window to the front of its level, even if its application isn't active, without changing either the key window or the main window.
Notes:

Normally an NSWindow object can't be moved in front of the key window unless it and the key window are in the same application. You should rarely need to invoke this method; it's designed to be used when applications are cooperating in such a way that an active application (with the key window) is using another application to display data.

Available in Mac OS X v10.0 and later.

31.80.106 orderOut

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the window from the screen list, which hides the window.
Notes:

More or less the same as Xojo's hide command on the window class.

If the window is the key or main window, the NSWindow object immediately behind it is made key or main in its place. Calling the orderOut method causes the window to be removed from the screen, but does not cause it to be released. See the close method for information on when a window is released.

The default animation based on the window type will be used when the window is ordered out unless it has been modified by the setAnimationBehavior method.

31.80.107 PerformClose

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method simulates the user clicking the close button by momentarily highlighting the button and then closing the window.
Notes:

Same as if the user clicks the close button.
So if the button is disabled or closing is not permitted by the window, it will do nothing.

31.80.108 performMiniaturize

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method simulates the user clicking the minimize button by momentarily highlighting the button, then minimizing the window.
Notes: If the receiver doesn't have a minimize button or can't be minimized for some reason, the system emits the alert sound.

31.80.109 performZoom

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method simulates the user clicking the zoom box by momentarily highlighting the button and then zooming the window.
Notes: If the receiver doesn't have a zoom box or can't be zoomed for some reason, the computer beeps.

31.80.110 print

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method runs the Print panel, and if the user chooses an option other than canceling, prints the window (its frame view and all subviews).

31.80.111 registerForDraggedTypes(Types() as string)

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Registers a give set of pasteboard types as the pasteboard types the window will accept as the destination of an image-dragging session.
Notes:

Types: An array of the pasteboard types the window will accept as the destination of an image-dragging session.

Registering an NSWindow object for dragged types automatically makes it a candidate destination object for a dragging session. NSWindow has a default implementation for many of the methods in the NSDraggingDestination informal protocol. The default implementation forwards each message to the delegate if the delegate responds to the selector of the message. The messages forwarded this way are draggingEntered:, draggingUpdated:, draggingExited:, prepareForDragOperation:, performDragOperation:, and concludeDragOperation:.

Xojo with Cocoa target implements the methods listed above. So this method is useful to change the allowed types for the case the framework has a bug.

31.80.112 removeChildWindow(win as NSWindowMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Detaches a given child window from the window.
Notes: win: The child window to detach.
See also:

- 31.80.113 removeChildWindow(win as window) 6565

31.80.113 removeChildWindow(win as window)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Detaches a given child window from the window.
Notes: win: The child window to detach.
See also:

- 31.80.112 removeChildWindow(win as NSWindowMBS) 6565

31.80.114 removeFrameUsingName(name as string)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the frame data stored under a given name from the application's user defaults.

31.80.115 resetCursorRects

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clears the window's cursor rectangles and the cursor rectangles of the NSView objects in its view hierarchy.
Notes:

Invokes discardCursorRects to clear the window's cursor rectangles, then sends resetCursorRects to every NSView object in the window's view hierarchy.

This method is typically invoked by the NSApplication object when it detects that the key window's cursor rectangles are invalid. In program code, it's more efficient to invoke invalidateCursorRectsForView.

31.80.116 resignKeyWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invoked automatically when the window resigns key window status; never invoke this method directly.
Notes: This method sends resignKeyWindow to the window's first responder, sends windowDidResignKey

to the window's delegate, and posts an NSWindowDidResignKeyNotification to the default notification center.

31.80.117 resignMainWindow

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invoked automatically when the window resigns main window status; never invoke this method directly.
Notes: This method sends windowDidResignMain to the window's delegate and posts an NSWindowDidResignMainNotification to the default notification center.

31.80.118 resizeFlags as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the flags field of the event record for the mouse-down event that initiated the resizing session.
Notes:

A mask indicating which of the modifier keys was held down when the mouse-down event occurred. The flags are listed in NSEvent object's modifierFlags method description.

This method is valid only while the window is being resized

You can use this method to constrain the direction or amount of resizing. Because of its limited validity, this method should only be invoked from within an implementation of the delegate method windowWillResize.

31.80.119 restoreCachedImage

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Splices the window's cached image rectangles, if any, back into its raster image (and buffer if it has one), undoing the effect of any drawing performed within those areas since they were established using cacheImageInRect.
Notes: You must invoke flushWindow after this method to guarantee proper redisplay. An NSWindow object automatically discards its cached image rectangles when it displays.

31.80.120 runToolbarCustomizationPalette

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The action method for the "Customize Toolbar..." menu item.

31.80.121 saveFrameUsingName(s as String)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Saves the window's frame rectangle in the user defaults system under a given name.
Notes: With the companion method setFrameUsingName, you can save and reset an NSWindow object's frame over various launches of an application. The default is owned by the application and stored under the name "NSWindow Frame frameName". See NSUserDefaults for more information.

31.80.122 selectKeyViewFollowingView(view as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Makes key the view that follows the given view.
Notes: Sends the nextValidKeyView message to referenceView and, if that message returns an NSView object, invokes makeFirstResponder with the returned object.

31.80.123 selectKeyViewPrecedingView(view as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Makes key the view that follows the given view.
Notes: Sends the nextValidKeyView message to referenceView and, if that message returns an NSView object, invokes makeFirstResponder with the returned object.

31.80.124 selectNextKeyView

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method searches for a candidate next key view and, if it finds one, invokes makeFirstResponder to establish it as the first responder.
Notes:

The candidate is one of the following (searched for in this order):

- The current first responder's next valid key view, as returned by the nextValidKeyView method of NSView
- The object designated as the window's initial first responder (using setInitialFirstResponder) if it returns true to an acceptsFirstResponder message
- Otherwise, the initial first responder's next valid key view, which may end up being nil

31.80.125 selectNextTab

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects next tab.
Example:

```
dim n as NSWindowMBS = window1.NSWindowMBS
n.selectNextTab
```

Notes: Raises an exception when used on OS X 10.11 and older.

31.80.126 selectPreviousKeyView

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method searches for a candidate previous key view and, if it finds one, invokes makeFirstResponder to establish it as the first responder.
Notes:

The candidate is one of the following (searched for in this order):

- The current first responder's previous valid key view, as returned by the previousValidKeyView method of NSView
- The object designated as the window's initial first responder (using setInitialFirstResponder) if it returns true to an acceptsFirstResponder message
- Otherwise, the initial first responder's previous valid key view, which may end up being nil

31.80.127 selectPreviousTab

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects previous tab.
Example:

```
dim n as NSWindowMBS = window1.NSWindowMBS
n.selectPreviousTab
```

Notes: Raises an exception when used on OS X 10.11 and older.

31.80.128 sendEvent(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method dispatches mouse and keyboard events sent to the window by the NSApplication object. **Notes:** Never invoke this method directly. A right mouse-down event in a window of an inactive application is not delivered to the corresponding NSWindow object. It is instead delivered to the NSApplication object through a sendEvent: message with a window number of 0.

31.80.129 setAutorecalculatesContentBorderThickness(flag as boolean, edge as Integer)

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies whether the window calculates the thickness of a given border automatically.
Notes:

flag: If true, the window calculates the thickness of the edge automatically; if false, it does not.

edge: The border whose thickness auto-recalculation status to set:

NSMaxYEdge: Top border.
NSMinYEdge: Bottom border.

Special Considerations
Turning off a border's auto-recalculation status sets its border thickness to 0.0.

In a non-textured window calling setAutorecalculatesContentBorderThickness passing NSMaxYEdge will raise an exception. It is only valid to set the content border thickness of the top edge in a textured window.

Requires Mac OS X 10.5.

31.80.130 setBottomCornerRounded(flag as boolean)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the bottom corner to be round.
Notes: This is an undocumented function in the NSWindow class.

31.80.131 setContentBorderThickness(thickness as Double, edge as Integer)

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies the thickness of a given border of the window.
Example:

```
dim w as NSWindowMBS = window1.NSWindowMBS

w.setContentBorderThickness(30, w.NSMinYEdge) // bottom 30 pixel
w.setContentBorderThickness(20, w.NSMaxYEdge) // top 30 pixel. Window must be metal for this
```

Notes:

thickness: The thickness for edge, in points.
edge: The border whose thickness to set:

NSMaxYEdge: Top border.
NSMinYEdge: Bottom border.

In a non-textured window calling setContentBorderThickness passing NSMaxYEdge will raise an exception. It is only valid to set the content border thickness of the top edge in a textured window.

The contentBorder does not include the titlebar or toolbar, so a textured window that just wants the gradient in the titlebar and toolbar should have a contentBorderThickness of 0 for NSMaxYEdge.

Requires Mac OS X 10.5.

31.80.132 setContentSize(size as NSSizeMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the size of the window's content view to a given size, which is expressed in the window's base coordinate system.
Notes: This size in turn alters the size of the NSWindow object itself. Note that the window server limits window sizes to 10,000; if necessary, be sure to limit aSize relative to the frame rectangle.

31.80.133 setFrame(frameRect as NSRectMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the origin and size of the window's frame rectangle according to a given frame rectangle, thereby setting its position and size onscreen.

Notes:

frameRect: The frame rectangle for the window, including the title bar.

Note that the window server limits window position coordinates to ±16,000 and sizes to 10,000.
See also:

- 31.80.134 setFrame(frameRect as NSRectMBS, display as boolean) 6571
- 31.80.135 setFrame(frameRect as NSRectMBS, display as boolean, animated as boolean) 6571
- 31.80.136 SetFrame(left as Double, top as Double, width as Double, height as Double) 6572

31.80.134 setFrame(frameRect as NSRectMBS, display as boolean)

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the origin and size of the window's frame rectangle according to a given frame rectangle, thereby setting its position and size onscreen.
Notes:

The point 0/0 is on the bottom left position of the main screen.
display: Specifies whether the window redraws the views that need to be displayed. When true the window sends a displayIfNeeded message down its view hierarchy, thus redrawing all views.
See also:

- 31.80.133 setFrame(frameRect as NSRectMBS) 6570
- 31.80.135 setFrame(frameRect as NSRectMBS, display as boolean, animated as boolean) 6571
- 31.80.136 SetFrame(left as Double, top as Double, width as Double, height as Double) 6572

31.80.135 setFrame(frameRect as NSRectMBS, display as boolean, animated as boolean)

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the origin and size of the window's frame rectangle, with optional animation, according to a given frame rectangle, thereby setting its position and size onscreen.
Notes:

The point 0/0 is on the bottom left position of the main screen.
If animated is true, the change is animated.
See also:

- 31.80.133 setFrame(frameRect as NSRectMBS) 6570
- 31.80.134 setFrame(frameRect as NSRectMBS, display as boolean) 6571
- 31.80.136 SetFrame(left as Double, top as Double, width as Double, height as Double) 6572

31.80.136 SetFrame(left as Double, top as Double, width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the origin and size of the window's frame rectangle according to a given frame rectangle, thereby setting its position and size onscreen.
Notes: The point 0/0 is on the bottom left position of the main screen.
See also:

- 31.80.133 setFrame(frameRect as NSRectMBS) 6570
- 31.80.134 setFrame(frameRect as NSRectMBS, display as boolean) 6571
- 31.80.135 setFrame(frameRect as NSRectMBS, display as boolean, animated as boolean) 6571

31.80.137 setFrameAutosaveName(name as String) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the name used to automatically save the window's frame rectangle in the defaults system to a given name.
Notes:

Returns true when the frame name is set successfully; false when frameName is being used as an autosave name by another NSWindow object in the application (in which case the window's old name remains in effect).

If frameName isn't the empty string (""), the window's frame is saved as a user default (as described in saveFrameUsingName) each time the frame changes.

When the window has an autosave name, its frame data is written whenever the frame rectangle changes.

If there is a frame rectangle previously stored for frameName in the user defaults, the window's frame is set to this frame rectangle. That is, when you call this method with a previously used frameName, the window picks up the previously saved setting. For example, if you call setFrameAutosaveName for a window that is already onscreen, this method could cause the window to move to a different screen location. For this reason, it is generally better to call this method before the window is visible on screen.

Keep in mind that a window controller may change the window's position when it displays it if window cascading is turned on. To preclude the window controller from changing a window's position from the one saved in the defaults system, you must send setShouldCascadeWindows(false) to the window controller.

31.80.138 setFrameFromString(s as String)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the window's frame rectangle from a given string representation.

Notes: If the window is not resizable, this method will not resize the window. The frame is constrained according to the window's minimum and maximum size settings. This method can cause a windowWillResize event.

31.80.139 setFrameOrigin(point as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Positions the bottom-left corner of the window's frame rectangle at a given point in screen coordinates.
Notes: Note that the window server limits window position coordinates to ±16,000.

31.80.140 setFrameTopLeftPoint(point as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Positions the top-left corner of the window's frame rectangle at a given point in screen coordinates.
Notes: Note that the window server limits window position coordinates to ±16,000; if necessary, adjust aPoint relative to the window's lower-left corner to account for this limit.

31.80.141 setFrameUsingName(name as String, force as boolean = false) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the window's frame rectangle by reading the rectangle data stored under a given name from the defaults system.
Notes:

Returns true when frameName is read and the frame is set successfully; otherwise, false.

The frame is constrained according to the window's minimum and maximum size settings. This method causes a windowWillResize event.

31.80.142 setRestorationClass

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies the class to use to acquire a matching window object during subsequent launches.
Notes:

The plugin provides a class to restore windows. See NSWindowRestoreHandlerMBS class.

The restoration class of a window is responsible for recreating not just the window but any other objects

needed to manage the window. Therefore, the restoration class must be able to create (or find existing instances of) all of these objects at launch time in your application.

If you mark your windows as restorable, you must associate a restoration class with them.
Available in OS X v10.7 and later.

31.80.143 setTitleWithRepresentedFile(filename as folderitem)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets a given path as the window's title, formatting it as a file-system path, and records this path as the window's associated filename using setRepresentedFilename.

31.80.144 setTitleWithRepresentedFilename(filename as string)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets a given path as the window's title, formatting it as a file-system path, and records this path as the window's associated filename using setRepresentedFilename.

31.80.145 Show

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Shows the window.

31.80.146 standardWindowButton(button as Integer) as Variant

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the window button of a given window button kind in the window's view hierarchy.
Example:

```
// another way to disable close button on Cocoa
dim n as NSButtonMBS = window1.NSWindowMBS.standardWindowButton(NSWindowMBS.NSWindow-
CloseButton)
n.isEnabled = false

// or move to to the right
dim r as NSRectMBS = n.frame
n.frame = NSMakeRectMBS(r.x+100, r.y, r.Width, r.Height)
```

Notes:

button: The kind of standard window button to return.

Returns Window button in the window's view hierarchy of the kind identified by windowButtonKind; nil when such button is not in the window's view hierarchy.

Declared as Variant for reduced plugin dependencies.
Button constants: NSWindowCloseButton, NSWindowDocumentIconButton, NSWindowMiniaturizeButton, NSWindowToolbarButton and NSWindowZoomButton.
See also:

- 31.80.147 standardWindowButton(button as Integer, StyleMask as Integer) as Variant 6575

31.80.147 standardWindowButton(button as Integer, StyleMask as Integer) as Variant

MBS MacBase Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new instance of a given standard window button, sized appropriately for a given window style.
Notes:

button: The kind of standard window button to return.
StyleMask: The window style for which windowButtonKind is to be sized. See "Window Style Masks" for the list of allowable values.

Returns the new window button of the kind identified by windowButtonKind; nil when no such button kind exists.

The caller is responsible for adding the button to the view hierarchy and for setting the target to be the window.

Declared as Variant for reduced plugin dependencies.
Button constants: NSWindowCloseButton, NSWindowDocumentIconButton, NSWindowMiniaturizeButton, NSWindowToolbarButton and NSWindowZoomButton
See also:

- 31.80.146 standardWindowButton(button as Integer) as Variant 6574

31.80.148 stringWithSavedFrame as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string representation of the window's frame rectangle.

Notes: A string representation of the window's frame rectangle in a format that can be used with a later setFrameFromString method.

31.80.149 tabbedWindows as NSWindowMBS()

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the entire group (stack) of windows that are all visually shown together in one virtual tabbed window and associated with this particular window.
Example:

```
dim n as NSWindowMBS = window1.NSWindowMBS
dim windows() as NSWindowMBS = n.tabbedWindows
break // check in debugger
```

Notes:

Operations can then be done on each window, as necessary. For instance, iterating over each window in the group and calling performClose: will close the entire stack. The result will be nil when the window is not tabbed at all (not showing a tab bar), and non-nil with at least one object when the tab bar is shown. The order of items in the array is the same order as the tabs visually shown (leading to trailing).
Raises an exception when used on OS X 10.11 and older.

31.80.150 toggleFullScreen

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Toggles fullscreen mode for this window.
Example:

```
dim w as new NSWindowMBS(window1)

// set window to have fullscreen
w.collectionBehavior = BitwiseOr(w.collectionBehavior, NSWindowMBS.NSWindowCollectionBehaviorFullScreen-
Primary)

// and switch to fullscreen
w.toggleFullScreen
```

Notes:

Available on Mac OS X 10.7 or later.
If an application supports fullscreen, it should add a menu item to the View menu with toggleFullScreen as the action.

This method does not much if you don't mark a window to be the primary fullscreen window.

31.80.151 toggleTabBar

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Toggles tab bar.
Example:

```
dim n as NSWindowMBS = window1.NSWindowMBS
n.toggleTabBar
```

Notes: Raises an exception when used on OS X 10.11 and older.

31.80.152 toggleToolbarShown

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The action method for the "Hide Toolbar" menu item (which alternates with "Show Toolbar").

31.80.153 toolbarview as NSViewMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Convenience function to find the toolbar view on the window.
Example:

```
dim v as NSViewMBS = window1.NSWindowMBS.toolbarview
dim m as NSMenuMBS = v.Menu
dim i as NSMenuItemMBS = m.Item(0)
MsgBox i.title
```

Notes: Returns nil if there is no toolbar view.

31.80.154 unregisterDraggedTypes

MBS MacBase Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Unregisters the window as a possible destination for dragging operations.

31.80.155 update

MBS MacBase Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates the window.
Notes:

The NSWindow implementation of this method does nothing more than post an NSWindowDidUpdateNotification notification to the default notification center. A subclass can override this method to perform specialized operations, but it should send an update message to super just before returning. For example, the NSMenu class implements this method to disable and enable menu commands.

An NSWindow object is automatically sent an update message on every pass through the event loop and before it's displayed onscreen. You can manually cause an update message to be sent to all visible NSWindow objects through the NSApplication updateWindows method.

31.80.156 useOptimizedDrawing(value as boolean)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies whether the window is to optimize focusing and drawing when displaying its views.
Notes:

value: If true, the window will optimize focusing and drawing for its views; if false, it will not, in which case, the window does not preserve the Z-ordering of overlapping views when an object explicitly sends lockFocus to a view and draws directly to it, instead of using the AppKit standard display mechanism.

The optimizations may prevent sibling subviews from being displayed in the correct order—which matters only if the subviews overlap. You should always set optimizedDrawing to true when there are no overlapping subviews within the window. The default is false.

31.80.157 WindowHandle as Integer

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Window handle.
Notes:

Can be used with the CarbonWindowsEventsMBS class.
(for events like open and close)

31.80.158 windowNumberAtPoint(x as Double, y as Double, belowWindowWithWindowNumber as Integer = 0) as Integer

MBS MacBase Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of the frontmost window that would be hit by a mouseDown at the screen location point.
Notes:

belowWindowWithWindowNumber can be specified to exclude a given window along with all windows above it, and may belong to any application. If no windows are to be excluded, specify 0 for belowWindowWithWindowNumber. The windowNumber returned may correspond to a window in another application.
Requires Mac OS X 10.6 or newer.

31.80.159 windowNumbersWithOptions(options as Integer = 0) as Integer()

MBS MacBase Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of integers containing windowNumbers for all visible windows satisfying options.
Example:

```
dim windowNumbers1() as Integer
dim windowNumbers2() as Integer
dim windowNumbers3() as Integer

// To get an array of windowNumbers visible on the current space and belonging to the calling application:
windowNumbers1 = NSWindowMBS.windowNumbersWithOptions(0)
// To get an array of windowNumbers visible on any space and belonging to any application:
windowNumbers2 = NSWindowMBS.windowNumbersWithOptions(NSWindowMBS.NSWindowNumberListAllApplications+NSWindowMBS.NSWindowNumberListAllSpaces)
// To get an array of windowNumbers visible on any space and belonging to the calling application:
windowNumbers3 = NSWindowMBS.windowNumbersWithOptions(NSWindowMBS.NSWindowNumberListAllSpaces)
```

Notes: In no options are specified, only visible windows belonging to the calling application and on the active space are included. If options include NSWindowNumberListAllApplications, visible windows belonging to all applications are included. If options include NSWindowNumberListAllSpaces, visible windows on all spaces are included.

31.80.160 zoom

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method toggles the size and location of the window between its standard state (provided by the application as the "best" size to display the window's data) and its user state (a new size and location the user may have set by moving or resizing the window).

31.80.161 Properties

31.80.162 acceptsMouseMovedEvents as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver is to accept mouse-moved events.
Notes:

True to have the receiver accept mouse-moved events (and to distribute them to its responders); false to not accept such events.
(Read and Write property)

31.80.163 allowsAutomaticWindowTabbing as Boolean

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Allows automatic window tabbing when the value is true.
Example:

```
// disable automatic tabbing
NSWindowMBS.allowsAutomaticWindowTabbing = false
```

Notes:

By default, this will be set to true, but applications can explicitly opt out of all automatic tabbing by setting it to false, and can still adoped explicit window tabbing, if desired.
Raises an exception when used on OS X 10.11 and older.
(Read and Write property)

31.80.164 allowsConcurrentViewDrawing as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether threading of view drawing is enabled for this window.
Notes:

Whether threading of view drawing should be enabled for this window. Defaults to true. When this is set to true, AppKit's view system is allowed to perform drawRect activity for the window's views on threads other than the main thread, for views that have canDrawConcurrently = true. When this is set to false, the window's views will be drawn serially as on 10.5 and earlier, even though some of the views may have canDrawConcurrently = true.

Available on Mac OS X 10.6.
(Read and Write property)

31.80.165 allowsToolTipsWhenApplicationIsInactive as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window displays tooltips even when the application is in the background.
Notes:

Default is false. Set to true to allow a window to display tooltips even when the application is in the background. Note that, enabling tooltips in an inactive application will cause the app to do work any time the mouse passes over the window. This can degrade system performance.
(Read and Write property)

31.80.166 alphaValue as Double

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's alpha value.
Example:

```
if TargetCocoa then
dim w as new NSWindowMBS(window1)
w.alphaValue=0.5
else
MsgBox "this sample requires Xojo Cocoa Target"
end if
```

Notes: (Read and Write property)

31.80.167 animationBehavior as Integer

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides for per-window control over automatic orderFront/orderOut animation behaviors added in 10.7.
Example:

```
dim w as new NSWindowMBS(window1)

w.animationBehavior = NSWindowMBS.NSWindowAnimationBehaviorDocumentWindow

Title = str(W.animationBehavior)
```

Notes:

Can be set to NSWindowAnimationBehaviorNone to disable Appkit's automatic animations for a given window, or to one of the other non-Default NSWindowAnimationBehavior values to override AppKit's automatic inference of appropriate animation behavior based on the window's apparent type.
Available on Mac OS X 10.7 or later.
(Read and Write property)

31.80.168 aspectRatio as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window's aspect ratio, which constrains the size of its frame rectangle to integral multiples of this ratio when the user resizes it.
Notes: (Read and Write property)

31.80.169 Autodisplay as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the window automatically displays views that need to be displayed.
Notes:

Automatic display typically occurs on each pass through the event loop.

Available in Mac OS X v10.0 and later.
(Read and Write property)

31.80.170 backgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window background color.
Notes: (Read and Write property)

31.80.171 backingLocation as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates the window's backing store location.
Notes:

The location of the window's backing store. See "Constants" for possible values.
Available in Mac OS X v10.5 and later.
(Read only property)

31.80.172 backingScaleFactor as Double

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the backing scale factor.
Notes:

Returns 2.0 for high resolution scaled display modes, and 1.0 for all other cases.

There are some scenarios where an application that is resolution-aware may want to reason on its own about the display environment it is running in.

It is important to note that this number returned by this method does not represent anything concrete, such as pixel density or physical size, since it can vary based on the configured display mode. For example, the display may be in a mirrored configuration that is still high resolution scaled, resulting in pixel geometry that may not match the native resolution of the display device.

Note: For almost all common cases, developers should avoid using the backingScaleFactor as an input to layout or drawing calculations. Developers should instead use the backing coordinate space conversion methods instead, as the resulting code will more likely work consistently and correctly under both low and high resolution operation.

For apps which are not enabled for retina support, the function returns 1. So you only see 2 here if app is Cocoa, display is retina and info.plist has the NSHighResolutionCapable key.
(Read only property)

31.80.173 backingType as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window's backing store type.
Notes:

Use constants like this:

(Read and Write property)

NSBackingStoreRetained	= 0	The window uses a buffer, but draws directly to the screen where possible and to the buffer for obscured portions. You should not use this mode. It combines the limitations of NSBackingStoreNonretained with the memory use of NSBackingStoreBuffered. The original NeXTSTEP implementation was an interesting compromise that worked well with fast memory mapped framebuffers on the CPU bus—something that hasn't been in general use since around 1994. These tend to have performance problems. In Mac OS X 10.5 and later, requests for retained windows will result in the window system creating a buffered window, as that better matches actual use. Available in Mac OS X v10.0 and later.
NSBackingStoreNonretained	= 1	The window draws directly to the screen without using any buffer. You should not use this mode. It exists primarily for use in the original Classic Blue Box. It does not support Quartz drawing, alpha blending, or opacity. Moreover, it does not support hardware acceleration, and interferes with system-wide display acceleration. If you use this mode, your application must manage visibility region clipping itself, and manage repainting on visibility changes. Available in Mac OS X v10.0 and later.
NSBackingStoreBuffered	= 2	The window renders all drawing into a display buffer and then flushes it to the screen. You should use this mode. It supports hardware acceleration, Quartz drawing, and takes advantage of the GPU when possible. It also supports alpha channel drawing, opacity controls, using the compositor. Available in Mac OS X v10.0 and later.

31.80.174 canBecomeKeyWindow as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window can become the key window.
Notes:

Attempts to make the window the key window are abandoned if this method returns false. The NSWindow implementation returns true if the window has a title bar or a resize bar, or false otherwise.
(Read only property)

31.80.175 canBecomeMainWindow as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window can become the application's main window.
Notes:

Attempts to make the window the main window are abandoned if this method returns false. The NSWindow implementation returns true if the window is visible, is not an NSPanel object, and has a title bar or a resize mechanism. Otherwise it returns false.
(Read only property)

31.80.176 canBecomeVisibleWithoutLogin as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window can be displayed at the login window.
Notes:

Default: false.
Available in Mac OS X v10.5 and later.
(Read and Write property)

31.80.177 canHide as boolean

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies whether the window can be hidden when its application becomes hidden (during execution of the NSApplication hide method).
Notes: (Read and Write property)

31.80.178 canStoreColor as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window has a depth limit that allows it to store color values.
Notes: (Read only property)

31.80.179 className as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of this NSWindow class.
Notes: (Read only property)

31.80.180 classPath as string

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path of this NSView class.
Notes:

Useful for debugging to know what super classes the window has.
(Read only property)

31.80.181 collectionBehavior as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Identifies the window's behavior in window collections.
Notes:

Available in Mac OS X v10.5 and later.
(Read and Write property)

31.80.182 colorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window's color space.
Notes:

Available in Mac OS X v10.6 and later.
(Read and Write property)

31.80.183 contentAspectRatio as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The aspect ratio (height in relation to width) of the window's content view, constraining the dimensions of its content rectangle to integral multiples of that ratio when the user resizes it.
Notes:

Available in Mac OS X v10.3 and later
(Read and Write property)

31.80.184 contentMaxSize as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum size of the window's content view.
Notes:

Available in Mac OS X v10.3 and later.
(Read and Write property)

31.80.185 contentMinSize as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minimum size of the window's content view.

Notes:

Available in Mac OS X v10.3 and later.
(Read and Write property)

31.80.186 contentResizeIncrements as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window's content-view resizing increments.
Notes:

Available in Mac OS X v10.3 and later.
(Read and Write property)

31.80.187 contentView as NSViewMBS

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's content view, the highest accessible NSView object in the receiver's view hierarchy.
Notes: (Read and Write property)

31.80.188 currentEvent as NSEventMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the event currently being processed by the application, by invoking NSApplication's currentEvent method.
Notes:

Returns the event being processed by the application.
(Read only property)

31.80.189 deepestScreen as NSScreenMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the deepest screen the window is on (it may be split over several screens).
Notes:

The deepest screen the window is on; nil when the window is offscreen.
(Read only property)

31.80.190 depthLimit as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the depth limit of the window.
Notes:

The value returned can be examined with the Application Kit functions NSPlanarFromDepth, NSColorSpaceFromDepth, NSBitsPerSampleFromDepth, and NSBitsPerPixelFromDepth.
(Read and Write property)

31.80.191 displaysWhenScreenProfileChanges as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window context should be updated when the screen profile changes or when the window moves to a different screen.
Notes:

Returns true when the window context should be updated when the screen profile changes or when the window moves to a different screen; otherwise, false.

The default value is false.

Available in Mac OS X v10.4 and later.
(Read and Write property)

31.80.192 hasDynamicDepthLimit as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window's depth limit can change to match the depth of the screen it's on.
Notes:

True when the window has a dynamic depth limit; otherwise, false.
(Read and Write property)

31.80.193 hasShadow as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver has a shadow.
Notes:

True when the receiver has a shadow, false when it doesn't.
(Read and Write property)

31.80.194 Height as Double

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The height of the color panel in pixel.
Notes: (Read and Write property)

31.80.195 hidesOnDeactivate as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver is removed from the screen when its application becomes inactive.
Notes:

True when the receiver is removed from the screen when its application is deactivated; false if it remains onscreen.

The default for NSWindow is false; the default for NSPanel is true.
(Read and Write property)

31.80.196 identifier as string

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A string that identifies this user interface item.
Example:

```
dim w as new NSWindowMBS(window1)

w.identifier = "window1"
MsgBox w.identifier
```

Notes:

It should be set to a unique value on NSViews when they are intended to be used inside a view-based NSTableView. Identifiers should be unique per-window. For programmatically created user interface items, you would typically set this value in code after creating a control but before adding it to a window. You may also want to set an identifier on a window, after creating it programmatically, to identify the window easily when it is reopened. You should not change the identifier after a control is added to a window. Identifiers beginning with an underscore are reserved for the system. In framework classes that implement this protocol, the accessor methods are not intended to be overridden.

To help avoid collision of identifiers, it is recommended that identifiers use the same prefix as is used for the framework or application. For example, identifiers for standard AppKit interface items, such as the open panel, will begin with "NS".

The slash '/', backslash '\', and colon ':' characters are reserved and should not be used in identifiers.
(Read and Write property)

31.80.197 ignoresMouseEvents as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver is transparent to mouse events.
Notes:

True when the receiver is transparent to mouse events, otherwise false.
(Read and Write property)

31.80.198 initialFirstResponder as NSViewMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The view that's made first responder the first time the window is placed onscreen.
Notes: (Read and Write property)

31.80.199 isDocumentEdited as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the receiver's document has been edited.
Notes:

True when the receiver's document has been edited; false otherwise.
Initially, by default, NSWindow objects are in the "not edited" state.
(Read and Write property)

31.80.200 isExcludedFromWindowsMenu as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver's title is omitted from the application's Windows menu.
Notes:

True to specify that the receiver is to be omitted from the application's Windows menu; false to specify otherwise.

(Read and Write property)

31.80.201 isFlushWindowDisabled as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window's flushing ability is disabled.
Notes: (Read only property)

31.80.202 isKeyWindow as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window is the key window for the application.
Notes: (Read only property)

31.80.203 isMainWindow as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window is the application's main window.
Notes: (Read only property)

31.80.204 isMiniaturized as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver is minimized.
Notes:

A minimized window is removed from the screen and replaced by a image, icon, or button that represents it, called the counterpart.
(Read only property)

31.80.205 isMovableByWindowBackground as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver is movable by clicking and dragging anywhere in its background.
Notes:

True when the window is movable by clicking and dragging anywhere in its background, otherwise false.

A window with a style mask of NSTexturedBackgroundWindowMask is movable by background by default. Sheets and drawers cannot be movable by window background.

Available in Mac OS X v10.2 and later.
Works in Xojo 2011r3, but not in 2011r4.
(Read and Write property)

31.80.206 isOnActiveSpace as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window is on the currently active space.
Notes:

For visible windows, this method indicates whether the window is currently visible on the active space. For offscreen windows, it indicates whether ordering the window onscreen would cause it to be on the active space.
Available in Mac OS X v10.6 and later.
(Read only property)

31.80.207 isOneShot as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window device the window manages is freed when it's removed from the screen list.
Notes: (Read and Write property)

31.80.208 isOpaque as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver is opaque.
Notes:

True when the receiver is opaque; false otherwise.
(Read and Write property)

31.80.209 isSheet as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window has ever run as a modal sheet.
Notes:

Sheets are created using the NSPanel subclass.
Available in Mac OS X v10.1 and later.
(Read only property)

31.80.210 isZoomed as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver is in a zoomed state.
Notes: (Read only property)

31.80.211 Left as Double

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The horizontal position of the color panel in pixel.
Notes: (Read and Write property)

31.80.212 Level as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window level of the receiver.
Example:

```
dim n as NSWindowMBS = window1.NSWindowMBS
n.Level = n.NSFloatingWindowLevel
```

Notes: (Read and Write property)

31.80.213 maxSize as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum size to which the window's frame (including its title bar) can be sized.
Notes:

The maximum size to which the window's frame (including its title bar) can be sized either by the user or by the setFrame... methods other than setFrame.
(Read and Write property)

31.80.214 miniwindowImage as Variant

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The custom miniaturized window image of the receiver.
Notes:

The miniaturized window image is the image displayed in the Dock when the window is minimized. If you did not assign a custom image to the window, this method returns nil.

Value is declares as Variant to minimize plugin dependencies, but should be NSImageMBS.
(Read and Write property)

31.80.215 miniwindowTitle as String

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The title displayed in the receiver's minimized window.
Notes: (Read and Write property)

31.80.216 minSize as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minimum size to which the window's frame (including its title bar) can be sized.
Notes:

The minimum size to which the window's frame (including its title bar) can be sized either by the user or by the setFrame... methods other than setFrame.
(Read and Write property)

31.80.217 Movable as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the window can be moved by clicking in its title bar or background.
Notes:

setMovableByWindowBackground, called with the argument true, is ignored by a window that returns false from isMovable. If a window returns false, that means it can only be dragged between spaces in F8 mode, and its relative screen position is always preserved. Note that a resizable window may still be resized, and the window frame may be changed programmatically. A non-movable window will not be moved or resized by the system in response to a display reconfiguration. Applications may choose to enable application-controlled window dragging after disabling user-initiating dragging by handling the mouseDown/mouseDragged/mouseUp sequence in sendEvent in an NSWindow subclass.
Available in Mac OS X v10.6 and later.

(Read and Write property)

31.80.218 parentWindow as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The parent window to which the window is attached as a child.
Notes:

Available in Mac OS X v10.2 and later.
(Read and Write property)

31.80.219 preferredBackingLocation as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The preferred location for the window's backing store.
Notes:

Available in Mac OS X v10.5 and later.
(Read and Write property)

31.80.220 preservesContentDuringLiveResize as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the window tries to optimize user-initiated resize operations by preserving the content of views that have not changed.
Notes:

Returns true if the window tries to optimize live resize operations by preserving the content of views that have not moved; otherwise, false.

Discussion
When live-resize optimization is active, the window redraws only those views that moved (or do not support this optimization) during a live resize operation.

See preservesContentDuringLiveResize in NSView for additional information on how to support this optimization.

Available in Mac OS X v10.4 and later.
(Read and Write property)

31.80.221 preventsApplicationTerminationWhenModal as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the window prevents application termination when modal.
Notes:

Available in Mac OS X v10.6 and later.
(Read and Write property)

31.80.222 representedFile as folderitem

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The pathname of the file the window represents.
Notes: (Read and Write property)

31.80.223 representedFilename as string

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The pathname of the file the window represents.
Notes: (Read and Write property)

31.80.224 representedURL as string

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The URL of the file the window represents.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
dim n as new NSWindowMBS(window1)
n.representedURL = f.URLPath

MsgBox n.representedURL
```

Notes:

The URL for the file the window represents.

When the URL specifies a path, the window shows an icon in its title bar, as described in Table 1.

Title bar document icon display:

Filepath	Document icon
Empty	None.
Specifies a nonexistent file	Generic.
Specifies an existent file	Specific for the file's type.

You can customize the file icon in the tile bar with the following code:

window.standardWindowButton(NSWindowDocumentIconButton).Image=theImage

When the URL identifies an existing file, the window's title offers a pop-up menu showing the path components of the URL. (The user displays this menu by Command-clicking the title.) The behavior and contents of this menu can be controlled with shouldPopUpDocumentPathMenu.

Available in Mac OS X v10.5 and later.
(Read and Write property)

31.80.225 resizeIncrements as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window's resizing increments.
Notes: (Read and Write property)

31.80.226 Restorable as boolean

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies whether the window configuration is preserved between application launches.
Notes:

value: Specify true if you want the window to be preserved or false if you do not want it preserved.

Windows should be preserved between launch cycles to maintain interface continuity for the user. During subsequent launch cycles, the system tries to recreate the window and restore its configuration to the preserved state. Configuration data is updated as needed and saved automatically by the system.

If you enable preservation for a given window, you should also specify a restoration class for the window using the setRestorationClass method.
Available in OS X v10.7 and later.

(Read and Write property)

31.80.227 screen as NSScreenMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the screen the window is on.
Notes:

The screen where most of the window is on; nil when the window is offscreen.

When the window is partly on one screen and partly on another, the screen where most of it lies is returned.
(Read only property)

31.80.228 sharingType as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The level of access other processes have to the window's content.
Notes:

Available in Mac OS X v10.5 and later.
(Read and Write property)

31.80.229 showsResizeIndicator as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver's resize indicator is visible
Notes:

True to show it, false to hide it.
This method does not affect whether the receiver is resizable.
(Read and Write property)

31.80.230 showsToolbarButton as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver shows the toolbar control button.
Notes:

True to display the toolbar control button; false to hide the button.

If the window does not have a toolbar, this method has no effect.
(Read and Write property)

31.80.231 styleMask as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's style mask, indicating what kinds of control items it displays.
Example:

```
dim p as new IKPictureTakerMBS
p.styleMask = BitwiseAnd(p.styleMask, & hFD) // disable close button
```

Notes:

See the information about the style mask in constants below. An NSWindow object's style is set when the object is initialized. Once set, it can't be changed.

constants:

NSBorderlessWindowMask = 0	The window displays none of the usual peripheral elements. Useful only for display or caching purposes.
NSTitledWindowMask = 1	The window displays a title bar.
NSClosableWindowMask = 2	The window displays a close button.
NSMiniaturizableWindowMask = 4	The window displays a minimize button.
NSResizableWindowMask = 8	The window displays a resize control.
NSTexturedBackgroundWindowMask = 256	The window displays with a metal-textured background. Additionally, the window may be moved by clicking and dragging anywhere in the window background. A bordered window with this mask gets rounded bottom corners.

(Read and Write property)

31.80.232 tabbingIdentifier as String

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Windows with the same tabbingIdentifier will have the ability to be tabbed together when a window is being shown.
Example:

```
dim n as NSWindowMBS = window1.NSWindowMBS
n.tabbingIdentifier = "test"
MsgBox n.tabbingIdentifier
```

Notes:

This allows aggregation of similiar windows. By default, the tabbingIdentifier will be generated based on inherit window properties, such as the window class name, the delegate class name, the window controller class name, and some additional state. Windows can be explicilty made to group together by using the same tabbingIdentifier.
Raises an exception when used on OS X 10.11 and older.
(Read and Write property)

31.80.233 tabbingMode as Integer

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get and set the tabbing mode for this window.
Example:

```
dim n as NSWindowMBS = window1.NSWindowMBS
n.tabbingMode = n.NSWindowTabbingModeDisallowed
MsgBox str(n.tabbingMode) // shows 2
```

Notes:

This should be set before a window is shown. The default value is NSWindowTabbingModeAutomatic. When the value is NSWindowTabbingModeAutomatic, the system will look at the userTabbingPreference and automatically tab windows together based on the tabbingIdentifier, when it is appropriate to do so.
Raises an exception when used on OS X 10.11 and older.
(Read and Write property)

31.80.234 Title as String

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The title of the color panel window.
Example:

```
if TargetCocoa then
dim w as new NSWindowMBS(window1)

MsgBox w.title

else
MsgBox "this sample requires Xojo Cocoa Target"
end if
```

Notes: (Read and Write property)

31.80.235 titlebarAppearsTransparent as Boolean

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether titlebar appears transparent.
Notes:

When True, the titlebar doesn't draw its background, allowing all buttons to show through, and "click through" to happen. In general, this is only useful when NSFullSizeContentViewWindowMask is set.

Available on Mac OS X 10.10 and newer.
(Read and Write property)

31.80.236 titleVisibility as Integer

MBS MacBase Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The title visibility.
Notes:

Can be NSWindowTitleVisible, NSWindowTitleHidden or NSWindowTitleHiddenWhenActive.
Available on Mac OS X 10.10 and newer.
(Read and Write property)

31.80.237 toolbar as Variant

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window's toolbar.
Notes:

Value is a NSToolbarMBS object.
Returned as Variant to reduce plugin dependencies.
(Read and Write property)

31.80.238 Top as Double

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The vertical position of the color panel in pixel.
Notes:

In the Cocoa world this is the distance from the bottom of the screen.
(Read and Write property)

31.80.239 userTabbingPreference as Integer

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the user's tabbing preference as set in System Preferences.
Example:

MsgBox str(NSWindowMBS.userTabbingPreference)

Notes:

This value should be queried anytime a new window is made to see if the user wants to automatically show it in tabs.

Can be NSWindowUserTabbingPreferenceManual, NSWindowUserTabbingPreferenceAlways or NSWindowUserTabbingPreferenceInFullScreen.
Raises an exception when used on OS X 10.11 and older.
(Read only property)

31.80.240 viewsNeedDisplay as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether any of the window's views need to be displayed.
Notes: (Read and Write property)

31.80.241 Visible as boolean

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the color panel is currently visible.
Notes:

Setting to false calls Hide and setting to true calls show.
(Read only property)

31.80.242 Width as Double

MBS MacBase Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The width of the color panel in pixel.
Notes: (Read and Write property)

31.80.243 windowController as NSWindowControllerMBS

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The window's window controller.
Notes: (Read and Write property)

31.80.244 windowNumber as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Provides the window number of the receiver's window device.
Example:

```
if TargetCocoa then
dim w as new NSWindowMBS(window1)

MsgBox str(w.windowNumber)

else
MsgBox "this sample requires Xojo Cocoa Target"
end if
```

Notes: (Read only property)

31.80.245 worksWhenModal as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the window is able to receive keyboard and mouse events even when some other window is being run modally.
Notes:

True if the window is able to receive keyboard and mouse events even when some other window is being run modally; otherwise, false.

The NSWindow implementation of this method returns false. Only subclasses of NSPanel should override

this default.
(Read only property)

31.80.246 frameAutosaveName as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name used to automatically save the window's frame rectangle data in the defaults system.
Notes: (Read and Write computed property)

31.80.247 Constants

31.80.248 NSBorderlessWindowMask=0

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.
Notes: The window displays none of the usual peripheral elements. Useful only for display or caching purposes.

31.80.249 NSClosableWindowMask=2

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.
Notes: The window displays a close button.

31.80.250 NSDirectSelection=0

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the direction a window is currently using to change the key view using keyViewSelectionDirection.
Notes: The window isn't traversing the key view loop.

31.80.251 NSFullScreenWindowMask = 16384

MBS MacBase Plugin, Plugin Version: 15.1. **Function:** One of the constants you can use to specify the style when creating a window.
Notes: When set, the window will appear full screen. This mask is automatically toggled when toggleFullScreen: is called.

31.80.252 NSFullSizeContentViewWindowMask = 32768

MBS MacBase Plugin, Plugin Version: 15.1. **Function:** One of the constants you can use to specify the style when creating a window.
Notes:

If set, the contentView will consume the full size of the window; it can be combined with other window style masks, but is only respected for windows with a titlebar.
Utilizing this mask opts-in to layer-backing. Utilize the contentLayoutRect or auto-layout contentLayoutGuide to layout views underneath the titlebar/toolbar area.

31.80.253 NSMaxXEdge = 2

MBS MacBase Plugin, Plugin Version: 11.1. **Function:** One of the Cocoa edge constants.
Notes: the maximum X edge. Typically right side.

31.80.254 NSMaxYEdge = 3

MBS MacBase Plugin, Plugin Version: 11.1. **Function:** One of the Cocoa edge constants.
Notes: The maximum Y edge. Topically the top edge of a window.

31.80.255 NSMiniaturizableWindowMask=4

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.
Notes: The window displays a minimize button.

31.80.256 NSMinXEdge = 0

MBS MacBase Plugin, Plugin Version: 11.1. **Function:** One of the Cocoa edge constants.
Notes: the minimum X edge. Typically left side.

31.80.257 NSMinYEdge = 1

MBS MacBase Plugin, Plugin Version: 11.1. **Function:** One of the Cocoa edge constants.
Notes: Minimum Y. As coordinates are upside down in the Cocoa world, this is the bottom edge of a window.

31.80.258 NSResizableWindowMask=8

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.
Notes: The window displays a resize control.

31.80.259 NSSelectingNext=1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the direction a window is currently using to change the key view using keyViewSelectionDirection.
Notes: The window is proceeding to the next valid key view.

31.80.260 NSSelectingPrevious=2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the direction a window is currently using to change the key view using keyViewSelectionDirection.
Notes: The window is proceeding to the previous valid key view.

31.80.261 NSTexturedBackgroundWindowMask=256

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.
Notes: The window displays with a metal-textured background. Additionally, the window may be moved by clicking and dragging anywhere in the window background. A bordered window with this mask gets rounded bottom corners.

31.80.262 NSTitledWindowMask=1

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.
Notes: The window displays a title bar.

31.80.263 NSUnifiedTitleAndToolbarWindowMask=4096

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.

31.80.264 NSUnscaledWindowMask=2048

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constants you can use to specify the style when creating a window.

31.80.265 NSWindowAbove=1

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the window order constants to specify how a window is ordered relative to another window.
Notes: Moves the window above the indicated window.

31.80.266 NSWindowAnimationBehaviorAlertPanel = 5

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the AnimationBehavior constants.
Notes: Default behavior for alert window.

31.80.267 NSWindowAnimationBehaviorDefault = 0

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the AnimationBehavior constants.
Notes: let AppKit infer animation behavior for this window

31.80.268 NSWindowAnimationBehaviorDocumentWindow = 3

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the AnimationBehavior constants.
Notes: Default behavior for document window.

31.80.269 NSWindowAnimationBehaviorNone = 2

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the AnimationBehavior constants.
Notes: suppress inferred animations (don't animate)

31.80.270 NSWindowAnimationBehaviorUtilityWindow = 4

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the AnimationBehavior constants.
Notes: Default behavior for utility window.

31.80.271 NSWindowBackingLocationDefault=0

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constant to specify the window backing store location.
Notes:

Determined by the operating system.
Available in Mac OS X v10.5 and later.

31.80.272 NSWindowBackingLocationMainMemory=2

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constant to specify the window backing store location.
Notes:

Physical memory.
Available in Mac OS X v10.5 and later.

31.80.273 NSWindowBackingLocationVideoMemory=1

MBS MacBase Plugin, Plugin Version: 8.4. **Function:** One of the constant to specify the window backing store location.
Notes:

Video memory.
Available in Mac OS X v10.5 and later.

31.80.274 NSWindowBelow=-1

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the window order constants to specify how a window is ordered relative to another window.
Notes: Moves the window below the indicated window.

31.80.275 NSWindowCloseButton=0

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One constants providing a way to access standard title bar buttons.
Notes: The close button.

31.80.276 NSWindowCollectionBehaviorCanJoinAllSpaces=1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for window collection behaviors related to Exposé and Spaces.
Notes:

The window appears in all spaces. The menu bar behaves this way.
Available in Mac OS X v10.5 and later.

31.80.277 NSWindowCollectionBehaviorDefault=0

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for window collection behaviors related to Exposé and Spaces.
Notes:

The window can be associated to one space at a time.
Available in Mac OS X v10.5 and later.

31.80.278 NSWindowCollectionBehaviorFullScreenAuxiliary = 256

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the constants for window collection behaviors.
Notes: Windows with this collection behavior can be shown with the fullscreen window.

31.80.279 NSWindowCollectionBehaviorFullScreenPrimary = 128

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the constants for window collection behaviors.
Notes: The frontmost window with this collection behavior will be the fullscreen window.

31.80.280 NSWindowCollectionBehaviorIgnoresCycle=64

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for window collection behaviors related to Exposé and Spaces.
Notes:

The window is not part of the window cycle for use with the Cycle Through Windows Window menu item.
Available in Mac OS X v10.6 and later.

31.80.281 NSWindowCollectionBehaviorManaged=4

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for window collection behaviors related to Exposé and Spaces.
Notes:

The window participates in Spaces and Exposé. This is the default behavior if windowLevel is equal to NSNormalWindowLevel.
Available in Mac OS X v10.6 and later.

31.80.282 NSWindowCollectionBehaviorMoveToActiveSpace=2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for window collection behaviors related to Exposé and Spaces.
Notes:

Making the window active does not cause a space switch; the window switches to the active space.
Available in Mac OS X v10.5 and later.

31.80.283 NSWindowCollectionBehaviorParticipatesInCycle=32

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for window collection behaviors related to Exposé and Spaces.
Notes:

The window participates in the window cycle for use with the Cycle Through Windows Window menu item.
Available in Mac OS X v10.6 and later.

31.80.284 NSWindowCollectionBehaviorStationary=16

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for window collection behaviors related to Exposé and Spaces.
Notes:

The window is unaffected by Exposé; it stays visible and stationary, like the desktop window.
Available in Mac OS X v10.6 and later.

31.80.285 NSWindowCollectionBehaviorTransient=8

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants for window collection behaviors related to Exposé and Spaces.

Notes:

The window floats in Spaces and is hidden by Exposé. This is the default behavior if windowLevel is not equal to NSNormalWindowLevel.
Available in Mac OS X v10.6 and later.

31.80.286 NSWindowDocumentIconButton=4

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One constants providing a way to access standard title bar buttons.
Notes: The document icon button.

31.80.287 NSWindowDocumentVersionsButton = 6

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One constants providing a way to access standard title bar buttons.

31.80.288 NSWindowFullScreenButton = 7

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One constants providing a way to access standard title bar buttons.

31.80.289 NSWindowMiniaturizeButton=1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One constants providing a way to access standard title bar buttons.
Notes: The minimize button.

31.80.290 NSWindowNumberListAllApplications=1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants used for options that may be passed to the windowNumbersWithOptions: method.
Notes:

The window numbers of windows visible on any space and belonging to any application.
Available in Mac OS X v10.6 and later.

If the value 0 is passed instead, then the list returned from the method contains window numbers for visible windows on the active space belonging to the calling application.

31.80.291 NSWindowNumberListAllSpaces=16

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants used for options that may be passed to the windowNumbersWithOptions: method.
Notes:

The window numbers of windows visible on any space and belonging to the calling application.
Available in Mac OS X v10.6 and later.

If the value 0 is passed instead, then the list returned from the method contains window numbers for visible windows on the active space belonging to the calling application.

31.80.292 NSWindowOut=0

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the window order constants to specify how a window is ordered relative to another window.
Notes: Moves the window off the screen.

31.80.293 NSWindowSharingNone=0

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the following constants and the related data type represent the access levels other processes can have to a window's content.
Notes:

The window's contents cannot be read by another process.
Available in Mac OS X v10.5 and later.

31.80.294 NSWindowSharingReadOnly=1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the following constants and the related data type represent the access levels other processes can have to a window's content.
Notes:

The window's contents can be read but not modified by another process.
Available in Mac OS X v10.5 and later.

31.80.295 NSWindowSharingReadWrite=2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the following constants and the related data type represent the access levels other processes can have to a window's content.
Notes:

The window's contents can be read and modified by another process.
Available in Mac OS X v10.5 and later.

31.80.296 NSWindowTabbingModeAutomatic = 0

MBS MacBase Plugin, Plugin Version: 16.5. **Function:** One of the tabbing modes.
Notes: The system automatically prefers to tab this window when appropriate.

31.80.297 NSWindowTabbingModeDisallowed = 2

MBS MacBase Plugin, Plugin Version: 16.5. **Function:** One of the tabbing modes.
Notes: The window explicitly should not prefer to tab when shown

31.80.298 NSWindowTabbingModePreferred = 1

MBS MacBase Plugin, Plugin Version: 16.5. **Function:** One of the tabbing modes.
Notes: The window explicitly should prefer to tab when shown.

31.80.299 NSWindowTitleHidden = 1

MBS MacBase Plugin, Plugin Version: 14.3. **Function:** One of the title visibility constants.
Notes: The always hidden mode hides the title and moves the toolbar up into the area previously occupied by the title.

31.80.300 NSWindowTitleHiddenWhenActive = 2

MBS MacBase Plugin, Plugin Version: 14.3. **Function:** One of the title visibility constants.
Notes: This mode hides the title when the window is active, and shows it when inactive. It does not adjust toolbars.

31.80.301 NSWindowTitleVisible = 0

MBS MacBase Plugin, Plugin Version: 14.3. **Function:** One of the title visibility constants.
Notes: The default mode has a normal window title and titlebar buttons.

31.80.302 NSWindowToolbarButton=3

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One constants providing a way to access standard title bar buttons.
Notes: The toolbar button.

31.80.303 NSWindowUserTabbingPreferenceAlways = 1

MBS MacBase Plugin, Plugin Version: 16.5. **Function:** One of the tabbing preferences values.

31.80.304 NSWindowUserTabbingPreferenceInFullScreen = 2

MBS MacBase Plugin, Plugin Version: 16.5. **Function:** One of the tabbing preferences values.

31.80.305 NSWindowUserTabbingPreferenceManual = 0

MBS MacBase Plugin, Plugin Version: 16.5. **Function:** One of the tabbing preferences values.

31.80.306 NSWindowZoomButton=2

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One constants providing a way to access standard title bar buttons.
Notes: The zoom button.

31.81 class NSWindowRestoreHandlerMBS

31.81.1 class NSWindowRestoreHandlerMBS

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class implementing the event to be called for window restoration.

31.81.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr1

31.81.3 Methods

31.81.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

31.81.5 Destructor

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

31.81.6 SetError(error as NSErrorMBS)

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the error to pass back from event.

31.81.7 SetRestoredWindow(win as NSWindowMBS)

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the window to pass back from event.
See also:

- 31.81.8 SetRestoredWindow(win as window) 6616

31.81.8 SetRestoredWindow(win as window)

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the window to pass back from event.
See also:

- 31.81.7 SetRestoredWindow(win as NSWindowMBS) 6615

31.81.9 Events

31.81.10 RestoreWindow(identifier as string, state as NSCoderMBS)

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The following event is sent to request that a window be restored.
Notes:

If the receiver knows how to restore the identified window, it should invoke the completion handler with the window, possibly creating it. It is acceptable to invoke the completion handler with a pre-existing window, though you should not pass the same window to more than one completion handler. If the receiver cannot restore the identified window (for example, the window referenced a document that has been deleted), it should invoke the completion handler with a nil window. In Mac OS X 10.7, the error parameter is ignored.

The receiver is passed the identifier of the window, which allows the receiver to quickly check for known windows. For example, you might give your preferences window an identifier of "preferences" in the nib, and then check for that identifier in your implementation. The receiver is also passed the NSCoder containing the combined restorable state of the window, its delegate, the window controller, and any document. The receiver may decode information previously stored in the coder to determine what window to restore.

Please call SetRestoredWindow or SetError to pass back status to system. It is not necessary or recommended for implementations of this method to order restored windows onscreen (for example, the window may have been minimized, in which case it will not be ordered onscreen).

Please call SetError and SetRestoredWindow to provide result to system.

31.82 class NSWorkspaceAuthorizationMBS

31.82.1 class NSWorkspaceAuthorizationMBS

MBS MacCocoa Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The authorization granted to the app by the user.
Notes:

To enable your app to prompt the user for these file permissions, you must have a Privileged File Operation entitlement. If you have an app on the Mac App Store or plan to submit your app for review, you can request this entitlement (see https://developer.apple.com/go/?id=workspace-authorization).

see also
https://developer.apple.com/documentation/appkit/nsworkspaceauthorization
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

31.82.4 Methods

31.82.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

31.82.6 Properties

31.82.7 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

31.82.8 Constants

31.82.9 NSWorkspaceAuthorizationTypeCreateSymbolicLink = 0

MBS MacCocoa Plugin, Plugin Version: 19.3. **Function:** One of the authorization types constants. **Notes:** Authorization for the app to create a symbolic link.

31.82.10 NSWorkspaceAuthorizationTypeReplaceFile = 2

MBS MacCocoa Plugin, Plugin Version: 19.3. **Function:** One of the authorization types constants. **Notes:** Authorization for the app to perform an atomic file write without changing the target file's permissions.

31.82.11 NSWorkspaceAuthorizationTypeSetAttributes = 1

MBS MacCocoa Plugin, Plugin Version: 19.3. **Function:** One of the authorization types constants. **Notes:** Authorization for the app to change specific file attributes.

31.83 class NSWorkspaceMBS

31.83.1 class NSWorkspaceMBS

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSWorkspace object responds to application requests to perform a variety of services.
Example:

```
// get icon image
dim n as NSImageMBS = NSWorkspaceMBS.iconForFile(SpecialFolder.desktop)
// set the size we want
n.setSize 512,512
// make a copy as picture
Backdrop = n.CopyPictureWithMask
```

Notes:

- Opening, manipulating, and obtaining information about files and devices
- Tracking changes to the file system, devices, and the user database
- Launching applications

31.83.4 Methods

31.83.5 absolutePathForAppBundleWithIdentifier(bundleIdentifier as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the absolute file-system path of an application bundle.
Notes:

bundleIdentifier: The bundle identifier string. This value corresponds to the value in the CFBundleIdentifier key of the application's Info.plist file. For example, the bundle identifier of the TextEdit application is com.apple.TextEdit.

Returns the file system path to the application bundle identified by bundleIdentifier, or "" if the bundle cannot be found.

31.83.6 activateFileViewerSelectingFiles(Files() as folderitem)

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Activates the Finder, and opens one or more windows selecting the specified files.
Example:

```
dim file as FolderItem = SpecialFolder.Pictures.Child("mbs.jpg") // some file

dim w as new NSWorkspaceMBS
dim files() as FolderItem

files.Append file

// show in Finder
w.activateFileViewerSelectingFiles(files)
```

Notes: Available in Mac OS X v10.6 and later.

31.83.7 activateFileViewerSelectingURLs(URLs() as string)

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Activates the Finder, and opens one or more windows selecting the specified files.
Notes: Available in Mac OS X v10.6 and later.

31.83.8 desktopImageOptionsForScreen(screen as NSScreenMBS) as dictionary

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the desktop image options for the given screen.
Example:

```
dim w as new NSWorkspaceMBS
dim m as NSScreenMBS = NSScreenMBS.mainScreen
dim dic as Dictionary = w.desktopImageOptionsForScreen(m)

break // check in debugger
```

Notes:

screen: The screen for which to get the desktop image options.

Returns a dictionary containing key-value pairs. Keys can be NSWorkspaceDesktopImageScalingKey, NSWorkspaceDesktopImageAllowClippingKey or NSWorkspaceDesktopImageFillColorKey.
Available in Mac OS X v10.6 and later.

31.83.9 desktopImageURLForScreen(screen as NSScreenMBS) as folderitem

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the folderitem for the desktop image for the given screen.
Example:

```
dim w as new NSWorkspaceMBS
dim m as NSScreenMBS = NSScreenMBS.mainScreen
dim file as FolderItem = w.desktopImageURLForScreen(m)

MsgBox file.NativePath
```

Notes:

screen: The screen for which to get the desktop image.
Returns the desktop image.
Available in Mac OS X v10.6 and later.

31.83.10 fileLabelColors as NSColorMBS()

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the corresponding array of file label colors for the file labels.
Example:

```
dim w as new NSWorkspaceMBS
dim labels() as string = w.fileLabels
dim colors() as NSColorMBS = w.fileLabelColors
dim lines() as string

dim u as Integer = UBound(Colors)
for i as Integer = 0 to u
dim co as NSColorMBS = colors(i)

lines.Append labels(i)+": "+str(co.colorValue)
next

MsgBox Join(lines,EndOfLine)
```

Notes:

This array has the same number of elements as fileLabels, and the color at a given index corresponds to the label at the same index.

You can listen for notifications named NSWorkspaceDidChangeFileLabelsNotification to be notified when file labels change which may result in changes to the order of the fileLabelColors.

Available in Mac OS X v10.6 and later.

31.83.11 fileLabels as string()

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the array of file labels as strings.
Example:

```
dim w as new NSWorkspaceMBS
dim labels() as string = w.fileLabels

MsgBox Join(labels, EndOfLine)
```

Notes:

You can listen for notifications named NSWorkspaceDidChangeFileLabelsNotification to be notified when file labels change.
Available in Mac OS X v10.6 and later.

31.83.12 findApplications

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Examines all applications and updates the records of registered services and file types.
Example:

```
NSWorkspaceMBS.findApplications
```

31.83.13 frontmostApplication as NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets the frontmost application, which is the application that will receive key events.
Example:

```
dim w as new NSWorkspaceMBS
dim n as NSRunningApplicationMBS = w.frontmostApplication

MsgBox n.localizedName
```

Notes: Requires Mac OS X 10.7.

31.83.14 fullPathForApplication(appname as string) as folderitem

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full path for the specified application.
Example:

```
MsgBox NSWorkspaceMBS.fullPathForApplication("textedit").ShellPath
// shows /Applications/TextEdit.app
```

Notes: The full path for the application, or nil if the specified application was not found.

31.83.15 hideOtherApplications

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Hides all applications other than the sender.
Example:

```
NSWorkspaceMBS.hideOtherApplications
```

Notes: The user can hide all applications except the current one by Command-Option-clicking on an application's Dock icon.

31.83.16 iconForFile(file as folderitem) as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an image containing the icon for the specified file.
Example:

```
dim f as FolderItem
f=SpecialFolder.Desktop.Child("test.txt")

dim n as NSImageMBS = NSWorkspaceMBS.iconForFile(f)
n.size = new NSSizeMBS(512,512)
Backdrop=n.CopyPictureWithMask
```

Notes:

The returned image has an initial size of 32 pixels by 32 pixels.
Returns nil on any error.

31.83.17 iconForFiles(files() as folderitem) as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an image containing the icon for the specified files.
Example:

```
dim w as new NSWorkspaceMBS
dim files() as FolderItem

dim folder as FolderItem = SpecialFolder.Pictures

// one file
files.Append folder.TrueItem(2)
```

```
canvas1.Backdrop = w.iconForFiles(files).CopyPictureWithMask

// two files
files.Append folder.TrueItem(3)
canvas2.Backdrop = w.iconForFiles(files).CopyPictureWithMask

// three files
files.Append folder.TrueItem(4)
canvas3.Backdrop = w.iconForFiles(files).CopyPictureWithMask
```

Notes:

files: An array of folderitems, each of which contains the full path to a file.

Returns the icon associated with the group of files.

If fullPaths specifies one file, that file's icon is returned. If fullPaths specifies more than one file, an icon representing the multiple selection is returned.

31.83.18 iconForFileType(filetype as string) as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an image containing the icon for files of the specified type.
Example:

```
const SizeWanted = 512
const typeWanted = "txt"

dim n as NSImageMBS = NSWorkspaceMBS.iconForFileType(typeWanted)
// set size we want
n.setSize SizeWanted*2, SizeWanted*2

// make picture
dim p as Picture = n.CopyPictureWithMask

// set DPI
p.VerticalResolution = 144
p.HorizontalResolution = 144
```

Notes:

filetype: The file type, which may be either a filename extension or an encoded HFS file type.

The returned image has an initial size of 32 pixels by 32 pixels.
Returns nil on any error.

Running this in a thread can lead to crashes.

31.83.19 isFilePackageAtPath(item as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Determines whether the specified path is a file package.
Example:

```
dim w as new NSWorkspaceMBS
dim file as FolderItem = SpecialFolder.Applications.Child("iTunes.app")

// shows true for iTunes
MsgBox str(w.isFilePackageAtPath(file))
```

Notes: Returns true if the path identifies a file package; otherwise, false if the path does not exist, is not a directory, or is not a file package.

31.83.20 launchApplication(appname as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Launches the specified application.
Example:

```
if NSWorkspaceMBS.launchApplication("Textedit") then
MsgBox "Ok"
else
MsgBox "failed"
end if
```

Notes:

Returns true if the application was successfully launched or was already running; otherwise, false.

The appName parameter need not be specified with a full path and, in the case of an application wrapper, may be specified with or without the .app extension, as described in "Use of .app Extension".
See also:

- 31.83.21 launchApplication(appname as string, showicon as boolean, autolaunch as boolean) as boolean

6627

31.83.21 launchApplication(appname as string, showicon as boolean, autolaunch as boolean) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Launches the specified application using additional options.
Example:

```
if NSWorkspaceMBS.launchApplication("Textedit",false,false) then
MsgBox "Ok"
else
MsgBox "failed"
end if
```

Notes:

appName: The name of the application to open.
showIcon: If false, the application's icon is not placed on the screen. (The icon still exists, though.)
autolaunch: If true, the autolaunch default is set as though the specified application were autolaunched at startup.

This method is provided to enable daemon-like applications that lack a normal user interface. Its use is not generally encouraged.
Returns true if the application is successfully launched or already running, and false if it can't be launched.
See also:

- 31.83.20 launchApplication(appname as string) as boolean 6626

31.83.22 launchApplicationAtFile(file as folderitem, options as UInt32 = 0, configuration as dictionary = nil) as NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Launches the app at the specified file location.
Notes:

file: The application folderitem.
options: Options to use when launching the application. see NSWorkspaceLaunch* constants.
configuration: A dictionary containing the configuration options. Possible key-value pairs are described NSWorkspaceLaunchConfiguration* functions.
error: The error is returned here.

Returns reference to newly started application.

Available in Mac OS X v10.6 and later.
See also:

- 31.83.23 launchApplicationAtFile(file as folderitem, options as UInt32, configuration as dictionary, byref error as NSErrorMBS) as NSRunningApplicationMBS 6628

31.83.23 launchApplicationAtFile(file as folderitem, options as UInt32, configuration as dictionary, byref error as NSErrorMBS) as NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Launches the app at the specified file location.
Example:

```
dim w as new NSWorkspaceMBS
dim file as FolderItem = SpecialFolder.Applications.Child("Address Book.app")

dim error as NSErrorMBS
dim configuration as new Dictionary
dim options as Integer

// today we start 32 bit version
configuration.Value(w.NSWorkspaceLaunchConfigurationArchitecture) = w.NSBundleExecutableArchitectureI386

// and hide all others
options = w.NSWorkspaceLaunchAndHideOthers

dim r as NSRunningApplicationMBS = w.launchApplicationAtFile(file, options, configuration, error)

if r = nil then
MsgBox "Error: "+error.LocalizedDescription
else
MsgBox "Started: "+r.localizedName
end if
```

Notes:

file: The application folderitem.
options: Options to use when launching the application. see NSWorkspaceLaunch* constants.
configuration: A dictionary containing the configuration options. Possible key-value pairs are described NSWorkspaceLaunchConfiguration* functions.
error: The error is returned here.

Returns reference to newly started application.

Available in Mac OS X v10.6 and later.
See also:

- 31.83.22 launchApplicationAtFile(file as folderitem, options as UInt32 = 0, configuration as dictionary = nil) as NSRunningApplicationMBS 6627

31.83.24 launchApplicationAtURL(URL as string, options as UInt32 = 0, configuration as dictionary = nil) as NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Launches the app at the specified URL.
Notes:

url: The application URL.
options: Options to use when launching the application. see NSWorkspaceLaunch* constants.
configuration: A dictionary containing the configuration options. Possible key-value pairs are described NSWorkspaceLaunchConfiguration* functions.
error: The error is returned here.

Returns reference to newly started application.

Available in Mac OS X v10.6 and later.
See also:

- 31.83.25 launchApplicationAtURL(URL as string, options as UInt32, configuration as dictionary, byref error as NSErrorMBS) as NSRunningApplicationMBS 6629

31.83.25 launchApplicationAtURL(URL as string, options as UInt32, configuration as dictionary, byref error as NSErrorMBS) as NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Launches the app at the specified URL.
Notes:

url: The application URL.
options: Options to use when launching the application. see NSWorkspaceLaunch* constants.
configuration: A dictionary containing the configuration options. Possible key-value pairs are described NSWorkspaceLaunchConfiguration* functions.
error: The error is returned here.

Returns reference to newly started application.

Available in Mac OS X v10.6 and later.
See also:

- 31.83.24 launchApplicationAtURL(URL as string, options as UInt32 = 0, configuration as dictionary = nil) as NSRunningApplicationMBS 6629

31.83.26 launchAppWithBundleIdentifier(bundleIdentifier as string, options as Integer = & h00030000, AppleEventDescriptor as Variant = nil) as Boolean

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Launches the application corresponding to the specified bundleIdentifier.
Notes:

bundleIdentifier: A bundle identifier string. This value corresponds to the value in the CFBundleIdentifier key of the application's Info.plist file. For example, the bundle identifier of the TextEdit application is com.apple.TextEdit.
options: Options to use when launching the application. Values for this parameter are described in constants.
descriptor: Additional options specified in an AppleEvent-style descriptor. For example, you could use this parameter to specify additional documents to open when the application is launched.

Returns true if the application was found and launched; otherwise, false.

31.83.27 localizedDescriptionForType(typeName as string) as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the localized description for the specified Uniform Type Identifier.
Example:

```
MsgBox NSWorkspaceMBS.localizedDescriptionForType("public.jpeg")
// "JPEG-Bild" in German
```

Notes:

The localized description is suitable for displaying to the user.
Available in Mac OS X v10.5 and later.

31.83.28 menuBarOwningApplication as NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets the menu bar owning application, which is the application that currently owns and draws

the menu bar.
Example:

```
dim w as new NSWorkspaceMBS
dim n as NSRunningApplicationMBS = w.menuBarOwningApplication

MsgBox n.localizedName
```

Notes: Requires Mac OS X 10.7.

31.83.29 mountedLocalVolumePaths as string()

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the mount points of all local volumes, not just the removable ones returned by mountedRemovableMedia.
Example:

```
dim w as new NSWorkspaceMBS
dim paths() as string = w.mountedLocalVolumePaths

MsgBox Join(paths, EndOfLine)
```

Notes: Returns an array of strings, each of which contains the full pathname of the mount point for any local volumes.

31.83.30 mountedRemovableMedia as string()

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the full pathnames of all currently mounted removable disks.
Example:

```
dim w as new NSWorkspaceMBS
dim paths() as string = w.mountedRemovableMedia

MsgBox Join(paths, EndOfLine)
```

Notes:

Returns an array of strings, each of which contains the full pathname of a mounted removable disk.

If the computer provides an interrupt or other notification when the user inserts a disk into a drive, the Finder will mount the disk immediately. However, if no notification is given, the Finder won't be aware that a disk needs to be mounted. On such systems, an application should invoke either mountNewRemovableMedia or checkForRemovableMedia before invoking mountedRemovableMedia. Either of these methods cause the Finder to poll the drives to see if a disk is present. If a disk has been inserted but not yet mounted, these methods will cause the Finder to mount it.

The Disk button in an Open or Save panel invokes mountedRemovableMedia and mountNewRemovableMedia as part of its operation, so most applications won't need to invoke these methods directly.

31.83.31 noteFileSystemChanged

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the NSWorkspace object that the file system has changed.
Notes:

The NSWorkspace object then gets the status of all the files and directories it is interested in and updates itself appropriately. This method is used by many objects that write or delete files.

The NSDocument and NSSavePanel objects use this method when saving a file. If you create a file directly, you should call noteFileSystemChanged so that the Finder can update the folder if it is open.

Available in Mac OS X v10.0 and later. Deprecated in Mac OS X v10.6.
See also:

- 31.83.32 noteFileSystemChanged(path as folderitem) 6632

31.83.32 noteFileSystemChanged(path as folderitem)

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the NSWorkspace object that the file system changed at the specified path.
Notes: The NSWorkspace object then gets the status of all the files and directories it is interested in and updates itself appropriately. This method is used by many objects that write or delete files.
See also:

- 31.83.31 noteFileSystemChanged 6632

31.83.33 notificationCenter as NSNotificationCenterMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the notification center for workspace notifications.

31.83.34 NSWorkspaceActiveSpaceDidChangeNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when a Spaces change has occurred.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.
Available in Mac OS X v10.6 and later.

31.83.35 NSWorkspaceApplicationKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: This constant is supplied in the userInfo dictionary of various notifications.
Notes:

The value corresponding to this key is an instance of NSRunningApplication that reflects the affected application.
Available in Mac OS X v10.6 and later.

31.83.36 NSWorkspaceCompressOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file operation modes.
Notes: Compress file. This operation always returns an error.

31.83.37 NSWorkspaceCopyOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the file operation modes.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test")
dim tag as Integer
dim files(-1) as string
dim b as Boolean
dim source,dest as FolderItem

// copies a file from one folder to another folder

source=f.Parent
files.Append f.name
```

```
dest=SpecialFolder.Pictures

b=NSWorkspaceMBS.performFileOperation(NSWorkspaceMBS.NSWorkspaceCopyOperation, source, dest, files, tag)

if b then
MsgBox "OK"
else
MsgBox "Failed"
end if
```

Notes: Copy file to destination.

31.83.38 NSWorkspaceDecompressOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file operation modes.
Notes: Decompress file. This operation always returns an error.

31.83.39 NSWorkspaceDecryptOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file operation modes.
Notes: Decrypt file. This operation always returns an error.

31.83.40 NSWorkspaceDesktopImageAllowClippingKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the options dictionary used with SetDesktopImageURL.
Notes:

The value is a boolean, which affects the interpretation of Proportional scaling types. A false value will make the image fully visible, but there may be empty space on the sides or top and bottom. A true value will cause the image to fill the entire screen, but the image may be clipped. If this is not specified, false is assumed. Non-proportional scaling types ignore this value.
Available in Mac OS X v10.6 and later.

31.83.41 NSWorkspaceDesktopImageFillColorKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the keys for the options dictionary used with SetDesktopImageURL.
Notes:

The value is an NSColor, which is used to fill any empty space around the image. If not specified, a default value is used. Currently, only colors that use or can be converted to use NSCalibratedRGBColorSpace are supported, and any alpha value is ignored.
Available in Mac OS X v10.6 and later.

31.83.42 NSWorkspaceDesktopImageScalingKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the keys for the options dictionary used with SetDesktopImageURL.
Notes:

The value is an Number containing an NSImageScaling constant as declared in NSCell. If this is not specified, NSImageScaleProportionallyUpOrDown=3 is used. NSImageScaleProportionallyDown=0 is not currently supported.
Available in Mac OS X v10.6 and later.

31.83.43 NSWorkspaceDestroyOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file operation modes.
Notes: Destroy file.

31.83.44 NSWorkspaceDidActivateApplicationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when the Finder is about to activate an application.
The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.
Available in Mac OS X v10.6 and later.

31.83.45 NSWorkspaceDidChangeFileLabelsNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when the Finder file labels or colors change.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.
Available in Mac OS X v10.6 and later.

31.83.46 NSWorkspaceDidDeactivateApplicationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when the Finder deactivated an application.
The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.
Available in Mac OS X v10.6 and later.

31.83.47 NSWorkspaceDidHideApplicationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when the Finder hid an application.
The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.
Available in Mac OS X v10.6 and later.

31.83.48 NSWorkspaceDidLaunchApplicationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when a new application has started up.
The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo

dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.

31.83.49 NSWorkspaceDidMountNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when a new device has been mounted.
The notification object is the shared NSWorkspace instance.

In Mac OS X v10.5 and earlier the userInfo dictionary contains a key @"NSDevicePath" that returns the path where the device was mounted, as a string.
Available in Mac OS X v10.0 and later.

31.83.50 NSWorkspaceDidPerformFileOperationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when a file operation has been performed in the receiving application.
The notification object is the shared NSWorkspace instance. The userInfo dictionary contains a key "NSOperationNumber" with a number containing an integer indicating the type of file operation
Available in Mac OS X v10.0 and later.

31.83.51 NSWorkspaceDidRenameVolumeNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when a volume changes its name and/or mount path. These typically change simultaneously, in which case only one notification is posted.
The notification object is the shared NSWorkspace instance.
Available in Mac OS X v10.6 and later.

31.83.52 NSWorkspaceDidTerminateApplicationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when an application finishes executing.
The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.

Available in Mac OS X v10.0 and later.

31.83.53 NSWorkspaceDidUnhideApplicationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when the Finder unhid an application.
The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.
Available in Mac OS X v10.6 and later.

31.83.54 NSWorkspaceDidUnmountNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when the Finder did unmount a device.
This notification is delivered even if a volume was forcibly and immediately made unavailable, such as when a drive is simply unplugged.

The notification object is the shared NSWorkspace instance. The userInfo dictionary contains a key "NSDevicePath" that returns the path where the device was mounted, as a string.
Available in Mac OS X v10.0 and later.

31.83.55 NSWorkspaceDidWakeNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names.
Notes:

Posted when the machine wakes from sleep.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.
Available in Mac OS X v10.3 and later.

31.83.56 NSWorkspaceDuplicateOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file operation modes.
Notes: Duplicate file in source directory.

31.83.57 NSWorkspaceEncryptOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file operation modes.
Notes: Encrypt file. This operation always returns an error.

31.83.58 NSWorkspaceLaunchConfigurationAppleEvent as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the configuration dictionary for launchApplication* methods.
Notes:

The value is the first NSAppleEventDescriptor to send to the new application. If an instance of the application is already running, this is sent to that application.
Available in Mac OS X v10.6 and later.

31.83.59 NSWorkspaceLaunchConfigurationArchitecture as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the configuration dictionary for launchApplication* methods.
Notes:

The value is a number containing an Mach-O Architecture constant. Ignored if a new instance of the application is not launched.

Available in Mac OS X v10.6 and later.
See NSBundleExecutableArchitecture* constants.

31.83.60 NSWorkspaceLaunchConfigurationArguments as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the keys for the configuration dictionary for launchApplication* methods.
Notes:

The value is an NSArray of NSStrings, passed to the new application in the argv parameter. Ignored if a new instance of the application is not launched.
Available in Mac OS X v10.6 and later.

31.83.61 NSWorkspaceLaunchConfigurationEnvironment as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the keys for the configuration dictionary for launchApplication* methods.
Notes:

The value is an dictionary, mapping Strings to Strings, containing environment variables to set for the new app. Ignored if a new instance of the application is not launched.
Available in Mac OS X v10.6 and later.

31.83.62 NSWorkspaceLinkOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the file operation modes.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test")
dim tag as Integer
dim files(-1) as string
dim b as Boolean
dim source,dest as FolderItem

// creates a hard link to a file in a folder

source=f.Parent
files.Append f.name
dest=SpecialFolder.Pictures

b=NSWorkspaceMBS.performFileOperation(NSWorkspaceMBS.NSWorkspaceLinkOperation, source, dest, files, tag)
```

```
if b then
MsgBox "OK"
else
MsgBox "Failed"
end if
```

Notes: Create hard link to file in destination.

31.83.63 NSWorkspaceMoveOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the file operation modes.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test")
dim tag as Integer
dim files(-1) as string
dim b as Boolean
dim source,dest as FolderItem

// moves a file from one folder to another folder

source=f.Parent
files.Append f.name
dest=SpecialFolder.Pictures

b=NSWorkspaceMBS.performFileOperation(NSWorkspaceMBS.NSWorkspaceMoveOperation, source, dest,
files, tag)

if b then
MsgBox "OK"
else
MsgBox "Failed"
end if
```

Notes: Move file to destination.

31.83.64 NSWorkspaceRecycleOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the file operation modes.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test")
dim tag as Integer
dim files(-1) as string
dim b as Boolean
dim source,dest as FolderItem

source=f.Parent

files.Append f.name

b=NSWorkspaceMBS.performFileOperation(NSWorkspaceMBS.NSWorkspaceRecycleOperation, source, dest, files, tag)

if b then
MsgBox "OK"
else
MsgBox "Failed"
end if
```

Notes: Move file to trash. The file is moved to the trash folder on the volume containing the file using the same semantics as NSWorkspaceMoveOperation. If a file with the same name currently exists in the trash folder, the new file is renamed. If no trash folder exists on the volume containing the file, the operation fails.

31.83.65 NSWorkspaceScreensDidSleepNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when the machine's screen goes to sleep.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.

Few applications are likely to be interested in this notification, but they may be useful for certain hardware-based drawing decisions, for example when using OpenGL.

Available in Mac OS X v10.6 and later.

31.83.66 NSWorkspaceScreensDidWakeNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when the machine's screens wake.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.

Few applications are likely to be interested in this notification, but they may be useful for certain hardware-based drawing decisions, for example when using OpenGL.

Available in Mac OS X v10.6 and later.

31.83.67 NSWorkspaceSessionDidBecomeActiveNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted after a user session is switched in. This allows an application to re-enable some processing when a switched out session gets switched back in, for example.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.

Available in Mac OS X v10.3 and later.

31.83.68 NSWorkspaceSessionDidResignActiveNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted before a user session is switched out. This allows an application to disable some processing when its user session is switched out, and re-enable when that session gets switched back in, for example.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.

If an application is launched in an inactive session, NSWorkspaceSessionDidResignActiveNotification is sent after NSApplicationWillFinishLaunchingNotification and before sending NSApplicationDidFinishLaunching-Notification.

Available in Mac OS X v10.3 and later.

31.83.69 NSWorkspaceVolumeLocalizedNameKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the keys for the userinfo dictionary for the NSWorkspaceDidRenameVolumeNotification notification.
Notes:

String containing the user-visible name of the volume.
Available in Mac OS X v10.6 and later.

31.83.70 NSWorkspaceVolumeOldLocalizedNameKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the keys for the userinfo dictionary for the NSWorkspaceDidRenameVolumeNotification notification.
Notes:

String containing the old user-visible name of the volume
Available in Mac OS X v10.6 and later.

31.83.71 NSWorkspaceVolumeOldURLKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the keys for the userinfo dictionary for the NSWorkspaceDidRenameVolumeNotification notification.
Notes:

URL containing the old mount path of the volume
Available in Mac OS X v10.6 and later.

31.83.72 NSWorkspaceVolumeURLKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the keys for the userinfo dictionary for the NSWorkspaceDidRenameVolumeNotification notification.
Notes:

URL containing the mount path of the volume.
Available in Mac OS X v10.6 and later.

31.83.73 NSWorkspaceWillLaunchApplicationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when the Finder is about to launch an application.
The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.

Available in Mac OS X v10.0 and later.

31.83.74 NSWorkspaceWillPowerOffNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted when the user has requested a logout or that the machine be powered off.
The notification object is the shared NSWorkspace instance. This notification does not contain a userInfo dictionary.
Available in Mac OS X v10.0 and later.

31.83.75 NSWorkspaceWillSleepNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names.
Notes:

Posted before the machine goes to sleep. An observer of this message can delay sleep for up to 30 seconds while handling this notification.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.

Available in Mac OS X v10.3 and later.

31.83.76 NSWorkspaceWillUnmountNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names.
Notes:

Posted when the Finder is about to unmount a device.
This notification will not be delivered if a volume was forcibly and immediately made unavailable, such as when a FireWire drive is simply unplugged, because there is no chance to deliver it before the volume becomes unavailable.

The notification object is the shared NSWorkspace instance. The userInfo dictionary contains a key "NSDevicePath" that returns the path where the device was mounted, as a string.
Available in Mac OS X v10.0 and later.

31.83.77 openFile(file as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Opens the specified file specified using the default application associated with its type.
Example:

```
dim f as FolderItem

f=SpecialFolder.Desktop.Child("test.txt")

if NSWorkspaceMBS.openFile(f) then
MsgBox "Ok"
else
MsgBox "failed"
end if
```

Notes:

Returns true if the file was successfully opened; otherwise, false.
The sending application is deactivated before the request is sent.
See also:

- 31.83.78 openFile(file as folderitem, appname as string) as boolean 6647
- 31.83.79 openFile(file as folderitem, appname as string, Deactivate as boolean) as boolean 6647

31.83.78 openFile(file as folderitem, appname as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Opens a file using the specified application.
Example:

```
dim f as FolderItem
f=SpecialFolder.Desktop.Child("test.txt")

if NSWorkspaceMBS.openFile(f,"BBEdit") then
MsgBox "Ok"
else
MsgBox "failed"
end if
```

Notes:

Returns true if the file was successfully opened; otherwise, false.

The appName parameter need not be specified with a full path and, in the case of an application wrapper, may be specified with or without the .app extension, as described in "Use of .app Extension". The sending application is deactivated before the request is sent.
See also:

- 31.83.77 openFile(file as folderitem) as boolean 6646
- 31.83.79 openFile(file as folderitem, appname as string, Deactivate as boolean) as boolean 6647

31.83.79 openFile(file as folderitem, appname as string, Deactivate as boolean) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Opens the specified file and optionally deactivates the sending application.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.file")

if NSWorkspaceMBS.openFile(f,"BBEdit",true) then
MsgBox "Ok"
else
MsgBox "failed"
end if
```

Notes:

appName: The name of the application to use when opening the file.

flag: If true, the sending application is deactivated before the request is sent, allowing the opening application to become the active application.

Returns true if the file was successfully opened; otherwise, false.

The appName parameter need not be specified with a full path and, in the case of an application wrapper, may be specified with or without the .app extension, as described in "Use of .app Extension". If appName is nil, the default application for the file's type is used.
See also:

- 31.83.77 openFile(file as folderitem) as boolean 6646
- 31.83.78 openFile(file as folderitem, appname as string) as boolean 6647

31.83.80 openURL(url as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Opens the location at the specified URL.
Example:

```
if NSWorkspaceMBS.openURL("http://www.apple.com") then
MsgBox "Ok"
else
MsgBox "failed"
end if
```

Notes: Returns true if the location was successfully opened; otherwise, false.
See also:

- 31.83.81 openURL(url as string, bundleIdentifier as string, options as Integer = & h00030000, AppleEventDescriptor as Variant = nil) as Boolean 6648

31.83.81 openURL(url as string, bundleIdentifier as string, options as Integer = & h00030000, AppleEventDescriptor as Variant = nil) as Boolean

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Opens one or more files from an array of URLs.
Notes:

url: A URL for the application to open.
bundleIdentifier: A bundle identifier string or "" to use the default system bindings. This value corresponds

to the value in the CFBundleIdentifier key of the application's Info.plist file. For example, the bundle identifier of the TextEdit application is com.apple.TextEdit.
options: Options to use when launching the application. Values for this parameter are described in constants.
descriptor: Additional options specified in an AppleEvent-style descriptor. For example, you could use this parameter to specify additional documents to open when the application is launched.

Returns true if the application was found and launched; otherwise, false.
See also:

- 31.83.80 openURL(url as string) as boolean 6648

31.83.82 performFileOperation(operation as string, source as folderitem, destination as folderitem, files() as string, byref tag as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Performs a file operation on a set of files in a particular directory.
Notes:

operation: The file operation to perform. The possible values for this parameter are described in "Constants."

source: The full path to the directory containing the files on which to operate.

destination: The full path to the destination directory of the operation.

files: An array of folderitems specifying the names of the files and directories to be manipulated. Each string must not contain any path information other than the name of the file or directory. In other words, all of the files and directories must be located in the source directory and not in one if its subdirectories.

tag: On input, a integer variable; on return, this variable contains a negative integer if the operation fails, 0 if he operation was performed synchronously and succeeded, or a positive integer if the operation was performed asynchronously. If the value is a positive integer, the value is a tag that identifies the requested file operation.

Return Value: True if the operation succeeded; otherwise, false.

Discussion:
Some operations—such as moving, copying, and linking files—require a destination directory to be specified. If not, destination should be the empty string (""). Before this method returns, it posts an NSWorkspaceDidPerformFileOperationNotification to the NSWorkspace object's notification center.

31.83.83 preferredFilenameExtensionForType(typeName as string) as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the preferred filename extension for the specified Uniform Type Identifier.
Example:

```
MsgBox NSWorkspaceMBS.preferredFilenameExtensionForType("public.jpeg")
// "jpeg" in German
```

Notes: The appropriate filename extension for typeName, or "" if no extension could be determined.

31.83.84 requestAuthorization(type as integer, tag as variant = nil)

MBS MacCocoa Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Requests authorization to perform a privileged file operation.
Notes:

type: The type of file operation to perform.

Calls requestAuthorizationCompleted event later.
Tag value is passed through as is to event.

31.83.85 selectFile(file as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects the file in the Finder.
Example:

```
dim f as FolderItem

f=SpecialFolder.Desktop.Child("test.txt")

if NSWorkspaceMBS.selectFile(f) then
MsgBox "Ok"
else
MsgBox "failed"
end if
```

Notes:

Returns true on success.

For Windows, please use WinOpenFolderAndSelectItemsMBS function.

31.83.86 setDesktopImageURL(file as folderitem, screen as NSScreenMBS, options as dictionary, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the desktop image for the given screen to the image at the specified URL.
Notes:

file: The image file. The file must not be nil.
screen: The screen to set the desktop image on.
options: The options dictionary may contain any of the Desktop Image Dictionary Keys (NSWorkspaceDesktopImageScalingKey, NSWorkspaceDesktopImageAllowClippingKey or NSWorkspaceDesktopImageFillColorKey), which control how the image is scaled on the screen.
error: A error that is returned by-reference if setting the image fails.

Returns true if the image was set as the desktop, otherwise false. If false is returned, the error parameter provides additional information.

You should not present a user interface for picking the options. Instead, choose appropriate defaults and allow the user to adjust them in the System Preference Pane.

Available in Mac OS X v10.6 and later.

31.83.87 setIcon(image as NSImageMBS, file as folderitem, flags as Integer = 0) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the icon for the file or directory at the specified path.
Example:

```
dim f as FolderItem
dim p as Picture
dim img as NSImageMBS

f=SpecialFolder.Desktop.Child("test.txt")

p=New Picture(128,128,32)
p.Graphics.ForeColor=rgb(0,128,0)
p.Graphics.fillrect 0,0,128,128
p.Graphics.ForeColor=rgb(255,0,0)
```

```
p.Graphics.filloval 0,0,128,128

img=new NSImageMBS(p)

if NSWorkspaceMBS.setIcon(img,f,0) then
MsgBox "Ok. Icon may not be visible directly. Maybe you make a copy of the file to see it directly?"
else
MsgBox "failed"
end if
```

Notes:

image: The image to use as the icon for the file or directory.
file: The full path of the file or directory.
flags: The icon representations to generate from the image. You specify this value by combining the appropriate NSWorkspaceIconCreationOptions constants, listed in Constants, using the C bitwise OR operator. Specify 0 if you want to generate icons in all available icon representation formats.

Returns true if the icon was set; otherwise, false.

The image can be an arbitrary image, with or without transparency. This image is automatically scaled (as needed) to generate the icon representations. The file or folder must exist and be writable by the user.

It is recommended that applications include the NSExclude10_4ElementsIconCreationOption option for compatibility with pre-Mac OS X v10.3 Finder. Icons that include the high resolution elements prevent custom icons from being displayed on earlier systems.

Before setting icon, make sure you close all Binarystream, Textoutputstream or other classes which may have the file open.
See also:

- 31.83.88 setIcon(image as NSImageMBS, path as string, flags as Integer = 0) as boolean 6652

31.83.88 setIcon(image as NSImageMBS, path as string, flags as Integer = 0) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the icon for the file or directory at the specified path.
Notes:

image: The image to use as the icon for the file or directory.
path: The full path of the file or directory.
flags: The icon representations to generate from the image. You specify this value by combining the appropriate NSWorkspaceIconCreationOptions constants, listed in Constants, using the C bitwise OR operator.

Specify 0 if you want to generate icons in all available icon representation formats.

Returns true if the icon was set; otherwise, false.

The image can be an arbitrary image, with or without transparency. This image is automatically scaled (as needed) to generate the icon representations. The file or folder must exist and be writable by the user.

- 31.83.87 setIcon(image as NSImageMBS, file as folderitem, flags as Integer = 0) as boolean 6651

31.83.89 showSearchResultsForQueryString(queryString as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Displays a Spotlight search results window in Finder for the specified query string.
Notes:

Returns true if the communication with Finder was successful, otherwise false.

Finder becomes the active application, if possible. The user can further refine the search via the Finder user interface.

Available in Mac OS X v10.6 and later.

31.83.90 typeOfFile(File as folderitem, byref error as NSErrorMBS) as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the uniform type identifier of the specified file, if it can be determined.
Notes:

file: The absolute path of the file.
Error: If the Uniform Type Identifier of the file at absolutePath can't be determined, outError contains an NSError object that describes why.

Returns a string containing the uniform type identifier of the file at absoluteFilePath. If no UTI can be

determined the return value is "".

If the file at the specified path is a symbolic link, the type of the symbolic link is returned.
See also:

- 31.83.91 typeOfFile(Path as string, byref error as NSErrorMBS) as string 6654

31.83.91 typeOfFile(Path as string, byref error as NSErrorMBS) as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the uniform type identifier of the specified file, if it can be determined.
Notes:

file: The absolute path of the file.
Error: If the Uniform Type Identifier of the file at absolutePath can't be determined, outError contains an NSError object that describes why.

Returns a string containing the uniform type identifier of the file at absoluteFilePath. If no UTI can be determined the return value is "".

If the file at the specified path is a symbolic link, the type of the symbolic link is returned.
See also:

- 31.83.90 typeOfFile(File as folderitem, byref error as NSErrorMBS) as string 6653

31.83.92 unmountAndEjectDevice(item as folderitem, byref e as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Unmounts and ejects the device at the specified path.
Example:

```
dim w as new NSWorkspaceMBS
dim disk as FolderItem = Volume(VolumeCount-1)

MsgBox disk.Name

dim e as NSErrorMBS
if w.unmountAndEjectDevice(disk, e) then
MsgBox "OK"
else
MsgBox "Error: "+e.localizedDescription
end if
```

Notes:

Returns true if the volume was unmounted and ejected successfully, otherwise false, for example, if the volume is not ejectable.
error: If the operation fails, this error contains more information about the failure.

31.83.93 URLForApplicationToOpenURL(url as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the URL to the default application that would be used to open the given URL.
Notes:

url: The URL of the file to open.

Returns the URL of the default application that would open the specified url. Returns "" if no application is able to open the url, or if the file url does not exist.

This is the programmatic equivalent of double clicking a document in the Finder.

31.83.94 URLForApplicationWithBundleIdentifier(bundleIdentifier as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the URL for the application with the specified identifier.
Notes:

bundleIdentifier: A bundle identifier specifying an application.

Returns the URL of the application, or nil if no application has the bundle identifier.
This uses various (currently unspecified) heuristics in case multiple apps have the same bundle ID.

31.83.95 Events

31.83.96 requestAuthorizationCompleted(type as Integer, authorization as NSWorkspaceAuthorizationMBS, error as NSErrorMBS, tag as variant)

MBS MacCocoa Plugin, Plugin Version: 19.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The request for authorization completed.
Notes:

type: The type of file operation requested.

authorization: The authorization granted for this app. Use it when creating a new NSFileManagerMBS with fileManagerWithAuthorization function.
error: nil if the app is authorized; otherwise, a pointer to the authorization error.

The completion event to call when the authorization request is completed.

31.83.97 Constants

31.83.98 NSBundleExecutableArchitectureI386 = & h00000007

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the CPU Architecture constants.
Notes: Intel 32 bit.

31.83.99 NSBundleExecutableArchitecturePPC = & h00000012

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the CPU Architecture constants.
Notes: PPC 32 bit.

31.83.100 NSBundleExecutableArchitecturePPC64 = & h01000012

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the CPU Architecture constants.
Notes: PPC 64 bit.

31.83.101 NSBundleExecutableArchitectureX86_64 = & h01000007

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the CPU Architecture constants.
Notes: Intel 64 bit.

31.83.102 NSExclude10_4ElementsIconCreationOption = 4

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the possible constants you can use with SetIcon.

31.83.103 NSExcludeQuickDrawElementsIconCreationOption = 2

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the possible constants you can use with SetIcon.

31.83.104 NSWorkspaceAuthorizationTypeCreateSymbolicLink = 0

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the type constants of privileged file operations that can be authorized by the user.
Notes: Authorization for the app to create a symoblic link.

31.83.105 NSWorkspaceAuthorizationTypeReplaceFile = 2

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the type constants of privileged file operations that can be authorized by the user.
Notes: Authorization for the app to perform an atomic file write without changing the target file's permissions.

31.83.106 NSWorkspaceAuthorizationTypeSetAttributes = 1

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the type constants of privileged file operations that can be authorized by the user.
Notes: Authorization for the app to change specific file attributes.

31.83.107 NSWorkspaceLaunchAndHide = & h00100000

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

31.83.108 NSWorkspaceLaunchAndHideOthers = & h00200000

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

31.83.109 NSWorkspaceLaunchAndPrint = 2

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

31.83.110 NSWorkspaceLaunchAsync = & h00010000

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

31.83.111 NSWorkspaceLaunchDefault = & h00010000

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

31.83.112 NSWorkspaceLaunchInhibitingBackgroundOnly = & h00000080

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

31.83.113 NSWorkspaceLaunchNewInstance = & h00080000

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

31.83.114 NSWorkspaceLaunchWithErrorPresentation = & h00000040

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the constants for the launch functions.

31.83.115 NSWorkspaceLaunchWithoutActivation = & h00000200

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

31.83.116 NSWorkspaceLaunchWithoutAddingToRecents = & h00000100

MBS MacCocoa Plugin, Plugin Version: 8.1. **Function:** One of the constants for the launch functions.

31.84 control WebViewControlMBS

31.84.1 control WebViewControlMBS

MBS MacFrameworks Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control for a webview.
Notes: Requires the window being composite for Carbon targets which is currently not available for modal windows in Xojo.

31.84.2 Properties

31.84.3 Available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether this control can work.
Notes:

Returns true on Mac OS X 10.5 (or newer) and false on any other OS.
(Read only property)

31.84.4 View as WebViewMBS

MBS MacFrameworks Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The view used with this control.
Example:

```
dim w as WebViewMBS = WebViewControlMBS1.View
w.LoadURL "http://www.apple.com"
```

Notes:

The view object is created for you in the constructor.
In version 9.6 it is a WebViewMBS object.
If you have a version declared as NSViewMBS, you need to cast to WebViewMBS yourself.
(Read only property)

31.84.5 WantsFocus as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether this control wants to have focus.

Notes:

By default this is true.
(Read and Write property)

31.84.6 Events

31.84.7 EnableMenuItems

MBS MacFrameworks Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.
Function: The event where you can enable menu items.

31.84.8 MenuAction(HitItem as MenuItem) As Boolean

MBS MacFrameworks Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

31.84.9 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacFrameworks Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was pressed inside the control's region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

31.84.10 MouseDrag(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

31.84.11 MouseUp(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

31.84.12 ScaleFactorChanged(NewFactor as Double)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

Chapter 32

Cocoa Controls

32.1 class CanvasGesturesMBS

32.1.1 class CanvasGesturesMBS

MBS MacControls Plugin, Plugin Version: 18.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The class to catch canvas gesture events.
Notes: Please use one global instance of this class to catch the events for all canvases you track.

32.1.2 Blog Entries

- MBS Xojo Plugins, version 19.2pr7
- MonkeyBread Software Releases the MBS Xojo Plugins in version 18.2
- MBS Xojo Plugins, version 18.2pr5

32.1.3 Xojo Developer Magazine

- 17.5, page 40: What's New in the MBS Plugins, With the Plugins growing every year, here are new capabilities you may have missed by Stefanie Juchmes
- 16.4, page 11: News

32.1.4 Methods

32.1.5 AddCanvas(c as Canvas)

MBS MacControls Plugin, Plugin Version: 18.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Adds a canvas to the list of canvases to track.
Notes: Please add canvas controls in Window.Open event.

32.1.6 Constructor

MBS MacControls Plugin, Plugin Version: 18.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

32.1.7 Destructor

MBS MacControls Plugin, Plugin Version: 18.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The destructor.

32.1.8 RemoveCanvas(c as Canvas)

MBS MacControls Plugin, Plugin Version: 18.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Removes a canvas from the list.
Notes:

Please remove canvas controls in Window.Close event.
The plugin tries to remove all when a window closes automatically.

32.1.9 Properties

32.1.10 CanvasCount as Integer

MBS MacControls Plugin, Plugin Version: 18.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Number of Canvas controls registered.
Notes: (Read only property)

32.1.11 Events

32.1.12 beginGestureWithEvent(can as Canvas, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 18.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a touch gesture.
Notes:

e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.1.13 endGestureWithEvent(can as Canvas, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 18.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has ended a touch gesture.
Notes:

e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.1.14 magnifyWithEvent(can as Canvas, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 18.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a pinch gesture.
Notes:

e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.1.15 rotateWithEvent(can as Canvas, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 18.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a rotation gesture.
Notes:

e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.

Return true if you handled this event.

32.1.16 scrollWheel(can as Canvas, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the mouse's scroll wheel has moved.
Notes:

The default implementation simply passes this message to the next responder.

e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Return true if you handled this event.

32.1.17 smartMagnifyWithEvent(can as Canvas, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user performed a smart zoom gesture.
Notes:

The smart zoom gesture is a two-finger double tap on trackpads. In response to this event, you should intelligently magnify the content.

e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Return true if you handled this event.

32.1.18 swipeWithEvent(can as Canvas, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 18.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a swipe gesture.
Notes:

e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.2 class ComboBox

32.2.1 class ComboBox

Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in ComboBox class in Xojo.

32.2.2 Methods

32.2.3 NSComboBoxMBS as NSComboBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSComboBoxMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

32.3 class Control

32.3.1 class Control

Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in Control class in Xojo.

32.3.2 Methods

32.3.3 CALayerMBS as CALayerMBS

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Core Animation layer that the receiver uses as its backing store.
Notes:

Works only in Cocoa target.
Also sets wantsLayer to true for the view to make sure it has a layer.

32.3.4 NSControlMBS as NSControlMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSControlMBS object for the given control.
Example:

```
BevelButton1.NSControlMBS.StringValue = "Hello"
```

Notes: This way you can manipulate Cocoa controls directly.

32.3.5 NSViewMBS as NSViewMBS

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSViewMBS object for the given control.
Example:

```
MsgBox PushButton1.NSViewMBS.className
```

Notes:

This way you can manipulate Cocoa controls directly.

For a pushbutton you may want to cast the NSViewMBS to NSButtonMBS to have more options.

32.3.6 WinClassNameMBS as string

MBS Win Plugin, Plugin Version: 14.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns internal control class name for a Windows control.

32.4 class CustomNSScrollerMBS

32.4.1 class CustomNSScrollerMBS

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The class for a custom scroller.
Notes: Subclass of the NSScrollerMBS class.

32.4.2 Blog Entries

- MBS Real Studio Plugins, version 12.4pr4
- Custom Scrollbars for Real Studio Cocoa Apps
- MBS Real Studio Plugins, version 12.1pr6

32.4.3 Methods

32.4.4 Constructor

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor for a new custom NSScroller object.
See also:

- 32.4.5 Constructor(Handle as Integer) 6670
- 32.4.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6670

32.4.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
See also:

- 32.4.4 Constructor 6670
- 32.4.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6670

32.4.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor for a new custom NSScroller object.
See also:

- 32.4.4 Constructor 6670
- 32.4.5 Constructor(Handle as Integer) 6670

32.4.7 Destructor

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The destructor.

32.4.8 Events

32.4.9 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes:

The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

32.4.10 acceptsFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

32.4.11 becomeFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when the object gets focus.
Notes: Return true to accept.

32.4.12 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a touch gesture.
Notes:

e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.4.13 canBecomeKeyView as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

32.4.14 Close

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the custom view is destroyed.

32.4.15 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches

the visual representation in the drag, this is a seamless transition.

32.4.16 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

32.4.17 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

32.4.18 draggingExited(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

32.4.19 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging session has completed.
Notes:

session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

32.4.20 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the drag moves on the screen.
Notes:

session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

32.4.21 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Declares the types of operations the source allows to be performed. (required)
Notes:

session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

32.4.22 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the drag will begin.
Notes:

session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

32.4.23 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

32.4.24 drawArrow(g as NSGraphicsMBS, Arrow as Integer, highlight as boolean)

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when arrow need to be drawn.
Notes:

Draw the scroll button indicated by arrow, which is either NSScrollerIncrementArrow (the down or right scroll button) or NSScrollerDecrementArrow (up or left).
If flag is true, the button is drawn highlighted; otherwise it's drawn normally. You should never need to invoke this method directly, but may wish to override it to customize the appearance of scroll buttons.

32.4.25 drawKnob(g as NSGraphicsMBS)

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Draw the knob.

32.4.26 drawKnobSlotInRect(g as NSGraphicsMBS, slotRect as NSRectMBS, highlight as boolean)

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Draw the knob slow in the rectangle.

32.4.27 drawParts(g as NSGraphicsMBS)

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when parts need to be drawn.

32.4.28 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has ended a touch gesture.
Notes:

e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.4.29 ignoreModifierKeysForDraggingSession(session as NSDraggingSession-MBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes:

session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

32.4.30 isOpaque as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether this view is opaque.

32.4.31 keyDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the key events.
Notes: Return true if you handled this event.

32.4.32 keyUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the key events.
Notes: Return true if you handled this event.

32.4.33 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a pinch gesture.
Notes:

e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.4.34 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 12.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes:

theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

32.4.35 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.4.36 mouseDownCanMoveWindow as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event is called so you can decide what happens with mouse down.
Notes:

Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

32.4.37 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.4.38 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.4.39 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.4.40 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.4.41 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.4.42 Open

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the custom NSView is created.

32.4.43 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.4.44 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.4.45 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.4.46 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

32.4.47 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this method.

32.4.48 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes:

This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

32.4.49 resignFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Focus is going away.

Notes: Return true to accept.

32.4.50 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.4.51 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.4.52 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.4.53 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a rotation gesture.
Notes:

e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.4.54 scrollWheel(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the subclass that the mouse's scroll wheel has moved.
Notes:

e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.

32.4.55 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a swipe gesture.
Notes:

e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.4.56 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging images should be changed.
Notes:

sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

32.4.57 viewDidMoveToWindow

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that it has been added to a new view hierarchy.
Notes:

The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

32.4.58 wantsPeriodicDraggingUpdates as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes:

Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

32.5 class CustomNSSearchFieldMBS

32.5.1 class CustomNSSearchFieldMBS

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The class for a custom searchfield.
Notes:

Some events will not fire as Searchfield eats them itself.
Subclass of the NSSearchFieldMBS class.

32.5.7 Destructor

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The destructor.

32.5.8 Events

32.5.9 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes:

The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

32.5.10 acceptsFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

32.5.11 becomeFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when the object gets focus.
Notes: Return true to accept.

32.5.12 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a touch gesture.
Notes:

e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.5.13 canBecomeKeyView as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

32.5.14 Close

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the custom view is destroyed.

32.5.15 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

32.5.16 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

32.5.17 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

32.5.18 draggingExited(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

32.5.19 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging session has completed.
Notes:

session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

32.5.20 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the drag moves on the screen.
Notes:

session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

32.5.21 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Declares the types of operations the source allows to be performed. (required)
Notes:

session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

32.5.22 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the drag will begin.
Notes:

session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

32.5.23 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

32.5.24 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has ended a touch gesture.
Notes:

e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.5.25 ignoreModifierKeysForDraggingSession(session as NSDraggingSessionMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes:

session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

32.5.26 isOpaque as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether this view is opaque.

32.5.27 keyDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the key events.
Notes:

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

32.5.28 keyUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the key events.
Notes:

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

32.5.29 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a pinch gesture.
Notes:

e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.5.30 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes:

theEvent: An object representing a mouse-down event.

defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

32.5.31 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.5.32 mouseDownCanMoveWindow as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event is called so you can decide what happens with mouse down.
Notes:

Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

32.5.33 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.5.34 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.

Notes: Return true if you handled this event.

32.5.35 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.5.36 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.5.37 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.5.38 Open

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the custom NSSearchField is created.

32.5.39 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.5.40 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.5.41 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.5.42 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

32.5.43 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this method.

32.5.44 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes:

This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

32.5.45 resignFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Focus is going away.
Notes: Return true to accept.

32.5.46 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.5.47 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.5.48 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.5.49 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a rotation gesture.
Notes:

e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.5.50 scrollWheel(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the subclass that the mouse's scroll wheel has moved.
Notes:

e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.

32.5.51 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a swipe gesture.
Notes:

e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.5.52 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging images should be changed.
Notes:

sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

32.5.53 viewDidMoveToWindow

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that it has been added to a new view hierarchy.
Notes:

The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

32.5.54 wantsPeriodicDraggingUpdates as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes:

Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

32.6 class CustomNSTextFieldCellMBS

32.6.1 class CustomNSTextFieldCellMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class to customize cells.
Notes: Subclass of the NSTextFieldCellMBS class.

32.6.2 Blog Entries

- MBS Xojo Plugins, version 17.2pr1

32.6.3 Methods

32.6.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

32.6.5 superDrawWithFrame(frame as NSRectMBS, view as NSViewMBS)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Calls drawWithFrame on super class.
Notes: This is for calling in DrawWithFrame event.

32.6.6 Events

32.6.7 cellSize(size as NSSizeMBS) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Return a custom cell size.
Notes:

If not implemented, we call through to super.cellSize.
We provide super.cellSize in size parameter.

32.6.8 Clone(clonedCell as NSTextFieldCellMBS) as CustomNSTextFieldCellMBS

MBS MacCocoa Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Requests a clone of the object.
Notes:

This event is called when the system needs a clone of the object.
Please create a new object, keep a reference and return it.

SuperClone provides the cloned object, which we use together with the xojo object you return.

32.6.9 didDrawWithFrame(cellFrame as NSRectMBS, controlView as NSViewMBS)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Event called after drawWithFrame run.

32.6.10 drawWithFrame(cellFrame as NSRectMBS, controlView as NSViewMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Event to replace drawWithFrame.
Notes: If false is returned or not implemented, we call super.drawWithFrame.

32.6.11 fieldEditorForView(controlView as NSViewMBS) as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a custom field editor for editing in the view.
Notes:

ControlView: The view containing cells that require a custom field editor.

Returns a custom field editor. The field editor must have fieldEditor set to true.

This is an override point for NSCell subclasses designed to use their own custom field editors. This message is sent to the selected cell of ControlView using the NSWindow method in fieldEditor.

Returning non-nil from this method indicates skipping the standard field editor querying processes including windowWillReturnFieldEditor delegation.
The default implementation returns nil.

32.6.12 imageRectForBounds(rect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event for imageRectForBounds method.

32.6.13 selectWithFrame(rect as NSRectMBS, controlView as NSViewMBS, text as NSTextMBS, theDelegate as Variant, selStart as Integer, selLength as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event for selectWithFrame method.
Notes: If you return false, we call super.selectWithFrame.

32.6.14 setUpFieldEditorAttributes(textObj as NSTextMBS, superFieldEditor as NSTextMBS) as NSTextMBS

MBS MacCocoa Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets up the field editor. You never invoke this method directly; by overriding it, however, you can customize the field editor.
Notes: When you override this method, you should generally invoke the implementation of super and return the textObj argument. For information on field editors, see Using the Window's Field Editor.

32.6.15 titleRectForBounds(rect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event for titleRectForBounds method.
Notes: If you return nil, we call super.titleRectForBounds.

32.7 class CustomNSTextFieldMBS

32.7.1 class CustomNSTextFieldMBS

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The class for a custom text field.
Notes:

Some events will not fire as text field eats them itself.
Subclass of the NSTextFieldMBS class.

32.7.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr3

32.7.3 Methods

32.7.4 Constructor

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The dummy constructor doing nothing.
See also:

- 32.7.5 Constructor(Handle as Integer) 6703
- 32.7.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6703

32.7.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
See also:

- 32.7.4 Constructor 6703
- 32.7.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6703

32.7.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor for a new custom NSView object.
See also:

- 32.7.4 Constructor 6703
- 32.7.5 Constructor(Handle as Integer) 6703

32.7.7 Destructor

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The destructor.

32.7.8 Events

32.7.9 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes:

The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

32.7.10 acceptsFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

32.7.11 becomeFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when the object gets focus.
Notes: Return true to accept.

32.7.12 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a touch gesture.
Notes:

e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.7.13 canBecomeKeyView as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

32.7.14 Close

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the custom view is destroyed.

32.7.15 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches

the visual representation in the drag, this is a seamless transition.

32.7.16 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

32.7.17 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

32.7.18 draggingExited(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

32.7.19 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging session has completed.
Notes:

session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

32.7.20 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the drag moves on the screen.
Notes:

session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

32.7.21 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Declares the types of operations the source allows to be performed. (required)
Notes:

session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

32.7.22 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the drag will begin.
Notes:

session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

32.7.23 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

32.7.24 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has ended a touch gesture.
Notes:

e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.7.25 ignoreModifierKeysForDraggingSession(session as NSDraggingSessionMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes:

session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

32.7.26 isOpaque as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether this view is opaque.

32.7.27 keyDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the key events.
Notes:

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

32.7.28 keyUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the key events.
Notes:

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

32.7.29 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a pinch gesture.
Notes:

e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.7.30 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes:

theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

32.7.31 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.7.32 mouseDownCanMoveWindow as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event is called so you can decide what happens with mouse down.
Notes:

Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

32.7.33 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.7.34 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.7.35 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.

Notes: Return true if you handled this event.

32.7.36 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.7.37 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.7.38 Open

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the custom NSSearchField is created.

32.7.39 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.7.40 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.7.41 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.7.42 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

32.7.43 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your

view, set the sender object's animatesToDestination property to true in your implementation of this method.

32.7.44 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes:

This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

32.7.45 resignFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Focus is going away.
Notes: Return true to accept.

32.7.46 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.7.47 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.7.48 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.

Notes: Return true if you handled this event.

32.7.49 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a rotation gesture.
Notes:

e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.7.50 scrollWheel(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the subclass that the mouse's scroll wheel has moved.
Notes:

e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.

32.7.51 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a swipe gesture.
Notes:

e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.7.52 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging images should be changed.
Notes:

sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

32.7.53 viewDidMoveToWindow

MBS MacControls Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that it has been added to a new view hierarchy.
Notes:

The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

32.7.54 wantsPeriodicDraggingUpdates as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes:

Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

32.8 class CustomNSTextViewMBS

32.8.1 class CustomNSTextViewMBS

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The class for a custom text view.
Notes:

Some events will not fire as text view eats them itself.
Subclass of the NSTextViewMBS class.

32.8.2 Blog Entries

- MBS Xojo Plugins, version 17.2pr1

32.8.3 Methods

32.8.4 Constructor

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The dummy constructor doing nothing.
See also:

- 32.8.5 Constructor(Handle as Integer) 6717
- 32.8.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6717

32.8.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
See also:

- 32.8.4 Constructor 6717
- 32.8.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6717

32.8.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor for a new custom NSView object.
See also:

- 32.8.4 Constructor 6717
- 32.8.5 Constructor(Handle as Integer) 6717

32.8.7 Destructor

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The destructor.

32.8.8 Events

32.8.9 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes:

The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

32.8.10 acceptsFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

32.8.11 becomeFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when the object gets focus.
Notes: Return true to accept.

32.8.12 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a touch gesture.
Notes:

e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.8.13 canBecomeKeyView as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

32.8.14 Close

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the custom view is destroyed.

32.8.15 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches

the visual representation in the drag, this is a seamless transition.

32.8.16 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

32.8.17 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

32.8.18 draggingExited(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

32.8.19 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging session has completed.
Notes:

session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

32.8.20 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the drag moves on the screen.
Notes:

session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

32.8.21 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Declares the types of operations the source allows to be performed. (required)
Notes:

session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

32.8.22 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the drag will begin.
Notes:

session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

32.8.23 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

32.8.24 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has ended a touch gesture.
Notes:

e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.8.25 ignoreModifierKeysForDraggingSession(session as NSDraggingSession-MBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes:

session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

32.8.26 isOpaque as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether this view is opaque.

32.8.27 keyDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the key events.
Notes:

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

32.8.28 keyUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the key events.
Notes:

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

32.8.29 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a pinch gesture.
Notes:

e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.8.30 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes:

theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

32.8.31 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.8.32 mouseDownCanMoveWindow as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event is called so you can decide what happens with mouse down.
Notes:

Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

32.8.33 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.8.34 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.8.35 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.

Notes: Return true if you handled this event.

32.8.36 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.8.37 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.8.38 Open

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the custom NSSearchField is created.

32.8.39 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.8.40 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.8.41 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.8.42 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

32.8.43 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your

view, set the sender object's animatesToDestination property to true in your implementation of this method.

32.8.44 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes:

This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

32.8.45 resignFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Focus is going away.
Notes: Return true to accept.

32.8.46 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.8.47 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.8.48 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.

Notes: Return true if you handled this event.

32.8.49 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a rotation gesture.
Notes:

e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.8.50 scrollWheel(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the subclass that the mouse's scroll wheel has moved.
Notes:

e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.

32.8.51 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a swipe gesture.
Notes:

e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.8.52 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging images should be changed.
Notes:

sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

32.8.53 viewDidMoveToWindow

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that it has been added to a new view hierarchy.
Notes:

The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

32.8.54 wantsPeriodicDraggingUpdates as boolean

MBS MacControls Plugin, Plugin Version: 17.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes:

Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

32.9 class CustomNSTokenFieldMBS

32.9.1 class CustomNSTokenFieldMBS

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The class for a custom NSTokenField.
Notes: Subclass of the NSTokenFieldMBS class.

32.9.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr2

32.9.3 Methods

32.9.4 Constructor

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The dummy constructor doing nothing.
See also:

- 32.9.5 Constructor(Handle as Integer) 6731
- 32.9.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6731

32.9.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
See also:

- 32.9.4 Constructor 6731
- 32.9.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6731

32.9.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor for a new custom NSTokenField object.
See also:

- 32.9.4 Constructor 6731
- 32.9.5 Constructor(Handle as Integer) 6731

32.9.7 Destructor

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The destructor.

32.9.8 Events

32.9.9 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes:

The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

32.9.10 acceptsFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

32.9.11 becomeFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when the object gets focus.
Notes: Return true to accept.

32.9.12 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a touch gesture.

Notes:

e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.9.13 canBecomeKeyView as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

32.9.14 Close

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the custom view is destroyed.

32.9.15 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

32.9.16 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

32.9.17 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

32.9.18 draggingExited(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view

object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

32.9.19 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging session has completed.
Notes:

session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

32.9.20 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the drag moves on the screen.
Notes:

session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

32.9.21 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Declares the types of operations the source allows to be performed. (required)
Notes:

session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

32.9.22 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the drag will begin.
Notes:

session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

32.9.23 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is

within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

32.9.24 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has ended a touch gesture.
Notes:

e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.9.25 ignoreModifierKeysForDraggingSession(session as NSDraggingSession-MBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes:

session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

32.9.26 isOpaque as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether this view is opaque.

32.9.27 keyDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the key events.
Notes:

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

32.9.28 keyUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the key events.
Notes:

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

32.9.29 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a pinch gesture.
Notes:

e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.9.30 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes:

theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

32.9.31 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.9.32 mouseDownCanMoveWindow as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event is called so you can decide what happens with mouse down.
Notes:

Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

32.9.33 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.9.34 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.9.35 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.9.36 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.9.37 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.9.38 Open

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the custom NSView is created.

32.9.39 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.9.40 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.9.41 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.9.42 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

32.9.43 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this method.

32.9.44 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes:

This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

32.9.45 resignFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Focus is going away.
Notes: Return true to accept.

32.9.46 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.9.47 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.9.48 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.9.49 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a rotation gesture.
Notes:

e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.9.50 scrollWheel(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the subclass that the mouse's scroll wheel has moved.
Notes:

e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.

32.9.51 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a swipe gesture.
Notes:

e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.9.52 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging images should be changed.
Notes:

sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this

method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

32.9.53 viewDidMoveToWindow

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that it has been added to a new view hierarchy.
Notes:

The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

32.9.54 wantsPeriodicDraggingUpdates as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes:

Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

32.10 class CustomNSViewMBS

32.10.1 class CustomNSViewMBS

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The class for a custom NSView.
Notes: Subclass of the NSViewMBS class.

32.10.3 Methods

32.10.4 Constructor

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The dummy constructor doing nothing.
See also:

- 32.10.5 Constructor(Handle as Integer) 6746
- 32.10.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6746

32.10.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given CustomNSView handle.
Notes: The handle is casted to a CustomNSView and the plugin retains this handle.
See also:

- 32.10.4 Constructor 6745
- 32.10.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6746

32.10.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor for a new custom NSView object.
See also:

- 32.10.4 Constructor 6745
- 32.10.5 Constructor(Handle as Integer) 6746

32.10.7 Destructor

MBS MacControls Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The destructor.

32.10.8 Events

32.10.9 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes:

The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do

accept them, so the user can immediately manipulate the control without having to release the mouse button.

32.10.10 acceptsFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

32.10.11 becomeFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when the object gets focus.
Notes: Return true to accept.

32.10.12 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has begun a touch gesture.
Notes:

e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.10.13 canBecomeKeyView as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

32.10.14 Close

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the custom view is destroyed.

32.10.15 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

32.10.16 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

32.10.17 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

32.10.18 draggingExited(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

32.10.19 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging session has completed.
Notes:

session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

32.10.20 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the drag moves on the screen.
Notes:

session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

32.10.21 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Declares the types of operations the source allows to be performed. (required)
Notes:

session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

32.10.22 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the drag will begin.
Notes:

session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

32.10.23 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

32.10.24 drawFocusRingMask(g as NSGraphicsMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Draw the focus ring mask for the view.
Notes:

If false is returned, the default method from NSView class runs.

This method provides the shape of the focus ring mask by drawing the focus ring mask. An implementation of this method should draw in the view's interior (bounds) coordinate space, that the focus ring style has been set (it will be set it to NSFocusRingOnly to capture the focus ring itself), and that the fill and stroke colors have been set to an arbitrary fully opaque color.

Subclasses that find the default behavior insufficient should only draw the focus ring shape.

The NSView default implementation of this method simply fills self.bounds.
Available in Mac OS X v10.7 and later.

Please use NSGraphicsMBS class for drawing.

32.10.25 DrawRect(g as NSGraphicsMBS, left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The paint event with the rectangle which needs to be redrawn.

32.10.26 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the user has ended a touch gesture.
Notes:

e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.10.27 focusRingMaskBounds as NSRectMBS

MBS MacControls Plugin, Plugin Version: 12.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the focus ring mask bounds.
Notes:

Return nil to run default NSView method.

Return a rectangle containing the mask in the view's interior (bounds) coordinate space.

The mask bounds allows the focus ring's overall size and position to be determined before it is drawn.
Subclasses must override this method if they require the display of a focus ring.
The NSView default implementation of this method simply returns NSRectMBS.Zero.

Note: The information provided by focusRingMaskBounds will enable Accessibility to identify selected subelements for zoom tracking, so it is important that this method provide a reasonably tight bounding box

and that noteFocusRingMaskChanged is invoked as described.

32.10.28 ignoreModifierKeysForDraggingSession(session as NSDraggingSession-MBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether the modifier keys will be ignored for this dragging session.
Notes:

session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

32.10.29 isFlipped as Boolean

MBS MacControls Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to return a boolean value indicating whether the view uses a flipped coordinate system.
Notes:

The default value of this property is false, which results in a non-flipped coordinate system. In a non-flipped coordinate system, the origin is in the lower-left corner of the view and positive y-values extend upward. In a flipped coordinate system, the origin is in the upper-left corner of the view and y-values extend downward. X-values always extend to the right.

If you want your view to use a flipped coordinate system, override this property and return true.

32.10.30 isOpaque as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this view is opaque.

32.10.31 keyDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the key events.
Notes:

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

32.10.32 keyUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the key events.
Notes:

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

32.10.33 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a pinch gesture.
Notes:

e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.10.34 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 12.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes:

theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

32.10.35 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.
Notes: Return true if you handled this event.

32.10.36 mouseDownCanMoveWindow as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called so you can decide what happens with mouse down.
Notes:

Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

32.10.37 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.
Notes: Return true if you handled this event.

32.10.38 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.
Notes: Return true if you handled this event.

32.10.39 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.

Notes: Return true if you handled this event.

32.10.40 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.
Notes: Return true if you handled this event.

32.10.41 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.
Notes: Return true if you handled this event.

32.10.42 Open

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the custom NSView is created.

32.10.43 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.10.44 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.10.45 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.10.46 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

32.10.47 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your

view, set the sender object's animatesToDestination property to true in your implementation of this method.

32.10.48 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes:

This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

32.10.49 resignFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Focus is going away.
Notes: Return true to accept.

32.10.50 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.
Notes: Return true if you handled this event.

32.10.51 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.
Notes: Return true if you handled this event.

32.10.52 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the mouse events.

Notes: Return true if you handled this event.

32.10.53 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a rotation gesture.
Notes:

e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.10.54 scrollWheel(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the subclass that the mouse's scroll wheel has moved.
Notes:

e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.

32.10.55 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a swipe gesture.
Notes:

e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.10.56 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging images should be changed.
Notes:

sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

32.10.57 viewDidMoveToWindow

MBS MacControls Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that it has been added to a new view hierarchy.
Notes:

The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

32.10.58 wantsPeriodicDraggingUpdates as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes:

Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

32.11 class DisclosureTriangle

32.11.1 class DisclosureTriangle

Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in DisclosureTriangle class in Xojo.

32.11.2 Methods

32.11.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSButtonMBS object for the given control.
Example:

MsgBox DisclosureTriangle1.NSButtonMBS.className

Notes: This way you can manipulate Cocoa controls directly.

32.12 class Groupbox

32.12.1 class Groupbox

Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in Groupbox class in Xojo.

32.12.2 Methods

32.12.3 NSBoxMBS as NSBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSBoxMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

32.13 class ImageWell

32.13.1 class ImageWell

Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in ImageWell class in Xojo.

32.13.2 Methods

32.13.3 NSImageViewMBS as NSImageViewMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSImageViewMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

32.14 class KeyValueCodingMBS

32.14.1 class KeyValueCodingMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The class for key value coding and using NSSortDescriptor class.
Notes: Events are only raised if called on main thread to avoid threading trouble.

32.14.2 Blog Entries

- MBS Xojo Plugins, version 17.1pr3

32.14.3 Methods

32.14.4 Constructor

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

32.14.5 sortedArrayUsingDescriptor(values() as KeyValueCodingMBS, sortDescriptor as NSSortDescriptorMBS) as KeyValueCodingMBS()

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a copy of the receiving array sorted as specified by a given a sort descriptor.
Notes:

sortDescriptor: The NSSortDescriptor objects.

Returns a copy of the receiving array sorted as specified by sortDescriptor.

32.14.6 sortedArrayUsingDescriptors(values() as KeyValueCodingMBS, sortDescriptor() as NSSortDescriptorMBS) as KeyValueCodingMBS()

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a copy of the receiving array sorted as specified by a given array of sort descriptors.
Notes:

sortDescriptors: An array of NSSortDescriptor objects.

Returns a copy of the receiving array sorted as specified by sortDescriptors.

The first descriptor specifies the primary key path to be used in sorting the receiving array's contents. Any subsequent descriptors are used to further refine sorting of objects with duplicate values. See NSSortDescriptor for additional information.

32.14.7 Properties

32.14.8 Description as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The description text property.
Notes: (Read only property)
See also:

- 32.14.13 Description as String 6766

32.14.9 Handle as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object handle.
Notes: (Read and Write property)

32.14.10 Tag as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The tag value.
Notes:

Store anything you need, e.g. a dictionary.
(Read and Write property)

32.14.11 valueForKey(key as String) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Get/set the value for the property identified by a given key.
Notes:

key: The name of one of the receiver's properties.
(Read and Write computed property)
See also:

• 32.14.16 valueForKey(key as string) as Variant 6767

32.14.12 Events

32.14.13 Description as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event when system queries description for object.
See also:

• 32.14.8 Description as String 6765

32.14.14 setValueForKey(key as string, value as Variant)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sets the property of the receiver specified by a given key to a given value.
Notes:

value: The value for the property identified by key.
key: The name of one of the receiver's properties.

If key identifies a to-one relationship, relate the object specified by value to the receiver, unrelating the previously related object if there was one. Given a collection object and a key that identifies a to-many relationship, relate the objects contained in the collection to the receiver, unrelating previously related objects if there were any.
The search pattern that setValueForKey uses is described in Accessor Search Patterns in Key-Value Coding Programming Guide.
In a reference-counted environment, if the instance variable is accessed directly, value is retained.

32.14.15 setValueForUndefinedKey(key as string, value as Variant)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked by setValueForKey when it finds no property for a given key.
Notes:

value: The value for the key identified by key.
key: A string that is not equal to the name of any of the receiver's properties.

Subclasses can override this method to handle the request in some other way. The default implementation raises an NSUndefinedKeyException.

32.14.16 valueForKey(key as string) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Return the value for the property identified by a given key.
Notes:

key: The name of one of the receiver's properties.

Returns the value for the property identified by key.

If event is not implemented, the search pattern that valueForKey uses to find the correct value to return is described in Accessor Search Patterns in Key-Value Coding Programming Guide.
See also:

- 32.14.11 valueForKey(key as String) as Variant 6765

32.14.17 valueForUndefinedKey(key as string) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked by valueForKey when it finds no property corresponding to a given key.
Notes:

key: A string that is not equal to the name of any of the receiver's properties.

Subclasses can override this method to return an alternate value for undefined keys. The default implementation raises an NSUndefinedKeyException.

32.15 class NSActionCellMBS

32.15.1 class NSActionCellMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSActionCell defines an active area inside a control (an instance of NSControl or one of its subclasses).
Notes:

As an NSControl's active area, an NSActionCell does three things: it usually performs display of text or an icon; it provides the NSControl with a target and an action; and it handles mouse (cursor) tracking by properly highlighting its area and sending action messages to its target based on cursor movement.
Subclass of the NSCellMBS class.

32.15.4 Methods

32.15.5 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new Cell object with an image.
Example:

```
dim pic as Picture = LogoMBS(500)
dim n as NSImageMBS = new NSImageMBS(pic)
dim c as new NSActionCellMBS(n)

Backdrop = c.image.CopyPictureWithMask
Title = c.classPath
```

See also:

- 32.15.6 Constructor(text as string)

32.15.6 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new Cell object with a text.
Example:

```
dim c as new NSActionCellMBS("Hello")
MsgBox c.StringValue
```

See also:

- 32.15.5 Constructor(image as NSImageMBS) 6768

32.16 class NSBoxMBS

32.16.1 class NSBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The NSBox class implements simple views that can title themselves and draw a border around their content.
Notes:

These objects are known as boxes. You can use box to group, visually, some number of other views.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

32.16.2 Blog Entries

- MBS REALbasic Plugins, version 10.3pr5

32.16.3 Methods

32.16.4 borderRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the rectangle in which the receiver's border is drawn.
Notes: The rectangle in which the border of the NSBox is drawn.

32.16.5 Constructor

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new box view with size 100/100 and position 0/0
Example:

```
dim x as new NSBoxMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.16.6 Constructor(Handle as Integer) 6771
- 32.16.7 Constructor(left as Double, top as Double, width as Double, height as Double) 6771

32.16.6 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSView handle.
Example:

```
dim t as new NSBoxMBS(0, 0, 100, 100)
dim v as new NSBoxMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSBox and the plugin retains this handle.
See also:

- 32.16.5 Constructor 6770
- 32.16.7 Constructor(left as Double, top as Double, width as Double, height as Double) 6771

32.16.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new control with the given size and position.
Example:

```
dim left,top,width,height as Integer
// define rectangle
dim x as new NSBoxMBS(left, top, width, height)
```

Notes: On success the handle property is not zero.
See also:

- 32.16.5 Constructor 6770
- 32.16.6 Constructor(Handle as Integer) 6771

32.16.8 setFrameFromContentFrame(contentFrame as NSRectMBS)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Places the receiver so its content view lies on the specified frame.
Notes: contentFrame: The rectangle specifying the frame of the box's content view, reckoned in the coordinate system of the box's superview. The box is marked for redisplay.

32.16.9 setTitleWithMnemonic(stringWithAmpersand as string)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the title of the receiver with a character denoted as an access key.
Notes:

Mnemonics are not supported in Mac OS X.

By default, a box's title is "Title." The content view is not automatically resized, and the box is not marked for redisplay.

32.16.10 sizeToFit

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Resizes and moves the receiver's content view so it just encloses its subviews.
Example:

```
dim n as new NSProgressIndicatorMBS
n.sizeToFit

MsgBox n.frame.String
```

Notes:

The receiver is then moved and resized to wrap around the content view. The receiver's width is constrained so its title will be fully displayed.

You should invoke this method after:

- Adding a subview (to the content view)
- Altering the size or location of such a subview
- Setting the margins around the content view

The mechanism by which the content view is moved and resized depends on whether the object responds to its own sizeToFit message: If it does respond, then that message is sent, and the content view is expected to be so modified. If the content view doesn't respond, the box moves and resizes the content view itself.

32.16.11 titleCell as NSCellMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the cell used to display the receiver's title.

32.16.12 titleRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the rectangle in which the receiver's title is drawn.
Notes: The rectangle in which the title is drawn.

32.16.13 Properties

32.16.14 borderColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the color of the receiver's border when the receiver is a custom box with a simple line border.
Notes:

The receiver's border color. It must be a custom box—that is, it has a type of NSBoxCustom—and it must have a border style of NSLineBorder.

Available in Mac OS X v10.5 and later.
(Read and Write computed property)

32.16.15 borderType as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The border type to aType, which must be a valid border type.
Notes:

A constant describing the type of border. Border types are defined in NSView.h. Currently, the following border types are defined: NSNoBorder, NSLineBorder, NSBezelBorder, NSGrooveBorder.

If the size of the new border is different from that of the old border, the content view is resized to absorb the difference, and the box is marked for redisplay.
(Read and Write computed property)

32.16.16 borderWidth as Double

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The border width.
Notes:

Functional only when the receiver's box type (boxType) is NSBoxCustom and its border type (borderType) is NSLineBorder.

Available in Mac OS X v10.5 and later.
(Read and Write computed property)

32.16.17 boxType as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The box type.
Notes:

Use the NSBox* constants.
(Read and Write computed property)

32.16.18 contentView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The receiver's content view.
Notes:

On settings the NSView object is resized to fit within the box's current content area and the box is marked for redisplay.
(Read and Write computed property)

32.16.19 contentViewMargins as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The horizontal and vertical distance between the border of the receiver and its content view.
Notes:

Value: The width and height of the offset between the box's border and content view. The horizontal value is applied (reckoned in the box's coordinate system) fully and equally to the left and right sides of the box. The vertical value is similarly applied to the top and bottom.

Unlike changing a box's other attributes, such as its title position or border type, changing the offsets

doesn't automatically resize the content view. In general, you should send a sizeToFit message to the box after changing the size of its offsets. This message causes the content view to remain unchanged while the box is sized to fit around it.
(Read and Write computed property)

32.16.20 cornerRadius as Double

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The corner radius for the box.
Notes:

Functional only when the receiver's box type (boxType) is NSBoxCustom and its border type (borderType) is NSLineBorder.
(Read and Write computed property)

32.16.21 fillColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The color of the receiver's background when the receiver is a custom box with a simple line border.
Notes:

The receiver's fill color. It must be a custom box—that is, it has a type of NSBoxCustom—and it must have a border style of NSLineBorder.
Available in Mac OS X v10.5 and later.
(Read and Write computed property)

32.16.22 title as string

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The title for the box.
Notes:

By default, a box's title is "Title."
(Read and Write computed property)

32.16.23 titleFont as NSFontMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The font object used to draw the receiver's title.
Notes:

By default, the title is drawn using the small system font (obtained using (smallSystemFontSize as the parameter of systemFontOfSize:, both NSFont class methods). If the size of the new font is different from that of the old font, the content view is resized to absorb the difference.
(Read and Write computed property)

32.16.24 titlePosition as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The position of the box's title.
Notes:

If the new title position changes the size of the box's border area, the content view is resized to absorb the difference, and the box is marked as needing redisplay.

Use this constants: NSNoTitle, NSAboveTop, NSAtTop, NSBelowTop, NSAboveBottom, NSAtBottom and NSBelowBottom.
(Read and Write computed property)

32.16.25 Transparent as Boolean

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver is transparent.
Notes:

True makes the receiver transparent.
False makes the receiver opaque.
(Read and Write computed property)

32.16.26 Constants

32.16.27 NSAboveBottom = 4

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants for the title position.
Notes: Title positioned above the box's bottom border.

32.16.28 NSAboveTop = 1

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants for the title position.
Notes: Title positioned above the box's top border.

32.16.29 NSAtBottom = 5

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants for the title position.
Notes: Title positioned within the box's bottom border.

32.16.30 NSAtTop = 2

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants for the title position.
Notes: Title positioned within the box's top border.

32.16.31 NSBelowBottom = 6

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants for the title position.
Notes: Title positioned below the box's bottom border.

32.16.32 NSBelowTop = 3

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants for the title position.
Notes: Title positioned below the box's top border.

32.16.33 NSBoxCustom = 4

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants and data type identifies box types, which, in conjunction with a box's border type, define the appearance of the box.
Notes: Specifies that the appearance of the box is determined entirely by the by box-configuration methods, without automatically applying Apple human interface guidelines.

32.16.34 NSBoxOldStyle = 3

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants and data type identifies box types, which, in conjunction with a box's border type, define the appearance of the box.
Notes: Specifies that the box is a Mac OS X v10.2–style box.

32.16.35 NSBoxPrimary = 0

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants and data type identifies box types, which, in conjunction with a box's border type, define the appearance of the box.
Notes: Specifies the primary box appearance. This is the default box type.

32.16.36 NSBoxSecondary = 1

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants and data type identifies box types, which, in conjunction with a box's border type, define the appearance of the box.
Notes: Specifies the secondary box appearance.

32.16.37 NSBoxSeparator = 2

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants and data type identifies box types, which, in conjunction with a box's border type, define the appearance of the box.
Notes: Specifies the secondary box appearance.

32.16.38 NSNoTitle = 0

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants for the title position.
Notes: The box has no title.

32.17 class NSButtonCellMBS

32.17.1 class NSButtonCellMBS

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The NSButtonCell class is a subclass of NSActionCell used to implement the user interfaces of push buttons, checkboxes (switches), and radio buttons.
Notes:

It can also be used for any other region of a view that's designed to send a message to a target when clicked. The NSButton subclass of NSControl uses a single NSButtonCell.

The NSButtonCell class implements the user interface of NSButton.

Setting the integer, float, double, or object value of an NSButtonCell object results in a call to setState with the value converted to integer. In the case of setObjectValue, nil is equivalent to 0, and a non-nil object that doesn't respond to intValue sets the state to 1. Otherwise, the state is set to the object's intValue. Similarly, querying the integer, float, double, or object value of an NSButtonCell returns the current state in the requested representation. In the case of objectValue, this is an NSNumber containing true for on, false for off, and integer value -1 for the mixed state.

For more information on the behavior of NSButtonCell, see the NSButton and NSMatrix class specifications, and Button Programming Topics.
Subclass of the NSActionCellMBS class.

32.17.4 Methods

32.17.5 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new Cell object with an image.

Example:

```
dim pic as Picture = LogoMBS(500)
dim n as NSImageMBS = new NSImageMBS(pic)
dim c as new NSButtonCellMBS(n)

Backdrop = c.image.CopyPictureWithMask
Title = c.classPath
```

- 32.17.6 Constructor(text as string) 6780

32.17.6 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new Cell object with a text.
Example:

```
dim c as new NSButtonCellMBS("Hello")
MsgBox c.StringValue
```

See also:

- 32.17.5 Constructor(image as NSImageMBS) 6779

32.17.7 Properties

32.17.8 alternateImage as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The image the button displays in its alternate state and, if necessary, redraws its contents.
Notes:

Note that some button types don't display an alternate image.
(Read and Write property)

32.17.9 alternateTitle as String

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The title the button displays when it's in its alternate state.
Notes:

Note that some button types don't display an alternate title.
(Read and Write property)

32.17.10 attributedAlternateTitle as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The string the button displays when it's in its alternate state to the given attributed string.
Notes:

Note that some button types don't display an alternate title.

Graphics attributes that are set on the cell (backgroundColor, alignment, font, etc.) are overridden when corresponding properties are set for the attributed string.
(Read and Write property)

32.17.11 attributedTitle as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The string the button displays when it's in its normal state to the given attributed string and redraws the button.
Notes:

The title is always shown on buttons that don't use their alternate contents when highlighting or displaying their alternate state.

Graphics attributes configured for the cell (backgroundColor, alignment, font, etc.) are overridden when corresponding properties are set for the attributed string.
(Read and Write property)

32.17.12 backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The background color for the button.
Notes: (Read and Write property)

32.17.13 imageDimsWhenDisabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether to dim image when button is disabled.

Notes:

When disabled, the image and text of an NSButtonCell are normally dimmed with gray.
Radio buttons and switches use (imageDimsWhenDisabled = false) so only their text is dimmed.
(Read and Write property)

32.17.14 imagePosition as Integer

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The position of the receiver's image relative to its title.
Notes: (Read and Write property)

32.17.15 imageScaling as Integer

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The scale factor for the receiver's image.
Notes:

Available in OS X v10.5 and later.
(Read and Write property)

32.17.16 showsBorderOnlyWhileMouseInside as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether to show border only while mouse is inside.
Notes: (Read and Write property)

32.17.17 sound as Variant

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The sound that's played when the user presses the receiver.
Notes:

The sound is played during a mouse-down event, such as NSLeftMouseDown.
Value is a NSSoundMBS object.
(Read and Write property)

32.18 control NSButtonControlMBS

32.18.1 control NSButtonControlMBS

MBS MacControls Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The Xojo control for a NSButton.
Notes:

This control embeds a special NSButton subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

32.18.3 Properties

32.18.4 AlternateTitle as String

MBS MacControls Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The title that the button displays when it's in its alternate state.
Notes: (Read and Write property)

32.18.5 BezelStyle as Integer

MBS MacControls Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The appearance of the border, if the view has one.
Notes:

Use this constants:

(Read and Write property)

32.18.6 ButtonType as Integer

MBS MacControls Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The button type.
Notes:

NSRoundedBezelStyle	= 1
NSRegularSquareBezelStyle	= 2
NSThickSquareBezelStyle	= 3
NSThickerSquareBezelStyle	= 4
NSDisclosureBezelStyle	= 5
NSShadowlessSquareBezelStyle	= 6
NSCircularBezelStyle	= 7
NSTexturedSquareBezelStyle	= 8
NSHelpButtonBezelStyle	= 9
NSSmallSquareBezelStyle	= 10
NSTexturedRoundedBezelStyle	= 11
NSRoundRectBezelStyle	= 12
NSRecessedBezelStyle	= 13
NSRoundedDisclosureBezelStyle	= 14

See also NSButtonMBS.ButtonType and the constants there like NSPushOnPushOffButton.
(Read and Write property)

32.18.7 Title as String

MBS MacControls Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The title displayed on the button when it's in its normal state.
Notes: (Read and Write property)

32.18.8 View as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

32.18.9 Events

32.18.10 Action

MBS MacControls Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The action event.

32.18.11 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the bounds, but not the frame, changed.

32.18.12 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event where you can enable menu items.

32.18.13 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the frame changed.

32.18.14 GotFocus

MBS MacControls Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

32.18.15 LostFocus

MBS MacControls Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

32.18.16 MenuAction(HitItem as MenuItem) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

32.18.17 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was pressed inside the control's region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

32.18.18 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

32.18.19 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

32.18.20 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

32.19 class NSButtonMBS

32.19.1 class NSButtonMBS

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The Cocoa class for a button control.
Notes: Subclass of the NSControlMBS class.

32.19.4 Methods

32.19.5 Constructor

MBS MacControls Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new button with size 100/100 and position 0/0
Example:

```
dim t as new NSButtonMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.19.6 Constructor(Handle as Integer) 6788
- 32.19.7 Constructor(left as Double, top as Double, width as Double, height as Double) 6788
- 32.19.8 Constructor(Title as String, Image as NSImageMBS = nil, Type as Integer = 0) 6788

32.19.6 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSButton handle.
Example:

```
dim t as new NSButtonMBS(0, 0, 100, 100)
dim v as new NSButtonMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSButton and the plugin retains this handle.
See also:

- 32.19.5 Constructor 6787
- 32.19.7 Constructor(left as Double, top as Double, width as Double, height as Double) 6788
- 32.19.8 Constructor(Title as String, Image as NSImageMBS = nil, Type as Integer = 0) 6788

32.19.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new button with the given size and position.
Example:

```
dim x as new NSButtonMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.19.5 Constructor 6787
- 32.19.6 Constructor(Handle as Integer) 6788
- 32.19.8 Constructor(Title as String, Image as NSImageMBS = nil, Type as Integer = 0) 6788

32.19.8 Constructor(Title as String, Image as NSImageMBS = nil, Type as Integer = 0)

MBS MacControls Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new button with default settings.
Notes:

For macOS 10.12, we use the convenience functions from Apple.
For older systems, we use our own code.
Title is the title to use. Can be empty.
Image is the image to use. Can be nil.
Type is the type, e.g. NSMomentaryLightButton.
See also:

- 32.19.5 Constructor 6787
- 32.19.6 Constructor(Handle as Integer) 6788
- 32.19.7 Constructor(left as Double, top as Double, width as Double, height as Double) 6788

32.19.9 setButtonType(buttonType as Integer)

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets how the button highlights while pressed and how it shows its state.
Notes:

Use this constants:

NSMomentaryLightButton	= 0
NSPushOnPushOffButton	= 1
NSToggleButton	= 2
NSSwitchButton	= 3
NSRadioButton	= 4
NSMomentaryChangeButton	= 5
NSOnOffButton	= 6
NSMomentaryPushInButton	= 7

32.19.10 setNextState

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the view to its next state.
Notes: If the button has three states, it cycles through them in this order: on, off, mixed, on, and so forth. If the button has two states, it toggles between them.

32.19.11 Properties

32.19.12 allowsMixedState as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the button allows a mixed state.

Notes: (Read and Write property)

32.19.13 alternateImage as NSImageMBS

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The image that appears on the button when it's in its alternate state.
Notes:

The image displayed by the button when it's in its alternate state, or nil if there is no alternate image. Note that some button types don't display an alternate image. Buttons don't display images by default.
(Read and Write property)

32.19.14 alternateTitle as string

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The title that the button displays when it's in its alternate state.
Notes: (Read and Write property)

32.19.15 attributedAlternateTitle as NSAttributedStringMBS

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The title that appears on the button when it's in its alternate state to the given attributed string.
Notes: (Read and Write property)

32.19.16 attributedTitle as NSAttributedStringMBS

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The title that the button displays in its normal state as an attributed string.
Notes: (Read and Write property)

32.19.17 backgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The background color.
Notes:

The background color is used only when drawing borderless buttons.
(Read and Write property)

32.19.18 bezelColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The color of the button's bezel, in appearances that support it.
Notes: (Read and Write property)

32.19.19 bezelStyle as Integer

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The appearance of the border, if the view has one.
Notes:

Use this constants:

NSRoundedBezelStyle	= 1
NSRegularSquareBezelStyle	= 2
NSThickSquareBezelStyle	= 3
NSThickerSquareBezelStyle	= 4
NSDisclosureBezelStyle	= 5
NSShadowlessSquareBezelStyle	= 6
NSCircularBezelStyle	= 7
NSTexturedSquareBezelStyle	= 8
NSHelpButtonBezelStyle	= 9
NSSmallSquareBezelStyle	= 10
NSTexturedRoundedBezelStyle	= 11
NSRoundRectBezelStyle	= 12
NSRecessedBezelStyle	= 13
NSRoundedDisclosureBezelStyle	= 14

(Read and Write property)

32.19.20 image as NSImageMBS

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The view's image.
Notes:

A button's image is displayed when the button is in its normal state, or all the time for a button that doesn't change its contents when highlighting or displaying its alternate state.
(Read and Write property)

32.19.21 imageDimsWhenDisabled as Boolean

MBS MacControls Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver's image appears "dim" when the button cell is disabled.
Notes:

True to indicate that the button's image should dim when the button is disabled.

By default, all button types except NSSwitchButton and NSRadioButton do dim when disabled. When NSSwitchButtons and NSRadioButtons are disabled, only the associated text dims. The default setting for this condition is reasserted whenever you set ButtonType, so be sure to specify the button cell's type before you set ImageDimsWhenDisabled.
(Read and Write property)

32.19.22 imageHugsTitle as Boolean

MBS MacControls Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether image hugs title.
Notes:

Available in macOS 10.12 and newer.
(Read and Write property)

32.19.23 imagePosition as Integer

MBS MacControls Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The position of the button's image relative to its title.
Notes:

Value can be:

NSNoImage	0	The cell doesn't display an image.
NSImageOnly	1	The cell displays an image, but not a title.
NSImageLeft	2	The image is to the left of the title.
NSImageRight	3	The image is to the right of the title.
NSImageBelow	4	The image is below the title.
NSImageAbove	5	The image is above the title.
NSImageOverlaps	6	The image overlaps the title.

(Read and Write property)

32.19.24 imageScaling as Integer

MBS MacControls Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The scale factor for the receiver's image.
Notes:

These constants specify a cell's image scaling behavior.

NSImageScaleProportionallyDown	0	If it is too large for the destination, scale the image down while preserving the aspect ratio.
NSImageScaleAxesIndependently	1	Scale each dimension to exactly fit destination. This setting does not preserve the aspect ratio of the image.
NSImageScaleNone	2	Do not scale the image.
NSImageScaleProportionallyUpOrDown	3	Scale the image to its maximum possible dimensions while both staying within the destination area and preserving its aspect ratio.

Available in OS X v10.5 and later.
(Read and Write property)

32.19.25 isBordered as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the button has a border.
Notes: (Read and Write property)

32.19.26 isTransparent as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the button is transparent.
Notes: (Read and Write property)

32.19.27 keyEquivalent as string

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The key-equivalent character of the view.
Notes: (Read and Write property)

32.19.28 keyEquivalentModifierMask as Integer

MBS MacControls Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: the controls's keyboard equivalent modifier mask.
Example:

```
const NSShiftKeyMask=131.072
const NSControlKeyMask=262144
const NSAlternateKeyMask=524288
const NSCommandKeyMask=1048576

dim d as NSButtonMBS // your button
d.KeyEquivalent="A"
d.KeyEquivalentModifierMask=NSShiftKeyMask+NSCommandKeyMask+NSAlternateKeyMask // command-option-shift
```

Notes:

Constants for the mask:

NSAlphaShiftKeyMask = 65536
Set if Caps Lock key is pressed.
Available in Mac OS X v10.0 and later.

NSShiftKeyMask = 131072
Set if Shift key is pressed.
Available in Mac OS X v10.0 and later.

NSControlKeyMask = 262144
Set if Control key is pressed.
Available in Mac OS X v10.0 and later.

NSAlternateKeyMask = 524288
Set if Option or Alternate key is pressed.
Available in Mac OS X v10.0 and later.

NSCommandKeyMask = 1048576
Set if Command key is pressed.
Available in Mac OS X v10.0 and later.

NSNumericPadKeyMask = 2097152
Set if any key in the numeric keypad is pressed. The numeric keypad is generally on the right side of the keyboard. This is also set if any of the arrow keys are pressed (NSUpArrowFunctionKey, NSDownArrow-

FunctionKey, NSLeftArrowFunctionKey, and NSRightArrowFunctionKey).
Available in Mac OS X v10.0 and later.

NSHelpKeyMask = 4194304
Set if the Help key is pressed.
Available in Mac OS X v10.0 and later.

NSFunctionKeyMask = 8388608
Set if any function key is pressed. The function keys include the F keys at the top of most keyboards (F1, F2, and so on) and the navigation keys in the center of most keyboards (Help, Forward Delete, Home, End, Page Up, Page Down, and the arrow keys).
Available in Mac OS X v10.0 and later.

NSDeviceIndependentModifierFlagsMask = 16777216
Used to retrieve only the device-independent modifier flags, allowing applications to mask off the device-dependent modifier flags, including event coalescing information.
Available in Mac OS X v10.4.
(Read and Write property)

32.19.29 maxAcceleratorLevel as Integer

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Configures the maximum allowed level for an NSMultiLevelAcceleratorButton, allowed values range from [1,5] .
Notes:

Defaults to 2.
Available on Mac OS X 10.10.3.
(Read and Write property)

32.19.30 showsBorderOnlyWhileMouseInside as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the view's border is displayed only when the cursor is over the button.
Notes:

If isBordered returns false, the border is never displayed, regardless of what this method returns.
(Read and Write property)

32.19.31 sound as Variant

MBS MacControls Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The sound played when the user presses the button.
Notes:

The sound that should be played when the user presses the button. The sound is played during a mouse-down event, such as NSLeftMouseDown.
Value is NSSoundMBS object.
(Read and Write property)

32.19.32 SpringLoaded as Boolean

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sends action on deep-press or extended hover while dragging.
Notes:

Defaults to false.
Available on Mac OS X 10.10.3.
(Read and Write property)

32.19.33 state as Integer

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The state of the button.
Notes:

This can be NSOnState (1), NSOffState (0), NSMixedState (-1).
(Read and Write property)

32.19.34 title as string

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The title displayed on the button when it's in its normal state.
Notes: (Read and Write property)

32.19.35 Constants

32.19.36 NSCircularBezelStyle=7

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
Notes:

A round button with room for a small icon or a single character.

This style has both regular and small variants, but the large variant is available only in gray at this time.

32.19.37 NSDisclosureBezelStyle=5

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
Notes:

A bezel style for use with a disclosure triangle.

To create the disclosure triangle, set the button bezel style to NSDisclosureBezelStyle and the button type to NSOnOffButton.

32.19.38 NSHelpButtonBezelStyle=9

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
Notes: A round button with a question mark providing the standard help button look.

32.19.39 NSInlineBezelStyle=15

MBS MacControls Plugin, Plugin Version: 14.3. **Function:** One of the button styles that can be specified using bezelStyle.
Notes: Inline Style.

32.19.40 NSMomentaryChangeButton=5

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button types that can be specified using ButtonType.

Notes:

While the button is held down, the alternate image and alternate title are displayed.

The normal image and title are displayed when the button isn't pressed. This option is called "Momentary Change" in Interface Builder's Button Inspector.

32.19.41 NSMomentaryLightButton=0

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button types that can be specified using ButtonType.
Notes:

While the button is held down it's shown as "lit," and also "pushed in" to the screen if the button is bordered.

This type of button is best for simply triggering actions, as it doesn't show its state; it always displays its normal image or title. This option is called "Momentary Light" in Interface Builder's Button Inspector.

32.19.42 NSMomentaryPushInButton=7

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button types that can be specified using ButtonType.
Notes:

While the button is held down it's shown as "lit."

This type of button is best for simply triggering actions, as it doesn't show its state; it always displays its normal image or title. This option is called "Momentary Push In" in Interface Builder's Button Inspector.

32.19.43 NSOnOffButton=6

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button types that can be specified using ButtonType.
Notes: The first click highlights the button; a second click returns it to the normal (unhighlighted) state.

32.19.44 NSPushOnPushOffButton=1

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button types that can be specified using ButtonType.

Notes: The first click both highlights and causes the button to be "pushed in" if the button is bordered; a second click returns it to its normal state.

32.19.45 NSRadioButton=4

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button types that can be specified using ButtonType.
Notes: This style is similar to NSSwitchButton, but it used to constrain a selection to a single element from several.

32.19.46 NSRecessedBezelStyle=13

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
Notes: A bezel style that matches the recessed buttons in Mail, Finder and Safari.

32.19.47 NSRegularSquareBezelStyle=2

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
Notes: A rectangular button with a 2 point border, designed for icons.

32.19.48 NSRoundedBezelStyle=1

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
Notes: A rounded rectangle button, designed for text.

32.19.49 NSRoundedDisclosureBezelStyle=14

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
Notes: A bezel style that matches the disclosure style used in the standard Save panel.

32.19.50 NSRoundRectBezelStyle=12

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
Notes: A bezel style that matches the search buttons in Finder and Mail.

32.19.51 NSShadowlessSquareBezelStyle=6

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
Notes:

Similar to NSRegularSquareBezelStyle, but has no shadow so you can abut the cells without overlapping shadows.

This style would be used in a tool palette, for example.

32.19.52 NSSmallSquareBezelStyle=10

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
Notes: A simple square bezel style. Buttons using this style can be scaled to any size.

32.19.53 NSSwitchButton=3

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button types that can be specified using ButtonType.
Notes: This style is a variant of NSToggleButton that has no border and is used to represent a checkbox.

32.19.54 NSTexturedRoundedBezelStyle=11

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
Notes: A textured (metal) bezel style similar in appearance to the Finder's action (gear) button.

32.19.55 NSTexturedSquareBezelStyle=8

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
Notes: A bezel style appropriate for use with textured (metal) windows.

32.19.56 NSThickerSquareBezelStyle=4

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
Notes: A rectangular button with a 4 point border, designed for icons.

32.19.57 NSThickSquareBezelStyle=3

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button styles that can be specified using bezelStyle.
Notes: A rectangular button with a 3 point border, designed for icons.

32.19.58 NSToggleButton=2

MBS MacControls Plugin, Plugin Version: 7.8. **Function:** One of the button types that can be specified using ButtonType.
Notes: After the first click, the button displays its alternate image or title; a second click returns the button to its normal state.

32.20 class NSCellMBS

32.20.1 class NSCellMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSCell class provides a mechanism for displaying text or images in an NSView object without the overhead of a full NSView subclass.
Notes: It's used heavily by most of the NSControl classes to implement their internal workings.

- MBS Xojo / Real Studio Plugins, version 13.2pr7
- Nearly 2000 new Functions in the 9.6 prerelease of MBS

32.20.3 Xojo Developer Magazine

- 7.6, page 8: News

32.20.4 Methods

32.20.5 acceptsFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver accepts first responder status.
Notes: The default value is true if the receiver is enabled. Subclasses may override this method to return a different value.

32.20.6 calcDrawInfo(theRect as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Recalculates the cell geometry.
Notes:

Objects (such as controls) that manage NSCell objects generally maintain a flag that informs them if any of their cells have been modified in such a way that the location or size of the cell should be recomputed. If so, calcSize method of NSControl is automatically invoked prior to the display of the cell, and that method invokes the calcDrawInfo method of the cell.
The default implementation of this method does nothing.

32.20.7 cellSize as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the minimum size needed to display the receiver.
Notes:

Returns the size of the cell, or the size (10000, 10000) if the receiver is not a text or image cell. If the cell is an image cell but no image has been set, returns NSZeroSize.
This method takes into account of the size of the image or text within a certain offset determined by the border type of the cell.

32.20.8 cellSizeForBounds(theRect as NSRectMBS) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the minimum size needed to display the receiver, constraining it to the specified rectangle.
Notes:

aRect: The size of the cell, or the size of the aRect parameter if the cell is not a text or image cell. If the cell is an image cell but no image has been set, returns an empty size.

This method takes into account of the size of the image or text within a certain offset determined by the border type of the cell. If the receiver is of text type, the text is resized to fit within aRect (as much as aRect is within the bounds of the cell).

32.20.9 compare(otherCell as NSCellMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Compares the string values of the receiver another cell, disregarding case.
Notes:

otherCell: The cell to compare against the receiver. This parameter must be of type NSCell; if it is not, this method raises NSBadComparisonException.

This value must not be nil. If the value is nil, the behavior is undefined and may change in future versions of Mac OS X.

Returns NSOrderedAscending if the string value of the receiver precedes the string value of otherCell in lexical ordering, NSOrderedSame if the string values are equivalent in lexical value, and NSOrderedDescending string value of the receiver follows the string value of otherCell in lexical ordering.

32.20.10 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new Cell object with an image.
Example:

```
dim pic as Picture = LogoMBS(500)
dim n as NSImageMBS = new NSImageMBS(pic)
dim c as new NSCellMBS(n)

Backdrop = c.image.CopyPictureWithMask
Title = c.classPath
```

See also:

- 32.20.11 Constructor(text as string) 6804

32.20.11 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new Cell object with a text.
Example:

```
dim c as new NSCellMBS("Hello")
MsgBox c.StringValue
```

See also:

- 32.20.10 Constructor(image as NSImageMBS) 6804

32.20.12 defaultFocusRingType as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default type of focus ring for the receiver.
Notes:

Use this constants:

32.20.13 defaultMenu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default menu for instances of the receiver.

NSFocusRingTypeDefault	= 0	The default focus ring type for NSView or NSCell.
NSFocusRingTypeNone	= 1	No focus ring. If you set the focus ring type to this value, NSView and NSCell will not draw any focus ring.
NSFocusRingTypeExterior	= 2	The standard Aqua focus ring.

Notes: Returns the default menu. The NSCell implementation of this method returns nil.

32.20.14 drawingRectForBounds(theRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the rectangle within which the receiver draws itself.
Notes:

theRect: The bounding rectangle of the receiver.
Returns the rectangle in which the receiver draws itself. This rectangle is slightly inset from the one in theRect.

32.20.15 highlightColorWithFrame(theRect as NSRectMBS, controlView as NSViewMBS) as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Redraws the receiver with the specified highlight setting.
Notes:

theRect: The bounding rectangle of the receiver.
controlView: The control that manages the cell.

Returns the color the receiver uses when drawing the selection highlight.
You should not assume that a cell would necessarily want to draw itself with the value returned from selectedControlColor. A cell may wish to draw with different a selection highlight color depending on such things as the key state of its controlView.

32.20.16 imageRectForBounds(theRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the rectangle in which the receiver draws its image.
Notes:

theRect: The bounding rectangle of the receiver.

The rectangle in which the receiver draws its image. This rectangle is slightly offset from the one in theRect.

32.20.17 isEntryAcceptable(aString as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether a string representing a numeric or date value is formatted in a suitable way for the cell's entry type.
Notes: This method is being deprecated in favor of a new class of formatter objects. For more information, see NSFormatter. This documentation is provided only for developers who need to modify older applications

32.20.18 mnemonic as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the character in the receiver's title that appears underlined for use as a mnemonic.
Notes: A string containing the mnemonic character, or an empty string if no mnemonic character is set.

32.20.19 nextState as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's next state.
Notes: If the receiver has three states, it cycles through them in this order: on, off, mixed, on, and so forth. If the receiver has two states, it toggles between them.

32.20.20 performClick

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Simulates a single mouse click on the receiver.
Notes:

This method performs the receiver's action on its target. The receiver must be enabled to perform the action. If the receiver's control view is valid, that view is used as the sender; otherwise, the value in sender is used.

The receiver of this message must be a cell of type NSActionCell. This method raises an exception if the action message cannot be successfully sent.

32.20.21 preferstrackingUntilMouseUp as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether tracking stops when the cursor leaves the cell.
Notes: The default implementation returns false. Subclasses may override this method to return a different value.

32.20.22 sendActionOn(mask as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the conditions on which the receiver sends action messages to its target.
Notes:

mask: A bit mask containing the conditions for sending the action. The only conditions that are actually checked are associated with the NSLeftMouseDownMask, NSLeftMouseUpMask, NSLeftMouseDraggedMask, and NSPeriodicMask bits.

Returns a bit mask containing the previous settings. This bit mask uses the same values as specified in the mask parameter.

You use this method during mouse tracking when the mouse button changes state, the mouse moves, or if the cell is marked to send its action continuously while tracking. Because of this, the only bits checked in mask are NSLeftMouseDownMask, NSLeftMouseUpMask, NSLeftMouseDraggedMask, and NSPeriodicMask, which are declared in the NSEvent class reference.

You can use the setContinuous method to turn on the flag corresponding to NSPeriodicMask or NSLeftMouseDraggedMask, whichever is appropriate to the given subclass of NSCell.

32.20.23 setNextState

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes the state of the receiver to its next state.
Notes: If the receiver has three states, it cycles through them in this order: on, off, mixed, on, and so forth. If the receiver has two states, it toggles between them.

32.20.24 setTitleWithMnemonic(stringWithAmpersand as string)

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the title of the receiver with one character in the string denoted as an access key.
Notes:

stringWithAmpersand: The new title of the cell. One character in the string should be preceded by an ampersand (&) character. The character that follows becomes the mnemonic character for the title.
Mnemonics are not supported in Mac OS X.

32.20.25 titleRectForBounds(theRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the rectangle in which the receiver draws its title text.
Notes: If the receiver is a text-type cell, this method resizes the drawing rectangle for the title (theRect) inward by a small offset to accommodate the cell border. If the receiver is not a text-type cell, the method does nothing.

32.20.26 wantsNotificationForMarkedText as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the field editor initiated by the receiver should post text change notifications.
Notes: Returns true if the field editor initiated by the receiver should post text change notifications (NSTextDidChangeNotification) while editing marked text; otherwise, they are delayed until the marked text confirmation.

32.20.27 Properties

32.20.28 alignment as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The alignment of text in the receiver..
Notes:

The alignment of text in the receiver (one of the following constants: NSLeftTextAlignment, NSRightTextAlignment,NSCenterTextAlignment, NSJustifiedTextAlignment, NSNaturalTextAlignment).
The default value is NSNaturalTextAlignment.
(Read and Write property)

32.20.29 allowsEditingTextAttributes as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver allows user editing of textual attributes.
Notes: (Read and Write property)

32.20.30 allowsMixedState as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver supports three states.
Notes:

Valus is true if the receiver supports all three states (on, off, and mixed), otherwise false (the receiver supports only the on and off states).
(Read and Write property)

32.20.31 allowsUndo as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver assumes responsibility for undo operations.
Notes:

By default, the NSTextFieldCell class uses this feature to handle undo operations for edited text. Other controls set a value that is appropriate for their implementation.
Available in Mac OS X v10.4 and later.
(Read and Write property)

32.20.32 attributedStringValue as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of the receiver's cell as an attributed string using the receiver's formatter object (if one exists).
Notes:

The textual attributes are the default paragraph style, the receiver's font and alignment, and whether the receiver is enabled and scrollable.

For Mac OS X v10.3 and later: If you use a class that responds to the selector attributedStringValue for the object value of a cell, then the cell will use that method to fetch the string to draw rather than using stringValue.
(Read and Write property)

32.20.33 backgroundStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the background style for the receiver.
Notes:

The background describes the surface the cell is drawn onto in drawWithFrame A control typically sets this before it asks the cell to draw. A cell may draw differently based on background characteristics. For example, a tableview drawing a cell in a selected row might set cell.backgroundStyle=NSBackgroundStyleDark. A text cell might decide to render its text white as a result. A rating-style level indicator might draw its stars white instead of gray.
Available in Mac OS X v10.5 and later.
(Read and Write property)

32.20.34 baseWritingDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The initial writing direction used to determine the actual writing direction for text.
Notes:

The default value is NSWritingDirectionNatural.
The Text system uses this value as a hint for calculating the actual direction for displaying Unicode characters. You should not need to call this method directly.
(Read and Write property)

32.20.35 Bezeled as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver has a bezeled border.
Notes: (Read and Write property)

32.20.36 Bordered as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver has a plain border.
Notes: (Read and Write property)

32.20.37 className as string

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of this NSCell class.
Example:

```
dim c as new NSActionCellMBS("Hello")
MsgBox c.className // shows "NSActionCell"
```

Notes: (Read only property)

32.20.38 classPath as string

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path of this NSCell class.
Example:

```
dim c as new NSActionCellMBS("Hello")
MsgBox c.classPath // shows "NSActionCell:NSCell:NSObject"
```

Notes:

Useful for debugging to know what super classes the view has.
(Read only property)

32.20.39 Continuous as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver's cell sends its action message continuously to its target during mouse tracking.
Notes: (Read and Write property)

32.20.40 controlSize as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The size of the receiver.
Notes:

Can be NSRegularControlSize, NSMiniControlSize or NSSmallControlSize.
(Read and Write property)

32.20.41 controlTint as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's control tint.
Notes:

Can be NSGraphiteControlTint, NSBlueControlTint, NSClearControlTint or NSDefaultControlTint.
(Read and Write property)

32.20.42 controlView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's control view.
Notes:

The control view represents the control currently being rendered by the cell.
(Read and Write property)

32.20.43 doubleValue as Double

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of the receiver's cell as a double-precision floating-point number.
Notes:

The value of the cell interpreted as a double-precision floating-point number. If the receiver is not a text-type cell or the cell value is not scannable, returns 0.
(Read and Write property)

32.20.44 Editable as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver is editable.
Notes: (Read and Write property)

32.20.45 Enabled as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver is enabled or disabled.
Notes: (Read and Write property)

32.20.46 floatValue as Double

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of the receiver's cell as a single-precision floating-point number.
Notes:

Returns the value of the cell interpreted as a single-precision floating-point number. If the receiver is not a text-type cell or the cell value is not scannable, returns 0.
(Read and Write property)

32.20.47 font as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The font used to display text in the receiver.
Notes:

The receiver's current font, or nil if the receiver is not a text-type cell.
(Read and Write property)

32.20.48 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal NSCell reference.
Notes: (Read and Write property)

32.20.49 hasValidObjectValue as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver has a valid object value.
Notes:

A valid object value is one that the receiver's formatter can "understand." Objects are always assumed to be valid unless they are rejected by the formatter.
(Read only property)

32.20.50 Highlighted as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver is highlighted.
Notes: (Read and Write property)

32.20.51 image as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image displayed by the receiver (if any).

Notes:

The image displayed by the receiver, or nil if the receiver is not an image-type cell.
(Read and Write property)

32.20.52 importsGraphics as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the text of the receiver can contain imported graphics.
Notes:

true if the receiver's text is in the RTFD format and supports imported graphics, otherwise false.
(Read and Write property)

32.20.53 interiorBackgroundStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the interior background style for the receiver.
Notes:

The interior background style describes the surface drawn onto in drawInteriorWithFrame:inView:. This is often the same as the backgroundStyle, but a button that draws a bezel would have a different interiorBackgroundStyle.
This is both an override point and a useful method to call. In a custom button with a custom bezel you can override this method to describe that surface. A cell that has custom interior drawing might query this method to help pick an image that looks good on the cell. Calling this method gives you some independence from changes in framework art style.
Available in Mac OS X v10.5 and later.
(Read only property)

32.20.54 intValue as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's value as an integer.
Notes:

The value of the cell interpreted as an integer. If the receiver is not a text-type cell or the cell value is not scannable, returns 0.
On Mac OS X v10.5 and later, you should use integerValue instead.
(Read and Write property)

32.20.55 isOpaque as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver is opaque (nontransparent).
Notes: (Read only property)

32.20.56 keyEquivalent as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the key equivalent to clicking the cell.
Notes:

Subclasses can override this method to return a string with a valid character for the key equivalent.
(Read only property)

32.20.57 lineBreakMode as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The line break mode currently used when drawing text.
Notes:

The line break mode the receiver currently uses when drawing text (one of the following constants: NSLineBreakByWordWrapping, NSLineBreakByCharWrapping, NSLineBreakByClipping, NSLineBreakByTruncatingHead, NSLineBreakByTruncatingTail, or NSLineBreakByTruncatingMiddle).
Available in Mac OS X v10.4 and later.
(Read and Write property)

32.20.58 menu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's contextual menu.
Notes:

The receiver's contextual menu, or nil if no menu is assigned.
(Read and Write property)

32.20.59 mnemonicLocation as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The position of the underlined mnemonic character in the receiver's title.
Notes:

A zero-based index into the receiver's title string indicating the position of the character. If there is no mnemonic character, this method returns NSNotFound.
Mnemonics are not supported in Mac OS X.
(Read and Write property)

32.20.60 refusesFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver should not become the first responder.
Notes:

To find out whether the receiver can become first responder at this time, use the method acceptsFirstResponder.
(Read and Write property)

32.20.61 Scrollable as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver scrolls excess text past the cell's bounds.
Notes: (Read and Write property)

32.20.62 Selectable as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the text of the receiver can be selected.
Notes: (Read and Write property)

32.20.63 sendsActionOnEndEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver's NSControl object sends its action message whenever the user finishes editing the cell's text.
Notes:

If this method returns true, the receiver's NSControl object sends its action message when the user does one of the following:

- Presses the Return key
- Presses the Tab key to move out of the field

- Clicks another text field

If it returns false, the cell's NSControl object sends its action message only when the user presses the Return key.
(Read and Write property)

32.20.64 showsFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver should draw some indication of its first responder status.
Notes:

The NSCell class itself does not draw a first-responder indicator. Subclasses may use the returned value to determine whether or not they should draw one, however.
(Read and Write property)

32.20.65 state as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's state.
Notes:

Cells can have two or three states. If the receiver has two states, it returns either NSOffState (the normal or unpressed state) or NSOnState (the alternate or pressed state). If it has three, it may also return NSMixedState, indicating the feature is in effect somewhere.
To check whether the receiver uses the mixed state, use the method allowsMixedState.
Note that the value state returns may not be the same value you passed into setState.
(Read and Write property)

32.20.66 stringValue as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of the receiver's cell as a string.
Notes:

If no formatter exists and the cell's value is a string, this method returns the value as a plain, attributed, or localized formatted string. If the value is not a string or cannot be converted to one, this method returns an empty string.

For Mac OS X v10.3 and later: If you use a class that responds to the selector attributedStringValue for the object value of a cell, the cell uses that method to fetch the string to draw rather than the stringValue

method.
(Read and Write property)

32.20.67 tag as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The tag identifying the receiver.
Notes:

The tag value. The NSCell implementation of this method returns –1.
Tags allow you to identify particular cells. Tag values are not used internally; they are only changed by external invocations of setTag:. You typically set tag values in Interface Builder and use them at runtime in your application. When you set the tag of a control with a single cell in Interface Builder, it sets the tags of both the control and the cell to the same value as a convenience.
(Read and Write property)

32.20.68 title as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's title.
Notes:

Subclasses (such as NSButtonCell) may override this method to return a different value.
(Read and Write property)

32.20.69 truncatesLastVisibleLine as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the receiver truncates and adds the ellipsis character to the last visible line if the text doesn't fit into the cell bounds.
Notes:

The line break mode must be either NSLineBreakByWordWrapping or NSLineBreakByCharWrapping. Otherwise, this setting is ignored.
Available in Mac OS X v10.5 and later.
(Read and Write property)

32.20.70 type as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of the cell, changing it to a text cell, image cell, or null cell.

Notes:

If the cell is already the same type as the one specified in the aType parameter, this method does nothing. If aType is NSTextCellType, this method converts the receiver to a cell of that type, giving it a default title and setting the font to the system font at the default size. If aType is NSImageCellType, the cell type is not changed until you set a new non-nil image.
(Read and Write property)

32.20.71 userInterfaceLayoutDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The layout direction of the user interface.
Notes:

This property specifies the general user interface layout flow directions. For subclasses that have multiple visual components in a single cell instance, this property should specify the directionality or flow of components.

NSUserInterfaceLayoutDirectionLeftToRight = 0
NSUserInterfaceLayoutDirectionRightToLeft = 1

Available in OS X v10.6 and later.
(Read and Write property)

32.20.72 usesSingleLineMode as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the text cell restricts layout and rendering of its content to a single line.
Notes:

If true, the cell ignores the return value from wraps, interprets NSLineBreakByWordWrapping and NSLineBreakByCharWrapping returned by lineBreakMode as NSLineBreakByClipping, and configures the field editor to ignore key binding commands that insert paragraph and line separators.

The field editor bound to a single line cell filters paragraph and line separator insertion from user actions. Cells in the single line mode use the fixed baseline layout. The text baseline position is determined solely by the control size regardless of content font style or size.
(Read and Write property)

32.20.73 wraps as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether text in the receiver wraps when its length exceeds the frame of the cell.
Notes:

If the text of the receiver is an attributed string value you must explicitly set the paragraph style line break mode. Calling this method with the value true is equivalent to calling the setLineBreakMode: method with the value NSLineBreakByWordWrapping.
(Read and Write property)

32.20.74 cellAttribute(aParameter as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value for the specified cell attribute.
Notes:

aParameter: The cell attribute whose value you want to get. Attributes include the receiver's current state and whether it is disabled, editable, or highlighted.

Returns the value for the cell attribute specified by aParameter.
(Read and Write computed property)

32.20.75 focusRingType as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of focus ring currently set for the receiver.
Notes:

You can disable a view's focus ring drawing by overriding this method so it always returns NSFocusRingTypeNone, or by calling setFocusRingType: with NSFocusRingTypeNone. You should only disable a view from drawing its focus ring if you want to draw your own focus ring, or if there isn't sufficient space to display a focus ring in the default location.
Available in Mac OS X v10.3 and later.
(Read and Write computed property)

32.20.76 Constants

32.20.77 NSAnyType = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell formats numeric data.

Notes:

Any value is allowed.
Deprecated in Mac OS X v10.4 and later.

32.20.78 NSBackgroundStyleDark = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants for background styles.
Notes:

The background is a dark color.
Light content contrasts well with this background.
Available in Mac OS X v10.5 and later.

32.20.79 NSBackgroundStyleLight = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants for background styles.
Notes:

The background is a light color.
Dark content contrasts well with this background.
Available in Mac OS X v10.5 and later.

32.20.80 NSBackgroundStyleLowered = 3

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants for background styles.
Notes:

The background is intended to appear lower than the content drawn on it.
Content might need to be embossed.
Available in Mac OS X v10.5 and later.

32.20.81 NSBackgroundStyleRaised = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants for background styles.
Example:

```
// ask for the textfield behind the label
dim n as NSTextFieldMBS = NSTextFieldMBS(label1.NSViewMBS)

// query cell
dim c as NSTextFieldCellMBS = n.cell
```

```
// and set background style
c.backgroundStyle = NSTextFieldCellMBS.NSBackgroundStyleRaised
```

Notes:

The background is intended to appear higher than the content drawn on it.
Content might need to be inset.
Available in Mac OS X v10.5 and later.

32.20.82 NSBlueControlTint = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell's tint.
Notes:

Aqua control tint
Available in Mac OS X v10.3 and later.

32.20.83 NSCellAllowsMixedState = 16

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: Lets the cell's state be NSMixedState, as well as NSOffState and NSOnState.

32.20.84 NSCellChangesContents = 14

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: If the cell's state is NSMixedState or NSOnState, displays the cell's alternate image.

32.20.85 NSCellDisabled = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: Does not let the user manipulate the cell.

32.20.86 NSCellEditable = 3

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: Lets the user edit the cell's contents.

32.20.87 NSCellHasImageHorizontal = 12

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
Notes:

Controls the position of the cell's image: places the image on the right of any text in the cell.
Together, NSCellHasImageOnLeftOrBottom, NSCellHasImageHorizontal, and NSCellHasOverlappingImage control the position of the cell's image and text. To place the image above, set none of them. To place the image below, set NSCellHasImageOnLeftOrBottom. To place the image to the right, set NSCellHasImageHorizontal. To place the image to the left, set NSCellHasImageHorizontal and NSCellHasImageOnLeftOrBottom. To place the image directly over, set NSCellHasOverlappingImage.

32.20.88 NSCellHasImageOnLeftOrBottom = 13

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
Notes:

Controls the position of the cell's image: places the image on the left of or below any text in the cell.
See NSCellHasImageHorizontal for more details.

32.20.89 NSCellHasOverlappingImage = 11

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
Notes:

Controls the position of the cell's image: places the image over any text in the cell.
See NSCellHasImageHorizontal for more details.

32.20.90 NSCellHighlighted = 5

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.

Notes: Draws the cell with a highlighted appearance. (Deprecated. Use Highlighted instead.)

32.20.91 NSCellHitContentArea = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants are used by hitTestForEvent to determine the effect of an event.
Notes:

A content area in the cell.
Available in Mac OS X v10.5 and later.

32.20.92 NSCellHitEditableTextArea = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants are used by hitTestForEvent to determine the effect of an event.
Notes:

An editable text area of the cell.
Available in Mac OS X v10.5 and later.

32.20.93 NSCellHitNone = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants are used by hitTestForEvent to determine the effect of an event.
Notes:

An empty area, or did not hit in the cell.
Available in Mac OS X v10.5 and later.

32.20.94 NSCellHitTrackableArea = 4

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants are used by hitTestForEvent to determine the effect of an event.
Notes:

A trackable area in the cell.
Available in Mac OS X v10.5 and later.

32.20.95 NSCellIsBordered = 10

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: Draws a border around the cell.

32.20.96 NSCellIsInsetButton = 15

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
Notes:

Insets the cell's contents from the border.
By default, the cell's contents are inset by 2 points. This constant is ignored if the cell is unbordered.

32.20.97 NSCellLightsByBackground = 9

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: If the cell is pushed in, changes the cell's background color from gray to white.

32.20.98 NSCellLightsByContents = 6

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: If the cell is pushed in, displays the cell's alternate image.

32.20.99 NSCellLightsByGray = 7

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: If the cell is pushed in, displays the cell's image as darkened.

32.20.100 NSCellState = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.

Notes: The cell's state can be NSMixedState, NSOffState, or NSOnState.

32.20.101 NSChangeBackgroundCell = 8

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: If the cell's state is NSMixedState or NSOnState, changes the cell's background color from gray to white.

32.20.102 NSChangeBackgroundCellMask = 8

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify what happens when a button is pressed or is displaying its alternate state.
Notes: Same as NSChangeGrayCellMask, but only background pixels are changed.

32.20.103 NSChangeGrayCell = 4

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: If the cell's state is NSMixedState or NSOnState, displays the cell's image as darkened.

32.20.104 NSChangeGrayCellMask = 4

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify what happens when a button is pressed or is displaying its alternate state.
Notes: The button cell swaps the "control color" (the controlColor method of NSColor) and white pixels on its background and icon.

32.20.105 NSClearControlTint = 7

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell's tint.
Notes:

Clear control tint
Available in Mac OS X v10.0 and later.

32.20.106 NSContentsCellMask = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify what happens when a button is pressed or is displaying its alternate state.
Notes: The button cell displays its alternate icon and/or title.

32.20.107 NSDefaultControlTint = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell's tint.
Notes:

The current default tint setting.
Available in Mac OS X v10.0 and later.

32.20.108 NSDoubleType = 6

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell formats numeric data.
Notes:

Must be between –FLT_MAX and FLT_MAX.
Deprecated in Mac OS X v10.4 and later.

32.20.109 NSFloatType = 3

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell formats numeric data.
Notes:

Must be between –FLT_MAX and FLT_MAX.
Deprecated in Mac OS X v10.4 and later.

32.20.110 NSGraphiteControlTint = 6

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell's tint.
Notes:

Graphite control tint
Available in Mac OS X v10.3 and later.

32.20.111 NSImageAbove = 5

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the position of a button's image relative to its title.
Notes: The image is above the title.

32.20.112 NSImageBelow = 4

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the position of a button's image relative to its title.
Notes: The image is below the title.

32.20.113 NSImageCellType = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell represents its data (as text or as an image).
Notes: Cell displays images.

32.20.114 NSImageLeft = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the position of a button's image relative to its title.
Notes: The image is to the left of the title.

32.20.115 NSImageOnly = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the position of a button's image relative to its title.
Notes: The cell displays an image, but not a title.

32.20.116 NSImageOverlaps = 6

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the position of a button's image relative to its title.
Notes: The image overlaps the title.

32.20.117 NSImageRight = 3

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the position of a button's image relative to its title.
Notes: The image is to the right of the title.

32.20.118 NSImageScaleAxesIndependently = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell's image scaling behavior.
Notes:

Scale each dimension to exactly fit destination.
This setting does not preserve the aspect ratio of the image.
Available in Mac OS X v10.5 and later.

32.20.119 NSImageScaleNone = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell's image scaling behavior.
Notes:

Do not scale the image.
Available in Mac OS X v10.5 and later.

32.20.120 NSImageScaleProportionallyDown = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell's image scaling behavior.
Notes:

If it is too large for the destination, scale the image down while preserving the aspect ratio.
Available in Mac OS X v10.5 and later.

32.20.121 NSImageScaleProportionallyUpOrDown = 3

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell's image scaling behavior.
Notes:

Scale the image to its maximum possible dimensions while both staying within the destination area and preserving its aspect ratio.
Available in Mac OS X v10.5 and later.

32.20.122 NSIntType = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell formats numeric data.
Notes:

Must be between INT_MIN and INT_MAX.
Deprecated in Mac OS X v10.4 and later.

32.20.123 NSMiniControlSize = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** These constants specify a cell's size.
Notes: The control has a smaller size than NSSmallControlSize.

32.20.124 NSMixedState = -1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell's state and are used mostly for buttons.
Notes: The corresponding feature is in effect somewhere.

32.20.125 NSNoCellMask = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify what happens when a button is pressed or is displaying its alternate state.
Notes: The button cell doesn't change.

32.20.126 NSNoImage = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the position of a button's image relative to its title.
Notes: The cell doesn't display an image.

32.20.127 NSNullCellType = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell represents its data (as text or as an image).
Notes: Cell displays nothing.

32.20.128 NSOffState = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell's state and are used mostly for buttons.
Notes: The corresponding feature is in effect nowhere.

32.20.129 NSOnState = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify a cell's state and are used mostly for buttons.
Notes: The corresponding feature is in effect everywhere.

32.20.130 NSPositiveDoubleType = 7

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell formats numeric data.
Notes:

Must be between FLT_MIN and FLT_MAX.
Deprecated in Mac OS X v10.4 and later.

32.20.131 NSPositiveFloatType = 4

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell formats numeric data.
Notes:

Must be between FLT_MIN and FLT_MAX.
Deprecated in Mac OS X v10.4 and later.

32.20.132 NSPositiveIntType = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell formats numeric data.
Notes:

Must be between 1 and INT_MAX.
Deprecated in Mac OS X v10.4 and later.

32.20.133 NSPushInCell = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: Determines whether the cell's image and text appear to be shifted down and to the right.

32.20.134 NSPushInCellMask = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify what happens when a button is pressed or is displaying its alternate state.
Notes: The button cell "pushes in" if it has a border.

32.20.135 NSRegularControlSize = 0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** These constants specify a cell's size.
Notes: The control is sized as regular.

32.20.136 NSSmallControlSize = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** These constants specify a cell's size.
Notes:

The control has a smaller size.
This constant is for controls that cannot be resized in one direction, such as push buttons, radio buttons, checkboxes, sliders, scroll bars, pop-up buttons, tabs, and progress indicators. You should use a small system font with a small control.

32.20.137 NSTextCellType = 1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants specify how a cell represents its data (as text or as an image).
Notes: Cell displays text.

32.21 class NSClipViewMBS

32.21.1 class NSClipViewMBS

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An NSClipView contains and scrolls the document view displayed by an NSScrollView.
Notes:

You normally don't need to program with NSClipViews, as NSScrollView handles most of the details of their operation.

An NSClipView holds the document view of an NSScrollView, clipping the document view to its frame, handling the details of scrolling in an efficient manner, and updating the NSScrollView when the document view's size or position changes. You don't normally use the NSClipView class directly; it's provided primarily as the scrolling machinery for the NSScrollView class. However, you might use the NSClipView class to implement a class similar to NSScrollView.

Interaction With NSScrollView
When using an NSClipView within an NSScrollView (the usual configuration), you should issue messages that control background drawing state to the NSScrollView, rather than messaging the NSClipView directly. This recommendation applies to the following methods:

- backgroundColor
- drawsBackground

The NSClipView methods are intended for when the NSClipView is used independently of a containing NSScrollView. In the usual case, NSScrollView should be allowed to manage the background-drawing properties of its associated NSClipView.

There is only one background-drawing state per NSScrollView/NSClipView pair. The two objects do not maintain independent and distinct drawsBackground and backgroundColor properties; rather, NSScrollView's accessors for these properties largely defer to the associated NSClipView and allow the NSClipView to maintain the state. In Mac OS X v10.2 and earlier system versions, NSScrollView maintained a cache of the last state it set for its NSClipView. If the NSClipView was sent a setDrawsBackground: message directly, the cache might not reflect the state accurately. This caching of state has been removed in Mac OS X v10.3.

It is also important to note that sending a setDrawsBackground message with a parameter of false to an NSScrollView has the added effect of sending the NSClipView a setCopiesOnScroll message with a parameter of false. The side effect of sending the setDrawsBackground message directly to the NSClipView is the appearance of "trails" (vestiges of previous drawing) in the document view as it is scrolled.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.

Subclass of the NSViewMBS class.

32.21.2 Blog Entries

- MBS Real Studio Plugins, version 11.3pr1

32.21.3 Methods

32.21.4 autoscroll(theEvent as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Scrolls the receiver proportionally to theEvent's distance outside of it.
Notes:

theEvent's location should be expressed in the window's base coordinate system (which it normally is), not the receiving NSClipView's. Returns true if any scrolling is performed; otherwise returns false.

Never invoke this method directly; instead, the NSClipView's document view should repeatedly send itself autoscroll: messages when the cursor is dragged outside the NSClipView's frame during a modal event loop initiated by a mouse-down event. The NSView class implements autoscroll to forward the message to the receiver's superview; thus the message is ultimately forwarded to the NSClipView.

32.21.5 constrainScrollPoint(newOrigin as NSPointMBS) as NSPointMBS

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a scroll point adjusted from proposedNewOrigin, if necessary, to guarantee the receiver will still lie within its document view.
Notes: For example, if proposedNewOrigin's y coordinate lies to the left of the document view's origin, then the y coordinate returned is set to that of the document view's origin.

32.21.6 Constructor

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new clipview with the given size and position.
Example:

```
dim x as new NSClipViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.21.7 Constructor(Handle as Integer) 6836
- 32.21.8 Constructor(left as Double, top as Double, width as Double, height as Double) 6836

32.21.7 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSClipView handle.
Example:

```
dim t as new NSClipViewMBS(0, 0, 100, 100)
dim v as new NSClipViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSClipView and the plugin retains this handle.
See also:

- 32.21.6 Constructor 6835
- 32.21.8 Constructor(left as Double, top as Double, width as Double, height as Double) 6836

32.21.8 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new NSClipView with the given size and position.
Example:

```
dim x as new NSClipViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.21.6 Constructor 6835
- 32.21.7 Constructor(Handle as Integer) 6836

32.21.9 documentRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the rectangle defining the document view's frame, adjusted to the size of the receiver if the document view is smaller.
Notes:

In other words, this rectangle is always at least as large as the receiver itself.

The document rectangle is used in conjunction with an NSClipView's bounds rectangle to determine values for the indicators of relative position and size between the NSClipView and its document view. For example, NSScrollView uses these rectangles to set the size and position of the knobs in its scrollers. When the document view is much larger than the NSClipView, the knob is small; when the document view is near the same size, the knob is large; and when the document view is the same size or smaller, there is no knob.

32.21.10 documentVisibleRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the exposed rectangle of the receiver's document view, in the document view's own coordinate system.
Notes: Note that this rectangle doesn't reflect the effects of any clipping that may occur above the NSClipView itself. To get the portion of the document view that's guaranteed to be visible, send it a visibleRect message.

32.21.11 reflectScrolledClipView(clipView as NSClipViewMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adjusts the receiver's scrollers to reflect the size and positioning of its content view.

32.21.12 scrollClipView(clipview as NSClipViewMBS, toPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Notifies the superview of a clip view that the clip view needs to reset the origin of its bounds rectangle.

32.21.13 scrollToPoint(newOrigin as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes the origin of the receiver's bounds rectangle to newOrigin.

32.21.14 viewBoundsChanged(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Handles an NSViewBoundsDidChangeNotification, passed in the aNotification argument, by updating a containing NSScrollView based on the new bounds.

32.21.15 viewFrameChanged(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Handles an NSViewFrameDidChangeNotification, passed in the aNotification argument, by updating a containing NSScrollView based on the new frame.

32.21.16 Properties

32.21.17 backgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The color of the receiver's background.
Notes: (Read and Write computed property)

32.21.18 copiesOnScroll as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver copies rendered images while scrolling.
Notes:

If true, the receiver copies the existing rendered image to its new location while scrolling and only draws exposed portions of its document view. If false, the receiver always forces its document view to draw itself on scrolling.
(Read and Write computed property)

32.21.19 documentCursor as NSCursorMBS

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The cursor object used over the receiver.
Notes: (Read and Write computed property)

32.21.20 documentView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The document view.
Notes:

Gets or sets the receiver's document view. On set removes any previous document view, and sets the origin of the receiver's bounds rectangle to the origin of the new view's frame rectangle.

If the receiver is contained in an NSScrollView, you should set the NSScrollView DocumentView instead, so it can perform whatever updating it needs.

In the process of setting the document view, this method registers the receiver for the notifications NSViewFrameDidChangeNotification and NSViewBoundsDidChangeNotification, adjusts the key view loop to include the new document view, and updates a parent NSScrollView's display if needed using reflectScrolledClipView.
(Read and Write computed property)

32.21.21 drawsBackground as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver draws its background color.
Notes:

If your NSClipView is enclosed in an NSScrollView, you should set the DrawsBackground on the NSScrollView.
(Read and Write computed property)

32.21.22 Constants

32.21.23 NSClipViewFindBarPositionAboveContent = 1

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants to define the position of the find bar in relation to the scroll view.
Notes:

The find bar is displayed above the scroll view content.
Available in Mac OS X v10.7 and later.

32.21.24 NSClipViewFindBarPositionAboveHorizontalRuler = 0

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants to define the position of the find bar in relation to the scroll view.
Notes:

The find bar is displayed above the horizontal ruler, if visible.
Available in Mac OS X v10.7 and later.

32.21.25 NSClipViewFindBarPositionBelowContent = 2

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants to define the position of the find bar in relation to the scroll view.
Notes:

The find bar is displayed below the scroll view content.
Available in Mac OS X v10.7 and later.

32.21.26 NSScrollElasticityAllowed = 2

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants to determine the elasticity behavior for an axis of the scrollview.
Notes:

Allow content to be scrolled past its bounds on this axis in an elastic fashion.
Available in Mac OS X v10.7 and later.

32.21.27 NSScrollElasticityAutomatic = 0

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants to determine the elasticity behavior for an axis of the scrollview.
Notes:

Automatically determine whether to allow elasticity on this axis.
Available in Mac OS X v10.7 and later.

32.21.28 NSScrollElasticityNone = 1

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants to determine the elasticity behavior for an axis of the scrollview.
Notes:

Disallow scrolling beyond document bounds on this axis.
Available in Mac OS X v10.7 and later.

32.22 class NSComboBoxMBS

32.22.1 class NSComboBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The ComboBox control from Cocoa.
Notes:

An NSComboBox is a kind of NSControl that allows you to either enter text directly (as you would with an NSTextField) or click the attached arrow at the right of the combo box and select from a displayed ("pop-up") list of items.
Subclass of the NSTextFieldMBS class.

32.22.2 Methods

32.22.3 addItemWithObjectValue(value as Variant)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Adds an object to the end of the receiver's internal item list.
Notes:

anObject: The object to add to the internal item list.

This method logs a warning if usesDataSource returns true.

32.22.4 Constructor

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new button with size 100/100 and position 0/0
Example:

```
dim t as new NSComboBoxMBS(0, 0, 100, 20)
```

Notes: On success the handle property is not zero.
See also:

- 32.22.5 Constructor(Handle as Integer) 6843
- 32.22.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6843

32.22.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSComboBox handle.
Example:

```
dim t as new NSComboBoxMBS(0, 0, 100, 100)
dim v as new NSComboBoxMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSComboBox and the plugin retains this handle.
See also:

- 32.22.4 Constructor 6842
- 32.22.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6843

32.22.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new combo box with the given size and position.
Example:

```
dim left,top,width,height as Integer
// define rectangle
dim x as new NSComboBoxMBS(left, top, width, height)
```

Notes: On success the handle property is not zero.
See also:

- 32.22.4 Constructor 6842
- 32.22.5 Constructor(Handle as Integer) 6843

32.22.7 deselectItemAtIndex(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Deselects the pop-up list item at the specified index if it's selected.
Notes:

index: The index of the item to deselect.

If the selection does in fact change, this method posts an NSComboBoxSelectionDidChangeNotification to the default notification center.

32.22.8 indexOfItemWithObjectValue(value as Variant) as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Searches the receiver's internal item list for the specified object and returns the lowest matching index.
Notes:

anObject: The object for which to return the index.

Returns the lowest index in the internal item list whose corresponding value is equal to that of the specified object. Objects are considered equal if they have the same id or if isEqual returns true.

If none of the objects in the receiver's internal item list are equal to anObject, indexOfItemWithObjectValue returns NSNotFound (-1).

This method logs a warning if usesDataSource returns true.

32.22.9 indexOfSelectedItem as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the last item selected from the pop-up list.
Notes:

Returns the index of the last item selected from the receiver's pop-up list or -1 if no item is selected.

Note that nothing is initially selected in a newly initialized combo box.

32.22.10 noteNumberOfItemsChanged

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the number of items in its data source has changed.
Notes:

This method allows the receiver to update the scrollers in its displayed pop-up list without actually reloading data into the receiver. It is particularly useful for a data source that continually receives data in the background over a period of time, in which case the NSComboBox can remain responsive to the user while the data is received.

See the NSComboBoxDataSource informal protocol specification for information on the messages an NSComboBox sends to its data source.

32.22.11 numberOfItems as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the total number of items in the pop-up list.

32.22.12 reloadData

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Marks the receiver as needing redisplay, so that it will reload the data for visible pop-up items and draw the new values.

32.22.13 removeAllItems

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes all items from the receiver's internal item list.
Notes: This method logs a warning if usesDataSource returns true.

32.22.14 removeItemAtIndex(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes the object at the specified location from the receiver's internal item list.
Notes:

index: The index of the object to remove. All items beyond index are moved up one slot to fill the gap.

The removed object receives a release message. This method raises an NSRangeException if index is beyond the end of the list and logs a warning if usesDataSource returns true.

32.22.15 removeItemWithObjectValue(value as Variant)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes all occurrences of the given object from the receiver's internal item list.
Notes:

anObject: The object to remove from the internal item list. Objects are considered equal if they have the same id or if isEqual: returns true.

This method logs a warning if usesDataSource returns true.

32.22.16 scrollItemAtIndexToTop(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Scrolls the receiver's pop-up list vertically so that the item at the specified index is as close to the top as possible.
Notes:

index: The index of the item to scroll to the top.

The pop-up list need not be displayed at the time this method is invoked.

32.22.17 scrollItemAtIndexToVisible(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Scrolls the receiver's pop-up list vertically so that the item at the specified index is visible.
Notes:

index: The index of the item to make visible.

The pop-up list need not be displayed at the time this method is invoked.

32.22.18 selectItemAtIndex(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Selects the pop-up list row at the given index.
Notes:

index: The index of the item to select in the pop-up list.

Posts an NSComboBoxSelectionDidChangeNotification to the default notification center if the selection does in fact change. Note that this method does not alter the contents of the combo box's text field—see Setting the Combo Box's Value for more information.

32.22.19 selectItemWithObjectValue(value as Variant)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Selects the first pop-up list item that corresponds to the given object.
Notes:

anObject: The object to select in the pop-up list. Objects are considered equal if they have the same id or if isEqual: returns true.

This method logs a warning if usesDataSource returns true. Posts an NSComboBoxSelectionDidChangeNotification to the default notification center if the selection does in fact change. Note that this method doesn't alter the contents of the combo box's text field—see Setting the Combo Box's Value for more information.

32.22.20 Properties

32.22.21 completes as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value indicating whether the receiver tries to complete what the user types in the text field.
Notes:

Returns true if the receiver tries to complete what the user types in the text field; otherwise false.
(Read and Write computed property)

32.22.22 hasVerticalScroller as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value indicating whether the receiver will display a vertical scroller.
Notes:

Returns true if the receiver will display a vertical scroller; otherwise false.

Note that the scroller will be displayed even if the pop-up list contains fewer items than will fit in the area specified for display.
(Read and Write computed property)

32.22.23 intercellSpacing as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the horizontal and vertical spacing between cells in the receiver's pop-up list.

Notes:

Returns the space between cells in the pop-up list. The default spacing is (3.0, 2.0).
(Read and Write computed property)

32.22.24 isButtonBordered as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the combo box button is set to display a border.
Notes:

True if the button has a border; otherwise false.
Available in Mac OS X v10.3 and later
(Read and Write computed property)

32.22.25 itemHeight as Double

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the height of each item in the receiver's pop-up list.
Notes:

The default item height is 16.0.
(Read and Write computed property)

32.22.26 numberOfVisibleItems as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the maximum number of items visible in the pop-up list.
Notes:

The maximum number of items visible at any one time in the pop-up list.
(Read and Write computed property)

32.22.27 usesDataSource as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the receiver uses an external data source to populate its pop-up list.
Notes:

True if the receiver uses an external data source to populate the receiver's pop-up list, false if it uses an internal item list.

(Read and Write computed property)

32.23 class NSControlMBS

32.23.1 class NSControlMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class for a NSControl.
Notes:

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

32.23.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.0pr7
- MBS Xojo / Real Studio Plugins, version 14.0pr2
- MBS Xojo / Real Studio Plugins, version 13.4pr1

- MBS Real Studio Plugins, version 12.1pr6
- MBS REALbasic Plugins, version 11.1pr3

32.23.3 Methods

32.23.4 calcSize

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Recomputes any internal sizing information for the receiver, if necessary.
Notes: This method uses the calcDrawInfo method of its cell to perform the calculations. Most controls maintain a flag that informs them if any of their cells have been modified in such a way that the location or size of the cell should be recomputed. If such a modification happens, this method is automatically invoked before the control is displayed. You should never need to invoke it yourself.

32.23.5 ConnectActionEvent

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Connects the action event.
Notes: If you want to use addhandler with this class and the action event, you need to call ConnectActionEvent after addhandler to actually have the plugin put things in place for handling the event.

32.23.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new control with size 100/100 and position 0/0
Example:

```
dim t as new NSControlMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.23.7 Constructor(Handle as Integer) 6851
- 32.23.8 Constructor(left as Double, top as Double, width as Double, height as Double) 6852

32.23.7 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an object based on the given NSControl handle.
Example:

```
dim t as new NSControlMBS(0, 0, 100, 100)
dim v as new NSControlMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSControl and the plugin retains this handle.
See also:

- 32.23.6 Constructor 6851
- 32.23.8 Constructor(left as Double, top as Double, width as Double, height as Double) 6852

32.23.8 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new control with the given size and position.
Example:

```
dim x as new NSControlMBS(0, 0, 100, 20)
```

Notes: On success the handle property is not zero.
See also:

- 32.23.6 Constructor 6851
- 32.23.7 Constructor(Handle as Integer) 6851

32.23.9 currentEditor as NSTextMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current field editor for the control.
Notes:

Returns the field editor for the current control, or nil if the receiver does not have a field editor.

When the receiver is a control displaying editable text (for example, a text field) and it is the first responder, it has a field editor, which is returned by this method. The field editor is a single NSTextView object that is shared among all the controls in a window for light text-editing needs. It is automatically instantiated when needed.

32.23.10 Destructor

MBS MacCocoa Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

32.23.11 EnableEvents

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enables events after you assigned methods to them with AddHandler.

32.23.12 performClick

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Simulates a single mouse click on the receiver.
Notes: This method calls the performClick method of the receiver's cell. This method raises an exception if the action message cannot be successfully sent.

32.23.13 selectCell(Cell as NSCellMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects the specified cell and redraws the control as needed.
Notes:

Cell: The cell to select. The cell must belong to the receiver.

If the cell is already selected (or does not belong to the receiver), this method does nothing. If the cell belongs to the receiver and is not selected, this method changes its state to NSOnState and redraws the cell.

32.23.14 selectedCell as NSCellMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's selected cell.
Notes: The default implementation of this method simply returns the control's associated cell (or nil if no cell has been set). Subclasses of NSControl that manage multiple cells (such as NSMatrix and NSForm) must override this method to return the cell selected by the user.

32.23.15 selectedTag as Integer

MBS MacCocoa Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The tag of the views's selected cell.

32.23.16 setNeedsDisplay

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Marks the receiver as needing redisplay (assuming automatic display is enabled).
Notes: This method also recalculates the dimensions of the control as needed.

32.23.17 sizeToFit

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Resizes the receiver's frame so that it is the minimum size needed to contain its cell.
Notes: If you want a multiple-cell custom subclass of NSControl to size itself to fit its cells, you must override this method. This method neither redisplays the receiver nor marks it as needing display. You must do this yourself with either thedisplay or setNeedsDisplay method.

32.23.18 validateEditing

MBS MacCocoa Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Validates changes to any user-typed text.
Notes: Validation sets the object value of the cell to the current contents of the cell's editor (the NSText object used for editing), storing it as a simple string or an attributed string object based on the attributes of the editor.

32.23.19 Properties

32.23.20 ActionSelector as String

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the selector.
Notes:

The new action-message selector to associate with the receiver's cell. Specify NULL to prevent action messages from being sent to the receiver's target.
(Read and Write computed property)

32.23.21 alignment as Integer

MBS MacCocoa Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The alignment mode of the text in the view's cell.
Example:

```
dim n as NSControlMBS // your control
n.alignment=3
```

Notes:

One of the following constants: NSLeftTextAlignment, NSRightTextAlignment,NSCenterTextAlignment, NSJustifiedTextAlignment, or NSNaturalTextAlignment. The default value is NSNaturalTextAlignment.

Constants:

NSLeftTextAlignment = 0
Text is visually left aligned.

NSRightTextAlignment = 1
Text is visually right aligned.

NSCenterTextAlignment = 2
Text is visually center aligned.

NSJustifiedTextAlignment = 3
Text is justified.

NSNaturalTextAlignment = 4
Use the natural alignment of the text's script.
(Read and Write computed property)

32.23.22 attributedStringValue as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of the view's cell as an attributed string.
Notes:

The value of the cell interpreted as an attributed string, or an empty attributed string if the receiver has no cell.

If the control contains many cells (for example, NSMatrix), then the value of the currently selected cell is returned. If the control is in the process of editing the affected cell, then it invokes the validateEditing method before extracting and returning the value.
(Read and Write computed property)

32.23.23 baseWritingDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The initial writing direction used to determine the actual writing direction for text.
Notes:

One of the following values: NSWritingDirectionNatural, NSWritingDirectionLeftToRight, or NSWritingDi-

rectionRightToLeft. The default value is NSWritingDirectionNatural.

The Text system uses this value as a hint for calculating the actual direction for displaying Unicode characters. You should not need to call this method directly.
(Read and Write computed property)

32.23.24 cell as Variant

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's cell object.
Notes:

Cocoa controls often have a frame control and inside a Cell which implements the raw functionality. This way you can for example have a table which embeds such cell controls inside the table cells.

Use this method with great care as it can irrevocably damage the affected control; specifically, you should only use this method in initializers for subclasses of NSControl.
(Read and Write computed property)

32.23.25 doubleValue as Double

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The double value of the control.
Notes: (Read and Write computed property)

32.23.26 font as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The font used to draw text in the receiver's cell.
Notes:

f the cell is being edited, the text in the cell is redrawn in the new font, and the cell's editor (the NSText object used globally for editing) is updated with the new font object.
(Read and Write computed property)

32.23.27 ignoresMultiClick as boolean

MBS MacCocoa Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the receiver ignores multiple clicks made in rapid succession.

Example:

```
dim n as NSControlMBS // your control
n.ignoresMultiClick=True
```

Notes:

True if the view ignores multiple clicks; otherwise, false.
(Read and Write computed property)

32.23.28 integerValue as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of the receiver's cell as an Integer value.
Notes:

If the control contains many cells (for example, NSMatrix), then the value of the currently selected cell is returned. If the control is in the process of editing the affected cell, then it invokes the validateEditing method before extracting and returning the value.

Available in OS X v10.5 and later.
(Read and Write computed property)

32.23.29 intValue as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The integer value of the control.
Example:

```
dim n as new nsbuttonMBS(0,0,100,100)

n.intValue=1
MsgBox str(n.intValue) // shows 1
n.intValue=0
MsgBox str(n.intValue) // shows 0
```

Notes: (Read and Write computed property)

32.23.30 isContinuous as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver's cell sends its action message continuously to its target during mouse tracking.
Notes:

True if the action message should be sent continuously; otherwise, false.
(Read and Write computed property)

32.23.31 isEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver reacts to mouse events.
Notes:

True if the view responds to mouse events; otherwise, false.
(Read and Write computed property)

32.23.32 refusesFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver refuses the first responder role.
Notes:

By default, the user can advance the focus of keyboard events between controls by pressing the Tab key; when this focus—or first responder status—is indicated for a control (by the insertion point or, for nontext controls, a faint rectangle), the user can activate the control by pressing the Space bar.
(Read and Write computed property)

32.23.33 stringValue as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The string value of the control.
Notes: (Read and Write computed property)

32.23.34 tag as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The tag identifying the object.
Notes:

You can set this property to the value you need.
(Read and Write computed property)

32.23.35 Events

32.23.36 Action

MBS MacCocoa Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control's action was triggered.
Notes: For a button if it was pressed.

32.23.37 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a control with editable text begins an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

See TextDidEndEditing for an explanation of why you may not always get one invocation of TextDidBeginEditing for each invocation of TextDidEndEditing.

32.23.38 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the text in the receiving control changes.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a

NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

32.23.39 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a control with editable text ends an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

Warning: In some cases, such as when editing within an instance of NSOutlineView, this method may be invoked without a previous invocation of TextDidBeginEditing. You will only get the TextDidBeginEditing: notification if the user actually types something, but you can get the TextDidEndEditing notification if the user just double-clicks the field and then clicks outside the field, without typing.

32.23.40 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called to decide whether text editing should be allowed.
Notes:

Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

32.23.41 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called to decide whether ending text editing should be allowed.
Notes:

Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

32.24 control NSDatePickerControlMBS

32.24.1 control NSDatePickerControlMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control to put a Mac OS X date picker on a Xojo window.
Notes:

This control embeds a special NSDatePicker subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

32.24.2 Blog Entries

- MBS Xojo Plugins, version 19.2pr1
- MBS Xojo / Real Studio Plugins, version 15.0pr7

32.24.3 Properties

32.24.4 AcceptTabs as Boolean

MBS MacControls Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether the control should accept tab keys.
Notes:

If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

32.24.5 View as NSDatePickerMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The reference to the underlaying NSDatePicker.
Notes: (Read only property)

32.24.6 Events

32.24.7 Action

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event is called when user clicks on a date/time and changes something.

32.24.8 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the bounds, but not the frame, changed.

32.24.9 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event where you can enable menu items.

32.24.10 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the frame changed.

32.24.11 GotFocus

MBS MacControls Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

32.24.12 LostFocus

MBS MacControls Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

32.24.13 MenuAction(HitItem as MenuItem) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

32.24.14 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was pressed inside the control's region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

32.24.15 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

32.24.16 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

32.24.17 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

32.25 class NSDatePickerMBS

32.25.1 class NSDatePickerMBS

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The plugin class for a Cocoa date picker.
Notes:

NSDatePicker is a subclass of NSControl that provides a user interface for displaying and editing an NSDate object.
Subclass of the NSControlMBS class.

32.25.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.4pr1
- MBS Real Studio Plugins, version 12.2pr4

32.25.3 Methods

32.25.4 Constructor

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new date picker with size 100/100 and position 0/0
Example:

```
dim t as new NSDatePickerMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.25.5 Constructor(Handle as Integer) 6865
- 32.25.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6866

32.25.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSDatePicker handle.
Example:

```
dim t as new NSDatePickerMBS(0, 0, 100, 100)
dim v as new NSDatePickerMBS(t.handle)
```

```
MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSDatePicker and the plugin retains this handle.
See also:

- 32.25.4 Constructor 6865
- 32.25.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6866

32.25.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new date picker with the given size and position.
Example:

```
dim x as new NSDatePickerMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.25.4 Constructor 6865
- 32.25.5 Constructor(Handle as Integer) 6865

32.25.7 Properties

32.25.8 backgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The background color.
Notes:

See also drawsBackground property.
(Read and Write computed property)

32.25.9 Bezeled as Boolean

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver has a bezeled border.
Notes:

True if the receiver has a bezeled border, false otherwise.
(Read and Write computed property)

32.25.10 Bordered as Boolean

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver has a plain border.
Notes:

True if the receiver has a plain border, false otherwise.
(Read and Write computed property)

32.25.11 calendar as NSCalendarMBS

MBS MacControls Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The calendar.
Notes: (Read and Write computed property)

32.25.12 datePickerElements as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A bitmask that indicates which visual elements of the date picker are currently shown, and which won't be usable because they are hidden.
Notes: (Read and Write computed property)

32.25.13 datePickerMode as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The date picker mode.
Notes: (Read and Write computed property)

32.25.14 datePickerStyle as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The date picker style.
Notes: (Read and Write computed property)

32.25.15 dateValue as date

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The current date value.
Notes: (Read and Write computed property)

32.25.16 drawsBackground as Boolean

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver draws the background.
Notes:

True if the receiver draws the background, false otherwise.
(Read and Write computed property)

32.25.17 locale as NSLocaleMBS

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The locale.
Notes: (Read and Write computed property)

32.25.18 maxDate as date

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The maximum date.
Notes:

nil indicates no maximum date.
(Read and Write computed property)

32.25.19 minDate as date

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The minimum date.
Notes:

nil indicates no minimum date.
(Read and Write computed property)

32.25.20 textColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The text color.
Notes: (Read and Write computed property)

32.25.21 timeInterval as Double

MBS MacControls Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The time interval that represents the date range.
Notes:

The time interval that represents the receiver's date range. The date range begins at the date returned by dateValue. This method returns 0 when the receiver is not in the NSRangeDateMode mode.
(Read and Write computed property)

32.25.22 timeZone as NSTimeZoneMBS

MBS MacControls Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The time zone.
Notes: (Read and Write computed property)

32.25.23 Constants

32.25.24 NSClockAndCalendarDatePickerStyle = 1

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** A constants for a date picker style.
Notes: Provide a visual clock and calendar style interface.

32.25.25 NSEraDatePickerElementFlag = & h100

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the constants which allows you to specify the date and time elements.
Notes:

Display and allow editing of the era of the date, if applicable.
This flag has been declared for possible future use, and does not yet have any effect.

32.25.26 NSHourMinuteDatePickerElementFlag = & hC

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the constants which allows you to specify the date and time elements.
Notes: Display and allow editing of the hour and minute elements of the date.

32.25.27 NSHourMinuteSecondDatePickerElementFlag = & hE

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the constants which allows you to specify the date and time elements.
Notes: Display and allow editing of the hour, minute and second elements of the date.

32.25.28 NSRangeDateMode = 1

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the constants to define whether the control provides a single date, or a range of dates.
Notes: Allow selection of a range of dates. (First implemented in Mac OS X v 10.5.)

32.25.29 NSSingleDateMode = 0

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the constants to define whether the control provides a single date, or a range of dates.
Notes: Allow selection of a single date.

32.25.30 NSTextFieldAndStepperDatePickerStyle = 0

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** A constants for a date picker style.
Notes: Provide a text field and stepper style interface.

32.25.31 NSTextFieldDatePickerStyle = 2

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** A constants for a date picker style.
Notes: Provide a text field interface.

32.25.32 NSTimeZoneDatePickerElementFlag = & h10

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the constants which allows you to specify the date and time elements.
Notes:

Display and allow editing of the time zone.
This flag has been declared for possible future use, and does not yet have any effect.

32.25.33 NSYearMonthDatePickerElementFlag = & hC0

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the constants which allows you to specify the date and time elements.
Notes: Display and allow editing of the year and month elements of the date.

32.25.34 NSYearMonthDayDatePickerElementFlag = & hE0

MBS MacControls Plugin, Plugin Version: 12.2. **Function:** One of the constants which allows you to specify the date and time elements.
Notes: Display and allow editing of the year, month and day elements of the date.

32.26 class NSImageCellMBS

32.26.1 class NSImageCellMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An NSImageCell object displays a single image (encapsulated in an NSImage object) in a frame.
Notes:

This class provides methods for choosing the frame and for aligning and scaling the image to fit the frame.

The object value of an NSImageCell object must be an NSImage object, so if you use the setObjectValue: method of NSCell, be sure to supply an NSImage object as an argument. Because an NSImage object does not need to be converted for display, do not use the NSCell methods relating to formatters.

An NSImageCell object is usually associated with some kind of control object—an NSImageView, an NSMatrix, or an NSTableView.
Subclass of the NSCellMBS class.

32.26.2 Methods

32.26.3 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new Cell object with an image.
Example:

```
dim pic as Picture = LogoMBS(500)
dim n as NSImageMBS = new NSImageMBS(pic)
dim c as new NSImageCellMBS(n)

Backdrop = c.image.CopyPictureWithMask
Title = c.classPath
```

See also:

- 32.26.4 Constructor(text as string) 6872

32.26.4 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new Cell object with a text.
Example:

```
dim c as new NSImageCellMBS("Hello")
MsgBox c.StringValue
```

See also:

- 32.26.3 Constructor(image as NSImageMBS) 6872

32.26.5 Properties

32.26.6 imageAlignment as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The alignment of the receiver's image relative to its frame.
Notes:

For a list of possible values, see NSImageAlign* constants. The default value is NSImageAlignCenter.
(Read and Write property)

32.26.7 imageFrameStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The style of the frame that borders the image.
Notes:

Value is one of the frame style constants. For a list of frame styles, see NSImageFrame* constants.
(Read and Write property)

32.26.8 imageScaling as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The scaling mode used to fit the receiver's image into the frame.
Notes:

Value is one of the image scaling constants. For a list of possible values, see NSScale* constants.
(Read and Write property)

32.26.9 Constants

32.26.10 NSImageAlignBottom = 5

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the bottom edge of the cell.

32.26.11 NSImageAlignBottomLeft = 6

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the bottom and left edges of the cell.

32.26.12 NSImageAlignBottomRight = 7

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the bottom and right edges of the cell.

32.26.13 NSImageAlignCenter = 0

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Center the image in the cell.

32.26.14 NSImageAlignLeft = 4

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the left edge of the cell.

32.26.15 NSImageAlignRight = 8

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.

Notes: Position the image along the right edge of the cell.

32.26.16 NSImageAlignTop = 1

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Position the image along the top edge of the cell.

32.26.17 NSImageAlignTopLeft = 2

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the top and left edges of the cell.

32.26.18 NSImageAlignTopRight = 3

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the top and right edges of the cell.

32.26.19 NSImageFrameButton = 4

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the imageFrameStyle property.
Notes: A convex bezel that makes the image stand out in relief, like a button

32.26.20 NSImageFrameGrayBezel = 2

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the imageFrameStyle property.
Notes: A gray, concave bezel that makes the image look sunken

32.26.21 NSImageFrameGroove = 3

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the imageFrameStyle property.

Notes: A thin groove that looks etched around the image

32.26.22 NSImageFrameNone = 0

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the imageFrameStyle property.
Notes: An invisible frame

32.26.23 NSImageFramePhoto = 1

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the imageFrameStyle property.
Notes: A thin black outline and a dropped shadow

32.26.24 NSScaleNone = 2

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the scale constants.

32.26.25 NSScaleProportionally = 0

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the scale constants.

32.26.26 NSScaleToFit = 1

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the scale constants.

32.27 class NSImageViewMBS

32.27.1 class NSImageViewMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An NSImageView object displays a single image from an NSImage object in a frame and can optionally allow a user to drag an image to it.
Example:

```
ImageWell1.NSImageViewMBS.alphaValue = 0.5
```

Notes:

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSControlMBS class.

32.27.2 Blog Entries

- Fun with ImageWell and NSImageViewMBS

32.27.3 Methods

32.27.4 Constructor

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new imageview with size 100/100 and position 0/0
Example:

```
dim t as new NSImageViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.27.5 Constructor(Handle as Integer) 6877
- 32.27.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6878

32.27.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSImageView handle.
Example:

```
dim t as new NSImageViewMBS(0, 0, 100, 100)
dim v as new NSImageViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSImageView and the plugin retains this handle.
See also:

- 32.27.4 Constructor 6877
- 32.27.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6878

32.27.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new image view with the given size and position.
Example:

```
dim x as new NSImageViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.27.4 Constructor 6877
- 32.27.5 Constructor(Handle as Integer) 6877

32.27.7 Properties

32.27.8 allowsCutCopyPaste as Boolean

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver allows the user to cut, copy and paste the image contents.
Notes:

True if the user can cut, copy, and paste the image contents; otherwise, false to prevent the use of pasteboard operations.
(Read and Write computed property)

32.27.9 animates as Boolean

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the receiver automatically plays animated images.
Notes:

True if the receiver automatically plays animated images; otherwise, false. The default value is true for NSImageView objects you create programmatically. For NSImageView objects loaded from a nib file, the control takes the value set in Interface Builder.

The timing and looping characteristics of the animation are taken from the image data. If this method returns false, the receiver displays the first frame of the animation only.
(Read and Write computed property)

32.27.10 image as NSImageMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the NSImage object displayed by the receiver.
Notes: (Read and Write computed property)

32.27.11 imageAlignment as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The alignment of the receiver's image relative to its frame.
Notes:

For a list of possible values, see NSImageAlign* constants. The default value is NSImageAlignCenter.
(Read and Write computed property)

32.27.12 imageFrameStyle as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The style of the frame that borders the image.
Example:

ImageWell1.NSImageViewMBS.imageFrameStyle = NSImageViewMBS.NSImageFramePhoto

Notes:

Value is one of the frame style constants. For a list of frame styles, see NSImageFrame* constants.
(Read and Write computed property)

32.27.13 imageScaling as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The scaling mode used to fit the receiver's image into the frame.
Example:

ImageWell1.NSImageViewMBS.imageScaling = NSImageViewMBS.NSScaleNone

Notes:

Value is one of the image scaling constants. For a list of possible values, see NSScale* constants.
(Read and Write computed property)

32.27.14 isEditable as Boolean

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the user can drag a new image into the frame.
Notes:

True if the user can drag an image into the receiver's frame; otherwise, false.
(Read and Write computed property)

32.27.15 Constants

32.27.16 NSImageAlignBottom = 5

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the bottom edge of the cell.

32.27.17 NSImageAlignBottomLeft = 6

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the bottom and left edges of the cell.

32.27.18 NSImageAlignBottomRight = 7

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the bottom and right edges of the cell.

32.27.19 NSImageAlignCenter = 0

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Center the image in the cell.

32.27.20 NSImageAlignLeft = 4

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the left edge of the cell.

32.27.21 NSImageAlignRight = 8

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Position the image along the right edge of the cell.

32.27.22 NSImageAlignTop = 1

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Position the image along the top edge of the cell.

32.27.23 NSImageAlignTopLeft = 2

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the top and left edges of the cell.

32.27.24 NSImageAlignTopRight = 3

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the top and right edges of the cell.

32.27.25 NSImageFrameButton = 4

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the imageFrameStyle property.
Notes: A convex bezel that makes the image stand out in relief, like a button

32.27.26 NSImageFrameGrayBezel = 2

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the imageFrameStyle property.
Notes: A gray, concave bezel that makes the image look sunken

32.27.27 NSImageFrameGroove = 3

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the imageFrameStyle property.
Example:

ImageWell1.NSImageViewMBS.imageFrameStyle = NSImageViewMBS.NSImageFrameGroove

Notes: A thin groove that looks etched around the image

32.27.28 NSImageFrameNone = 0

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the imageFrameStyle property.
Notes: An invisible frame

32.27.29 NSImageFramePhoto = 1

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the frame constants for the imageFrameStyle property.
Notes: A thin black outline and a dropped shadow

32.27.30 NSScaleNone = 2

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the scale constants.

32.27.31 NSScaleProportionally = 0

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the scale constants.

32.27.32 NSScaleToFit = 1

MBS MacControls Plugin, Plugin Version: 10.0. **Function:** One of the scale constants.

32.28 class NSMenuItemCellMBS

32.28.1 class NSMenuItemCellMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: NSMenuItemCell is a class that handles the measurement and display of a single menu item in its encompassing frame.
Notes:

Instances of NSMenuItemCell work in conjunction with an NSMenuView object to control the overall appearance of the menu.
Subclass of the NSButtonCellMBS class.

32.28.2 Blog Entries

- MBS Xojo Plugins, version 17.1pr5

32.28.3 Methods

32.28.4 calcSize

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Calculates the minimum required width and height of the receiver's menu item.
Notes:

The calculated values are cached for future use. This method also calculates the sizes of individual components of the cell's menu item and caches those values.
This method is invoked automatically when necessary. You should not need to invoke it directly.

32.28.5 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.
Notes: Don't use it.
See also:

- 32.28.6 Constructor(text as string) 6884

32.28.6 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

See also:

- 32.28.5 Constructor(image as NSImageMBS) 6884

32.28.7 Properties

32.28.8 menuItem as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The menu item object associated with the cell.
Notes: (Read and Write property)

32.28.9 needsDisplay as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the menu item needs to be displayed.
Notes:

Set this property to true when you want the menu item to be drawn.
(Read and Write property)

32.28.10 needsSizing as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the size of the menu needs to be calculated.
Notes:

When the value of this property is true, the next attempt to obtain size information about the menu cause the calcSize method to be called. When the value of the property is false, the size information is obtained from the currently cached values.
Subclasses that drastically change the way a menu item is drawn can change the value of this property to update the menu item information. Other parts of your application should not need to change this property directly. The cell checks this value of this property as necessary when the content of its menu item changes.
(Read and Write property)

32.28.11 tag as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The integer tag of the selected menu item.
Notes:

If no item is selected, the value in this property is 0.
(Read and Write property)

32.29 control NSOutlineControlMBS

32.29.1 control NSOutlineControlMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control for a NSOutlineView.
Notes: Please use NSOutlineControlMBS for hierarchical lists and NSTableControlMBS for normal lists.

32.29.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 17.1
- MBS Xojo Plugins, version 17.1pr4

32.29.3 Xojo Developer Magazine

- 15.3, page 10: News

32.29.4 Properties

32.29.5 AcceptTabs as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether the control should accept tab keys.
Notes:

If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

32.29.6 allowsColumnReordering as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the table view allows the user to rearrange columns by dragging their headers.
Notes:

The default value of this property is true, which allows the user to rearrange the table view's columns. You can rearrange columns programmatically regardless of this setting.
(Read and Write property)

32.29.7 allowsColumnResizing as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the table view allows the user to resize columns by dragging between their headers.
Notes:

The default of this property is true, which allows the user to resize the table view's columns. You can resize columns programmatically regardless of this setting.
(Read and Write property)

32.29.8 allowsColumnSelection as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the table view allows the user to select columns by clicking their headers.
Notes:

The default is false, which prevents the user from selecting columns (if you create the table view in Interface Builder, the default value is true). You can select columns programmatically regardless of this setting.
(Read and Write property)

32.29.9 allowsEmptySelection as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the table view allows the user to select zero columns or rows.
Notes:

The default is true, which allows the user to select zero columns or rows.
(Read and Write property)

32.29.10 allowsMultipleSelection as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the table view allows the user to select more than one column or row at a time.
Notes:

The default is false, which allows the user to select only one column or row at a time. You can select multiple columns or rows programmatically regardless of this setting.
(Read and Write property)

32.29.11 autohidesScrollers as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean that indicates whether the scroll view automatically hides its scroll bars when they are not needed.
Notes:

The horizontal and vertical scroll bars are hidden independently of each other. When the value of this property is YES and the content of the scroll view doesn't extend beyond the size of the clip view on a given axis, the scroller on that axis is removed to leave more room for the content.
(Read and Write property)

32.29.12 hasHorizontalScroller as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean that indicates whether the scroll view has a horizontal scroller.
Notes:

When the value of this property is true, the scroll view allocates and displays a horizontal scroller as needed. The default value of this property is false.
(Read and Write property)

32.29.13 hasVerticalScroller as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean that indicates whether the scroll view has a vertical scroller.
Notes:

When the value of this property is true, the scroll view allocates and displays a vertical scroller as needed. The default value of this property is false.
(Read and Write property)

32.29.14 ScrollView as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The scroll view used in this control.
Notes: (Read only property)

32.29.15 View as NSOutlineViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The outline view used in this control.
Notes: (Read only property)
See also:

- 32.29.92 view(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as NSViewMBS 6913

32.29.16 Events

32.29.17 acceptDrop(info as NSDraggingInfoMBS, item as NSOutlineViewItemMBS, index as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether a drop operation was successful.
Notes:

info: An object that contains more information about this dragging operation.
item: The parent of the item over which the cursor was placed when the mouse button was released.
index: The index of the child of item over which the cursor was placed when the mouse button was released.

Return true if the drop operation was successful, otherwise false.

The data source should incorporate the data from the dragging pasteboard in the implementation of this method. You can get the data for the drop operation from info using the draggingPasteboard method.
The return value indicates success or failure of the drag operation to the system.

32.29.18 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the bounds, but not the frame, changed.

32.29.19 childOfItem(index as Integer, item as NSOutlineViewItemMBS) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the child item at the specified index of a given item.
Notes:

index: The index of the child item from item to return.
item: An item in the data source.

Return the child item at index of item. If item is nil, returns the appropriate child item of the root object.

Children of a given parent item are accessed sequentially. In order for the collapsed state of the outline view to remain consistent when it is reloaded you must always return the same object for a specified child and item.

Do not call reloadData from this method.

This event is called very frequently, so it must be efficient.

32.29.20 ColumnDidMove(notification as NSNotificationMBS, OldColumn as Integer, NewColumn as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked whenever the user moves a column in the outline view.

32.29.21 ColumnDidResize(notification as NSNotificationMBS, tableColumn as NSTableColumnMBS, OldWidth as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked whenever the user resizes a column in the outline view.

32.29.22 concludeDragOperation(info as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

32.29.23 dataCell(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as NSCellMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the cell to use in a given column for a given item.
Notes:

tableColumn: The table column for which the cell is required. This value may be nil.
item: The item for which the cell is required.

Return the cell to use in column tableColumn for item item, or nil. The cell must properly implement copyWithZone (since it may be copied by by the outline view).

You can return a different data cell for any particular combination of table column and item, or a cell that will be used for the entire row (a full-width cell). If tableColumn is non-nil, you should return a cell. Typically, you should default to returning the result from [tableColumn dataCellForRow:row] .
When each row (identified by the item) is being drawn, this method is first called with a nil value for tableColumn. At this time, you can return a cell that is used to draw the entire row, acting like a group. If you do return a cell for the nil table column, your implementations of the other corresponding data source and delegate methods must be prepared to be invoked with a nil value for tableColumn. If do not return a cell for the nil table column, the method is called once for each column in the outline view, as usual.

32.29.24 didAddRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implemented to know when a new row view is added to the table.
Notes:

rowView: The new row view.
row: The row to which the view was added.

This evemt is for NSView-based outline views. At this point, you can choose to add in extra views or modify any properties on rowView.

32.29.25 didClickTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent at the time the mouse button subsequently goes up in outlineView and tableColumn has been "clicked" without having been dragged anywhere.

32.29.26 didDragTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent at the time the mouse button goes up in outlineView and tableColumn has been dragged during the time the mouse button was down.

32.29.27 didRemoveRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implemented to know when a row view is removed from the table
Notes:

rowView: The row view that was removed.
row: The number of the row that was removed due to being moved offscreen, or -1 if the row was removed from the table so it is no longer valid.

The removed rowView may be reused by the table, so any additionally inserted views should be removed at this point.

32.29.28 didTile

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The tableview did tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

32.29.29 DoubleClick

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse made a double click.

32.29.30 draggingEnded(info as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.
This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

32.29.31 draggingExited(info as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

32.29.32 draggingSessionEnded(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this method to know when the given dragging session has ended.
Notes:

session: The dragging session that ended.
screenPoint: The point onscreen at which the drag ended.
operation: A mask specifying the types of drag operations permitted by the dragging source.

You can implement this optional delegate method to know when the dragging source operation ended at a specific location, such as the trash (by checking for an operation of NSDragOperationDelete).

32.29.33 draggingSessionWillBegin(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, draggedItems() as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this method know when the given dragging session is about to begin and potentially modify the dragging session.
Notes:

session: The dragging session that is about to begin.
screenPoint: The point onscreen at which the drag is to begin.
draggedItems: A array of items to be dragged, excluding items for which pasteboardWriterForItem returns nil.

The draggedItems array directly matches the pasteboard writer array used to begin the dragging session with the NSView method beginDraggingSessionWithItems. Hence, the order is deterministic, and can be used in acceptDrop when enumerating the NSDraggingInfo protocol's pasteboard classes.

32.29.34 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event where you can enable menu items.

32.29.35 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the frame changed.

32.29.36 GotFocus

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control itself got focus.

Notes: This only fires if the control itself got focus and not a sub control.

32.29.37 heightOfRowByItem(item as NSOutlineViewItemMBS) as Double

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the height in points of the row containing item.
Notes:

item: The row item.

Return the height of the row.

Values returned by this method should not include intercell spacing and must be greater than 0.
Implement this event to support an outline view with varying row heights.

For large tables in particular, you should make sure that this method is efficient. NSOutlineView may cache the values this method returns, so if you would like to change a row's height make sure to invalidate the row height by calling noteHeightOfRowsWithIndexesChanged. NSOutlineView automatically invalidates its entire row height cache in reloadData and noteNumberOfRowsChanged.

If you call viewAtColumn or rowViewAtRow within your implementation of this method, an exception is thrown.

To avoid the possibility of a hang due to unexpected recursion, don't call geometry-calculating methods such as bounds, rectOfColumn, or any NSTableView method that calls tile within your implementation of this method.

32.29.38 isGroupItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean that indicates whether a given row should be drawn in the "group row" style.
Notes:

item: An item in the outline view.

Return true to indicate a particular row should have the "group row" style drawn for that row, otherwise false.

If the cell in that row is an instance of NSTextFieldCell and contains only a string value, the "group row" style attributes are automatically applied for that cell.

32.29.39 isItemExpandable(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether the a given item is expandable.
Notes:

item: An item in the data source.

Returns true if item can be expanded to display its children, otherwise NO.

This method may be called quite often, so it must be efficient.

Do not call reloadData from this method.

32.29.40 ItemDidCollapse(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the did collapse notification is posted—that is, whenever the user collapses an item in the outline view.

32.29.41 ItemDidExpand(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when notification is posted—that is, whenever the user expands an item in the outline view.

32.29.42 itemForPersistentObject(PersistentObject as Variant) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked by outlineView to return the item for the archived object.
Notes:

object: An archived representation of an item in outlineView's data source.

Return the unarchived item corresponding to object. If the item is an archived object, this method may return the object.

When the outline view is restoring the saved expanded items, this method is called for each expanded item, to translate the archived object to an outline view item.

You must implement this method if you are automatically saving expanded items (that is, if autosaveExpandedItems returns true).

32.29.43 ItemWillCollapse(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when notification is posted—that is, whenever the user is about to collapse an item in the outline view.

32.29.44 ItemWillExpand(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when notification is posted—that is, whenever the user is about to expand an item in the outline view.

32.29.45 LeftMouseDown(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has pressed the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.29.46 LeftMouseDragged(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has moved the mouse with the left button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.29.47 LeftMouseUp(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has released the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.29.48 LostFocus

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

32.29.49 MenuAction(HitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

32.29.50 MouseDown(x as Integer, y as Integer, Modifiers as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was pressed inside the control's region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

32.29.51 mouseDownInHeaderOfTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Event sent whenever the mouse button is clicked in outlineView while the cursor is in a column header tableColumn.

32.29.52 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

32.29.53 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

32.29.54 namesOfPromisedFilesDroppedAtDestination(dropDestination as folderItem, DraggedItems() as NSOutlineViewItemMBS) as string()

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns an array of filenames for the created files that the receiver promises to create.
Notes:

dropDestination: The drop location where the files are created.
items: The items being dragged.

Returns an array of filenames (not full paths) for the created files that the receiver promises to create.

For more information on file promise dragging, see documentation on the NSDraggingSource protocol and namesOfPromisedFilesDroppedAtDestination.

32.29.55 nextTypeSelectMatchFromItem(startItem as NSOutlineViewItemMBS, endItem as NSOutlineViewItemMBS, searchString as String) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the first item that matches the searchString from within the range of startItem to endItem.
Notes:

startItem: The first item to search.
endItem: The item before which to stop searching. It is possible for endItem to be less than startItem if the search will wrap.
searchString: The string for which to search.

Returns the first item—from within the range of startItem to endItem—that matches the searchString, or nil if there is no match.

Implement this method if you want to control how type selection works. You should include startItem as a possible match, but do not include endItem.
It is not necessary to implement this event in order to support type select.

32.29.56 numberOfChildrenOfItem(item as NSOutlineViewItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the number of child items encompassed by a given item.
Notes:

item: An item in the data source.

Returns the number of child items encompassed by item. If item is nil, this method should return the number of children for the top-level item.

The numberOfChildrenOfItem method is called very frequently, so it must be efficient.

Do not call reloadData from this method.

32.29.57 objectValue(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked by outlineView to return the data object associated with the specified item.
Notes:

tableColumn: A column in outlineView.
item: An item in the data source in the specified tableColumn of the view.

Returns the item is located in the specified tableColumn of the view.

Do not call reloadData from this method.

32.29.58 OtherMouseDown(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has pressed a mouse button other than the left or right one.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.29.59 OtherMouseDragged(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has moved the mouse with a button other than the left or right button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.29.60 OtherMouseUp(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has released a mouse button other than the left or right button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.29.61 pasteboardWriterForItem(item as NSOutlineViewItemMBS) as NSPasteboardItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this method to enable the table to be an NSDraggingSource that supports dragging multiple items.
Notes:

item: The item for which to return a pasteboard writer.

Returns a NSPasteboardItem object.

If this method is implemented, then writeItems is not called.

32.29.62 persistentObjectForItem(item as NSOutlineViewItemMBS) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked by outlineView to return an archived object for item.
Notes:

item: The item for which to return an archived object.

Returns an archived representation of item. If the item is an archived object, this method may return the item.

When the outline view is saving the expanded items, this method is called for each expanded item, to translate the outline view item to an archived object.

You must implement this method if you are automatically saving expanded items (that is, if autosaveExpandedItems returns true).

32.29.63 RightMouseDown(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the view that the user has pressed the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.29.64 RightMouseDragged(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has moved the mouse with the right button pressed .
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.29.65 RightMouseUp(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has released the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.29.66 rowViewForItem(item as NSOutlineViewItemMBS) as NSTableRowViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this method to return a custom NSTableRowView for a particular item.
Notes:

item: The item displayed by the returned table row view.

Return an instance or subclass of NSTableRowView. If nil is returned, a NSTableRowView instance is created and used.

This method, if implemented, is only invoked for NSView-based outline views.

32.29.67 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

32.29.68 SelectionDidChange(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the selection did change notification is posted—that is, immediately after the outline view's selection has changed.

32.29.69 selectionIndexesForProposedSelection(proposedSelectionIndexes as NSIndexSetMBS) as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the delegate to modify the proposed selection.
Notes:

proposedSelectionIndexes: An index set containing the indexes of the proposed selection.
Return an NSIndexSet instance containing the indexes of the new selection. Return proposedSelectionIndexes if the proposed selection is acceptable, or the value of the table view's existing selection to avoid changing the selection.

This method may be called multiple times with one new index added to the existing selection to find out if a particular index can be selected when the user is extending the selection with the keyboard or mouse.

Implementation of this method is optional. If implemented, this method will be called instead of willDisplayOutlineCell.

If not implemented or returns nil, the plugin will return proposedSelectionIndexes.

32.29.70 SelectionIsChanging(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when notification is posted—that is, whenever the outline view's selection changes.

32.29.71 selectionShouldChangeInOutlineView as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether the outline view should change its selection.
Notes:

Return true to permit outlineView to change its selection (typically a row being edited), false to deny permission.

For example, if the user is editing a cell and enters an improper value, the delegate can prevent the user from selecting or editing any other cells until a proper value has been entered into the original cell. You can implement this method for complex validation of edited rows based on the values of any of their cells.

32.29.72 setObjectValue(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS, value as Variant)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Set the data object for a given item in a given column.
Notes:

object: The new value for the item.
tableColumn: A column in outlineView.
item: An item in the data source in the specified tableColumn of the view.

The item is located in the specified tableColumn of the view.

Do not call reloadData from this method.

32.29.73 shouldCollapseAutoExpandedItemsForDeposited(deposited as Boolean, superResult as Boolean) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether auto-expanded items should return to their original collapsed state.
Notes:

deposited: If true, the drop terminated successfully; if false the drop failed.

Return true if auto-expanded items should return to their original collapsed state; otherwise false.

Implement this event to provide custom behavior. If the target of a drop is not auto-expanded (by hovering long enough) the drop target still gets expanded after a successful drop unless this method returns true. The default implementation returns false after a successful drop.
This method is called in a variety of situations. For example, it is called shortly after the acceptDrop method is called and also if the drag exits the outline view (exiting the view is treated the same as a failed drop). The return value of the acceptDrop method determines the incoming value of the deposited parameter.

32.29.74 shouldCollapseItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether the outline view should collapse a given item.
Notes:

item: The item that should collapse.

Return true to permit outlineView to collapse item, false to deny permission.

You can implement this method to disallow collapsing of specific items. For example, if the first row of your outline view should not be collapsed, your delegate method could contain this line of code:

return rowForItem(item) <>0

32.29.75 shouldEdit(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMB as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether the outline view should allow editing of a given item in a given table column.
Notes:

tableColumn: The table column.
item: The item.

Returns true to permit outlineView to edit the cell specified by tableColumn and item, false to deny permission.
If this method returns true, the cell may still not be editable—for example, if you have set up a custom NSTextFieldCell as a data cell, it must return true for isEditable to allow editing.

You can implement this method to disallow editing of specific cells.

32.29.76 shouldExpandItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether the outline view should expand a given item.
Notes:

item: The item that should expand.

Returns true to permit outlineView to expand item, false to deny permission.
You can implement this method to disallow expanding of specific items.

32.29.77 shouldReorderColumn(columnIndex as Integer, newColumnIndex as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent to the delegate to allow or prohibit the specified column to be dragged to a new location.
Notes:

columnIndex: The index of the column being dragged.
newColumnIndex: The proposed target index of the column.

Returns true if the column reordering should be allowed, otherwise false.

When a column is initially dragged by the user, the delegate is first called with a newColumnIndex value of -1. Returning false will disallow that column from being reordered at all. Returning true allows it to be reordered, and the delegate will be called again when the column reaches a new location.

The actual NSTableColumn instance can be retrieved from the tableColumns array.
If this method is not implemented, all columns are considered reorderable.

32.29.78 shouldSelectItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether the outline view should select a given item.
Notes:

item: The item.

Return true to permit outlineView to select item, false to deny permission.

You implement this event to disallow selection of particular items.
For better performance and finer grain control over the selection, use dataCell.

32.29.79 shouldSelectTableColumn(tableColumn as NSTableColumnMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether the outline view should select a given table column.
Notes:

tableColumn: The table column.

Return true to permit outlineView to select tableColumn, false to deny permission.

You can implement this method to disallow selection of specific columns.

32.29.80 shouldShowCellExpansion(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the delegate to control cell expansion for a specific column and item.
Notes:

tableColumn: A table column in the outline view.
item: An item in the outline view.

Returns true to allow an expansion tooltip to appear in the column tableColumn for item item, otherwise false.

Cell expansion can occur when the mouse hovers over the specified cell and the cell contents are unable to be fully displayed within the cell. If this method returns true, the full cell contents will be shown in a special floating tool tip view, otherwise the content is truncated.

32.29.81 shouldShowOutlineCellForItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the specified item should display the outline cell (the disclosure triangle).
Notes:

item: An item in the outline view.

Returns true if the outline cell should be displayed, otherwise false.

Returning false causes frameOfOutlineCellAtRow to return NSZeroRect, hiding the cell. In addition, the row will not be collapsible by keyboard shortcuts.
This method is called only for expandable rows.

32.29.82 shouldTrackCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether a given cell should be tracked.
Notes:

cell: The cell used to display item item in column tableColumn
tableColumn: A table column in the outline view.
item: An item in the outline view.

Returns true if the cell should be tracked for the item item in column tableColumn, otherwise false.

Normally, only selectable or selected cells can be tracked. If you implement this method, cells which are not selectable or selected can be tracked (and vice-versa). For example, this allows you to have a button cell in a table which does not change the selection, but can still be clicked on and tracked.

32.29.83 shouldTypeSelectForEvent(e as NSEventMBS, searchString as String) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether type select should proceed for a given event and search string.
Notes:

e: The event that caused the message to be sent.
searchString: The string for which searching is to proceed. The search string is nil if no type select has begun.

Return true if type select should proceed, otherwise false.

Generally, this method will be called from keyDown and the event will be a key event.

32.29.84 sizeToFitWidthOfColumn(Column as Integer) as Double

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the delegate to provide custom sizing behavior when a column's resize divider is double clicked.
Notes:

column: The index of the column.

Returns the width of the specified column.

By default, NSOutlineView iterates every row in the table, accesses a cell via preparedCellAtColumn, and requests the cellSize to find the appropriate largest width to use.
For accurate results and performance, it is recommended that this method is implemented when using large tables. By default, large tables use a monte carlo simulation instead of iterating every row.

32.29.85 sortDescriptorsDidChange(oldDescriptors() as NSSortDescriptorMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked by an outline view to notify the data source that the descriptors changed and the data may need to be resorted.
Notes:

oldDescriptors: An array that contains the previous descriptors.

The data source typically sorts and reloads the data, and adjusts the selections accordingly. If you need to know the current sort descriptors and the data source does not itself manage them, you can get outlineView's current sort descriptors by sending it a sortDescriptors message.

32.29.86 textShouldBeginEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow.

32.29.87 textShouldEndEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow.

32.29.88 toolTipForCell(cell as NSCellMBS, byref rect as NSRectMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS, mouseLocation as NSPointMBS) as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: When the cursor pauses over a given cell, the value returned from this method is displayed in a tooltip.
Notes:

cell: The cell for which to generate a tooltip.
rect: The proposed active area of the tooltip. To control the default active area, you can modify the rect parameter. By default, rect is computed as cell.drawingRectForBounds(cellFrame).
tc: The table column that contains cell.
item: The item for which to display a tooltip.
mouseLocation: The current mouse location in view coordinates.

If you don't want a tooltip at that location, return nil or the empty string.

32.29.89 typeSelectString(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the string that is used for type selection for a given column and item.
Notes:

tableColumn: A table column in the outline view.
item: An item in the outline view.

Return the string that is used for type selection. You may want to change what is searched for based on what is displayed, or simply return nil for that row and/or column to not be searched

Implement this method if you want to control the string that is used for type selection. You may want to change what is searched for based on what is displayed, or simply return nil to specify that the given row and/or column should not be searched. By default, all cells with text in them are searched.

The default value when this delegate method is not implemented is:
outlineView.preparedCellAtColumn(tableColumn, outlineView.rowForItem(item)).stringValue
and you can return this value from the event if you wish.

32.29.90 updateDraggingItemsForDrag(draggingInfo as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this method to enable the table to update dragging items as they are dragged over the view.
Notes: draggingInfo: The dragging info object.

32.29.91 validateDrop(info as NSDraggingInfoMBS, proposedItem as NSOutlineViewItemMBS, proposedChildIndex as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Used by an outline view to determine a valid drop target.
Notes:

info: An object that contains more information about this dragging operation.
item: The proposed parent.
index: The proposed child location.

Returns a value that indicates which dragging operation the data source will perform.

Based on the mouse position, the outline view will suggest a proposed drop location. The data source may "retarget" a drop if desired by calling setDropItem and returning something other than NSDragOperationNone. You may choose to retarget for various reasons (for example, for better visual feedback when inserting into a sorted position).
Implementation of this method is optional.

32.29.92 view(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as NSViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implemented to return the view used to display the specified item and column.
Notes:

tableColumn: The table column, or nil if the row is a group row.
item: The item displayed by the returned view.

Return the view to display the specified column and row. Returning nil is acceptable, in which case a view is not shown at that location.

This method is required if you wish to use NSView objects instead of NSCell objects for the cells within an outline view. Cells and views cannot be mixed within the same outline view.
It is recommended that the implementation of this method first call the NSTableView method make-

ViewWithIdentifier passing, respectively, the tableColumn parameter's identifier and self as the owner to attempt to reuse a view that is no longer visible. The frame of the view returned by this method is not important, and is automatically set by the outline view.
The view's properties should be properly set up before returning the result.
When using Cocoa bindings, this method is optional if at least one identifier has been associated with the table view at design time. If this method is not implemented, the outline view automatically calls makeViewWithIdentifier with the tableColumn parameter's identifier and the outline view's delegate as parameters, to attempt to reuse a previous view or automatically unarchive a prototype associated with the table view.
The autoresizingMask of the returned view is automatically set to NSViewHeightSizable to resize properly on row height changes.
See also:

- 32.29.15 View as NSOutlineViewMBS 6890

32.29.93 willDisplayCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the delegate that the cell specified by the column and item will be displayed.
Notes:

cell: The cell.
tableColumn: The table column.
item: The item.

You can implement this method to modify cell to provide further setup for the cell in tableColumn and item. It is not safe to do drawing inside this method—you should only set up state for cell.

32.29.94 willDisplayOutlineCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the delegate that an outline view is about to display a cell used to draw the expansion symbol.
Notes:

cell: The cell.
tableColumn: The table column.
item: The item.

Informs the event that outlineView is about to display cell—an expandable cell (a cell that has the expansion symbol)—for the column and item specified by tableColumn and item. The delegate can modify cell to alter its display attributes.

This method is not invoked when outlineView is about to display a non-expandable cell.

32.29.95 willTile

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The tableview will tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

32.29.96 writeItems(items() as NSOutlineViewItemMBS, pasteboard as NSPasteboardMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether a drag operation is allowed.
Notes:

items: An array of the items participating in the drag.
pasteboard: The pasteboard to which to write the drag data.

Returns true if the drag operation is allowed, otherwise false.

Invoked by outlineView after it has been determined that a drag should begin, but before the drag has been started.
To refuse the drag, return false. To start a drag, return true and place the drag data onto the pboard (data, owner, and so on). The drag image and other drag-related information will be set up and provided by the outline view once this call returns with true.

32.30 class NSOutlineViewItemMBS

32.30.1 class NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The class to subclass for your items.

32.30.2 Blog Entries

- MBS Xojo Plugins, version 17.1pr4

32.30.3 Methods

32.30.4 Constructor

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

32.30.5 sortedArrayUsingDescriptor(values() as NSOutlineViewItemMBS, sortDescriptor as NSSortDescriptorMBS) as NSOutlineViewItemMBS()

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a copy of the receiving array sorted as specified by a given a sort descriptor.
Notes:

sortDescriptor: The NSSortDescriptor objects.

Returns a copy of the receiving array sorted as specified by sortDescriptor.

32.30.6 sortedArrayUsingDescriptors(values() as NSOutlineViewItemMBS, sortDescriptor() as NSSortDescriptorMBS) as NSOutlineViewItemMBS()

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a copy of the receiving array sorted as specified by a given array of sort descriptors.
Notes:

sortDescriptors: An array of NSSortDescriptor objects.

Returns a copy of the receiving array sorted as specified by sortDescriptors.

The first descriptor specifies the primary key path to be used in sorting the receiving array's contents. Any subsequent descriptors are used to further refine sorting of objects with duplicate values. See NSSortDescriptor for additional information.

32.30.7 Properties

32.30.8 Description as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The description text property.
Notes: (Read only property)
See also:

- 32.30.12 Description as String 6917

32.30.9 Handle as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

32.30.10 valueForKey(key as String) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Get/set the value for the property identified by a given key.
Notes:

key: The name of one of the receiver's properties.
(Read and Write computed property)
See also:

- 32.30.15 valueForKey(key as string) as Variant 6918

32.30.11 Events

32.30.12 Description as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event when system queries description for object.

See also:

- 32.30.8 Description as String 6917

32.30.13 setValueForKey(key as string, value as Variant)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sets the property of the receiver specified by a given key to a given value.
Notes:

value: The value for the property identified by key.
key: The name of one of the receiver's properties.

If key identifies a to-one relationship, relate the object specified by value to the receiver, unrelating the previously related object if there was one. Given a collection object and a key that identifies a to-many relationship, relate the objects contained in the collection to the receiver, unrelating previously related objects if there were any.
The search pattern that setValueForKey uses is described in Accessor Search Patterns in Key-Value Coding Programming Guide.
In a reference-counted environment, if the instance variable is accessed directly, value is retained.

32.30.14 setValueForUndefinedKey(key as string, value as Variant)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked by setValueForKey when it finds no property for a given key.
Notes:

value: The value for the key identified by key.
key: A string that is not equal to the name of any of the receiver's properties.

Subclasses can override this method to handle the request in some other way. The default implementation raises an NSUndefinedKeyException.

32.30.15 valueForKey(key as string) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Return the value for the property identified by a given key.
Notes:

key: The name of one of the receiver's properties.

Returns the value for the property identified by key.

If event is not implemented, the search pattern that valueForKey uses to find the correct value to return is described in Accessor Search Patterns in Key-Value Coding Programming Guide.
See also:

- 32.30.10 valueForKey(key as String) as Variant 6917

32.30.16 valueForUndefinedKey(key as string) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked by valueForKey when it finds no property corresponding to a given key.
Notes:

key: A string that is not equal to the name of any of the receiver's properties.

Subclasses can override this method to return an alternate value for undefined keys. The default implementation raises an NSUndefinedKeyException.

32.31 class NSOutlineViewMBS

32.31.1 class NSOutlineViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The class for a hierarchical list.
Notes:

NSOutlineView is a subclass of NSTableView that uses a row-and-column format to display hierarchical data that can be expanded and collapsed, such as directories and files in a file system. A user can expand and collapse rows, edit values, and resize and rearrange columns.

Like a table view, an outline view does not store its own data, instead it retrieves data values as needed from a data source to which it has a weak reference.

MBS Plugin provides all events in NSOutlineControlMBS control.

An outline view has the following features:

- A user can expand and collapse rows.
- Each item in the outline view must be unique. In order for the collapsed state to remain consistent between reloads the item's pointer must remain the same and the item must maintain isEqual: sameness.
- The view gets data from a data source (see NSOutlineControlMBS).
- The view retrieves only the data that needs to be displayed.

Subclass of the NSTableViewMBS class.

32.31.3 Methods

32.31.4 child(index as Integer, ofItem as NSOutlineViewItemMBS) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the specified child of an item.
Notes:

index: The index of the child item in the parent.
item: The parent item whose child item you want to retrieve.

Returns the child item or nil if the item could not be found.

You can call this method on an outline view with either a static or dynamic data source. For an outline view whose contents are dynamic, this method may call out to the child event of the associated data source.

32.31.5 childIndexForItem(item as NSOutlineViewItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the child index of the specified item within its parent.
Notes: The performance of this method is O(1) at best and O(n) at worst.

32.31.6 collapseItem(item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Collapses a given item.
Notes:

If item is not expanded or not expandable, does nothing
If collapsing takes place, posts item collapse notification.
See also:

- 32.31.7 collapseItem(item as NSOutlineViewItemMBS, collapseChildren as Boolean) 6921

32.31.7 collapseItem(item as NSOutlineViewItemMBS, collapseChildren as Boolean)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Collapses a given item and, optionally, its children.
Notes:

item: An item in the receiver.
Starting in OS X version 10.5, passing 'nil' will collapse each item under the root in the outline view.
collapseChildren: If true, recursively collapses item and its children. If NO, collapses item only (identical to collapseItem:).

For example, this method is invoked with the collapseChildren parameter set to true when a user Option-clicks the disclosure triangle for an item in the outline view (to collapse the item and all its contained items).
For each item collapsed, posts an item collapsed notification.
See also:

- 32.31.6 collapseItem(item as NSOutlineViewItemMBS) 6921

32.31.8 Constructor

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new outline view with size 100/100 and position 0/0
Example:

```
dim t as new NSOutlineViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.31.9 Constructor(Handle as Integer) 6922
- 32.31.10 Constructor(left as Double, top as Double, width as Double, height as Double) 6922

32.31.9 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSOutlineView handle.
Example:

```
dim t as new NSOutlineViewMBS(0, 0, 100, 100)
dim v as new NSOutlineViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSOutlineViewMBS and the plugin retains this handle.
See also:

- 32.31.8 Constructor 6922
- 32.31.10 Constructor(left as Double, top as Double, width as Double, height as Double) 6922

32.31.10 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new outline view with the given size and position.
Example:

```
dim x as new NSOutlineViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.31.8 Constructor 6922
- 32.31.9 Constructor(Handle as Integer) 6922

32.31.11 expandItem(item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Expands a given item.
Notes:

If item is not expandable or is already expanded, does nothing.
If expanding takes place, posts an item expanded notification.
See also:

- 32.31.12 expandItem(item as NSOutlineViewItemMBS, expandChildren as Boolean) 6923

32.31.12 expandItem(item as NSOutlineViewItemMBS, expandChildren as Boolean)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Expands a specified item and, optionally, its children.
Notes:

item: An item in the receiver.
Starting in OS X version 10.5, passing 'nil' will expand each item under the root in the outline view.

expandChildren: If true, recursively expands item and its children. If false, expands item only (identical to expandItem).

For example, this method is invoked with the expandChildren parameter set to YES when a user Option-clicks the disclosure triangle for an item in the outline view (to expand the item and all its contained items).
For each item expanded, posts an item expanded notification.
See also:

- 32.31.11 expandItem(item as NSOutlineViewItemMBS) 6923

32.31.13 frameOfOutlineCellAtRow(row as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the frame of the outline cell for a given row.

Notes:

row: The index of the row for which to return the frame.

Returns the frame of the outline cell for the row at index row, considering the current indentation and the value in the indentationMarkerFollowsCell property. If the row at index row is not an expandable row, returns NSZeroRect.

You can override this method in a subclass to return a custom frame for the outline button cell. If your override returns an empty rect, no outline cell is drawn for that row. You might do that, for example, so that the disclosure triangle will not be shown for a row that should never be expanded.

32.31.14 insertItemsAtIndexes(indexes as NSIndexSetMBS, Parent as NSOutlineViewItemMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Inserts new items at the given indexes in the given parent with the specified optional animations.
Notes:

indexes: Indexes at which to insert items.
parent: The parent for the items, or nil if the parent is the root.
animationOptions: Animated slide effects used when inserting items.

This method parallels the insertRowsAtIndexes method of NSTableView and is used in a way similar to the insertObjects method of NSMutableArray. The method does nothing if parent is not expanded. The actual item values are determined by the data source's child event (which is called only after endUpdates to ensure data source integrity).

NSCell-based outline views must first call beginUpdates before calling this method.

You can call this method multiple times within the same beginUpdates/endUpdates block; new insertions move previously inserted new items, just like modifying an array. Inserting an index beyond what is available throws an exception.

32.31.15 insertRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Private method to block you from calling this method in NSTableViewMBS.

32.31.16 isExpandable(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether a given item is expandable.
Notes: True if item is expandable—that is, item can contain other items, otherwise false.

32.31.17 isItemExpanded(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether a given item is expanded.
Notes: True if item is expanded, otherwise false.

32.31.18 itemAtRow(row as Integer) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the item associated with a given row.
Notes:

row: The index of a row in the receiver.

Returns the item associated with row.

32.31.19 levelForItem(item as NSOutlineViewItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the indentation level for a given item.
Notes:

The indentation level for item. If item is nil (which is the root item), returns -1.
The levels are zero-based—that is, the first level of displayed items is level 0.

32.31.20 levelForRow(row as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the indentation level for a given row.
Notes:

The indentation level for row. For an invalid row, returns -1.
The levels are zero-based—that is, the first level of displayed items is level 0.

32.31.21 moveItemAtIndex(oldIndex as Integer, oldParent as NSOutlineViewItemMBS, newIndex as Integer, newParent as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Moves an item at a given index in the given parent to a new index in a new parent.
Notes:

fromIndex: Index of the item to be moved.
oldParent: The parent of the item to be moved.
toIndex: Index in the new parent to which the item is moved.
newParent: The parent of the item after it is moved.

This method parallels the moveRowAtIndex method of NSTableView. The newParent can be the same as oldParent to reorder an item within the same parent.

NSCell-based outline views must first call beginUpdates before calling this method.

You can call this method multiple times within the same beginUpdates/endUpdates block. Moving from an invalid index, or to an invalid index, throws an exception.

32.31.22 moveRowAtIndex(oldIndex as Integer, newIndex as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Private method to block you from calling this method in NSTableViewMBS.

32.31.23 NSOutlineViewColumnDidMoveNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Posted whenever a column is moved by user action in an NSOutlineView object.
Notes:

The notification object is the NSOutlineView object in which a column moved. The userInfo dictionary contains the following information:

NSOldColumn: An NSNumber object containing the integer value of the column's original index
NSNewColumn: An NSNumber object containing the integer value of the column's present index

32.31.24 NSOutlineViewColumnDidResizeNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Posted whenever a column is resized in an NSOutlineView object.
Notes:

The notification object is the NSOutlineView object in which a column was resized. The userInfo dictionary contains the following information:

NSTableColumn: The column that was resized.
NSOldWidth: An NSNumber object containing the column's original width

32.31.25 NSOutlineViewDisclosureButtonKey as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: These key is used by the outline view to create disclosure buttons that collapse and expand items.
Notes: The normal triangle disclosure button.

32.31.26 NSOutlineViewItemDidCollapseNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Posted whenever an item is collapsed in an NSOutlineView object.
Notes:

The notification object is the NSOutlineView object in which an item was collapsed. A collapsed item's children lose their status as being selected. The userInfo dictionary contains the following information:

NSObject: The item that was collapsed (an id)

32.31.27 NSOutlineViewItemDidExpandNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Posted whenever an item is expanded in an NSOutlineView object.
Notes:

The notification object is the NSOutlineView object in which an item was expanded. The userInfo dictionary contains the following information:

NSObject: The item that was expanded (an id)

32.31.28 NSOutlineViewItemWillCollapseNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Posted before an item is collapsed (after the user clicks the arrow but before the item is collapsed).
Notes:

The notification object is the NSOutlineView object that contains the item about to be collapsed. A collapsed item's children will lose their status as being selected. The userInfo dictionary contains the following information:

NSObject: The item about to be collapsed (an id)

32.31.29 NSOutlineViewItemWillExpandNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Posted before an item is expanded (after the user clicks the arrow but before the item is collapsed).
Notes:

The notification object is the outline view that contains an item about to be expanded. The userInfo dictionary contains the following information:

NSObject: The item that is to be expanded (an id)

32.31.30 NSOutlineViewSelectionDidChangeNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Posted after the outline view's selection changes.
Notes: The notification object is the outline view whose selection changed. This notification does not contain a userInfo dictionary.

32.31.31 NSOutlineViewSelectionIsChangingNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Posted as the outline view's selection changes (while the mouse button is still down).
Notes: The notification object is the outline view whose selection is changing. This notification does not contain a userInfo dictionary.

32.31.32 NSOutlineViewShowHideButtonKey as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: These key is used by the outline view to create disclosure buttons that collapse and expand items.
Notes: The Show/Hide button.

32.31.33 numberOfChildrenOfItem(item as NSOutlineViewItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the number of children for the specified parent item.
Notes:

item: The parent item.

Returns the number of children associated with the parent.

You can call this method on an outline view with either a static or dynamic data source. For an outline view whose contents are dynamic, this method may call out to the numberOfChildrenOfItem event of the associated data source.

32.31.34 parentForItem(item as NSOutlineViewItemMBS) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the parent for a given item.
Notes:

item: The item for which to return the parent.

Returns the parent for item, or nil if the parent is the root.

32.31.35 reloadItem(item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Reloads and redisplays the data for the given item.
Notes:

Reloading the cell views associated with item occurs only in apps that link against macOS 10.12 and later. This method may cause the outline view to change its selection without calling the SelectionDidChange

event.
See also:

- 32.31.36 reloadItem(item as NSOutlineViewItemMBS, reloadChildren as Boolean) 6930

32.31.36 reloadItem(item as NSOutlineViewItemMBS, reloadChildren as Boolean)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Reloads a given item and, optionally, its children.
Notes:

item: An item in the receiver.
Starting in OS X version 10.5, passing 'nil' will reload everything under the root in the outline view.

reloadChildren: If true, recursively reloads item and its children. If false, reloads item only (identical to reloadItem).

It is not necessary, or efficient, to reload children if the item is not expanded.
See also:

- 32.31.35 reloadItem(item as NSOutlineViewItemMBS) 6929

32.31.37 removeItemsAtIndexes(indexes as NSIndexSetMBS, Parent as NSOutlineViewItemMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes items at the given indexes in the given parent with the specified optional animations.
Notes:

indexes: Indexes of the items to be removed.
parent: The parent of the items to be removed.
animationOptions: Animated slide effects used when removing items.

This method parallels the removeRowsAtIndexes method of NSTableView and is used in a way similar to the removeObjectsAtIndexes method of NSMutableArray. The method does nothing if parent is not expanded. If any of the child items is expanded, then all of its child rows are also be removed.

NSCell-based outline views must first call beginUpdates before calling this method.

You can call this method multiple times within the same beginUpdates/endUpdates block; changes work just like modifying an array. Removing an item at an index beyond what is available throws an exception.

32.31.38 removeRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Private method to block you from calling this method in NSTableViewMBS.

32.31.39 rowForItem(item as NSOutlineViewItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the row associated with a given item.
Notes: The row associated with item, or -1 if item is nil or cannot be found.

32.31.40 setDropItem(item as NSOutlineViewItemMBS, dropChildIndex as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Used to "retarget" a proposed drop.
Notes:

item: The target item.
index: The drop index.

For example, to specify a drop on someOutlineItem, you specify item as someOutlineItem and index as NSOutlineViewDropOnItemIndex. To specify a drop between child 2 and 3 of someOutlineItem, you specify item as someOutlineItem and index as 3 (children are a zero-based index). To specify a drop on an un-expandable someOutlineItem, you specify item as someOutlineItem and index as NSOutlineViewDropOnItemIndex.

32.31.41 Properties

32.31.42 autoresizesOutlineColumn as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value that indicates whether the outline view resizes its outline column when the user expands or collapses items.
Notes:

The outline column contains the cells with the expansion symbols and is generally the first column. The default value of this property is true, which causes the outline column to be resized.
The outline column is resized based on how many indentation levels are exposed or hidden. For example, if expanding a row exposes a single indentation level, the outline column width is increased by one indenta-

tionPerLevel.
(Read and Write property)

32.31.43 autosaveExpandedItems as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the expanded items are automatically saved across launches of the app.
Notes:

When the value of this property is true, the outline view saves the state of its expanded items and restores that state the next time the user launches the app. (If the outline view's autosaveName property is nil, or if you have not implemented the itemForPersistentObject and persistentObjectForItem events, this setting is ignored and outline information is not saved.) The configuration data is saved separately for each user and for each app. The default value of this property is NO.
You can have separate settings for the autosaveExpandedItems and autosaveTableColumns properties, so you could, for example, save expanded item information, but not table column positions.
(Read and Write property)

32.31.44 indentationMarkerFollowsCell as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the indentation marker symbol displayed in the outline column should be indented along with the cell contents.
Notes:

When the value of this property is true, the indentation marker is indented along with the cell contents. When the value is false, the marker is always displayed left-justified in the column. The default value of this property is true.
(Read and Write property)

32.31.45 indentationPerLevel as Double

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The per-level indentation, measured in points.
Notes: (Read and Write property)

32.31.46 outlinetableColumn as NSTableColumnMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The table column in which hierarchical data is displayed.

Notes:

Each level of hierarchical data is indented by the amount specified by the indentationPerLevel property (the default is 16.0), and decorated with the indentation marker (disclosure triangle) on rows that are expandable. Outline table column data is archived with the rest of the outline view's state information.
Attempts to set the value of this property to nil are silently ignored.
(Read and Write property)

32.31.47 stronglyReferencesItems as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the outline view retains and releases the objects returned from its data source.
Notes:

For Xojo applications we highly recommend to keep all items in arrays in Xojo, so they are not released by Xojo too early!

When the value of this property is true, the outline view retains and releases the objects returned to it from dataSource. When the value is NO, the outline view treats the objects as opaque items and assumes that the client has a retain on them. The default value is YES for applications linked on macOS 10.12 and later, and false for applications linked on earlier versions of macOS. If you require the legacy behavior and your app links in macOS 10.12 or later, the value of this property must be explicitly set toNO in code, because it is not encoded in the nib. In general, this is required if the items themselves create a retain cycle.
(Read and Write property)

32.31.48 userInterfaceLayoutDirection as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The user interface layout direction.
Notes:

When set to NSUserInterfaceLayoutDirectionRightToLeft, the outline view displays the disclosure triangle to the right of the cell instead of the left. The default value is NSUserInterfaceLayoutDirectionLeftToRight.
(Read and Write property)

32.31.49 Constants

32.31.50 NSOutlineViewDropOnItemIndex = -1

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** May be used as a valid child index of a drop target item.

Notes: In this case, the drop will happen directly on the target item.

32.32 class NSPathComponentCellMBS

32.32.1 class NSPathComponentCellMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSPathComponentCell class displays a component of a path.
Notes:

An NSPathCell object manages a collection of NSPathComponentCell objects, in conjunction with an NSPathControl object, to represent a path.
Subclass of the NSTextFieldCellMBS class.

32.32.2 Blog Entries

- MBS Real Studio Plugins, version 12.0pr6

32.32.3 Methods

32.32.4 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new Cell object with a text.

32.32.5 Properties

32.32.6 File as folderitem

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of the portion of the path from the root through the component represented by the receiver.
Notes: (Read and Write computed property)

32.32.7 Image as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image displayed for this component cell.
Notes:

Generally, a 16-by-16–point image fits best when the path style is NSPathStyleStandard or NSPathStylePopUp, and a 14-by-14–point image is best when the path style is NSPathStyleNavigationBar.
Available in Mac OS X v10.5 and later.

(Read and Write computed property)

32.32.8 URL as string

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of the portion of the path from the root through the component represented by the receiver. **Notes:** (Read and Write computed property)

32.33 class NSPathControlMBS

32.33.1 class NSPathControlMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: NSPathControl is a subclass of NSControl that represents a file system path or virtual path.
Notes:

The NSPathControl class uses NSPathCell to implement its user interface. NSPathControl provides cover methods for most NSPathCell methods—the cover method simply invokes the corresponding cell method. See also NSPathComponentCell, which represents individual components of the path, and two associated protocols: NSPathCellDelegate and NSPathControlDelegate.

NSPathControl has three styles represented by the NSPathStyle enumeration constants NSPathStyleStandard, NSPathStyleNavigationBar, and NSPathStylePopUp. The represented path can be a file system path or any other type of path leading through a sequence of nodes or components, as defined by the programmer.

NSPathControl automatically supports drag and drop, which can be further customized via delegate methods. To accept drag and drop, NSPathControl calls registerForDraggedTypes: with NSFilenamesPboardType and NSURLPboardType. When the URL value in the NSPathControl object changes because of an automatic drag and drop operation or the user selecting a new path via the open panel, the action is sent. On Mac OS X v10.5 the value returned by clickedPathComponentCell is nil, on Mac OS X v10.6 and later, clickedPathComponentCell returns the clicked cell.
Subclass of the NSControlMBS class.

32.33.4 Methods

32.33.5 clickedPathComponentCell as NSPathComponentCellMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns component cell that was clicked.
Notes:

The value returned is generally valid only when the action or double action is being sent.
Note: In Mac OS X 10.5 and earlier the returned value was nil if no cell had been clicked. In Mac OS X 10.6, the folder of the cell that the user selected is returned instead.

32.33.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new path control with size 100/100 and position 0/0
Example:

```
dim t as new NSPathControlMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.33.7 Constructor(Handle as Integer) 6938
- 32.33.8 Constructor(left as Double, top as Double, width as Double, height as Double) 6938

32.33.7 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSPathControl handle.
Example:

```
dim t as new NSPathControlMBS(0, 0, 100, 100)
dim v as new NSPathControlMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSPathControl and the plugin retains this handle.
See also:

- 32.33.6 Constructor 6938
- 32.33.8 Constructor(left as Double, top as Double, width as Double, height as Double) 6938

32.33.8 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new path control with the given size and position.

Example:

```
dim x as new NSPathControlMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.33.6 Constructor 6938
- 32.33.7 Constructor(Handle as Integer) 6938

32.33.9 pathComponentCells as NSPathComponentCellMBS()

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of the NSPathComponentCell objects currently being displayed.
Notes: Available in Mac OS X v10.5 and later.

32.33.10 setDraggingSourceOperationMask(mask as Integer, local as boolean)

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Configures the default value returned from draggingSourceOperationMaskForLocal.
Notes:

mask: The types of drag operations allowed.
isLocal: If true, mask applies when the drag destination object is in the same application as the receiver; if false, mask applies when the destination object is outside the receiver's application.

By default, draggingSourceOperationMaskForLocal returns NSDragOperationEvery when isLocal is true and NSDragOperationNone when isLocal is false.

Available in Mac OS X v10.5 and later.

32.33.11 setPathComponentCells(cells() as NSPathComponentCellMBS)

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the array of NSPathComponentCell objects currently being displayed.
Notes:

cells: An array of NSPathComponentCell objects.

Each item in the array must be an instance of NSPathComponentCell or a subclass thereof. You cannot set this value to nil, but you can set it to an empty array.

Available in Mac OS X v10.5 and later.

32.33.12 Properties

32.33.13 backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The background color.
Notes:

By default, the background is set to a light blue color for NSPathStyleStandard and nil for the other styles. You can use NSColorMBS.clearColor to make the background transparent.
Available in Mac OS X v10.5 and later.
(Read and Write computed property)

32.33.14 File as folderitem

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The path property.
Notes:

When setting, an array of NSPathComponentCell objects is automatically set based on the path in url. If url is a file URL (returns true from isFileURL), the images are automatically filled with file icons, if the path exists. The URL value itself is stored in the objectValue property of the cell.

See also URL property.
(Read and Write computed property)

32.33.15 menu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The menu used for the path control's cells.
Notes:

Available in Mac OS X v10.6 and later.
(Read and Write computed property)

32.33.16 pathStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path style.
Notes:

Either NSPathStyleStandard or NSPathStylePopUp.
(Read and Write computed property)

32.33.17 URL as string

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path property.
Notes:

When setting, an array of NSPathComponentCell objects is automatically set based on the path in url. If url is a file URL (returns true from isFileURL), the images are automatically filled with file icons, if the path exists. The URL value itself is stored in the objectValue property of the cell.

See also File property.
(Read and Write computed property)

32.33.18 Events

32.33.19 DoubleClick

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called on a double click.

32.33.20 Constants

32.33.21 NSPathStyleNavigationBar = 1

MBS MacCocoa Plugin, Plugin Version: 12.0. **Function:** One of the path style constants.
Notes:

The navigation bar display style and behavior. Similar to the NSPathStyleStandard with the navigation bar drawing style. Also known as the breadcrumb style.
Available in Mac OS X v10.5 and later.

32.33.22 NSPathStylePopUp = 2

MBS MacCocoa Plugin, Plugin Version: 12.0. **Function:** One of the path style constants.
Notes:

The pop-up display style and behavior. Only the last path component is displayed with an icon image and component name. The full path is shown when the user clicks on the cell. If the cell is editable, a Choose item is included to enable selecting a different path.
Available in Mac OS X v10.5 and later.

32.33.23 NSPathStyleStandard = 0

MBS MacCocoa Plugin, Plugin Version: 12.0. **Function:** One of the path style constants.
Notes:

The standard display style and behavior. All path component cells are displayed with an icon image and component name. If the path can not fully be displayed, the middle parts are truncated as required.
Available in Mac OS X v10.5 and later.

32.34 class NSPopUpButtonCellMBS

32.34.1 class NSPopUpButtonCellMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The NSPopUpButtonCell class defines the visual appearance of pop-up buttons that display pop-up or pull-down menus.
Notes:

Pop-up menus present the user with a set of choices, much the way radio buttons do, but using much less space. Pull-down menus also provide a set of choices but present the information in a slightly different way, usually to provide a set of commands from which the user can choose.

The NSPopUpButtonCellMBS class implements the user interface for the NSPopUpButtonMBS class.
Changes made to a menu (such as adding, removing, or changing the items) are not apparent while the menu is being displayed or interacted with.
Subclass of the NSMenuItemCellMBS class.

32.34.2 Blog Entries

- MBS Xojo Plugins, version 17.1pr5

32.34.3 Methods

32.34.4 addItemsWithTitles(itemTitles() as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Adds multiple items to the end of the menu.
Notes:

itemTitles: An array of strings containing the titles of the items you want to add. Each string in the array should be unique. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

The new menu items use the pop-up button's default action and target, but you can change these using the setAction: and setTarget: methods of the corresponding NSMenuItem object.

If you want to move an item, it's better to invoke removeItemWithTitle: explicitly and then call this method. After adding the items, this method uses the synchronizeTitleAndSelectedItem method to make sure the item being displayed matches the currently selected item.

Because this method searches for duplicate items, it should not be used if you are adding items to an already populated menu with more than a few hundred items. In a situation like this, add items directly to the

receiver's menu instead.

32.34.5 addItemWithTitle(title as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Adds an item with the specified title to the end of the menu.
Notes:

title: The title of the new menu item. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

The menu item uses the pop-up button's default action and target, but you can change these using the setAction: and setTarget: methods of the corresponding NSMenuItemMBS object.
Because this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. In a situation like this, add items directly to the button's menu instead.

32.34.6 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.
See also:

- 32.34.7 Constructor(text as string, pullsDown as boolean) 6944

32.34.7 Constructor(text as string, pullsDown as boolean)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns an NSPopUpButtonCell object initialized with the specified title.
See also:

- 32.34.6 Constructor(image as NSImageMBS) 6944

32.34.8 dismissPopUp

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Dismisses the pop-up button's menu by ordering its window out.
Notes:

If the pop-up button was not displaying its menu, this method does nothing.
You normally do not call this method explicitly. It is called by the Application Kit automatically to dismiss

the menu for the pop-up button.

32.34.9 indexOfItem(item as NSMenuItemMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the specified menu item.
Notes:

item: The menu item whose index you want.

Returns the index of the item or -1 if no such item was found.

32.34.10 indexOfItemWithTag(tag as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the menu item with the specified tag.
Notes:

tag: The tag of the menu item you want.

Returns the index of the item or -1 if no item with the specified tag was found.

Tags are values your application assigns to an object to identify it. You can assign tags to menu items using the tag property of NSMenuItemMBS.

32.34.11 indexOfItemWithTitle(title as String) as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the item with the specified title.
Notes:

title: The title of the item you want. You must not pass nil for this parameter.

Returns the index of the item or -1 if no item with the specified title was found.

32.34.12 insertItemWithTitle(title as string, atIndex as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Inserts an item at the specified position in the menu.

Notes:

title: The title of the new item. If an item with the same title already exists in the menu, the existing item is removed and the new one is added
index: The zero-based index at which to insert the item. Specifying 0 inserts the item at the top of the menu.

The value in index must represent a valid position in the array. The menu item at index and all those that follow it are shifted down one slot to make room for the new menu item.
This method assigns the pop-up button's default action and target to the new menu item. This triggers the action event of the NSActionCellMBS.

Because this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. In a situation like this, add items directly to the button's menu instead.

32.34.13 itemArray as NSMenuItemMBS()

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array of NSMenuItemMBS objects that represent the items in the menu.

32.34.14 itemAtIndex(Index as Integer) as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the menu item at the specified index.
Notes:

index: The index of the item you want. The specified index must refer to an existing menu item.

Returns the menu item, or nil if no item exists at the specified index.

32.34.15 itemTitleAtIndex(Index as Integer) as String

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the title of the item at the specified index.
Notes:

index: The index of the item you want.

Returns the title of the item, or an empty string if no item exists at the specified index.

32.34.16 itemTitles as String()

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array of strings containing the titles of every item in the menu.
Notes: The titles appear in the order in which the items appear in the menu. If the menu contains separator items, the array contains an empty string ("") for each separator item.

32.34.17 itemWithTitle(title as String) as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the menu item with the specified title.
Notes:

title: The title of the menu item you want.

Returns the menu item, or nil if no item with the specified title exists in the menu.

32.34.18 removeAllItems

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all items in the receiver's item menu.

32.34.19 removeItemAtIndex(Index as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the item at the specified index.
Notes: index: The zero-based index indicating which item to remove. Specifying 0 removes the item at the top of the menu. The index must be valid and non-negative.

32.34.20 removeItemWithTitle(title as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the item with the specified title from the menu.
Notes: title: The title of the item you want to remove. If no menu item exists with the specified title, this method triggers an assertion.

32.34.21 selectItem(item as NSMenuItemMBS)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Selects the specified menu item.
Notes:

item: The menu item to select, or nil if you want to deselect all menu items.

By default, selecting or deselecting a menu item from a pop-up menu changes its state. Selecting a menu item from a pull-down menu does not automatically alter the state of the item. To disassociate the current selection from the state of menu items, set the altersStateOfSelectedItem property to NO.

32.34.22 selectItemAtIndex(Index as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Selects the item in the menu at the specified index.
Notes:

index: The index of the item you want to select, or -1 you want to deselect all menu items.

By default, selecting or deselecting a menu item from a pop-up menu changes its state. Selecting a menu item from a pull-down menu does not automatically alter the state of the item. To disassociate the current selection from the state of menu items, set the altersStateOfSelectedItem property to false.
Subclassers can override this method to catch all select calls.

32.34.23 selectItemWithTag(tag as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Selects the menu item with the specified tag.
Notes:

tag: The tag of the item you want to select.

Returns true if the item was successfully selected; otherwise, false.

If no item with the specified tag is found, this method returns false and leaves the menu state unchanged.
You typically assign tags to menu items from Interface Builder, but you can also assign them programmatically using the tag property of NSMenuItemMBS.

32.34.24 selectItemWithTitle(title as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Selects the item with the specified title.
Notes:

title: The title of the item to select. If you specify nil, an empty string, or a string that does not match the title of a menu item, this method deselects the currently selected item.

By default, selecting or deselecting a menu item changes its state. To disassociate the current selection from the state of menu items, set the altersStateOfSelectedItem property to false.

32.34.25 setTitle(title as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the string displayed in the receiver when the user isn't pressing the mouse button.
Notes:

title: The string to display.

For pull-down menus that get their titles from a menu item, this method simply sets the pop-up button cell's menu item to the first item in the menu. For pop-up menus, if a menu item whose title matches aString exists, this method makes that menu item the current selection; otherwise, it creates a new menu item with the title aString, adds it to the pop-up menu, and selects it.

32.34.26 synchronizeTitleAndSelectedItem

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Synchronizes the the pop-up button's displayed item with the currently selected menu item.
Notes:

If no item is currently selected, this method synchronizes the pop-up buttons displayed item with the first menu item. If the pop-up button cell does not get its displayed item from a menu item, this method does nothing.
For pull-down menus, this method sets the displayed item to the title first menu item.
If the pop-up button's menu does not contain any menu items, this method sets the pop-up button's displayed item to nil, resulting in nothing being displayed in the control.

32.34.27 Properties

32.34.28 altersStateOfSelectedItem as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value that indicates if the pop-up button links the state of the selected menu item to the current selection.
Notes:

When the value of this property is true (which is the default value), the state of the selected item is set to NSOnState. When the value of this property is false, the items in the menu are left alone. When you change the value of this property, the state of the currently selected item is updated appropriately.
Note that this property affects only pop-up buttons (it is ignored for pull-down menus).
(Read and Write property)

32.34.29 arrowPosition as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The position of the arrow displayed on the button.
Notes:

When the value of this property is NSPopUpNoArrow, the control displays no arrow. NSPopUpArrowAt-Center displays the arrow centered horizontally within the cell and NSPopUpArrowAtBottom displays the arrow at the edge of the cell. This property is used with preferredEdge to determine the exact location and orientation of the arrow.
This property applies to only bezel style and borderless pop-up buttons.
(Read and Write property)

32.34.30 autoenablesItems as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value that indicates if the button automatically enables and disables its items every time a user event occurs.
Notes:

When the value of this property is true, the button automatically enables and disables items. The default value is true. For more information about enabling and disabling menu items, see NSMenuValidation.
(Read and Write property)

32.34.31 indexOfSelectedItem as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The index of the item last selected by the user.

Notes:

The value of this property is the index of the selected item, or -1 if no item is selected.
(Read only property)

32.34.32 lastItem as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last item in the menu.
Notes: (Read only property)

32.34.33 menu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The pop-up button's associated menu.
Notes: (Read and Write property)

32.34.34 numberOfItems as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of items in the menu.
Notes: (Read only property)

32.34.35 preferredEdge as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The edge of the cell from which the menu should pop out when screen conditions are restrictive.
Notes:

At display time, if attaching the menu to the preferred edge would cause part of the menu to be obscured, the pop-up button may use a different edge. If no preferred edge is set, the pop-up button uses the bottom edge by default, which is NSMaxYEdge for flipped views or NSMinYEdge for unflipped views. Additional values for this property include NSMinXEdge and NSMaxXEdge.
The exact location of the arrow is determined by examining the value of this property and arrowPosition.

If the arrow position is NSPopUpArrowAtCenter, the arrow stays in the center of the button and the value of this property determines which edge the arrow points to: NSMinXEdge points to the left, NSMaxYEdge points to the top, NSMaxXEdge points to the right, and NSMinYEdge points to the bottom.

If the arrow position is NSPopUpArrowAtBottom, the value of this property determines which edge at which the arrow is placed: NSMinXEdge places the arrow at the center of the left side, pointing to the left, NSMinYEdge places the arrow at bottom right corner, pointing up, NSMaxXEdge places the arrow at the center of the right side, pointing to the right, and NSMaxYEdge places the arrow at the bottom right corner, pointing down.
(Read and Write property)

32.34.36 pullsDown as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value that indicates the behavior of the button's menu.
Notes:

When the value of this property is true, the menu behaves like a pull-down menu; when the value is false, it behaves like a pop-up menu. If you use this property to change the menu type from a pop-up menu to a pull-down menu, and the cell alters the state of its selected items, the state of the currently selected item is set to NSOffState before the menu type is changed.
(Read and Write property)

32.34.37 selectedItem as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The menu item last selected by the user.
Notes:

The value of this property is the menu item that is currently selected, or nil if no item is selected. The last selected menu item is the one that was highlighted when the user released the mouse button. It is possible for a pull-down menu's selected item to be its first item.
(Read only property)

32.34.38 titleOfSelectedItem as String

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The title of the item last selected by the user.
Notes:

The value of this property is the title of the selected menu item, or an empty string if no item is selected.
(Read only property)

32.34.39 usesItemFromMenu as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value that indicates if the control uses an item from the menu for its own title.
Notes:

When the value of this property is true, a pull-down menu uses the title of the first menu item, and a pop-up menu uses the title of the currently selected menu (if no menu item is selected, the pop-up button displays no item and is drawn empty). When the value is false, the menu item set with menuItem (NSMenuItemMBS) is always displayed. The default value is true.
(Read and Write property)

32.34.40 Constants

32.34.41 NSPopUpArrowAtBottom = 2

MBS MacCocoa Plugin, Plugin Version: 17.1. **Function:** One of the arrowPosition constants.
Notes: Arrow is drawn at the edge of the button, pointing toward the preferredEdge.

32.34.42 NSPopUpArrowAtCenter = 1

MBS MacCocoa Plugin, Plugin Version: 17.1. **Function:** One of the arrowPosition constants.
Notes: Arrow is centered vertically, pointing toward the preferredEdge.

32.34.43 NSPopUpNoArrow = 0

MBS MacCocoa Plugin, Plugin Version: 17.1. **Function:** One of the arrowPosition constants.
Notes: Does not display any arrow in the control.

32.35 control NSPopUpButtonControlMBS

32.35.1 control NSPopUpButtonControlMBS

MBS MacControls Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The Xojo control for a NSPopUpButtonControl.
Notes:

This control embeds a special NSPopUpButtonControl subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.

32.35.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr6

32.35.3 Properties

32.35.4 View as NSPopUpButtonMBS

MBS MacControls Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

32.35.5 Events

32.35.6 Action

MBS MacControls Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The action event.

32.35.7 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the bounds, but not the frame, changed.

32.35.8 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event where you can enable menu items.

32.35.9 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the frame changed.

32.35.10 GotFocus

MBS MacControls Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

32.35.11 LostFocus

MBS MacControls Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

32.35.12 MenuAction(HitItem as MenuItem) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

32.35.13 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was pressed inside the control's region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.

Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

32.35.14 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

32.35.15 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

32.35.16 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

32.36 class NSPopUpButtonMBS

32.36.1 class NSPopUpButtonMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An NSPopUpButton object controls a pop-up menu or a pull-down menu from which a user can select an item.
Example:

```
// get cocoa view for the popupmenu
dim p as NSPopUpButtonMBS = PopupMenu1.NSPopUpButtonMBS

// find a menu entry
dim it as NSMenuItemMBS = p.itemAtIndex(0)

// get a picture
dim pic as Picture = LogoMBS(500)
dim img as new NSImageMBS(pic)
img.setSize 16,16

// and assign icon
it.image = img
```

Notes:

The NSPopUpButton class defines objects that implement the pop-up and pull-down menus of the graphical user interface.

An NSPopUpButton object uses an NSPopUpButtonCell object to implement its user interface.

Note that while a menu is tracking, adding, removing, or changing items on the menu is not reflected.
Subclass of the NSButtonMBS class.

32.36.3 Methods

32.36.4 addItemsWithTitles(titles() as string)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Adds multiple items to the end of the menu.
Notes:

temTitles: An array of strings containing the titles of the items you want to add. Each string in the array should be unique. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

If you want to move an item, it's better to invoke removeItemWithTitle: explicitly and then send this method. After adding the items, this method uses the synchronizeTitleAndSelectedItem method to make sure the item being displayed matches the currently selected item.

Since this method searches for duplicate items, it should not be used if you are adding items to an already populated menu with more than a few hundred items. Add items directly to the receiver's menu instead.

32.36.5 addItemWithTitle(title as string)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Adds an item with the specified title to the end of the menu.
Notes:

title: The title of the menu-item entry. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

If you want to move an item, it's better to invoke removeItemWithTitle explicitly and then send this method. After adding the item, this method calls the synchronizeTitleAndSelectedItem method to make sure the item being displayed matches the currently selected item.

Since this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. Add items directly to the receiver's menu instead.

32.36.6 Constructor

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new button with size 100/100 and position 0/0
Example:

```
dim t as new NSPopUpButtonMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.36.7 Constructor(Handle as Integer) 6959
- 32.36.8 Constructor(left as Double, top as Double, width as Double, height as Double) 6959
- 32.36.9 Constructor(left as Double, top as Double, width as Double, height as Double, pullsDown as boolean) 6960

32.36.7 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSPopUpButton handle.
Example:

```
dim t as new NSPopUpButtonMBS(0, 0, 100, 100)
dim v as new NSPopUpButtonMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSPopUpButton and the plugin retains this handle.
See also:

- 32.36.6 Constructor 6958
- 32.36.8 Constructor(left as Double, top as Double, width as Double, height as Double) 6959
- 32.36.9 Constructor(left as Double, top as Double, width as Double, height as Double, pullsDown as boolean) 6960

32.36.8 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new popup button with the given size and position.
Example:

```
dim x as new NSPopUpButtonMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.36.6 Constructor 6958
- 32.36.7 Constructor(Handle as Integer) 6959
- 32.36.9 Constructor(left as Double, top as Double, width as Double, height as Double, pullsDown as boolean) 6960

32.36.9 Constructor(left as Double, top as Double, width as Double, height as Double, pullsDown as boolean)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an NSPopUpButton object initialized to the specified dimensions.
Notes:

left,top,width,height: The frame rectangle for the button, specified in the parent view's coordinate system.

pullsDown: true if you want the receiver to display a pull-down menu; otherwise, false if you want it to display a pop-up menu.
See also:

- 32.36.6 Constructor 6958
- 32.36.7 Constructor(Handle as Integer) 6959
- 32.36.8 Constructor(left as Double, top as Double, width as Double, height as Double) 6959

32.36.10 indexOfItem(item as NSMenuItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the specified menu item.
Notes:

item: The menu item whose index you want.

Returns the index of the item or -1 if no such item was found.
This method invokes the method of the same name of its NSPopUpButtonCell object.

32.36.11 indexOfItemWithTag(tag as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the menu item with the specified tag.
Notes:

tag: The tag of the menu item you want.

Returns the index of the item or -1 if no item with the specified tag was found.

This method invokes the method of the same name of its NSPopUpButtonCell object.

32.36.12 indexOfItemWithTitle(title as string) as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the item with the specified title.
Notes:

title: The title of the item you want.

Returns the index of the item or -1 if no item with the specified title was found.

32.36.13 indexOfSelectedItem as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the item last selected by the user.
Notes: The index of the selected item, or -1 if no item is selected.

32.36.14 insertItemWithTitle(title as string, atIndex as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Inserts an item at the specified position in the menu.
Notes:

title: The title of the new item. If an item with the same title already exists in the menu, the existing item is removed and the new one is added

index: The zero-based index at which to insert the item. Specifying 0 inserts the item at the top of the menu.

If you want to move an item, it's better to invoke removeItemWithTitle: explicitly and then send this method. After adding the item, this method uses the synchronizeTitleAndSelectedItem method to make sure the item displayed matches the currently selected item.

Since this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. Add items directly to the receiver's menu instead.

32.36.15 itemAtIndex(index as Integer) as NSMenuItemMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the menu item at the specified index.
Notes:

index: The index of the item you want.

Returns the menu item, or nil if no item exists at the specified index.

32.36.16 itemWithTitle(title as string) as NSMenuItemMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the menu item with the specified title.
Notes:

title: The title of the menu item you want.

The menu item, or nil if no item with the specified title exists in the menu.

32.36.17 lastItem as NSMenuItemMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the last item in the menu.

32.36.18 removeAllItems

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes all items in the receiver's item menu.
Notes: After removing the items, this method uses the synchronizeTitleAndSelectedItem method to refresh the menu.

32.36.19 removeItemAtIndex(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes the item at the specified index.
Notes:

index: The zero-based index indicating which item to remove. Specifying 0 removes the item at the top of the menu.

After removing the item, this method uses the synchronizeTitleAndSelectedItem method to make sure the title displayed matches the currently selected item.

32.36.20 removeItemWithTitle(title as string)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes the item with the specified title from the menu.
Notes:

title: The title of the item you want to remove. If no menu item exists with the specified title, this method triggers an assertion.

This method removes the first item it finds with the specified name. This method then uses synchronizeTitleAndSelectedItem to refresh the menu.

32.36.21 selectItem(item as NSMenuItemMBS)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Selects the specified menu item.
Notes: item: The menu item to select, or nil if you want to deselect all menu items.

32.36.22 selectItemAtIndex(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Selects the item in the menu at the specified index.
Notes: index: The index of the item you want to select, or -1 you want to deselect all menu items.

32.36.23 selectItemWithTag(tag as Integer) as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Selects the menu item with the specified tag.
Notes:

tag: The tag of the item you want to select.

Returns true if the item was successfully selected; otherwise, false.

If no item with the specified tag is found, this method returns false and leaves the menu state unchanged.

You typically assign tags to menu items from Interface Builder, but you can also assign them programmatically using the setTag: method of NSMenuItem.

Available in Mac OS X v10.4 and later.

32.36.24 selectItemWithTitle(title as string)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Selects the item with the specified title.
Notes: title: The title of the item to select. If you specify an empty string, or a string that does not match the title of a menu item, this method deselects the currently selected item.

32.36.25 setTitle(title as string)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the string displayed in the receiver when the user isn't pressing the mouse button.
Notes: If the receiver displays a pop-up menu, this method changes the current item to be the item with the specified title, adding a new item by that name if one does not already exist. If the receiver displays a pull-down list, this method sets its title to the specified string.

32.36.26 synchronizeTitleAndSelectedItem

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Ensures that the item being displayed by the receiver agrees with the selected item.
Notes: If there's no selected item, this method selects the first item in the item menu and sets the receiver's item to match. For pull-down menus, this method makes sure that the first item is being displayed (the NSPopUpButtonCell object must be set to use the selected menu item, which happens by default).

32.36.27 titleOfSelectedItem as string

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the title of the item last selected by the user.
Notes: Returns the title of the selected menu item, or an empty string if no item is selected.

32.36.28 Properties

32.36.29 arrowPosition as Integer

MBS MacControls Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The position of the arrow displayed.
Notes:

If you specify NSPopUpNoArrow, the receiver displays no arrow. NSPopUpArrowAtCenter displays the arrow centered horizontally within the cell. NSPopUpArrowAtBottom displays the arrow at the edge of the cell. This method works with setPreferredEdge: to determine the exact location and orientation of the arrow. For more information, see setPreferredEdge:.

This method is ignored unless the receiver is a pull-down list with a beveled border.
(Read and Write property)

32.36.30 autoenablesItems as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver automatically enables and disables its items every time a user event occurs.
Notes:

true if the receiver automatically enables and disables items; otherwise, false. The default value is true.
(Read and Write property)

32.36.31 menu as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the pop-up button's associated menu.
Notes: (Read and Write property)

32.36.32 numberOfItems as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the number of items in the menu.
Notes: (Read only property)

32.36.33 pullsDown as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating the behavior of the control's menu.
Notes:

True if the menu behaves like a pull-down menu; otherwise, false if it behaves like a pop-up menu.
(Read and Write property)

32.36.34 selectedItem as NSMenuItemMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the menu item last selected by the user.
Notes:

Returns the menu item that is currently selected, or nil if no item is selected.

The last selected menu item is the one that was highlighted when the user released the mouse button. It is possible for a pull-down menu's selected item to be its first item.
(Read and Write computed property)

32.36.35 Constants

32.36.36 NSPopUpArrowAtBottom = 2

MBS MacControls Plugin, Plugin Version: 14.3. **Function:** One of the constants for the arrow positions.
Notes: Arrow is drawn at the edge of the button, pointing toward the preferredEdge.

32.36.37 NSPopUpArrowAtCenter = 1

MBS MacControls Plugin, Plugin Version: 14.3. **Function:** One of the constants for the arrow positions.
Notes: Arrow is centered vertically, pointing toward the preferredEdge.

32.36.38 NSPopUpNoArrow = 0

MBS MacControls Plugin, Plugin Version: 14.3. **Function:** One of the constants for the arrow positions.
Notes: Does not display any arrow in the receiver.

32.37 class NSProgressIndicatorMBS

32.37.1 class NSProgressIndicatorMBS

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The NSProgressIndicator class lets an application display a progress indicator to show that a lengthy task is under way.
Notes:

Some progress indicators are indeterminate and do nothing more than spin to show that the application is busy. Others are determinate and show the percentage of the task that has been completed.

This also eliminates the hung appearance is you move the window or open a menu. Unlike the RB progress controls that pause when you do these things, the Cocoa version continues to update.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

32.37.2 Xojo Developer Magazine

- 6.6, page 8: News

32.37.3 Methods

32.37.4 Constructor

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new progress indicator with size 100/100 and position 0/0
Example:

```
dim t as new NSProgressIndicatorMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.37.5 Constructor(Handle as Integer) 6968
- 32.37.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6968

32.37.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSProgressIndicator handle.
Example:

```
dim t as new NSProgressIndicatorMBS(0, 0, 100, 100)
dim v as new NSProgressIndicatorMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSProgressIndicator and the plugin retains this handle.
See also:

- 32.37.4 Constructor 6967
- 32.37.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6968

32.37.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new progress indicator with the given size and position.
Example:

```
dim x as new NSProgressIndicatorMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.37.4 Constructor 6967
- 32.37.5 Constructor(Handle as Integer) 6968

32.37.7 incrementBy(delta as Double)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Advances the progress bar of a determinate progress indicator by the specified amount.
Notes: The amount by which to increment the progress bar. For example, if you want to advance a progress bar from 0.0 to 100.0 in 20 steps, you would invoke incrementBy 20 times with a delta value of 5.0.

32.37.8 sizeToFit

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: This action method resizes the receiver to an appropriate size depending on what style returns.
Notes: Use this after you set style to re-size the receiver.

32.37.9 startAnimation

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Starts the animation of an indeterminate progress indicator.
Notes: Does nothing for a determinate progress indicator.

32.37.10 stopAnimation

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Stops the animation of an indeterminate progress indicator.
Notes: Does nothing for a determinate progress indicator.

32.37.11 Properties

32.37.12 controlSize as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The size of the receiver.
Notes: (Read and Write computed property)

32.37.13 controlTint as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The receiver's control tint.
Notes: (Read and Write computed property)

32.37.14 doubleValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A value that indicates the current extent of the progress bar of a determinate progress indicator.
Notes:

The value representing the current extent of a determinate progress bar. For example, a determinate progress indicator goes from 0.0 to 100.0 by default. If the progress bar has advanced halfway across the view, the value returned by doubleValue would be 50.0. An indeterminate progress indicator does not use this value.
(Read and Write computed property)

32.37.15 isBezeled as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the receiver's frame has a bezel.
Notes:

True if the receiver's frame has a three-dimensional bezel; otherwise, false.
(Read and Write computed property)

32.37.16 isDisplayedWhenStopped as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the receiver shows itself even when it's not animating.
Notes:

True if the progress indicator shows itself even when it's not animating. By default, this returns returns true if style is NSProgressIndicatorBarStyle and false if style isNSProgressIndicatorSpinningStyle.
(Read and Write computed property)

32.37.17 isIndeterminate as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver is indeterminate.
Notes:

This method only has an effect if style returns NSProgressIndicatorBarStyle. If style returns NSProgressIndicatorSpinningStyle, the indicator is always indeterminate, regardless of what you pass to this method.
(Read and Write computed property)

32.37.18 maxValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The maximum value for the receiver.
Notes:

The maximum value of the progress indicator. An indeterminate progress indicator does not use this value.

(Read and Write computed property)

32.37.19 minValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minimum value for the receiver.
Notes:

An indeterminate progress indicator does not use this value.
(Read and Write computed property)

32.37.20 style as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The style of the progress indicator (bar or spinning).
Notes:

Either NSProgressIndicatorBarStyle or NSProgressIndicatorSpinningStyle.
(Read and Write computed property)

32.37.21 usesThreadedAnimation as boolean

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A hint as to whether the receiver should implement animation of the progress indicator in a separate thread.
Notes:

Value is true to indicate that animation of the progress indicator should occur in a separate thread; otherwise, false. This value is only a hint and may be ignored.

If the application becomes multithreaded as a result of an invocation of this method, the application's performance could become noticeably slower.
(Read and Write computed property)

32.37.22 Constants

32.37.23 NSBlueControlTint=1

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify a the control tint.

Notes: Aqua control tint

32.37.24 NSClearControlTint=7

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify a the control tint.
Notes: Clear control tint

32.37.25 NSDefaultControlTint=0

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify a the control tint.
Notes: The current default tint setting

32.37.26 NSGraphiteControlTint=6

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify a the control tint.
Notes: Graphite control tint

32.37.27 NSMiniControlSize=2

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the ControlSize property.
Notes: The control has a smaller size than NSSmallControlSize.

32.37.28 NSProgressIndicatorBarStyle=0

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants for the style property.
Notes: A rectangular indicator that can be determinate or indeterminate.

32.37.29 NSProgressIndicatorPreferredAquaThickness=12

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the height of a progress indicator.

32.37.30 NSProgressIndicatorPreferredLargeThickness=18

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the height of a progress indicator.

32.37.31 NSProgressIndicatorPreferredSmallThickness=10

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the height of a progress indicator.

32.37.32 NSProgressIndicatorPreferredThickness=14

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the height of a progress indicator.

32.37.33 NSProgressIndicatorSpinningStyle=1

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants for the style property.
Notes: A small square indicator that can be indeterminate only .

32.37.34 NSRegularControlSize=0

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the ControlSize property.
Notes: The control is sized as regular.

32.37.35 NSSmallControlSize=1

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the ControlSize property.
Notes: This constant is for controls that cannot be resized in one direction, such as push buttons, radio buttons, checkboxes, sliders, scroll bars, pop-up buttons, tabs, and progress indicators. You should use a small system font with a small control.

32.38 class NSScrollerMBS

32.38.1 class NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An NSScroller object controls scrolling of a document view within an NSScrollView's clip view (or potentially another kind of container view).
Notes:

It typically displays a pair of buttons that the user can click to scroll by a small amount (called a line increment or decrement) and Alt-click to scroll by a large amount (called a page increment or decrement), plus a slot containing a knob that the user can drag directly to the desired location. The knob indicates both the position within the document view and, by varying in size within the slot, the amount visible relative to the size of the document view. You can configure whether an NSScroller object uses scroll buttons, but it always draws the knob when there's room for it.

Don't use an NSScroller when an NSSlider would be better. A slider represents a range of values for something in the application and lets the user choose a setting. A scroller represents the relative position of the visible portion of a view and lets the user choose which portion to view.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSControlMBS class.

32.38.2 Blog Entries

32.38.4 Methods

32.38.5 checkSpaceForParts

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Checks to see if there is enough room in the receiver to display the knob and buttons.
Notes: usableParts returns the state calculated by this method. You should never need to invoke this method; it's invoked automatically whenever the NSScroller's size changes.

32.38.6 Constructor

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new scroller with size 100/100 and position 0/0
Example:

```
dim t as new NSScrollerMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.38.7 Constructor(Handle as Integer) 6975
- 32.38.8 Constructor(left as Double, top as Double, width as Double, height as Double) 6975

32.38.7 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSScroller handle.
Example:

```
dim t as new NSScrollerMBS(0, 0, 100, 100)
dim v as new NSScrollerMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSScroller and the plugin retains this handle.
See also:

- 32.38.6 Constructor 6975
- 32.38.8 Constructor(left as Double, top as Double, width as Double, height as Double) 6975

32.38.8 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new scroller with the given size and position.
Example:

```
dim x as new NSScrollerMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.38.6 Constructor 6975
- 32.38.7 Constructor(Handle as Integer) 6975

32.38.9 drawArrow(Arrow as Integer, highlight as boolean)

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Draws the scroll button indicated by arrow, which is either NSScrollerIncrementArrow (the down or right scroll button) or NSScrollerDecrementArrow (up or left).
Notes:

If flag is true, the button is drawn highlighted; otherwise it's drawn normally. You should never need to invoke this method directly, but may wish to override it to customize the appearance of scroll buttons.
Calling this method on CustomNSScrollerMBS objects does not trigger the drawArrow event.

32.38.10 drawKnob

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Draws the knob.
Notes:

You should never need to invoke this method directly, but may wish to override it to customize the appearance of the knob.
Calling this method on CustomNSScrollerMBS objects does not trigger the drawKnob event.

32.38.11 drawKnobSlotInRect(slotRect as NSRectMBS, highlight as boolean)

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Draws the knob slow in the rectangle.
Notes: Calling this method on CustomNSScrollerMBS objects does not trigger the drawKnobSlotInRect event.

32.38.12 drawParts

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Caches images for the scroll buttons and knob.
Notes:

It's invoked only once when the NSScroller is created. You may want to override this method if you alter the look of the NSScroller, but you should never invoke it directly.

Calling this method on CustomNSScrollerMBS objects does not trigger the drawParts event.

32.38.13 highlight(flag as boolean)

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Highlights or unhighlights the scroll button the user clicked.
Notes: The receiver invokes this method while tracking the mouse; you should not invoke it directly. If flag is true, the appropriate part is drawn highlighted; otherwise it's drawn normally.

32.38.14 hitPart as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a part code indicating the manner in which the scrolling should be performed.
Notes: This method is typically invoked by an NSScrollView to determine how to scroll its document view when it receives an action message from the NSScroller.

32.38.15 isCompatibleWithOverlayScrollers as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether the class is compatible with overlay scroller style and behavior.
Notes:

Returns true if the the class is compatible with overlay scroller style and behavior, otherwise false.
The plugin implements this so you can query the value.

32.38.16 NSPreferredScrollerStyleDidChangeNotification as string

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A notification name.
Notes:

Posted if the preferred scroller style changes.
Available in Mac OS X v10.7 and later.

32.38.17 preferredScrollerStyle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the style of scrollers that applications should use wherever possible.
Notes:

The preferred scroller style is determined by the Appearance preference panel's "Show scroll bars" setting for the current user, and—when the user's preference is set to "Automatically based on input device"—by the set of built-in and connected pointing devices and the user's scroll capability preference settings for them. The preferred scroller style may therefore change over time, and applications should be prepared to adapt their user interfaces to the new scroller style if needed.

In most cases, updating to a new scroller style is automatic: When the preferred scroller style changes, AppKit notifies all NSScrollView instances, sending setScrollerStyle to each with the new style, which causes each scroll view to automatically re-tile (update its layout) to adapt to the new scroller style. Some NSScrollView instances may refuse the new scroller style setting if they cannot accommodate it for compatibility reasons (the presence of accessory views or legacy scroller subclasses prevent use of overlay scrollers), but most instances will switch to the specified new preferred scroller style.

If you need to be notified of changes to the preferred scroller style, you can register to receive NSPreferredScrollerStyleDidChangeNotification notifications.

Available in Mac OS X v10.7 and later.

32.38.18 rectForPart(part as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the rectangle occupied by aPart, which for this method is interpreted literally rather than as an indicator of scrolling direction.
Notes:

Note the interpretations of NSScrollerDecrementPage and NSScrollerIncrementPage. The actual part of an NSScroller that causes page-by-page scrolling varies, so as a convenience these part codes refer to useful parts different from the scroll buttons.

Returns NSRectMBS.Zero if the part requested isn't present on the receiver.

32.38.19 scrollerWidth as Double

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the width of "normal-sized" instances.
Notes: NSScrollView uses this value to lay out its components. Subclasses that use a different width should

override this method.

32.38.20 scrollerWidthForControlSize(controlsize as Integer) as Double

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the width of the scroller based on controlSize.

32.38.21 setFloatValue(aFloat as Double, proportion as Double)

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the position of the knob to aFloat, which is a value from 0.0 (indicating the top or left end) to 1.0 (the bottom or right end).
Notes:

Also sets the proportion of the knob slot filled by the knob to knobProp, also a value from 0.0 (minimal size) to 1.0 (fills the slot).

Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

32.38.22 testPart(p as NSPointMBS) as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the part that would be hit by a mouse-down event at p (expressed in the window's coordinate system).
Notes: Note the interpretations of NSScrollerDecrementPage and NSScrollerIncrementPage. The actual part of an NSScroller that causes page-by-page scrolling varies, so as a convenience these part codes refer to useful parts different from the scroll buttons.

32.38.23 trackKnob(theEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Tracks the knob and sends action messages to the receiver's target.
Notes: This method is invoked automatically when the receiver receives theEvent mouse-down event in the knob; you should not invoke it directly.

32.38.24 trackScrollButtons(theEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Tracks the scroll buttons and sends action messages to the receiver's target.
Notes: This method is invoked automatically when the receiver receives theEvent mouse-down event in a scroll button; you should not invoke this method directly.

32.38.25 usableParts as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a value indicating which parts of the receiver are displayed and usable.

32.38.26 Properties

32.38.27 arrowsPosition as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The location of the scroll buttons within the receiver.
Notes:

Can be NSScrollerArrowsMaxEnd, NSScrollerArrowsMinEnd, NSScrollerArrowsDefaultSetting or NSScroller-ArrowsNone.
(Read and Write computed property)

32.38.28 controlSize as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The size of the receiver.
Notes:

Can be NSRegularControlSize, NSMiniControlSize or NSSmallControlSize.
(Read and Write computed property)

32.38.29 controlTint as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The receiver's control tint.
Notes:

Can be NSGraphiteControlTint, NSBlueControlTint, NSClearControlTint or NSDefaultControlTint.

(Read and Write computed property)

32.38.30 knobProportion as Double

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The portion of the knob slot the knob should fill, as a floating-point value from 0.0 (minimal size) to 1.0 (fills the slot).
Notes:

Can be set on Mac OS X 10.5 directly.
(Read and Write computed property)

32.38.31 knobStyle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The knob style.
Notes:

The value of this property does not affect legacy scrollers. NSScrollerKnobStyleDefault is appropriate for a wide range of content, but in some cases choosing an alternative knob style may enhance visibility of the scroller knob atop some kinds of content.

Available in Mac OS X v10.7 and later.

use constants: NSScrollerKnobStyleDefault, NSScrollerKnobStyleDark or NSScrollerKnobStyleLight.
(Read and Write computed property)

32.38.32 scrollerStyle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The scroller style.
Notes:

or a scroller that's managed by an NSScrollView object, the setter is automatically invoked by the scroll view with the appropriate setting, according to the user's Appearance preference settings and possibly what pointing device(s) are present (see preferredScrollerStyle).
Available in Mac OS X v10.7 and later.
(Read and Write computed property)

32.38.33 Constants

32.38.34 NSAllScrollerParts = 2

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify which parts of the scroller are visible.
Notes: Scroller has at least a knob, possibly also scroll buttons.

32.38.35 NSBlueControlTint = 1

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify a the control tint.
Notes: Aqua control tint

32.38.36 NSClearControlTint = 7

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify a the control tint.
Notes: Clear control tint

32.38.37 NSDefaultControlTint = 0

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify a the control tint.
Notes: The current default tint setting

32.38.38 NSGraphiteControlTint = 6

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify a the control tint.
Notes: Graphite control tint

32.38.39 NSMiniControlSize = 2

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the ControlSize property.
Notes: The control has a smaller size than NSSmallControlSize.

32.38.40 NSNoScrollerParts = 0

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify which parts of the scroller are visible.
Notes: Scroller has neither a knob nor scroll buttons, only the knob slot.

32.38.41 NSOnlyScrollerArrows = 1

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify which parts of the scroller are visible.
Notes: Scroller has only scroll buttons, no knob.

32.38.42 NSRegularControlSize = 0

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the ControlSize property.
Notes: The control is sized as regular.

32.38.43 NSScrollerArrowsDefaultSetting = 0

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify where the scroller's buttons appear with the arrowsPosition property.
Notes: Contains the information from the AppleScrollBarVariant default value.

32.38.44 NSScrollerArrowsMaxEnd = 0

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify where the scroller's buttons appear with the arrowsPosition property.
Notes: Buttons at bottom or right. This constant has been deprecated.

32.38.45 NSScrollerArrowsMinEnd = 1

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify where the scroller's buttons appear with the arrowsPosition property.
Notes: Buttons at top or left. This has been deprecated.

32.38.46 NSScrollerArrowsNone = 2

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify where the scroller's buttons appear with the arrowsPosition property.
Notes: No buttons.

32.38.47 NSScrollerDecrementArrow = 1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants describe the two scroller buttons and are used by drawArrow.
Notes: The down or right scroll button.

32.38.48 NSScrollerDecrementLine = 4

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the different parts of the scroller.
Notes: Up or left by a small amount.

32.38.49 NSScrollerDecrementPage = 1

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the different parts of the scroller.
Notes: Up or left by a large amount.

32.38.50 NSScrollerIncrementArrow = 0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants describe the two scroller buttons and are used by drawArrow.
Notes: The up or left scroll button.

32.38.51 NSScrollerIncrementLine = 5

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the different parts of the scroller.
Notes: Down or right by a small amount.

32.38.52 NSScrollerIncrementPage = 3

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the different parts of the scroller.
Notes: Down or right by a large amount.

32.38.53 NSScrollerKnob = 2

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the different parts of the scroller.
Notes: Directly to the NSScroller's value, as given by floatValue.

32.38.54 NSScrollerKnobSlot = 6

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the different parts of the scroller.
Notes: Directly to the NSScroller's value, as given by floatValue.

32.38.55 NSScrollerKnobStyleDark = 1

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the knob style constants.
Notes:

Specifies a dark knob.
This style is particularly good against a light background.
Available in Mac OS X v10.7 and later.

32.38.56 NSScrollerKnobStyleDefault = 0

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the knob style constants.
Notes:

Specifies a dark knob with a light border.
This is the default style; it is good against any background.
Available in Mac OS X v10.7 and later.

32.38.57 NSScrollerKnobStyleLight = 2

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the knob style constants.
Notes:

Specifies a light knob.
This style is particularly good against a dark background.
Available in Mac OS X v10.7 and later.

32.38.58 NSScrollerNoPart = 0

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the constants to specify the different parts of the scroller.
Notes: Don't scroll at all.

32.38.59 NSScrollerStyleLegacy = 0

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants to specify the scroller style.
Notes:

Specifies legacy-style scrollers as prior to Mac OS X v10.7.
Available in Mac OS X v10.7 and later.

32.38.60 NSScrollerStyleOverlay = 1

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants to specify the scroller style.
Notes:

Specifies overlay-style scrollers in Mac OS X v10.7 and later.
Available in Mac OS X v10.7 and later.

32.38.61 NSSmallControlSize = 1

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the ControlSize property.
Notes: This constant is for controls that cannot be resized in one direction, such as push buttons, radio buttons, checkboxes, sliders, scroll bars, pop-up buttons, tabs, and progress indicators. You should use a small system font with a small control.

32.39 class NSScrollViewMBS

32.39.1 class NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The Cocoa class for a view which has scrollbars.
Notes:

Embed another view inside it to add scrolling.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

32.39.4 Methods

32.39.5 Constructor

MBS MacControls Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new scrollview with size 100/100 and position 0/0
Example:

```
dim t as new NSScrollViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.39.6 Constructor(Handle as Integer) 6988
- 32.39.7 Constructor(left as Double, top as Double, width as Double, height as Double) 6988

32.39.6 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSScrollView handle.
Example:

```
dim t as new NSScrollViewMBS(0, 0, 100, 100)
dim v as new NSScrollViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSScrollView and the plugin retains this handle.
See also:

- 32.39.7 Constructor(left as Double, top as Double, width as Double, height as Double) 6988

32.39.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new scrollview with the given size and position.
Example:

```
dim x as new NSScrollViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.39.5 Constructor 6987
- 32.39.6 Constructor(Handle as Integer) 6988

32.39.8 flashScrollers

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Flash the overlay scroll bars.
Notes:

This method is only to scroll views that use overlay scrollers.

This method can be invoked to cause the overlay scroller knobs to be momentarily shown. This may be desirable when changing a document view's size or swapping new content into the view, or to give the user a sense of the current position within the scrollable range at each step of an incremental search or similar operation.

Available in Mac OS X v10.7 and later.

32.39.9 reflectScrolledClipView(clipView as NSClipViewMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Adjusts the receiver's scrollers to reflect the size and positioning of its content view.
Notes:

ClipView: The clip view being adjusted to. If aClipView is any view object other than the receiver's content view, the method does nothing.

This method is invoked automatically during scrolling and when an NSClipView object's relationship to its document view changes; you should rarely need to invoke it yourself, but may wish to override it for custom updating or other behavior. If you override this method, be sure to call the superclass implementation. If you do not, other controls (such as the current scrollers) may not be updated properly.

Available in Mac OS X v10.0 and later.

32.39.10 tile

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Lays out the components of the receiver: the content view, the scrollers, and the ruler views.
Notes: You rarely need to invoke this method, but subclasses may override it to manage additional components.

32.39.11 Properties

32.39.12 autohidesScrollers as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: True when autohiding is set for scroll bars in the scrollview.
Notes: (Read and Write property)

32.39.13 backgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The background color.
Notes: (Read and Write property)

32.39.14 borderType as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The border type.
Notes:

Specifies the appearance of the style of the scroll view's border. See NSBorderType for a list of possible values.
Use constants NSNoBorder = 0, NSLineBorder = 1, NSBezelBorder = 2 or NSGrooveBorder = 3.
(Read and Write property)

32.39.15 contentSize as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the size of the receiver's content view.
Notes: (Read only property)

32.39.16 contentView as NSClipViewMBS

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The content view.
Notes:

If view has a document view, this method also sets the receiver's document view to be the document view of view. The original content view retains its document view.

(Read and Write property)

32.39.17 documentCursor as NSCursorMBS

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The cursor used when the cursor is over the content view.
Notes: (Read and Write property)

32.39.18 documentView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The view the receiver scrolls within its content view.
Notes: (Read and Write property)

32.39.19 documentVisibleRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the portion of the document view, in its own coordinate system, visible through the receiver's content view.
Notes: (Read only property)

32.39.20 drawsBackground as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value that indicates whether the scrollview draws its background.
Notes: (Read and Write property)

32.39.21 FindBarPosition as Integer

MBS MacControls Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The position of the find bar.
Notes:

See NSScrollViewFindBarPosition* constants for possible values.
(Read and Write property)

32.39.22 FindBarView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The view assigned by the text bar as the find bar view for the container.
Notes:

This property is managed by NSTextFinderMBS and you must not set this property.
The container may freely modify the view's width, but should not modify its height.
(Read only property)

32.39.23 FindBarVisible as Boolean

MBS MacControls Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the container should display its find bar.
Notes:

When this property is true and the findBarView property is set, then the find bar is displayed by the container. Otherwise, the find bar is not displayed.
The default value should be false.
(Read and Write property)

32.39.24 hasHorizontalRuler as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: True if the receiver maintains a horizontal ruler view, false if it doesn't.
Notes: (Read and Write property)

32.39.25 hasHorizontalScroller as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver keeps a horizontal scroller
Notes: (Read and Write property)

32.39.26 hasVerticalRuler as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Determines whether the scrollview keeps a vertical ruler object.
Notes: (Read and Write property)

32.39.27 hasVerticalScroller as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: True if the scrollview displays a vertical scroller, false if it doesn't.
Notes: (Read and Write property)

32.39.28 horizontalLineScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The amount by which the receiver scrolls itself horizontally when scrolling line by line to aFloat, expressed in the content view's coordinate system.
Notes:

This amount is the amount used when the user clicks the scroll arrows on the horizontal scroll bar without holding down a modifier key. When displaying text in an NSScrollView, for example, you might set this amount to the height of a single line of text in the default font.
(Read and Write property)

32.39.29 horizontalPageScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The amount of the document view kept visible when scrolling horizontally page by page, expressed in the content view's coordinate system.
Notes:

This amount is used when the user clicks the scroll arrows on the horizontal scroll bar while holding down the Option key.

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to orient to the new display. It differs from the line scroll amount, which indicates how far the document view moves. The page scroll amount is the amount common to the content view before and after the document view is scrolled by one page.
(Read and Write property)

32.39.30 horizontalScrollElasticity as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The scroll view's horizontal elasticity mode.
Notes:

A scroll view can scroll its contents past its bounds to achieve an elastic effect.

When set to NSScrollElasticityAutomatic, scrolling the horizontal axis beyond its document bounds only occurs if the document width is greater than the view width or, the vertical scroller is hidden and the horizontal scroller is visible.

The default value is NSScrollElasticityAutomatic.

Available in Mac OS X v10.7 and later.
(Read and Write property)

32.39.31 horizontalScroller as NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The receiver's horizontal scroller, regardless of whether the receiver is currently displaying it, or nil if the receiver has none.
Notes: (Read and Write property)

32.39.32 lineScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The horizontal and vertical line scroll amounts to aFloat.
Notes:

The line scroll is the amount by which the receiver scrolls itself when scrolling line by line, expressed in the content view's coordinate system. It's used when the user clicks the scroll arrows without holding down a modifier key. When displaying text in an NSScrollView, for example, you might set this value to the height of a single line of text in the default font.

As part of its implementation, this method sets VerticalLineScroll and HorizontalLineScroll.
(Read and Write property)

32.39.33 pageScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The vertical page scroll amount: the amount of the document view kept visible when scrolling vertically page by page, expressed in the content view's coordinate system.
Notes:

This amount is used when the user clicks the scroll arrows on the vertical scroll bar while holding down the Option key. As part of its implementation, this method calls verticalPageScroll.

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to orient to the new display. It differs from the line scroll amount, which indicates how far the document view moves. The page scroll amount is the amount common to the content view before and after the document view is scrolled by one page.

Note that a scroll view can have two different page scroll amounts: verticalPageScroll and horizontalPageScroll. Use this method only if you can be sure they're both the same.
(Read and Write property)

32.39.34 rulersVisible as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether rulers should be visible.
Notes: (Read and Write property)

32.39.35 scrollerKnobStyle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The knob style of scroll views that use the overlay scroller style.
Notes:

Applicable only to scroll views that use overlay scrollers.
Available in Mac OS X v10.7 and later.
(Read and Write property)

32.39.36 scrollerStyle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The scroller style used by the scroll view.
Notes:

This setting is automatically set at runtime, based on the user's preference setting and, if relevant, the set of connected pointing devices and their configured scroll capabilities, as determined by the NSScroller method preferredScrollerStyle.

Setting an scroll view's scroller style sets the style of both the horizontal and vertical scrollers. If the scroll view subsequently creates or is assigned a new horizontal or vertical scroller, they will be assigned the same scroller style that was assigned to the scroll view..

Available in Mac OS X v10.7 and later.
(Read and Write property)

32.39.37 scrollsDynamically as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: True if the scrollview redraws its document view while tracking the knob, false if it redraws only when the scroller knob is released.
Notes:

NSScrollView scrolls dynamically by default.
(Read and Write property)

32.39.38 usesPredominantAxisScrolling as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the scroll view uses a predominant scrolling axis for content.
Notes:

Whether the scroll view supports a predominant scrolling direction. true if there is a predominant scrolling direction; otherwise false.

Some content is scrollable in both the horizontal and vertical axes, but is predominantly scrolled one axis at a time. Other content (such as a drawing canvas) should scroll freely in both axes.

Traditionally this is not an issue with scroll wheels since they can only scroll in one direction at a time. With scroll balls and touch surfaces, it becomes more difficult to determine the user's intention.

This property helps a scroll view determine the user's intention by specifying if there is a predominant scrolling axis for content.

The default value is true.

Available in Mac OS X v10.7 and later.
(Read and Write property)

32.39.39 verticalLineScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The amount by which the view scrolls itself vertically when scrolling line by line to aFloat, expressed in the content view's coordinate system.
Notes:

This value is the amount used when the user clicks the scroll arrows on the vertical scroll bar without holding down a modifier key. When displaying text in an NSScrollView, for example, you might set this value to the height of a single line of text in the default font.
(Read and Write property)

32.39.40 verticalPageScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The amount of the document view kept visible when scrolling vertically page by page to aFloat, expressed in the content view's coordinate system.
Notes:

This amount is used when the user clicks the scroll arrows on the vertical scroll bar while holding down the Option key.

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to orient to the new display. It differs from the line scroll amount, which indicates how far the document view moves. The page scroll amount is the amount common to the content view before and after the document view is scrolled by one page. Thus, setting the page scroll amount to 0.0 implies that the entire visible portion of the document view is replaced when a page scroll occurs.
(Read and Write property)

32.39.41 verticalScrollElasticity as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The scroll view's vertical elasticity mode.
Notes:

A scroll view can scroll its contents past its bounds to achieve an elastic effect.

When set to NSScrollElasticityAutomatic, scrolling the vertical axis beyond its document bounds occurs if any of the following are true: the vertical scroller is visible, the content height is greater than view height, or the horizontal scroller hidden.

Available in Mac OS X v10.7 and later.
(Read and Write property)

32.39.42 verticalScroller as NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The receiver's vertical scroller, regardless of whether the receiver is currently displaying it, or nil

if the receiver has none.
Notes: (Read and Write property)

32.39.43 Constants

32.39.44 NSScrollElasticityAllowed = 2

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants used to determine the elasticity behavior for an axis of the scrollview..
Notes:

Allow content to be scrolled past its bounds on this axis in an elastic fashion.
Available in Mac OS X v10.7 and later.

32.39.45 NSScrollElasticityAutomatic = 0

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants used to determine the elasticity behavior for an axis of the scrollview..
Notes:

Automatically determine whether to allow elasticity on this axis.
Available in Mac OS X v10.7 and later.

32.39.46 NSScrollElasticityNone = 1

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants used to determine the elasticity behavior for an axis of the scrollview..
Notes:

Disallow scrolling beyond document bounds on this axis.
Available in Mac OS X v10.7 and later.

32.39.47 NSScrollViewFindBarPositionAboveContent = 1

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants used to define the position of the find bar in relation to the scroll view.
Notes:

The find bar is displayed above the scroll view content.
Available in Mac OS X v10.7 and later.

32.39.48 NSScrollViewFindBarPositionAboveHorizontalRuler = 0

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants used to define the position of the find bar in relation to the scroll view.
Notes:

The find bar is displayed above the horizontal ruler, if visible.
Available in Mac OS X v10.7 and later.

32.39.49 NSScrollViewFindBarPositionBelowContent = 2

MBS MacControls Plugin, Plugin Version: 11.3. **Function:** One of the constants used to define the position of the find bar in relation to the scroll view.
Notes:

The find bar is displayed below the scroll view content.
Available in Mac OS X v10.7 and later.

32.40 control NSSearchFieldControlMBS

32.40.1 control NSSearchFieldControlMBS

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The Xojo control for a NSSearchField.
Notes:

This control embeds a special NSSearchField subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

32.40.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.0pr8
- MBS Xojo / Real Studio Plugins, version 14.0pr2
- MBS Xojo / Real Studio Plugins, version 13.5pr10
- MBS Xojo / Real Studio Plugins, version 13.4pr7

32.40.3 Properties

32.40.4 View as NSSearchFieldMBS

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

32.40.5 Events

32.40.6 Action

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The Xojo control for a NSSearchField.
Notes:

This control embeds a special NSSearchField subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

32.40.7 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the bounds, but not the frame, changed.

32.40.8 EnableMenuItems

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event where you can enable menu items.

32.40.9 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the frame changed.

32.40.10 GotFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

32.40.11 LostFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

32.40.12 MenuAction(HitItem as MenuItem) As Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

32.40.13 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The mouse button was pressed inside the control's region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

32.40.14 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

32.40.15 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

32.40.16 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

32.40.17 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent when a control with editable text begins an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

32.40.18 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent when the text in the receiving control changes.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

32.40.19 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent when a control with editable text ends an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

32.40.20 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether text editing should be allowed.
Notes:

Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

32.40.21 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether ending text editing should be allowed.
Notes:

Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

32.41 class NSSearchFieldMBS

32.41.1 class NSSearchFieldMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An NSSearchField object implements a text field control that is optimized for performing text-based searches.
Example:

```
// create searchfield
dim n as new NSSearchFieldMBS(0,0,100,20)

// set placeholder
dim x as NSTextFieldCellMBS = n.cell
x.placeholderString = "Test"
```

Notes:

The control provides a customized text field for entering search data, a search button, a cancel button, and a pop-up icon menu for listing recent search strings and custom search categories.

An NSSearchField object wraps an NSSearchFieldCell object. Access to most search field attributes occurs through the cell, which provides a more comprehensive programmatic interface for manipulating the search field. You can use an NSSearchField object though to manipulate some aspects of the search field. For additional information about search fields and how to manipulate them, see the NSSearchFieldCell class.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSTextFieldMBS class.

32.41.2 Blog Entries

32.41.3 Methods

32.41.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new search field with size 100/100 and position 0/0
Example:

```
dim t as new NSSearchFieldMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.41.5 Constructor(Handle as Integer) 7006
- 32.41.6 Constructor(left as Double, top as Double, width as Double, height as Double) 7006

32.41.5 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSSearchField handle.
Example:

```
dim t as new NSSearchFieldMBS(0, 0, 100, 100)
dim v as new NSSearchFieldMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSSearchField and the plugin retains this handle.
See also:

- 32.41.4 Constructor 7006
- 32.41.6 Constructor(left as Double, top as Double, width as Double, height as Double) 7006

32.41.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new search field with the given size and position.
Example:

```
dim x as new NSSearchFieldMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.41.4 Constructor 7006
- 32.41.5 Constructor(Handle as Integer) 7006

32.41.7 recentSearches as string()

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the list of recent search strings for the control.
Notes: An array of strings, each of which contains a search string either displayed in the search menu or from a recent autosave archive. If there have been no recent searches and no prior searches saved under an autosave name, this array may be empty.

32.41.8 setRecentSearches(values() as string)

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the list of recent search strings to list in the pop-up icon menu of the receiver.
Notes: You might use this method to set the recent list of searches from an archived copy.

32.41.9 Properties

32.41.10 maximumRecents as Integer

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum number of search strings that can appear in the search menu.
Notes:

The maximum number of search strings that can appear in the menu. This value can be between 0 and 254. Specifying a value less than 0 sets the value to the default, which is 10. Specifying a value greater than 254 sets the maximum to 254.

When the limit is exceeded, the oldest search string on the menu is dropped.
(Read and Write computed property)

32.41.11 recentsAutosaveName as string

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The key under which the prior list of recent search strings has been archived.
Notes:

The autosave name, which is used as a key in the standard user defaults to save the recent searches. The default value is "", which causes searches not to be autosaved.
(Read and Write computed property)

32.41.12 searchMenuTemplate as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The menu template object used to dynamically construct the search pop-up icon menu.
Notes:

The receiver looks for the tag constants described in Menu tags to determine how to populate the menu with items related to recent searches. (See constants)

To modify the actual menu shown, please use NSMenuItemMBS.validateMenuItem event. There you can for example set the state of the menu item shown. The SearchField makes a copy of the NSMenuItem, so the menuitem where the event is called, is not the one shown. It's the one passes as parameter.
(Read and Write computed property)

32.41.13 sendsSearchStringImmediately as boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the cell sends its action message to the target immediately upon notification of any changes to the search field text or after a brief pause.
Notes:

True to send the cell's action immediately upon notification of any changes to the search field; otherwise, false if you want the cell to pause briefly before sending its action message. Pausing gives the user the opportunity to type more text into the search field before initiating the search.
(Read and Write computed property)

32.41.14 sendsWholeSearchString as boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver sends the search action message when the user clicks the search button (or presses return) or after each keystroke.
Notes:

True to send the action message all at once when the user clicks the search button or presses return; otherwise, False to send the search string after each keystroke.
(Read and Write computed property)

32.41.15 Constants

32.41.16 NSSearchFieldClearRecentsMenuItemTag = 1002

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the tag values for the search menu template.
Notes:

Identifies the menu item for clearing the current set of recent string searches in the menu.
This item is hidden if there are no recent strings.

32.41.17 NSSearchFieldNoRecentsMenuItemTag = 1003

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the tag values for the search menu template.
Notes:

Identifies the menu item that describes a lack of recent search strings (for example, "No recent searches").
This item is hidden if there have been recent searches.

32.41.18 NSSearchFieldRecentsMenuItemTag = 1001

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the tag values for the search menu template.
Notes: Identifies where recent search strings should appear in the "recents" menu group.

32.41.19 NSSearchFieldRecentsTitleMenuItemTag = 1000

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the tag values for the search menu template.
Notes:

Identifies the menu item that is the title of the menu group for recent search strings.
This item is hidden if there are no recent strings.
You may use this tagged item for separator characters that also do not appear if there are no recent strings to display.

32.42 control NSSecureTextFieldControlMBS

32.42.1 control NSSecureTextFieldControlMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The Xojo control for a NSSecureTextField.
Notes:

This control embeds a special NSSecureTextField subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

32.42.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.0pr8

32.42.3 Properties

32.42.4 echosBullets as Boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver echoes a bullet character rather than each character typed.
Example:

```
dim t as NSSecureTextFieldControlMBS // your textfield
t.echosBullets = true
```

Notes:

If true, bullets are echoed. If false, the cursor is moved for each character typed, but nothing is displayed.
(Read and Write property)

32.42.5 View as NSSecureTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

32.42.6 Events

32.42.7 Action

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control's action was triggered.
Notes: The text changed.

32.42.8 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the bounds, but not the frame, changed.

32.42.9 EnableMenuItems

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event where you can enable menu items.

32.42.10 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the frame changed.

32.42.11 GotFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

32.42.12 LostFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

32.42.13 MenuAction(HitItem as MenuItem) As Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

32.42.14 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The mouse button was pressed inside the control's region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

32.42.15 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

32.42.16 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

32.42.17 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

32.42.18 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a control with editable text begins an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

32.42.19 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the text in the receiving control changes.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

32.42.20 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a control with editable text ends an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidEndEditing-Notification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

32.42.21 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether text editing should be allowed.
Notes:

Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

32.42.22 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether ending text editing should be allowed.
Notes:

Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

32.43 class NSSecureTextFieldMBS

32.43.1 class NSSecureTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: NSSecureTextField is a subclass of NSTextField that hides its text from display or other access via the user interface.
Notes:

It's suitable for use as a password-entry object or for any item in which a secure value must be kept.

NSSecureTextField uses NSSecureTextFieldCell to implement its user interface.
Subclass of the NSTextFieldMBS class.

32.43.2 Blog Entries

- MBS REALbasic Plugins, version 11.1pr3

32.43.3 Methods

32.43.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new secure text field with size 100/100 and position 0/0
Example:

```
dim t as new NSSecureTextFieldMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.43.5 Constructor(Handle as Integer) 7015
- 32.43.6 Constructor(left as Double, top as Double, width as Double, height as Double) 7016

32.43.5 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSSecureTextField handle.
Example:

```
dim t as new NSSecureTextFieldMBS(0, 0, 100, 100)
dim v as new NSSecureTextFieldMBS(t.handle)
```

```
MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSSecureTextField and the plugin retains this handle.
See also:

- 32.43.4 Constructor 7015
- 32.43.6 Constructor(left as Double, top as Double, width as Double, height as Double) 7016

32.43.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new secure text field with the given size and position.
Example:

```
dim x as new NSSecureTextFieldMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.43.4 Constructor 7015
- 32.43.5 Constructor(Handle as Integer) 7015

32.43.7 Properties

32.43.8 echosBullets as boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver echoes a bullet character rather than each character typed.
Example:

```
dim t as NSSecureTextFieldMBS // your textfield
t.echosBullets = true
```

Notes:

If true, bullets are echoed. If false, the cursor is moved for each character typed, but nothing is displayed.
(Read and Write computed property)

32.44 class NSSegmentedControlMBS

32.44.1 class NSSegmentedControlMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The plugin class for a Cocoa NSSegmentedControl.
Notes:

An NSSegmentedControl object implements a horizontal button made of multiple segments.

The NSSegmentedControl class uses an NSSegmentedCell class to implement much of the control's functionality. Most methods in NSSegmentedControl are simply "cover methods" that call the corresponding method in NSSegmentedCell. The methods of NSSegmentedCell that do not have covers relate to accessing and setting values for tags and tool tips; programatically setting the key segment; and establishing the mode of the control.

The features of a segmented control include:

- Each segment can have an image, text (label), menu, tooltip, and tag
- Either the whole control or individual segments can be enabled or disabled
- There are three tracking modes for segments: select one mode (also known as radio button mode and illustrated by Finder's view mode selection control), momentary mode (as illustrated by Safari's toolbar buttons), or select any mode (where any combination of buttons may be on or off)
- Each segment can be either a fixed width or autosized to fit the contents
- If a segment has text and is marked as autosizing, then the text may be truncated so that the control completely fits
- If an image is too large to fit in a segment, it is clipped
- Full keyboard control of the user interface

Subclass of the NSControlMBS class.

32.44.4 Methods

32.44.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new path control with size 100/100 and position 0/0
Example:

```
dim t as new NSSegmentedControlMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.44.6 Constructor(Handle as Integer) 7018
- 32.44.7 Constructor(left as Double, top as Double, width as Double, height as Double) 7019

32.44.6 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSPathControl handle.
Example:

```
dim t as new NSSegmentedControlMBS(0, 0, 100, 100)
dim v as new NSSegmentedControlMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSSegmentedControl and the plugin retains this handle.
See also:

- 32.44.5 Constructor 7018
- 32.44.7 Constructor(left as Double, top as Double, width as Double, height as Double) 7019

32.44.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new path control with the given size and position.
Example:

```
dim x as new NSSegmentedControlMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.44.5 Constructor 7018
- 32.44.6 Constructor(Handle as Integer) 7018

32.44.8 makeNextSegmentKey

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects the next segment.
Notes: The next segment is the one to the right of the currently selected segment. For the last segment, the selection wraps back to the beginning of the control.

32.44.9 makePreviousSegmentKey

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects the previous segment.
Notes: The previous segment is the one to the left of the currently selected segment. For the first segment, the selection wraps around to the last segment of the control.

32.44.10 selectSegmentWithTag(Tag as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Selects the segment with the specified tag.
Notes:

tag: The tag associated with the desired segment.
True if the segment was selected successfully; otherwise, false.

Typically, you use Interface Builder to specify the tag for each segment. You may also set this value programmatically using the setTag:forSegment: method of NSSegmentedCell.

32.44.11 Properties

32.44.12 cellTrackingMode as Integer

MBS MacCocoa Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The tracking mode used for the segments of the receiver.
Notes:

Possible values for trackingMode are described in NSSegmentSwitchTracking. The default value is NSSegmentSwitchTrackingSelectOne.

This property was named only trackingMode in 15.1 and older plugins.
(Read and Write property)

32.44.13 doubleValueForSelectedSegment as Double

MBS MacCocoa Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Query the double value for selected segment.
Notes:

This message is valid only for trackingMode = NSSegmentSwitchTrackingMomentaryAccelerator and provides the double value for the selected segment.
Available on Mac OS X 10.10.3.
(Read only property)

32.44.14 segmentCount as Integer

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of segments in the receiver.
Notes: (Read and Write property)

32.44.15 segmentStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The visual style used to display the receiver.
Notes:

See style constants.
Available in Mac OS X v10.5 and later.
(Read and Write property)

32.44.16 selectedSegment as Integer

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The index of the selected segment of the receiver.
Notes:

The index of the currently selected segment or -1 if no segment is selected. If the receiver allows multiple selections, this method returns the most recently selected segment.
(Read and Write property)

32.44.17 springLoaded as Boolean

MBS MacCocoa Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sends action on deep-press or extended hover while dragging.
Notes:

Defaults to false.
(Read and Write property)

32.44.18 trackingMode as Integer

MBS MacCocoa Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The type of tracking behavior the control exhibits.
Notes:

An NSSegmentSwitchTracking value specifies how the control responds when the user presses a keyboard key or clicks, force clicks (applies pressure in a pressure-sensitive system), releases pressure, and so on.

see NSSegmentSwitchTracking* constants.
Available on Mac OS X 10.10.3 and newer.
(Read and Write property)

32.44.19 imageForSegment(segment as Integer) as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The image for the specified segment.
Notes:

image: The image to apply to the segment or nil if you want to clear the existing image. Images are not scaled to fit inside a segment. If the image is larger than the available space, it is clipped.
segment: The index of the segment whose image you want to set. This method raises an NSRangeException if the index is out of bounds.

(Read and Write computed property)

32.44.20 imageScalingForSegment(segment as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The scaling mode used to display the specified segment's image.
Notes:

scaling: One of the image scaling constants. For a list of possible values, see constants.
segment: The index of the segment whose enabled state you want to get. This method raises an NSRangeException if the index is out of bounds.
Available in Mac OS X v10.5 and later.
(Read and Write computed property)

32.44.21 isEnabledForSegment(segment as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The enabled state of the specified segment.
Notes:

True to enable the segment; otherwise, false to disable it.
segment: The index of the segment you want to enable or disable. This method raises an NSRangeException if the index is out of bounds.
(Read and Write computed property)

32.44.22 isSelectedForSegment(segment as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The selection state of the specified segment.
Notes:

True if you want to select the segment; otherwise, false.

segment: The index of the segment whose selection state you want to set. This method raises an NSRangeException if the index is out of bounds.

If the receiver allows only a single selection, this method deselects any other selected segments.
(Read and Write computed property)

32.44.23 labelForSegment(segment as Integer) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The label for the specified segment.
Notes:

label: The label you want to display in the segment. If the width of the string is greater than the width of the segment, the string's text is truncated during drawing.
segment: The index of the segment whose label you want to set. This method raises an NSRangeException if the index is out of bounds.
(Read and Write computed property)

32.44.24 menuForSegment(segment as Integer) as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The menu for the specified segment.
Notes:

menu: The menu you want to add to the segment or nil to clear the current menu. This menu is displayed when the user clicks and holds the mouse button while the mouse is over the segment.
segment: The index of the segment whose menu you want to set. This method raises an NSRangeException if the index is out of bounds.

Adding a menu to a segment allows that segment to be used as a pop-up button.
(Read and Write computed property)

32.44.25 tagForSegment(segment as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The tag value for the segment.
Notes:

segment: The index of the segment whose width you want to get. This method raises an NSRangeException if the index is out of bounds.

The tag is an integer you define to identify your items.
(Read and Write computed property)

32.44.26 ToolTipForSegment(segment as Integer) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The tool tip for the specified segment.

Notes:

segment: The index of the segment whose tool tip you want to set. This method raises an NSRangeException if the index is out of bounds.

Tool tips are currently not displayed. Apple may change that in the future.
(Read and Write computed property)

32.44.27 widthForSegment(segment as Integer) as Double

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The width of the specified segment.
Notes:

width: The width of the segment, measured in points. Specify the value 0 if you want the segment to be sized to fit the available space automatically.
segment: The index of the segment whose width you want to set. This method raises an NSRangeException if the index is out of bounds.
(Read and Write computed property)

32.44.28 Constants

32.44.29 NSImageScaleAxesIndependently = 1

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants specify a cell's image scaling behavior.
Notes:

Scale each dimension to exactly fit destination.
This setting does not preserve the aspect ratio of the image.
Available in Mac OS X v10.5 and later.

32.44.30 NSImageScaleNone = 2

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants specify a cell's image scaling behavior.
Notes:

Do not scale the image.
Available in Mac OS X v10.5 and later.

32.44.31 NSImageScaleProportionallyDown = 0

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants specify a cell's image scaling behavior.
Notes:

If it is too large for the destination, scale the image down while preserving the aspect ratio.
Available in Mac OS X v10.5 and later.

32.44.32 NSImageScaleProportionallyUpOrDown = 3

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants specify a cell's image scaling behavior.
Notes:

Scale the image to its maximum possible dimensions while both staying within the destination area and preserving its aspect ratio.
Available in Mac OS X v10.5 and later.

32.44.33 NSSegmentStyleAutomatic = 0

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants to specify the visual style used to display the segmented control.
Notes:

The appearance of the segmented control is automatically determined based on the type of window in which the control is displayed and the position within the window.
Available in Mac OS X v10.5 and later.

32.44.34 NSSegmentStyleRounded = 1

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants to specify the visual style used to display the segmented control.
Notes:

The control is displayed using the rounded style.
Available in Mac OS X v10.5 and later.

32.44.35 NSSegmentStyleRoundRect = 2

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants to specify the visual style used to display the segmented control.
Notes:

The control is displayed using the round rect style.
Available in Mac OS X v10.5 and later.

32.44.36 NSSegmentStyleSmallSquare = 6

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants to specify the visual style used to display the segmented control.
Notes:

The control is displayed using the small square style.
Available in Mac OS X v10.5 and later.

32.44.37 NSSegmentStyleTexturedSquare = 4

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants to specify the visual style used to display the segmented control.
Notes:

The control is displayed using the textured square style.
Available in Mac OS X v10.5 and later.

32.44.38 NSSegmentSwitchTrackingMomentary = 2

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants for switch tracking.
Notes: A segment is selected only when tracking.

32.44.39 NSSegmentSwitchTrackingMomentaryAccelerator = 3

MBS MacCocoa Plugin, Plugin Version: 15.2. **Function:** One of the constants for switch tracking.
Notes: accelerator behavior, only selected while tracking.

32.44.40 NSSegmentSwitchTrackingSelectAny = 1

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants for switch tracking. **Notes:** Any segment can be selected.

32.44.41 NSSegmentSwitchTrackingSelectOne = 0

MBS MacCocoa Plugin, Plugin Version: 12.1. **Function:** One of the constants for switch tracking. **Notes:** Only one segment may be selected.

32.45 class NSSliderMBS

32.45.1 class NSSliderMBS

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An NSSlider object displays a range of values for something in the application.
Notes:

Sliders can be vertical or horizontal bars or circular dials. An indicator, or knob, notes the current setting. The user can move the knob in the slider's bar—or rotate the knob in a circular slider—to change the setting.

The NSSlider class uses the NSSliderCell class to implement its user interface.
Subclass of the NSControlMBS class.

32.45.2 Methods

32.45.3 acceptsFirstMouse(event as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes:

The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

32.45.4 closestTickMarkValueToValue(value as Double) as Double

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the value of the tick mark closest to the specified value.

32.45.5 Constructor

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new slider with size 100/100 and position 0/0
Example:

```
dim t as new NSSliderMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.45.6 Constructor(Handle as Integer) 7029
- 32.45.7 Constructor(left as Double, top as Double, width as Double, height as Double) 7029

32.45.6 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSSlider handle.
Example:

```
dim t as new NSSliderMBS(0, 0, 100, 100)
dim v as new NSSliderMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSSlider and the plugin retains this handle.
See also:

- 32.45.5 Constructor 7029
- 32.45.7 Constructor(left as Double, top as Double, width as Double, height as Double) 7029

32.45.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new slider with the given size and position.
Example:

```
dim x as new NSSliderMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.45.5 Constructor 7029
- 32.45.6 Constructor(Handle as Integer) 7029

32.45.8 indexOfTickMarkAtPoint(p as NSPointMBS) as Integer

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the tick mark closest to the location of the receiver represented by the given point.
Notes:

Returns the index of the tick mark closest to the location specified by point. If point is not within the bounding rectangle (plus an extra pixel of space) of any tick mark, the method returns NSNotFound.
In its implementation of this method, the receiving NSSlider instance simply invokes the method of the same name of its NSSliderCell instance. This method invokes rectOfTickMarkAtIndex: for each tick mark on the slider until it finds a tick mark containing the point.
See also:

- 32.45.9 indexOfTickMarkAtPoint(x as Double, y as Double) as Integer 7030

32.45.9 indexOfTickMarkAtPoint(x as Double, y as Double) as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the tick mark closest to the location of the receiver represented by the given point.
Notes: The index of the tick mark closest to the location specified by point. If point is not within the bounding rectangle (plus an extra pixel of space) of any tick mark, the method returns NSNotFound (& h7fffffff).
See also:

- 32.45.8 indexOfTickMarkAtPoint(p as NSPointMBS) as Integer 7030

32.45.10 isVertical as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns an integer indicating the orientation (horizontal or vertical) of the slider.
Notes: 1 if the receiver is vertical, 0 if it's horizontal, and –1 if the orientation can't be determined (for example, if the slider hasn't been displayed yet). A slider is defined as vertical if its height is greater than its width.

32.45.11 rectOfTickMarkAtIndex(index as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the bounding rectangle of the tick mark at the given index.
Notes: If no tick mark is associated with index, the method raises NSRangeException.

32.45.12 tickMarkValueAtIndex(index as Integer) as Double

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the receiver's value represented by the tick mark at the specified index.

32.45.13 Properties

32.45.14 allowsTickMarkValuesOnly as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the receiver fixes its values to those values represented by its tick marks.
Notes:

True if the slider fixes its values to the values represented by its tick marks; otherwise, false.
(Read and Write computed property)

32.45.15 altIncrementValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The amount by which the receiver changes its value when the user Option–drags the slider knob.
Notes:

The amount by which the value changes when the user drags the slider knob with the Option key held down. Unless you assign a value to AltIncrementValue, altIncrementValue returns –1.0, and the receiver behaves no differently with the Option key down than with it up.
(Read and Write computed property)

32.45.16 image as NSImageMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: This method has been deprecated. Returns nil.
Notes:

The slider may scale and distort barImage to fit inside the bar.

The knob may cover part of the image. If you want the image to be visible all the time, you're better off placing it near the slider.

This method has been deprecated by Apple.
(Read and Write computed property)

32.45.17 knobThickness as Double

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The knob's thickness, in pixels.
Notes:

The thickness of the slider knob. The thickness is defined to be the extent of the knob along the long dimension of the bar. In a vertical slider, then, a knob's thickness is its height; in a horizontal slider, a knob's thickness is its width.
(Read and Write computed property)

32.45.18 maxValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The maximum value the receiver can send to its target.
Notes:

The slider's maximum value. A horizontal slider sends its maximum value when the knob is at the right end of the bar; a vertical slider sends it when the knob is at the top.
(Read and Write computed property)

32.45.19 minValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: the minimum value the receiver can send to its target.
Notes:

The slider's minimum value. A vertical slider sends its minimum value when its knob is at the bottom; a horizontal slider, when its knob is all the way to the left.
(Read and Write computed property)

32.45.20 numberOfTickMarks as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The number of tick marks associated with the receiver.
Notes:

The number of the slider's tick marks.The tick marks assigned to the minimum and maximum values are included.
(Read and Write computed property)

32.45.21 sliderType as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The slider type.
Notes:

Either NSLinearSlider or NSCircularSlider.
(Read and Write computed property)

32.45.22 tickMarkPosition as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: How the receiver's tick marks are aligned with it.
Notes:

A constant indicating the position of the tick marks. Possible values are NSTickMarkBelow, NSTickMarkAbove, NSTickMarkLeft, and NSTickMarkRight (the last two are for vertical sliders). The default alignments are NSTickMarkBelow and NSTickMarkLeft.
(Read and Write computed property)

32.45.23 title as string

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The receiver's title.
Notes:

The default title is the empty string.
(Read and Write computed property)

32.45.24 titleCell as NSCellMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the cell used to draw the receiver's title.
Notes:

You only need to invoke this method if the default title cell, NSTextFieldCell, doesn't suit your needs—that is, you want to display the title in a manner that NSTextFieldCell doesn't permit. When you do choose to override the default, titleCell should be an instance of a subclass of NSTextFieldCell.

This method has been deprecated by Apple.
(Read and Write computed property)

32.45.25 titleColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the color used to draw the receiver's title.
Notes:

This method has been deprecated by Apple.
(Read and Write computed property)

32.45.26 titleFont as NSFontMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the font used to draw the receiver's title.
Notes:

This method has been deprecated by Apple.
(Read and Write computed property)

32.45.27 Constants

32.45.28 NSCircularSlider=1

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the slider type constants.
Notes: A circular slider; that is, a dial.

32.45.29 NSLinearSlider=0

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the slider type constants.
Notes: A bar-shaped slider.

32.45.30 NSTickMarkAbove=1

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the tickMarkPosition property.
Notes: Tick marks above (for horizontal sliders).

32.45.31 NSTickMarkBelow=0

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the tickMarkPosition property.
Notes: Tick marks below (for horizontal sliders); the default for horizontal sliders.

32.45.32 NSTickMarkLeft=1

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the tickMarkPosition property.
Notes: Tick marks to the left (for vertical sliders); the default. for vertical sliders

32.45.33 NSTickMarkRight=0

MBS MacControls Plugin, Plugin Version: 8.4. **Function:** One of the values for the tickMarkPosition property.
Notes: Tick marks to the right (for vertical sliders).

32.46 class NSStepperMBS

32.46.1 class NSStepperMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A stepper consists of two small arrows that can increment and decrement a value that appears beside it, such as a date or time.
Notes:

The illustration below shows a stepper to the right of a text field, which would show the stepper's value.
Subclass of the NSControlMBS class.

32.46.2 Methods

32.46.3 Constructor

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new stepper with size 100/100 and position 0/0
Example:

```
dim t as new NSStepperMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.46.4 Constructor(Handle as Integer) 7036
- 32.46.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7037

32.46.4 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSStepper handle.
Example:

```
dim t as new NSStepperMBS(0, 0, 100, 100)
dim v as new NSStepperMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSStepper and the plugin retains this handle.
See also:

- 32.46.3 Constructor 7036
- 32.46.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7037

32.46.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new stepper with the given size and position.
Example:

```
dim x as new NSStepperMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.46.3 Constructor 7036
- 32.46.4 Constructor(Handle as Integer) 7036

32.46.6 Properties

32.46.7 autorepeat as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating how the receiver responds to mouse events.
Notes:

True if the first mouse down does one increment (or decrement) and, after a delay of 0.5 seconds, increments (or decrements) at a rate of ten times per second. False if the receiver does one increment (decrement) on a mouse up. The default is true.
(Read and Write computed property)

32.46.8 increment as Double

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The amount by which the receiver will change per increment (decrement).
Notes: (Read and Write computed property)

32.46.9 maxValue as Double

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The maximum value.
Notes: (Read and Write computed property)

32.46.10 minValue as Double

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The minimum value.
Notes: (Read and Write computed property)

32.46.11 valueWraps as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver wraps around the minimum and maximum values.
Notes:

If true, then when incrementing or decrementing, the value wraps around to the minimum or maximum. If valueWraps is false, the value stays pinned at the minimum or maximum.

For example for an angle where 359 increases to 0.
(Read and Write computed property)

32.47 class NSTableColumnMBS

32.47.1 class NSTableColumnMBS

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An NSTableColumn stores the display characteristics and attribute identifier for a column in an NSTableView.
Notes: The NSTableColumn determines the width and width limits, resizability, and editability of its column in the NSTableView. It also stores two NSCell objects: the header cell, which is used to draw the column header, and the data cell, used to draw the values for each row. You can control the display of the column by setting the subclasses of NSCell used and by setting the font and other display characteristics for these NSCells. For example, you can use the default NSTextFieldCell for displaying string values or substitute an NSImageCell to display pictures.

32.47.2 Blog Entries

- MBS Real Studio Plugins, version 12.0pr5

32.47.3 Xojo Developer Magazine

- 14.4, page 27: NSTabula Rasa, What to do when your new sports car arrives in parts by Ulrich Bogun

32.47.4 Methods

32.47.5 Constructor(identifier as string)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes a NSTableColumn with identifier as its identifier and with an NSTextFieldCell as its data cell.

32.47.6 dataCellForRow(row as Integer) as NSCellMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the NSCell object used by the NSTableView to draw values for the receiver.
Notes: NSTableView always calls this method. By default, this method just calls dataCell. Subclassers can override if they need to potentially use different cells for different rows. Subclasses should expect this method to be invoked with row equal to –1 in cases where no actual row is involved but the table view needs to get some generic cell info.

32.47.7 sizeToFit

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Resizes the receiver to fit the width of its header cell.
Notes: If the maximum width is less than the width of the header, the maximum is increased to the header's width. Similarly, if the minimum width is greater than the width of the header, the minimum is reduced to the header's width. Marks the NSTableView as needing display if the width actually changes.

32.47.8 Properties

32.47.9 dataCell as NSCellMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The NSCell object used by the NSTableView to draw values for the receiver.
Notes:

You can use this property to control the font, alignment, and other text attributes for an NSTableColumn. You can also assign a cell to display things other than text—for example, an NSImageCell to display images.
(Read and Write property)

32.47.10 Editable as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Controls whether the user can edit cells in the receiver by double-clicking them.
Notes:

If value is true a double click initiates editing; if flag is false it merely sends the double-click event to the NSTableView. You can initiate editing programmatically regardless of this setting with NSTableView's editColumn() method.
(Read and Write property)

32.47.11 headerCell as NSTableHeaderCellMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The NSCell used to draw the receiver's header to aCell.
Notes: (Read and Write property)

32.47.12 headerToolTip as string

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The tooltip string that is displayed when the cursor pauses over the header cell of the receiver.
Notes: (Read and Write property)

32.47.13 Hidden as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the column is hidden.
Notes: (Read and Write property)

32.47.14 identifier as string

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The object used by the data source to identify the attribute corresponding to the receiver.
Notes: (Read and Write property)

32.47.15 maxWidth as Double

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The maximum width.
Notes:

Setting this value will also adjusting the current width if it's greater than this value.
(Read and Write property)

32.47.16 minWidth as Double

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The minimum width.
Notes:

Setting this value will also adjusting the current width if it's less than this value.
(Read and Write property)

32.47.17 Resizable as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this column can be resized.
Notes: (Read and Write property)

32.47.18 resizingMask as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Defines the resizing mode for this column.
Notes:

Use kNoResizing, kAutoresizingMask and kUserResizingMask constants.
(Read and Write property)

32.47.19 sortDescriptorPrototype as NSSortDescriptorMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The table column's sort descriptor prototype.
Notes:

A table column is considered sortable if it has a sort descriptor that specifies the sorting direction, a key to sort by, and a selector that defines how to sort.
(Read and Write property)

32.47.20 tableView as NSTableViewMBS

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The owner tableview.
Notes: (Read and Write property)

32.47.21 title as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The title of the table column's header.
Notes: (Read and Write property)

32.47.22 width as Double

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The width of the column.
Notes: (Read and Write property)

32.47.23 Constants

32.47.24 NSTableColumnAutoresizingMask=1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the resizing modes available for the table column.
Notes:

Allows the table column to resize automatically in response to resizing the tableview. Enabling this option is the same as enabling the "Live Resizable" option in Interface Builder. The resizing behavior for the table view is set using the NSTableView method setColumnAutoresizingStyle:.
Available in Mac OS X v10.4 and later.

32.47.25 NSTableColumnNoResizing=0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the resizing modes available for the table column.
Notes:

Prevents the table column from resizing.
Available in Mac OS X v10.4 and later.

32.47.26 NSTableColumnUserResizingMask=2

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants specify the resizing modes available for the table column.
Notes:

Allows the table column to be resized explicitly by the user. Enabling this option is the same as enabling the "User Resizable" option in Interface Builder.
Available in Mac OS X v10.4 and later.

32.48 control NSTableControlMBS

32.48.1 control NSTableControlMBS

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control for a NSTableView.
Notes: Please use NSOutlineControlMBS for hierarchical lists and NSTableControlMBS for normal lists.

32.48.4 Properties

32.48.5 AcceptTabs as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether the control should accept tab keys.
Notes:

If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

32.48.6 allowsColumnReordering as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the table view allows the user to rearrange columns by dragging their headers.
Notes:

The default value of this property is true, which allows the user to rearrange the table view's columns. You can rearrange columns programmatically regardless of this setting.
(Read and Write property)

32.48.7 allowsColumnResizing as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the table view allows the user to resize columns by dragging between their headers.
Notes:

The default of this property is true, which allows the user to resize the table view's columns. You can resize columns programmatically regardless of this setting.
(Read and Write property)

32.48.8 allowsColumnSelection as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the table view allows the user to select columns by clicking their headers.
Notes:

The default is false, which prevents the user from selecting columns (if you create the table view in Interface Builder, the default value is true). You can select columns programmatically regardless of this setting.
(Read and Write property)

32.48.9 allowsEmptySelection as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the table view allows the user to select zero columns or rows.
Notes:

The default is true, which allows the user to select zero columns or rows.
(Read and Write property)

32.48.10 allowsMultipleSelection as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the table view allows the user to select more than one

column or row at a time.
Notes:

The default is false, which allows the user to select only one column or row at a time. You can select multiple columns or rows programmatically regardless of this setting.
(Read and Write property)

32.48.11 autohidesScrollers as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean that indicates whether the scroll view automatically hides its scroll bars when they are not needed.
Notes:

The horizontal and vertical scroll bars are hidden independently of each other. When the value of this property is YES and the content of the scroll view doesn't extend beyond the size of the clip view on a given axis, the scroller on that axis is removed to leave more room for the content.
(Read and Write property)

32.48.12 disableCellEvents as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether to disable cell based events.
Notes:

The table view can work with cell modes and use NSCell to disable cells.
Or since OS X 10.7 it can work with NSView to display cells or rows.
This property lets you explicitly disable cells and use only views.
(Read and Write property)

32.48.13 disableViewEvents as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether to disable view based events.
Notes:

The table view can work with cell modes and use NSCell to disable cells.
Or since OS X 10.7 it can work with NSView to display cells or rows.
This property lets you explicitly disable views and use only cells.
(Read and Write property)

32.48.14 hasHorizontalScroller as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean that indicates whether the scroll view has a horizontal scroller.
Notes:

When the value of this property is true, the scroll view allocates and displays a horizontal scroller as needed. The default value of this property is false.
(Read and Write property)

32.48.15 hasVerticalScroller as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean that indicates whether the scroll view has a vertical scroller.
Notes:

When the value of this property is true, the scroll view allocates and displays a vertical scroller as needed. The default value of this property is false.
(Read and Write property)

32.48.16 ScrollView as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The scroll view used in this control.
Notes: (Read only property)

32.48.17 View as NSTableViewMBS

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The table view used in this control.
Notes: (Read only property)
See also:

- 32.48.80 view(tableColumn as NSTableColumnMBS, row as Integer) as NSViewMBS 7066

32.48.18 Events

32.48.19 acceptDrop(info as NSDraggingInfoMBS, row as Integer, dropOperation as Integer) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called by TableView when the mouse button is released over a table view that previously decided to allow a drop.
Notes:

info: An object that contains more information about this dragging operation.
row: The index of the proposed target row.
operation: The type of dragging operation.

Returns true if the drop operation was successful, otherwise false.

The data source should incorporate the data from the dragging pasteboard in the implementation of this method. You can use the draggingPasteboard method to get the data for the drop operation from info.
To accept a drop on the second row, row would be 2 and operation would be NSTableViewDropOn. To accept a drop below the last row, row would be TableView.numberOfRows and operation would be NSTableViewDropAbove.

32.48.20 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the bounds, but not the frame, changed.

32.48.21 ColumnDidMove(notification as NSNotificationMBS, oldColumn as Integer, newColumn as Integer)

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event informs the delegate that a column was moved by user action in the table view.

32.48.22 ColumnDidResize(notification as NSNotificationMBS, tableColumn as NSTableColumnMBS, OldWidth as Double)

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event informs you that a column was resized in the table view.

32.48.23 dataCell(tableColumn as NSTableColumnMBS, row as Int64) as NSCellMBS

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Optional return a different cells for each row.
Notes:

A different data cell can be returned for any particular tableColumn and row, or a cell that will be used for the entire row (a full width cell). The returned cell should properly implement copyWithZone:, since the cell may be copied by NSTableView. If the tableColumn is non-nil, and nil is returned, then the table will use the default cell from tableColumn.dataCellForRow(Row).

When each row is being drawn, this method will first be called with a nil tableColumn. At this time, you can return a cell that will be used to draw the entire row, acting like a group. If you do return a cell for the 'nil' tableColumn, be prepared to have the other corresponding datasource and delegate methods to be called with a 'nil' tableColumn value. If don't return a cell, the method will be called once for each tableColumn in the tableView, as usual.

32.48.24 didAddRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that a row view was added at the specified row.
Notes:

rowView: The row view.
row: The index of the row.

At this point, the delegate can add extra views, or modify the properties of rowView.

This method is only valid for NSView-based table views.

32.48.25 didClickTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called if a table column was clicked on.

32.48.26 didDragTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent at the time the mouse button goes up in tableView and tableColumn has been dragged during the time the mouse button was down.
Notes:

tableColumn: The table column.

The behavior of this method on Mac OS X v10.5 is different from prior versions. On Mac OS X v 10.5 the dragged column is sent to the subclass. In earlier versions the table column that is currently located at the dragged column's original index is sent.

32.48.27 didRemoveRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that a row view was removed from the table at the specified row.
Notes:

rowView: The row view.
row: The index of the row.

If row equals -1, the row is being deleted from the table and is no longer a valid row; otherwise row is a valid row that is being removed by being moved off screen.

This method is only valid for NSView-based table views.

32.48.28 didTile

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The tableview did tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

32.48.29 DoubleClick

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse made a double click.

32.48.30 draggingSessionEnded(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this method to determine when a dragging session has ended.

Notes:

session: The dragging session.
screenPoint: The ending drag location in screen coordinates.
operation: The drag operation. See NSDragOperation for supported values.

This delegate method can be used to determine when the dragging source operation ended at a specific location, such as the trash, by checking for an operation of NSDragOperationDelete.

32.48.31 draggingSessionWillBegin(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, rowIndexes as NSIndexSetMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this method to determine when a dragging session will begin.
Notes:

session: The dragging session.
screenPoint: The initial drag location in screen coordinates.
rowIndexes: The indexes of the rows to be dragged, excluding rows that were not dragged due to pasteboardItemForRow returning nil.

Implement this method to know when the dragging session is about to begin and to potentially modify the dragging session.
The dragged item order will directly match the pasteboard writer array used to begin the dragging session with the NSView method beginDraggingSessionWithItems. Hence, the order is deterministic, and can be used in acceptDrop when enumerating the NSDraggingInfo pasteboard classes.

32.48.32 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event where you can enable menu items.

32.48.33 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the frame changed.

32.48.34 GotFocus

MBS MacControls Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

32.48.35 heightOfRow(row as Int64) as Double

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this event to support a table with varying row heights.
Notes: The height returned by this method should not include intercell spacing and must be greater than zero. Performance Considerations: For large tables in particular, you should make sure that this method is efficient. NSTableView may cache the values this method returns, but this should NOT be depended on, as all values may not be cached. To signal a row height change, call noteHeightOfRowsWithIndexesChanged. For a given row, the same row height should always be returned until noteHeightOfRowsWithIndexesChanged is called, otherwise unpredicable results will happen. NSTableView automatically invalidates its entire row height cache in reloadData, and noteNumberOfRowsChanged.

32.48.36 isGroupRow(row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the delegate to indicate that a specified row is a group row.
Notes:

row: The row index.

Return true if the specified row should have the group row style drawn, false otherwise.

If the cell in row is an NSTextFieldCell and contains only a string, the group row style attributes will automatically be applied to the cell.

Group rows in view-based table views can be made to visually 'float' by setting the tableview method setFloatsGroupRows to true.

Note: When configured as a source list style table view, rows identified as group rows draw with a specific style unique for source lists.
Available in Mac OS X v10.5 and later.

32.48.37 LeftMouseDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has pressed the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.48.38 LeftMouseDragged(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has moved the mouse with the left button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.48.39 LeftMouseUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has released the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.48.40 LostFocus

MBS MacControls Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

32.48.41 MenuAction(HitItem as MenuItem) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

32.48.42 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was pressed inside the control's region at the location passed in to x, y.

Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

32.48.43 mouseDownInHeaderOfTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent to the subclass whenever the mouse button is clicked in the table view's header column.
Notes: tableColumn: The table column.

32.48.44 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

32.48.45 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

32.48.46 namesOfPromisedFilesDroppedAtDestination(dropDestination as folderItem, DraggedRowsWithIndexes as NSIndexSetMBS) as string()

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns an array of filenames that represent the indexSet rows for a drag to dropDestination.
Notes:

dropDestination: The drop location where the files are created.
indexSet: The indexes of the items being dragged.

Returns an array of filenames (not full paths) for the created files that the receiver promises to create.

This method is called when a destination has accepted a promise drag.
For more information on file promise dragging, see documentation on the NSDraggingSource protocol and namesOfPromisedFilesDroppedAtDestination:.

32.48.47 nextTypeSelectMatchFromRow(startRow as Int64, endRow as Int64, searchString as string) as Int64

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the subclass to modify how type selection works.
Notes:

startRow: The starting row of the search range.
endRow: The ending row of the search range.
searchString: A string containing the typed selection.

Return the first row in the range of startRow through endRow (excluding endRow itself) that matches selectionString. Return -1 if no match is found.

It is possible for endRow to be less than startRow if the search will wrap.
Available in Mac OS X v10.5 and later.

32.48.48 numberOfRowsInTableView as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when the table view needs to know the number of rows.
Notes: numberOfRowsInTableView is called very frequently, so it must be efficient.

32.48.49 objectValue(column as NSTableColumnMBS, row as Integer) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when a value is required for a given cell.
Notes: Please implement your own arrays to store values.

32.48.50 OtherMouseDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has pressed a mouse button other than the left or right one.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.48.51 OtherMouseDragged(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has moved the mouse with a button other than the left or right button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.48.52 OtherMouseUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has released a mouse button other than the left or right button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.48.53 pasteboardItemForRow(row as Integer) as NSPasteboardItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called to allow the table to support multiple item dragging.
Notes:

row: The row.

Returns an instance of NSPasteboardItem. Returning nil excludes the row from being dragged.

This method is required for multi-image dragging.
If this method is implemented, then writeRowsWithIndexes will not be called.

32.48.54 RightMouseDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the view that the user has pressed the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.48.55 RightMouseDragged(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has moved the mouse with the right button pressed .
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.48.56 RightMouseUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has released the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

32.48.57 rowActionsForRow(row as Integer, edge as Integer) as NSTableViewRowActionMBS()

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks the control to provide an array of row actions to be attached to the specified edge of a table row and displayed when the user swipes horizontally across the row.
Notes:

row: The index of the target row.
edge: The edge (NSTableRowActionEdgeLeading or NSTableRowActionEdgeTrailing) for which row actions are requested. This is based on the direction in which the user swiped on the row. Swiping to the right results in an edge value of leading. Swiping to the left results in an edge value of trailing.

Returns an array of row actions (of class NSTableViewRowActionMBS) to be enabled on the specified edge of the table row.

Implement this method if your table row supports actions that are displayed when the user swipes horizontally across the row. For example, your table view could use this method to implement a swipe left to delete function in your table rows. When called, this method receives the table view, the index of the row the user swiped, and an edge of type NSTableRowActionEdge. The method should return an array of any row actions of class NSTableViewRowAction that are supported for the specified edge. If no row actions are available, an empty array should be returned.
If this method isn't implemented, then the table row displays no actions when the user swipes horizontally away from the specified edge.

32.48.58 rowViewForRow(row as Integer) as NSTableRowViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks the delegate for a view to display the specified row.
Notes:

row: The row index.

Return an instance or subclass of NSTableRowView. If nil is returned, an NSTableRowView instance will be created and used.

You can implement this event to return a custom NSTableRowView for row.
The reuse queue can be used in the same way as documented in tableView:view:row:. The returned view will have attributes properly set to it before it's added to the tableView.

This method is only valid for NSView-based table views.

32.48.59 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

32.48.60 SelectionDidChange(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event informs you that the table view's selection has changed.

32.48.61 selectionIndexesForProposedSelection(proposedSelectionIndexes as NSIndexSetMBS) as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the delegate to modify the proposed selection.
Notes:

proposedSelectionIndexes: An index set containing the indexes of the proposed selection.

Return an NSIndexSet instance containing the indexes of the new selection. Return proposedSelectionIndexes if the proposed selection is acceptable, or the value of the table view's existing selection to avoid changing the selection.

This method may be called multiple times with one new index added to the existing selection to find out if a particular index can be selected when the user is extending the selection with the keyboard or mouse.

Implementation of this method is optional. If implemented, this method will be called instead of shouldSelectRow.
Available in Mac OS X v10.5 and later.

32.48.62 SelectionIsChanging(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event informs you that the table view's selection is in the process of changing (typically because the user is dragging the mouse across a number of rows).

32.48.63 selectionShouldChangeInTableView as boolean

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the selection should change.
Notes:

Return true to allow the table view to change its selection (typically a row being edited), false to deny selection change.

The user can select and edit different cells within the same row, but can't select another row unless the delegate approves. The subclass can implement this method for complex validation of edited rows based on the values of any of their cells.

32.48.64 setObjectValue(value as Variant, column as NSTableColumnMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when a cell value is saved to the datasource.

32.48.65 shouldEditTableColumn(tableColumn as NSTableColumnMBS, row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the cell at the specified row and column can be edited.
Notes:

TableColumn: The table column.
rowIndex: The row index.
Return true to allow editing the cell, false to deny editing.

The subclass can implement this method to disallow editing of specific cells.
Note: This method is only valid for cell-based table views.

32.48.66 shouldReorderColumn(columnIndex as Int64, newColumnIndex as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent to the subclass to allow or prohibit the specified column to be dragged to a new location.
Notes:

columnIndex: The index of the column being dragged.
newColumnIndex: The proposed target index of the column.

Return true if the column reordering should be allowed, otherwise false.

When a column is initially dragged by the user, the delegate is first called with a newColumnIndex value of -1. Returning false will disallow that column from being reordered at all. Returning true allows it to be reordered, and the delegate will be called again when the column reaches a new location.

The actual NSTableColumn instance can be retrieved from the tableColumns array.

If this method is not implemented, all columns are considered reorderable.
Available in Mac OS X v10.6 and later.

32.48.67 shouldSelectRow(row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the table view should allow selection of the specified row.
Notes:

rowIndex: The row index.

Return true to permit selection of the row, false to deny selection.

The delegate can implement this method to disallow selection of particular rows.
For better performance and finer-grain control over the selection, use selectionIndexesForProposedSelection.

32.48.68 shouldSelectTableColumn(tableColumn as NSTableColumnMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the specified table column can be selected.
Notes:

TableColumn: The table column.

Return true to permit selection, otherwise false.

The subclass can implement this event to disallow selection of particular columns.

32.48.69 shouldShowCellExpansion(tableColumn as NSTableColumnMBS, row as Int64) as Boolean

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the subclass to control cell expansion for a specific row and column.
Notes:

TableColumn: The table column.
row: The row index.

Return true if the tooltip cell should expand, false otherwise.

Cell expansion can occur when the mouse hovers over the specified cell and the cell contents are unable to be fully displayed within the cell. If this method returns true, the full cell contents will be shown in a special floating tool tip view, otherwise the content is truncated.

Note: This method is only valid for cell-based table views.

Available in Mac OS X v10.5 and later.

32.48.70 shouldTrackCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, row as Int64) as Boolean

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the subclass to control the tracking behavior for a specific cell.
Notes:

cell: The cell to track.
tableColumn: The table column.
row: A row in tableView.

Returns true if the cell should track, false otherwise.

Normally, only selectable or selected cells can be tracked. If you implement this method, cells which are not selectable or selected can be tracked, and vice-versa.

For example, this allows you to have an NSButtonCell in a table which does not change the selection, but can still be clicked on and tracked.

Note: This method is only valid for cell-based table views.

Available in Mac OS X v10.5 and later.

32.48.71 shouldTypeSelectForEvent(e as NSEventMBS, searchString as string) as Boolean

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the subclass to control type select for a specific event.
Notes:

event: The event.
searchString: The search string or nil if no type select has began.

Return true to allow type select for event, false otherwise.

Typically, this is called from the table view keyDown implementation and the event will be a key event.
Available in Mac OS X v10.5 and later.

32.48.72 sizeToFitWidthOfColumn(column as Int64) as Double

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the subclass to provide custom sizing behavior when a column's resize divider is double clicked.
Notes:

column: The index of the column.

Returns the width of the specified column.

By default, NSTableView iterates every row in the table, accesses a cell via preparedCellAtColumn, and requests the cellSize to find the appropriate largest width to use.

For accurate results and performance, it is recommended that this method is implemented when using large tables. By default, large tables use a monte carlo simulation instead of iterating every row.

Available in Mac OS X v10.6 and later.

32.48.73 sortDescriptorsDidChange(oldDescriptors() as NSSortDescriptorMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called by TableView to indicate that sorting may need to be done.
Notes: The data source typically sorts and reloads the data, and adjusts the selections accordingly. If you need to know the current sort descriptors and the data source doesn't manage them itself, you can get the current sort descriptors by calling TableView.sortDescriptors function.

32.48.74 textShouldBeginEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow.

32.48.75 textShouldEndEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow.

32.48.76 toolTipForCell(cell as NSCellMBS, r as NSRectMBS, tableColumn as NSTableColumnMBS, row as Int64, mouseLocation as NSPointMBS) as string

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a string that is displayed as a tooltip for the specified cell in the column and row.
Notes:

Cell: The cell.
r: The proposed active area of the tooltip. You can modify rect to provide an alternative active area.
TableColumn: The table column.
row: The row index.
mouseLocation: The mouse location.

Return a string containing the tooltip. Return empty string if no tooltip is desired.

By default, rect is computed as cell.drawingRectForBounds(cellFrame).
Available in Mac OS X v10.4 and later.

32.48.77 typeSelectString(tableColumn as NSTableColumnMBS, row as Int64) as string

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the subclass to provide an alternate text value used for type selection for a specified row and column.
Notes:

tableColumn: The table column.
row: The row index.

Returns a string that is used in type select comparison for row and tableColumn. Return "" if the row or tableColumn should not be searched.

Implement this method to change the string value that is searched for based on what is displayed. By default,

all cells with text in them are searched.

If this event is not implemented the string value is the cell string value.
Implementation of this event is optional.

Available in Mac OS X v10.5 and later.

32.48.78 updateDraggingItemsForDrag(draggingInfo as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this method to allow the table to update dragging items as they are dragged over a view.
Notes:

The dragging information.

Required for multi-image dragging. Typically this will involve invoking enumerateDraggingItemsWithOptions on the draggingInfo parameter value and setting the draggingItem object's imageComponentsProvider to a proper image based on the content.
For view-based table views, you can use the NSTableCellView method draggingImageComponents. For cell-based tables, use the NSCell method draggingImageComponentsWithFrame.

32.48.79 validateDrop(info as NSDraggingInfoMBS, proposedRow as Integer, dropOperation as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Used by aTableView to determine a valid drop target.
Notes:

info: An object that contains more information about this dragging operation.
row: The index of the proposed target row.
operation: The type of dragging operation proposed.

Returns the dragging operation the data source will perform.

The data source may retarget a drop by calling setDropRow and returning something other than NSDragOperationNone. A data source might retarget for various reasons, such as to provide better visual feedback when inserting into a sorted position.
To propose a drop on the second row, row would be 2 and operation would be NSTableViewDropOn. To propose a drop below the last row, row would be TableView.numberOfRows and operation would be NSTableViewDropAbove.

32.48.80 view(tableColumn as NSTableColumnMBS, row as Integer) as NSViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks the delegate for a view to display the specified row and column.
Notes:

see also
https://developer.apple.com/reference/appkit/nstableviewdelegate/1527449-tableview?language=objc
See also:

- 32.48.17 View as NSTableViewMBS 7047

32.48.81 willDisplayCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, row as Int64)

MBS MacControls Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs you that the tableview will display the specified cell at the row in the column.
Notes:

Cell: The cell to be displayed.
TableColumn: The table column.
row: The row index.

The event can modify the display attributes of cell to alter the appearance of the cell.

Because cell is reused for every row in tableColumn, the event must set the display attributes both when drawing special cells and when drawing normal cells.

Note: The implementation of this method must not draw portions of the cell. It should only alter the state of the passed in cell.

32.48.82 willTile

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The tableview will tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

32.48.83 writeRowsWithIndexes(rowIndexes as NSIndexSetMBS, pboard as NSPasteboardMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether a drag operation is allowed.
Notes:

rowIndexes: An index set of row numbers that will be participating in the drag.
pboard: The pasteboard to which to write the drag data.

Returns true if the drag operation is allowed, false otherwise.

Called by TableView after it has been determined that a drag should begin, but before the drag has been started.
To refuse the drag, return false. To start a drag, return true and place the drag data onto pboard (data, owner, and so on). The drag image and other drag-related information will be set up and provided by the table view once this call returns with true.

32.49 class NSTableDataSourceMBS

32.49.1 class NSTableDataSourceMBS

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for a data source of a NSTableView.
Notes:

A listbox stores the data itself, but the NSTableView is just a view.
so you need to handle the storage of the table view yourself by subclassing this class and filling the events.

32.49.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 17.1pr1

32.49.3 Xojo Developer Magazine

- 14.4, page 27: NSTabula Rasa, What to do when your new sports car arrives in parts by Ulrich Bogun

32.49.4 Events

32.49.5 Close

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event is called when the datasource is destroyed.

32.49.6 numberOfRowsInTableView as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when the table view needs to know the number of rows.
Notes: numberOfRowsInTableView is called very frequently, so it must be efficient.

32.49.7 objectValue(column as NSTableColumnMBS, row as Integer) as Variant

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when a value is required for a given cell.
Notes: Please implement your own arrays to store values.

32.49.8 setObjectValue(value as Variant, column as NSTableColumnMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when a cell value is saved to the datasource.

32.49.9 sortDescriptorsDidChange(oldDescriptors() as NSSortDescriptorMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called by TableView to indicate that sorting may need to be done.
Notes: The data source typically sorts and reloads the data, and adjusts the selections accordingly. If you need to know the current sort descriptors and the data source doesn't manage them itself, you can get the current sort descriptors by calling TableView.sortDescriptors function.

32.50 class NSTableHeaderCellMBS

32.50.1 class NSTableHeaderCellMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An NSTableHeaderCell is used by an NSTableHeaderView to draw its column headers.
Notes:

See the NSTableViewMBS class specification for more information on how it's used.

Subclasses of NSTableHeaderCell can override drawInteriorWithFrame, editWithFrame, and highlight:withFrame to change the way headers appear. See the NSCell class specification, and the following description, for information on these methods. (This works in Cocoa, but does not yet work in the plugin. If you need, send in a feature request.)
Subclass of the NSTextFieldCellMBS class.

- Nearly 2000 new Functions in the 9.6 prerelease of MBS

32.50.3 Xojo Developer Magazine

- 7.6, page 8: News
- 14.4, page 29: NSTabula Rasa, What to do when your new sports car arrives in parts by Ulrich Bogun

32.50.4 Methods

32.50.5 drawSortIndicatorWithFrame(cellFrame as NSRectMBS, inView as NSViewMBS, ascending as boolean, priority as Integer)

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Draws a sorting indicator given a cellFrame contained inside controlView.
Notes:

If priority is 0, this is the primary sort indicator. If ascending is true, a "^" indicator will be drawn. Override this method to customize the sorting user interface.
Available in Mac OS X v10.3 and later.

32.50.6 sortIndicatorRectForBounds(r as NSRectMBS) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the location to display the sorting indicator given rectangle.
Notes: Available in Mac OS X v10.3 and later.

32.51 class NSTableHeaderViewMBS

32.51.1 class NSTableHeaderViewMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An NSTableHeaderView is used by an NSTableView to draw headers over its columns and to handle mouse events in those headers.
Notes:

NSTableHeaderView uses NSTableHeaderCell to implement its user interface.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

32.51.2 Blog Entries

- MBS Real Studio Plugins, version 12.0pr5
- Nearly 2000 new Functions in the 9.6 prerelease of MBS

32.51.3 Xojo Developer Magazine

32.51.4 Methods

32.51.5 columnAtPoint(point as NSPointMBS) as Integer

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the column whose header lies under aPoint in the receiver, or –1 if no such column is found.
Notes: point: is expressed in the receiver's coordinate system.

32.51.6 Constructor

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new table header view with size 100/100 and position 0/0
Example:

```
dim t as new NSTableHeaderViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.51.7 Constructor(Handle as Integer) 7073
- 32.51.8 Constructor(left as Double, top as Double, width as Double, height as Double) 7073

32.51.7 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSTableHeaderView handle.
Example:

```
dim t as new NSTableHeaderViewMBS(0, 0, 100, 100)
dim v as new NSTableHeaderViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSTableHeaderView and the plugin retains this handle.
See also:

- 32.51.6 Constructor 7072
- 32.51.8 Constructor(left as Double, top as Double, width as Double, height as Double) 7073

32.51.8 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new table header view with the given size and position.
Example:

```
dim x as new NSTableHeaderViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.51.6 Constructor 7072
- 32.51.7 Constructor(Handle as Integer) 7073

32.51.9 draggedColumn as Integer

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: If the user is dragging a column in the receiver, returns the index of that column.
Notes: Otherwise returns –1.

32.51.10 draggedDistance as Double

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: If the user is dragging a column in the receiver, returns the column's horizontal distance from its original position.
Notes: Otherwise the return value is meaningless.

32.51.11 headerRectOfColumn(Column as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the rectangle containing the header tile for the column at columnIndex.
Notes: Raises an NSInternalInconsistencyException if columnIndex is out of bounds.

32.51.12 resizedColumn as Integer

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: If the user is resizing a column in the receiver, returns the index of that column.
Notes: Otherwise returns –1.

32.51.13 Properties

32.51.14 tableView as NSTableViewMBS

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The owner tableview.
Notes: (Read and Write computed property)

32.52 class NSTableRowViewMBS

32.52.1 class NSTableRowViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The NSTableRowView class is the view shown for a row in an NSTableView.
Notes:

It is responsible for displaying attributes associated with the row, including the selection highlight, and group row look.
Subclass of the NSViewMBS class.

32.52.2 Blog Entries

- MBS Xojo Plugins, version 17.1pr2

32.52.3 Methods

32.52.4 Constructor

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

32.52.5 Properties

32.52.6 backgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The background color of the row.
Notes:

The property defaults to the table view's backgroundColor, unless usesAlternatingRowBackgroundColors is set to true. In that case, the colors alternate, and are automatically updated as required by insertions and deletions.
The value of the background color can be customized in the NSTableViewMBS.didAddRowView event. The property is animatable.
(Read and Write property)

32.52.7 emphasized as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Determines whether the row will draw with the alternate or secondary color (unless overridden).
Notes:

When emphasized is true, the view will draw with the alternateSelectedControlColor defined by NSColor. When false it will use the secondarySelectedControlColor defined by NSColor.
(Read and Write property)

32.52.8 Floating as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Specifies whether the row is drawn using the floating style.
Notes:

Floating is a temporary attribute that is set when a particular group row is actually floating above other rows. The state may change dynamically based on the position of the group row. Drawing may be different for rows that are currently 'floating'.
(Read and Write property)

32.52.9 groupRowStyle as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Specifies whether this row view is a group row.
Notes:

When true this row is a group row and will draw appropriately.
(Read and Write property)

32.52.10 NextRowSelected as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether next row is selected.
Notes: (Read and Write property)

32.52.11 PreviousRowSelected as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether the previous row is selected.

Notes: (Read and Write property)

32.52.12 selected as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Determines whether the row is selected.
Notes:

True if selected, otherwise false.
(Read and Write property)

32.52.13 selectionHighlightStyle as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Specifies the selection highlight style.
Notes:

The possible values are specified in NSTableViewSelectionHighlightStyle in NSTableView.
(Read and Write property)

32.53 class NSTableViewMBS

32.53.1 class NSTableViewMBS

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An NSTableView object displays record-oriented data in a table and allows the user to edit values and resize and rearrange columns.
Notes:

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

- 14.4, page 25: NSTabula Rasa, What to do when your new sports car arrives in parts by Ulrich Bogun

32.53.4 Methods

32.53.5 addTableColumn(column as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Adds a given column as the last column of the receiver.

32.53.6 beginUpdates

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Begins a group of updates for the table view.
Notes:

For NSView-based table views, multiple row changes—that is, insertions, deletions, and moves—are animated simultaneously by surrounding calls to those method calls with beginUpdates and endUpdates. These methods are nestable.
The selected rows are maintained during the series of insertions, deletions, moves, and scrolling. If a selected row is deleted, a selection changed notification occurs after removeRowsAtIndexes is called.
It is not necessary to call beginUpdates and endUpdates if only one insertion, deletion, or move is occurring and the table view is an NSView-based table view. When using an NSCell-based table view, you must surround any insertion, deletion, or move in an update block for animations to occur.
The main reason for doing a batch update of changes to a table view is to avoid having the table animate unnecessarily.
Note that these methods should be called to reflect changes in your model; they do not make any underlying model changes.

For NSCell-based table views, it is required to call beginUpdates if you want to animate the insertRowsAtIndexes, removeRowsAtIndexes, and moveRowAtIndex.

32.53.7 canDragRowsWithIndexes(rowIndexes as NSIndexSetMBS, mouseDownPoint as NSPointMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value indicating whether the table view allows dragging the rows at with the drag initiated at the specified point.
Notes:

rowIndexes: The row indexes to drag.
mouseDownPoint: The location where the drag was initiated.

Returns no to disallow the drag.

32.53.8 columnAtPoint(p as NSPointMBS) as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the column a given point lies in.
Notes: Returns the index of the column aPoint lies in, or –1 if aPoint lies outside the receiver's bounds.
See also:

- 32.53.9 columnAtPoint(x as Double, y as Double) as Integer 7080

32.53.9 columnAtPoint(x as Double, y as Double) as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of the column a given point lies in.
Notes: Returns the index of the column aPoint lies in, or –1 if aPoint lies outside the receiver's bounds.
See also:

- 32.53.8 columnAtPoint(p as NSPointMBS) as Integer 7079

32.53.10 columnForView(view as NSViewMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the column index for the specified view.
Notes:

view: The view for which to retrieve the column.

Returns the index of the column containing view in the tableColumns array. This method returns -1 if the view is not in the table view. This method may also return -1 if the row containing the view is being animated away, such as during the deletion of a row.

This method is typically called in the action method of an NSButton (or NSControl) to find out what row (and column) the action should be performed on.
The implementation is O(n) where n is the number of visible rows, so this method should generally not be called within a loop.

32.53.11 columnIndexesInRect(rect as NSRectMBS) as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the indexes of the receiver's columns that intersect the specified rectangle.
Notes: Available in Mac OS X v10.5 and later.

32.53.12 columnWithIdentifier(identifier as string) as Integer

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of the first column in the receiver whose identifier is equal to a given identifier.
Notes: Returns the index of the first column in the receiver whose identifier is equal to anObject (when compared using isEqual:) or –1 if no columns are found with the specified identifier.

32.53.13 Constructor

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new table view with size 100/100 and position 0/0
Example:

```
dim t as new NSTableViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.53.14 Constructor(Handle as Integer) 7081
- 32.53.15 Constructor(left as Double, top as Double, width as Double, height as Double) 7081

32.53.14 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSTableView handle.
Example:

```
dim t as new NSTableViewMBS(0, 0, 100, 100)
dim v as new NSTableViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSTableView and the plugin retains this handle.
See also:

- 32.53.13 Constructor 7081
- 32.53.15 Constructor(left as Double, top as Double, width as Double, height as Double) 7081

32.53.15 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new table view with the given size and position.
Example:

```
dim x as new NSTableViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.53.13 Constructor 7081
- 32.53.14 Constructor(Handle as Integer) 7081

32.53.16 deselectAll

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Deselects all selected rows or columns if empty selection is allowed; otherwise does nothing.

32.53.17 deselectColumn(column as Integer)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Deselects the column at a given index if it's selected.
Notes: Colunn is from 0 to numberOfColumns-1.

32.53.18 deselectRow(row as Integer)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Deselects the row at a given index if it's selected.
Notes: Deselects the row at rowIndex if it's selected, regardless of whether empty selection is allowed.

32.53.19 Destructor

MBS MacControls Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The destructor.
Notes: Xojo calls this destructor automatically.

32.53.20 dragImageForRowsWithIndexes(dragRows as NSIndexSetMBS, tableColumns() as NSTableColumnMBS, theEvent as NSEventMBS, byref dragImageOffset as NSPointMBS) as NSImageMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Computes and returns an image to use for dragging.
Notes:

dragRows: An index set containing the row indexes that should be in the image.
tableColumns: An array of table columns that should be in the image.
dragEvent: The event that initiated the drag.
dragImageOffset: An in/out parameter specifying the offset of the cursor in the image, the default value is NSZeroPoint. Returning NSZeroPoint causes the cursor to be centered.

Returns an NSImage containing a custom image for the specified rows and columns participating in the drag.

32.53.21 edit(column as Integer, row as Integer, selectit as boolean)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Edits the cell at columnIndex and rowIndex, selecting its entire contents if flag is true.
Notes:

This method is invoked automatically in response to user actions; you should rarely need to invoke it directly.

This method scrolls the receiver so that the cell is visible, sets up the field editor, and sends selectWithFrame() and editWithFrame() to the field editor's NSCell object with the NSTableView as the text delegate.

The row at rowIndex must be selected prior to calling editColumn:row:withEvent:select:, or an exception will be raised.

32.53.22 endUpdates

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Ends the group of updates for the table view.
Notes: Ends the group of updates for the table view. This method, like beginUpdates, is nestable. See beginUpdates for details.

32.53.23 frameOfCellAtColumnRow(column as Integer, row as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a rectangle locating the cell that lies at the intersection of the specified column and row.
Notes:

column: The index in the tableColumns array of the column containing the cell whose rectangle you want.
row: The index of the row containing the cell whose rectangle you want.

Returns a rectangle locating the cell that lies at the intersection of columnIndex and rowIndex. This method returns NSRectMBS.Zero if columnIndex or rowIndex is greater than the number of columns or rows in the

table view.

You can use this method to update a single cell more efficiently than sending the table view a reloadData message using reloadData function.
The result of this method is used in a drawWithFrame:inView: message to the table column's data cell. You can subclass and override this method to customize the frame of a particular cell. However, never return a frame larger than the default implementation returns.
The default frame is computed to have a height equal to the rectOfRow: for rowIndex, minus the half intercellSpacing height on the top and half on the bottom. The width of frame is equal to the with of the table column minus half the intercellSpacing width on the left, and half on the right.

32.53.24 hiddenRowIndexes as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The indexes of all hidden table rows.
Notes: The value of this property is an index set containing the indexes of any hidden table rows. Table rows may be hidden by invoking the hideRowsAtIndexes method. Some drag-and-drop operations also result in hidden rows.

32.53.25 hideRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Hides the specified table rows.
Notes:

indexes: An index set containing indexes of the rows to be hidden.
rowAnimation: An animation effect to be applied when the rows are hidden.

Use this method when you no longer want the data to be visible to the user, but you don't want to permanently remove the data. Hidden table rows have a height of zero and cannot be selected by the user. However, if a selected table row is hidden, it will remain selected.
Hiding a table row causes the didRemoveRowView delegate method to be invoked.

32.53.26 insertRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Inserts the rows using the specified animation.
Notes:

indexes: The final positions of the new rows to be inserted.
animationOptions: The animation displayed during the insert. See NSTableViewAnimationOptions for the possible values that can be combined using the bitwise OR operator.

The numberOfRows in the table view is automatically increased by the count of indexes.
Calling this method multiple times within the same beginUpdates and endUpdates block is allowed, and changes are processed incrementally.

NSCell-based table views must first call beginUpdates before calling this method.

32.53.27 isColumnSelected(column as Integer) as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether the column at a given index is selected.
Notes: column is from 0 to to numberOfColumns.

32.53.28 isRowSelected(row as Integer) as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a Boolean value that indicates whether the row at a given index is selected.
Notes: row is from 0 to to numberOfRows.

32.53.29 moveColumn(column as Integer, toIndex as Integer)

MBS MacControls Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Moves the column and heading at a given index to a new given index.
Notes:

columnIndex: The current index of the column to move.
newIndex: The new index for the moved column.

This method raises the ColumnDidMove event.

32.53.30 moveRowAtIndex(oldIndex as Integer, newIndex as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Moves the specified row to the new row location using animation.
Notes:

oldIndex: Initial row index.
newIndex: New row index.

This is similar to removing a row at oldIndex and inserting it at newIndex, except the same view is used and simply has its position updated to the new location.
Changes happen incrementally as they are sent to the table, so as soon as this method is called the row can be considered moved. However the underlying view is not moved until endUpdates has been called.
This method can be called multiple times within the same beginUpdates and endUpdates block.

NSCell-based table views must first call beginUpdates before calling this method.

32.53.31 noteHeightOfRowsWithIndexesChanged(indexSet as NSIndexSetMBS)

MBS MacControls Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Informs the table view that the rows specified in indexSet have changed height.
Notes:

indexSet: Index set of rows that have changed their height.

If you implement heightOfRow event this method immediately retiles the table view using the row heights the event provides.

For NSView-based tables, this method will animate. To turn off the animation, create an NSAnimationContext grouping and set the duration to 0. Then call this method and end the grouping.

For NSCell-based tables, this method normally doesn't animate. However, it will animate if you call it inside a beginUpdates/endUpdates block.

32.53.32 noteNumberOfRowsChanged

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the number of records in its data source has changed.
Notes: This method allows the receiver to update the scrollers in its scroll view without actually reloading data into the receiver. It's useful for a data source that continually receives data in the background over a period of time, in which case the table view can remain responsive to the user while the data is received.

32.53.33 rectOfColumn(column as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the rectangle containing the column at at a given index.
Notes:

The rectangle containing the column at columnIndex. Returns NSRectMBS.Zero (an empty rectangle) if columnIndex lies outside the range of valid column indices for the receiver.

You can use this method to update a single column more efficiently than sending the table view a reloadData message.

aTableView.setNeedsDisplayInRect(aTableView.rectOfColumn(column))

32.53.34 rectOfRow(row as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the rectangle containing the row at a given index.
Notes: Returns the rectangle containing the row at rowIndex. Returns NSRectMBS.Zero (an empty rectangle) if rowIndex lies outside the range of valid row indices for the receiver.

32.53.35 reloadData

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Marks the receiver as needing redisplay, so it will reload the data for visible cells and draw the new values.
Notes: This method forces redraw of all the visible cells in the receiver. If you want to update the value in a single cell, column, or row, it is more efficient to use frameOfCellAtColumn(), rectOfColumn(), or rectOfRow() in conjunction with setNeedsDisplayInRect(). If you just want to update the scroller, use noteNumberOfRowsChanged; if the height of a set of rows changes, use noteHeightOfRowsWithIndexesChanged().
See also:

- 32.53.36 reloadData(rowIndexes as NSIndexSetMBS, columnIndexes as NSIndexSetMBS) 7087

32.53.36 reloadData(rowIndexes as NSIndexSetMBS, columnIndexes as NSIndexSetMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Reloads the data for only the specified rows and columns.
Notes:

rowIndexes: The indexes of the rows to update.
columnIndexes: The indexes of the columns to update.

For cells that are visible, the appropriate dataSource and delegate methods are called and the cells are redrawn.
For tables that support variable row heights, the row height is not re-queried from the delegate; it is your responsibility to invoke noteHeightOfRowsWithIndexesChanged if a row height change is required.

For NSView-based table views, this method drops the view-cells in the table row, but not the NSTableRowView instances.
See also:

- 32.53.35 reloadData 7087

32.53.37 removeRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes the rows using the specified animation.
Notes:

indexes: An index set containing the rows to remove.
animationOptions: The animation displayed during the insert. See NSTableViewAnimationOptions for the possible values that can be combined using the bitwise OR operator.

This method deletes from the table the rows represented at indexes and automatically decreases numberOfRows by the count of indexes.
The row indexes should be with respect to the current state displayed in the table view, and not the final state, because the specified rows do not exist in the final state.
Calling this method multiple times within the same beginUpdates and endUpdates block is allowed, and changes are processed incrementally.
Changes are processed incrementally as the insertRowsAtIndexes, removeRowsAtIndexes, and the moveRowAtIndex methods are called. It is acceptable to delete row 0 multiple times, as long as there is still a row available.

NSCell-based table views must first call beginUpdates before calling this method.

32.53.38 removeTableColumn(column as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes a given column from the receiver.

32.53.39 rowAtPoint(p as NSPointMBS) as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the row a given point lies in.
Notes: Returns the index of the row aPoint lies in, or –1 if aPoint lies outside the receiver's bounds.
See also:

- 32.53.40 rowAtPoint(x as Double, y as Double) as Integer 7089

32.53.40 rowAtPoint(x as Double, y as Double) as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the row a given point lies in.
Notes: Returns the index of the row aPoint lies in, or –1 if aPoint lies outside the receiver's bounds.
See also:

- 32.53.39 rowAtPoint(p as NSPointMBS) as Integer 7089

32.53.41 rowForView(view as NSViewMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the row for the specified view.
Notes:

view: The view for which to retrieve the row.

Returns the index of the row containing to view. This method returns -1 if the view is not in the table view. This method may also return -1 if the row containing the view is being animated away, such as during the deletion of a row.

This method is typically called in the action method for an NSButton (or NSControl) to find out what row (and column) the action should be performed on.
The implementation is O(n) where n is the number of visible rows, so this method should generally not be called within a loop.

32.53.42 rowsInRect(rect as NSRectMBS) as NSRangeMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a range of indexes for the rows that lie wholly or partially within the vertical boundaries of the specified rectangle.
Notes:

Rect: A rectangle in the coordinate system of the table view.

Returns a range of indexes for the table view's rows that lie wholly or partially within the horizontal boundaries of aRect. If the width or height of aRect is 0, this method returns an NSRange whose length is 0.

The location of the range is the index of the first row in the rectangle, and the length is the number of rows that lie in the rectangle.

32.53.43 rowViewAtRow(row as Integer, makeIfNecessary as Boolean) as NSViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a row view at the specified index, creating one if necessary.
Notes:

row: The row index.
makeIfNecessary: True if a view is required, NO if you want to update properties on a view, if one is available.

Returns an instance, or subclass, of NSTableRowView. Returning nil is also valid if makeIfNecessary is false and the view did not exist.

This method first attempts to return a currently displayed view in the visible area. If there is no visible view, and makeIfNecessary is true, a prepared temporary view is returned. If makeIfNecessary is false, and the view is not visible, nil is returned.
In general, makeIfNecessary should be true if you require a resulting view, and false if you want to update properties on a view only if it is available (generally this means it is visible).
An exception is thrown if row falls outside of the number of rows in the table (numberOfRows). The returned result should generally not be held onto for longer than the current run loop cycle. It's better to call rowViewAtRow whenever a view is required.

32.53.44 scrollColumnToVisible(column as Integer)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Scrolls the receiver and header view horizontally in an enclosing NSClipView so the column specified by columnIndex is visible.

32.53.45 scrollRowToVisible(row as Integer)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Scrolls the receiver vertically in an enclosing NSClipView so the row specified by rowIndex is

visible.

32.53.46 ScrollToLine(Line as Integer, Animated as Boolean)

MBS MacControls Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Scrolls to line.
Notes:

If animated is true, the scroll is animated.
The line is centered in the middle of the viewable area if possible.

32.53.47 selectAll

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects all rows or all columns, according to whether rows or columns were most recently selected.
Notes: If the table allows multiple selection, this action method selects all rows or all columns, according to whether rows or columns were most recently selected. If nothing has been recently selected, this method selects all rows. If this table doesn't allow multiple selection, this method does nothing.

32.53.48 selectColumnIndexes(indexes as NSIndexSetMBS, extend as boolean)

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the column selection using indexes.
Notes: f the extend flag is false the selected columns are specified by indexes. If extend is true, the columns indicated by indexes are added to the collection of already selected columns, providing multiple selection.

32.53.49 selectedColumnIndexes as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an index set containing the indexes of the selected columns.
Notes: Returns an index set containing the indexes of the selected columns.

32.53.50 selectedRowIndexes as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an index set containing the indexes of the selected rows.
Notes: Available in Mac OS X v10.3 and later.

32.53.51 selectRowIndexes(indexes as NSIndexSetMBS, extend as boolean)

MBS MacControls Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the row selection using indexes.
Notes:

If the extend flag is false the selected rows are specified by indexes. If extend is true, the rows indicated by indexes are added to the collection of already selected rows, providing multiple selection.

Available in Mac OS X v10.3 and later.

32.53.52 setDraggingSourceOperationMask(mask as Integer, isLocal as Boolean)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the default operation mask returned by draggingSourceOperationMaskForLocal to mask.
Notes:

mask: The drag operation mask. See NSDragOperation for the supported values.
isLocal: True if the destination is the same application, otherwise false. In either case the specified mask value is archived and used.

32.53.53 setDropRow(row as Integer, dropOperation as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Retargets the proposed drop operation.
Notes:

row: The target row index.
dropOperation: The drop operation. Supported values are specified by NSTableViewDropOperation.

For example, to specify a drop on the second row, specify row as 1, and operation as NSTableViewDropOn. To specify a drop below the last row, specify row as [self numberOfRows] and operation as NSTableViewDropAbove.
Passing a value of –1 for row and NSTableViewDropOn as the operation causes the entire table view to be highlighted rather than a specific row. This is useful if the data displayed by the table view does not allow the user to drop items at a specific row location.

32.53.54 setSortDescriptor(sortDescriptor as NSSortDescriptorMBS)

MBS MacControls Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the receiver's sort descriptors.
Notes:

A table column is considered sortable if it has a sort descriptor that specifies the sorting direction, a key to sort by, and a selector defining how to sort.

The array of sort descriptors is archived. Sort descriptors persist along with other column information if an autosave name is set.

Calling setSortDescriptors may have the side effect of invoking the data source method tableViewSortDescriptorsDidChange.

32.53.55 setSortDescriptors(sortDescriptors() as NSSortDescriptorMBS)

MBS MacControls Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the receiver's sort descriptors.
Notes:

A table column is considered sortable if it has a sort descriptor that specifies the sorting direction, a key to sort by, and a selector defining how to sort.

The array of sort descriptors is archived. Sort descriptors persist along with other column information if an autosave name is set.

Calling setSortDescriptors may have the side effect of invoking the data source method tableViewSortDescriptorsDidChange.

32.53.56 sizeLastColumnToFit

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Resizes the last column if there's room so the receiver fits exactly within its enclosing clip view.

32.53.57 sizeToFit

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Changes the width of columns in the receiver so all columns are visible.
Notes: All columns are resized to the same size, up to a column's maximum size. This method then invokes tile.

32.53.58 sortDescriptors as NSSortDescriptorMBS()

MBS MacControls Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the receiver's sort descriptors.

32.53.59 tableColumns as NSTableColumnMBS()

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns an array containing the the NSTableColumn objects in the receiver.
Notes: The array returned by tableColumns contains all receiver's columns, including those that are hidden.

32.53.60 tableColumnWithIdentifier(identifier as string) as NSTableColumnMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NSTableColumn object for the first column whose identifier is equal to a given object.
Notes: Returns the NSTableColumn object for the first column whose identifier is equal to anObject, as compared using isEqual:, or nil if no columns are found with the specified identifier.

32.53.61 tile

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Properly sizes the receiver and its header view and marks it as needing display.
Notes: Also resets cursor rectangles for the header view and line scroll amounts for the NSScrollView object.

32.53.62 unhideRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Unhides the specified table rows.
Notes:

indexes: An index set containing indexes of the hidden rows to be shown again.
rowAnimation: An animation effect to be applied when the rows are hidden.

Unhiding a table row causes the didAddRowView event to be invoked.

32.53.63 viewAtColumn(column as Integer, row as Integer, makeIfNecessary as Boolean) as NSViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a view at the specified row and column indexes, creating one if necessary.
Notes:

column: The index of the column in the tableColumns array.
row: The row index.
makeIfNecessary: true if a view is required, false if you want to update properties on a view, if one is available.

Returns an instance of NSView.

This method first attempts to return an available view, which is generally in the visible area. If there is no available view, and makeIfNecessary is true, a prepared temporary view is returned. If makeIfNecessary is false, and the view is not available, nil will be returned.
In general, makeIfNecessary should be true if you require a resulting view, and false if you only want to update properties on a view only if it is available (generally this means it is visible).
An exception will be thrown if row is not within the numberOfRows. The returned result should generally not be held onto for longer than the current run loop cycle. Instead they should re-query the table view for the row view.

32.53.64 Properties

32.53.65 allowsColumnReordering as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Controls whether the user can drag column headers to reorder columns.
Notes:

The default is true. You can rearrange columns programmatically regardless of this setting.
(Read and Write property)

32.53.66 allowsColumnResizing as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver allows the user to resize columns by dragging between their headers.
Notes: (Read and Write property)

32.53.67 allowsColumnSelection as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Controls whether the user can select an entire column by clicking its header.
Notes:

The default is false. You can select columns programmatically regardless of this setting.
(Read and Write property)

32.53.68 allowsEmptySelection as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Controls whether the receiver allows zero rows or columns to be selected.
Notes:

Unlike with the other settings that affect selection behavior, you cannot set an empty selection programmatically if empty selection is disallowed.
(Read and Write property)

32.53.69 allowsMultipleSelection as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Controls whether the user can select more than one row or column at a time.
Notes:

The default is false. You can select multiple columns or rows programmatically regardless of this setting.
(Read and Write property)

32.53.70 allowsTypeSelect as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether the receiver allows the user to type characters to select rows.
Notes:

Available in Mac OS X v10.5 and later.
(Read and Write property)

32.53.71 autosaveName as string

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The name under which table information is automatically saved.

Notes:

The table information is saved separately for each user and for each application that user uses.

Note that even when a table view has an autosave name, it may not be saving table information automatically.
(Read and Write property)

32.53.72 autosaveTableColumns as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether the order and width of this table view's columns are automatically saved.
Notes:

If flag is different from the current value, this method also reads in the saved information and sets the table options to match.

The table information is saved separately for each user and for each application that user uses. Note that if autosaveName returns nil, this setting is ignored and table information isn't saved.
(Read and Write property)

32.53.73 backgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The color used to draw the background of the receiver.
Notes:

The default background color is light gray.
(Read and Write property)

32.53.74 clickedColumn as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the column the user clicked to trigger an action message.
Notes:

The index of the column the user clicked to trigger an action message. Returns –1 if the user clicked in an area of the table view not occupied by columns.

Index is zero based.
(Read only property)

32.53.75 clickedRow as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the row the user clicked to trigger an action message.
Notes:

The index of the row the user clicked to trigger an action message. Returns –1 if the user clicked in an area of the table view not occupied by table rows.

Index is zero based.
(Read only property)

32.53.76 columnAutoresizingStyle as Integer

MBS MacControls Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The table's column autoresizing style.
Notes:

Use the following constants:

NSTableViewMBS.kFirstColumnOnlyAutoresizingStyle
NSTableViewMBS.kUniformColumnAutoresizingStyle
NSTableViewMBS.kSequentialColumnAutoresizingStyle
NSTableViewMBS.kReverseSequentialColumnAutoresizingStyle
NSTableViewMBS.kNoColumnAutoresizing
NSTableViewMBS.kLastColumnOnlyAutoresizingStyle

Available in Mac OS X v10.4 and later.
(Read and Write property)

32.53.77 cornerView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The view used to draw the area to the right of the column headers and above the vertical scroller of the enclosing scroll view.
Notes:

This is by default a simple view that merely fills in its frame, but you can replace it with a custom view using this property.
(Read and Write property)

32.53.78 dataSource as NSTableDataSourceMBS

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The object that provides the data displayed in the table view.
Notes: (Read and Write property)

32.53.79 draggingDestinationFeedbackStyle as Integer

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The feedback style displayed when the user drags over the table view.
Notes:

Available in Mac OS X v10.6 and later.
(Read and Write property)

32.53.80 editedColumn as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of the column being edited.
Notes:

First column has index zero.
If sent during editColumn(), the index of the row being edited; otherwise –1.
(Read only property)

32.53.81 editedRow as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of the row being edited.
Notes:

The first row index is zero.
If sent during editColumn(), the index of the row being edited; otherwise –1.
(Read only property)

32.53.82 effectiveRowSizeStyle as Integer

MBS MacControls Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the effective row size style for the table.
Notes:

If the rowSizeStyle is NSTableViewRowSizeStyleDefault, then this method returns the default size for this table.
The default size is currently set in the System Preferences by the users.
Available in OS X v10.7 and later.
(Read only property)

32.53.83 floatsGroupRows as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the table view draws grouped rows as if they are floating.
Notes:

Group rows are rows for which the table view delegate's isGroupRow method returns true. These rows can be displayed as if they are floating in a view-based table view.
The default value of this property is true.
(Read and Write property)

32.53.84 focusedColumn as Integer

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The currently focused column.
Notes:

Returns the index of the column, or -1 if there is no focused column
The focus interaction will always be on the selectedRow of the table. If the selectedRow is a full width cell, then focusedColumn will return 1 when focused..
Available in Mac OS X v10.6 and later.
(Read and Write property)

32.53.85 gridColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The color used to draw grid lines.
Notes:

The default color is gray.
(Read and Write property)

32.53.86 gridStyleMask as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The receiver's grid style mask.
Notes:

use the constants;

kGridNone	= 0,
kSolidVerticalGridLineMask	= 1
kSolidHorizontalGridLineMask	= 2

(Read and Write property)

32.53.87 headerView as NSTableHeaderViewMBS

MBS MacControls Plugin, Plugin Version: 9.6, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The NSTableHeaderView object used to draw headers over columns.
Notes:

The NSTableHeaderView object used to draw headers over columns, or nil if the receiver has no header view
(Read and Write property)

32.53.88 highlightedtableColumn as NSTableColumnMBS

MBS MacControls Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The table column highlighted in the receiver.
Notes:

A highlightable column header can be used in conjunction with row selection to highlight a particular column of the table. An example of this is how the Mail application indicates the currently sorted column.
(Read and Write property)

32.53.89 intercellSpacing as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The horizontal and vertical spacing between cells.
Notes:

The default spacing is (3.0, 2.0).
(Read and Write property)

32.53.90 numberOfColumns as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of columns in the receiver.
Notes:

The value returned includes table columns that are currently hidden.
(Read only property)

32.53.91 numberOfRows as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of rows in the receiver.
Notes:

Typically you should not ask the table view how many rows it has; instead you should interrogate the table view's data source.
(Read only property)

32.53.92 numberOfSelectedColumns as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of selected columns.
Notes: (Read only property)

32.53.93 numberOfSelectedRows as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of selected rows.
Notes: (Read only property)

32.53.94 rowActionsVisible as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether a table row's actions are visible.
Notes:

This property contains a Boolean value indicating whether a table row's actions are visible or not—the user has swiped the row to reveal the row actions. Set the value of this property to false to hide any visible row actions. Setting the value of this property to true is not supported, and will result in an exception.

(Read and Write property)

32.53.95 rowHeight as Double

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the height of each row in the receiver.
Notes:

The default row height is 16.0.
(Read and Write property)

32.53.96 rowSizeStyle as Integer

MBS MacControls Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The row size used by the tableview: small, medium, large, or on a custom row by row basis.
Notes:

The row size style can be modified on a row by row basis by invoking the event heightOfRow, if implemented.

The rowSizeStyle defaults to NSTableViewRowSizeStyleCustom. NSTableViewRowSizeStyleCustom indicates to use the rowHeight of the table, instead of the pre-determined system values.

Generally, rowSizeStyle should always be NSTableViewRowSizeStyleCustom except for "source lists". To implement variable row heights, set the value to NSTableViewRowSizeStyleCustom and implement tableView:heightOfRow: in the delegate.

Available in OS X v10.7 and later.
(Read and Write property)

32.53.97 selectedColumn as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the last column selected or added to the selection.
Notes:

Returns the index of the last column selected or added to the selection, or –1 if no column is selected.
(Read only property)

32.53.98 selectedRow as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the index of the last row selected or added to the selection.
Notes:

Returns the index of the last row selected or added to the selection, or –1 if no row is selected.
(Read only property)

32.53.99 selectionHighlightStyle as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The selection highlight style used by the receiver to indicate row and column selection.
Notes:

Available in Mac OS X v10.5 and later.
(Read and Write property)

32.53.100 usesAlternatingRowBackgroundColors as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value that indicates whether the receiver uses the standard alternating row colors for its background.
Notes:

Available in Mac OS X v10.3 and later.
(Read and Write property)

32.53.101 usesStaticContents as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the table uses static data.
Notes:

A static table does not rely on a data source to provide the number of rows. A static table view's contents are set at design time and can be changed programmatically as needed. Typically, you do not change the contents of a static table view after setting them.
In Xcode, any rows you add to a static table are saved in the corresponding nib or storyboard file and loaded with the rest of the table at runtime. You can add table rows programmatically to a static table view using the insertRowsAtIndexes method. When adding rows programmatically, your table view delegate must implement the view method to provide the corresponding view for any new rows. You can also remove rows at any time using the removeRowsAtIndexes method.

A table with static contents must be an NSView-based table view.

Available in macOS 10.10 or later.
(Read and Write property)

32.53.102 verticalMotionCanBeginDrag as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether vertical motion is treated as a drag or selection change to flag.
Notes:

If flag is false then vertical motion will not start a drag. The default is true.

Note that horizontal motion is always a valid motion to begin a drag. Most often, you would want to disable vertical dragging when it's expected that horizontal dragging is the natural motion.
(Read and Write property)

32.53.103 indicatorImageInTableColumn(column as NSTableColumnMBS) as NSImageMBS

MBS MacControls Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The indicator image of a given table column.
Notes:

An indicator image is an arbitrary (small) image that is rendered on the right side of the column header. An example of its use is in Mail to indicate the sorting direction of the currently sorted column in a mailbox.
(Read and Write computed property)

32.53.104 Events

32.53.105 ColumnDidMove(notification as NSNotificationMBS, oldColumn as Integer, newColumn as Integer)

MBS MacControls Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event informs the delegate that a column was moved by user action in the table view.

32.53.106 ColumnDidResize(notification as NSNotificationMBS, column as NSTableColumnMBS, index as Integer)

MBS MacControls Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event informs you that a column was resized in the table view.

32.53.107 dataCell(tableColumn as NSTableColumnMBS, row as Int64) as NSCellMBS

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Optional return a different cells for each row.
Notes:

A different data cell can be returned for any particular tableColumn and row, or a cell that will be used for the entire row (a full width cell). The returned cell should properly implement copyWithZone:, since the cell may be copied by NSTableView. If the tableColumn is non-nil, and nil is returned, then the table will use the default cell from tableColumn.dataCellForRow(Row).

When each row is being drawn, this method will first be called with a nil tableColumn. At this time, you can return a cell that will be used to draw the entire row, acting like a group. If you do return a cell for the 'nil' tableColumn, be prepared to have the other corresponding datasource and delegate methods to be called with a 'nil' tableColumn value. If don't return a cell, the method will be called once for each tableColumn in the tableView, as usual.

32.53.108 didAddRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that a row view was added at the specified row.
Notes:

rowView: The row view.
row: The index of the row.

At this point, the delegate can add extra views, or modify the properties of rowView.

This method is only valid for NSView-based table views.

32.53.109 didClickTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called if a table column was clicked on.

32.53.110 didDragTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent at the time the mouse button goes up in tableView and tableColumn has been dragged

during the time the mouse button was down.
Notes:

tableColumn: The table column.

The behavior of this method on Mac OS X v10.5 is different from prior versions. On Mac OS X v 10.5 the dragged column is sent to the subclass. In earlier versions the table column that is currently located at the dragged column's original index is sent.

32.53.111 didRemoveRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Tells the delegate that a row view was removed from the table at the specified row.
Notes:

rowView: The row view.
row: The index of the row.

If row equals -1, the row is being deleted from the table and is no longer a valid row; otherwise row is a valid row that is being removed by being moved off screen.

This method is only valid for NSView-based table views.

32.53.112 DoubleClick

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: A double click was recognized.

32.53.113 heightOfRow(row as Int64) as Double

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this event to support a table with varying row heights.
Notes: The height returned by this method should not include intercell spacing and must be greater than zero. Performance Considerations: For large tables in particular, you should make sure that this method is efficient. NSTableView may cache the values this method returns, but this should NOT be depended on, as all values may not be cached. To signal a row height change, call noteHeightOfRowsWithIndexesChanged. For a given row, the same row height should always be returned until noteHeightOfRowsWithIndexesChanged is called, otherwise unpredicable results will happen. NSTableView automatically invalidates its entire row height cache in reloadData, and noteNumberOfRowsChanged.

32.53.114 isGroupRow(row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the delegate to indicate that a specified row is a group row.
Notes:

row: The row index.

Return true if the specified row should have the group row style drawn, false otherwise.

If the cell in row is an NSTextFieldCell and contains only a string, the group row style attributes will automatically be applied to the cell.

Group rows in view-based table views can be made to visually 'float' by setting the tableview method setFloatsGroupRows to true.

Note: When configured as a source list style table view, rows identified as group rows draw with a specific style unique for source lists.
Available in Mac OS X v10.5 and later.

32.53.115 mouseDownInHeaderOfTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent to the subclass whenever the mouse button is clicked in the table view's header column.
Notes: tableColumn: The table column.

32.53.116 nextTypeSelectMatchFromRow(startRow as Int64, endRow as Int64, searchString as string) as Int64

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the subclass to modify how type selection works.
Notes:

startRow: The starting row of the search range.
endRow: The ending row of the search range.
searchString: A string containing the typed selection.

Return the first row in the range of startRow through endRow (excluding endRow itself) that matches selectionString. Return -1 if no match is found.

It is possible for endRow to be less than startRow if the search will wrap.
Available in Mac OS X v10.5 and later.

32.53.117 rowViewForRow(row as Integer) as NSTableRowViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Asks the delegate for a view to display the specified row.
Notes:

row: The row index.

Return an instance or subclass of NSTableRowView. If nil is returned, an NSTableRowView instance will be created and used.

You can implement this event to return a custom NSTableRowView for row.
The reuse queue can be used in the same way as documented in tableView:view:row:. The returned view will have attributes properly set to it before it's added to the tableView.

This method is only valid for NSView-based table views.

32.53.118 SelectionDidChange(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event informs you that the table view's selection has changed.

32.53.119 selectionIndexesForProposedSelection(proposedSelectionIndexes as NSIndexSetMBS) as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked to allow the delegate to modify the proposed selection.
Notes:

proposedSelectionIndexes: An index set containing the indexes of the proposed selection.

Return an NSIndexSet instance containing the indexes of the new selection. Return proposedSelectionIndexes if the proposed selection is acceptable, or the value of the table view's existing selection to avoid changing the selection.

This method may be called multiple times with one new index added to the existing selection to find out if

a particular index can be selected when the user is extending the selection with the keyboard or mouse.

Implementation of this method is optional. If implemented, this method will be called instead of shouldSelectRow.
Available in Mac OS X v10.5 and later.

32.53.120 SelectionIsChanging(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event informs you that the table view's selection is in the process of changing (typically because the user is dragging the mouse across a number of rows).

32.53.121 selectionShouldChangeInTableView as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether the selection should change.
Notes:

Return true to allow the table view to change its selection (typically a row being edited), false to deny selection change.

The user can select and edit different cells within the same row, but can't select another row unless the delegate approves. The subclass can implement this method for complex validation of edited rows based on the values of any of their cells.

32.53.122 shouldEditTableColumn(tableColumn as NSTableColumnMBS, row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether the cell at the specified row and column can be edited.
Notes:

TableColumn: The table column.
rowIndex: The row index.
Return true to allow editing the cell, false to deny editing.

The subclass can implement this method to disallow editing of specific cells.
Note: This method is only valid for cell-based table views.

32.53.123 shouldReorderColumn(columnIndex as Int64, newColumnIndex as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent to the subclass to allow or prohibit the specified column to be dragged to a new location.
Notes:

columnIndex: The index of the column being dragged.
newColumnIndex: The proposed target index of the column.

Return true if the column reordering should be allowed, otherwise false.

When a column is initially dragged by the user, the delegate is first called with a newColumnIndex value of -1. Returning false will disallow that column from being reordered at all. Returning true allows it to be reordered, and the delegate will be called again when the column reaches a new location.

The actual NSTableColumn instance can be retrieved from the tableColumns array.

If this method is not implemented, all columns are considered reorderable.
Available in Mac OS X v10.6 and later.

32.53.124 shouldSelectRow(row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the table view should allow selection of the specified row.
Notes:

rowIndex: The row index.

Return true to permit selection of the row, false to deny selection.

The delegate can implement this method to disallow selection of particular rows.
For better performance and finer-grain control over the selection, use selectionIndexesForProposedSelection.

32.53.125 shouldSelectTableColumn(tableColumn as NSTableColumnMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the specified table column can be selected.
Notes:

TableColumn: The table column.

Return true to permit selection, otherwise false.

The subclass can implement this event to disallow selection of particular columns.

32.53.126 shouldShowCellExpansion(tableColumn as NSTableColumnMBS, row as Int64) as Boolean

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the subclass to control cell expansion for a specific row and column.
Notes:

TableColumn: The table column.
row: The row index.

Return true if the tooltip cell should expand, false otherwise.

Cell expansion can occur when the mouse hovers over the specified cell and the cell contents are unable to be fully displayed within the cell. If this method returns true, the full cell contents will be shown in a special floating tool tip view, otherwise the content is truncated.

Note: This method is only valid for cell-based table views.

Available in Mac OS X v10.5 and later.

32.53.127 shouldTrackCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, row as Int64) as Boolean

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the subclass to control the tracking behavior for a specific cell.
Notes:

cell: The cell to track.
tableColumn: The table column.
row: A row in tableView.

Returns true if the cell should track, false otherwise.

Normally, only selectable or selected cells can be tracked. If you implement this method, cells which are not selectable or selected can be tracked, and vice-versa.

For example, this allows you to have an NSButtonCell in a table which does not change the selection, but can still be clicked on and tracked.

Note: This method is only valid for cell-based table views.

Available in Mac OS X v10.5 and later.

32.53.128 shouldTypeSelectForEvent(e as NSEventMBS, searchString as string) as Boolean

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the subclass to control type select for a specific event.
Notes:

event: The event.
searchString: The search string or nil if no type select has began.

Return true to allow type select for event, false otherwise.

Typically, this is called from the table view keyDown implementation and the event will be a key event.
Available in Mac OS X v10.5 and later.

32.53.129 sizeToFitWidthOfColumn(column as Int64) as Double

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the subclass to provide custom sizing behavior when a column's resize divider is double clicked.
Notes:

column: The index of the column.

Returns the width of the specified column.

By default, NSTableView iterates every row in the table, accesses a cell via preparedCellAtColumn, and requests the cellSize to find the appropriate largest width to use.

For accurate results and performance, it is recommended that this method is implemented when using large

tables. By default, large tables use a monte carlo simulation instead of iterating every row.

Available in Mac OS X v10.6 and later.

32.53.130 textShouldBeginEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow.

32.53.131 textShouldEndEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow.

32.53.132 toolTipForCell(cell as NSCellMBS, r as NSRectMBS, tableColumn as NSTableColumnMBS, row as Int64, mouseLocation as NSPointMBS) as string

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns a string that is displayed as a tooltip for the specified cell in the column and row.
Notes:

Cell: The cell.
r: The proposed active area of the tooltip. You can modify rect to provide an alternative active area.
TableColumn: The table column.
row: The row index.
mouseLocation: The mouse location.

Return a string containing the tooltip. Return empty string if no tooltip is desired.

By default, rect is computed as cell.drawingRectForBounds(cellFrame).
Available in Mac OS X v10.4 and later.

32.53.133 typeSelectString(tableColumn as NSTableColumnMBS, row as Int64) as string

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked to allow the subclass to provide an alternate text value used for type selection for a specified row and column.
Notes:

tableColumn: The table column.
row: The row index.

Returns a string that is used in type select comparison for row and tableColumn. Return "" if the row or tableColumn should not be searched.

Implement this method to change the string value that is searched for based on what is displayed. By default, all cells with text in them are searched.

If this event is not implemented the string value is the cell string value.
Implementation of this event is optional.

Available in Mac OS X v10.5 and later.

32.53.134 view(tableColumn as NSTableColumnMBS, row as Integer) as NSViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks the delegate for a view to display the specified row and column.
Notes:

see also
https://developer.apple.com/reference/appkit/nstableviewdelegate/1527449-tableview?language=objc

32.53.135 willDisplayCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, row as Int64)

MBS MacControls Plugin, Plugin Version: 12.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs you that the tableview will display the specified cell at the row in the column.
Notes:

Cell: The cell to be displayed.
TableColumn: The table column.
row: The row index.

The event can modify the display attributes of cell to alter the appearance of the cell.

Because cell is reused for every row in tableColumn, the event must set the display attributes both when drawing special cells and when drawing normal cells.

Note: The implementation of this method must not draw portions of the cell. It should only alter the state of the passed in cell.

32.53.136 Constants

32.53.137 NSTableRowActionEdgeLeading = 0

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** One of the constants to define table row edges on which row actions are attached.
Notes: Denotes the leading, or left, edge of an table row view.

32.53.138 NSTableRowActionEdgeTrailing = 1

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** One of the constants to define table row edges on which row actions are attached.
Notes: Denotes the trailing, or right, edge of an table row view.

32.53.139 NSTableViewAnimationEffectFade = 1

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** Specifies the animation effects to apply when inserting or removing rows.
Notes: Use a fade for row or column removal. The effect can be combined with any of the slide constants.

32.53.140 NSTableViewAnimationEffectGap = 2

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** Specifies the animation effects to apply when inserting or removing rows.
Notes: Creates a gap for newly inserted rows. This is useful for drag and drop animations that animate to a newly opened gap and should be used in the acceptDrop event.

32.53.141 NSTableViewAnimationEffectNone = 0

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** Specifies the animation effects to apply when inserting or removing rows.
Notes: Use no animation effects.

32.53.142 NSTableViewAnimationSlideDown = & h20

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** Specifies the animation effects to apply when inserting or removing rows.
Notes: Animates a row insertion or removal by sliding downward.

32.53.143 NSTableViewAnimationSlideLeft = & h30

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** Specifies the animation effects to apply when inserting or removing rows.
Notes: Animates a row insertion by sliding from the left. Animates a row removal by sliding towards the left.

32.53.144 NSTableViewAnimationSlideRight = & h40

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** Specifies the animation effects to apply when inserting or removing rows.
Notes: Animates a row insertion by sliding from the right. Animates a row removal by sliding towards the right.

32.53.145 NSTableViewAnimationSlideUp = & h10

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** Specifies the animation effects to apply when inserting or removing rows.
Notes: Animates a row insertion or removal by sliding upward.

32.53.146 NSTableViewDashedHorizontalGridLineMask=8

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** One of the constants to specify grid styles.
Notes: Specifies that the horizontal grid lines should be drawn dashed.

32.53.147 NSTableViewDraggingDestinationFeedbackStyleGap=2

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** One of the dragging styles.
Notes: Provides a gap insertion when dragging over the table. Note that this style is only officially supported for View Based TableViews, but may partially work in Cell Based TableViews. The decision to use the gap style (compared to another style) can be made in draggingSessionWillBeginAtPoint, or it can dynamically be changed.

32.53.148 NSTableViewDraggingDestinationFeedbackStyleNone=-1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the drag styles displayed by the table view.
Notes:

Provides no feedback when the user drags over the table view. This option exists to allow subclasses to implement their dragging destination highlighting, or to make it not show anything all.

Available in Mac OS X v10.6 and later.

32.53.149 NSTableViewDraggingDestinationFeedbackStyleRegular=0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the drag styles displayed by the table view.
Notes:

Draws a solid round-rect background on drop target rows, and an insertion marker between rows. This style should be used in most cases.

Available in Mac OS X v10.6 and later.

32.53.150 NSTableViewDraggingDestinationFeedbackStyleSourceList=1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the drag styles displayed by the table view.
Notes:

Draws an outline on drop target rows, and an insertion marker between rows. This style will automatically be set for source lists when the table's setSelectionHighlightStyle: is set to NSTableViewSelectionHighlight-StyleSourceList. This is the standard look for Source Lists, but may be used in other areas as needed.

Available in Mac OS X v10.6 and later.

32.53.151 NSTableViewDropAbove=1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify drop operations.
Notes:

Specifies that the drop should occur above the specified row.

For example, given a table with n rows (numbered with row 0 at the top visually), a row of n–1 and operation of NSTableViewDropOn would specify a drop on the last row. To specify a drop below the last row, you use a row of n and NSTableViewDropAbove for the operation.

32.53.152 NSTableViewDropOn=0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify drop operations.
Notes:

Specifies that the drop should occur on the specified row.

For example, given a table with n rows (numbered with row 0 at the top visually), a row of n–1 and operation of NSTableViewDropOn would specify a drop on the last row. To specify a drop below the last row, you use a row of n and NSTableViewDropAbove for the operation.

32.53.153 NSTableViewFirstColumnOnlyAutoresizingStyle=5

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the autoresizing style.
Notes:

Autoresize only the first table column.

When that table column can no longer be resized, stop autoresizing. Normally you should use one of the sequential autoresizing modes instead.

Available in Mac OS X v10.4 and later.

32.53.154 NSTableViewGridNone=0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants for the grid styles.
Notes: Specifies that no grid lines should be displayed.

32.53.155 NSTableViewLastColumnOnlyAutoresizingStyle=4

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the autoresizing style.
Notes:

Autoresize only the last table column.

When that table column can no longer be resized, stop autoresizing. Normally you should use one of the sequential autoresizing modes instead.

Available in Mac OS X v10.4 and later.

32.53.156 NSTableViewNoColumnAutoresizing=0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the autoresizing style.
Notes:

Disable table column autoresizing.
Available in Mac OS X v10.4 and later.

32.53.157 NSTableViewReverseSequentialColumnAutoresizingStyle=3

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the autoresizing style.
Notes:

Autoresize each table column sequentially, from the first auto-resizable column to the last auto-resizable column; proceed to the next column when the current column has reached its minimum or maximum size.

Available in Mac OS X v10.4 and later.

32.53.158 NSTableViewRowSizeStyleCustom = 0

MBS MacControls Plugin, Plugin Version: 13.4. **Function:** One of the row size style constants.
Notes:

The table will use the rowHeight or invoke the delegate method tableView:heightOfRow:, if implemented. The cell layout is not changed.
Available in OS X v10.7 and later.
The row size style constants define the size of the rows in the table view. They are used by the effectiveRowSizeStyle and rowSizeStyle methods. You can also query the row size in the NSTableCellView class' property rowSizeStyle.

32.53.159 NSTableViewRowSizeStyleDefault = -1

MBS MacControls Plugin, Plugin Version: 13.4. **Function:** One of the row size style constants.
Notes:

The table will use the system default layout size: small, medium or large.
Available in OS X v10.7 and later.
The row size style constants define the size of the rows in the table view. They are used by the effectiveRowSizeStyle and rowSizeStyle methods. You can also query the row size in the NSTableCellView class' property rowSizeStyle.

32.53.160 NSTableViewRowSizeStyleLarge = 3

MBS MacControls Plugin, Plugin Version: 13.4. **Function:** One of the row size style constants.
Notes:

The table will use a row height specified for a small table. It is required that the size be fully tested and supported if NSTableViewRowSizeStyleCustom is not used.
Available in OS X v10.7 and later.
The row size style constants define the size of the rows in the table view. They are used by the effectiveRowSizeStyle and rowSizeStyle methods. You can also query the row size in the NSTableCellView class' property rowSizeStyle.

32.53.161 NSTableViewRowSizeStyleMedium = 2

MBS MacControls Plugin, Plugin Version: 13.4. **Function:** One of the row size style constants.
Notes:

The table will use a row height specified for a medium table. It is required that the size be fully tested and supported if NSTableViewRowSizeStyleCustom is not used.
Available in OS X v10.7 and later.

The row size style constants define the size of the rows in the table view. They are used by the effectiveRowSizeStyle and rowSizeStyle methods. You can also query the row size in the NSTableCellView class' property rowSizeStyle.

32.53.162 NSTableViewRowSizeStyleSmall = 1

MBS MacControls Plugin, Plugin Version: 13.4. **Function:** One of the row size style constants.
Notes:

The table will use a row height specified for a small table. It is required that the size be fully tested and supported if NSTableViewRowSizeStyleCustom is not used.
Available in OS X v10.7 and later.
The row size style constants define the size of the rows in the table view. They are used by the effectiveRowSizeStyle and rowSizeStyle methods. You can also query the row size in the NSTableCellView class' property rowSizeStyle.

32.53.163 NSTableViewSelectionHighlightStyleNone=-1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the selection highlight styles.
Notes:

Displays no highlight style at all.
Available in Mac OS X v10.6 and later.

32.53.164 NSTableViewSelectionHighlightStyleRegular=0

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants for the selectionHighlightStyle property.
Notes:

The regular highlight style of NSTableView. On Mac OS X v10.5 a light blue (returned by sending NSColor a alternateSelectedControlColor message) or light gray color (returned by sending NSColor a secondarySelectedControlColor message).

Available in Mac OS X v10.5 and later.

32.53.165 NSTableViewSelectionHighlightStyleSourceList=1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants for the selectionHighlightStyle property.
Notes:

The source list style of NSTableView. On 10.5, a light blue gradient is used to highlight selected rows.

Note: When using this style, cell subclasses that implement drawsBackground must set the value to false. Otherwise, the cells will draw over the tableview's highlighting.

32.53.166 NSTableViewSequentialColumnAutoresizingStyle=2

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the autoresizing style.
Notes:

Autoresize each table column sequentially, from the last auto-resizable column to the first auto-resizable column; proceed to the next column when the current column has reached its minimum or maximum size.

Available in Mac OS X v10.4 and later.

32.53.167 NSTableViewSolidHorizontalGridLineMask=2

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify grid styles.
Notes:

Specifies that horizontal grid lines should be displayed.

Available in Mac OS X v10.3 and later.

You can combine NSTableViewSolidVerticalGridLineMask and NSTableViewSolidHorizontalGridLineMask with bitwiseor.

32.53.168 NSTableViewSolidVerticalGridLineMask=1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify grid styles.
Notes:

Specifies that vertical grid lines should be displayed.

Available in Mac OS X v10.3 and later.

You can combine NSTableViewSolidVerticalGridLineMask and NSTableViewSolidHorizontalGridLineMask with bitwiseor.

32.53.169 NSTableViewUniformColumnAutoresizingStyle=1

MBS MacControls Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the autoresizing style.
Notes:

Autoresize all columns by distributing space equally, simultaneously.
Available in Mac OS X v10.4 and later.

32.54 class NSTableViewRowActionMBS

32.54.1 class NSTableViewRowActionMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An NSTableViewRowAction object defines a single action to present when the user swipes horizontally on a table row.
Notes:

In an editable table, performing a horizontal swipe on a row reveals a button to delete the row by default. This class lets you define one or more custom actions to display for a given row in your table. Each instance of this class represents a single action to perform and includes the text, formatting information, and behavior for the corresponding button.

To add custom actions to your table view's rows, implement the rowActionsForRow event in your table view's delegate object. In that method, create and return an array of actions for the specified row. The table handles the remaining work of displaying the action buttons and executing the appropriate handler block when the user clicks the button.

32.54.2 Blog Entries

- MBS Xojo Plugins, version 17.1pr3

32.54.3 Methods

32.54.4 available as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Check whether this class is available.
Notes: Returns true on macOS 10.11.

32.54.5 Constructor(Style as Integer, Title as String)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates and returns a new table view row action object.
Notes:

style: The style characteristics to apply to the button. Use this value to apply default appearance characteristics to the button. These characteristics visually communicate, such as by color, information about what the button does. For example, specify a style of NSTableViewRowActionStyleDestructive to indicate an action is destructive to the underlying data. For a list of possible style values, see NSTableViewRowActionStyle.

title: The string to display in the button. Specify a string localized for the user's current language.

Returns a new table row action object that you can return from your table view's event.

The style you specify cannot be changed later. You can change the title of the action button. You can also configure other appearance-related properties of the button using the properties of this class.
You can assign the same row action object to multiple rows of your table.

32.54.6 Properties

32.54.7 BackgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The background color of the action button.
Notes:

Use this property to specify the background color for your button. If you do not specify a value for this property, AppKit assigns a default color based on the value in the style property. Generally, this color is red for destructive actions and blue for nondestructive actions.
(Read and Write property)

32.54.8 Handle as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

32.54.9 Image as NSImageMBS

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The image.
Notes:

Available in macOS 10.12 or later.
(Read and Write property)

32.54.10 Style as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The style applied to the action button.
Notes:

The value of this property is set at creation time and cannot be changed later.
(Read only property)

32.54.11 Title as String

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The title of the action button.
Notes: (Read and Write property)

32.54.12 Events

32.54.13 Action(row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when action is invoked.
Notes: The event to execute when the user clicks the button associated with this action. When the user selects the action represented by this object, AppKit executes your event on the app's main thread.

32.54.14 Constants

32.54.15 NSTableViewRowActionStyleDestructive = 1

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** Constants that help define the appearance and behavior of action buttons.
Notes: Apply a style that indicates that the action might change or delete data. This style changes the value of the backgroundColor property to an appropriate value to reflect the destructive action. After creating the action object, you can change the background color as needed. Destructive actions require a longer swipe to activate, and trigger an animation when a table row is deleted.

32.54.16 NSTableViewRowActionStyleRegular = 0

MBS MacControls Plugin, Plugin Version: 17.1. **Function:** Constants that help define the appearance and behavior of action buttons.

Notes: Apply the default style to the button. This style does not apply any special coloring to the button.

32.55 class NSTabViewItemMBS

32.55.1 class NSTabViewItemMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class for items on the tabview.
Notes: An NSTabViewItem is a convenient way for presenting information in multiple pages. A tab view is usually distinguished by a row of tabs that give the visual appearance of folder tabs. When the user clicks a tab, the tab view displays a view page provided by your application. A tab view keeps a zero-based array of NSTabViewItems, one for each tab in the view.

32.55.2 Blog Entries

- Disable tab panel item in Xojo
- MBS Xojo / Real Studio Plugins, version 15.1pr4

32.55.3 Methods

32.55.4 Constructor(identifier as Variant)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new tabview item with the identifier.

32.55.5 Properties

32.55.6 color as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color of the tab view item.
Notes:

May not be used by the control.
(Read and Write property)

32.55.7 Enabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The enabled state of the tab view item.
Example:

```
dim n as NSTabViewMBS = TabPanel1.NSTabViewMBS
dim t as NSTabViewItemMBS = n.tabViewItemAtIndex(0)
t.Enabled = false
```

Notes: (Read and Write property)

32.55.8 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSTabViewItem object.
Notes: (Read and Write property)

32.55.9 identifier as Variant

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identifier for this item.
Notes: (Read and Write property)

32.55.10 image as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image for the tab panel item.
Notes:

Available in Mac OS X 10.10.
(Read and Write property)

32.55.11 initialFirstResponder as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The initial first responder for the view associated with the receiver.
Notes:

Sets the initial first responder for the view associated with the receiver (the view that is displayed when a user clicks on the tab) to view.
(Read and Write property)

32.55.12 label as string

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The label text for the receiver.
Notes: (Read and Write property)

32.55.13 tabState as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current display state of the tab associated with the receiver.
Notes:

The possible values are NSSelectedTab, NSBackgroundTab, or NSPressedTab. Your application does not directly set the tab state.
(Read only property)

32.55.14 tabView as NSTabViewMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the parent tab view for the receiver.
Notes:

Note that this is the tab view itself, not the view displayed when a user clicks the tab.

A tab view item normally learns about its parent tab view when it is inserted into the view's array of items. The NSTabView methods addTabViewItem and insertTabViewItem set the tab view for the added or inserted item.
(Read only property)

32.55.15 toolTip as string

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The tooltip displayed for the tab view item.
Notes: (Read and Write property)

32.55.16 view as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The view associated with the receiver to view.
Notes:

This is the view displayed when a user clicks the tab. When you set a new view, the old view is released. (Read and Write property)

32.55.17 Constants

32.55.18 NSBackgroundTab = 1

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants describing the current display state of a tab.
Notes: A tab that's not being displayed.

32.55.19 NSPressedTab = 2

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants describing the current display state of a tab.
Notes: A tab that the user is in the process of clicking. That is, the user has pressed the mouse button while the cursor is over the tab but has not released the mouse button.

32.55.20 NSSelectedTab = 0

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants describing the current display state of a tab.
Notes: The tab that's being displayed.

32.56 class NSTabViewMBS

32.56.1 class NSTabViewMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The Cocoa tabpanel control.
Notes:

An NSTabView object provides a convenient way to present information in multiple pages. The view contains a row of tabs that give the appearance of folder tabs, as shown in the following figure. The user selects the desired page by clicking the appropriate tab or using the arrow keys to move between pages. Each page displays a view hierarchy provided by your application.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

32.56.2 Blog Entries

- Disable tab panel item in Xojo

32.56.3 Methods

32.56.4 addTabViewItem(tabViewItem as NSTabViewItemMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Adds the tab item specified by tabViewItem.
Notes:

tabViewItem: The tab view item to be added.

The item is added at the end of the array of tab items, so the new tab appears on the right side of the view.

32.56.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new tab view with size 100/100 and position 0/0
Example:

```
dim t as new NSTabViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.56.6 Constructor(Handle as Integer) 7135
- 32.56.7 Constructor(left as Double, top as Double, width as Double, height as Double) 7135

32.56.6 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given NSTabView handle.
Example:

```
dim t as new NSTabViewMBS(0, 0, 100, 100)
dim v as new NSTabViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSTabView and the plugin retains this handle.
See also:

- 32.56.5 Constructor 7134
- 32.56.7 Constructor(left as Double, top as Double, width as Double, height as Double) 7135

32.56.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new tab view with the given size and position.
Example:

```
dim x as new NSTabViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.56.5 Constructor 7134
- 32.56.6 Constructor(Handle as Integer) 7135

32.56.8 contentRect as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the rectangle describing the content area of the receiver.
Notes: This area does not include the space required for the receiver's tabs or borders (if any).

32.56.9 indexOfTabViewItem(tabViewItem as NSTabViewItemMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of the specified item in the tab view.
Notes: The zero-based index of tabViewItem, or [NSNotFound] if the item is not found.

32.56.10 indexOfTabViewItemWithIdentifier(identifier as Variant) as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of the item that matches the specified identifier. identifier, or NSNotFound (-1) if the item is not found.
Notes: Returns nil on any error.

32.56.11 insertTabViewItem(tabViewItem as NSTabViewItemMBS, atIndex as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts tabViewItem into the receiver's array of tab view items at index.
Notes:

tabViewItem: The tab view item to be added.
index: The index at which to insert the tab view item. The index parameter is zero-based.

32.56.12 minimumSize as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the minimum size necessary for the receiver to display tabs in a useful way.
Notes: You can use the value returned by this method to limit how much a user can resize a tab view.

32.56.13 numberOfTabViewItems as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of items in the receiver's array of tab view items.

32.56.14 removeTabViewItem(tabViewItem as NSTabViewItemMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the item specified by tabViewItem from the receiver's array of tab view items.

32.56.15 selectedTabViewItem as NSTabViewItemMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects the specified tab view item.

32.56.16 selectFirstTabViewItem

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method selects the first tab view item.

32.56.17 selectLastTabViewItem

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method selects the last tab view item.

32.56.18 selectNextTabViewItem

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method selects the next tab view item in the sequence.
Notes: If the currently visible item is the last item in the sequence, this method does nothing, and the last page remains displayed.

32.56.19 selectPreviousTabViewItem

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method selects the previous tab view item in the sequence.

Notes: If the currently visible item is the first item in the sequence, this method does nothing, and the first page remains displayed.

32.56.20 selectTabViewItem(tabViewItem as NSTabViewItemMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the tab view item for the currently selected tab.
Notes: Returns the currently selected tab view item, or nil if no item is selected.

32.56.21 selectTabViewItemAtIndex(index as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects the tab view item specified by index.
Notes: The index parameter is base 0.

32.56.22 selectTabViewItemWithIdentifier(identifier as Variant)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Selects the tab view item specified by identifier.

32.56.23 tabViewItemAtIndex(index as Integer) as NSTabViewItemMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the tab view item at index in the tab view's array of items.
Notes:

index: The index at which to insert the tab view item. The index parameter is zero-based.

Returns the tab view item at the specified index.

32.56.24 tabViewItemAtPoint(x as Double, y as Double) as NSTabViewItemMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the tab view item at the specified point.
Notes:

Returns the tab view item under the hit point, or nil if no tab view item is under that location.
You can use this method to find a tab view item based on a user's mouse click.

32.56.25 tabViewItems as NSTabViewItemMBS()

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's array of tab view items.
Notes: A tab view keeps an array containing one tab view item for each tab in the view.

32.56.26 Properties

32.56.27 allowsTruncatedLabels as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether if the receiver allows truncating for labels that don't fit on a tab.
Notes:

Value is true if the receiver allows truncating for labels that don't fit on a tab, otherwise false.

The default is true.
When truncating is allowed, the tab view inserts an ellipsis, if necessary, to fit a label in the tab.
(Read and Write computed property)

32.56.28 controlSize as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The size of the receiver.
Notes:

Use NSRegularControlSize, NSSmallControlSize or NSMiniControlSize.
(Read and Write computed property)

32.56.29 controlTint as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The tab view's control tint.
Notes:

Use NSDefaultControlTint, NSBlueControlTint, NSGraphiteControlTint or NSClearControlTint.
(Read and Write computed property)

32.56.30 drawsBackground as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether if the receiver draws a background color when the tab view type is NSNoTabsNoBorder. **Notes:**

True if the receiver draws a background color when the tab view type is NSNoTabsNoBorder, otherwise false.

If the receiver uses bezeled edges or a line border, the appropriate background color for that border is used.
(Read and Write computed property)

32.56.31 font as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The font for tab label text.
Notes:

Tab height is adjusted automatically to accommodate a new font size. If the view allows truncating, tab labels are truncated as needed.
(Read and Write computed property)

32.56.32 tabViewType as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The tab type for the receiver.
Notes:

Use constants: NSTopTabsBezelBorder, NSLeftTabsBezelBorder, NSBottomTabsBezelBorder, NSRightTabsBezelBorder, NSNoTabsBezelBorder, NSNoTabsLineBorder or NSNoTabsNoBorder.
(Read and Write computed property)

32.56.33 Constants

32.56.34 NSBlueControlTint=1

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify a the control tint. **Notes:** Aqua control tint

32.56.35 NSBottomTabsBezelBorder = 2

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the tab view's type as used by tabViewType.
Notes: Tabs are on the bottom of the view with a bezeled border.

32.56.36 NSClearControlTint=7

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify a the control tint.
Notes: Clear control tint

32.56.37 NSDefaultControlTint=0

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify a the control tint.
Notes: The current default tint setting

32.56.38 NSGraphiteControlTint=6

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify a the control tint.
Notes: Graphite control tint

32.56.39 NSLeftTabsBezelBorder = 1

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the tab view's type as used by tabViewType.
Notes: Tabs are on the left of the view with a bezeled border.

32.56.40 NSMiniControlSize=2

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the values for the ControlSize property.
Notes: The control has a smaller size than NSSmallControlSize.

32.56.41 NSNoTabsBezelBorder = 4

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the tab view's type as used by tabViewType.

Notes: The view does not include tabs and has a bezeled border.

32.56.42 NSNoTabsLineBorder = 5

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the tab view's type as used by tabViewType.
Notes: The view does not include tabs and has a lined border.

32.56.43 NSNoTabsNoBorder = 6

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the tab view's type as used by tabViewType.
Notes: The view does not include tabs and has no border.

32.56.44 NSRegularControlSize=0

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the values for the ControlSize property.
Notes: The control is sized as regular.

32.56.45 NSRightTabsBezelBorder = 3

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the tab view's type as used by tabViewType.
Notes: Tabs are on the right of the view with a bezeled border.

32.56.46 NSSmallControlSize=1

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the values for the ControlSize property.
Notes: This constant is for controls that cannot be resized in one direction, such as push buttons, radio buttons, checkboxes, sliders, scroll bars, pop-up buttons, tabs, and progress indicators. You should use a small system font with a small control.

32.56.47 NSTopTabsBezelBorder = 0

MBS MacCocoa Plugin, Plugin Version: 10.0. **Function:** One of the constants to specify the tab view's type as used by tabViewType.

Notes: The view includes tabs on the top of the view and has a bezeled border (the default).

32.57 class NSTextFieldCellMBS

32.57.1 class NSTextFieldCellMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The text field class for using as NSCell.
Example:

```
// ask for the textfield behind the label
dim n as NSTextFieldMBS = NSTextFieldMBS(label1.NSViewMBS)

// query cell
dim c as NSTextFieldCellMBS = n.cell

// and set background style
c.backgroundStyle = NSTextFieldCellMBS.NSBackgroundStyleRaised
```

Notes:

The NSTextFieldCell class adds to the text display capabilities of the NSCell class by allowing you to set the color of both the text and its background. You can also specify whether the cell draws its background at all.

All of the methods declared by this class are also declared by the NSTextField class, which uses NSTextFieldCell objects to draw and edit text. These NSTextField cover methods call the corresponding NSTextFieldCell methods.

Placeholder strings, set using PlaceholderString or PlaceholderAttributedString, now appear in the text field cell if the actual string is "". They are drawn in grey on the cell.
Subclass of the NSActionCellMBS class.

32.57.2 Blog Entries

- MBS Real Studio Plugins, version 11.3pr1
- Nearly 2000 new Functions in the 9.6 prerelease of MBS

32.57.3 Xojo Developer Magazine

- 7.6, page 8: News
- 14.4, page 29: NSTabula Rasa, What to do when your new sports car arrives in parts by Ulrich Bogun

32.57.4 Methods

32.57.5 allowedInputSourceLocales as string()

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of locale identifiers representing input sources that are allowed to be enabled when the receiver has the keyboard focus.
Notes: Available in Mac OS X v10.5 and later.

32.57.6 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new Cell object with a text.
Example:

```
dim c as new NSTextFieldCellMBS("Hello")
MsgBox c.StringValue
```

32.57.7 setAllowedInputSourceLocales(Identifiers() as string)

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets an array of locale identifiers representing input sources that are allowed to be enabled when the receiver has the keyboard focus.
Notes:

You can use the meta-locale identifier, NSAllRomanInputSourcesLocaleIdentifier, to specify input sources that are limited for Roman script editing.

Available in Mac OS X v10.5 and later.

32.57.8 setUpFieldEditorAttributes(textobj as NSTextMBS) as NSTextMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets up the field editor. You never invoke this method directly; by overriding it, however, you can customize the field editor.

32.57.9 setWantsNotificationForMarkedText(value as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Directs the cell's associated field editor to post text change notifications.
Notes:

If true, the field editor posts text change notifications (NSTextDidChangeNotification) while editing marked text; if false, notifications are delayed until the marked text confirmation.

Available in Mac OS X v10.5 and later.

32.57.10 Properties

32.57.11 backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color of the background the receiver draws behind the text.
Notes: (Read and Write property)

32.57.12 bezelStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's bezel style.
Notes:

To set the bezel style, you must have already set Bezeled to true.
(Read and Write property)

32.57.13 drawsBackground as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether the receiver draws its background color.
Notes:

In order to prevent inconsistent rendering, background color rendering is disabled for rounded-bezel text fields.
(Read and Write property)

32.57.14 placeholderAttributedString as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The placeholder of the cell as an attributed string.
Notes:

Note that invoking this successfully will clear out any plain text string set by PlaceholderString.

Available in Mac OS X v10.3 and later.
(Read and Write property)

32.57.15 placeholderString as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The placeholder of the cell as a plain text string.
Notes:

Note that invoking this successfully will clear out any attributed string set by setPlaceholderAttributedString.
(Read and Write property)

32.57.16 textColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color used to draw the receiver's text.
Notes: (Read and Write property)

32.57.17 Constants

32.57.18 NSTextFieldRoundedBezel=1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the bezel style of the text field cell.
Notes:

Corners are rounded.
Available in Mac OS X v10.2 and later.

32.57.19 NSTextFieldSquareBezel=0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the bezel style of the text field cell.
Notes:

Corners are square.
Available in Mac OS X v10.2 and later.

32.58 control NSTextFieldControlMBS

32.58.1 control NSTextFieldControlMBS

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The Xojo control for a NSTextField.
Notes:

This control embeds a special NSTextField subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

32.58.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.0pr2
- MBS Xojo / Real Studio Plugins, version 13.4pr7

32.58.3 Properties

32.58.4 View as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

32.58.5 Events

32.58.6 Action

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control's action was triggered.
Notes: The text changed.

32.58.7 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the bounds, but not the frame, changed.

32.58.8 EnableMenuItems

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event where you can enable menu items.

32.58.9 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the frame changed.

32.58.10 GotFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

32.58.11 LostFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

32.58.12 MenuAction(HitItem as MenuItem) As Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

32.58.13 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The mouse button was pressed inside the control's region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

32.58.14 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

32.58.15 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

32.58.16 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

32.58.17 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a control with editable text begins an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

32.58.18 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent when the text in the receiving control changes.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

32.58.19 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent when a control with editable text ends an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

32.58.20 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether text editing should be allowed.

Notes:

Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

32.58.21 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether ending text editing should be allowed.
Notes:

Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

32.59 class NSTextFieldMBS

32.59.1 class NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSTextField object is a kind of NSControl that displays text that the user can select or edit and that sends its action message to its target when the user presses the Return key while editing.
Notes: Subclass of the NSControlMBS class.

32.59.2 Blog Entries

- MBS Xojo Plugins, version 17.1pr4
- MBS Xojo / Real Studio Plugins, version 14.4pr1

32.59.3 Methods

32.59.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new text field with size 100/100 and position 0/0
Example:

```
dim t as new NSTextFieldMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.59.5 Constructor(Handle as Integer) 7154
- 32.59.6 Constructor(left as Double, top as Double, width as Double, height as Double) 7155

32.59.5 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an object based on the given NSTextField handle.
Example:

```
dim t as new NSTextFieldMBS(0, 0, 100, 100)
dim v as new NSTextFieldMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSTextField and the plugin retains this handle.
See also:

- 32.59.4 Constructor 7154
- 32.59.6 Constructor(left as Double, top as Double, width as Double, height as Double) 7155

32.59.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new text field with the given size and position.
Example:

```
dim x as new NSTextFieldMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.59.4 Constructor 7154
- 32.59.5 Constructor(Handle as Integer) 7154

32.59.7 selectText

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Ends editing and selects the entire contents of the receiver if it's selectable.
Notes: If the receiver isn't in some window's view hierarchy, this method has no effect.

32.59.8 Properties

32.59.9 AllowsCharacterPickerTouchBarItem as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether to allow character picker in touch bar.
Notes:

Available in macOS 10.12.2.
(Read and Write property)

32.59.10 allowsEditingTextAttributes as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver allows the user to change font attributes of the receiver's text.
Notes:

If true, the user is permitted to change font attributes of the receiver's text; if flag is false, the user isn't so permitted. You can change text attributes programmatically regardless of this setting.
(Read and Write property)

32.59.11 AutomaticTextCompletionEnabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether automatic text completion is enabled.
Notes:

Available in macOS 10.12.2.
(Read and Write property)

32.59.12 backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color of the background that the receiver's cell draws behind the text.
Notes: (Read and Write property)

32.59.13 Bezeled as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the receiver draws a bezeled frame.
Notes: (Read and Write property)

32.59.14 bezelStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's bezel style.
Notes:

You must have already sent the receiver Bezeled with true to make this property take affect.
(Read and Write property)

32.59.15 Bordered as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the receiver draws a black border around its contents.
Notes:

True if the receiver draws a solid black border around its contents; otherwise false.
(Read and Write property)

32.59.16 drawsBackground as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Controls whether the receiver's cell draws its background color behind its text.
Notes:

In order to prevent inconsistent rendering, background color rendering is disabled for rounded-bezel text fields.

To really make the background go away, also set bordered=false.
(Read and Write property)

32.59.17 Editable as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the user can edit the receiver's text.
Notes:

If true, then the user is allowed to both select and edit text. If flag is false, then the user isn't permitted to edit text, and the receiver's selectability is restored to its previous value.

For example, if an NSTextField object is selectable but not editable, then made editable for a time, then made not editable, it remains selectable. To guarantee that text is neither editable nor selectable, simply use setSelectable to turn off selectability.
(Read and Write property)

32.59.18 importsGraphics as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Controls whether the receiver allows the user to drag image files into it.
Notes:

If true, the receiver accepts dragged images; if false, it doesn't. You can add images programmatically regardless of this setting.
(Read and Write property)

32.59.19 placeholderAttributedString as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 14.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The attributed placeholder string.
Notes: (Read and Write property)

32.59.20 placeholderString as String

MBS MacCocoa Plugin, Plugin Version: 14.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The plain text placeholder string.
Notes: (Read and Write property)

32.59.21 Selectable as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver is selectable (but not editable).
Notes:

If true, the receiver is made selectable but not editable (use Editable to make text both selectable and editable). If false, the text is neither editable nor selectable.
(Read and Write property)

32.59.22 textColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color used to draw the receiver's text.
Notes: (Read and Write property)

32.59.23 Constants

32.59.24 NSTextFieldRoundedBezel = 1

MBS MacCocoa Plugin, Plugin Version: 10.4. **Function:** One of the constants for the bezelStyle property. **Notes:** Corners are rounded.

32.59.25 NSTextFieldSquareBezel = 0

MBS MacCocoa Plugin, Plugin Version: 10.4. **Function:** One of the constants for the bezelStyle property. **Notes:** Corners are square.

32.60 class NSTextFinderMBS

32.60.1 class NSTextFinderMBS

MBS MacCocoa Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An optional search-and-replace find interface inside a view, usually a scroll view.
Notes:

The class serves as a controller for the standard Cocoa find bar. The NSTextFinder class interacts heavily with a client object which supports the NSTextFinderClient protocol. The client object provides access to the content being searched and provides visual feedback for a search operation.
All menu items related to finding (Find…, Find Next, Find Previous, Use Selection for Find, etc.) should have the same action, performTextFinderAction:, which gets sent down the responder chain in the standard method.

https://developer.apple.com/documentation/appkit/nstextfinder

32.60.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 18.5
- MBS Xojo Plugins, version 18.5pr3

32.60.3 Methods

32.60.4 cancelFindIndicator

MBS MacCocoa Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Cancels the find indicator immediately.
Notes:

There may be some circumstances where the find indicator should be immediately cancelled or hidden, such as when the view's content or selection is changed without the knowledge of the text finder. This method will immediately cancel the current find indicator.
The NSTextFinderMBS and NSViewMBS classes will handle the find indicator correctly when a content view is resized, moved, or removed from the view hierarchy. If your content view's scrolling is done by an NSScrollViewMBS, the find indicator will also be handled for you during scrolling.

32.60.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new object.

32.60.6 performAction(operation as Integer)

MBS MacCocoa Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Performs the specified text finding action.
Notes:

operation: The text finding action. See NSTextFinderAction for the possible values.

Objects that respond to performTextFinderAction typically call validateAction: to ensure that the action is valid and then invoke performAction if validation is successful.

When invoking the validateAction and performAction the item or sender's tag should be passed as the parameter. By convention, the sender parameter for this method will have an kAction* constants set as its tag. The responder that receives this method should pass the tag as the action for this method:

32.60.7 validateAction(operation as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Allows validation of the find action before performing.
Notes: Returns true if the operation is valid; otherwise false.

32.60.8 Properties

32.60.9 client as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The object that provides the target search string, find bar location, and feedback methods.
Notes:

The NSTextFinderMBS instance class must be associated with a client object that implements the NSTextFinderClient protocol in order to function. The client is responsible for providing the string to be searched, the location for the find bar, and the methods which control feedback to the user about the search results.
(Read and Write property)

32.60.10 findBarContainer as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies the find bar container.
Notes:

This property must be set to support the find bar.
When the find bar is to be shown, NSTextFinderMBS invokes showFindBarView on the findBarContainer object, passing the view for the find bar, which it should display somewhere that is associated appropriately with the content being searched.
The NSScrollViewMBS class implements NSTextFinderBarContainer protocol and is the correct place to display the find bar in most circumstances. The container may freely modify the find bar view's width and origin, but not its height.
If this property is not set, then the find bar cannot be shown.
(Read and Write property)

32.60.11 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference number.
Notes: (Read and Write property)

32.60.12 incrementalSearchingEnabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Determines if incremental searching is enabled.
Notes:

If true, then the find bar will do incremental searches. If it returns false, then the find bar will behave regularly.
The default value is false.
(Read and Write property)

32.60.13 incrementalSearchingShouldDimContentView as Boolean

MBS MacCocoa Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Determines the type of incremental search feedback to be presented.
Notes:

If true, then when an incremental search begins, the findBarContainer instance's parent contentView will be dimmed, except for the locations of the incremental matches. If false, then the incremental matches will not be highlighted automatically, but you can use incrementalMatchRanges to highlight the matches yourself.
The default value is true.

(Read and Write property)

32.60.14 Constants

32.60.15 kActionHideFindInterface = 11

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the action constants. **Notes:** Hides the find bar interface.

32.60.16 kActionHideReplaceInterface = 13

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the action constants. **Notes:** Displays the find bar interface including the replace functionality.

32.60.17 kActionNextMatch = 2

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the action constants. **Notes:** The next match, if any, is displayed.

32.60.18 kActionPreviousMatch = 3

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the action constants. **Notes:** The previous match, if any, is displayed.

32.60.19 kActionReplace = 5

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the action constants. **Notes:** Replaces a single instance of the string.

32.60.20 kActionReplaceAll = 4

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the action constants. **Notes:** All occurrences of the string are replaced.

32.60.21 kActionReplaceAllInSelection = 8

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the action constants. **Notes:** Selects all matching search strings within the current selection.

32.60.22 kActionReplaceAndFind = 6

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the action constants. **Notes:** Replaces a single instance of the string and searches for the next match.

32.60.23 kActionSelectAll = 9

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the action constants. **Notes:** Selects all matching search strings.

32.60.24 kActionSelectAllInSelection = 10

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the action constants. **Notes:** Replaces all occurrences of the string within the current selection.

32.60.25 kActionSetSearchString = 7

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the action constants. **Notes:** Sets the search string.

32.60.26 kActionShowFindInterface = 1

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the action constants. **Notes:** The find bar interface is displayed.

32.60.27 kActionShowReplaceInterface = 12

MBS MacCocoa Plugin, Plugin Version: 18.5. **Function:** One of the action constants. **Notes:** Displays the find bar interface including the replace functionality.

32.61 control NSTextViewControlMBS

32.61.1 control NSTextViewControlMBS

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The Xojo control for a NSTextView.
Notes:

This control embeds a special NSTextView subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

32.61.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.5pr6
- MBS Xojo / Real Studio Plugins, version 15.0pr8
- MBS Xojo / Real Studio Plugins, version 13.5pr1
- MBS Xojo / Real Studio Plugins, version 13.4pr7

32.61.3 Properties

32.61.4 AcceptTabs as Boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the control should accept tab keys.
Notes:

If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

32.61.5 Scrollview as Variant

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The scrollview for this textview.
Notes: (Read only property)

32.61.6 View as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

32.61.7 Events

32.61.8 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the bounds, but not the frame, changed.

32.61.9 EnableMenuItems

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event where you can enable menu items.

32.61.10 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the frame changed.

32.61.11 GotFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

32.61.12 LostFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

32.61.13 MenuAction(HitItem as MenuItem) As Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

32.61.14 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The mouse button was pressed inside the control's region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

32.61.15 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

32.61.16 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

32.61.17 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

32.61.18 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a text view needs to determine if text in a specified range should be changed.
Notes:

affectedCharRange: The range of characters to be replaced.
replacementString: The characters that will replace the characters in affectedCharRange; nil if only text attributes are being changed.

Return true to allow the replacement, or false to reject the change.

32.61.19 textDidBeginEditing

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Informs you that the text object has begun editing (that the user has begun changing it).

32.61.20 textDidChange

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Informs you that the text object has changed its characters or formatting attributes.

32.61.21 textDidEndEditing

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Informs you that the text object has finished editing (that it has resigned first responder status).

32.61.22 textShouldBeginEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when a text object begins to change its text, this method requests permission to begin editing.
Notes: If the delegate returns false, the text object proceeds to make changes. If the delegate returns true, the text object abandons the editing operation. This method is also invoked when the user drags and drops a file onto the text object.

32.61.23 textShouldEndEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked from a text object's implementation of resignFirstResponder, this method requests permission to end editing.
Notes: If the delegate returns false, the text object proceeds to finish editing and resign first responder status. If the delegate returns true, the text object selects all of its text and remains the first responder.

32.61.24 textViewDidChangeSelection

MBS MacCocoa Plugin, Plugin Version: 13.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the selection changes in the text view.

32.62 class NSTextViewMBS

32.62.1 class NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The cocoa text view class.
Notes:

Like the editfield in Xojo.
Should be placed in a scrollview.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSTextMBS class.

32.62.3 Xojo Developer Magazine

- 6.6, page 8: News

32.62.4 Methods

32.62.5 alignJustified

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Applies full justification to selected paragraphs (or all text, if the receiver is a plain text object).

32.62.6 breakUndoCoalescing

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that it should begin coalescing successive typing operations in a new undo grouping.
Notes: This method should be invoked when saving the receiver's contents to preserve proper tracking of unsaved changes and the document's dirty state.

32.62.7 changeAttributes

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes the attributes of the current selection.
Notes:

This method changes the attributes by invoking convertAttributes: on sender and applying the returned attributes to the appropriate text. See the NSFontManager class reference for more information on attribute conversion.

Available in Mac OS X v10.3 and later.

32.62.8 changeColor

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the color of the selected text.

32.62.9 changeDocumentBackgroundColor

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An action method used to set the background color.
Notes:

This method gets the new color by sending a color message to sender.
This will only set the background color if allowsDocumentBackgroundColorChangereturns true.

32.62.10 checkTextInDocument

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Check text in document.
Notes: Available in Mac OS X v10.6 and later.

32.62.11 checkTextInSelection

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Check text in selection.
Notes: Available in Mac OS X v10.6 and later.

32.62.12 complete

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invokes completion in a text view.
Notes: By default invoked using the Escape key, this method provides users with a choice of completions for the word currently being typed. May be invoked programmatically if autocompletion is desired by a client of the text system. You can change the key invoking this method using the text system's key bindings mechanism; see "Text System Defaults and Key Bindings" for an explanation of the procedure (on Apple website).

32.62.13 Constructor

MBS MacCocoa Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new text view with size 100/100 and position 0/0
Example:

```
dim t as new NSTextViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.62.14 Constructor(Handle as Integer) 7172
- 32.62.15 Constructor(left as Double, top as Double, width as Double, height as Double) 7173

32.62.14 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an object based on the given NSTextView handle.
Example:

```
dim t as new NSTextViewMBS(0, 0, 100, 100)
dim v as new NSTextViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSTextView and the plugin retains this handle.
See also:

- 32.62.13 Constructor 7172
- 32.62.15 Constructor(left as Double, top as Double, width as Double, height as Double) 7173

32.62.15 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new text view with the given size and position.
Example:

```
dim x as new NSTextViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.62.13 Constructor 7172
- 32.62.14 Constructor(Handle as Integer) 7172

32.62.16 didChangeText

MBS MacCocoa Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sends out necessary notifications when a text change completes.
Notes:

Invoked automatically at the end of a series of changes, this method posts an NSTextDidChangeNotification to the default notification center, which also results in the delegate receiving an NSText delegate textDidChange message.

Subclasses implementing methods that change their text should invoke this method at the end of those methods. See Subclassing NSTextView for more information.

32.62.17 insertText(attributedString as NSAttributedStringMBS)

MBS MacCocoa Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts text into the receiver's text at the insertion point if there is one, otherwise replacing the selection.
Example:

```
dim textView as NSTextViewMBS // your view
dim a as new NSMutableAttributedStringMBS

if a.initWithString( "Hello World. This is just a little test." ) then

Dim NSFont as NSFontMBS = NSFontMBS.fontWithName("Arial", 24.0)
Dim NSColor as NSColorMBS = NSColorMBS.blueColor
Dim NSRange as NSRangeMBS = NSMakeRangeMBS( 0, 20)
Dim NSAttributes as New Dictionary

NSAttributes.value(NSAttributedStringMBS.NSFontAttributeName) = NSFont
NSAttributes.value(NSAttributedStringMBS.NSForegroundColorAttributeName) = NSColor

a.addAttributes( NSAttributes, NSRange)

textView.insertText a

// replace text with new one:
'textView.textStorage.setAttributedString a

end if
```

Notes:

text: The string to insert. Can be either an string or an NSAttributedStringMBS object.

The inserted text is assigned the current typing attributes.

This method is the means by which text typed by the user enters an NSTextView. See the NSInputManager class and NSTextInput protocol specifications for more information.

This method is the entry point for inserting text typed by the user and is generally not suitable for other purposes. Programmatic modification of the text is best done by operating on the text storage directly. Because this method pertains to the actions of the user, the text view must be editable for the insertion to work.
See also:

- 32.62.18 insertText(text as string) 7174

32.62.18 insertText(text as string)

MBS MacCocoa Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts text into the receiver's text at the insertion point if there is one, otherwise replacing the selection.

Notes:

text: The string to insert. Can be either an string or an NSAttributedStringMBS object.

The inserted text is assigned the current typing attributes.

This method is the means by which text typed by the user enters an NSTextView. See the NSInputManager class and NSTextInput protocol specifications for more information.

This method is the entry point for inserting text typed by the user and is generally not suitable for other purposes. Programmatic modification of the text is best done by operating on the text storage directly. Because this method pertains to the actions of the user, the text view must be editable for the insertion to work.
See also:

- 32.62.17 insertText(attributedString as NSAttributedStringMBS) 7173

32.62.19 invalidateTextContainerOrigin

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invalidates the calculated origin of the text container.
Notes: This method is invoked automatically; you should never need to invoke it directly. Usually called because the text view has been resized or the contents of the text container have changed.

32.62.20 loosenKerning

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Increases the space between glyphs in the receiver's selection, or in all text if the receiver is a plain text view.
Notes: Kerning values are determined by the point size of the fonts in the selection.

32.62.21 lowerBaseline

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Lowers the baseline offset of selected text by 1 point, or of all text if the receiver is a plain text view.
Notes: As such, this method defines a more primitive operation than subscripting.

32.62.22 orderFrontLinkPanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Brings forward a panel allowing the user to manipulate links in the text view.
Notes: Available in Mac OS X v10.4 and later.

32.62.23 orderFrontListPanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Brings forward a panel allowing the user to manipulate text lists in the text view.
Notes: Available in Mac OS X v10.4 and later.

32.62.24 orderFrontSpacingPanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Brings forward a panel allowing the user to manipulate text line heights, interline spacing, and paragraph spacing, in the text view.
Notes: Available in Mac OS X v10.4 and later.

32.62.25 orderFrontSubstitutionsPanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Orders the substitution panel to the front.
Notes: Available on Mac OS X 10.6 or newer.

32.62.26 orderFrontTablePanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Brings forward a panel allowing the user to manipulate text tables in the text view.

32.62.27 outline

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds the outline attribute to the selected text attributes if absent; removes the attribute if present.
Notes:

If there is a selection and the first character of the selected range has a non-zero stroke width, or if there is no selection and the typing attributes have a non-zero stroke width, then the stroke width is removed;

otherwise the value of NSStrokeWidthAttributeName is set to the default value for outline (3.0).

Operates on the selected range if the receiver contains rich text. For plain text the range is the entire contents of the receiver.

32.62.28 pasteAsPlainText

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts the contents of the pasteboard into the receiver's text as plain text.
Notes: This method behaves analogously to insertText.

32.62.29 pasteAsRichText

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This action method inserts the contents of the pasteboard into the receiver's text as rich text, maintaining its attributes.
Notes: The text is inserted at the insertion point if there is one, otherwise replacing the selection.

32.62.30 performFindPanelAction(FindAction as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Performs a find panel action specified by the sender's tag.
Example:

```
const NSFindPanelActionShowFindPanel = 1

dim n as NSTextViewMBS = TextArea1.NSTextViewMBS
n.usesFindPanel = true
n.performFindPanelAction(NSFindPanelActionShowFindPanel)
```

Notes:

This is the generic action method for the find menu and find panel, and can be overridden to implement a custom find panel.

Possible values:
NSFindPanelActionShowFindPanel = 1
NSFindPanelActionNext = 2
NSFindPanelActionPrevious = 3
NSFindPanelActionReplaceAll = 4

NSFindPanelActionReplace = 5
NSFindPanelActionReplaceAndFind = 6
NSFindPanelActionSetFindString = 7
NSFindPanelActionReplaceAllInSelection = 8
NSFindPanelActionSelectAll = 9
NSFindPanelActionSelectAllInSelection = 10
See also:

- 32.62.31 performFindPanelAction(sender as object) 7178

32.62.31 performFindPanelAction(sender as object)

MBS MacCocoa Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Performs a find panel action specified by the sender.
Notes:

This is the generic action method for the find menu and find panel, and can be overridden to implement a custom find panel.
Sender could be a NSMenuItem or maybe also a NSView.
See also:

- 32.62.30 performFindPanelAction(FindAction as Integer) 7177

32.62.32 raiseBaseline

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Raises the baseline offset of selected text by 1 point, or of all text if the receiver is a plain text view.
Notes: As such, this method defines a more primitive operation than superscripting.

32.62.33 replaceTextContainer(textContainer as NSTextContainerMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the text container for the group of text system objects containing the receiver, keeping the association between the receiver and its layout manager intact.
Notes: textContainer: The new text container. This method raises NSInvalidArgumentException if TextContainer is nil.

32.62.34 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string = "") as Boolean

MBS MacCocoa Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initiates a series of delegate messages (and general notifications) to determine whether modifications

can be made to the characters and attributes of the receiver's text.
Notes:

affectedCharRange: The range of characters affected by the proposed change.
replacementString: The characters that will replace those in affectedCharRange. If only text attributes are being changed, replacementString is "".

Returns true to allow the change, false to prohibit it.

This method checks with the delegate as needed using textShouldBeginEditing and shouldChangeTextIn-Range.
This method must be invoked at the start of any sequence of user-initiated editing changes. If your subclass of NSTextView implements methods that modify the text, make sure to invoke this method to determine whether the change should be made. If the change is allowed, complete the change by invoking the did-ChangeText method.

If the receiver is not editable, this method automatically returns false. This result prevents instances in which a text view could be changed by user actions even though it had been set to be non-editable.
In macOS 10.4 and later, if there are multiple selections, this method acts on the first selected subrange.
See also:

- 32.62.99 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string) as boolean 7196

32.62.35 showFindIndicatorForRange(charRange as NSRangeMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Causes a temporary highlighting effect to appear around the visible portion (or portions) of the specified range.
Notes:

charRange: The character range around which indicators appear.

This method supports lozenge-style indication of find results. The indicators automatically disappear after a certain period of time, or when the method is called again, or when any of a number of changes occur to the view (such as changes to text, view size, or view position).

This method does not itself scroll the specified range to be visible; any desired scrolling should be done before this method is called, first, because the method acts only on the visible portion of the specified range, and, second, because scrolling causes the indicators to disappear. Calling this method with a zero-length range always removes any existing indicators.

Available in OS X v10.5 and later.

32.62.36 startSpeaking

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Speaks the selected text, or all text if no selection.

32.62.37 stopSpeaking

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops the speaking of text.

32.62.38 tightenKerning

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Decreases the space between glyphs in the receiver's selection, or for all glyphs if the receiver is a plain text view.
Notes: Kerning values are determined by the point size of the fonts in the selection.

32.62.39 toggleAutomaticDashSubstitution

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Toggles automatic dash substitution.
Notes: Available on Mac OS X 10.6 or newer.

32.62.40 toggleAutomaticDataDetection

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Toggles automatic data detection.
Notes: Available on Mac OS X 10.6 or newer.

32.62.41 toggleAutomaticLinkDetection

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes the state of automatic link detection from enabled to disabled and vice versa.
Notes:

Automatic link detection causes strings representing URLs typed in the view to be automatically made into links to those URLs.

Available in Mac OS X v10.5 and later.

32.62.42 toggleAutomaticQuoteSubstitution

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes the state of automatic quotation mark substitution from enabled to disabled and vice versa.
Notes:

Automatic quote substitution causes ASCII quotation marks and apostrophes to be automatically replaced, on a context-dependent basis, with more typographically accurate symbols.

Available in Mac OS X v10.5 and later.

32.62.43 toggleAutomaticSpellingCorrection

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Toggles automatic spelling correction.
Notes: Available on Mac OS X 10.6 or newer.

32.62.44 toggleAutomaticTextReplacement

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Toggles automatic text replacements.
Notes: Available on Mac OS X 10.6 or newer.

32.62.45 toggleBold

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Toggles the use of a bold/non-bold font.
Example:

```
// some textview
dim textview as NSTextView = TextArea1.NSTextViewMBS

// switch between bold and non bold
textview.toggleBold
```

Notes:

You can set this to continue typing with/without bold or change current selection.
Can only provide bold if the font supports it.

32.62.46 toggleContinuousSpellChecking

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Toggles whether continuous spell checking is enabled for the receiver.

32.62.47 toggleGrammarChecking

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes the state of grammar checking from enabled to disabled and vice versa.
Notes: Available in Mac OS X v10.5 and later.

32.62.48 toggleItalic

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Toggles the use of an italic/non-italic font.
Example:

```
// some textview
dim textview as NSTextView = TextArea1.NSTextViewMBS

// switch between italic and non italic
textview.toggleItalic
```

Notes:

You can set this to continue typing with/without bold or change current selection.
Can only provide italic if the font supports it.

32.62.49 toggleSmartInsertDelete

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes the state of smart insert and delete from enabled to disabled and vice versa.
Notes:

Controls whether the receiver inserts or deletes space around selected words so as to preserve proper spacing and punctuation.

Available in Mac OS X v10.5 and later.

32.62.50 toggleTraditionalCharacterShape

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Toggles the NSCharacterShapeAttributeName attribute at the current selection.

32.62.51 turnOffKerning

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the receiver to use nominal glyph spacing for the glyphs in its selection, or for all glyphs if the receiver is a plain text view.

32.62.52 turnOffLigatures

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the receiver to use only required ligatures when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it's a plain text view.

32.62.53 updateDragTypeRegistration

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates the acceptable drag types of all text views associated with the receiver's layout manager.
Notes:

If the receiver is editable and is a rich text view, causes all text views associated with the receiver's layout manager to register their acceptable drag types. If the text view isn't editable or isn't rich text, causes those text views to unregister their dragged types.

Subclasses can override this method to change the conditions for registering and unregistering drag types, whether as a group or individually based on the current state of the text view. They should invoke this method when that state changes to perform the necessary update.

32.62.54 updateFontPanel

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates the Font panel to contain the font attributes of the selection.
Notes: Does nothing if the receiver doesn't use the Font panel. You should never need to invoke this method directly, but you can override it if needed to handle additional font attributes.

32.62.55 updateRuler

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates the ruler view in the receiver's enclosing scroll view to reflect the selection's paragraph and marker attributes.
Notes: Does nothing if the ruler isn't visible or if the receiver doesn't use the ruler. You should never need to invoke this method directly, but you can override this method if needed to handle additional ruler attributes.

32.62.56 useAllLigatures

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the receiver to use all ligatures available for the fonts and languages used when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it's a plain text view.

32.62.57 useStandardKerning

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Set the receiver to use pair kerning data for the glyphs in its selection, or for all glyphs if the receiver is a plain text view.

32.62.58 useStandardLigatures

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the receiver to use the standard ligatures available for the fonts and languages used when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it's a plain text view.

32.62.59 Properties

32.62.60 acceptsGlyphInfo as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver accepts the glyph info attribute.
Notes:

True if the receiver should accept the NSGlyphInfoAttributeName attribute from text input sources such as input methods and the pasteboard, false otherwise.
(Read and Write property)

32.62.61 allowsDocumentBackgroundColorChange as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets whether the receiver allows its background color to change.
Notes:

This corresponds to the background color of the entirety of the text view, not just to a selected range of text.
(Read and Write property)

32.62.62 allowsImageEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether image attachments should permit editing of their images.
Notes:

True if image editing is allowed; otherwise, false.

For image editing to be allowed, the text view must be editable and the text attachment cell must support image editing.

Available in Mac OS X v10.5 and later.
(Read and Write property)

32.62.63 allowsUndo as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether undo support is enabled.

Notes: (Read and Write property)

32.62.64 AutomaticDashSubstitutionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether automatic dash substitution is enabled.
Notes:

Turning on automatic dash substitution enables automatic conversion of sequences of ASCII hyphen (-) characters to typographic dashes.
Available in Mac OS X v10.6 and later.
(Read and Write property)

32.62.65 AutomaticDataDetectionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether automatic data detection is enabled.
Notes:

Automatic data detection enables detection of dates, addresses, and phone numbers.
Available in Mac OS X v10.6 and later.
(Read and Write property)

32.62.66 AutomaticLinkDetectionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enables or disables automatic link detection.
Notes:

If true, automatic link detection is enabled; if false, it is disabled.

Automatic link detection causes strings representing URLs typed in the view to be automatically made into links to those URLs.

Available in Mac OS X v10.5 and later.
(Read and Write property)

32.62.67 AutomaticQuoteSubstitutionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether automatic quotation mark substitution is enabled.
Notes:

True if automatic quotation mark substitution is enabled; otherwise, false.

Automatic quote substitution causes ASCII quotation marks and apostrophes to be automatically replaced, on a context-dependent basis, with more typographically accurate symbols.

Available in Mac OS X v10.5 and later.
(Read and Write property)

32.62.68 AutomaticSpellingCorrectionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether automatic spelling correction is enabled.
Notes:

Available in Mac OS X v10.6 and later.
(Read and Write property)

32.62.69 AutomaticTextReplacementEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether automatic text replacement is enabled.
Notes:

Turning on automatic text replacement enables automatic substitution of a variety of static text items based on user preferences.
Available in Mac OS X v10.6 and later.
(Read and Write property)

32.62.70 backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The background color.
Notes: (Read and Write property)

32.62.71 Bold as Boolean

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the current typing uses a bold font.
Example:

```
// some textview
dim textview as NSTextView = TextArea1.NSTextViewMBS

// switch to bold font
textview.Bold = true
```

Notes:

You can set this to continue typing with/without bold or change current selection.
Can only provide bold if the font supports it.
(Read and Write property)

32.62.72 ContinuousSpellCheckingEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver has continuous spell checking enabled.
Notes:

True if the receiver has continuous spell checking enabled, otherwise, false.

See Textarea.WinSpellcheckingMBS property for Windows.
(Read and Write property)

32.62.73 defaultParagraphStyle as Variant

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets or sets the receiver's default paragraph style.
Notes:

Use with NSParagraphStyleMBS class.
(Read and Write property)

32.62.74 displaysLinkToolTips as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the text view automatically supplies the destination of a link as a tooltip for text that has a link attribute.
Notes:

True if link tooltips are automatically displayed; otherwise, false.

The default value for this feature is true; clients who do not wish tooltips to be displayed automatically must explicitly disable it.

Available in Mac OS X v10.5 and later.
(Read and Write property)

32.62.75 enabledTextCheckingTypes as Int64

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default text checking types.
Notes:

Available in Mac OS X v10.6 and later.

Can be NSTextCheckingAllSystemTypes (& hffffffff) or NSTextCheckingAllCustomTypes (& hffffffff00000000) or NSTextCheckingAllTypes (& hffffffffffffffff).
(Read and Write property)

32.62.76 GrammarCheckingEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether or not grammar checking is enabled.
Notes:

Available on Mac OS X 10.5 or newer.
If grammar checking is enabled, then it is performed alongside spell checking, whenever the text view checks spelling, whether continuously or manually.
(Read and Write property)

32.62.77 insertionPointColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color used to draw the insertion point.
Notes: (Read and Write property)

32.62.78 isCoalescingUndo as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether undo coalescing is in progress.
Notes:

True if undo coalescing is in progress, otherwise false.
Available in OS X v10.6 and later.
(Read only property)

32.62.79 Italic as Boolean

MBS MacCocoa Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the current typing uses a italic font.
Example:

```
// some textview
dim textview as NSTextView = TextArea1.NSTextViewMBS

// switch to italic font
textview.Italic = true
```

Notes:

You can set this to continue typing with/without italic or change current selection.
Can only provide italic if the font supports it.
(Read and Write property)

32.62.80 layoutManager as NSLayoutManagerMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the layout manager that lays out text for the receiver's text container.
Notes:

The layout manager that lays out text for the receiver's text container, or nil if there's no such object, such as when a text view isn't linked into a group of text objects.

(Read only property)

32.62.81 linkTextAttributes as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Gets and sets the attributes used to draw the onscreen presentation of link text.
Notes:

A dictionary of attributes corresponding to the onscreen presentation of link text.

Link text attributes are applied as temporary attributes to any text with a link attribute. Candidates include those attributes that do not affect layout.

In applications created prior to OS X v10.3, the default value is an empty dictionary. In applications created with OS X v10.3 or greater, the default attributes specify blue text with a single underline and the pointing hand cursor.
(Read and Write property)

32.62.82 markedTextAttributes as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Gets or sets the attributes used to draw marked text.
Notes:

A dictionary of attributes used to draw marked text. Text color, background color, and underline are the only supported attributes for marked text.
(Read and Write property)

32.62.83 RTFData as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Get or set the textview content as RTF data.
Notes:

Works only for Cocoa and uses RTF parser/generator from Apple.
(Read and Write property)

32.62.84 RulerVisible as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the scroll view enclosing the text views sharing the receiver's layout manager shows its ruler.
Notes:

True if the scroll view enclosing the text views sharing the receiver's layout manager shows its ruler, false otherwise. The default is false.
(Read and Write property)

32.62.85 selectedTextAttributes as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets or sets the attributes used to indicate the selection.
Example:

```
// underline selected text in TextArea1

dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
dim s as NSTextStorageMBS = t.textStorage

dim d as Dictionary = t.selectedTextAttributes
d.Value(NSAttributedStringMBS.NSStrikethroughStyleAttributeName) = s.NSUnderlineStyleSingle
t.selectedTextAttributes = d
```

Notes:

A dictionary of attributes used to indicate the selection. Text color, background color, and underline are the only supported attributes for selected text.
(Read and Write property)

32.62.86 smartInsertDeleteEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the view inserts or deletes space around selected words so as to preserve proper spacing and punctuation.
Notes: (Read and Write property)

32.62.87 spellCheckerDocumentTag as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a tag identifying the text view's text as a document for the spell checker server.
Notes:

The document tag is obtained by sending a uniqueSpellDocumentTag message to the spell server the first time this method is invoked for a particular group of text views. See the NSSpellChecker and NSSpellServer class specifications for more information on how this tag is used.
(Read only property)

32.62.88 textContainer as NSTextContainerMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The text container.
Notes:

The receiver uses the layout manager and text storage of aTextContainer.

Special Considerations
This method is invoked automatically when you create a text view; you should never invoke it directly, but might want to override it. To change the text view for an established group of text system objects, use TextView setter on the text container. To replace the text container for a text view and maintain the view's association with the existing layout manager and text storage, use replaceTextContainer.
(Read and Write property)

32.62.89 textContainerInset as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The empty space the receiver leaves around its text container.
Example:

```
dim n as NSTextViewMBS = TextArea1.NSTextViewMBS

n.textContainerInset = NSMakeSizeMBS(-3,0)
```

Notes:

It is possible to set the text container and view sizes and resizing behavior so that the inset cannot be maintained exactly, although the text system tries to maintain the inset wherever possible. In any case, the textContainerOrigin and size of the text container are authoritative as to the location of the text container within the view.

The text itself can have an additional inset, inside the text container, specified by the setLineFragmentPadding method of NSTextContainer.
(Read and Write property)

32.62.90 textContainerOrigin as NSPointMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the origin of the receiver's text container.
Notes:

The origin of the receiver's text container, which is calculated from the receiver's bounds rectangle, container inset, and the container's used rect.
(Read only property)

32.62.91 textStorage as NSTextStorageMBS

MBS MacCocoa Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the receiver's text storage object.
Example:

```
// load rtfd file into textarea
dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
dim n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(file)
dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
t.textStorage.setAttributedString(n)
```

Notes: (Read only property)

32.62.92 typingAttributes as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Get or set typing attributes.
Notes:

Typing attributes are reset automatically whenever the selection changes. However, if you add any user actions that change text attributes, the action should use this method to apply those attributes afterwards. User actions that change attributes should always set the typing attributes because there might not be a subsequent change in selection before the next typing.
(Read and Write property)

32.62.93 usesFindBar as Boolean

MBS MacCocoa Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether to use the find bar for this text view.
Notes:

The value of this property is true if the find bar is used for this text view; otherwise false.
See NSTextFinderMBS class for information about the find bar.
A text view can use either a find panel or a find bar. If usesFindBar is set to true, usesFindPanel is set to false and vice versa.
(Read and Write property)

32.62.94 usesFindPanel as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver allows for a find panel.
Notes: (Read and Write property)

32.62.95 usesFontPanel as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Controls whether the text views sharing the receiver's layout manager use the Font panel and Font menu.
Notes: (Read and Write property)

32.62.96 usesInspectorBar as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this text view uses the inspector bar.
Example:

```
dim t as NSTextViewMBS = textarea1.NSTextViewMBS
t.usesInspectorBar = true
```

Notes:

Available in OS X v10.7 and later.
(Read and Write property)

32.62.97 usesRuler as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the text views sharing the receiver's layout manager use a ruler.
Notes:

True to cause text views sharing the receiver's layout manager to respond to NSRulerView client messages and to paragraph-related menu actions, and update the ruler (when visible) as the selection changes with its paragraph and tab attributes, otherwise false.

Text views must use a ruler to respond to Format menu commands. If a set of text views don't use the ruler, the ruler is hidden, and the text views disallow paragraph attribute changes. By default, text view objects use the ruler.
(Read and Write property)

32.62.98 Events

32.62.99 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a text view needs to determine if text in a specified range should be changed.
Notes:

affectedCharRange: The range of characters to be replaced.
replacementString: The characters that will replace the characters in affectedCharRange; nil if only text attributes are being changed.

Return true to allow the replacement, or false to reject the change.
See also:

- 32.62.34 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string = "") as Boolean 7178

32.62.100 textViewDidChangeSelection

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the selection changes in the text view.

32.62.101 Constants

32.62.102 NSFindPanelSubstringMatchTypeContains=0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the type of substring matching used by the Find panel.
Notes:

Finds a word containing the search string.
Available in Mac OS X v10.5 and later.

32.62.103 NSFindPanelSubstringMatchTypeEndsWith=3

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the type of substring matching used by the Find panel.
Notes:

Finds a word ending with the search string.
Available in Mac OS X v10.5 and later.

32.62.104 NSFindPanelSubstringMatchTypeFullWord=2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the type of substring matching used by the Find panel.
Notes:

Finds a word exactly matching the search string.
Available in Mac OS X v10.5 and later.

32.62.105 NSFindPanelSubstringMatchTypeStartsWith=1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the type of substring matching used by the Find panel.
Notes:

Finds a word starting with the search string.
Available in Mac OS X v10.5 and later.

32.62.106 NSSelectByCharacter=0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify how much the text view extends the selection when the user drags the mouse.
Notes: Extends the selection character by character.

32.62.107 NSSelectByParagraph=2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify how much the text view extends the selection when the user drags the mouse.
Notes: Extends the selection paragraph by paragraph.

32.62.108 NSSelectByWord=1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify how much the text view extends the selection when the user drags the mouse.
Notes: Extends the selection word by word.

32.62.109 NSSelectionAffinityDownstream=1

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the preferred direction of selection.
Notes: The selection is moving toward the bottom of the document.

32.62.110 NSSelectionAffinityUpstream=0

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the constants to specify the preferred direction of selection.
Notes: The selection is moving toward the top of the document.

32.63 control NSTokenFieldControlMBS

32.63.1 control NSTokenFieldControlMBS

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control to host a NSTokenField.

32.63.2 Properties

32.63.3 View as NSTokenFieldMBS

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The view used for the control.
Notes: (Read only property)

32.63.4 Events

32.63.5 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the bounds, but not the frame, changed.

32.63.6 completionsForSubstring(substring as string, tokenIndex as Integer, byref selectedIndex as Integer) as Variant()

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to provide an array of appropriate completions for the contents of the receiver.
Notes:

substring: The partial string that is to be completed.
tokenIndex: The index of the token being edited.
selectedIndex: Optionally, you can return by-reference an index into the returned array that specifies which of the completions should be initially selected. If none are to be selected, return by reference -1.

Returns an array of strings that are possible completions.

If the delegate does not implement this method, no completions are provided.
Available in OS X v10.4 and later.

32.63.7 displayStringForRepresentedObject(representedObject as Variant) as string

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to provide a string to be displayed as a proxy for the given represented object.
Notes:

representedObject: A represented object of the token field.

Returns the string to be used as a proxy for representedObject. If you return nil or do not implement this method, then representedObject is displayed as the string.

32.63.8 editingStringForRepresentedObject(representedObject as Variant) as string

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to provide a string to be edited as a proxy for a represented object.
Notes:

representedObject: A represented object of the token field.

Returns a string that's an editable proxy of the represented object, or nil if the token should not be editable.

32.63.9 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event where you can enable menu items.

32.63.10 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the frame changed.

32.63.11 GotFocus

MBS MacControls Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control itself got focus.

Notes: This only fires if the control itself got focus and not a sub control.

32.63.12 hasMenuForRepresentedObject(representedObject as Variant) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to specify whether the given represented object provides a menu.
Notes:

representedObject: A represented object of the token field.

Returns true if the represented object has a menu, false otherwise.
By default tokens in a token field have no menus.

32.63.13 LostFocus

MBS MacControls Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

32.63.14 MenuAction(HitItem as MenuItem) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

32.63.15 menuForRepresentedObject(representedObject as Variant) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to provide a menu for the specified represented object.
Notes:

representedObject: A represented object of the token field.

Returns the menu associated with the represented object.
By default tokens in a token field do not return menus.

32.63.16 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was pressed inside the control's region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

32.63.17 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

32.63.18 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

32.63.19 readFromPasteboard(pboard as NSPasteboardMBS) as Variant()

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to return an array of objects representing the data read from the specified pasteboard.
Notes:

pboard: The pasteboard from which to read the represented objects.

Returns an array of represented objects created from the pasteboard data.

32.63.20 representedObjectForEditingString(editingString as string) as Variant

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to provide a represented object for the given editing string.
Notes:

editingString: The edited string representation of a represented object.

Returns a represented object that is displayed rather than the editing string.

Note: In OS X v10.4, NSTokenField trims whitespace around tokens but it does not trim whitespace in OS X versions 10.5.0 and 10.5.1. In OS X v10.5.2, you get whitespace-trimming behavior by either linking against the v10.4 binary or linking against the v10.5 binary and not implementing the this method. If you do not want the whitespace-trimming behavior, link against the v10.5 binary and implement this method, returning the editing string if you have no represented object.

32.63.21 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

32.63.22 shouldAddObjects(tokens() as Variant, index as Integer) as Variant()

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows to validate the tokens to be added to the receiver at a particular location.
Notes:

tokens: An array of tokens to be inserted in the receiver at index.
index: The index of the receiver in which the array of tokens to be validated (tokens) will be inserted.

Returns an array of validated tokens.

The event can return the array unchanged or return a modified array of tokens. To reject the add completely, return an empty array. Returning nil causes an error.

32.63.23 styleForRepresentedObject(representedObject as Variant) as Integer

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Allows the delegate to return the token style for editing the specified represented object.
Notes:

representedObject: A represented object of the token field.

Returns the style that should be used to display the representedObject. Possible values are shown in NSTokenStyle Values.

If the event implements this method and returns an NSTokenStyle that differs from the style set by setTokenStyle:, the value the event returns is preferred.

If you don't implement this method, the token field's tokenStyle is used.

32.63.24 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent when a control with editable text begins an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

See TextDidEndEditing for an explanation of why you may not always get one invocation of TextDidBeginEditing for each invocation of TextDidEndEditing.

32.63.25 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent when the text in the receiving control changes.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidChangeNo-

tification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

32.63.26 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent when a control with editable text ends an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

Warning: In some cases, such as when editing within an instance of NSOutlineView, this method may be invoked without a previous invocation of TextDidBeginEditing. You will only get the TextDidBeginEditing: notification if the user actually types something, but you can get the TextDidEndEditing notification if the user just double-clicks the field and then clicks outside the field, without typing.

32.63.27 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether text editing should be allowed.
Notes:

Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

32.63.28 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether ending text editing should be allowed.
Notes:

Return true to allow end of text editing or false to deny.

Be aware that an event in Xojo without return will cause false to be returned.

32.63.29 tokenFieldAction

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control's action was triggered.
Notes: For a button if it was pressed.

32.63.30 tokenFieldTextShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow text editing.

32.63.31 tokenFieldTextShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow text editing.

32.63.32 writeRepresentedObjects(objects() as Variant, pboard as NSPasteboardMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent so the delegate can write represented objects to the pasteboard corresponding to a given array of display strings.
Notes:

objects: An array of represented objects associated with the token field.
pboard: The pasteboard to which to write the represented objects.

Return true if you writes the represented objects to the pasteboard, false otherwise. If false, the token field writes the display strings to the NSStringPboardType pasteboard.

32.64 control NSViewControlMBS

32.64.1 control NSViewControlMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control to host a generic NSView.

32.64.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 18.2
- MBS Xojo / Real Studio Plugins, version 15.0pr10

32.64.3 Properties

32.64.4 View as NSViewMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

32.64.5 Events

32.64.6 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes:

The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

32.64.7 acceptsFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

32.64.8 becomeFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when the object gets focus.
Notes: Return true to accept.

32.64.9 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a touch gesture.
Notes:

e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.64.10 canBecomeKeyView as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

32.64.11 Close

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the custom view is destroyed.

32.64.12 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary

clean-up.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

32.64.13 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

32.64.14 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer

enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

32.64.15 draggingExited(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

32.64.16 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging session has completed.
Notes:

session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

32.64.17 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the drag moves on the screen.
Notes:

session: The dragging session.

screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

32.64.18 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Declares the types of operations the source allows to be performed. (required)
Notes:

session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

32.64.19 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the drag will begin.
Notes:

session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

32.64.20 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

32.64.21 drawFocusRingMask(g as NSGraphicsMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Draw the focus ring mask for the view.
Notes:

If false is returned, the default method from NSView class runs.

This method provides the shape of the focus ring mask by drawing the focus ring mask. An implementation of this method should draw in the view's interior (bounds) coordinate space, that the focus ring style has been set (it will be set it to NSFocusRingOnly to capture the focus ring itself), and that the fill and stroke colors have been set to an arbitrary fully opaque color.

Subclasses that find the default behavior insufficient should only draw the focus ring shape.

The NSView default implementation of this method simply fills self.bounds.
Available in Mac OS X v10.7 and later.

Please use NSGraphicsMBS class for drawing.

32.64.22 DrawRect(g as NSGraphicsMBS, left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The paint event with the rectangle which needs to be redrawn.

32.64.23 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event where you can enable menu items.

32.64.24 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has ended a touch gesture.
Notes:

e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.64.25 focusRingMaskBounds as NSRectMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the focus ring mask bounds.
Notes:

Return nil to run default NSView method.

Return a rectangle containing the mask in the view's interior (bounds) coordinate space.

The mask bounds allows the focus ring's overall size and position to be determined before it is drawn.
Subclasses must override this method if they require the display of a focus ring.
The NSView default implementation of this method simply returns NSRectMBS.Zero.

Note: The information provided by focusRingMaskBounds will enable Accessibility to identify selected subelements for zoom tracking, so it is important that this method provide a reasonably tight bounding box and that noteFocusRingMaskChanged is invoked as described.

32.64.26 ignoreModifierKeysForDraggingSession(session as NSDraggingSession-MBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes:

session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

32.64.27 isOpaque as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether this view is opaque.

32.64.28 keyDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the key events.
Notes:

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

32.64.29 keyUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the key events.
Notes:

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

32.64.30 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a pinch gesture.
Notes:

e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.64.31 MenuAction(HitItem as MenuItem) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

32.64.32 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes:

theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

32.64.33 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.

Notes: Return true if you handled this event.

32.64.34 mouseDownCanMoveWindow as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event is called so you can decide what happens with mouse down.
Notes:

Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

32.64.35 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.64.36 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.64.37 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.64.38 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.

Notes: Return true if you handled this event.

32.64.39 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.64.40 Open

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the custom NSView is created.

32.64.41 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.64.42 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.64.43 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

32.64.44 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

32.64.45 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this method.

32.64.46 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the current object that a pressure change occurred on a system that supports pressure

sensitivity.
Notes:

This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

32.64.47 resignFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Focus is going away.
Notes: Return true to accept.

32.64.48 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.64.49 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.64.50 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

32.64.51 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a rotation gesture.
Notes:

e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.64.52 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

32.64.53 scrollWheel(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the subclass that the mouse's scroll wheel has moved.
Notes:

e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.

32.64.54 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a swipe gesture.
Notes:

e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

32.64.55 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging images should be changed.
Notes:

sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

32.64.56 viewDidMoveToWindow

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that it has been added to a new view hierarchy.
Notes:

The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

32.64.57 wantsPeriodicDraggingUpdates as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes:

Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

32.65 class Popupmenu

32.65.1 class Popupmenu

Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Gives access to the NSMenuMBS of the PopupMenu.

32.65.2 Methods

32.65.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSButtonMBS object for the given control.
Example:

```
MsgBox PopupMenu1.NSButtonMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.

32.65.4 NSPopUpButtonMBS as NSPopUpButtonMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSPopUpButtonMBS object for the given control.
Example:

```
// get cocoa view for the popupmenu
dim p as NSPopUpButtonMBS = PopupMenu1.NSPopUpButtonMBS

// find a menu entry
dim it as NSMenuItemMBS = p.itemAtIndex(0)

// get a picture
dim pic as Picture = LogoMBS(500)
dim img as new NSImageMBS(pic)
img.setSize 16,16

// and assign icon
it.image = img
```

Notes: This way you can manipulate Cocoa controls directly.

32.66 class ProgressBar

32.66.1 class ProgressBar

Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in progressbar class in Xojo.

32.66.2 Methods

32.66.3 NSProgressIndicatorMBS as NSProgressIndicatorMBS

MBS MacControls Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSProgressIndicatorMBS object for the given control.
Example:

MsgBox ProgressBar1.NSProgressIndicatorMBS.className

Notes: This way you can manipulate Cocoa controls directly.

32.66.4 SetMaximumThreadSafeMBS(maximum as Integer)

MBS Util Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets maximum property on main thread.
Notes:

This method is to allow you to set the maximum property of a progressbar in a thread without a problem.

If called on main thread, the plugin will simply set maximum property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

32.66.5 SetMinimumThreadSafeMBS(minimum as Integer)

MBS Util Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets minimum property on main thread.
Notes:

This method is to allow you to set the minimum property of a progressbar in a thread without a problem.

If called on main thread, the plugin will simply set minimum property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

32.66.6 SetValueThreadSafeMBS(value as Integer)

MBS Util Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets value property on main thread.
Notes:

This method is to allow you to set the value property of a progressbar in a thread without a problem.

If called on main thread, the plugin will simply set value property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

32.67 class ProgressWheel

32.67.1 class ProgressWheel

Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in ProgressWheel class in Xojo.

32.67.2 Methods

32.67.3 NSProgressIndicatorMBS as NSProgressIndicatorMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSProgressIndicatorMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

32.68 class PushButton

32.68.1 class PushButton

Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in push-button class in Xojo.

32.68.2 Methods

32.68.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSButtonMBS object for the given control.
Example:

MsgBox PushButton1.NSButtonMBS.className

Notes: This way you can manipulate Cocoa controls directly.

32.69 class ScrollBar

32.69.1 class ScrollBar

Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in Scrollbar class in Xojo.

32.69.2 Methods

32.69.3 NSScrollerMBS as NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSScrollerMBS object for the given control.
Example:

MsgBox ScrollBar1.NSScrollerMBS.className

Notes: This way you can manipulate Cocoa controls directly.

32.70 class SegmentedControl

32.70.1 class SegmentedControl

Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Build in Segmented Control class in Xojo.

32.70.2 Methods

32.70.3 NSSegmentedControlMBS as NSSegmentedControlMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSSegmentedControlMBS object for the given control.
Example:

```
SegmentedControl1.NSSegmentedControlMBS.selectedSegment = 0
```

Notes: This way you can manipulate Cocoa controls directly.

32.71 class Separator

32.71.1 class Separator

Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in Separator class in Xojo.

32.71.2 Methods

32.71.3 NSBoxMBS as NSBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSBoxMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

32.72 class Slider

32.72.1 class Slider

Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in slider class in Xojo.

32.72.2 Methods

32.72.3 NSSliderMBS as NSSliderMBS

MBS MacControls Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSSliderMBS object for the given control.
Example:

MsgBox Slider1.NSSliderMBS.className

Notes: This way you can manipulate Cocoa controls directly.

32.73 class SpinningProgressIndicatorMBS

32.73.1 class SpinningProgressIndicatorMBS

MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A resizable, recolorable clone of the spinning NSProgressIndicator.
Notes:

Based on YRKSpinningProgressIndicator from Kelan Champagne.
See also https://github.com/kelan/yrk-spinning-progress-indicator
Subclass of the NSViewMBS class.

32.73.2 Blog Entries

- MonkeyBread Software Releases the MBS Real Studio plug-ins in version 13.2
- MBS Xojo / Real Studio Plugins, version 13.2pr1

32.73.3 Methods

32.73.4 Constructor

MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new progress indicator with size 100/100 and position 0/0
Example:

```
dim t as new SpinningProgressIndicatorMBS
```

Notes: On success the handle property is not zero.
See also:

- 32.73.5 Constructor(Handle as Integer) 7233
- 32.73.6 Constructor(left as Double, top as Double, width as Double, height as Double) 7234

32.73.5 Constructor(Handle as Integer)

MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an object based on the given SpinningProgressIndicator handle.
Example:

```
dim t as new SpinningProgressIndicatorMBS(0, 0, 100, 100)
dim v as new SpinningProgressIndicatorMBS(t.handle)
```

```
MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a SpinningProgressIndicator and the plugin retains this handle.
See also:

- 32.73.4 Constructor 7233
- 32.73.6 Constructor(left as Double, top as Double, width as Double, height as Double) 7234

32.73.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new progress indicator with the given size and position.
Example:

```
dim x as new SpinningProgressIndicatorMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 32.73.4 Constructor 7233
- 32.73.5 Constructor(Handle as Integer) 7233

32.73.7 startAnimation

MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Starts animation.
Notes: If you see no animation, you can maybe add a timer with short period (50ms) and set needsDisplay to true.

32.73.8 stopAnimation

MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops the animation.

32.73.9 Properties

32.73.10 backgroundColor as NSColorMBS

MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The background color.
Notes:

Default color is NSColorMBS.clearColor.
(Read and Write computed property)

32.73.11 colorValue as NSColorMBS

MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The color for drawing.
Notes:

Default color is NSColorMBS.blackColor.
(Read and Write computed property)

32.73.12 doubleValue as Double

MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The current value.
Notes:

Default is 0.0.
(Read and Write computed property)

32.73.13 drawsBackground as boolean

MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether to draw background.
Notes:

Default is false.
(Read and Write computed property)

32.73.14 isDisplayedWhenStopped as boolean

MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether this control is visible without animation turned on.
Notes:

Default is true.
(Read and Write computed property)

32.73.15 isIndeterminate as boolean

MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether progress is indeterminated.
Notes:

Default is true.
(Read and Write computed property)

32.73.16 maxValue as Double

MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The maximum value.
Notes:

Default is 100.0.
(Read and Write computed property)

32.73.17 usesThreadedAnimation as boolean

MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether to use a thread for the animation.
Notes:

Default is true.
(Read and Write computed property)

32.74 class Statictext

32.74.1 class Statictext

Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in Statictext class in Xojo.

32.74.2 Methods

32.74.3 NSTextFieldMBS as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSTextFieldMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

32.75 class TextField

32.75.1 class TextField

Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in TextField class in Xojo.

32.75.2 Methods

32.75.3 NSTextFieldMBS as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSTextFieldMBS object for the given control.
Notes:

This way you can manipulate Cocoa controls directly.
Seems like RS 2011r1 uses a NSTextField, so this method should return an object on Cocoa targets.

32.75.4 NSTextViewMBS as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSTextViewMBS object for the given control.
Notes:

This way you can manipulate Cocoa controls directly.
Seems like RS 2011r1 uses a NSTextField, so this method should return nil on Cocoa targets. Please use NSTextFieldMBS method in this case.

32.75.5 SetTextThreadSafeMBS(text as string)

MBS Util Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets text property on main thread.
Notes:

This method is to allow you to set the text property of a label in a thread without a problem.

If called on main thread, the plugin will simply set text property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

32.76 class UpDownArrows

32.76.1 class UpDownArrows

Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The build in control class in Xojo.

32.76.2 Methods

32.76.3 NSStepperMBS as NSStepperMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSStepperMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

Chapter 33

Cocoa Drawing

33.1 class NSBezierPathMBS

33.1.1 class NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The plugin class for a Cocoa NSBezierPath.
Notes:

An NSBezierPath object allows you to create paths using PostScript-style commands. Paths consist of straight and curved line segments joined together. Paths can form recognizable shapes such as rectangles, ovals, arcs, and glyphs; they can also form complex polygons using either straight or curved line segments. A single path can be closed by connecting its two endpoints, or it can be left open.

An NSBezierPath object can contain multiple disconnected paths, whether they are closed or open. Each of these paths is referred to as a subpath. The subpaths of an NSBezierPath object must be manipulated as a group. The only way to manipulate subpaths individually is to create separate NSBezierPath objects for each.

For a given NSBezierPath object, you can stroke the path's outline or fill the region occupied by the path. You can also use the path as a clipping region for views or other regions. Using methods of NSBezierPath, you can also perform hit detection on the filled or stroked path. Hit detection is needed to implement interactive graphics, as in rubberbanding and dragging operations.

The current graphics context is automatically saved and restored for all drawing operations involving NSBezierPath objects, so your application does not need to worry about the graphics settings changing across invocations.

33.1.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr4

33.1.3 Methods

33.1.4 appendBezierPath(path as NSBezierPathMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends the contents of the specified path object to the receiver's path.
Notes:

Path: The path to add to the receiver.

This method adds the commands used to create aPath to the end of the receiver's path. This method does not explicitly try to connect the subpaths in the two objects, although the operations in Path may still cause that effect.

33.1.5 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends an arc of a circle to the receiver's path.
Notes:

center: Specifies the center point of the circle used to define the arc.
radius: Specifies the radius of the circle used to define the arc.
startAngle: Specifies the starting angle of the arc, measured in degrees counterclockwise from the x-axis.
endAngle: Specifies the end angle of the arc, measured in degrees counterclockwise from the x-axis.

The created arc lies on the perimeter of the circle, between the angles specified by the startAngle and endAngle parameters. The arc is drawn in a counterclockwise direction. If the receiver's path is empty, this method sets the current point to the beginning of the arc before adding the arc segment. If the receiver's path is not empty, a line is drawn from the current point to the starting point of the arc.

Depending on the length of the arc, this method may add multiple connected curve segments to the path.
See also:

- 33.1.6 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double, clockwise as boolean) 7243
- 33.1.7 appendBezierPathWithArc(point1 as NSPointMBS, point2 as NSPointMBS, radius as Double) 7243

33.1.6 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double, clockwise as boolean)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends an arc of a circle to the receiver's path.
Notes:

center: Specifies the center point of the circle used to define the arc.
radius: Specifies the radius of the circle used to define the arc.
startAngle: Specifies the starting angle of the arc, measured in degrees counterclockwise from the x-axis.
endAngle: Specifies the end angle of the arc, measured in degrees counterclockwise from the x-axis.
clockwise: true if you want the arc to be drawn in a clockwise direction; otherwise false to draw the arc in a counterclockwise direction.

The created arc lies on the perimeter of the circle, between the angles specified by the startAngle and endAngle parameters. The arc is drawn in the direction indicated by the clockwise parameter. If the receiver's path is empty, this method sets the current point to the beginning of the arc before adding the arc segment. If the receiver's path is not empty, a line is drawn from the current point to the starting point of the arc.

Depending on the length of the arc, this method may add multiple connected curve segments to the path.
See also:

- 33.1.5 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double) 7242
- 33.1.7 appendBezierPathWithArc(point1 as NSPointMBS, point2 as NSPointMBS, radius as Double) 7243

33.1.7 appendBezierPathWithArc(point1 as NSPointMBS, point2 as NSPointMBS, radius as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends an arc to the receiver's path.
Notes:

point1: The middle point of the angle.
point2: The end point of the angle.
radius: The radius of the circle inscribed in the angle.

The created arc is defined by a circle inscribed inside the angle specified by three points: the current point, the fromPoint parameter, and the toPoint parameter (in that order). The arc itself lies on the perimeter of the circle, whose radius is specified by the radius parameter. The arc is drawn between the two points of the circle that are tangent to the two legs of the angle.

The arc usually does not contain the points in the fromPoint and toPoint parameters. If the starting point

of the arc does not coincide with the current point, a line is drawn between the two points. The starting point of the arc lies on the line defined by the current point and the fromPoint parameter.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

Depending on the length of the arc, this method may add multiple connected curve segments to the path.
See also:

- 33.1.5 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double) 7242
- 33.1.6 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double, clockwise as boolean) 7243

33.1.8 appendBezierPathWithGlyph(glyph as Integer, font as NSFontMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends an outline of the specified glyph to the receiver's path.
Notes:

Glyph: The glyph to add to the path.
font: The font in which the glyph is encoded.

If the glyph is not encoded in the font specified by the font parameter—that is, the font does not have an entry for the specified glyph—then no path is appended to the receiver.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

33.1.9 appendBezierPathWithGlyphs(glyphs() as Integer, font as NSFontMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends the outlines of the specified glyphs to the receiver's path.
Notes:

glyphs: An array of glpyhs to add to the path.
count: The number of glyphs in the glyphs parameter.
font: The font in which the glyphs are encoded.

If the glyphs are not encoded in the font specified by the font parameter—that is, the font does not have an

entry for one of the specified glyphs—then no path is appended to the receiver.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

33.1.10 appendBezierPathWithOvalInRect(rect as NSRectMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends an oval path to the receiver, inscribing the oval in the specified rectangle.
Notes:

rect: The rectangle in which to inscribe the oval.

Before adding the oval, this method moves the current point, which implicitly closes the current subpath. If the aRect parameter specifies a square, the inscribed path is a circle. The path is constructed by starting in the lower-right quadrant of the rectangle and adding arc segments counterclockwise to complete the oval.

33.1.11 appendBezierPathWithPoints(points() as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends a series of line segments to the receiver's path.
Notes:

points: An array of NSPoint data types, each of which contains the end point of the next line segment.
count :The number of points in the points parameter.

This method interprets the points as a set of connected line segments. If the current path contains an open subpath, a line is created from the last point in that subpath to the first point in the points array. If the current path is empty, the first point in the points array is used to set the starting point of the line segments. Subsequent line segments are added using the remaining points in the array.

This method does not close the path that is created. If you wish to create a closed path, you must do so by explicitly invoking the receiver's closePath method.

33.1.12 appendBezierPathWithRect(rect as NSRectMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends a rectangular path to the receiver's path.
Notes:

rect: The rectangle describing the path to create.

Before adding the rectangle, this method moves the current point to the origin of the rectangle, which implicitly closes the current subpath (if any). The path is constructed by starting at the origin of aRect and adding line segments in a counterclockwise direction. The final segment is added using a closePath message.

33.1.13 appendBezierPathWithRoundedRect(rect as NSRectMBS, xRadius as Double, yRadius as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends a rounded rectangular path to the receiver's path.
Notes:

rect: The rectangle that defines the basic shape of the path.
xRadius: The radius of each corner oval along the x-axis. Values larger than half the rectangle's width are clamped to half the width.
yRadius: The radius of each corner oval along the y-axis. Values larger than half the rectangle's height are clamped to half the height.

The path is constructed in a counter-clockwise direction, starting at the top-left corner of the rectangle. If either one of the radius parameters contains the value 0.0, the returned path is a plain rectangle without rounded corners.

33.1.14 bezierPath as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a new NSBezierPath object.

33.1.15 bezierPathByFlatteningPath as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a "flattened" copy of the receiver.
Notes:

Returns a new path object whose contents are a flattened version of the receiver's path.

Flattening a path converts all curved line segments into straight line approximations. The granularity of the approximations is controlled by the path's current flatness value, which is set using the DefaultFlatness property.

33.1.16 bezierPathByReversingPath as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a new NSBezierPath object with the reversed contents of the receiver's path.
Notes:

Returns a new path object whose contents are a reversed version of the receiver's path.

Reversing a path does not necessarily change the appearance of the path when rendered. Instead, it changes the direction in which path segments are drawn. For example, reversing the path of a rectangle (whose line segments are normally drawn starting at the origin and proceeding in a counterclockwise direction) causes its line segments to be drawn in a clockwise direction instead. Drawing a reversed path could affect the appearance of a filled pattern, depending on the pattern and the fill rule in use.

This method reverses each whole or partial subpath in the path object individually.

33.1.17 bezierPathWithOvalInRect(r as NSRectMBS) as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a new NSBezierPath object initialized with an oval path inscribed in the specified rectangle.
Notes:

r: The rectangle in which to inscribe an oval.

Returns an NSBezierPath new path object with the oval path.

If the rect parameter specifies a square, the inscribed path is a circle. The path is constructed by starting in the lower-right quadrant of the rectangle and adding arc segments counterclockwise to complete the oval.

33.1.18 bezierPathWithRect(r as NSRectMBS) as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a new NSBezierPath object initialized with a rectangular path.
Notes:

r: The rectangle describing the path to create.

Returns a new path object with the rectangular path.
The path is constructed by starting at the origin of aRect and adding line segments in a counterclockwise direction.

33.1.19 bezierPathWithRoundedRect(r as NSRectMBS, xRadius as Double, yRadius as Double) as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a new NSBezierPath object initialized with a rounded rectangular path.
Notes:

r: The rectangle that defines the basic shape of the path.
xRadius: The radius of each corner oval along the x-axis. Values larger than half the rectangle's width are clamped to half the width.
yRadius: The radius of each corner oval along the y-axis. Values larger than half the rectangle's height are clamped to half the height.

Returns a new path object with the rounded rectangular path.

The path is constructed in a counter-clockwise direction, starting at the top-left corner of the rectangle. If either one of the radius parameters contains the value 0.0, the returned path is a plain rectangle without rounded corners.

33.1.20 closePath

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the most recently added subpath.
Notes: This method closes the current subpath by creating a line segment between the first and last points in the subpath. This method subsequently updates the current point to the end of the newly created line segment, which is also the first point in the now closed subpath.

33.1.21 Constructor

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a new empty NSBezierPath object.

33.1.22 containsPoint(p as NSPointMBS) as boolean

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the receiver contains the specified point.
Example:

```
dim r as new NSRectMBS(10, 10, 50, 50)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(r)
dim p as new NSPointMBS(20,20)
```

MsgBox str(b.containsPoint(p))

Notes:

p: The point to test against the path, specified in the path object's coordinate system.

Returns true if the path's enclosed area contains the specified point; otherwise, false.

This method checks the point against the path itself and the area it encloses. When determining hits in the enclosed area, this method uses the non-zero winding rule (NSNonZeroWindingRule). It does not take into account the line width used to stroke the path.

33.1.23 copy as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the bezier path.

33.1.24 curveToPoint(endPoint as NSPointMBS, controlPoint1 as NSPointMBS, controlPoint2 as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a Bezier cubic curve to the receiver's path.
Notes:

endPoint: The destination point of the curve segment, specified in the current coordinate system
controlPoint1: The point that determines the shape of the curve near the current point.
controlPoint2: The point that determines the shape of the curve near the destination point.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

33.1.25 elementAtIndex(index as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the type of path element at the specified index.
Notes:

index: The index of the desired path element.

Returns the type of the path element.
Path elements describe the commands used to define a path and include basic commands such as moving to a specific point, creating a line segment, creating a curve, or closing the path. The elements are stored in the order of their execution.
See also:

- 33.1.26 elementAtIndex(index as Integer, byref associatedPoints() as NSPointMBS) as Integer 7250

33.1.26 elementAtIndex(index as Integer, byref associatedPoints() as NSPointMBS) as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets the element type and (and optionally) the associated points for the path element at the specified index.
Notes:

index: The index of the desired path element.
associatedPoints: On output, the data points associated with the specified path element.

Returns the type of the path element.

For curve operations, the order of the points is controlPoint1 (associatedPoints(0)), controlPoint2 (associatedPoints(1)), endPoint (associatedPoints(2)).
See also:

- 33.1.25 elementAtIndex(index as Integer) as Integer 7249

33.1.27 elementCount as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the total number of path elements in the receiver's path.
Example:

```
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath

b.moveToPoint NSMakePointMBS(10, 10)
b.lineToPoint NSMakePointMBS(290, 290)
MsgBox str(b.elementCount) // 2

b.removeAllPoints
MsgBox str(b.elementCount) // 0
```

Notes: Each element type corresponds to one of the operations described in constants.

33.1.28 getLineDash(byref pattern() as Double, byref count as Integer, byref phase as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the line-stroking pattern for the receiver.
Notes:

pattern: On output, this array contains the lengths (measured in points) of the line segments and gaps in the pattern. The values in the array alternate, starting with the first line segment length, followed by the first gap length, followed by the second line segment length, and so on.
count: On output, the number of entries written to pattern.
phase: On output, this value contains the offset at which to start drawing the pattern, measured in points along the dashed-line pattern. For example, a phase of 6 in the pattern 5-2-3-2 would cause drawing to begin in the middle of the first gap.

33.1.29 isEmpty as boolean

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the receiver is empty.
Example:

```
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath
MsgBox "isEmpty: "+str(b.isEmpty)
```

Notes: True if the receiver contains no path elements; otherwise, false.

33.1.30 lineToPoint(p as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends a straight line to the receiver's path.
Notes:

p: The destination point of the line segment, specified in the current coordinate system.

This method creates a straight line segment starting at the current point and ending at the point specified by the aPoint parameter. The current point is the last point in the receiver's most recently added segment.

You must set the path's current point (using the moveToPoint method or through the creation of a pre-

ceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

33.1.31 moveToPoint(p as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Moves the receiver's current point to the specified location.
Notes:

p: A point in the current coordinate system.

This method implicitly closes the current subpath (if any) and sets the current point to the value in p. When closing the previous subpath, this method does not cause a line to be created from the first and last points in the subpath.

For many path operations, you must invoke this method before issuing any commands that cause a line or curve segment to be drawn.

33.1.32 relativeCurveToPoint(endPoint as NSPointMBS, controlPoint1 as NSPointMBS, controlPoint2 as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a Bezier cubic curve to the receiver's path from the current point to a new location, which is specified as a relative distance from the current point.
Notes:

endPoint: The destination point of the curve segment, interpreted as a relative offset from the current point.
controlPoint1: The point that determines the shape of the curve near the current point, interpreted as a relative offset from the current point.
controlPoint2: The point that determines the shape of the curve near the destination point, interpreted as a relative offset from the current point.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

33.1.33 relativeLineToPoint(p as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends a straight line segment to the receiver's path starting at the current point and moving towards

the specified point, relative to the current location.
Notes:

p: A point whose coordinates are interpreted as a relative offset from the current point.

The destination point is relative to the current point. For example, if the current point is (1, 1) and aPoint contains the value (1, 2), a line segment is created between the points (1, 1) and (2, 3).

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

33.1.34 relativeMoveToPoint(p as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Moves the receiver's current point to a new point whose location is the specified distance from the current point.
Notes:

p: A point whose coordinates are interpreted as a relative offset from the current point.

This method implicitly closes the current subpath (if any) and updates the location of the current point. For example, if the current point is (1, 1) and aPoint contains the value (1, 2), the previous subpath would be closed and the current point would become (2, 3). When closing the previous subpath, this method does not cause a line to be created from the first and last points in the subpath.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

33.1.35 removeAllPoints

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all path elements from the receiver, effectively clearing the path.
Example:

```
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath

b.moveToPoint NSMakePointMBS(10, 10)
b.lineToPoint NSMakePointMBS(290, 290)
MsgBox str(b.elementCount) // 2

b.removeAllPoints
```

```
MsgBox str(b.elementCount) // 0
```

33.1.36 setAssociatedPoints(points() as NSPointMBS, index as Integer)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes the points associated with the specified path element.
Notes:

points: An array containing up to three NSPointMBS data types. This parameter must contain the correct number of points for the path element at the specified index. Move, close path, and line segment commands require one point. Curve operations require three points.
index: The index of the path element you want to modify.

You can use this method to change the points associated with a path quickly and without recreating the path. You cannot use this method to change the type of the path element.

The following example shows you how you would modify the point associated with a line path element. The path created by this example results in a path with two elements. The first path element specifies a move to point (0, 0) while the second creates a line to point (100, 100). It then changes the line to go only to the point (50,50) using this method:

Note: If you specify too few points for a path element of type NSCurveToBezierPathElement, the behavior of this method is undefined.

33.1.37 setLineDash(pattern() as Double, phase as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the line-stroking pattern for the receiver.
Example:

```
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)

g.setFillColor NSColorMBS.redColor

dim r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath

b.moveToPoint NSMakePointMBS(10, 10)
b.lineToPoint NSMakePointMBS(290, 290)

dim pattern() as Double
```

```
pattern.Append 5
pattern.Append 2
b.setLineDash pattern, 6

g.stroke(b)

g = nil

window1.Backdrop = n.CopyPicture // red line with dash pattern
```

Notes:

pattern: An array of floating point values that contains the lengths (measured in points) of the line segments and gaps in the pattern. The values in the array alternate, starting with the first line segment length, followed by the first gap length, followed by the second line segment length, and so on
count: The number of values in pattern.
phase: The offset at which to start drawing the pattern, measured in points along the dashed-line pattern. For example, a phase of 6 in the pattern 5-2-3-2 would cause drawing to begin in the middle of the first gap.

33.1.38 transformUsingAffineTransform(transform as Variant)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Transforms all points in the receiver using the specified transform.
Example:

```
dim bezierPath as NSBezierPathMBS = NSBezierPathMBS.bezierPath
dim transform as NSAffineTransformMBS = NSAffineTransformMBS.transform

bezierPath.moveToPoint NSMakePointMBS(0.0, 0.0)
bezierPath.lineToPoint NSMakePointMBS(100.0, 100.0)

transform.translate(10,10)
bezierPath.transformUsingAffineTransform(transform)

Break // bezierPath.bounds starts now at 10/10
```

Notes:

Transform: The transform to apply to the path.

This method applies the transform to the path's points immediately. The following code translates a line from 0,0 to 100,100 to a line from 10,10 to 110,110.

transform must be a NSAffineTransformMBS object.

33.1.39 Properties

33.1.40 Bounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bounding box of the receiver's path.
Example:

```
dim r as new NSRectMBS(10, 10, 50, 50)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(r)
dim rr as NSRectMBS = b.Bounds
MsgBox rr.String
```

Notes:

The rectangle that encloses the path of the receiver. If the path contains curve segments, the bounding box encloses the curve but may not enclose the control points used to calculate the curve.
(Read only property)

33.1.41 ControlPointBounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bounding box of the receiver's path, including any control points.
Notes:

The rectangle that encloses the receiver's path. If the path contains curve segments, the bounding box encloses the control points of the curves as well as the curves themselves.
(Read only property)

33.1.42 CurrentPoint as NSPointMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's current point (the trailing point or ending point in the most recently added segment).
Example:

```
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath
b.moveToPoint NSMakePointMBS(10,10)
```

MsgBox b.CurrentPoint.String

Notes:

The point from which the next drawn line or curve segment begins.
If the receiver is empty, this method raises NSGenericException.
(Read only property)

33.1.43 defaultFlatness as Double

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default flatness value for all paths.
Notes:

The flatness value specifies the accuracy (or smoothness) with which curves are rendered. It is also the maximum error tolerance (measured in pixels) for rendering curves, where smaller numbers give smoother curves at the expense of more computation. The exact interpretation may vary slightly on different rendering devices.

The default flatness value is 0.6, which yields smooth curves.
(Read and Write property)

33.1.44 defaultLineCapStyle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default line cap style for all paths.
Notes:

The default line cap style or NSButtLineCapStyle if no other style has been set. For a list of values, see Constants.

The default line cap style can be overridden for individual paths by setting a custom style for that path using the LineCapStyle property.
(Read and Write property)

33.1.45 defaultLineJoinStyle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default line join style for all paths.
Notes:

The default line join style or NSMiterLineJoinStyle if no other value has been set. For a list of values, see Constants.
(Read and Write property)

33.1.46 defaultLineWidth as Double

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default line width for the all paths.
Notes:

The line width defines the thickness of stroked paths. A width of 0 is interpreted as the thinnest line that can be rendered on a particular device. The actual rendered line width may vary from the specified width by as much as 2 device pixels, depending on the position of the line with respect to the pixel grid and the current anti-aliasing settings. The width of the line may also be affected by scaling factors specified in the current transformation matrix of the active graphics context.
(Read and Write property)

33.1.47 defaultMiterLimit as Double

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default miter limit for all paths.
Notes:

The miter limit helps you avoid spikes at the junction of two line segments connected by a miter join (NSMiterLineJoinStyle). If the ratio of the miter length—the diagonal length of the miter join—to the line thickness exceeds the miter limit, the joint is converted to a bevel join. The default miter limit value is 10, which converts miters whose angle at the joint is less than 11 degrees.
(Read and Write property)

33.1.48 defaultWindingRule as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default winding rule used to fill all paths.
Notes:

The current default winding rule or NSNonZeroWindingRule if no default rule has been set. This value may be either NSNonZeroWindingRule or NSEvenOddWindingRule.

Winding rules determine how to paint (or fill) the region enclosed by a path. You use this method to set the default rule that is applied to paths that do not have a custom winding rule assigned.
(Read and Write property)

33.1.49 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

33.1.50 flatness as Double

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The flatness value of the path.
Notes:

If no value is set, this method returns the default flatness value.
(Read and Write computed property)

33.1.51 lineCapStyle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The line cap style for the receiver's path.
Notes:

If this value is not set for the receiver, the default line cap style is returned.
(Read and Write computed property)

33.1.52 lineJoinStyle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's line join style.
Notes:

If this value is not set for the receiver, the default line join style is returned.
(Read and Write computed property)

33.1.53 lineWidth as Double

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The line width of the receiver's path.
Example:

```
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)
```

```
g.setFillColor NSColorMBS.redColor

dim r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath

b.moveToPoint NSMakePointMBS(10, 10)
b.lineToPoint NSMakePointMBS(290, 290)

dim pattern() as Double
pattern.Append 10
pattern.Append 4

b.lineWidth = 5
b.setLineDash pattern, 12

g.stroke(b)

g = nil

window1.Backdrop = n.CopyPicture // red line with dash pattern
```

Notes:

The line width of the receiver, measured in points in the user coordinate space.
If no value was set explicitly for the receiver, this method returns the default line width.
(Read and Write computed property)

33.1.54 miterLimit as Double

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The miter limit of the receiver's path.
Notes:

If no value is set, this method returns the default miter limit.
(Read and Write computed property)

33.1.55 windingRule as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the winding rule used to fill the receiver's path.
Notes:

Returns the winding rule for the path. This value may be either NSNonZeroWindingRule or NSEvenOddWindingRule.

This value overrides the default value returned by defaultWindingRule.
For more information on how winding rules affect the appearance of filled paths, see Constants.
(Read and Write computed property)

33.1.56 Constants

33.1.57 NSBevelLineJoinStyle = 2

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** One of the constants to specify the shape of the joints between connected segments of a stroked path.
Notes:

Specifies a bevel line shape of the joints between connected segments of a stroked path.
See the setDefaultLineJoinStyle method for an example of the appearance.

33.1.58 NSButtLineCapStyle = 0

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** One of the constants to specify the shape of endpoints for an open path when stroked.
Notes:

Specifies a butt line cap style for endpoints for an open path when stroked.
See the setDefaultLineCapStyle method for an example of the appearance.

33.1.59 NSClosePathBezierPathElement = 3

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** Basic path element command constants.
Notes:

Marks the end of the current subpath at the specified point.
Note that the point specified for the Close Path element is essentially the same as the current point.

33.1.60 NSCurveToBezierPathElement = 2

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** Basic path element command constants.
Notes:

Creates a curved line segment from the current point to the specified endpoint using two control points to define the curve.
The points are stored in the following order: controlPoint1, controlPoint2, endPoint. Ovals, arcs, and Bezier curves all use curve elements to specify their geometry.
Contains 3 points.

33.1.61 NSEvenOddWindingRule = 1

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** One of the constants used to specify the winding rule a Bezier path should use.
Notes:

Specifies the even-odd winding rule.
Count the total number of path crossings. If the number of crossings is even, the point is outside the path. If the number of crossings is odd, the point is inside the path and the region containing it should be filled.

33.1.62 NSLineToBezierPathElement = 1

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** Basic path element command constants.
Notes:

Creates a straight line from the current drawing point to the specified point.
Lines and rectangles are specified using this path element.
Contains 1 point.

33.1.63 NSMiterLineJoinStyle = 0

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** One of the constants to specify the shape of the joints between connected segments of a stroked path.
Notes:

Specifies a miter line shape of the joints between connected segments of a stroked path.
See the setDefaultLineJoinStyle method for an example of the appearance.

33.1.64 NSMoveToBezierPathElement = 0

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** Basic path element command constants.
Notes:

Moves the path object's current drawing point to the specified point.
This path element does not result in any drawing. Using this command in the middle of a path results in a

disconnected line segment.
Contains 1 point.

33.1.65 NSNonZeroWindingRule = 0

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** One of the constants used to specify the winding rule a Bezier path should use.
Notes:

Specifies the non-zero winding rule.
Count each left-to-right path as +1 and each right-to-left path as -1. If the sum of all crossings is 0, the point is outside the path. If the sum is nonzero, the point is inside the path and the region containing it is filled. This is the default winding rule.

33.1.66 NSRoundLineCapStyle = 1

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** One of the constants to specify the shape of endpoints for an open path when stroked.
Notes:

Specifies a round line cap style for endpoints for an open path when stroked.
See the setDefaultLineCapStyle method for an example of the appearance.

33.1.67 NSRoundLineJoinStyle = 1

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** One of the constants to specify the shape of the joints between connected segments of a stroked path.
Notes:

Specifies a round line shape of the joints between connected segments of a stroked path.
See the setDefaultLineJoinStyle method for an example of the appearance.

33.1.68 NSSquareLineCapStyle = 2

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** One of the constants to specify the shape of endpoints for an open path when stroked.
Notes:

Specifies a square line cap style for endpoints for an open path when stroked.
See the setDefaultLineCapStyle method for an example of the appearance.

33.2 class NSBitmapImageRepMBS

33.2.1 class NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSBitmapImageRep class renders an image from bitmap data.
Notes:

Bitmap data formats supported include GIF, JPEG, TIFF, PNG, and various permutations of raw bitmap data.

Alpha Premultiplication

If a coverage (alpha) plane exists, a bitmap's color components are premultiplied with it. If you modify the contents of the bitmap, you are therefore responsible for premultiplying the data. For this reason, though, if you want to manipulate the actual data, an NSBitmapImageRep object is not recommended for storage. If you need to work with data that is not premultiplied, you should use Quartz, specifically CGImageCreate with kCGImageAlphaLast.

Note that premultiplying does not affect the output quality. Given source bitmap pixel s, destination pixel d, and alpha value a, a blend is basically

d' = a * s + (1 - a) * d

All premultiplication does is precalculate a * s.
Subclass of the NSImageRepMBS class.

33.2.2 Blog Entries

- MBS Xojo Plugins, version 17.2pr1
- MBS Xojo / Real Studio Plugins, version 14.2pr3
- MBS Xojo / Real Studio Plugins, version 13.5pr5
- MBS Real Studio Plugins, version 12.3pr7

33.2.3 Methods

33.2.4 bitmapImageRepByConvertingToColorSpace(colorSpace as NSColorSpaceMBS, renderingIntent as Integer) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts the image rep to the specified colorspace.
Notes:

targetSpace: The new colorSpace
renderingIntent: The rendering intent specifies how to handle colors that are not located within the target color space. The supported values are NSColorRenderingIntent.

Constant	Value
Default	0
AbsoluteColorimetric	1
RelativeColorimetric	2
Perceptual	3
Saturation	4

An NSBitmapImageRep, or nil, if the conversion fails. If the original NSBitmapImageRep already uses that colorSpace, it is returned as is.

33.2.5 bitmapImageRepByRetaggingWithColorSpace(newSpace as NSColorSpaceMBS) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes the colorSpace tag of the receiver.
Notes:

newSpace: The desired colorSpace.

Returns an NSBitmapImageRep, or nil, if the conversion fails. If the original NSBitmapImageRep already uses that colorSpace, it is returned as is.

This method will definitely fail if you pass a colorSpace that has a different color space model than the receiver. That is, if your original image is sRGB, you can only retag with some other RGB colorspace.
Available in Mac OS X v10.6 and later.

33.2.6 BMPRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bitmap as bmp data.

33.2.7 canBeCompressedUsing(compression as Integer) as Boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Tests whether the receiver can be compressed by the specified compression scheme.
Notes:

Returns ture if the receiver's data matches compression with this type, false if the data doesn't match compression or if compression is unsupported..

Legal values for compression can be found in NSBitmapImageRep.h and are described in TIFF Compression in NSBitmapImageReps. This method returns true if the receiver's data matches compression; for example, if compression is NSTIFFCompressionCCITTFAX3, then the data must be 1 bit per sample and 1 sample per pixel.

33.2.8 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a newly allocated NSBitmapImageRep from the provided data.
Notes:

data: A data object containing image data. The contents of bitmapData can be any supported bitmap format. For TIFF data, the NSBitmapImageRep is initialized from the first header and image data found in bitmapData.

On success the handle property is not zero.
See also:

- 33.2.9 Constructor(pic as Picture) 7266
- 33.2.10 Constructor(pixelsWide as Integer, pixelsHigh as Integer, bitsPerSample as Integer, samplesPerPixel as Integer, hasAlpha as boolean, colorSpaceName as string, bytesPerRow as Integer, bitsPerPixel as Integer) 7267

33.2.9 Constructor(pic as Picture)

MBS MacBase Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSBitmapImageRep object created from a Core Graphics image object.
Notes:

pic: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn't be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the cgImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.
See also:

- 33.2.8 Constructor(data as Memoryblock) 7266
- 33.2.10 Constructor(pixelsWide as Integer, pixelsHigh as Integer, bitsPerSample as Integer, samplesPerPixel as Integer, hasAlpha as boolean, colorSpaceName as string, bytesPerRow as Integer, bitsPerPixel as Integer) 7267

33.2.10 Constructor(pixelsWide as Integer, pixelsHigh as Integer, bitsPerSample as Integer, samplesPerPixel as Integer, hasAlpha as boolean, colorSpaceName as string, bytesPerRow as Integer, bitsPerPixel as Integer)

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a newly allocated NSBitmapImageRep object, so it can render the specified image.
Example:

```
dim n as new NSImageMBS(300,300)
dim r as new NSBitmapImageRepMBS(300, 300, 8, 4, true, NSColorSpaceMBS.NSCalibratedRGBColorSpace, 4*300, 32)

dim g as new NSGraphicsMBS(r)
g.SetColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
g = nil // flush
n.addRepresentation r

Backdrop = n.CopyPictureWithMask
```

Notes:

The image bitmap data is allocated for you.

pixelsWide: The width of the image in pixels. This value must be greater than 0.
pixelsHigh: The height of the image in pixels. This value must be greater than 0.
bitsPerSample: The number of bits used to specify one pixel in a single component of the data. All components are assumed to have the same bits per sample. bps should be one of these values: 1, 2, 4, 8, 12, or 16.
samplesPerPixel: The number of data components, or samples per pixel. This value includes both color components and the coverage component (alpha), if present. Meaningful values range from 1 through 5. An image with cyan, magenta, yellow, and black (CMYK) color components plus a coverage component would have an spp of 5; a grayscale image that lacks a coverage component would have an spp of 1.
hasAlpha: True if one of the components counted in the number of samples per pixel (spp) is a coverage (alpha) component, and false if there is no coverage component. If true, the color components in the bitmap data must be premultiplied with their coverage component.
colorSpaceName: A string constant that indicates how data values are to be interpreted. It should be one of the following values: NSCalibratedWhiteColorSpace, NSCalibratedBlackColorSpace, NSCalibratedRGBColorSpace, NSDeviceWhiteColorSpace, NSDeviceBlackColorSpace, NSDeviceRGBColorSpace, NSDeviceCMYKColorSpace, NSNamedColorSpace or NSCustomColorSpace. (see NSColorSpaceMBS)
If bps is 12, you cannot specify the monochrome color space.
bytesPerRow: The number of bytes that are allocated for each scan line in each plane of data. A scan line is a single row of pixels spanning the width of the image.
Normally, rowBytes can be figured from the width of the image, the number of bits per pixel in each sample (bps), and, if the data is in a meshed configuration, the number of samples per pixel (spp). However, if the data for each row is aligned on word or other boundaries, it may have been necessary to allocate more memory for each row than there is data to fill it. rowBytes lets the object know whether that's the case.
If you pass in a rowBytes value of 0, the bitmap data allocated may be padded to fall on long word or larger boundaries for performance. If your code wants to advance row by row, use bytesPerRow and do not assume the data is packed. Passing in a non-zero value allows you to specify exact row advances.
bitsPerPixel: This integer value informs NSBitmapImageRep how many bits are actually allocated per pixel in each plane of data. If the data is in planar configuration, this normally equals bps (bits per sample). If the data is in meshed configuration, it normally equals bps times spp (samples per pixel). However, it's possible for a pixel specification to be followed by some meaningless bits (empty space), as may happen, for example, if pixel data is aligned on byte boundaries. NSBitmapImageRep supports only a limited number of pixelBits values (other than the default): for RGB images with 4 bps, pixelBits may be 16; for RGB images with 8 bps, pixelBits may be 32. The legal values for pixelBits are system dependent.
If you specify 0 for this parameter, the object interprets the number of bits per pixel using the values in the bps and spp parameters, as described in the preceding paragraph, without any meaningless bits.

On success the handle property is not zero.

You can add several NSBitmapImageRepMBS to NSImage to make a multi page tiff file.
To make a 300 dpi image, the size of the NSImage must be smaller than the size of the bitmap inside by factor 72/300.
See also:

- 33.2.8 Constructor(data as Memoryblock) 7266
- 33.2.9 Constructor(pic as Picture) 7266

33.2.11 GIFRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bitmap as gif data.

33.2.12 imageRepWithCGImage(CGImage as Variant) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSBitmapImageRep object created from a Core Graphics image object.
Notes:

cgimage: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn't be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the cgImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

33.2.13 imageRepWithCGImageRef(CGImageHandle as Integer) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSBitmapImageRep object created from a Core Graphics image reference.
Notes:

CGImageHandle: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn't be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the cgImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

33.2.14 imageRepWithCIImage(CIImage as variant) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSBitmapImageRep object created from a CoreImage object.
Notes:

CIImage: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn't be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the CIImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

33.2.15 imageRepWithCIImageRef(CIImageHandle as Integer) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSBitmapImageRep object created from a CoreImage reference.
Notes:

CIImageHandle: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn't be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the CIImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

33.2.16 imageRepWithData(data as Memoryblock) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSBitmapImageRep object initialized with the first image in the supplied data.
Notes:

data: A data object containing one or more bitmapped images. The bitmapData parameter can contain data in any supported bitmap format.

Returns an NSBitmapImageRep instance or nil if the class is unable to create an image representation.

33.2.17 JPEGRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bitmap as jpeg data.

33.2.18 NSImageColorSyncProfileData as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.
Notes:

Identifies a memoryblock containing the ColorSync profile data.
It can be used for TIFF, JPEG, GIF, and PNG files. This value is set when reading in and used when writing out image data. You can get the profile data for a particular color space from the corresponding NSColorSpace object or from the ColorSync Manager.

33.2.19 NSImageCompressionFactor as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.
Notes:

Identifies a number containing the compression factor of the image.
Used only for JPEG files. JPEG compression in TIFF files is not supported, and the factor is ignored. The value is a float between 0.0 and 1.0, with 1.0 resulting in no compression and 0.0 resulting in the maximum

compression possible. It's set when reading in and used when writing out the image.

33.2.20 NSImageCompressionMethod as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.
Notes:

Identifies a number identifying the compression method of the image.
Used only for TIFF files. The value corresponds to one of the NSTIFFCompression constants, described below. It's set when reading in and used when writing out.

33.2.21 NSImageCurrentFrame as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.
Notes:

Identifies a number containing the current frame for an animated GIF file.
The first frame is 0.

33.2.22 NSImageCurrentFrameDuration as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.
Notes:

Identifies a number containing the duration (in seconds) of the current frame for an animated GIF image.
The frame duration can be a floating-point value. It is used when reading in, but not when writing out.

33.2.23 NSImageDitherTransparency as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.
Notes:

Identifies a number containing a boolean that indicates whether the image is dithered.
Used only when writing GIF files.

33.2.24 NSImageEXIFData as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.
Notes:

Identifies an dictionary containing the EXIF data for the image.
This property is used only when reading or writing JPEG files. The dictionary contains the EXIF keys and values. Th standard dictionary keys (that is, those that are not specific to camera vendors) are identical to those for kCGImagePropertyExifDictionary declared in the CGImageSource API. See kCGImagePropertyExifDictionary Keys for details.

33.2.25 NSImageFallbackBackgroundColor as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.
Notes:

Specifies the background color to use when writing to an image format (such as JPEG) that doesn't support alpha. The color's alpha value is ignored. The default background color, when this property is not specified, is white. The value of the property should be an NSColorMBS object. This constant corresponds to the kCGImageDestinationBackgroundColor constant in Quartz.
Available in Mac OS X v10.5 and later.

33.2.26 NSImageFrameCount as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.
Notes:

Identifies a number containing the number of frames in an animated GIF file.
This value is used when reading in data.

33.2.27 NSImageGamma as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.
Notes:

Identifies a number containing the gamma value for the image.
Used only for PNG files. The gamma values is a floating-point number between 0.0 and 1.0, with 0.0 being black and 1.0 being the maximum color. It's set when reading in and used when writing out.

33.2.28 NSImageInterlaced as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.
Notes:

Identifies a number containing a Boolean value that indicates whether the image is interlaced.
Used only when writing out PNG files.

33.2.29 NSImageLoopCount as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.
Notes:

Identifies a number containing the number of loops to make when animating a GIF image.
A value of 0 indicates the animation should loop indefinitely. Values should be specified as Integer numbers.
It is used when reading in but not when writing out the image.

33.2.30 NSImageProgressive as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.
Notes:

Identifies a number containing a boolean that indicates whether the image uses progressive encoding.
Used only for JPEG files. It's set when reading in and used when writing out.

33.2.31 NSImageRGBColorTable as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.
Notes:

Identifies an Memoryblock containing the RGB color table.
Used only for GIF files. It's stored as packed RGB. It's set when reading in and used when writing out.

33.2.32 PNGRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bitmap as PNG data.

33.2.33 TIFFRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a TIFF representation of the receiver.
Notes:

This method invokes TIFFRepresentationUsingCompression using the stored compression type and factor retrieved from the initial image data or changed using setCompression. If the stored compression type isn't supported for writing TIFF data (for example, NSTIFFCompressionNEXT), the stored compression is changed to NSTIFFCompressionNone before invoking TIFFRepresentationUsingCompression. receiver, using the compression that's returned by getCompression (if applicable).

If a problem is encountered during generation of the TIFF, TIFFRepresentation raises an NSTIFFException or an NSBadBitmapParametersException.
See also:

- 33.2.34 TIFFRepresentation(properties as dictionary = nil) as Memoryblock 7275

33.2.34 TIFFRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bitmap as tiff data.
See also:

- 33.2.33 TIFFRepresentation as Memoryblock 7275

33.2.35 Properties

33.2.36 bitmapData as Ptr

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a pointer to the bitmap data.
Notes:

If the data is planar, returns a pointer to the first plane.
(Read only property)

33.2.37 bitmapFormat as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bitmap format of the receiver.

Notes:

Returns 0 by default. The return value can indicate several different attributes, which are described in Constants.
(Read only property)

33.2.38 bitsPerPixel as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of bits allocated for each pixel in each plane of data.
Notes:

This number is normally equal to the number of bits per sample or, if the data is in meshed configuration, the number of bits per sample times the number of samples per pixel. It can be explicitly set to another value (in initWithBitmapDataPlanes) in case extra memory is allocated for each pixel. This may be the case, for example, if pixel data is aligned on byte boundaries.
(Read only property)

33.2.39 bytesPerPlane as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of bytes in each plane or channel of data.
Notes:

This number is calculated from the number of bytes per row and the height of the image.
(Read only property)

33.2.40 bytesPerRow as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the minimum number of bytes required to specify a scan line (a single row of pixels spanning the width of the image) in each data plane.
Notes:

If not explicitly set to another value (in initWithBitmapDataPlanes), this number will be figured from the width of the image, the number of bits per sample, and, if the data is in a meshed configuration, the number of samples per pixel. It can be set to another value to indicate that each row of data is aligned on word or other boundaries.
(Read only property)

33.2.41 CGImage as Variant

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the CGImageMBS for this image representation.
Notes:

If the image was created using a CGImage, you can get it back.
Else a new CGImage may be created for you.
(Read only property)

33.2.42 colorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the image rep's colorSpace
Notes:

Available in Mac OS X v10.6 and later.
(Read only property)

33.2.43 isPlanar as Boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if image data is a planar configuration and false if its in a meshed configuration.
Notes:

In a planar configuration, the image data is segregated into a separate plane for each color and coverage component. In a meshed configuration, the data is integrated into a single plane.
(Read only property)

33.2.44 numberOfPlanes as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of separate planes image data is organized into.
Notes:

This number is the number of samples per pixel if the data has a separate plane for each component (isPlanar returns true) and 1 if the data is meshed (isPlanar returns false).
(Read only property)

33.2.45 samplesPerPixel as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of components in the data.
Notes:

The returned value includes both color components and the coverage component, if present.
(Read only property)

33.2.46 valueForProperty(key as string) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value for the specified property.
Notes:

Value can be nil.
(Read and Write computed property)

33.2.47 Constants

33.2.48 NSAlphaFirstBitmapFormat = 1

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the bitmap format constants.
Notes:

If 0, alpha values are the last component.
For example, CMYKA and RGBA.
Available in Mac OS X v10.4 and later.

33.2.49 NSAlphaNonpremultipliedBitmapFormat = 2

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the bitmap format constants.
Notes:

If 0, alpha values are premultiplied.
Available in Mac OS X v10.4 and later.

33.2.50 NSBMPFileType = 1

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Image format file type constants.
Notes: Windows bitmap image (BMP) format

33.2.51 NSFloatingPointSamplesBitmapFormat = 4

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the bitmap format constants.
Notes:

If 0, samples are integer values.
Available in Mac OS X v10.4 and later.

33.2.52 NSGIFFileType = 2

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Image format file type constants.
Notes: Graphics Image Format (GIF), originally created by CompuServe for online downloads

33.2.53 NSImageRepLoadStatusCompleted = -6

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the image loading state constants.
Notes: Enough data has been provided to successfully decompress the image (regardless of the complete: flag).

33.2.54 NSImageRepLoadStatusInvalidData = -4

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the image loading state constants.
Notes: An error occurred during image decompression. The image contains the portions of the data that have already been successfully decompressed, if any.

33.2.55 NSImageRepLoadStatusReadingHeader = -2

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the image loading state constants.
Notes: The image format is known, but not enough data has been read to determine the size, depth, etc., of the image. You should continue to provide more data.

33.2.56 NSImageRepLoadStatusUnexpectedEOF = -5

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the image loading state constants.
Notes: incrementalLoadFromData was called with true, but not enough data was available for decompres-

sion. The image contains the portions of the data that have already been successfully decompressed, if any.

33.2.57 NSImageRepLoadStatusUnknownType = -1

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the image loading state constants.
Notes: Not enough data to determine image format. You should continue to provide more data.

33.2.58 NSImageRepLoadStatusWillNeedAllData = -3

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the image loading state constants.
Notes: Incremental loading cannot be supported. Until you call incrementalLoadFromData with true, this status will be returned. You can continue to call the method but no decompression will take place. Once you do call the method with true, then the image will be decompressed and one of the final three status messages will be returned.

33.2.59 NSJPEG2000FileType = 5

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Image format file type constants.
Notes: JPEG 2000 file format.

33.2.60 NSJPEGFileType = 3

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Image format file type constants.
Notes: JPEG format.

33.2.61 NSPNGFileType = 4

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Image format file type constants.
Notes: Portable Network Graphics (PNG) format.

33.2.62 NSTIFFCompressionCCITTFAX3 = 3

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Tiff Compression constants
Notes:

CCITT Fax Group 3 compression.
Used for 1-bit fax images sent over telephone lines.

33.2.63 NSTIFFCompressionCCITTFAX4 = 4

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Tiff Compression constants **Notes:**

CCITT Fax Group 4 compression.
Used for 1-bit fax images sent over ISDN lines.

33.2.64 NSTIFFCompressionJPEG = 6

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Tiff Compression constants **Notes:** JPEG compression. No longer supported for input or output.

33.2.65 NSTIFFCompressionLZW = 5

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Tiff Compression constants **Notes:** LZW compression.

33.2.66 NSTIFFCompressionNEXT = 32766

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Tiff Compression constants **Notes:** NeXT compressed. Supported for input only.

33.2.67 NSTIFFCompressionNone = 1

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Tiff Compression constants **Notes:** No compression.

33.2.68 NSTIFFCompressionOldJPEG = 32865

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Tiff Compression constants **Notes:** Old JPEG compression. No longer supported for input or output.

33.2.69 NSTIFFCompressionPackBits = 32773

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Tiff Compression constants
Notes: PackBits compression.

33.2.70 NSTIFFFileType = 0

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Image format file type constants.
Notes: Tagged Image File Format (TIFF)

33.3 class NSColorListMBS

33.3.1 class NSColorListMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a Cocoa ColorList.

33.3.2 Methods

33.3.3 colorWithKey(key as string) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color with the given key.
Notes: Returns nil if key doesn't exist.

33.3.4 Create(name as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a color list; specify "" if you don't want a name.
Notes: Note that this does not add the color list to availableColorLists until the color list is saved into the user's path with writeToFile("").
See also:

- 33.3.5 Create(name as string, path as string) as boolean 7283

33.3.5 Create(name as string, path as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a color list; specify "" if you don't want a name.
Notes: Note that this does not add the color list to availableColorLists until the color list is saved into the user's path with writeToFile("").
See also:

- 33.3.4 Create(name as string) as boolean 7283

33.3.6 insertColor(theColor as NSColorMBS, key as string, index as Integer)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts color at the specified location.
Notes: If a color by the same key is already in the list but at a different location it is removed from there.

33.3.7 isEditable as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this color list is editable.
Notes: True if it is editable.

33.3.8 Load(name as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Loads the named color list from availableColorLists.
Notes: Returns true on success.

33.3.9 name as string

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Name of the color list.

33.3.10 removeColorWithKey(key as string)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the color with the given key.
Notes: Does nothing if the key does not exist.

33.3.11 removeFile

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If the color list is in the user's path, removes the corresponding file in user's colorlists directory.
Notes: Also removes the color list from availableColorLists. If there are no outstanding references to the color list this might deallocate the object as well.

33.3.12 setColor(theColor as NSColorMBS, key as string)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If key already exists, sets the corresponding color; otherwise inserts the color at the end.

33.3.13 writeToFile(path as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the color list to the given path.
Notes:

Use "" to save to the user's private colorlists directory. If the color list is named, this method will also insert the color list into availableColorLists.
Returns true for success.

33.4 class NSColorMBS

33.4.1 class NSColorMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for a Cocoa color.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.blueComponent)
```

33.4.4 Methods

33.4.5 alternateSelectedControlColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the face of a selected control.
Example:

```
dim c as NSColorMBS = NSColorMBS.alternateSelectedControlColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for the face of a selected control—a control being clicked or dragged. This color can be used where iApp-like highlighting is desired.

33.4.6 alternateSelectedControlTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for text in a selected control.
Example:

```
dim c as NSColorMBS = NSColorMBS.alternateSelectedControlTextColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for text in a selected control—a control being clicked or dragged. This color can be used where iApp-like highlighting is desired.

33.4.7 alternatingContentBackgroundColors as NSColorMBS()

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The background colors for alternating content items: such as table view rows, collection view items.
Notes:

Alias for controlAlternatingRowBackgroundColors function.
Available on MacOS 10.14 or newer.
This function calls controlAlternatingRowBackgroundColors when alternatingContentBackgroundColors is

not available.

33.4.8 blackColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose grayscale value is 0.0 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.blackColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.9 blendedColorWithFraction(alpha as Double, c as NSColorMBS) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object whose component values are a weighted sum of the receiver's and the specified color object's.
Example:

```
dim b as NSColorMBS = NSColorMBS.blueColor
dim r as NSColorMBS = NSColorMBS.redColor
dim c as NSColorMBS = b.blendedColorWithFraction(0.5, r)

MsgBox c.description
```

Notes:

fraction: The amount of the color to blend with the receiver's color. The method converts color and a copy of the receiver to RGB, and then sets each component of the returned color to fraction of color's value plus 1 – fraction of the receiver's.
color: The color to blend with the receiver's color.

The resulting color object or nil if the colors can't be converted.

33.4.10 blueColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 0.0, 0.0, 1.0 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.11 brownColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 0.6, 0.4, 0.2 and whose alpha value is 1.0.
Notes:

```
dim c as NSColorMBS = NSColorMBS.brownColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.12 CGColorHandle as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts NSColor to CGColor.
Notes:

Return value may be an approximation in some cases, so there isn't guaranteed round-trip fidelity.
Available on Mac OS X 10.8.

33.4.13 clearColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose grayscale and alpha values are both 0.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.clearColor

window1.Title=c.description
```

```
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.14 colorFromPasteboard as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NSColor currently on the given pasteboard.
Notes: The color currently on the pasteboard or nil if pasteBoard doesn't contain color data.

33.4.15 colorNamed(colorName as String) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create catalog colors from values stored with the given name in the Asset Catalog of the main app bundle.

33.4.16 colorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an object representing the color space of the receiver.
Example:

```
dim b as NSColorMBS = NSColorMBS.blueColor

MsgBox b.colorSpace.localizedName
```

Notes:

An object representing a color space. The returned NSColorSpace object may represent a custom color space.

Calling this method raises an exception if the receiver is not based on a color space represented by an NSColorSpace object—specifically, colors designated by NSNamedColorSpace and NSPatternColorSpace. If you are unsure about a color object, convert it to an equivalent NSColorSpace-based object before calling this method. Color objects created with color-space names NSCalibratedWhiteColorSpace, NSCalibratedBlackColorSpace, NSCalibratedRGBColorSpace, NSDeviceWhiteColorSpace, NSDeviceBlackColorSpace, NSDeviceRGBColorSpace, NSDeviceCMYKColorSpace, or NSCustomColorSpace—or with the NSColorSpace class methods corresponding to these names—are safe to use with this method. See "About Color Spaces" in Color Programming Topics for Cocoa for a list of these corresponding methods.

33.4.17 colorUsingColorSpace(colorSpace as NSColorSpaceMBS) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new color object representing the color of the receiver in the specified color space.
Example:

```
dim b as NSColorMBS = NSColorMBS.blueColor
dim c as NSColorMBS = b.colorUsingColorSpace(NSColorSpaceMBS.deviceRGBColorSpace)

MsgBox b.description
```

Notes:

space: The color space of the new NSColor object.

Returns the new NSColor object. This method converts the receiver's color to an equivalent one in the new color space. Although the new color might have different component values, it looks the same as the original. Returns nil if conversion is not possible.

If the receiver's color space is the same as that specified in space, this method returns the same NSColor object.

33.4.18 colorUsingColorSpaceName(colorSpace as string) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor whose color is the same as the receiver's, except that the new NSColor is in the specified color space.
Notes:

colorSpace: The name of the color space containing the new NSColor object. If colorSpace is "", the most appropriate color space is used.

The new NSColor object or nil if the specified conversion cannot be done.

33.4.19 colorUsingType(type as Integer) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Convert the color to a color of different type.
Notes: Return nil if conversion is not possible.

33.4.20 colorWithAlphaComponent(alpha as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object that has the same color space and component values as the receiver, but the specified alpha component.
Example:

```
dim b as NSColorMBS = NSColorMBS.blueColor.colorWithAlphaComponent(0.5)
MsgBox b.description // shows "NSCalibratedRGBColorSpace 0 0 1 0.5"
```

Notes:

alpha: The opacity value of the new NSColor object.

Returns a new NSColor object. If the receiver's color space doesn't include an alpha component, the receiver is returned.

A subclass with explicit opacity components should override this method to return a color with the specified alpha.

33.4.21 colorWithCalibratedHSV(hue as Double, saturation as Double, brightness as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object using the given opacity and HSB color space components.
Example:

```
dim b as NSColorMBS = NSColorMBS.colorWithCalibratedHSV(1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSCalibratedRGBColorSpace 0.2 0.1 0.1 1"
```

Notes:

hue: The hue component of the color object in the HSB color space.
saturation: The saturation component of the color object in the HSB color space.
brightness: The brightness (or value) component of the color object in the HSB color space.
alpha: The opacity value of the color object,

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

33.4.22 colorWithCalibratedRGB(red as Double, green as Double, blue as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object using the given opacity and RGB components.
Example:

```
dim b as NSColorMBS = NSColorMBS.colorWithCalibratedRGB(1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSCalibratedRGBColorSpace 1 0.5 0.2 1"
```

Notes:

red: The red component of the color object.
green: The green component of the color object.
blue: The blue component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

33.4.23 colorWithCalibratedWhite(white as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object using the given opacity and grayscale value.
Example:

```
dim b as NSColorMBS = NSColorMBS.colorWithCalibratedWhite(1.0, 1.0)
MsgBox b.description // shows "NSCalibratedWhiteColorSpace 1 1"
```

Notes:

white: The grayscale value of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

33.4.24 colorWithCatalogName(listName as String, colorName as String) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Look up and return catalog colors from standard color catalogs, or from NSColorList whose name matches the specified catalog name.

33.4.25 colorWithCGColor(CGColorHandle as Integer) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts CGColor to NSColor.
Notes:

Return value may be an approximation in some cases, so there isn't guaranteed round-trip fidelity.
Available on Mac OS X 10.8.

33.4.26 colorWithColorSpace(ColorSpace as NSColorSpaceMBS, components() as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object created from the specified components of the given color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericRGBColorSpace
MsgBox n.localizedName

dim co as NSColorMBS = NSColorMBS.colorWithColorSpace(n, 1.0, 0, 0, 1.0)
MsgBox co.description
```

Notes:

space: An NSColorSpace object representing a color space. The method raises an exception if this is nil.
components: An array of the components in the specified color space to use to create the NSColor object. The order of these components is determined by the color-space profile, with the alpha component always last. (If you want the created color to be opaque, specify 1.0 for the alpha component.)

Returns the color object. If space represents a color space that cannot cannot be used with NSColor objects (for example, a "pattern" color space) the method returns nil.
Raises an NSExceptionMBS if the number of components does not match.
See also:

- 33.4.27 colorWithColorSpace(ColorSpace as NSColorSpaceMBS, paramarray components as Double)

as NSColorMBS 7295

33.4.27 colorWithColorSpace(ColorSpace as NSColorSpaceMBS, paramarray components as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object created from the specified components of the given color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericRGBColorSpace
MsgBox n.localizedName

dim co as NSColorMBS = NSColorMBS.colorWithColorSpace(n, 1.0, 0, 0, 1.0)
MsgBox co.description
```

Notes:

space: An NSColorSpace object representing a color space. The method raises an exception if this is nil.
components: An array of the components in the specified color space to use to create the NSColor object. The order of these components is determined by the color-space profile, with the alpha component always last. (If you want the created color to be opaque, specify 1.0 for the alpha component.)

Returns the color object. If space represents a color space that cannot cannot be used with NSColor objects (for example, a "pattern" color space) the method returns nil.
Raises an NSExceptionMBS if the number of components does not match.
See also:

- 33.4.26 colorWithColorSpace(ColorSpace as NSColorSpaceMBS, components() as Double) as NSColorMBS 7294

33.4.28 colorWithColorSpaceHSV(ColorSpace as NSColorSpaceMBS, hue as Double, saturation as Double, brightness as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object with the specified color space, hue, saturation, brightness, and alpha channel values.
Notes:

ColorSpace: An NSColorSpace object representing a color space. An exception is raised if the color model of the provided color space is not RGB.
hue: The hue (color) component, expressed as a floating-point value in the range 0–1.0.
saturation: The color saturation component, expressed as a floating-point value in the range 0–1.0.
brightness: The brightness component, expressed as a floating-point value in the range 0–1.0.

alpha: The alpha (opacity), expressed as a floating-point value in the range 0 (transparent) to 1.0 (opaque).

Returns the color object.

33.4.29 colorWithDeviceCMYK(cyan as Double, magenta as Double, yellow as Double, black as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object using the given opacity value and CMYK components.
Example:

```
dim b as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.5, 1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSDeviceCMYKColorSpace 0.5 1 0.5 0.2 1"
```

Notes:

cyan: The cyan component of the color object.
magenta: The magenta component of the color object.
yellow: The yellow component of the color object.
black: The black component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0. In PostScript, this color space corresponds directly to the device-dependent operator setcmykcolor.

33.4.30 colorWithDeviceHSV(hue as Double, saturation as Double, brightness as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object using the given opacity value and HSB color space components.
Example:

```
dim b as NSColorMBS = NSColorMBS.colorWithDeviceHSV(1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSDeviceRGBColorSpace 0.2 0.1 0.1 1"
```

Notes:

hue: The hue component of the color object.
saturation: The saturation component of the color object.
brightness: The brightness component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0. In PostScript, this color space corresponds directly to the device-dependent operator setrgbcolor.

33.4.31 colorWithDeviceRGB(red as Double, green as Double, blue as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object using the given opacity value and RGB components.
Example:

```
dim b as NSColorMBS = NSColorMBS.colorWithDeviceRGB(1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSDeviceRGBColorSpace 1 0.5 0.2 1"
```

Notes:

red: The red component of the color object.
green: The green component of the color object.
blue: The blue component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0. In PostScript, this color space corresponds directly to the device-dependent operator setrgbcolor.

33.4.32 colorWithDeviceWhite(white as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object using the given opacity and grayscale values.
Example:

```
dim b as NSColorMBS = NSColorMBS.colorWithDeviceWhite(1.0, 1.0)
MsgBox b.description // shows "NSDeviceWhiteColorSpace 1 1"
```

Notes:

white: The grayscale value of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0. In PostScript, this color

space corresponds directly to the device-dependent operator setgray.

33.4.33 colorWithDisplayP3(red as Double, green as Double, blue as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a color created from the specified components in the Display P3 colorspace.
Notes:

red: The red component of the color object.
green: The green component of the color object.
blue: The blue component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

33.4.34 colorWithGenericGamma22White(white as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an color created with the specified white and alpha values in the GenericGamma22 colorspace.
Notes:

white: The white value of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.
Available in OS X v10.7 and later.

33.4.35 colorWithHSV(hue as double, saturation as double, brightness as double, alpha as double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create component-based colors that are compatible with sRGB colorspace.
Notes: These methods are effectively same as colorWithSRGBHSV:, but provided for easier reuse of code that uses UIColor on iOS. If red, green, blue, or saturation, brightness, or white values are outside of the 0..1 range, these will create colors in the extended sRGB (or for colorWithWhite:alpha:, extendedGenericGamma22GrayColorSpace) color spaces. This behavior is compatible with iOS UIColor.

33.4.36 colorWithPatternImage(image as Variant) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object that uses the specified image pattern.
Example:

```
dim p as Picture = LogoMBS(100)
dim n as new NSImageMBS(p)
dim c as NSColorMBS = NSColorMBS.colorWithPatternImage(n)
dim x as NSImageMBS = c.patternImage

Backdrop=x.CopyPictureWithMask
```

Notes:

The image is tiled starting at the bottom of the window. The image is not scaled.

Parameter is a NSImageMBS object. We declare it as a variant to reduce plugin dependencies.

33.4.37 colorWithRGB(red as double, green as double, blue as double, alpha as double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create component-based colors that are compatible with sRGB colorspace.
Notes: These methods are effectively same as colorWithSRGBHSV:, but provided for easier reuse of code that uses UIColor on iOS. If red, green, blue, or saturation, brightness, or white values are outside of the 0..1 range, these will create colors in the extended sRGB (or for colorWithWhite:alpha:, extendedGenericGamma22GrayColorSpace) color spaces. This behavior is compatible with iOS UIColor.

33.4.38 colorWithSRGB(red as Double, green as Double, blue as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a color created from the specified components in the sRGB colorspace.
Notes:

red: The red component of the color object.
green: The green component of the color object.
blue: The blue component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

Available in OS X v10.7 and later.

33.4.39 colorWithSystemEffect(systemEffect as Integer) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a color representing the base color with a system defined effect applied to it.
Notes:

This color is safe to create before draw time, as the resolution of the final color only happens when being set, retrieving its CGColor, resolving with colorWithType, etc. The return color type is named.
Available on MacOS 10.14 or newer.

33.4.40 colorWithWhite(white as double, alpha as double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create component-based colors that are compatible with sRGB colorspace.
Notes: These methods are effectively same as colorWithSRGBHSV:, but provided for easier reuse of code that uses UIColor on iOS. If red, green, blue, or saturation, brightness, or white values are outside of the 0..1 range, these will create colors in the extended sRGB (or for colorWithWhite:alpha:, extendedGenericGamma22GrayColorSpace) color spaces. This behavior is compatible with iOS UIColor.

33.4.41 Components as Double()

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the components of the receiver as an array.
Example:

```
dim b as NSColorMBS = NSColorMBS.blueColor
dim c(-1) as Double = b.Components
dim lines(-1) as string

for each d as Double in c
lines.Append str(d)
next

MsgBox Join(lines) // shows 0 0 1 1
```

Notes: You can invoke this method on NSColor objects created from custom color spaces to get the individual floating point components, including alpha. Raises an exception if the receiver doesn't have floating-point components. To find out how many components are in the components array, send the receiver a numberOfComponents message.

33.4.42 Constructor(c as color)

MBS MacBase Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the color with generic colorspace.
Example:

```
dim r as NSColorMBS = NSColorMBS.redColor
dim c as color = & cFF0000
dim n as new NSColorMBS(c)

Break // check debugger
```

See also:

- 33.4.43 Constructor(red as Double, green as Double, blue as Double, alpha as Double = 1.0) 7301

33.4.43 Constructor(red as Double, green as Double, blue as Double, alpha as Double = 1.0)

MBS MacBase Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the color with generic colorspace.
Notes: Pass values in range from 0.0 to 1.0.
See also:

- 33.4.42 Constructor(c as color) 7301

33.4.44 controlAccentColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A dynamic color that reflects the user's current preferred accent color.
Notes:

This color automatically updates when the accent color preference changes. Do not make assumptions about the color space of this color, which may change across releases.
Available on MacOS 10.14 or newer.

33.4.45 controlAlternatingRowBackgroundColors as NSColorMBS()

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The background colors for alternating content items: such as table view rows, collection view items.

Notes: Available on MacOS 10.3 or newer.

33.4.46 controlBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the background of large controls.
Example:

```
dim c as NSColorMBS = NSColorMBS.controlBackgroundColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for the background of large controls such as browsers, table views, and clip views.

33.4.47 controlColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the flat surfaces of a control.
Example:

```
dim c as NSColorMBS = NSColorMBS.controlColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes:

The system color used for the flat surfaces of a control. By default, the control color is a pattern color that will draw the ruled lines for the window background, which is the same as returned by windowBackgroundColor.

If you use controlColor assuming that it is a solid, you may have an incorrect appearance. You should use lightGrayColor in its place.

33.4.48 controlDarkShadowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the dark edge of the shadow dropped from controls.
Example:

```
dim c as NSColorMBS = NSColorMBS.controlDarkShadowColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: Of the two dark borders that run along the bottom and right of controls, representing shadows, the color of the outer, darker border.

33.4.49 controlHighlightColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the highlighted bezels of controls.
Example:

```
dim c as NSColorMBS = NSColorMBS.controlHighlightColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: Of the two light borders that run along the top and left of controls, representing reflections from a light source in the upper left, the color of the inner, duller border.

33.4.50 controlLightHighlightColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for light highlights in controls.
Example:

```
dim c as NSColorMBS = NSColorMBS.controlLightHighlightColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: Of the two light borders that run along the top and left of controls, representing reflections from a light source in the upper left, the color of the outer, brighter border.

33.4.51 controlShadowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the shadows dropped from controls.
Example:

```
dim c as NSColorMBS = NSColorMBS.controlShadowColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: Of the two dark borders that run along the bottom and right of controls, representing shadows, the color of the inner, lighter border.

33.4.52 controlTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for text on controls that aren't disabled.
Example:

```
dim c as NSColorMBS = NSColorMBS.controlTextColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.53 currentControlTint as Integer

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns current system control tint.

33.4.54 cyanColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 0.0, 1.0, 1.0 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.cyanColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.55 darkGrayColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose grayscale value is 1/3 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.darkGrayColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.56 disabledControlTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for text on disabled controls.
Example:

```
dim c as NSColorMBS = NSColorMBS.disabledControlTextColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.57 findHighlightColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Background color of find indicators: the bubbles that show inline search result hits.

Notes: Requires MacOS 10.13 or newer.

33.4.58 getCMYK(byref cyan as Double, byref magenta as Double, byref yellow as Double, byref black as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's CMYK and opacity values.
Example:

```
dim co as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(1.0, 0.5, 1.0, 0.8)
dim c,m,y,k as Double

co.getCMYK(c,m,y,k)

MsgBox str(c)+" "+str(m)+" "+str(y)+" "+str(k)
```

Notes:

cyan: Upon return, contains the cyan component of the color object.
magenta: Upon return, contains the magenta component of the color object.
yellow: Upon return, contains the yellow component of the color object.
black: Upon return, contains the black component of the color object.
alpha: Upon return, contains opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSDeviceCMYKColorSpace. Sending it to other objects raises an exception.
See also:

- 33.4.59 getCMYK(byref cyan as Double, byref magenta as Double, byref yellow as Double, byref black as Double, byref alpha as Double) 7306

33.4.59 getCMYK(byref cyan as Double, byref magenta as Double, byref yellow as Double, byref black as Double, byref alpha as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's CMYK and opacity values.
Example:

```
dim co as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(1.0, 0.5, 1.0, 0.8, 0.4)
dim c,m,y,k,a as Double

co.getCMYK(c,m,y,k,a)
```

MsgBox str(c)+" "+str(m)+" "+str(y)+" "+str(k)+" "+str(a)

Notes:

cyan: Upon return, contains the cyan component of the color object.
magenta: Upon return, contains the magenta component of the color object.
yellow: Upon return, contains the yellow component of the color object.
black: Upon return, contains the black component of the color object.
alpha: Upon return, contains opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSDeviceCMYKColorSpace. Sending it to other objects raises an exception.
See also:

- 33.4.58 getCMYK(byref cyan as Double, byref magenta as Double, byref yellow as Double, byref black as Double) 7306

33.4.60 getHSV(byref hue as Double, byref saturation as Double, byref brightness as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's HSB component and opacity values in the respective arguments.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithCalibratedHSV(1.0, 0.5, 1.0, 0.4)
dim h,s,v,a as Double

c.getHSV(h,s,v,a)

MsgBox str(h)+" "+str(s)+" "+str(v)+" "+str(a)
```

Notes:

hue: Upon return, contains the hue component of the color object.
saturation: Upon return, contains the saturation component of the color object.
brightness: Upon return, contains the brightness component of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedRGBColorSpace or NSDeviceRGBColorSpace color space. Sending it to other objects raises an exception.
See also:

- 33.4.61 getHSV(byref hue as Double, byref saturation as Double, byref brightness as Double, byref alpha as Double) 7308

33.4.61 getHSV(byref hue as Double, byref saturation as Double, byref brightness as Double, byref alpha as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's HSB component and opacity values in the respective arguments.
Notes:

hue: Upon return, contains the hue component of the color object.
saturation: Upon return, contains the saturation component of the color object.
brightness: Upon return, contains the brightness component of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedRGBColorSpace or NSDeviceRGBColorSpace color space. Sending it to other objects raises an exception.
See also:

- 33.4.60 getHSV(byref hue as Double, byref saturation as Double, byref brightness as Double) 7307

33.4.62 getRGB(byref red as Double, byref green as Double, byref blue as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's RGB component and opacity values in the respective arguments.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
dim r,g,b as Double

c.getRGB(r,g,b)

MsgBox str(r)+" "+str(g)+" "+str(b) // shows "0 0 1"
```

Notes:

red: Upon return, contains the red component of the color object.
green: Upon return, contains the green component of the color object.
blue: Upon return, contains the blue component of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedRGBColorSpace or NSDeviceRGBColorSpace color space. Sending it to other objects raises an exception.

Plugin converts color to calibrated RGB if needed.
See also:

- 33.4.63 getRGB(byref red as Double, byref green as Double, byref blue as Double, byref alpha as Double) 7309

33.4.63 getRGB(byref red as Double, byref green as Double, byref blue as Double, byref alpha as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's RGB component and opacity values in the respective arguments.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
dim r,g,b,a as Double

c.getRGB(r,g,b,a)

MsgBox str(r)+" "+str(g)+" "+str(b)+" "+str(a) // shows "0 0 1 1"
```

Notes:

red: Upon return, contains the red component of the color object.
green: Upon return, contains the green component of the color object.
blue: Upon return, contains the blue component of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedRGBColorSpace or NSDeviceRGBColorSpace color space. Sending it to other objects raises an exception.

Plugin converts color to calibrated RGB if needed.
See also:

- 33.4.62 getRGB(byref red as Double, byref green as Double, byref blue as Double) 7308

33.4.64 getWhite(byref white as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's grayscale value and alpha values.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceWhite(1.0, 1.0)
dim w as Double

c.getWhite(w)

MsgBox str(w)
```

Notes:

white: Upon return, contains the grayscale value of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedWhiteColorSpace, NSCalibratedBlackColorSpace, NSDeviceBlackColorSpace, or NSDeviceWhiteColorSpace color space. Sending it to other objects raises an exception.
See also:

- 33.4.65 getWhite(byref white as Double, byref alpha as Double) 7310

33.4.65 getWhite(byref white as Double, byref alpha as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's grayscale value and alpha values.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceWhite(1.0, 1.0)
dim w,a as Double

c.getWhite(w,a)

MsgBox str(w)+" "+str(a)
```

Notes:

white: Upon return, contains the grayscale value of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedWhiteColorSpace, NSCalibratedBlackColorSpace, NSDeviceBlackColorSpace, or NSDeviceWhiteColorSpace color space. Sending it to other objects raises an exception.
See also:

- 33.4.64 getWhite(byref white as Double) 7309

33.4.66 grayColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose grayscale value is 0.5 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.grayColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.67 greenColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 0.0, 1.0, 0.0 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.greenColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.68 gridColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the optional gridlines in, for example, a table view.
Example:

```
dim c as NSColorMBS = NSColorMBS.gridColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.69 headerColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used as the background color for header cells in table views and outline views.
Example:

```
dim c as NSColorMBS = NSColorMBS.headerColor

window1.Title=c.description
window1.HasBackColor=true
```

```
window1.backcolor=c.colorValue
```

Notes: The system color used as the background for header cells in table and outline views.

33.4.70 headerTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for text in header cells in table views and outline views.
Example:

```
dim c as NSColorMBS = NSColorMBS.headerTextColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.71 highlightColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color that represents the virtual light source on the screen.
Example:

```
dim c as NSColorMBS = NSColorMBS.highlightColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.72 highlightWithLevel(level as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object that represents a blend between the receiver and the highlight color returned by highlightColor.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
dim h as NSColorMBS = c.highlightWithLevel(0.5)
MsgBox h.description
```

Notes:

level: The amount of the highlight color that is blended with the receiver's color. This should be a number from 0.0 through 1.0. A highlightLevel below 0.0 is interpreted as 0.0; a highlightLevel above 1.0 is interpreted as 1.0.

Returns the new NSColor object. Returns nil if the colors can't be converted.

Invoke this method when you want to brighten the receiving NSColor for use in highlights.

33.4.73 keyboardFocusIndicatorColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color that represents the keyboard focus ring around controls.
Example:

```
dim c as NSColorMBS = NSColorMBS.keyboardFocusIndicatorColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.74 knobColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the flat surface of a slider knob that hasn't been selected.
Example:

```
dim c as NSColorMBS = NSColorMBS.knobColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The knob's beveled edges, which set it in relief, are drawn in highlighted and shadowed versions of the face color. When a knob is selected, its color changes to selectedKnobColor.

33.4.75 labelColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Foreground color for static text and related elements.
Notes: Requires MacOS 10.10 or newer.

33.4.76 lightGrayColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose grayscale value is 2/3 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.lightGrayColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.77 linkColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Foreground color for standard system links
Notes: Requires MacOS 10.10 or newer.

33.4.78 magentaColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 1.0, 0.0, 1.0 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.magentaColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.79 orangeColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 1.0, 0.5, 0.0 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.orangeColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.80 patternImage as Variant

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the image that the receiver is using as a pattern.
Example:

```
dim p as Picture = LogoMBS(100)
dim n as new NSImageMBS(p)
dim c as NSColorMBS = NSColorMBS.colorWithPatternImage(n)
dim x as NSImageMBS = c.patternImage

Backdrop=x.CopyPictureWithMask
```

Notes:

The image used by the color object. If the receiver doesn't have an image, this method raises an exception.

Declared a variant instead of NSImageMBS to reduce plugin dependencies.

33.4.81 placeholderTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Foreground color for placeholder text in controls or text views.
Notes: Requires MacOS 10.10 or newer.

33.4.82 purpleColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 0.5, 0.0, 0.5 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.purpleColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.83 quaternaryLabelColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Foreground color for large secondary or disabled static text, separators, large glyphs/icons, etc.
Notes: Requires MacOS 10.10 or newer.

33.4.84 redColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 1.0, 0.0, 0.0 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.redColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.85 scrollBarColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for scroll "bars"—that is, for the groove in which a scroller's knob moves.
Example:

```
dim c as NSColorMBS = NSColorMBS.scrollBarColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for scroll bars.

33.4.86 scrubberTexturedBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The scrubber texture background color.

33.4.87 secondaryLabelColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Foreground color for secondary static text and related elements.
Notes: Requires MacOS 10.10 or newer.

33.4.88 secondarySelectedControlColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used in non-key views.
Example:

```
dim c as NSColorMBS = NSColorMBS.secondarySelectedControlColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.89 selectedContentBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The background color of selected and emphasized (focused) content: table views rows, collection views, etc.
Notes:

Alias for alternateSelectedControlColor
Requires MacOS 10.14 or newer.

33.4.90 selectedControlColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the face of a selected control.
Example:

```
dim c as NSColorMBS = NSColorMBS.selectedControlColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for the face of a selected control—a control being dragged or clicked.

33.4.91 selectedControlTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for text in a selected control—a control being clicked or dragged.
Example:

```
dim c as NSColorMBS = NSColorMBS.selectedControlTextColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.92 selectedKnobColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the slider knob when it is selected.
Example:

```
dim c as NSColorMBS = NSColorMBS.selectedKnobColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for a slider knob that is selected—that is, dragged.

33.4.93 selectedMenuItemColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the face of selected menu items.
Example:

```
dim c as NSColorMBS = NSColorMBS.selectedMenuItemColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for selected menu items.

33.4.94 selectedMenuItemTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the text in menu items.
Example:

```
dim c as NSColorMBS = NSColorMBS.selectedMenuItemTextColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for text in selected menu items.

33.4.95 selectedTextBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the background of selected text.
Example:

```
dim c as NSColorMBS = NSColorMBS.selectedTextBackgroundColor

Title=c.description
```

window1.HasBackColor=true
window1.backcolor=c.colorValue

33.4.96 selectedTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for selected text.
Example:

```
dim c as NSColorMBS = NSColorMBS.selectedTextColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.97 separatorColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Foreground used for separators between sections of content.
Notes:

Not appropriate for use as split view or window chrome dividers.
Requires MacOS 10.14 or newer.

33.4.98 shadowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color that represents the virtual shadows cast by raised objects on the screen.
Example:

```
dim c as NSColorMBS = NSColorMBS.shadowColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.99 shadowWithLevel(level as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object that represents a blend between the receiver and the shadow color returned by shadowColor.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
dim h as NSColorMBS = c.shadowWithLevel(0.5)
MsgBox h.description
```

Notes:

level: The amount of the shadow color used for the blend. This should be a number from 0.0 through 1.0. A shadowLevel below 0.0 is interpreted as 0.0; a shadowLevel above 1.0 is interpreted as 1.0.

Returns the new NSColor object. Returns nil if the colors can't be converted.

Invoke this method when you want to darken the receiving NSColor for use in shadows.

33.4.100 systemBlueColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The system blue color.
Notes: Requires MacOS 10.10 or newer.

33.4.101 systemBrownColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The system brown color.
Notes: Requires MacOS 10.10 or newer.

33.4.102 systemGrayColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The system gray color.
Notes: Requires MacOS 10.10 or newer.

33.4.103 systemGreenColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The system green color.
Notes: Requires MacOS 10.10 or newer.

33.4.104 systemIndigoColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The system indigo color.
Notes: Available in MacOS 10.15 or later.

33.4.105 systemOrangeColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The system orange color.
Notes: Requires MacOS 10.10 or newer.

33.4.106 systemPinkColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The system pink color.
Notes: Requires MacOS 10.10 or newer.

33.4.107 systemPurpleColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The system purple color.
Notes: Requires MacOS 10.10 or newer.

33.4.108 systemRedColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The system red color.
Notes: Requires MacOS 10.10 or newer.

33.4.109 systemTealColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The system teal color.
Notes: Available in MacOS 10.12 or later.

33.4.110 systemYellowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The system yellow color.
Notes: Requires MacOS 10.10 or newer.

33.4.111 tertiaryLabelColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Foreground color for disabled static text and related elements.
Notes: Requires MacOS 10.10 or newer.

33.4.112 textBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the text background.
Example:

```
dim c as NSColorMBS = NSColorMBS.textBackgroundColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for the background of text. When text is selected, its background color changes to the return value of selectedTextBackgroundColor.

33.4.113 textColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for text.
Example:

```
dim c as NSColorMBS = NSColorMBS.textColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for text. When text is selected, its color changes to the return value of selectedTextColor.

33.4.114 underPageBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Background areas revealed behind documents. This should not be used for drawing, and NSVisualEffectMaterialUnderPageBackground should be used instead.
Notes: Requires MacOS 10.8 or newer.

33.4.115 unemphasizedSelectedContentBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The background color of selected and unemphasized content: table views rows, collection views, etc.
Notes:

Requires MacOS 10.14 or newer.
Alias for secondarySelectedControlColor

33.4.116 unemphasizedSelectedTextBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The background for unemphasized text selection (e.g. when the associated control/view/window is not key)
Notes: Requires MacOS 10.14 or newer.

33.4.117 unemphasizedSelectedTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The foreground for unemphasized text selection (e.g. when the associated control/view/window is not key)
Notes: Requires MacOS 10.14 or newer.

33.4.118 whiteColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose grayscale and alpha values are both 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.whiteColor

Title=c.description
```

```
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.119 windowBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a pattern color that will draw the ruled lines for the window background.
Example:

```
dim c as NSColorMBS = NSColorMBS.windowBackgroundColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.120 windowFrameColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for window frames, except for their text.
Example:

```
dim c as NSColorMBS = NSColorMBS.windowFrameColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

33.4.121 windowFrameTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the text in window frames.
Example:

```
dim c as NSColorMBS = NSColorMBS.windowFrameTextColor

// convert to Calibrated RGB ColorSpace
c=c.colorUsingColorSpaceName("NSCalibratedRGBColorSpace")
```

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue

33.4.122 writeToPasteboard

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the receiver's data to the specified pasteboard.

33.4.123 yellowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 1.0, 1.0, 0.0 and whose alpha value is 1.0.
Example:

dim c as NSColorMBS = NSColorMBS.yellowColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue

33.4.124 Properties

33.4.125 alphaComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The alpha value of the color.
Example:

dim c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.alphaComponent)

Notes:

Value is from 0.0 to 1.0.
(Read only property)

33.4.126 blackComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a CMYK color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.1, 0.2, 0.3, 0.4)
MsgBox str(c.blackComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

33.4.127 blueComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a RGB color.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.blueComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

33.4.128 brightnessComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a HSV color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceHSV(0.1, 0.2, 0.3)
MsgBox str(c.brightnessComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

33.4.129 catalogNameComponent as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name of the catalog containing the receiver's name.
Notes:

This method raises an exception if the receiver's color space isn't NSNamedColorSpace.
(Read only property)

33.4.130 colorNameComponent as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's name.
Notes:

This method raises an exception if the receiver's color space isn't NSNamedColorSpace.
(Read only property)

33.4.131 colorSpaceName as string

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the color space of the color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceHSV(0.1, 0.2, 0.3)

MsgBox c.colorSpaceName
```

Notes: (Read only property)

33.4.132 colorValue as color

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the color value of this color (ignoring color space).
Notes:

The alphaComponent is ignored.
Returns RGB(RedComponent*255, GreenComponent*255, BlueComponent*255).

Plugin converts color to calibrated RGB if needed.
(Read only property)

33.4.133 cyanComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a CMYK color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.1, 0.2, 0.3, 0.4)
MsgBox str(c.cyanComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

33.4.134 description as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The description of the color object.
Example:

```
dim n as NSColorMBS = NSColorMBS.blueColor

MsgBox n.description // shows "NSCalibratedRGBColorSpace 0 0 1 1"
```

Notes: (Read only property)

33.4.135 greenComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a RGB color.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.greenComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

33.4.136 Handle as Integer

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes:

Useful for declares. Value is a NSColor pointer.
(Read and Write property)

33.4.137 hueComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a HSV color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceHSV(0.1, 0.2, 0.3)
MsgBox str(c.hueComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

33.4.138 localizedCatalogNameComponent as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name of the catalog containing the receiver's name as a localized string.
Notes:

This string may be displayed in user interface items like color pickers.
(Read only property)

33.4.139 localizedColorNameComponent as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name of the receiver as a localized string.
Notes:

The name of color object as a localized string. This string may be displayed in user interface items like color pickers.
(Read only property)

33.4.140 magentaComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a CMYK color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.1, 0.2, 0.3, 0.4)
MsgBox str(c.magentaComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

33.4.141 numberOfComponents as Integer

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of components in the receiver.
Example:

```
dim n as NSColorMBS = NSColorMBS.blueColor

MsgBox str(n.numberOfComponents) // shows 4
```

Notes:

The number of components in the color object. The floating-point components counted include alpha. This method raises an exception if the receiver doesn't have floating-point components.

Available in Mac OS X v10.4 and later.
(Read only property)

33.4.142 redComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a RGB color.

Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.redComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

33.4.143 saturationComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a HSV color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceHSV(0.1, 0.2, 0.3)
MsgBox str(c.saturationComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

33.4.144 Type as Integer

MBS MacBase Plugin, Plugin Version: 18.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return the type of the color, which in turn determines which accessors are valid for this color.
Notes:

It's an exception-raising error to use properties that are not valid for a color; so, before using a given accessor on a color, call colorUsingType to convert the color to the appropriate type. Or, if wanting to use colorSpace-specific accessors such as redComponent, convert to the desired colorSpace with colorUsingColorSpace.

Note that as of macOS 10.13, the new APIs type and colorUsingType replace colorSpaceName and colorUsingColorSpaceName as the funnel APIs for determining the type of color. In code destined to run on 10.13 and newer systems, subclassers are encouraged to implement these two rather than the older colorSpaceName based methods.

Requires MacOS 10.13 or newer.
(Read only property)

33.4.145 whiteComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a Gray color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceWhite(0.1)
MsgBox str(c.whiteComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

33.4.146 yellowComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a CMYK color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.1, 0.2, 0.3, 0.4)
MsgBox str(c.yellowComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

33.4.147 Constants

33.4.148 SystemEffectDeepPressed = 2

MBS MacBase Plugin, Plugin Version: 18.4. **Function:** One of the system effect constants.
Notes: Deep Pressed

33.4.149 SystemEffectDisabled = 3

MBS MacBase Plugin, Plugin Version: 18.4. **Function:** One of the system effect constants.
Notes: Disabled

33.4.150 SystemEffectNone = 0

MBS MacBase Plugin, Plugin Version: 18.4. **Function:** One of the system effect constants.
Notes: No

33.4.151 SystemEffectPressed = 1

MBS MacBase Plugin, Plugin Version: 18.4. **Function:** One of the system effect constants.
Notes: Pressed

33.4.152 SystemEffectRollover = 4

MBS MacBase Plugin, Plugin Version: 18.4. **Function:** One of the system effect constants.
Notes: Rollover

33.4.153 TypeCatalog = 2

MBS MacBase Plugin, Plugin Version: 18.4. **Function:** One of the color type constants.
Notes: nColor with a catalog name and a color name. These colors can be dynamic and have multiple underlying color values.one

33.4.154 TypeComponentBased = 0

MBS MacBase Plugin, Plugin Version: 18.4. **Function:** One of the color type constants.
Notes: Colors which have a color space (specified as NSColorSpace) and appropriate number of CGFloat components.

33.4.155 TypePattern = 1

MBS MacBase Plugin, Plugin Version: 18.4. **Function:** One of the color type constants.
Notes: Colors that draw a pattern, specified as an NSImage.

33.5 class NSColorPanelMBS

33.5.1 class NSColorPanelMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to control a Color Panel (floating window).
Notes:

If you use SelectColor in your application, this color panel will be converted in a dialog which makes this class useless.

You should only have one instance of this class in your application.

If you compile for Cocoa, a TextField/TextArea automatically registers for color panel. So in order to avoid them updating text color with color panel selection, clear the focus by calling window.clearfocus method.

This class does only work on desktop computers, not in a webbrowser.
Subclass of the NSPanelMBS class.

33.5.2 Blog Entries

33.5.3 Methods

33.5.4 attachColorList(list as NSColorListMBS)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Attaches the given color list to the panel.
Notes: An application should use this method to add an NSColorList saved with a document in its file package or in a directory other than NSColorList's standard search directories.

33.5.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor to create a new color panel.

33.5.6 detachColorList(list as NSColorListMBS)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Detaches the color list from the panel.

33.5.7 GetColor(byref red as single, byref green as single, byref blue as single, byref alpha as single) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The current color in the RGB color model.
Notes:

Values from 0.0 to 1.0.
Returns true if the values are valid.
See also:

- 33.5.22 getColor as NSColorMBS 7341

33.5.8 GetColorFromDrag as color

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns color values from the drag.
Notes:

If you receive a drag flavor which can't be handled, it may be a NSColor.
In this case only this method will be successfull.
See also:

- 33.5.9 GetColorFromDrag(byref red as single, byref green as single, byref blue as single, byref alpha as single) as boolean 7338

33.5.9 GetColorFromDrag(byref red as single, byref green as single, byref blue as single, byref alpha as single) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns color values from the drag.
Notes:

If you receive a drag flavor which can't be handled, it may be a NSColor.
In this case only this method will be successfull.
See also:

• 33.5.8 GetColorFromDrag as color 7338

33.5.10 orderFrontColorPanel

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Brings up the color panel, an instance of NSColorPanel.
Notes: If the NSColorPanel object does not exist yet, this method creates one. This method is typically invoked when the user chooses Colors from a menu.

33.5.11 SetColor(red as single, green as single, blue as single, alpha as single)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the color.
Notes: Values from 0.0 to 1.0.
See also:

• 33.5.12 setColor(value as NSColorMBS) 7339

33.5.12 setColor(value as NSColorMBS)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the color.
See also:

• 33.5.11 SetColor(red as single, green as single, blue as single, alpha as single) 7339

33.5.13 setContinuous(value as boolean)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether you want to receive Changed events while the user chooses the color.
Notes: Set value to true to have the receiver calls the Changed event continuously as the color of the NSColorPanel is set by the user; otherwise false.

33.5.14 setMode(value as Integer)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the mode of the panel the mode is one of the modes allowed by the color mask.
Notes:

Constants:

```
const NSGrayModeColorPanel              = 0
const NSRGBModeColorPanel               = 1
const NSCMYKModeColorPanel              = 2
const NSHSBModeColorPanel               = 3
const NSCustomPaletteModeColorPanel     = 4
const NSColorListModeColorPanel         = 5
const NSWheelModeColorPanel             = 6
const NSCrayonModeColorPanel            = 7
```

33.5.15 SetPickerMode(value as Integer)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies the color panel's initial picker.
Notes:

Constants:

```
NSColorPanelGrayModeMask            = & h00000001
NSColorPanelRGBModeMask             = & h00000002
NSColorPanelCMYKModeMask            = & h00000004
NSColorPanelHSBModeMask             = & h00000008
NSColorPanelCustomPaletteModeMask   = & h00000010
NSColorPanelColorListModeMask       = & h00000020
NSColorPanelWheelModeMask           = & h00000040
NSColorPanelCrayonModeMask          = & h00000080
NSColorPanelAllModesMask            = & h0000ffff
```

33.5.16 setShowsAlpha(value as boolean)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Tells the panel whether or not to show alpha values and an opacity slider.
Notes: Note that calling the NSColor method setIgnoresAlpha with a value of true overrides any value set with this method.

33.5.17 SharedColorPanelExists as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the NSColorPanel has been created already.
Notes: True if the NSColorPanel has been created already; otherwise false.

33.5.18 Properties

33.5.19 accessoryView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The accessory view displayed in the panel.
Notes:

The accessory view can be any custom view you want to display with NSColorPanel, such as a view offering color blends in a drawing program. The accessory view is displayed below the color picker and above the color swatches in the NSColorPanel. The NSColorPanel automatically resizes to accommodate the accessory view.
(Read and Write property)

33.5.20 alpha as Double

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's current alpha value based on its opacity slider.
Notes:

Value is in the range between 0.0 and 1.0.
This is 1.0 (opaque) if the panel has no opacity slider.
(Read only property)

33.5.21 ColorValue as Color

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The current color as a Xojo color in the RGB model.
Notes: (Read and Write property)

33.5.22 getColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The current color.
Notes:

The color returned can be RGB or something else.
(Read and Write property)
See also:

- 33.5.7 GetColor(byref red as single, byref green as single, byref blue as single, byref alpha as single) as boolean 7338

33.5.23 getColorAsRGB as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The current color.
Notes:

Returned NSColorMBS object is in RGB color mode.
(Read only property)

33.5.24 isContinuous as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the class continuously calls the Changed event.
Notes:

Returns true if the receiver continuouslycalls the Changed event as the user manipulates the color picker; otherwise false.
(Read and Write property)

33.5.25 mode as Integer

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the color picker mode.
Notes:

Constants:

```
const NSGrayModeColorPanel              = 0
const NSRGBModeColorPanel               = 1
const NSCMYKModeColorPanel              = 2
const NSHSBModeColorPanel               = 3
const NSCustomPaletteModeColorPanel     = 4
const NSColorListModeColorPanel         = 5
const NSWheelModeColorPanel             = 6
const NSCrayonModeColorPanel            = 7
```

(Read and Write property)

33.5.26 showsAlpha as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether or not the panel shows alpha values and an opacity slider.

Notes:

Note that calling the NSColor method setIgnoresAlpha with a value of true overrides any value set with setShowsAlpha.
(Read and Write property)

33.5.27 Events

33.5.28 Changed

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The color changed.
Notes: May not fire in the RB IDE.

33.5.29 DidMove

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The color panel did move.

33.5.30 GotFocus

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The color panel got focus.

33.5.31 Hidden

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The color panel is hidden.

33.5.32 LostFocus

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The color panel lost focus.

33.5.33 Shown

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The color panel shows.

33.5.34 WillClose

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The color panel will close.

33.5.35 Constants

33.5.36 NSCMYKModeColorPanel = 2

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Cyan-yellow-magenta-black

33.5.37 NSColorListModeColorPanel = 5

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Custom color list

33.5.38 NSColorPanelAllModesMask = & h0000ffff

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the masks to specify the which modes the panel allows.
Notes: All of the above.

33.5.39 NSColorPanelCMYKModeMask = & h00000004

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the masks to specify the which modes the panel allows.
Notes: Cyan-yellow-magenta-black.

33.5.40 NSColorPanelColorListModeMask = & h00000020

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the masks to specify the which modes the panel allows.
Notes: Custom color list.

33.5.41 NSColorPanelCrayonModeMask = & h00000080

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the masks to specify the which modes the panel allows.
Notes: Crayons.

33.5.42 NSColorPanelCustomPaletteModeMask = & h00000010

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the masks to specify the which modes the panel allows.
Notes: Custom palette.

33.5.43 NSColorPanelGrayModeMask = & h00000001

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the masks to specify the which modes the panel allows.
Notes: Grayscale-alpha.

33.5.44 NSColorPanelHSBModeMask = & h00000008

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the masks to specify the which modes the panel allows.
Notes: Hue-saturation-brightness.

33.5.45 NSColorPanelRGBModeMask = & h00000002

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the masks to specify the which modes the panel allows.
Notes: Red-green-blue.

33.5.46 NSColorPanelWheelModeMask = & h00000040

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the masks to specify the which modes the panel allows.
Notes: Color wheel.

33.5.47 NSCrayonModeColorPanel = 7

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Crayons.

33.5.48 NSCustomPaletteModeColorPanel = 4

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Custom palette

33.5.49 NSGrayModeColorPanel = 0

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Grayscale-alpha

33.5.50 NSHSBModeColorPanel = 3

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Hue-saturation-brightness

33.5.51 NSNoModeColorPanel = -1

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes:

Indicates no color panel mode.
Available in OS X version 10.5 and later.

33.5.52 NSRGBModeColorPanel = 1

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Red-green-blue

33.5.53 NSWheelModeColorPanel = 6

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Color wheel

33.5.54 Screenshots

33.5.55 NSColorPanel.jpg

Function: The NSColorPanel running in a Xojo application.

33.6 class NSColorSamplerMBS

33.6.1 class NSColorSamplerMBS

MBS MacBase Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for color sampler.

33.6.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 19.4

33.6.4 Methods

33.6.5 Available as Boolean

MBS MacBase Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether NSColorSampler is available.
Notes: Returns true on MacOS 10.15 or newer.

33.6.6 Constructor

MBS MacBase Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.
Notes: May raise PlatformNotSupportedException if not available.

33.6.7 Show

MBS MacBase Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Shows the color sampler.
Notes:

Begins or attaches to an existing color sampling session which presents UI to the user for selecting a color from their screen. The handler will be called on the main thread when the user completes the session (either

by selection, or cancelation). In the event of user-cancellation, the color passed with be nil.

Calls Completed event later.

33.6.8 Properties

33.6.9 Handle as Integer

MBS MacBase Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

33.6.10 Events

33.6.11 Completed(selectedColor as NSColorMBS)

MBS MacBase Plugin, Plugin Version: 19.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when color sampler finished.
Notes: selectedColor is selected color or nil in case of cancel.

33.7 class NSColorSpaceMBS

33.7.1 class NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSColorSpace class enables the creation of objects representing custom color spaces.
Notes: You can make custom color spaces from ColorSync profiles or from ICC profiles. NSColorSpace also has factory methods that return objects representing the system color spaces.

33.7.2 Blog Entries

33.7.3 Methods

33.7.4 adobeRGB1998ColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing an Adobe RGB (1998) color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.adobeRGB1998ColorSpace
MsgBox n.localizedName
```

Notes:

The NSColorSpace object. This color-additive color space has red, green, blue, and alpha components.

The Adobe RGB (1998) color space was designed to encompass most of the colors achievable on CMYK color printers, but by using RGB primary colors on a device such as the computer display. For more information on this color space, go to this website:

http://www.adobe.com/digitalimag/adobergb.html

33.7.5 availableColorSpacesWithModel(Model as Integer) as NSColorSpaceMBS()

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the list of color spaces available on the system that are displayed in the color panel, in the order they are displayed in the color panel.
Example:

```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSRGBColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next

MsgBox Join(names,EndOfLine)
```

Notes:

This method doesn't return color spaces created on the fly or spaces without user-displayable names. Pass NSUnknownColorSpaceModel as model to get all available color spaces.

Available in Mac OS X v10.6 and later.

33.7.6 CGColorSpaceHandle as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Core Graphics color-space object that represents a color space equivalent to the receiver's.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox hex(n.CGColorSpaceHandle)
```

Notes:

A reference to an Core Graphics color-space object (CGColorSpaceRef) or 0if the type of color space represented by the receiver cannot be represented by a CGColorSpace object.

Available in Mac OS X version 10.5.

33.7.7 colorSpaceForColorSpaceName(name as string) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The colorspace for this color space name.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NS-
DeviceWhiteColorSpace)
MsgBox n.localizedName
```

Notes:

This plugin function uses an undocumented method from Apple's AppKit framework. Seems like they use it only internally.

Works well on Mac OS X 10.6.

33.7.8 ColorSpaceWithCGColorSpace(CGColorSpaceHandle as Integer) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSColorSpace object initialized from a Core Graphics color-space object.
Notes:

The initialized NSColorSpace object or nil if initialization was not successful, which might happen if the color space represented by the CGColorSpace object is not supported by NSColorSpace.

Because NSColorSpace might retain or copy the CGColorSpace object depending on circumstances, you should not assume pointer equality of the provided object with that returned by CGColorSpace. And even if the pointer equality is preserved during runtime, it may not be after the NSColorSpace object is archived and unarchived.

Available in Mac OS X version 10.5 and later.

33.7.9 ColorSpaceWithColorSyncProfile(ColorSyncProfileHandle as Integer) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSColorSpace object given a ColorSync profile.
Notes:

The initialized NSColorSpace object or nil if initialization was not successful.

Available in Mac OS X v10.4 and later.

33.7.10 ColorSpaceWithICCProfileData(File as Folderitem) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSColorSpace object given an ICC profile.
Notes:

file: The path to the ICC profile to use when initializing the NSColorSpace object. For information on ICC profiles, see the latest ICC specification at the International Color Consortium website.

Returns the initialized NSColorSpace object or nil if initialization was not successful.
Available in Mac OS X v10.4 and later.
See also:

- 33.7.11 ColorSpaceWithICCProfileData(ICCProfileData as Memoryblock) as NSColorSpaceMBS 7355

33.7.11 ColorSpaceWithICCProfileData(ICCProfileData as Memoryblock) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSColorSpace object given an ICC profile.
Notes:

ICCProfileData:
The ICC profile to use when initializing the NSColorSpace object. For information on ICC profiles, see the latest ICC specification at the International Color Consortium website.

Returns the initialized NSColorSpace object or nil if initialization was not successful.
Available in Mac OS X v10.4 and later.
See also:

- 33.7.10 ColorSpaceWithICCProfileData(File as Folderitem) as NSColorSpaceMBS 7355

33.7.12 colorSyncProfileHandle as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ColorSync profile from which the receiver was created.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox hex(n.colorSyncProfileHandle)
```

Notes:

The ColorSync profile on which the receiver is based. You need to cast this value to an object of opaque type CMProfileRef. Returns NULL if the receiver was created from a ICC-profile data instead. See ColorSync Manager Reference for further information on CMProfileRef.

Available in Mac OS X v10.4 and later.

33.7.13 Constructor(ICCProfileData as Memoryblock)

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSColorSpace object given an ICC profile.
Notes:

ICCProfileData:
The ICC profile to use when initializing the NSColorSpace object. For information on ICC profiles, see the latest ICC specification at the International Color Consortium website.

The initialized NSColorSpace object or nil if initialization was not successful.

Available in Mac OS X v10.4 and later.

33.7.14 deviceCMYKColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing a calibrated or device-dependent CMYK color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.deviceCMYKColorSpace
MsgBox n.localizedName
```

Notes:

The NSColorSpace object. This color space has cyan, magenta, yellow, black, and alpha components. Typical devices that use the color-subtractive CMYK color space are color printers. This object corresponds to the Cocoa color space name NSDeviceCMYKColorSpace.

Available in Mac OS X v10.4 and later.

33.7.15 deviceGrayColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing a calibrated or device-dependent gray color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.deviceGrayColorSpace
MsgBox n.localizedName
```

Notes:

The NSColorSpace object. The color space also includes an alpha component. Typical devices that use this color space are grayscale printers and displays. This object corresponds to the Cocoa color space name NSDeviceWhiteColorSpace.

Available in Mac OS X v10.4 and later.

33.7.16 deviceRGBColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing a calibrated or device-dependent RGB color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.deviceRGBColorSpace
MsgBox n.localizedName
```

Notes: The NSColorSpace object. This color space has red, green, blue, and alpha components. Typical devices that use the color-additive RGB color space are displays and scanners. This object corresponds to the Cocoa color space name NSDeviceRGBColorSpace.

33.7.17 genericCMYKColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing a device-independent CMYK color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericCMYKColorSpace
MsgBox n.localizedName
```

Notes:

The NSColorSpace object. This color space has cyan, magenta, yellow, black and alpha component.

Available in Mac OS X v10.4 and later.

33.7.18 genericGamma22GrayColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing a gray color space with a gamma value of 2.2.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericGamma22GrayColorSpace
MsgBox n.localizedName
```

Notes: Available in Mac OS X v10.6 and later.

33.7.19 genericGrayColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing a device-independent gray color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericGrayColorSpace
MsgBox n.localizedName
```

Notes:

The NSColorSpace object. The color space also includes an alpha component. This object corresponds to the Cocoa color space name NSCalibratedWhiteColorSpace.

Available in Mac OS X v10.4 and later.

33.7.20 genericRGBColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing a device-independent RGB color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericRGBColorSpace
MsgBox n.localizedName
```

Notes:

The NSColorSpace object. This color-additive color space has red, green, blue, and alpha components. This object corresponds to the Cocoa color space name NSCalibratedRGBColorSpace.

Available in Mac OS X v10.4 and later.

33.7.21 ICCProfileData as Memoryblock

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ICC profile data from which the receiver was created.
Notes:

The ICC profile from which the receiver was created. This method attempts to compute the profile data from a CMProfileRef object and returns nil if it is unable to.

For information on ICC profiles, see the latest ICC specification at the International Color Consortium website.

Available in Mac OS X v10.4 and later.

33.7.22 initWithCGColorSpace(CGColorSpaceHandle as Integer)

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSColorSpace object initialized from a Core Graphics color-space object.
Notes:

The initialized NSColorSpace object or nil if initialization was not successful, which might happen if the color space represented by the CGColorSpace object is not supported by NSColorSpace.

Because NSColorSpace might retain or copy the CGColorSpace object depending on circumstances, you should not assume pointer equality of the provided object with that returned by CGColorSpace. And even if the pointer equality is preserved during runtime, it may not be after the NSColorSpace object is archived and unarchived.

Available in Mac OS X version 10.5 and later.

33.7.23 initWithColorSyncProfile(ColorSyncProfileHandle as Integer)

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSColorSpace object given a ColorSync profile.
Notes:

The initialized NSColorSpace object or nil if initialization was not successful.

Available in Mac OS X v10.4 and later.

33.7.24 sRGBColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing an sRGB color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox n.localizedName
```

Notes:

The NSColorSpace object. This color-additive color space has red, green, blue, and alpha components.

The sRGB color space is a standard color space for use on monitors, printers, and the Internet. For further information on sRGB, see this website:

http://www.color.org/srgb.html

Available in Mac OS X version 10.5.

33.7.25 Properties

33.7.26 colorSpaceModel as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the model on which the color space of the receiver is based.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox str(n.colorSpaceModel)
```

Notes:

Available in Mac OS X v10.4 and later.
(Read only property)

33.7.27 colorSpaceName as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the colorspace.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericRGBColorSpace
MsgBox n.colorSpaceName
```

Notes:

This plugin function uses an undocumented method from Apple's AppKit framework. Seems like they use it only internally.

Works well on Mac OS X 10.6.
Returns an empty string for some color spaces.
(Read only property)

33.7.28 description as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the description of the color space.
Notes: (Read only property)

33.7.29 File as FolderItem

MBS MacBase Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The reference to file if available.
Notes:

Will be nil for profiles created from string/MemoryBlock.
(Read only property)

33.7.30 Handle as Integer

MBS MacBase Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

33.7.31 localizedName as string

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the localized name of the receiver.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox n.localizedName
```

Notes:

The name of the color space as a localized string or nil if no localized name exists.

Available in Mac OS X v10.4 and later.
(Read only property)

33.7.32 numberOfColorComponents as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of components supported by the receiver.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox str(n.numberOfColorComponents) // shows 3
```

Notes:

The number of components (excluding alpha) the receiver supports or zero if the receiver is not based on float components.

Available in Mac OS X v10.4 and later.
(Read only property)

33.7.33 Constants

33.7.34 NSCalibratedBlackColorSpace = "NSCalibratedBlackColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Calibrated color space with black and alpha components (pure black is 1.0)
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NSCalibratedBlackColorSpace)
MsgBox n.localizedName
```

Notes: Deprecated in Mac OS X v10.6.

33.7.35 NSCalibratedRGBColorSpace = "NSCalibratedRGBColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Calibrated color space with red, green, blue, and alpha components.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NSCalibratedRGBColorSpace)
MsgBox n.localizedName
```

Notes: You can also create a color with HSB (hue, saturation, brightness) and alpha components and can extract these components.

33.7.36 NSCalibratedWhiteColorSpace = "NSCalibratedWhiteColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Calibrated color space with white and alpha components (pure white is 1.0)
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NSCalibratedWhiteColorSpace)
MsgBox n.localizedName
```

33.7.37 NSCMYKColorSpaceModel=2

MBS MacBase Plugin, Plugin Version: 8.6. **Function:** The CYMK (cyan, yellow, magenta, black) color-space model.
Example:

```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSCMYKColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next

MsgBox Join(names,EndOfLine)
```

Notes:

Can refer to both device-dependent and generic color space variants.
Available in Mac OS X v10.4 and later.

33.7.38 NSCustomColorSpace = "NSCustomColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Custom NSColorSpace object and floating-point components describing a color in that space.
Notes: A custom color-space object represents a color space that is not necessarily predefined by the Application Kit. See "Working With Color Spaces" for information on creating custom color-space objects.

33.7.39 NSDeviceBlackColorSpace = "NSDeviceBlackColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Device-dependent color space with black and alpha components (pure black is 1.0)
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NS-
DeviceBlackColorSpace)
MsgBox n.localizedName
```

33.7.40 NSDeviceCMYKColorSpace = "NSDeviceCMYKColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Device-dependent color space with cyan, magenta, yellow, black, and alpha components.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NS-
DeviceCMYKColorSpace)
MsgBox n.localizedName
```

33.7.41 NSDeviceNColorSpaceModel=4

MBS MacBase Plugin, Plugin Version: 8.6. **Function:** DeviceN is a color-space model from Adobe Systems, Inc. used in PostScript and PDF color specification.
Example:

```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSDeviceNColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next

MsgBox Join(names,EndOfLine)
```

Notes: Available in Mac OS X v10.4 and later.

33.7.42 NSDeviceRGBColorSpace = "NSDeviceRGBColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Device-dependent color space with red, green, blue, and alpha components.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NS-
DeviceRGBColorSpace)
MsgBox n.localizedName
```

Notes: You can also create a color with HSB (hue, saturation, brightness) and alpha components and can extract these components.

33.7.43 NSDeviceWhiteColorSpace = "NSDeviceWhiteColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Device-dependent color space with white and alpha components (pure white is 1.0)
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NS-
DeviceWhiteColorSpace)
MsgBox n.localizedName
```

33.7.44 NSGrayColorSpaceModel=0

MBS MacBase Plugin, Plugin Version: 8.6. **Function:** The grayscale color-space model. Can refer to both device-dependent and generic color space variants.
Example:

```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSGrayColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next

MsgBox Join(names,EndOfLine)
```

Notes: Available in Mac OS X v10.4 and later.

33.7.45 NSIndexedColorSpaceModel=5

MBS MacBase Plugin, Plugin Version: 8.6. **Function:** An indexed color space, which identifies specified discrete colors in a color list by index number.
Example:

```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSIndexedColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next

MsgBox Join(names,EndOfLine)
```

Notes:

An indexed color value (a color specification in indexed color space) consists of an index value that refers to a color in a color list.

Available in Mac OS X version 10.5 and later.

33.7.46 NSLABColorSpaceModel=3

MBS MacBase Plugin, Plugin Version: 8.6. **Function:** The L*a*b* device-independent color-space model, which represents colors relative to a reference white point.
Example:

```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSLABColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next

MsgBox Join(names,EndOfLine)
```

Notes: Available in Mac OS X v10.4 and later.

33.7.47 NSNamedColorSpace = "NSNamedColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Catalog name and color name components.
Notes: The components of this color space are indexes into lists or catalogs of prepared colors. The catalogs of named colors come with lookup tables that are able to generate the correct color on a given device.

33.7.48 NSPatternColorSpace = "NSPatternColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Pattern image (tiled)
Notes: Identifies a pattern color space, which is simply an image that is repeated over and over again in a tiled pattern.

33.7.49 NSPatternColorSpaceModel=6

MBS MacBase Plugin, Plugin Version: 8.6. **Function:** Identifies a pattern color space, which is simply an image that is repeated over and over again in a tiled pattern.
Example:

```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSPatternColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next

MsgBox Join(names,EndOfLine)
```

Notes: Available in Mac OS X version 10.5 and later.

33.7.50 NSRGBColorSpaceModel=1

MBS MacBase Plugin, Plugin Version: 8.6. **Function:** The RGB (red green blue) color-space model.
Example:

```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSRGBColorSpaceModel
```

```
a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next

MsgBox Join(names,EndOfLine)
```

Notes:

Can refer to both device-dependent and generic color space variants.
Available in Mac OS X v10.4 and later.

33.7.51 NSUnknownColorSpaceModel=-1

MBS MacBase Plugin, Plugin Version: 8.6. **Function:** This model is not known to NSColorSpace.
Notes: Available in Mac OS X v10.4 and later.

33.8 class NSEPSImageRepMBS

33.8.1 class NSEPSImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSEPSImageRep object can render an image from encapsulated PostScript (EPS) code.
Notes: Subclass of the NSImageRepMBS class.

33.8.2 Blog Entries

- MBS Xojo Plugins, version 18.1pr2
- MBS Real Studio Plugins, version 12.0pr5

33.8.3 Methods

33.8.4 boundingBox as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the rectangle that bounds the receiver.
Notes: This rectangle is obtained from the "% % BoundingBox:" comment in the EPS header when the NSEPSImageRep object is initialized.

33.8.5 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an NSEPSImageRep object initialized with the specified EPS data.
Notes:

The size of the receiver is set using the bounding box information specified in the EPS header comments.
On success the handle property is not zero.

33.8.6 EPSRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the EPS representation of the receiver.

33.8.7 imageRepWithData(data as Memoryblock) as NSEPSImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSEPSImageRep object initialized with the specified EPS data.
Notes:

Returns a new, initialized NSEPSImageRep object or nil if the object could not be initialized.
The size of the receiver is set using the bounding box information specified in the EPS header comments.

33.8.8 prepareGState

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Implemented by subclasses to configure the graphics state prior to drawing.
Notes: The draw method of NSEPSImageRep sends this message to itself just before rendering the EPS code. The default implementation of this method does nothing. You can override it in your subclass to prepare the graphics state as needed.

33.8.9 Properties

33.8.10 pdfImage as NSPDFImageRepMBS

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The PDF representation of the image.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("logo_new.eps")

// read in as image
dim image as new nsimageMBS(f)

// get represenations
dim reps() as NSImageRepMBS = image.representations

// get EPS representation
dim rep as NSEPSImageRepMBS = NSEPSImageRepMBS(Reps(0))

// get PDF representation
dim pdf as NSPDFImageRepMBS = rep.pdfImage

Break
```

Notes:

When you load an EPS file, a PDF file is automatically created.
(Read only property)

33.9 class NSGraphicsMBS

33.9.1 class NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Cocoa class for drawing.
Example:

```
// make new image
dim myImage as new NSImageMBS(500,500)
dim myGraphics as new NSGraphicsMBS(myImage)

// make logo image
dim myPicture as Picture = LogoMBS(500)
dim anotherImage as new NSImageMBS(myPicture)

// draw logo image to new image
myGraphics.drawInRect(anotherImage, 0, 0, myImage.width, myImage.height, 0, 0, anotherImage.width,
anotherImage.height, myGraphics.NSCompositeSourceOver, 1.0)
myGraphics = nil // flush drawing

// save to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim b as BinaryStream = BinaryStream.Create(f, True)
if b<>nil then
b.Write myImage.JPEGRepresentation
b.Close
end if
```

Notes:

The plugin often provides in events such objects for drawing. In that case please only use the object in the event and don't store it for later use. It is only valid with in a draw event.

Internally this is a NSGraphicsContext object.

If you create objects on your own, make sure you only use the methods while the object is valid.

33.9.4 Methods

33.9.5 addClip(path as NSBezierPathMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Intersects the area enclosed by the receiver's path with the clipping path of the current graphics context and makes the resulting shape the current clipping path.
Notes: This method uses the current winding rule to determine the clipping shape of the receiver. This method does not affect the receiver's path.

33.9.6 boundingRectWithSize(text as NSAttributedStringMBS, size as NSSizeMBS, options as Integer = 0) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Calculates and returns bounding rectangle for the receiver drawn using the options specified, within the given rectangle in the current graphics context.
Example:

```
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// query size
dim g as new NSGraphicsMBS(Canvas1.NSViewMBS)
```

```
dim r as NSRectMBS = g.boundingRectWithSize(m, new NSSizeMBS(canvas1.Width, canvas1.Height),
g.NSStringDrawingUsesLineFragmentOrigin)

MsgBox r.String
```

Notes:

size: The size of the rectangle to draw in.
options: The string drawing options.

Returns the bounding rectangle in the current graphics context.
The origin of the rectangle returned from this method is the first glyph origin.
See also:

- 33.9.7 boundingRectWithSize(text as string, size as NSSizeMBS, options as Integer = 0, DicAttributes as dictionary = nil) as NSRectMBS 7375

33.9.7 boundingRectWithSize(text as string, size as NSSizeMBS, options as Integer = 0, DicAttributes as dictionary = nil) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Calculates and returns the bounding rect for the text drawn using the given options and display characteristics, within the specified rectangle in the current graphics context.
Example:

```
Dim NSGraphics as New NSGraphicsMBS()
dim size as NSSizeMBS = new NSSizeMBS(100,100)
dim text as string = "Hello World. How are you? I'm fine. This is just a test string."
dim options as Integer = NSGraphics.NSStringDrawingUsesLineFragmentOrigin
Dim rect as NSRectMBS = NSGraphics.boundingRectWithSize(text, size, options)

MsgBox str(Rect.Width)+" "+str(Rect.Height)
```

Notes:

text: the text to use for calculation.
size: The size of the rectangle to draw in.
options: String drawing options.
attributes: A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an NSAttributedString object, but in the case of Strings, the attributes apply to the entire string, rather than ranges within the string.

Returns the bounding rect for the receiver drawn using the given options and display characteristics. The rect origin returned from this method is the first glyph origin.

Available in Mac OS X v10.4 and later.

See NSStringDrawing* constants. Use NSStringDrawingUsesLineFragmentOrigin to switch to multiline mode.
See also:

- 33.9.6 boundingRectWithSize(text as NSAttributedStringMBS, size as NSSizeMBS, options as Integer = 0) as NSRectMBS 7374

33.9.8 clipRect(r as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Intersects the specified rectangle with the clipping path of the current graphics context and makes the resulting shape the current clipping path
Notes: r: The rectangle to intersect with the current clipping path.

33.9.9 concat(transform as NSAffineTransformMBS)

MBS MacCocoa Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Concats this transform to the current transform of the graphics environment.

33.9.10 ConcatTransform(NSAffineTransform as Variant)

MBS MacCocoa Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends the receiver's matrix to the current transformation matrix stored in the current graphics context, replacing the current transformation matrix with the result.
Notes:

Please use saveGraphicsState so you can restore the state before applying matrix for other drawings.

Concatenation is performed by matrix multiplication.

If this method is invoked from within an NSView drawRect method, then the current transformation matrix is an accumulation of the screen, window, and any superview's transformation matrices. Invoking this method defines a new user coordinate system whose coordinates are mapped into the former coordinate system according to the receiver's transformation matrix. To undo the concatenation, you must invert the receiver's matrix and invoke this method again.

NSAffineTransform must be a NSAffineTransformMBS object.

33.9.11 Constructor

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Initializes the current graphics context of the current thread.
See also:

- 33.9.12 Constructor(targetImage as NSBitmapImageRepMBS) 7377
- 33.9.13 Constructor(targetImage as NSImageMBS) 7378
- 33.9.14 Constructor(targetView as NSViewMBS) 7379
- 33.9.15 Constructor(targetWindow as NSWindowMBS) 7379
- 33.9.16 Constructor(targetWindow as window) 7379

33.9.12 Constructor(targetImage as NSBitmapImageRepMBS)

MBS MacCocoa Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new graphics context for drawing into a bitmap image representation.
Example:

```
dim n as new NSImageMBS(300,300)
dim r as new NSBitmapImageRepMBS(300, 300, 8, 4, true, NSColorSpaceMBS.NSCalibratedRGBColorSpace, 4*300, 32)

dim g as new NSGraphicsMBS(r)
g.SetColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
g = nil // flush
n.addRepresentation r

Backdrop = n.CopyPictureWithMask
```

Notes:

Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the image.
Returns nil on any error.
See also:

- 33.9.11 Constructor 7377
- 33.9.13 Constructor(targetImage as NSImageMBS) 7378

- 33.9.14 Constructor(targetView as NSViewMBS) 7379
- 33.9.15 Constructor(targetWindow as NSWindowMBS) 7379
- 33.9.16 Constructor(targetWindow as window) 7379

33.9.13 Constructor(targetImage as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new graphics context for drawing into an image.
Example:

```
// make new image
dim myImage as new NSImageMBS(500,500)
dim myGraphics as new NSGraphicsMBS(myImage)

// make logo image
dim myPicture as Picture = LogoMBS(500)
dim anotherImage as new NSImageMBS(myPicture)

// draw logo image to new image
myGraphics.drawInRect(anotherImage, 0, 0, myImage.width, myImage.height, 0, 0, anotherImage.width,
anotherImage.height, myGraphics.NSCompositeSourceOver, 1.0)
myGraphics = nil // flush drawing

// save to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim b as BinaryStream = BinaryStream.Create(f, True)
if b<>nil then
b.Write myImage.JPEGRepresentation
b.Close
end if
```

Notes: Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the image.

- 33.9.15 Constructor(targetWindow as NSWindowMBS) 7379
- 33.9.16 Constructor(targetWindow as window) 7379

33.9.14 Constructor(targetView as NSViewMBS)

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new graphics context for drawing into a Cocoa view.
Notes: Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the window.
See also:

- 33.9.11 Constructor 7377

- 33.9.15 Constructor(targetWindow as NSWindowMBS) 7379

33.9.17 drawAtPoint(image as NSImageMBS, x as Double, y as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws all or part of the image at the specified point in the current coordinate system.
Notes:

x/y: The location in the current coordinate system at which to draw the image.
sx/sy/sw/sh: The source rectangle specifying the portion of the image you want to draw. The coordinates of this rectangle are specified in the image's own coordinate system. If you pass in zeros, the entire image is drawn.
operation: The compositing operation to use when drawing the image. See the NSCompositingOperation constants.
fraction: The opacity of the image, specified as a value from 0.0 to 1.0. Specifying a value of 0.0 draws the image as fully transparent while a value of 1.0 draws the image as fully opaque. Values greater than 1.0 are interpreted as 1.0.

The image content is drawn at its current resolution and is not scaled unless the CTM of the current coordinate system itself contains a scaling factor. The image is otherwise positioned and oriented using the current coordinate system.

For Operation you use the Composite constants in this class.
In the Cocoa world the y axis is reversed. y=0 is on the bottom.
See also:

- 33.9.18 drawAtPoint(text as NSAttributedStringMBS, point as NSPointMBS) 7380
- 33.9.19 drawAtPoint(text as string, point as NSPointMBS, DicAttributes as dictionary = nil) 7381

33.9.18 drawAtPoint(text as NSAttributedStringMBS, point as NSPointMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws the receiver with its font and other display attributes at the given point in the currently focused view.
Example:

```
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m
```

```
// draw in Canvas
dim g as new NSGraphicsMBS(Canvas1.NSViewMBS)

g.drawAtPoint m, new NSPointMBS(20,20)
```

Notes:

point: The point in the current view to draw the text.

The width (height for vertical layout) of the rendering area is unlimited, unlike drawInRect, which uses a bounding rectangle. As a result, this method renders the text in a single line.

Don't invoke this method when no NSView is focused.
See also:

- 33.9.17 drawAtPoint(image as NSImageMBS, x as Double, y as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double) 7380
- 33.9.19 drawAtPoint(text as string, point as NSPointMBS, DicAttributes as dictionary = nil) 7381

33.9.19 drawAtPoint(text as string, point as NSPointMBS, DicAttributes as dictionary = nil)

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Draws the text with the font and other display characteristics of the given attributes, at the specified point in the currently focused view.
Notes:

Point: The origin for the bounding box for drawing the string. If the focused view is flipped, the origin is the upper-left corner of the drawing bounding box; otherwise, the origin is the lower-left corner.
attributes: A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an NSAttributedString object, but in the case of strings, the attributes apply to the entire string, rather than ranges within the string.

The width (height for vertical layout) of the rendering area is unlimited, unlike drawInRect, which uses a bounding rectangle. As a result, this method renders the text in a single line.

You should only invoke this method when an NSView object has focus.
See also:

- 33.9.17 drawAtPoint(image as NSImageMBS, x as Double, y as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double) 7380
- 33.9.18 drawAtPoint(text as NSAttributedStringMBS, point as NSPointMBS) 7380

33.9.20 drawInRect(image as NSImageMBS, x as Double, y as Double, w as Double, h as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** draws the image into the given rectangle with the given source rectangle and the given mode.
Example:

```
// make new image
dim myImage as new NSImageMBS(500,500)
dim myGraphics as new NSGraphicsMBS(myImage)

// make logo image
dim myPicture as Picture = LogoMBS(500)
dim anotherImage as new NSImageMBS(myPicture)

// draw logo image to new image
myGraphics.drawInRect(anotherImage, 0, 0, myImage.width, myImage.height, 0, 0, anotherImage.width,
anotherImage.height, myGraphics.NSCompositeSourceOver, 1.0)
myGraphics = nil // flush

// save to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim b as BinaryStream = BinaryStream.Create(f, True)
if b<>nil then
b.Write myImage.JPEGRepresentation
b.Close
end if
```

Notes:

For Operation you use the Composite constants in this class.
In the Cocoa world the y axis is reversed. y=0 is on the bottom.
See also:

- 33.9.21 drawInRect(text as NSAttributedStringMBS, rect as NSRectMBS) 7382
- 33.9.22 drawInRect(text as string, rect as NSRectMBS, DicAttributes as dictionary = nil) 7383

33.9.21 drawInRect(text as NSAttributedStringMBS, rect as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws the attributed string within the given rectangle in the currently view, clipping the text layout to this rectangle.
Example:

```
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m

// draw in Canvas
dim g as new NSGraphicsMBS(Canvas1.NSViewMBS)

g.drawInRect m, new NSRectMBS(20,20, 100, 100)
```

Notes:

rect: The rectangle in which to draw.

Text is drawn within rect according to its line sweep direction; for example, Arabic text will begin at the right edge and potentially be clipped on the left.

The rect parameter determines how many glyphs are typeset within the width of a line, but it's possible for a portion of a glyph to appear outside the area of rect if the image bounding box of the particular glyph exceeds its typographic bounding box.

If the focus view is flipped, the text origin is set at the upper-left corner of the drawing bounding box; otherwise the origin is set at the lower-left corner. For text rendering, whether the view coordinates are flipped or not doesn't affect the flow of line layout, which goes from top to bottom. However, it affects the interpretation of the text origin. So, for example, if the rect argument is { 0.0, 0.0, 100.0, 100.0 } , the text origin is { 0.0, 0.0 } when the view coordinates are flipped and { 0.0, 100.0 } when not.

Don't invoke this method when no NSView is focused.
See also:

- 33.9.20 drawInRect(image as NSImageMBS, x as Double, y as Double, w as Double, h as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double) 7382
- 33.9.22 drawInRect(text as string, rect as NSRectMBS, DicAttributes as dictionary = nil) 7383

33.9.22 drawInRect(text as string, rect as NSRectMBS, DicAttributes as dictionary = nil)

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Draws the text with the font and other display characteristics of the given attributes, within the

specified rectangle in the currently focused NSView.
Notes:

text: The text to draw.
Rect: The rectangle in which to draw the string.
attributes: A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an NSAttributedString object, but in the case of strings, the attributes apply to the entire string, rather than ranges within the string.

The rendering area is bounded by rect, unlike drawAtPoint, which has an unlimited width. As a result, this method renders the text in multiple lines.

You should only invoke this method when an NSView has focus.
See also:

- 33.9.20 drawInRect(image as NSImageMBS, x as Double, y as Double, w as Double, h as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double) 7382
- 33.9.21 drawInRect(text as NSAttributedStringMBS, rect as NSRectMBS) 7382

33.9.23 drawPicture(image as Picture, x as Double, y as Double, w as Double, h as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Draws a picture.
Notes: Same as drawInRect with NSImageMBS, but using picture.

33.9.24 drawRect(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws a rectangle with the current color.
Notes: In the Cocoa world the y axis is reversed. y=0 is on the bottom.

33.9.25 DrawWindowBackground(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws the window's default background pattern into the specified rectangle of the currently focused view.
Notes: Pass the rectangle (in the current coordinate system) in which to draw the window's background

pattern.

33.9.26 drawWithRect(text as NSAttributedStringMBS, rect as NSRectMBS, options as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Draws the receiver with the specified options, within the given rectangle in the current graphics context.
Example:

```
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m

// draw in Canvas
dim g as new NSGraphicsMBS(Canvas1.NSViewMBS)

g.drawWithRect m, new NSRectMBS(20,20, 100, 100), g.NSStringDrawingUsesLineFragmentOrigin
```

Notes:

rect: The rectangle specifies the rendering origin in the current graphics context.
options: The string drawing options. See NSStringDrawingOptions for the available options..

The rect argument's origin field specifies the rendering origin. The point is interpreted as the baseline origin by default. With NSStringDrawingUsesLineFragmentOrigin, it is interpreted as the upper left corner of the line fragment rect. The size field specifies the text container size. The width part of the size field specifies the maximum line fragment width if larger than 0.0. The height defines the maximum size that can be occupied with text if larger than 0.0 and NSStringDrawingUsesLineFragmentOrigin is specified. If NSStringDrawingUsesLineFragmentOrigin is not specified, height is ignored and considered to be single-line rendering (NSLineBreakByWordWrapping and NSLineBreakByCharWrapping are treated as NSLineBreakByClipping).

You should only invoke this method when there is a current graphics context.
Available in OS X v10.4 and later.

33.9.27 eraseRect(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Erases a rectangle with the current color.
Notes: In the Cocoa world the y axis is reversed. y=0 is on the bottom.

33.9.28 fill(path as NSBezierPathMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Paints the region enclosed by the receiver's path.
Example:

```
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)

g.setFillColor NSColorMBS.redColor

dim r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(r)
g.fill(b)

g = nil

window1.Backdrop = n.CopyPicture // black image with red color rect
```

Notes:

This method fills the path using the current fill color and the receiver's current winding rule. If the path contains any open subpaths, this method implicitly closes them before painting the fill region.

The painted region includes the pixels right up to, but not including, the path line itself. For paths with large line widths, this can result in overlap between the fill region and the stroked path (which is itself centered on the path line).

33.9.29 fillRect(r as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fills the specified rectangular path with the current fill color.
Example:

```
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)
```

```
g.setFillColor NSColorMBS.redColor

dim r as new NSRectMBS(10,10,200,200)
g.fillRect(r)

g = nil

window1.Backdrop = n.CopyPicture // black image with red color rectangle
```

Notes:

r: A rectangle in the current coordinate system.

This method fills the specified region immediately. This method uses the compositing operation returned by the compositingOperation method of NSGraphicsContext.
See also:

- 33.9.30 fillRect(x as Double, y as Double, w as Double, h as Double) 7387
- 33.9.31 fillRect(x as Double, y as Double, w as Double, h as Double, operation as Integer) 7387

33.9.30 fillRect(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fills a rectangle with the current color.
Notes: In the Cocoa world the y axis is reversed. y=0 is on the bottom.
See also:

- 33.9.29 fillRect(r as NSRectMBS) 7386
- 33.9.31 fillRect(x as Double, y as Double, w as Double, h as Double, operation as Integer) 7387

33.9.31 fillRect(x as Double, y as Double, w as Double, h as Double, operation as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fills a rectangle using the current fill color and the specified compositing operation.
Notes: See NSComposite* constants.
See also:

- 33.9.29 fillRect(r as NSRectMBS) 7386
- 33.9.30 fillRect(x as Double, y as Double, w as Double, h as Double) 7387

33.9.32 flushGraphics

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Forces any buffered operations or data to be sent to the receiver's destination.
Notes: Graphics contexts use buffers to queue pending operations but for efficiency reasons may not always empty those buffers immediately. This method forces the buffers to be emptied.

33.9.33 graphicsContext as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSGraphicsMBS object with the current graphics context of the current thread.
Example:

```
Sub Paint(g As Graphics)
// Canvas Paint event in a Mac Cocoa application

dim ng as NSGraphicsMBS = NSGraphicsMBS.graphicsContext
ng.drawAtPoint "Hello World", new NSPointMBS(30, 30)

End Sub
```

Notes: Returns nil on any error.

33.9.34 graphicsContextWithCGContext(targetCGContext as Variant, initialFlippedState as boolean = false) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new graphics context pointing to the given CGContextMBS object.
Example:

```
Sub Paint(g As Graphics)
// get current context
dim cg as CGContextMBS = GetCurrentCGContextMBS

// get graphics context
dim ng as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithCGContext(cg)

// and draw inside
ng.drawAtPoint "Hello World", new NSPointMBS(30, 30)
End Sub
```

Notes: Returns nil on any error.

33.9.35 graphicsContextWithCGContextHandle(targetCGContextRef as Integer, initialFlippedState as boolean = false) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new graphics context pointing to the given CGContext reference.
Example:

```
Sub Paint(g As Graphics)
// get current context
dim cg as CGContextMBS = GetCurrentCGContextMBS

// get graphics context
dim ng as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithCGContextHandle(cg.Handle)

// and draw inside
ng.drawAtPoint "Hello World", new NSPointMBS(30, 30)
End Sub
```

Notes: Returns nil on any error.
See also:

- 33.9.36 graphicsContextWithCGContextHandle(targetCGContextRef as Ptr, initialFlippedState as boolean = false) as NSGraphicsMBS 7389

33.9.36 graphicsContextWithCGContextHandle(targetCGContextRef as Ptr, initialFlippedState as boolean = false) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new graphics context pointing to the given CGContext reference.
Example:

```
Sub Paint(g As Graphics)
// get current context
dim cg as CGContextMBS = GetCurrentCGContextMBS

// get graphics context
dim ng as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithCGContextHandle(cg.Handle)

// and draw inside
ng.drawAtPoint "Hello World", new NSPointMBS(30, 30)
End Sub
```

Notes: Returns nil on any error.
See also:

- 33.9.35 graphicsContextWithCGContextHandle(targetCGContextRef as Integer, initialFlippedState as boolean = false) as NSGraphicsMBS 7389

33.9.37 graphicsContextWithNSBitmapImageRep(targetImage as NSBitmapImageRepMBS) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new graphics context for drawing into a bitmap image representation.
Example:

```
dim n as new NSImageMBS(300,300)
dim r as new NSBitmapImageRepMBS(300, 300, 8, 4, true, NSColorSpaceMBS.NSCalibratedRGBColorSpace, 4*300, 32)

dim g as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithNSBitmapImageRep(r)
g.SetColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
g = nil // flush
n.addRepresentation r

Backdrop = n.CopyPictureWithMask
```

Notes:

Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the image.
Returns nil on any error.

33.9.38 graphicsContextWithNSImage(targetImage as NSImageMBS) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new graphics context for drawing into an image.
Example:

```
// make new image
dim myImage as new NSImageMBS(500,500)
dim myGraphics as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithNSImage(myImage)
```

```
// make logo image
dim myPicture as Picture = LogoMBS(500)
dim anotherImage as new NSImageMBS(myPicture)

// draw logo image to new image
myGraphics.drawInRect(anotherImage, 0, 0, myImage.width, myImage.height, 0, 0, anotherImage.width,
anotherImage.height, myGraphics.NSCompositeSourceOver, 1.0)
myGraphics = nil // flush drawing

// save to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim b as BinaryStream = BinaryStream.Create(f, True)
if b<>nil then
b.Write myImage.JPEGRepresentation
b.Close
end if
```

Notes:

Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the image.
Returns nil on any error.

33.9.39 graphicsContextWithNSView(targetView as NSViewMBS) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new graphics context for drawing into a Cocoa view.
Example:

```
// draws in a Cocoa view
dim gg as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithNSView(canvas1.NSViewMBS)
gg.SetColorRGB 1.0,0,0,0.5
gg.fillRect 0, 0, 100, 100
gg = nil // flush
```

Notes:

Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the window.
Returns nil on any error.

33.9.40 graphicsContextWithNSWindow(targetNSWindow as NSWindowMBS) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new graphics context for drawing into a window.
Example:

```
// draw in a Cocoa window
dim g as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithNSWindow(window1.NSWindowMBS)
g.SetColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
g = nil // flush
```

Notes: Returns nil on any error.

33.9.41 graphicsContextWithWindow(targetWindow as window) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new graphics context for drawing into a window.
Example:

```
// draws in a Cocoa window
dim g as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithWindow(window1)
g.SetColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
g = nil // flush
```

Notes: Returns nil on any error.

33.9.42 graphicsPort as Variant

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the low-level, platform-specific graphics context represented by the receiver.
Notes: In Mac OS X, this is the Core Graphics context, a CGContextMBS object.

33.9.43 highlightRect(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Highlights the rectangle.
Notes: In the Cocoa world the y axis is reversed. y=0 is on the bottom.

33.9.44 invalidate

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invalides the graphics object.

33.9.45 isDrawingToScreen as boolean

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the drawing destination is the screen.
Notes:

True if the drawing destination is the screen, otherwise false.

A return value of false may mean that the drawing destination is a printer, but the destination may also be a PDF or EPS file. If this method returns false, you can call attributes to see if additional information is available about the drawing destination.

33.9.46 isFlipped as boolean

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates the receiver's flipped state.
Notes:

True if the receiver is flipped, otherwise false.

The state is determined by sending isFlipped to the receiver's view that has focus. If no view has focus, returns false unless the receiver is instantiated using graphicsContextWithGraphicsPort:flipped: specifying true as the flipped parameter.

Available in Mac OS X v10.4 and later.

33.9.47 restoreGraphicsState

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the receiver's graphics state from the top of the graphics state stack and makes the next graphics state the current graphics state.
Notes:

This method must have been preceded with a saveGraphicsState message to add the graphics state to the stack. Invocations of saveGraphicsState and restoreGraphicsState methods may be nested.

Restoring the graphics state restores such attributes as the current drawing style, transformation matrix, color, and font of the original graphics state.

33.9.48 saveGraphicsState

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Saves the graphics state of the current graphics context.
Notes: This method pushes the context onto the per-thread stack.

33.9.49 ScaleCoordinates(x as Double, y as Double)

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Scales coordinate system so the next drawing commands will use different scaling.
Notes: Use saveGraphicsState and restoreGraphicsState so you can restore the old state.

33.9.50 set(transform as NSAffineTransformMBS)

MBS MacCocoa Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the current transform of the graphics environment.

33.9.51 setClip(path as NSBezierPathMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the clipping path of the current graphics context with the area inside the receiver's path.
Notes:

You should avoid using this method as a way of adjusting the clipping path, as it may expand the clipping path beyond the bounds set by the enclosing view. If you do use this method, be sure to save the graphics

state prior to modifying the clipping path and restore the graphics state when you are done.

This method uses the current winding rule to determine the clipping shape of the receiver. This method does not affect the receiver's path.

33.9.52 setColor(c as NSColorMBS)

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the color of subsequent drawing to the color that the receiver represents.

33.9.53 SetColorBW(white as Double, alpha as Double = 1.0)

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the color to a BW color.
Notes:

Values range is from 0.0 to 1.0.
Alpha 0.0 is invisible and alpha 1.0 is visible.

33.9.54 SetColorCMYK(cyan as Double, magenta as Double, yellow as Double, black as Double, alpha as Double = 1.0)

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the color to a CMYK color.
Notes:

Values range is from 0.0 to 1.0.
Alpha 0.0 is invisible and alpha 1.0 is visible.

33.9.55 SetColorHSV(hue as Double, saturation as Double, brightness as Double, alpha as Double = 1.0)

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the color to an HSV color.
Notes: Values range is from 0.0 to 1.0.

33.9.56 SetColorRGB(red as Double, green as Double, blue as Double, alpha as Double = 1.0)

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the color to a RGB color.
Notes:

Values range is from 0.0 to 1.0.
Alpha 0.0 is invisible and alpha 1.0 is visible.

33.9.57 setCurrentContext

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets this context to be the current.

33.9.58 setFillColor(c as NSColorMBS)

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the fill color of subsequent drawing to the receiver's color.

33.9.59 setStrokeColor(c as NSColorMBS)

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the stroke color of subsequent drawing to the receiver's color.

33.9.60 SetTransform(NSAffineTransform as Variant)

MBS MacCocoa Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the current transformation matrix to the receiver's transformation matrix.
Notes:

Please use saveGraphicsState so you can restore the state before applying matrix for other drawings.

The current transformation is stored in the current graphics context and is applied to subsequent drawing operations. You should use this method sparingly because it removes the existing transformation matrix, which is an accumulation of transformation matrices for the screen, window, and any superviews. Instead use the concat method to add this transformation matrix to the current transformation matrix.

NSAffineTransform must be a NSAffineTransformMBS object.

33.9.61 sizeWithAttributes(text as string, DicAttributes as dictionary = nil) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the bounding box size the text occupies when drawn with the given attributes.
Example:

```
Dim NSGraphics as New NSGraphicsMBS()
Dim NSStringWidth as Double = NSGraphics.sizeWithAttributes("Hello World").Width

MsgBox("StringWidth from NSGraphicsMBS: " + Str(NSStringWidth))

Dim REALGraphics as Graphics = window1.Graphics
Dim REALStringWidth as Double = REALGraphics.StringWidth("Hello World")

MsgBox("StringWidth from REAL Graphics: " + Str(REALStringWidth))
```

Notes:

attributes: A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an NSAttributedString object, but in the case of strings, the attributes apply to the entire string, rather than ranges within the string.

Returns the bounding box size the receiver occupies when drawn with attributes.

33.9.62 stroke(path as NSBezierPathMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Draws a line along the receiver's path using the current stroke color and drawing attributes.
Example:

```
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)

g.setStrokeColor NSColorMBS.redColor

dim r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(r)
b.lineWidth = 5
g.stroke(b)
```

```
g = nil

window1.Backdrop = n.CopyPicture // black image with red color rect
```

Notes: The drawn line is centered on the path with its sides parallel to the path segment. This method uses the current drawing attributes associated with the receiver. If a particular attribute is not set for the receiver, this method uses the corresponding default attribute.

33.9.63 strokeLine(point1 as NSPointMBS, point2 as NSPointMBS)

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Strokes a line between two points using the current stroke color and the default drawing attributes.
Example:

```
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)

g.setStrokeColor NSColorMBS.redColor

dim p1 as new NSPointMBS(10,10)
dim p2 as new NSPointMBS(50,50)
g.strokeLine(p1,p2)

g = nil

window1.Backdrop = n.CopyPicture // black image with red color line
```

Notes:

point1: The starting point of the line.
point2: The ending point of the line.

This method strokes the specified path immediately.
See also:

- 33.9.64 strokeLine(x1 as Double, y1 as Double, x2 as Double, y2 as Double) 7398

33.9.64 strokeLine(x1 as Double, y1 as Double, x2 as Double, y2 as Double)

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Strokes a line.
See also:

• 33.9.63 strokeLine(point1 as NSPointMBS, point2 as NSPointMBS) 7398

33.9.65 strokeRect(r as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Strokes the path of the specified rectangle using the current stroke color and the default drawing attributes.
Example:

```
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)

g.setStrokeColor NSColorMBS.redColor

dim r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
g.strokeRect(r)

g = nil

window1.Backdrop = n.CopyPicture // black image with red color rect
```

Notes:

r: A rectangle in the current coordinate system.

The path is drawn beginning at the rectangle's origin and proceeding in a counterclockwise direction. This method strokes the specified path immediately.

33.9.66 TranslateCoordinates(x as Double, y as Double)

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Moves coordinate system so the next drawing commands will use different starting point.
Notes: Use saveGraphicsState and restoreGraphicsState so you can restore the old state.

33.9.67 Properties

33.9.68 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal handle to the Graphics Context.
Notes:

Reference to NSGraphicsContext object.
(Read and Write property)

33.9.69 Owner as Variant

MBS MacCocoa Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The owner object.
Notes:

When you have a graphics object based on a window, view or image, this property points to the original object to keep it alive while drawing.
(Read and Write property)

33.9.70 Valid as Boolean

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Wheter this graphics object is still valid.
Notes:

Set to true when the plugin creates an object and false when the object is no longer needed.
(Read and Write property)

33.9.71 imageInterpolation as Integer

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The interpolation behavior.
Notes:

Note that this value is not part of the graphics state, so it cannot be reset using restoreGraphicsState.
(Read and Write computed property)

33.9.72 shouldAntialias as boolean

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver should use antialiasing.
Notes:

This value is part of the graphics state and is restored by restoreGraphicsState.
(Read and Write computed property)

33.9.73 Constants

33.9.74 NSCompositeClear=0

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Transparent. (R = 0)

33.9.75 NSCompositeCopy=1

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Source image. (R = S)

33.9.76 NSCompositeDestinationAtop=9

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Destination image wherever both images are opaque, source image wherever source image is opaque but destination image is transparent, and transparent elsewhere. (R = S*(1 - Da) + D*Sa)

33.9.77 NSCompositeDestinationIn=7

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Destination image wherever both images are opaque, and transparent elsewhere. (R = D*Sa)

33.9.78 NSCompositeDestinationOut=8

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Destination image wherever destination image is opaque but source image is transparent, and transparent elsewhere. (R = D*(1 - Sa))

33.9.79 NSCompositeDestinationOver=6

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Destination image wherever destination image is opaque, and source image elsewhere. (R = S*(1 - Da) + D)

33.9.80 NSCompositeHighlight=12

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Source image wherever source image is opaque, and destination image elsewhere. (Deprecated. Mapped to NSCompositeSourceOver.)

33.9.81 NSCompositePlusDarker=11

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Sum of source and destination images, with color values approaching 0 as a limit. (R = MAX(0, (1 - D) + (1 - S)))

33.9.82 NSCompositePlusLighter=13

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Sum of source and destination images, with color values approaching 1 as a limit. (R = MIN(1, S + D))

33.9.83 NSCompositeSourceAtop=5

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Source image wherever both images are opaque, destination image wherever destination image is opaque but source image is transparent, and transparent elsewhere. (R = S*Da + D*(1 - Sa))

33.9.84 NSCompositeSourceIn=3

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Source image wherever both images are opaque, and transparent elsewhere. (R = S*Da)

33.9.85 NSCompositeSourceOut=4

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Source image wherever source image is opaque but destination image is transparent, and transparent elsewhere. (R = S*(1 - Da))

33.9.86 NSCompositeSourceOver=2

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Source image wherever source image is opaque, and destination image elsewhere. (R = S + D*(1 - Sa))

33.9.87 NSCompositeXOR=10

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Exclusive OR of source and destination images. (R = S*(1 - Da) + D*(1 - Sa))
Notes: Works only with black and white images and is not recommended for color contexts.

33.9.88 NSImageInterpolationDefault=0

MBS MacCocoa Plugin, Plugin Version: 10.3. **Function:** One of the interpolation contants.
Notes: Use the context's default interpolation.

33.9.89 NSImageInterpolationHigh=3

MBS MacCocoa Plugin, Plugin Version: 10.3. **Function:** One of the interpolation contants.
Notes: Slower, higher-quality interpolation.

33.9.90 NSImageInterpolationLow=2

MBS MacCocoa Plugin, Plugin Version: 10.3. **Function:** One of the interpolation contants.
Notes: Fast, low-quality interpolation.

33.9.91 NSImageInterpolationMedium=4

MBS MacCocoa Plugin, Plugin Version: 10.3. **Function:** One of the interpolation contants.
Notes:

Medium quality, slower than NSImageInterpolationLow.
Available in Mac OS X v10.6 and later.

33.9.92 NSImageInterpolationNone=1

MBS MacCocoa Plugin, Plugin Version: 10.3. **Function:** One of the interpolation contants.
Notes: No interpolation.

33.9.93 NSStringDrawingDisableScreenFontSubstitution = 4

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the drawing option constants.
Notes: Disable screen font substitution (equivalent to NSLayoutManager.setUsesScreenFonts(false)).

33.9.94 NSStringDrawingOneShot = 16

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the drawing option constants.
Notes: Suppresses caching layout information.

33.9.95 NSStringDrawingTruncatesLastVisibleLine = 32

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the drawing option constants.
Notes:

Truncates and adds the ellipsis character to the last visible line if the text doesn't fit into the bounds specified.
This option is ignored if NSStringDrawingUsesLineFragmentOrigin is not also set. In addition, the line break mode must be either NSLineBreakByWordWrapping or NSLineBreakByCharWrapping for this option to take effect. The line break mode can be specified in a paragraph style passed in the attributes dictionary argument of the drawing methods.
Available in Mac OS X v10.5 and later.

33.9.96 NSStringDrawingUsesDeviceMetrics = 8

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the drawing option constants.
Notes: Uses image glyph bounds instead of typographic bounds.

33.9.97 NSStringDrawingUsesFontLeading = 2

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the drawing option constants.
Notes: Uses the font leading for calculating line heights.

33.9.98 NSStringDrawingUsesLineFragmentOrigin = 1

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the drawing option constants.
Example:

```
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m

// draw in Canvas
dim g as new NSGraphicsMBS(Canvas1.NSViewMBS)

g.drawWithRect m, new NSRectMBS(20,20, 100, 100), g.NSStringDrawingUsesLineFragmentOrigin
```

Notes: The specified origin is the line fragment origin, not the baseline origin.

33.10 class NSImageMBS

33.10.1 class NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSImage object is a high-level class for manipulating image data.
Notes:

You use this class to load existing images or create new ones and composite them into a view or other image. This class works in conjunction with one or more image representation objects (subclasses of NSImageRep), which manage the actual image data.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

33.10.4 Methods

33.10.5 addRepresentation(img as NSImageRepMBS)

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds the specified image representation object to to the receiver.
Notes:

After invoking this method, you may need to explicitly set features of the new image representation, such as the size, number of colors, and so on. This is true particularly when the NSImage object has multiple image representations to choose from. See NSImageRep and its subclasses for the methods you use to complete initialization.

Any representation added by this method is retained by the receiver. Image representations cannot be shared among multiple NSImage objects.

33.10.6 BMPRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image as the binary data in a BMP file.
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p,p.Mask)

f=SpecialFolder.Desktop.Child("test.bmp")
b=f.CreateBinaryFile("")
b.Write img.BMPRepresentation
b.Close

f.Launch
```

Notes: BMP does not support masks.

33.10.7 BMPRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image as the binary data in a BMP file.
Notes:

BMP does not support masks.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

33.10.8 cancelIncrementalLoad

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Cancels the current download operation immediately, if the image is being incrementally loaded.
Notes: This call has no effect if the image is not loading.

33.10.9 canInitWithPasteboard as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Tests whether the receiver can create an instance of itself using pasteboard data.
Notes: This method uses the NSImageRep class method imageUnfilteredPasteboardTypes to find a class that can handle the data in the specified pasteboard. If you create your own NSImageRep subclasses, override the imageUnfilteredPasteboardTypes method to notify NSImage of the pasteboard types your class supports.

33.10.10 Constructor

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default constructor creating a dummy NSImage object.
See also:

- 33.10.11 Constructor(data as Memoryblock) 7409
- 33.10.12 Constructor(file as folderitem) 7409
- 33.10.13 Constructor(image as Picture, mask as picture = nil) 7409
- 33.10.14 Constructor(width as Double, height as Double) 7410

33.10.11 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The data constructor calling initWithData internally.
Notes:

Calls initWithData.
On success the image is valid and the handle is not zero.
See also:

- 33.10.10 Constructor 7408
- 33.10.12 Constructor(file as folderitem) 7409
- 33.10.13 Constructor(image as Picture, mask as picture = nil) 7409
- 33.10.14 Constructor(width as Double, height as Double) 7410

33.10.12 Constructor(file as folderitem)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The file constructor calling initWithContentsOfURL(file) internally.
Notes:

Calls initWithContentsOfURL.
On success the image is valid and the handle is not zero.
See also:

- 33.10.10 Constructor 7408
- 33.10.11 Constructor(data as Memoryblock) 7409
- 33.10.13 Constructor(image as Picture, mask as picture = nil) 7409
- 33.10.14 Constructor(width as Double, height as Double) 7410

33.10.13 Constructor(image as Picture, mask as picture = nil)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSImageMBS object based on the image data in a Xojo picture.
Example:

```
dim img as new NSImageMBS(pict)
```

Notes:

Optional you can pass a picture with the mask. It is valid to use the mask property of the image for the second parameter.

With 11.3 plugins we are deprecating to pass a mask. The plugin prefers to simply take the mask or alpha channel of the picture itself.

On success the image is valid and the handle is not zero.
Calls initWithPicture.
See also:

- 33.10.10 Constructor 7408
- 33.10.11 Constructor(data as Memoryblock) 7409
- 33.10.12 Constructor(file as folderitem) 7409
- 33.10.14 Constructor(width as Double, height as Double) 7410

33.10.14 Constructor(width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The size constructor calling initWithSize internally.
Notes:

Calls initWithSize.
On success the image is valid and the handle is not zero.
See also:

- 33.10.10 Constructor 7408
- 33.10.11 Constructor(data as Memoryblock) 7409
- 33.10.12 Constructor(file as folderitem) 7409
- 33.10.13 Constructor(image as Picture, mask as picture = nil) 7409

33.10.15 CopyMask as picture

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies the content of the NSImage in current size.
Example:

```
dim f as FolderItem
dim n as NSImageMBS

f=SpecialFolder.Desktop.Child("test.png")
n=new NSImageMBS(f)
```

```
Backdrop=n.CopyMask
```

Notes:

Copies only the alpha channel as mask.

A convenience function instead of using CGPictureContextMBS with DrawIntoCGContextAtRect.

Returns nil on any error.

33.10.16 CopyPicture(CGColorSpace as Variant = nil, BackgroundColor as NSColorMBS = nil) as picture

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies the content of the NSImage in current size.
Example:

```
dim f as FolderItem
dim n as NSImageMBS

f=SpecialFolder.Desktop.Child("test.png")
n=new NSImageMBS(f)
Backdrop=n.CopyPicture // background is black
```

Notes:

A convenience function instead of using CGPictureContextMBS with DrawIntoCGContextAtRect.

Returns nil on any error.

With Colorspace parameter you can pass a RGB CGColorspace to define which colorspace is used. Default is DeviceRGB, but you could also pass generic RGB or other.

If BackgroundColor is not nil, the image is filled in background with this color and NSImage rendered on top of it.

33.10.17 CopyPictureRect(x as Integer, y as Integer, w as Integer, h as Integer, CGColorSpace as Variant = nil, BackgroundColor as NSColorMBS = nil) as picture

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies the content of the NSImage from the given rectangle.
Example:

```
dim f as FolderItem
dim n as NSImageMBS

f=SpecialFolder.Desktop.Child("test.png")
n=new NSImageMBS(f)
Backdrop=n.CopyPicture // background is black
```

Notes:

A convenience function instead of using CGPictureContextMBS with DrawIntoCGContextAtRect.

Returns nil on any error.

With Colorspace parameter you can pass a RGB CGColorspace to define which colorspace is used. Default is DeviceRGB, but you could also pass generic RGB or other.

If BackgroundColor is not nil, the image is filled in background with this color and NSImage rendered on top of it.

33.10.18 CopyPictureWithAlpha as picture

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies the content of the NSImage in current size.
Notes:

This is a function for Cocoa target which returns picture with alpha channel.
Returns nil on any error.

33.10.19 CopyPictureWithAlphaRect(x as Integer, y as Integer, w as Integer, h as Integer) as picture

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies the content of the NSImage in given rectangle.

Notes:

This is a function for Cocoa target which returns picture with alpha channel.
Returns nil on any error.

33.10.20 CopyPictureWithMask(CGColorSpace as Variant = nil) as picture

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies the content of the NSImage in current size.
Example:

```
dim f as FolderItem
dim n as NSImageMBS

f=SpecialFolder.Desktop.Child("test.png")
n=new NSImageMBS(f)
Backdrop=n.CopyPictureWithMask
```

Notes:

Copies the picture and its mask.
This function is faster than CopyPicture and CopyMask combined as the picture is only copied one time to an internal buffer.

A convenience function instead of using CGPictureContextMBS with DrawIntoCGContextAtRect.

Returns nil on any error.

With Colorspace parameter you can pass a RGB CGColorspace to define which colorspace is used. Default is DeviceRGB, but you could also pass generic RGB or other.

33.10.21 DrawIntoCGContextAtPoint(cgcontext as Integer, x as Double, y as Double, sx as Double, sy as Double, SourceW as Double, SourceH as Double, operation as Integer, fraction as Double) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws the image.
Notes: Same as DrawIntoCGContextAtRect, but with a point instead of a rectangle.

33.10.22 DrawIntoCGContextAtRect(cgcontext as Integer, x as Double, y as Double, w as Double, h as Double, SourceX as Double, SourceY as Double, SourceW as Double, SourceH as Double, operation as Integer, fraction as Double) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws the image.
Example:

```
Function OpenAsNSimage(extends file as folderitem) As picture
dim width as Integer
dim height as Integer
dim c as NSImageMBS
dim g as CGPictureContextMBS

// load image from file
c=new NSImageMBS

// is that image valid?
if c.initWithContentsOfURL(file) then
Width=c.Width
height=c.Height

// create a drawing buffer to draw inside
g=new CGPictureContextMBS(width,height)

if g.Handle<>0 then // valid?

// now draw the image inside.
// you could scale or even apply transparency...
if c.DrawIntoCGContextAtRect(g.Handle, 0, 0, width, height, 0,0,width,height,2,1.0) then
// make a RB Picture from it
Return g.CopyPicture
end if
end if
end if
End Function
```

Notes:

Draws the image into a CGContext. You need to specify first the destination rectangle followed by the source rectangle.

fraction:
The opacity of the image, specified as a value from 0.0 to 1.0. Specifying a value of 0.0 draws the image as fully transparent while a value of 1.0 draws the image as fully opaque. Values greater than 1.0 are interpreted

as 1.0.

operation codes:

NSCompositeClear	= 0	Transparent.
NSCompositeCopy	= 1	Source image.
NSCompositeSourceOver	= 2	Source image wherever source image is opaque, and destination image elsewhere.
NSCompositeSourceIn	= 3	Source image wherever both images are opaque, and transparent elsewhere.
NSCompositeSourceOut	= 4	Source image wherever source image is opaque but destination image is transparent, and transparent elsewhere.
NSCompositeSourceAtop	= 5	Source image wherever both images are opaque, destination image wherever destination image is opaque but source image is transparent, and transparent elsewhere.
NSCompositeDestinationOver	= 6	Destination image wherever destination image is opaque, and source image elsewhere.
NSCompositeDestinationIn	= 7	Destination image wherever both images are opaque, and transparent elsewhere.
NSCompositeDestinationOut	= 8	Destination image wherever destination image is opaque but source image is transparent, and transparent elsewhere.
NSCompositeDestinationAtop	= 9	Destination image wherever both images are opaque, source image wherever source image is opaque but destination image is transparent, and transparent elsewhere.
NSCompositeXOR	= 10	Exclusive OR of source and destination images.
NSCompositePlusDarker	= 11	Sum of source and destination images, with color values approaching 0 as a limit.
NSCompositeHighlight	= 12	Source image wherever source image is opaque, and destination image elsewhere.
NSCompositePlusLighter	= 13	Sum of source and destination images, with color values approaching 1 as a limit.

Returns true on success and false on failure.

33.10.23 GIFRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image as the binary data in a GIF file.
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
```

```
Backdrop=p
img=new NSImageMBS(p,p.Mask)

f=SpecialFolder.Desktop.Child("test.gif")
b=f.CreateBinaryFile("")
b.Write img.GIFRepresentation
b.Close

f.Launch
```

Notes: GIF does support masks in a limited way.

33.10.24 GIFRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image as the binary data in a GIF file.
Notes:

GIF does support masks in a limited way.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

33.10.25 imageByFadingToFraction(fraction as Double) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an image with a mask faded to the given percentage
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)
```

```
img=img.imageByFadingToFraction(0.1)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile("")
b.Write img.PNGRepresentation
b.Close

f.Launch
```

Notes: Returns nil on failure.

33.10.26 imageByScalingToSize(width as Double, height as Double) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Scales image to the new size.
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

img=img.imageByScalingToSize(200,200)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile("")
b.Write img.PNGRepresentation
b.Close

f.Launch
```

Notes:

Returns nil on failure.
Internally creates a copy of the image.

See also:

- 33.10.27 imageByScalingToSize(width as Double, height as Double, fraction as Double) as NSImageMBS 7418
- 33.10.28 imageByScalingToSize(width as Double, height as Double, fraction as Double, flip as boolean, proportionally as boolean) as NSImageMBS 7419

33.10.27 imageByScalingToSize(width as Double, height as Double, fraction as Double) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Scales image to the new size with given fading.
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

img=img.imageByScalingToSize(200,200,0.5)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile("")
b.Write img.PNGRepresentation
b.Close

f.Launch
```

Notes:

Returns nil on failure.
Internally creates a copy of the image.
See also:

- 33.10.26 imageByScalingToSize(width as Double, height as Double) as NSImageMBS 7417
- 33.10.28 imageByScalingToSize(width as Double, height as Double, fraction as Double, flip as boolean, proportionally as boolean) as NSImageMBS 7419

33.10.28 imageByScalingToSize(width as Double, height as Double, fraction as Double, flip as boolean, proportionally as boolean) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Scales image to the new size with given fading fraction.
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

img=img.imageByScalingToSize(200,200)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile("")
b.Write img.PNGRepresentation
b.Close

f.Launch
```

Notes:

Returns nil on failure.
The image can be flipped vertically with the flip property.
Internally creates a copy of the image.
See also:

- 33.10.26 imageByScalingToSize(width as Double, height as Double) as NSImageMBS 7417
- 33.10.27 imageByScalingToSize(width as Double, height as Double, fraction as Double) as NSImageMBS 7418

33.10.29 imageFileTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of strings identifying the image types supported by the registered NSImageRep objects.
Example:

```
dim types() as string = NSImageMBS.imageFileTypes
MsgBox Join(types, EndOfLine)
```

Notes:

An array of strings, each of which identifies a single supported file type. The array can include encoded HFS file types as well as filename extensions.

This list includes all file types supported by registered subclasses of NSImageRep plus those that can be converted to a supported type by a user-installed filter service. You can pass the array returned by this method directly to NSOpenPanelMBS.

When creating a subclass of NSImageRep, do not override this method. Instead, override the imageUnfilteredFileTypes method to notify NSImage of the file types your class supports directly.

33.10.30 imageNamed(name as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NSImage instance associated with the specified name.
Notes:

This method searches for named images in several places, returning the first image it finds matching the given name. The order of the search is as follows:

1. Search for an object whose name was set explicitly using the setName: method and currently resides in the image cache.
2. Search the application's main bundle for a file whose name matches the pecified string. (For information on how the bundle is searched, see "Searching for Bundle Resources" in Bundle Programming Guide.)
3. Search the Application Kit framework for a shared image with the specified name.

When looking for files in the application bundle, it is better (but not required) to include the filename extension in the name parameter. When naming an image with the setName method, it is also convention not to include filename extensions in the names you specify. That way, you can easily distinguish between images you have named explicitly and those you want to load from the application's bundle.

One particularly useful image you can retrieve is your application's icon. This image is set by Cocoa automatically and referenced by the string "NSApplicationIcon". Icons for other applications can be obtained through the use of methods declared in the NSWorkspace class. You can also retrieve some standard system images using Cocoa defined constants; for more information, see the Constants section of this class.

If an application is linked in Mac OS X v10.5 or later, images requested using this method and whose name

ends in the word "Template" are automatically marked as template images.

The NSImage class keeps a reference to any named images in a table until the image name is cleared. Consequently you do not need to retain the returned image object unless its name could be cleared. You can clear an image object from the table by passing nil to the setName: method of the corresponding NSImage object.

Here is a good list of identifiers you can use:
http://hetima.github.io/fucking_nsimage_syntax/

33.10.31 imagePasteboardTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of strings identifying the pasteboard types supported directly by the registered NSImageRep objects.
Example:

```
dim types() as string = NSImageMBS.imagePasteboardTypes
MsgBox Join(types, EndOfLine)
```

Notes:

Returns an array of strings, each of which identifies a single supported pasteboard type. By default, this list contains the NSPDFPboardType, NSPICTPboardType, NSPostScriptPboardType, and NSTIFFPboardType types.

This list includes all pasteboard types supported by registered subclasses of NSImageRep plus those that can be converted to a supported type by a user-installed filter service.

When creating a subclass of NSImageRep, do not override this method. Instead, override the imageUnfilteredPasteboardTypes method to notify NSImage of the pasteboard types your class supports.

33.10.32 imageTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of UTI strings identifying the image types supported by the registered NSImageRep objects, either directly or through a user-installed filter service.
Example:

```
dim types() as string = NSImageMBS.imageTypes
MsgBox Join(types, EndOfLine)
```

Notes:

Returns an array of strings, each of which contains a UTI identifying a supported image type. Some sample image-related UTI strings include "public.image", "public.jpeg", and "public.tiff". For a list of supported types, see UTCoreTypes.h.

The returned list includes UTIs all file types supported by registered subclasses of NSImageRep plus those that can be converted to a supported type by a user-installed filter service. You can use the returned UTI strings with any method that supports UTIs.

You should not override this method directly. Instead, you should override the imageTypes method of NSImageRep.

Available in Mac OS X v10.5 and later.

33.10.33 imageUnfilteredFileTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of strings identifying the file types supported directly by the registered NSImageRep objects.
Example:

```
dim types() as string = NSImageMBS.imageUnfilteredFileTypes
MsgBox Join(types, EndOfLine)
```

Notes:

An array of strings, each of which identifies a single supported file type. File types are identified by file extension and HFS file types.
The returned list does not contain pasteboard types that are available only through a user-installed filter service.

33.10.34 imageUnfilteredPasteboardTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of strings identifying the pasteboard types supported directly by the registered NSImageRep objects.
Example:

```
dim types() as string = NSImageMBS.imageUnfilteredPasteboardTypes
MsgBox Join(types, EndOfLine)
```

Notes:

An array of strings, each of which identifies a single supported pasteboard type.
The returned list does not contain pasteboard types that are supported only through a user-installed filter service.

33.10.35 imageUnfilteredTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of UTI strings identifying the image types supported directly by the registered NSImageRep objects.
Example:

```
dim types() as string = NSImageMBS.imageUnfilteredTypes
MsgBox Join(types, EndOfLine)
```

Notes:

Returns an array of strings, each of which contains a UTI identifying a supported image type. Some sample image-related UTI strings include "public.image", "public.jpeg", and "public.tiff". For a list of supported types, see UTCoreTypes.h.

The returned list includes UTI strings only for those file types that are supported directly by registered subclasses of NSImageRep. It does not include types that are supported through user-installed filter services. You can use the returned UTI strings with any method that supports UTIs.

You should not override this method directly. Instead, you should override the imageUnfilteredTypes method of NSImageRep.

33.10.36 imageWithCGImage(CGImage as Variant, width as Double = 0, height as Double = 0) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the CGImage.
Example:

```
dim logo as Picture = LogoMBS(500)
dim cgimage as CGImageMBS = CGCreateImageMBS(logo)
```

```
dim nsimage as NSImageMBS = NSImageMBS.imageWithCGImage(cgimage)
dim pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes:

If width is zero, we take the width from the CGImage.
If height is zero, we take the height from the CGImage.

cgImage: The source CGImageMBS object.
width & height: The size of the new image.

Returns an initialized NSImage instance, or nil if the new instance cannot be initialized.

You should not assume anything about the image, other than that drawing it is equivalent to drawing the CGImage.
Available in OS X v10.6 and later.

33.10.37 imageWithContentsOfFile(file as folderitem) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified file.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
dim image as NSImageMBS = NSImageMBS.imageWithContentsOfFile(file)
Backdrop = image.CopyPictureWithMask
```

Notes:

File: The file to open.

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified file.

33.10.38 imageWithContentsOfFileMT(file as folderitem) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified file.

Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
dim image as NSImageMBS = NSImageMBS.imageWithContentsOfFileMT(file)
Backdrop = image.CopyPictureWithMask
```

Notes:

File: The file to open.

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified file.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

33.10.39 imageWithContentsOfPath(path as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified file.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
dim path as string = file.UnixpathMBS
dim image as NSImageMBS = NSImageMBS.imageWithContentsOfPath(path)
Backdrop = image.CopyPictureWithMask
```

Notes:

path: A full or relative path name specifying the file with the desired image data. Relative paths must be relative to the current working directory.

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified file.

The filename parameter should include the file extension that identifies the type of the image data. This method looks for an NSImageRep subclass that handles that data type from among those registered with NSImage.

33.10.40 imageWithContentsOfPathMT(path as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified file.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
dim path as string = file.UnixpathMBS
dim image as NSImageMBS = NSImageMBS.imageWithContentsOfPathMT(path)
Backdrop = image.CopyPictureWithMask
```

Notes:

path: A full or relative path name specifying the file with the desired image data. Relative paths must be relative to the current working directory.

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified file.

The filename parameter should include the file extension that identifies the type of the image data. This method looks for an NSImageRep subclass that handles that data type from among those registered with NSImage.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

33.10.41 imageWithContentsOfURL(URL as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified URL.
Example:

```
dim url as string = "http://www.monkeybreadsoftware.de/images/MBSLogo.jpg"
dim img as NSImageMBS = NSImageMBS.imageWithContentsOfURL(url)
Backdrop = img.CopyPictureWithMask
```

Notes: Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified URL.

33.10.42 imageWithContentsOfURLMT(URL as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified URL.
Example:

```
dim url as string = "http://www.monkeybreadsoftware.de/images/MBSLogo.jpg"
dim img as NSImageMBS = NSImageMBS.imageWithContentsOfURLMT(url)
Backdrop = img.CopyPictureWithMask
```

Notes:

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified URL.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

33.10.43 imageWithData(data as memoryblock) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified memoryblock.
Example:

```
dim logo as Picture = LogoMBS(500)
dim jpeg as string = PictureToJPEGStringMBS(logo, 75)
dim nsimage as NSImageMBS = NSImageMBS.imageWithData(jpeg)
dim pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes: Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.
See also:

- 33.10.44 imageWithData(data as string) as NSImageMBS 7427

33.10.44 imageWithData(data as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified string.
Example:

```
dim logo as Picture = LogoMBS(500)
dim jpeg as string = PictureToJPEGStringMBS(logo, 75)
dim nsimage as NSImageMBS = NSImageMBS.imageWithData(jpeg)
dim pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes: Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.
See also:

- 33.10.43 imageWithData(data as memoryblock) as NSImageMBS 7427

33.10.45 imageWithDataMT(data as memoryblock) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified memoryblock.
Example:

```
dim logo as Picture = LogoMBS(500)
dim jpeg as string = PictureToJPEGStringMBS(logo, 75)
dim nsimage as NSImageMBS = NSImageMBS.imageWithDataMT(jpeg)
dim pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes:

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.
See also:

- 33.10.46 imageWithDataMT(data as string) as NSImageMBS 7428

33.10.46 imageWithDataMT(data as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified string.
Example:

```
dim logo as Picture = LogoMBS(500)
dim jpeg as string = PictureToJPEGStringMBS(logo, 75)
dim nsimage as NSImageMBS = NSImageMBS.imageWithDataMT(jpeg)
dim pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes:

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.
See also:

- 33.10.45 imageWithDataMT(data as memoryblock) as NSImageMBS 7428

33.10.47 imageWithHandle(Handle as Integer) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 14.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new picture for a NSImage handle.

33.10.48 imageWithTintColor(tintColor as NSColorMBS) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 20.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the image colored with the given tint.
Notes: Input image should be grayscale.

33.10.49 initWithContentsOfURL(file as folderitem) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified folderitem.
Notes: Returns true on success and false on failure.
See also:

- 33.10.50 initWithContentsOfURL(url as string) as boolean 7430

33.10.50 initWithContentsOfURL(url as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified URL.
Notes: Returns true on success and false on failure.
See also:

- 33.10.49 initWithContentsOfURL(file as folderitem) as boolean 7429

33.10.51 initWithData(data as Memoryblock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and with the contents of the specified data in the string.
Notes: Returns true on success and false on failure.

33.10.52 initWithDataIgnoringOrientation(data as Memoryblock) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified memoryblock, ignoring the EXIF orientation tags.
Notes:

An initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.
Available in Mac OS X v10.6 and later.

33.10.53 initWithIconRef(IconHandle as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the image object with a Carbon-style icon resource.
Notes:

IconHandle: A reference to a Carbon icon resource (IconRef).

Creates one or more bitmap image representations, one for each size icon contained in the IconRef data structure. This initialization method automatically retains the data in the iconRef parameter and loads the bitmaps from that data file lazily.
Available in Mac OS X v10.5 and later.

33.10.54 initWithPasteboard as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an NSImage instance with data from the pasteboard.
Notes: The specified pasteboard should contain a type supported by one of the registered NSImageRep subclasses. Table 1 lists the default pasteboard types and file extensions for several NSImageRep subclasses.

33.10.55 initWithPicture(img as picture, mask as picture = nil) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the image object with image data from the Xojo pictures.
Example:

```
dim img as new NSImageMBS
if img.initWithPicture(pict, pict.mask) then
MsgBox "OK"
end if
```

Notes:

Optional you can pass a picture with the mask. It is valid to use the mask property of the image for the second parameter.

With 11.3 plugins we are deprecating to pass a mask. The plugin prefers to simply take the mask or alpha channel of the picture itself.

On success the image is valid and the handle is not zero.

33.10.56 initWithSize(width as Double, height as Double) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an empty image object with the given size.
Notes: Returns true on success and false on failure.

33.10.57 JPEGRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image as the binary data in a JPEG file.
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

f=SpecialFolder.Desktop.Child("test.jpeg")
b=f.CreateBinaryFile("")
b.Write img.JPEGRepresentation
b.Close

f.Launch
```

Notes: JPEG does not support masks. Uses 80% for the quality.

33.10.58 JPEGRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image as the binary data in a JPEG file.
Example:

```
// take some Picture
dim logo as Picture = LogoMBS(500)

// make a NSImageMBS from it
dim nsimage as new NSImageMBS(logo)

// use thread friendly compress function
dim jpeg as MemoryBlock = nsimage.JPEGRepresentationMT

// decode to see if it worked
dim test as Picture = JPEGStringToPictureMBS(jpeg)

// and display
Backdrop = test
```

Notes:

JPEG does not support masks. Uses 80% for the quality.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

33.10.59 JPEGRepresentationWithCompressionFactor(factor as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image as the binary data in a JPEG file.
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

f=SpecialFolder.Desktop.Child("test.jpeg")
b=f.CreateBinaryFile("")
b.Write img.JPEGRepresentationWithCompressionFactor(0.01)
b.Close

f.Launch
```

Notes:

Factor for compression goes from 0.0 to 1.0.
JPEG does not support masks.

33.10.60 JPEGRepresentationWithCompressionFactorMT(factor as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image as the binary data in a JPEG file.
Example:

```
// take some Picture
dim logo as Picture = LogoMBS(500)

// make a NSImageMBS from it
dim nsimage as new NSImageMBS(logo)

// use thread friendly compress function
dim jpeg as MemoryBlock = nsimage.JPEGRepresentationWithCompressionFactorMT(1.0)

// decode to see if it worked
dim test as Picture = JPEGStringToPictureMBS(jpeg)

// and display
Backdrop = test
```

Notes:

Factor for compression goes from 0.0 to 1.0.
JPEG does not support masks.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

33.10.61 NSImageHintUserInterfaceLayoutDirection as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the dictionary keys used in the hints dictionary.
Notes: value is a number with NSUserInterfaceLayoutDirection enum value

33.10.62 NSImageNameActionTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
An action menu template image.
Available in Mac OS X v10.5 and later.

33.10.63 NSImageNameAddTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

An add item template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

33.10.64 NSImageNameAdvanced as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Advanced preferences toolbar icon. Use in a preferences window only.
Available in Mac OS X v10.5 and later.

33.10.65 NSImageNameApplicationIcon as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
The application's icon.
On versions of Mac OS X prior to v10.6, you can use the string "NSApplicationIcon".
Available in Mac OS X v10.6 and later.

33.10.66 NSImageNameBluetoothTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A Bluetooth template image.
Available in Mac OS X v10.5 and later.

33.10.67 NSImageNameBonjour as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing Finder items.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A Bonjour icon.
Available in Mac OS X v10.5 and later.

33.10.68 NSImageNameBookmarksTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Bookmarks image suitable for a template.
Available in Mac OS X v10.6 and later.

33.10.69 NSImageNameCaution as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Caution Image.
Available in Mac OS X v10.6 and later.

33.10.70 NSImageNameColorPanel as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A color panel toolbar icon.
Available in Mac OS X v10.5 and later.

33.10.71 NSImageNameColumnViewTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images used in segmented controls to switch the current view type.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A column view mode template image.
Available in Mac OS X v10.5 and later.

33.10.72 NSImageNameComputer as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing Finder items.
Example:

```
dim n as NSImageMBS = NSImageMBS.imageNamed(NSImageMBS.NSImageNameComputer)

// set to size you need
n.size = NSMakeSizeMBS(512,512)

// and make picture
Backdrop = n.CopyPictureWithMask
```

Notes:

To access this image, pass the specified constant to the imageNamed method.
A computer icon.
Available in Mac OS X v10.5 and later.

33.10.73 NSImageNameDotMac as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing Finder items.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A Dot Mac icon.
Available in Mac OS X v10.5 and later.

33.10.74 NSImageNameEnterFullScreenTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

An enter full-screen mode template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

33.10.75 NSImageNameEveryone as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing sharing permission icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Permissions for all users.
Available in Mac OS X v10.5 and later.

33.10.76 NSImageNameExitFullScreenTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

An exit full-screen mode template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

33.10.77 NSImageNameFlowViewTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images used in segmented controls to switch the current view type.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A cover flow view mode template image.
Available in Mac OS X v10.5 and later.

33.10.78 NSImageNameFolder as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A folder image.
Available in Mac OS X v10.6 and later.

33.10.79 NSImageNameFolderBurnable as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing Finder items.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A burnable folder icon.
Available in Mac OS X v10.5 and later.

33.10.80 NSImageNameFolderSmart as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing Finder items.
Notes:

A smart folder icon.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

33.10.81 NSImageNameFollowLinkFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

A link template image. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

33.10.82 NSImageNameFontPanel as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A font panel toolbar icon.
Available in Mac OS X v10.5 and later.

33.10.83 NSImageNameGoBackTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The template name for the go back image.
Notes:

Use these images for "go forward" or "go back" functions, as seen in Safari's toolbar. These images will automatically mirror when the user interface layout direction is right to left.
Available in macOS 10.12 and newer.

33.10.84 NSImageNameGoForwardTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The template name for the go forward image.
Notes:

Use these images for "go forward" or "go back" functions, as seen in Safari's toolbar. These images will automatically mirror when the user interface layout direction is right to left.
Available in macOS 10.12 and newer.

33.10.85 NSImageNameGoLeftTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A "go back" template image.
Available in Mac OS X v10.5 and later.

33.10.86 NSImageNameGoRightTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A "go forward" template image.
Available in Mac OS X v10.5 and later.

33.10.87 NSImageNameHomeTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Home image suitable for a template.
Available in Mac OS X v10.6 and later.

33.10.88 NSImageNameIChatTheaterTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
An iChat Theater template image.
Available in Mac OS X v10.5 and later.

33.10.89 NSImageNameIconViewTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images used in segmented controls to switch the current view type.
Notes:

To access this image, pass the specified constant to the imageNamed method.
An icon view mode template image.
Available in Mac OS X v10.5 and later.

33.10.90 NSImageNameInfo as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
An information toolbar icon.
Available in Mac OS X v10.5 and later.

33.10.91 NSImageNameInvalidDataFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
An invalid data template image. Place this icon to the right of any fields containing invalid data. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.

33.10.92 NSImageNameLeftFacingTriangleTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A generic left-facing triangle template image.
Available in Mac OS X v10.5 and later.

33.10.93 NSImageNameListViewTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images used in segmented controls to switch the current view type.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A list view mode template image.
Available in Mac OS X v10.5 and later.

33.10.94 NSImageNameLockLockedTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A locked lock template image. Use to indicate locked content.
Available in Mac OS X v10.5 and later.

33.10.95 NSImageNameLockUnlockedTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
An unlocked lock template image. Use to indicate modifiable content that can be locked.
Available in Mac OS X v10.5 and later.

33.10.96 NSImageNameMenuMixedStateTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A horizontal dash. Drawing these outside of menus is discouraged.
Available in Mac OS X v10.6 and later.

33.10.97 NSImageNameMenuOnStateTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A check mark. Drawing these outside of menus is discouraged.
Available in Mac OS X v10.6 and later.

33.10.98 NSImageNameMobileMe as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
MobileMe logo. Note that this is preferred to using the NSImageNameDotMac image, although that image is not expected to be deprecated.
Available in Mac OS X v10.6 and later.

33.10.99 NSImageNameMultipleDocuments as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Drag image you can use in your applications.
Notes:

A drag image for multiple items.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

33.10.100 NSImageNameNetwork as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing Finder items.
Notes:

A network icon.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

33.10.101 NSImageNamePathTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A path button template image.
Available in Mac OS X v10.5 and later.

33.10.102 NSImageNamePreferencesGeneral as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
General preferences toolbar icon. Use in a preferences window only.
Available in Mac OS X v10.5 and later.

33.10.103 NSImageNameQuickLookTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A Quick Look template image.
Available in Mac OS X v10.5 and later.

33.10.104 NSImageNameRefreshFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

A refresh template image. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

33.10.105 NSImageNameRefreshTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

A refresh template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

33.10.106 NSImageNameRemoveTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

A remove item template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

33.10.107 NSImageNameRevealFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

A reveal contents template image. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

33.10.108 NSImageNameRightFacingTriangleTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A generic right-facing triangle template image.
Available in Mac OS X v10.5 and later.

33.10.109 NSImageNameShareTemplate as string

MBS MacBase Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images used in segmented controls to switch the current view type.
Notes:

A share view template image.
Available in OS X v10.8 and later.

33.10.110 NSImageNameSlideshowTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A slideshow template image.
Available in Mac OS X v10.5 and later.

33.10.111 NSImageNameSmartBadgeTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

A badge for a "smart" item.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

33.10.112 NSImageNameStatusAvailable as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Small green indicator, similar to iChat's available image.
Available in Mac OS X v10.6 and later.

33.10.113 NSImageNameStatusNone as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Small clear indicator.
Available in Mac OS X v10.6 and later.

33.10.114 NSImageNameStatusPartiallyAvailable as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Small yellow indicator, similar to iChat's idle image.
Available in Mac OS X v10.6 and later.

33.10.115 NSImageNameStatusUnavailable as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Small red indicator, similar to iChat's unavailable image.
Available in Mac OS X v10.6 and later.

33.10.116 NSImageNameStopProgressFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A stop progress template image. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.

33.10.117 NSImageNameStopProgressTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.
Notes:

A stop progress button template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

33.10.118 NSImageNameTouchBarAddDetailTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAddDetailTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.119 NSImageNameTouchBarAddTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAddTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.120 NSImageNameTouchBarAlarmTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAlarmTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.121 NSImageNameTouchBarAudioInputMuteTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioInputMuteTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.122 NSImageNameTouchBarAudioInputTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioInputTemplate
```

```
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.123 NSImageNameTouchBarAudioOutputMuteTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputMuteTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.124 NSImageNameTouchBarAudioOutputVolumeHighTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputVolumeHighTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.125 NSImageNameTouchBarAudioOutputVolumeLowTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputVolumeLowTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.126 NSImageNameTouchBarAudioOutputVolumeMediumTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputVolumeMediumTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.127 NSImageNameTouchBarAudioOutputVolumeOffTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputVolumeOffTemplate
```

```
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.128 NSImageNameTouchBarBookmarksTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarBookmarksTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.129 NSImageNameTouchBarColorPickerFill as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarColorPickerFill
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.130 NSImageNameTouchBarColorPickerFont as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarColorPickerFont
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.131 NSImageNameTouchBarColorPickerStroke as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarColorPickerStroke
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.132 NSImageNameTouchBarCommunicationAudioTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarCommunicationAudioTemplate
```

```
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.133 NSImageNameTouchBarCommunicationVideoTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarCommunicationVideoTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.134 NSImageNameTouchBarComposeTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarComposeTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.135 NSImageNameTouchBarDeleteTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarDeleteTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.136 NSImageNameTouchBarDownloadTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarDownloadTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.137 NSImageNameTouchBarEnterFullScreenTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarEnterFullScreenTemplate
```

```
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.138 NSImageNameTouchBarExitFullScreenTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarExitFullScreenTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.139 NSImageNameTouchBarFastForwardTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarFastForwardTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.140 NSImageNameTouchBarFolderCopyToTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarFolderCopyToTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.141 NSImageNameTouchBarFolderMoveToTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarFolderMoveToTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.142 NSImageNameTouchBarFolderTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarFolderTemplate
```

```
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.143 NSImageNameTouchBarGetInfoTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGetInfoTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.144 NSImageNameTouchBarGoBackTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGoBackTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.145 NSImageNameTouchBarGoDownTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGoDownTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.146 NSImageNameTouchBarGoForwardTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGoForwardTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.147 NSImageNameTouchBarGoUpTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGoUpTemplate
```

```
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.148 NSImageNameTouchBarHistoryTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarHistoryTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.149 NSImageNameTouchBarIconViewTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarIconViewTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.150 NSImageNameTouchBarListViewTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarListViewTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.151 NSImageNameTouchBarMailTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarMailTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.152 NSImageNameTouchBarNewFolderTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarNewFolderTemplate
```

```
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.153 NSImageNameTouchBarNewMessageTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarNewMessageTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.154 NSImageNameTouchBarOpenInBrowserTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarOpenInBrowserTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.155 NSImageNameTouchBarPauseTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarPauseTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.156 NSImageNameTouchBarPlayheadTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarPlayheadTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.157 NSImageNameTouchBarPlayPauseTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarPlayPauseTemplate
```

```
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.158 NSImageNameTouchBarPlayTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarPlayTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.159 NSImageNameTouchBarQuickLookTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarQuickLookTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.160 NSImageNameTouchBarRecordStartTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRecordStartTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.161 NSImageNameTouchBarRecordStopTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRecordStopTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.162 NSImageNameTouchBarRefreshTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRefreshTemplate
```

```
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.163 NSImageNameTouchBarRewindTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRewindTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.164 NSImageNameTouchBarRotateLeftTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRotateLeftTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.165 NSImageNameTouchBarRotateRightTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRotateRightTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.166 NSImageNameTouchBarSearchTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSearchTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.167 NSImageNameTouchBarShareTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarShareTemplate
```

```
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.168 NSImageNameTouchBarSidebarTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSidebarTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.169 NSImageNameTouchBarSkipAhead15SecondsTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipAhead15SecondsTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.170 NSImageNameTouchBarSkipAhead30SecondsTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipAhead30SecondsTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.171 NSImageNameTouchBarSkipAheadTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipAheadTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.172 NSImageNameTouchBarSkipBack15SecondsTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipBack15SecondsTemplate
```

```
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.173 NSImageNameTouchBarSkipBack30SecondsTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipBack30SecondsTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.174 NSImageNameTouchBarSkipBackTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipBackTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.175 NSImageNameTouchBarSkipToEndTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipToEndTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.176 NSImageNameTouchBarSkipToStartTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipToStartTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.177 NSImageNameTouchBarSlideshowTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSlideshowTemplate
```

```
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.178 NSImageNameTouchBarTagIconTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTagIconTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.179 NSImageNameTouchBarTextBoldTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextBoldTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.180 NSImageNameTouchBarTextBoxTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextBoxTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.181 NSImageNameTouchBarTextCenterAlignTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextCenterAlignTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.182 NSImageNameTouchBarTextItalicTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextItalicTemplate
```

```
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.183 NSImageNameTouchBarTextJustifiedAlignTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextJustifiedAlignTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.184 NSImageNameTouchBarTextLeftAlignTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextLeftAlignTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.185 NSImageNameTouchBarTextListTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextListTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.186 NSImageNameTouchBarTextRightAlignTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextRightAlignTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.187 NSImageNameTouchBarTextStrikethroughTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextStrikethroughTemplate
```

```
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.188 NSImageNameTouchBarTextUnderlineTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextUnderlineTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.189 NSImageNameTouchBarUserAddTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarUserAddTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.190 NSImageNameTouchBarUserGroupTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarUserGroupTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.191 NSImageNameTouchBarUserTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarUserTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.192 NSImageNameTouchBarVolumeDownTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarVolumeDownTemplate
```

```
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.193 NSImageNameTouchBarVolumeUpTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarVolumeUpTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

33.10.194 NSImageNameTrashEmpty as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
An image of the empty trash can.
Available in Mac OS X v10.6 and later.

33.10.195 NSImageNameTrashFull as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
An image of the full trash can.

Available in Mac OS X v10.6 and later.

33.10.196 NSImageNameUser as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing sharing permission icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Permissions for a single user.
Available in Mac OS X v10.5 and later.

33.10.197 NSImageNameUserAccounts as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
User account toolbar icon. Use in a preferences window only.
Available in Mac OS X v10.5 and later.

33.10.198 NSImageNameUserGroup as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing sharing permission icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Permissions for a group of users.
Available in Mac OS X v10.5 and later.

33.10.199 NSImageNameUserGuest as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Shaded user figure.

Available in Mac OS X v10.6 and later.

33.10.200 PNGRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image as the binary data in a PNG file.
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p,p.Mask)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile("")
b.Write img.PNGRepresentation
b.Close

f.Launch
```

Notes: PNG does support masks.

33.10.201 PNGRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image as the binary data in a PNG file.
Example:

```
// take some Picture
dim logo as Picture = LogoMBS(500)

// make a NSImageMBS from it
dim nsimage as new NSImageMBS(logo)

// use thread friendly compress function
dim jpeg as MemoryBlock = nsimage.PNGRepresentationMT
```

```
// decode to see if it worked
dim test as Picture = PNGStringToPictureMBS(jpeg)

// and display
Backdrop = test
```

Notes:

PNG does support masks.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

33.10.202 recache

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invalidates and frees the offscreen caches of all image representations.
Notes:

If you modify an image representation, you must send a recache message to the corresponding image object to force the changes to be recached. The next time any image representation is drawn, it is asked to recreate its cached image. If you do not send this message, the image representation may use the old cache data. This method simply clears the cached image data; it does not delete the NSCachedImageRep objects associated with any image representations.
If you do not plan to use an image again right away, you can free its caches to reduce the amount of memory consumed by your program.

33.10.203 removeRepresentation(img as NSImageRepMBS)

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the specified image representation from the receiver and releases it.

33.10.204 RepresentationHeight(index as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Height of the representation with the given index in pixel.
Notes:

Index from 0 to RepresetationCount-1.
Returns 0 on invalid index.

33.10.205 representations as NSImageRepMBS()

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array containing all of the receiver's image representations.
Notes:

An array containing zero or more NSImageRep objects.
Returns nil on any error.

33.10.206 RepresentationWidth(index as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Width of the representation with the given index in pixel.
Notes:

Index from 0 to RepresetationCount-1.
Returns 0 on invalid index.

33.10.207 setName(value as String) as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Registers the image under the specified name.
Notes:

Returns true if the receiver was successfully registered with the given name; otherwise, false.

Discussion
If the receiver is already registered under a different name, this method unregisters the other name. If a different image is registered under the name specified in aString, this method does nothing and returns false.

When naming an image using this method, it is convention not to include filename extensions in the names you specify. That way, you can easily distinguish between images you have named explicitly and those you want to load from the application's bundle. For information about the rules used to search for images, see the imageNamed method.

33.10.208 setSize(width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the width and height of the image.
Notes:

Pass the new size of the image, measured in points.

Discussion:
The size of an NSImage object must be set before it can be used. If the size of the image hasn't already been set when an image representation is added, the size is taken from the image representation's data. For EPS images, the size is taken from the image's bounding box. For TIFF images, the size is taken from the ImageLength and ImageWidth attributes.

Changing the size of an NSImage after it has been used effectively resizes the image. Changing the size invalidates all its caches and frees them. When the image is next composited, the selected representation will draw itself in an offscreen window to recreate the cache.

33.10.209 TIFFRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string containing TIFF data for all of the image representations in the receiver.
Example:

```
Dim p As Picture = LogoMBS(500)

// save as tiff

Dim n As New NSImageMBS(p)
Dim tiff As String = n.TIFFRepresentation
Dim file1 As FolderItem = SpecialFolder.Desktop.Child("test1.tif")
Dim b As BinaryStream = BinaryStream.Create(file1)
b.Write tiff
b.Close
```

Notes:

A string containing the TIFF data, or nil if the TIFF data could not be created.

Discussion:
You can use the returned data object to write the TIFF data to a file. For each image representation, this method uses the TIFF compression option associated with that representation or NSTIFFCompressionNone, if no option is set.

If one of the receiver's image representations does not support the creation of TIFF data natively (PDF and EPS images, for example), this method creates the TIFF data from that representation's cached content.

33.10.210 TIFFRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string containing TIFF data for all of the image representations in the receiver.
Example:

```
// take some Picture
dim logo as Picture = LogoMBS(500)

// make a NSImageMBS from it
dim nsimage as new NSImageMBS(logo)

// use thread friendly compress function
dim data as MemoryBlock = nsimage.TIFFRepresentationMT

// decode to see if it worked
dim test as Picture = TIFFStringToPictureMBS(data)

// and display
Backdrop = test
```

Notes:

A string containing the TIFF data, or nil if the TIFF data could not be created.

Discussion:
You can use the returned data object to write the TIFF data to a file. For each image representation, this method uses the TIFF compression option associated with that representation or NSTIFFCompressionNone, if no option is set.

If one of the receiver's image representations does not support the creation of TIFF data natively (PDF and EPS images, for example), this method creates the TIFF data from that representation's cached content.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

33.10.211 TIFFRepresentationUsingCompression(comp as Integer, factor as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string containing TIFF data for all of the image representations in the receiver.
Notes:

comp: The type of compression to use. For a list of values, see the constants in NSBitmapImageRep.

aFloat: Provides a hint for compression types that implement variable compression ratios. Currently, only JPEG compression uses a compression factor.

Returns a string containing the TIFF data, or nil if the TIFF data could not be created.

Discussion:
You can use the returned data object to write the TIFF data to a file. If the specified compression isn't applicable, no compression is used. If a problem is encountered during generation of the TIFF data, this method may raise an exception.

If one of the receiver's image representations does not support the creation of TIFF data natively (PDF and EPS images, for example), this method creates the TIFF data from that representation's cached content.

33.10.212 TIFFRepresentationUsingCompressionMT(comp as Integer, factor as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string containing TIFF data for all of the image representations in the receiver.
Notes:

comp: The type of compression to use. For a list of values, see the constants in NSBitmapImageRep.

aFloat: Provides a hint for compression types that implement variable compression ratios. Currently, only JPEG compression uses a compression factor.

Returns a string containing the TIFF data, or nil if the TIFF data could not be created.

Discussion:
You can use the returned data object to write the TIFF data to a file. If the specified compression isn't applicable, no compression is used. If a problem is encountered during generation of the TIFF data, this method may raise an exception.

If one of the receiver's image representations does not support the creation of TIFF data natively (PDF and EPS images, for example), this method creates the TIFF data from that representation's cached content.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

33.10.213 Properties

33.10.214 accessibilityDescription as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image's accessibility description.
Notes:

A short localized string that does not include the name of the interface element.

This description will be used automatically by interface elements that display images. Like all accessibility descriptions, the string should be a short localized string that does not include the name of the interface element. For instance, "delete" rather than "delete button".
(Read and Write property)

33.10.215 backgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The background color of image.
Notes:

The background color of the image. The default color is transparent, as returned by the clearColor method of NSColor.
The background color is visible only if the drawn image representation does not completely cover all of the pixels available for the image's current size.

The value of this variant must be an object of class NSColorMBS.
(Read and Write property)

33.10.216 cacheDepthMatchesImageDepth as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether an image's offscreen window caches use the same bit depth as the image data itself.
Notes:

Returns true if the offscreen window caches use the same bit depth as the image data; otherwise, false. The default value is false.
(Read and Write property)

33.10.217 cacheMode as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's caching mode.
Notes:

The caching mode determines when the receiver's image representations use offscreen caches. Offscreen caches speed up rendering time but do so by using extra memory. In the default caching mode (NSImageCacheDefault), each image representation chooses the caching technique that produces the fastest drawing times. For example, in the default mode, the NSPDFImageRep and NSEPSImageRep classes use the NSImageCacheAlways mode but the NSBitmapImageRep class uses the NSImageCacheBySize mode.
(Read and Write property)

33.10.218 EXIFData as Dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a dictionary with exif data.
Notes: (Read only property)

33.10.219 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the internally used NSImage object.
Notes: (Read and Write property)

33.10.220 height as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The height of the image or zero.

Notes:

If no size has been set and the size cannot be determined from any of the receiver's image representations.
(Read only property)

33.10.221 isCachedSeparately as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether each image representation caches its contents in a separate offscreen window.
Notes:

Returns true if the image representations cache their content in separate offscreen windows; otherwise, false. The default value is false.

Discussion:
If this method returns false, it means that the image may be cached in a shared window but is not required to be. Images are cached in a shared window if they have the same general attributes, such as color space, resolution, and bit depth.
(Read and Write property)

33.10.222 isDataRetained as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the receiver retains its source image data.
Notes:

Returns true if the image retains its source data; otherwise, false. The default value is false with some exceptions, which are covered in the discussion.
(Read and Write property)

33.10.223 isFlipped as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the image uses a flipped coordinate system.
Notes:

Returns true if the image's coordinate system is flipped; otherwise, false. The default is false.
(Read and Write property)

33.10.224 isTemplate as Boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the image is a template image.
Example:

```
Dim ActionGearTemplate as string // content of PDF file
Dim Image as New NSImageMBS( ActionGearTemplate )
Image.setSize( 14,14 )
Image.IsTemplate = true
```

Notes:

Value is true if the image is a template image; otherwise, false.
Template images consist of black and clear colors (and an alpha channel). Template images are not intended to be used as standalone images and are usually mixed with other content to create the desired final appearance.
Available in Mac OS X v10.5 and later.
Assigning value to istemplate, will internally call setTemplate.
(Read and Write property)

33.10.225 isValid as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the image can be drawn.
Notes:

Return value: true if the receiver can be drawn; otherwise, false.

If the object is initialized with an existing image file, but the corresponding image data is not yet loaded into memory, this method loads the data and expands it as needed. If the object contains no image representations and no associated image file, this method creates a valid cached image representation and initializes it to the default bit depth. This method returns false in cases where the file or URL from which it was initialized is nonexistent or when the data in an existing file is invalid.
(Read only property)

33.10.226 matchesOnMultipleResolution as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether image representations whose resolution is an integral multiple of the device resolution are considered a match.
Notes:

Returns true if image representations whose resolution is an integral multiple of the device resolution are considered a match; otherwise, false.

Discussion:
When this method returns false, only image representations whose resolution is exactly the same as the device resolution are considered matches. If this method returns true and multiple image representations fit this criteria, the one whose resolution is closest to the device resolution is chosen.

The default value is true.
(Read and Write property)

33.10.227 MaximumPixelHeight as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** From all the image representation the height of the heighest one.
Notes:

Value is returned in pixels. Returns 0 on any error.
(Read only property)

33.10.228 MaximumPixelWidth as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** From all the image representation the width of the widest one.
Notes:

Value is returned in pixels. Returns 0 on any error.
(Read only property)

33.10.229 MinimumPixelHeight as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** From all the image representation the width of the smallest one.
Notes:

Value is returned in pixels. Returns 0 on any error.
(Read only property)

33.10.230 MinimumPixelWidth as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** From all the image representation the width of the smallest one.
Notes:

Value is returned in pixels. Returns 0 on any error.
(Read only property)

33.10.231 name as String

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name associated with the receiver, if any.
Notes: (Read only property)

33.10.232 prefersColorMatch as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the image prefers to choose image representations using color matching or resolution matching.
Notes:

Discussion:
Both color matching and resolution matching may influence the choice of an image representation. This method simply indicates which technique is used first during the selection process. The default value is true.
(Read and Write property)

33.10.233 RepresentationsCount as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of represtations this image has.
Notes:

Same as Representations.Count
(Read only property)

33.10.234 scalesWhenResized as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether image representations are scaled to fit the receiver's size.
Notes:

Returns true if image representations are scaled to fit the receiver; otherwise, false. The default value is false.

Images are not resized during drawing if this method returns true. They are only resized when you change the size by sending the receiver a setSize message.
(Read and Write property)

33.10.235 size as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The size of the receiver.
Notes:

The size of the receiver or (0.0, 0.0) if no size has been set and the size cannot be determined from any of the receiver's image representations.

The size of an NSImage object must be set before it can be used. If the size of the image hasn't already been set when an image representation is added, the size is taken from the image representation's data. For EPS images, the size is taken from the image's bounding box. For TIFF images, the size is taken from the ImageLength and ImageWidth attributes.

Changing the size of an NSImage after it has been used effectively resizes the image. Changing the size invalidates all its caches and frees them. When the image is next composited, the selected representation will draw itself in an offscreen window to recreate the cache.
(Read and Write property)

33.10.236 usesEPSOnResolutionMismatch as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether EPS image representations are preferred when no other representations match the resolution of the device.
Notes: (Read and Write property)

33.10.237 width as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The width of the image or zero.
Notes:

If no size has been set and the size cannot be determined from any of the receiver's image representations.
(Read only property)

33.10.238 Constants

33.10.239 NSImageCacheAlways=1

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image cache mode constants.
Notes: Always generate a cache when drawing.

33.10.240 NSImageCacheBySize=2

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image cache mode constants.
Notes: Cache if cache size is smaller than the original data.

33.10.241 NSImageCacheDefault=0

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image cache mode constants.
Notes:

Caching is unspecified.
Use the image rep's default.

33.10.242 NSImageCacheNever=3

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image cache mode constants.
Notes: Never cache; always draw direct.

33.10.243 NSImageLoadStatusCancelled=1

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image load status constants.
Notes:

Image loading was canceled.
The image contains the portions of the data that have already been successfully decompressed, if any.

33.10.244 NSImageLoadStatusCompleted=0

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image load status constants.
Notes: Enough data has been provided to completely decompress the image.

33.10.245 NSImageLoadStatusInvalidData=2

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image load status constants.
Notes:

An error occurred during image decompression.
The image data is probably corrupt. The image contains the portions of the data that have already been successfully decompressed, if any.

33.10.246 NSImageLoadStatusReadError=4

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image load status constants.
Notes:

Not enough data was available for full decompression of the image.
The image contains the portions of the data that have already been successfully decompressed, if any.

33.10.247 NSImageLoadStatusUnexpectedEOF=3

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image load status constants.
Notes:

Not enough data was available for full decompression of the image.
The image contains the portions of the data that have already been successfully decompressed, if any.

33.11 class NSImageRepMBS

33.11.1 class NSImageRepMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSImageRep class is a semiabstract superclass ("semi" because it has some instance variables and implementation of its own).
Notes:

Each of its subclasses knows how to draw an image from a particular kind of source data. While an NSImageRep subclass can be used directly, it is typically through an NSImage object. An NSImage object manages a group of image representations, choosing the best one for the current output device.

Subclasses are not implemented in the plugin currently.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

33.11.2 Methods

33.11.3 canInitWithData(data as memoryblock) as Boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the receiver can initialize itself from the specified data.
Notes:

Returns true if the receiver understands the format of the specified data and can use it to initialize itself; otherwise, false.

This method should be overridden by subclasses. Note that this method does not need to do a comprehensive check of the image data; it should return false only if it knows it cannot initialize itself from the data.

33.11.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

33.11.5 setSize(width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the size of the image representation to the specified value.
Notes:

This method determines the size of the image when it's rendered. It is not necessarily the same as the width and height of the image in pixels as specified by the image data, nor must it be equal to the size set for the NSImage object that wraps this image representation. You must set the image size before you can render it.

The size of an image representation combined with the physical dimensions of the image data determine the resolution of the image.

33.11.6 Properties

33.11.7 bitsPerSample as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of bits per sample in the receiver.
Notes: (Read and Write property)

33.11.8 colorSpaceName as String

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the receiver's color space.
Notes:

The colorspace name, or NSCalibratedRGBColorSpace if no name has been assigned.

By default, an NSImageRep object's color space name is NSCalibratedRGBColorSpace. Color space names are defined as part of the NSColor class, in NSGraphics.h. The following are valid color space names:

NSCalibratedWhiteColorSpace
NSCalibratedBlackColorSpace
NSCalibratedRGBColorSpace
NSDeviceWhiteColorSpace
NSDeviceBlackColorSpace
NSDeviceRGBColorSpace
NSDeviceCMYKColorSpace
NSNamedColorSpace
NSCustomColorSpace
(Read and Write property)

33.11.9 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

33.11.10 hasAlpha as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver has an alpha channel.
Notes:

Returns true if the receiver has a known alpha channel; otherwise, false.

Subclasses should call this method when loading image data to notify the parent class whether that data contains an alpha component. Passing in a value of true does not add an alpha channel to the image data itself; it merely records the fact that the data has an alpha channel.
(Read and Write property)

33.11.11 height as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Height of image in points.
Notes:

0 on any error.
(Read only property)

33.11.12 isOpaque as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the receiver is opaque.
Notes:

Use this method to test whether an image representation completely covers the area within the rectangle returned by the size method.

The returned value does not indicate whether the image has an alpha channel or if there is partial or complete transparency when drawing the image rep. Use the hasAlpha method to determine if the image has

an alpha channel.
(Read and Write property)

33.11.13 pixelsHigh as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the height of the image, measured in pixels.
Notes:

Return Value:
The height of the image, measured in the units of the device coordinate space. This value is usually derived from the image data itself.
(Read and Write property)

33.11.14 pixelsWide as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the width of the image, measured in pixels.
Notes:

Return Value:
The width of the image, measured in the units of the device coordinate space. This value is usually derived from the image data itself.
(Read and Write property)

33.11.15 size as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The size of the image representation.
Notes:

This size is the size of the image representation when it's rendered. It is not necessarily the same as the width and height of the image in pixels as specified by the image data, nor must it be equal to the size set for the NSImage object that wraps this image representation.

The size of an image representation combined with the physical dimensions of the image data determine the resolution of the image.
(Read and Write property)

33.11.16 width as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Width of image in points.
Notes:

0 on any error.
(Read only property)

33.11.17 Constants

33.11.18 NSImageRepMatchesDevice = 0

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants used by NSImageRep to denote an attribute whose value changes to match the display device.
Notes:

Indicates that the value of certain attributes, such as the number of colors or bits per sample, will change to match the display device.

This value can be passed in (or received back) as the value of bitsPerSample, pixelsWide, and pixelsHigh.

33.12 class NSPDFImageRepMBS

33.12.1 class NSPDFImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSPDFImageRep object can render an image from a PDF format data stream.
Notes: Subclass of the NSImageRepMBS class.

33.12.2 Blog Entries

- MBS Real Studio Plugins, version 12.0pr5

33.12.3 Methods

33.12.4 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSPDFImageRep object initialized with the specified PDF data.
Notes:

Initialized NSPDFImageRep object. Initialization may fail if the PDF data does not conform to the PDF file format.
On success handle property is not zero.

33.12.5 imageRepWithData(data as Memoryblock) as NSPDFImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSPDFImageRep object initialized with the specified PDF data.
Notes: Returns an initialized NSPDFImageRep object or nil if the object could not be initialized. Initialization may fail if the PDF data does not conform to the PDF file format.

33.12.6 PDFRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the PDF representation of the receiver's image.

33.12.7 Properties

33.12.8 bounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's bounding rectangle.
Notes:

This value is equivalent to the crop box specified by the PDF data.
(Read only property)

33.12.9 currentPage as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The page currently displayed by the image representation.
Notes:

A zero-based index indicating the page being displayed.
(Read and Write property)

33.12.10 pageCount as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of pages in the receiver.
Notes: (Read only property)

33.13 class NSPICTImageRepMBS

33.13.1 class NSPICTImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSPICTImageRep object renders an image from a PICT format data stream as described in the Carbon QuickDraw Manager documentation.
Notes:

This class can render PICT format version 1, version 2, and extended version 2 pictures.
Subclass of the NSImageRepMBS class.

33.13.2 Blog Entries

- MBS Real Studio Plugins, version 12.0pr5

33.13.3 Methods

33.13.4 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSPICTImageRep object initialized with the specified data.
Notes:

data: A data object containing the PICT data.

Initialization may fail if the data does not conform to the PICT file format.
On success the handle property is not zero.

If the PICT data is obtained directly from a PICT file or document, this method ignores most of the 512-byte header that occurs before the start of the actual picture data. It may retrieve some relevant meta information from the header.

33.13.5 imageRepWithData(data as Memoryblock) as NSPICTImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSPICTImageRep object initialized with the specified data.
Notes:

Initialization may fail if the data does not conform to the PICT file format.
On failure the handle property is nil.

33.13.6 PICTRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver's PICT data.
Notes: A data object containing the PICT data. The returned data does not include the 512-byte header, if it was present in the original data. If you want to write the returned data to a file, you must precede it with a 512-byte header (containing all zeros) if you want to conform to the PICT document format.

33.13.7 Properties

33.13.8 boundingBox as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the rectangle that bounds the receiver.
Notes:

The rectangle bounding the receiver. This rectangle is obtained from the the picFrame field in the picture header. See the Carbon QuickDraw Manager documentation for information on the picture header.
(Read only property)

Chapter 34

Cocoa Menus

34.1 class NSMenuItemMBS

34.1.1 class NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to represent a menuitem from the Cocoa world.
Notes: All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

34.1.4 Methods

34.1.5 Constructor(Handle as Integer)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Constructor for creating an instanced based on an existing handle.
Example:

```
dim m as MenuItem = EditCopy
dim h as Integer = m.Handle(MenuItem.HandleType.CocoaNSMenuItem)
dim i as new NSMenuItemMBS(h)

i.Title = "Hello"
```

Notes:

Useful if you get a NSMenuItem reference from a declare.
The object is retained.
See also:

- 34.1.6 Constructor(MenuItem as MenuItem) 7506
- 34.1.7 Constructor(title as string="", keyEquivalent as string="") 7507

34.1.6 Constructor(MenuItem as MenuItem)

MBS MacBase Plugin, Plugin Version: 18.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSMenuItemMBS object for a given MenuItem.
Example:

```
dim FileDot, FileDiamond as MenuItem

FileDot.enable
FileDot.checked = true

// via constructor
dim n1 as new NSMenuItemMBS(fileDot)
n1.onStateImage = NSImageMBS.imageNamed("NSMenuItemBullet")
```

```
FileDiamond.enable
FileDiamond.checked = true

// via function
dim n2 as NSMenuItemMBS = NSMenuItemMBS.MenuItem(FileDiamond)
n2.onStateImage = NSImageMBS.imageNamed("NSMenuItemDiamond")
```

Notes: May raise UnsupportedOperationException or NilObjectException if used incorrectly.
See also:

- 34.1.5 Constructor(Handle as Integer) 7506
- 34.1.7 Constructor(title as string="", keyEquivalent as string="") 7507

34.1.7 Constructor(title as string="", keyEquivalent as string="")

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new menu items.
Notes:

Handle is not 0 after this call if it was successfull.
name and charcode are optional and can be "".
Charcode is the initial keyEquivalent for this menu item.
You can set the KeyEquivalentModifierMask to get different modifier keys.
See also:

- 34.1.5 Constructor(Handle as Integer) 7506
- 34.1.6 Constructor(MenuItem as MenuItem) 7506

34.1.8 CreateMenuItem(title as string="", keyEquivalent as string="")

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new menu items.
Notes:

Handle is not 0 after this call if it was successfull.
name and charcode are optional and can be "".
Charcode is the initial keyEquivalent for this menu item.
You can set the KeyEquivalentModifierMask to get different modifier keys.

Deprecated, please use the Constructor instead.

34.1.9 CreateSeparator

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a Separator menu item.

34.1.10 MenuItem(MenuItem as MenuItem) as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 18.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Queries NSMenuItemMBS for a given menu item.
Example:

```
dim FileDot, FileDiamond as MenuItem

FileDot.enable
FileDot.checked = true

// via constructor
dim n1 as new NSMenuItemMBS(fileDot)
n1.onStateImage = NSImageMBS.imageNamed("NSMenuItemBullet")

FileDiamond.enable
FileDiamond.checked = true

// via function
dim n2 as NSMenuItemMBS = NSMenuItemMBS.MenuItem(FileDiamond)
n2.onStateImage = NSImageMBS.imageNamed("NSMenuItemDiamond")
```

Notes: Returns nil on any error.

34.1.11 separatorItem as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new separator menu item.

34.1.12 setTitleWithMnemonic(title as String)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the title of a menu item with a character denoting an access key.
Notes:

Use an ampersand character to mark the character (the one following the ampersand) to be designated.

Deprecated by Apple.

34.1.13 Properties

34.1.14 ActionSelector as String

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name of the objective-c method called for this menu event.
Notes:

You can use this to find menu items by their selector. Which is often more save than by index or title.
(Read only property)

34.1.15 Alternate as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this menu item is an alternate to the previous menu item.
Notes:

Available in Mac OS X v10.3 and later.
(Read and Write property)

34.1.16 attributedTitle as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Specifies a custom string for a menu item.
Notes:

You can use this method to add styled text and embedded images to menu item strings. If you do not set a text color for the attributed string, it is black when not selected, white when selected, and gray when disabled. Colored text remains unchanged when selected.

When you call this method to set the menu title to an attributed string, the setTitle: method is also called to set the menu title with a plain string. If you clear the attributed title, the plain title remains unchanged.
(Read and Write property)

34.1.17 Enabled as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this menuitem is enabled.

Notes: (Read and Write property)

34.1.18 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The reference to the NSMenuItem object used internally.
Notes: (Read and Write property)

34.1.19 hasSubmenu as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the menuitem has a submenu, false if it doesn't.
Notes: (Read only property)

34.1.20 image as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image displayed by the menuitem, or nil if it displays no image.
Notes: (Read and Write property)

34.1.21 indentationLevel as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The menu item indentation level for the menu item.
Notes:

The value will be from 0 to 15. The default indentation level is 0.
Available in Mac OS X v10.3 and later.
(Read and Write property)

34.1.22 isHidden as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the menuitem is hidden.
Notes:

Mac OS X 10.5 only.
Returns true if the receiver is hidden, otherwise false.

This value can be set to hide or show a menuitem.
(Read and Write property)

34.1.23 isHiddenOrHasHiddenAncestor as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the menuitem or any of its superitems is hidden.
Notes:

Mac OS X 10.5 only.
Returns true if the receiver or any of its superitems is hidden, otherwise false.
(Read only property)

34.1.24 isHighlighted as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver should be drawn highlighted.
Notes:

Returns true if the receiver should be drawn highlighted, otherwise false.
Mac OS X 10.5 only.
(Read only property)

34.1.25 isSeparatorItem as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether the receiver is a separator item (that is, a menu item used to visually segregate related menu items).
Notes: (Read only property)

34.1.26 keyEquivalent as String

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's unmodified keyboard equivalent, or the empty string if one hasn't been defined.
Example:

```
dim m as new NSMenuItemMBS
m.CreateMenuItem "Hello"
m.keyEquivalent = "a" // A
m.keyEquivalent = "A" // shift-A
```

Notes:

Use keyEquivalentModifierMask to determine the modifier mask for the key equivalent. In the current implementation "A" can be interpreted as Shift-A by the system even without the shift in the mask.
(Read and Write property)

34.1.27 keyEquivalentModifierMask as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** the menu item's keyboard equivalent modifier mask.
Example:

```
const NSShiftKeyMask=131072
const NSControlKeyMask=262144
const NSAlternateKeyMask=524288
const NSCommandKeyMask=1048576

dim d as new NSMenuItemMBS
d.CreateMenuItem "Last menu entry",""
d.Enabled=true
d.KeyEquivalent="A"
d.KeyEquivalentModifierMask=NSShiftKeyMask+NSCommandKeyMask+NSAlternateKeyMask // command-option-shift
```

Notes:

Constants for the mask:

NSAlphaShiftKeyMask = 65536
Set if Caps Lock key is pressed.
Available in Mac OS X v10.0 and later.

NSShiftKeyMask = 131072
Set if Shift key is pressed.
Available in Mac OS X v10.0 and later.

NSControlKeyMask = 262144
Set if Control key is pressed.
Available in Mac OS X v10.0 and later.

NSAlternateKeyMask = 524288
Set if Option or Alternate key is pressed.
Available in Mac OS X v10.0 and later.

NSCommandKeyMask = 1048576
Set if Command key is pressed.
Available in Mac OS X v10.0 and later.

NSNumericPadKeyMask = 2097152
Set if any key in the numeric keypad is pressed. The numeric keypad is generally on the right side of the keyboard. This is also set if any of the arrow keys are pressed (NSUpArrowFunctionKey, NSDownArrowFunctionKey, NSLeftArrowFunctionKey, and NSRightArrowFunctionKey).
Available in Mac OS X v10.0 and later.

NSHelpKeyMask = 4194304
Set if the Help key is pressed.
Available in Mac OS X v10.0 and later.

NSFunctionKeyMask = 8388608
Set if any function key is pressed. The function keys include the F keys at the top of most keyboards (F1, F2, and so on) and the navigation keys in the center of most keyboards (Help, Forward Delete, Home, End, Page Up, Page Down, and the arrow keys).
Available in Mac OS X v10.0 and later.

NSDeviceIndependentModifierFlagsMask = 16777216
Used to retrieve only the device-independent modifier flags, allowing applications to mask off the device-dependent modifier flags, including event coalescing information.
Available in Mac OS X v10.4.
(Read and Write property)

34.1.28 menu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The menu where this menu item is inside.
Notes:

nil if no menu belongs to this menuitem.
(Read only property)

34.1.29 mixedStateImage as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image used to depict a "mixed state."
Notes:

A mixed state is useful for indicating "off" and "on" attribute values in a group of selected objects, such as a selection of text containing bold and plain (nonbolded) words.
(Read and Write property)

34.1.30 offStateImage as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image used to depict the receiver's "off" state, or nil if the image has not been set.
Notes:

By default, there is no off state image.
(Read and Write property)

34.1.31 onStateImage as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image of the receiver that indicates an "on" state.
Notes:

The Image object to use for the "on" state of the menu item. If itemImage is nil, any current on-state image is removed.
(Read and Write property)

34.1.32 parentItem as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the menu item whose submenu contains the receiver.
Notes:

Returns the parent menu item, or nil if the receiver does not have a parent item.
Available in Mac OS X v10.6 and later.
(Read only property)

34.1.33 state as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The state of the menuitem.
Notes:

An integer constant representing a state; it should be one of NSOffState, NSOnState, or NSMixedState. Same as Checked property on Xojo's menu items.

Constants:

NSMixedState = -1	The corresponding feature is in effect somewhere.
NSOffState = 0	The corresponding feature is in effect nowhere.
NSOnState = 1	The corresponding feature is in effect everywhere.

(Read and Write property)

34.1.34 submenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The submenu attached to this menuitem.
Notes:

nil if there is no submenu.
(Read and Write property)

34.1.35 tag as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The menu item tag value.
Notes:

You can use this value as you like.

If you need to store more custom data than just an integer, you should subclass the NSMenuItemMBS class and add properties as needed.
(Read and Write property)

34.1.36 Title as String

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The title of the menu item.
Notes: (Read and Write property)

34.1.37 toolTip as String

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The help tag for a menu item.
Notes: (Read and Write property)

34.1.38 userKeyEquivalent as String

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The user-assigned key equivalent for the menu item.
Notes: (Read only property)

34.1.39 view as NSViewMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The view to be used for this menuitem.
Notes:

Using a view you can draw whatever you like in the menu item.
You can set it to nil to remove the view.
Requires Mac OS X 10.5.
(Read and Write property)

34.1.40 usesUserKeyEquivalents as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether menu items conform to user preferences for key equivalents.
Notes:

If true, menu items conform to user preferences for key equivalents; if false, the key equivalents originally assigned to the menu items are used.
(Read and Write computed property)

34.1.41 Events

34.1.42 Action

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The action event called when the user clicks on the statusitem.
Notes:

This event is coming from the Cocoa event system. What you can do is a bit limited when using GUI functions from Xojo. To avoid some redraw errors, you may want to start a timer and let your Xojo code run a millisecond after the menu code has finished.
Depending on what you do, you can see the menu not redrawing properly (staying highlighted) and crashes if the Xojo code modifies some global Cocoa states.

34.1.43 validateMenuItem(menuItem as NSMenuItemMBS) as boolean

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Implemented to override the default action of enabling or disabling a specific menu item.
Notes:

Return true to enable menuItem, false to disable it.
This is needed to modify the menuitem for a menu attached to a NSSearchFieldMBS.
Menuitem parameter is often the same as self, but for a searchfield menu, self is the template and menuitem parameter the actual menu item.

34.1.44 Constants

34.1.45 NSMixedState=-1

MBS MacBase Plugin, Plugin Version: 9.2. **Function:** One of the constants for the state property.
Notes: The corresponding feature is in effect somewhere.

34.1.46 NSOffState=0

MBS MacBase Plugin, Plugin Version: 9.2. **Function:** One of the constants for the state property.
Notes: The corresponding feature is in effect nowhere.

34.1.47 NSOnState=1

MBS MacBase Plugin, Plugin Version: 9.2. **Function:** One of the constants for the state property.
Notes: The corresponding feature is in effect everywhere.

34.2 class NSMenuMBS

34.2.1 class NSMenuMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to represent a menu in the Cocoa world.
Notes: All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

34.2.3 Xojo Developer Magazine

- 5.6, page 33: Third Party Plugins: Statusitems, Getting an icon in the top right of the Mac OS X menubar by Christian Schmitz

34.2.4 Methods

34.2.5 addItem(m as NSMenuItemMBS)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a menu item to the end.
Notes:

If the menuitem is nil, nothing happens.
The menuitem can only be in one menu.

The menu doesn't references to the RB classes behind, so it's up to you to keep those references if you want to get the events and avoid crashes.

The StatusItem example keeps an array with all those menu item objects it needs so RB will not destroy them.

34.2.6 cancelTracking

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Dismisses the menu and ends all menu tracking.
Notes: Available in Mac OS X v10.5 and later.

34.2.7 cancelTrackingWithoutAnimation

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Dismisses the menu and ends all menu tracking without displaying the associated animation.
Notes: Available in Mac OS X v10.6 and later.

34.2.8 CarbonMenuRef as Integer

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries the Carbon Menu Reference for this Cocoa menu.
Notes:

This is an undocumented API from Apple.
You only get a handle if the menu has been added to the menubar or popuped up.
Returns zero on failure. Returns always zero on 64 bit target.

34.2.9 Constructor(Handle as Integer)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a NSMenu reference from a declare.
The object is retained.
See also:

- 34.2.10 Constructor(title as string="") 7520

34.2.10 Constructor(title as string="")

MBS MacBase Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Constructor for a new nsmenu.

Example:

```
dim m as NSMenuMBS
m=new NSMenuMBS("Hello World")
msgbox m.title // shows "Hello World"
```

Notes: Title is optional.
See also:

- 34.2.9 Constructor(Handle as Integer) 7520

34.2.11 helpMenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the help menu if one is registered.

34.2.12 indexOfItem(item as NSMenuItemMBS) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index identifying the location of a specified menu item in the receiver.
Notes: Returns the integer index of the menu item or, if no such menu item is in the menu, –1.

34.2.13 indexOfItemWithSelector(selector as string) as Integer

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Searches menu items for one with the given selector.
Notes:

Returns -1 if not found.
You can use this to find menu items by their selector. Which is often more save than by index or title.

34.2.14 indexOfItemWithSubmenu(item as NSMenuMBS) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of the menu item in the receiver with the given submenu.
Notes:

item: A menu object that is a menu item of the receiver (that is, a submenu).

The integer index of the menu item or, if no such menu item is in the menu, –1.

34.2.15 indexOfItemWithTag(tag as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of the first menu item in the receiver identified by a tag.
Notes: Returns the integer index of the menu item or, if no such menu item is in the menu, –1.

34.2.16 indexOfItemWithTitle(title as string) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of the first menu item in the receiver that has a specified title.
Notes: The integer index of the menu item or, if no such menu item is in the menu, –1.

34.2.17 insertItem(m as NSMenuItemMBS, index as Integer)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts a menu item into the menu at a specific location.
Notes:

If the menuitem is nil, nothing happens. A menuitem can only be part of one menu.

index: An integer index identifying the location of the menu item in the menu. Zero based.

34.2.18 Item(index as Integer) as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the item with the given index.
Notes:

Index is from 0 to numberOfItems-1.
Remember: The objects returned are not the same Xojo objects used with additem or insertitem.

34.2.19 itemWithSelector(selector as string) as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Searches menu items for one with the given selector.

Notes: You can use this to find menu items by their selector. Which is often more save than by index or title.

34.2.20 mainMenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the main menu.

34.2.21 menuBarVisible as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the menu bar is visible.
Notes:

Available in Mac OS X v10.2 and later.
Returns true if the menu bar is visible, otherwise false.

34.2.22 NSMenuDidAddItemNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notifications sent for menus.
Notes:

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted after a menu item is added to the menu. The notification object is the instance of NSMenuMBS that just added the new menu item.
This is very useful to customize the menu in Xojo. The runtime rebuilds menu bar often, so you can catch it and edit menu.

The userInfo dictionary contains the following information:
NSMenuItemIndex: An integer index of the menu item that was added.

34.2.23 NSMenuDidBeginTrackingNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notifications sent for menus.
Notes:

Posted when menu tracking begins. The notification object is the main menu bar (NSApplicationMBS mainMenu) or the root menu of a popup button. This notification does not contain a userInfo dictionary.

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

34.2.24 NSMenuDidChangeItemNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notifications sent for menus.
Notes:

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted after a menu item in the menu changes appearance. Changes include enabling/disabling, changes in state, and changes to title. The notification object is the instance of NSMenuMBS with the menu item that changed. The userInfo dictionary contains the following information:

Key	Value
NSMenuItemIndex	An integer index of the menu item that changed.

34.2.25 NSMenuDidEndTrackingNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notifications sent for menus.
Notes:

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted when menu tracking ends, even if no action is sent. The notification object is the main menu bar (NSApplicationMBS mainMenu) or the root menu of a popup button. This notification does not contain a userInfo

34.2.26 NSMenuDidRemoveItemNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notifications sent for menus.
Notes:

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted after a menu item is removed from the menu. The notification object is the instance of NSMenu that

just removed the menu item. The userInfo dictionary contains the following information:

NSMenuItemIndex: An integer index of the menu item that was removed. Note that this index may no longer be valid and in any event no longer points to the menu item that was removed.

34.2.27 NSMenuDidSendActionNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notifications sent for menus.
Notes:

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted just after the application dispatches a menu item's action method to the menu item's target. The notification object is the instance of NSMenuMBS containing the chosen menu item. The userInfo dictionary contains the following information:

Key	Value
MenuItem	The menu item that was chosen.

34.2.28 NSMenuWillSendActionNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notifications sent for menus.
Notes:

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted just before the application dispatches a menu item's action method to the menu item's target. The notification object is the instance of NSMenuMBS containing the chosen menu item. The userInfo dictionary contains the following information:

Key	Value
MenuItem	The menu item that was chosen.

34.2.29 performActionForItemAtIndex(index as Integer)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Causes the application to send the action message of a specified menu item to its target.
Notes:

If a target is not specified, the message is sent to the first responder. As a side effect, this method posts NSMenuWillSendActionNotification and NSMenuDidSendActionNotification.

In Mac OS X v10.6 and laster the performActionForItemAtIndex no longer triggers menu validation. This is because validation is typically done during menu tracking or key equivalent matching, so the subsequent performActionForItemAtIndex validation was redundant. To trigger validation explicitly, use invoke the update method.

In Mac OS X v10.6 performActionForItemAtIndex, when called, now triggers highlighting in the menu bar. It also sends out appropriate accessibility notifications indicating the item was selected.

34.2.30 popUpContextMenu(menu as NSMenuMBS, theEvent as NSEventMBS, view as NSViewMBS, font as NSFontMBS = nil)

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Displays a contextual menu over a view for an event using a specified font.
Notes:

menu: The menu object to use for the contextual menu.
event: An NSEvent object representing the event.
view: The view object over which to display the contextual menu.
font: An NSFont object representing the font for the contextual menu. If you pass in nil for the font, the method uses the default font for menu.

Specifying a font using the font parameter is discouraged. Instead set the menu's font using the setFont: method and pass nil for the font parameter.

34.2.31 popUpMenuPositioningItem(item as NSMenuItemMBS, location as NSPointMBS, view as NSViewMBS = nil) as boolean

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Pops up the menu at the specified location.
Example:

```
// create menu
dim m as new NSMenuMBS
m.autoenablesItems = false
```

```
// add some items
dim it as new NSMenuItemMBS
it.CreateMenuItem "Hello"
it.Enabled = true
m.addItem it

it = new NSMenuItemMBS
it.CreateMenuItem "World"
it.Enabled = true
m.addItem it

// show relative to this view
dim v as NSViewMBS = window1.PushButton1.NSViewMBS

dim r as Boolean
r = m.popUpMenuPositioningItem(nil, nil, v)
// you need to use NSMenuItemMBS subclasses with action event to get an event for which item was selected...
```

Notes:

item: The menu item to be positioned at the specified location in the view.
location: The location in the view coordinate system to display the menu item.
view: The view to display the menu item over.

Returns true if menu tracking ended because an item was selected, and false if menu tracking was cancelled for any reason.

Pops up the receiver as a popup menu. The top left corner of the specified item (if specified, item must be present in the receiver) is positioned at the specified location in the specified view, interpreted in the view's own coordinate system.

If item is nil, the menu is positioned such that the top left of the menu content frame is at the given location. If view is nil, the location is interpreted in the screen coordinate system. This allows you to pop up a menu disconnected from any window.

Available in OS X v10.6 and later.

34.2.32 removeAllItems

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all the menu items in the receiver.
Example:

```
dim n as NSMenuMBS // your menu

// for Mac OS X 10.6
n.removeAllItems

// for any Mac OS X version
for i as Integer = n.numberOfItems-1 DownTo 0
n.removeItemAtIndex i
next
```

Notes:

This method is more efficient than removing menu items individually.
Unlike the other remove methods, this method does not post NSMenuDidChangeItemNotification notifications.
Available in Mac OS X v10.6 and later.

34.2.33 removeItem(m as NSMenuItemMBS)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the menuitem.
Notes:

Does nothing if menuitem is nil.

The Xojo object used to add the menuitem must not be the same as the one you use here, but the values for the menuitems handle property must match.

34.2.34 removeItemAtIndex(index as Integer)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the menu item with the given index.
Example:

```
dim n as NSMenuMBS // your menu

// for Mac OS X 10.6
```

```
n.removeAllItems

// for any Mac OS X version
for i as Integer = n.numberOfItems-1 DownTo 0
n.removeItemAtIndex i
next
```

Notes: Index is from 0 to NumberOfItems-1.

34.2.35 setMenuBarVisible(value as boolean)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets whether the menu bar is visible and selectable by the user.
Notes:

value: true if menu bar is to be visible, otherwise false.
Available in Mac OS X v10.2 and later.

34.2.36 update

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enables or disables the receiver's menu items based on the NSMenuValidation informal protocol and sizes the menu to fit its current menu items if necessary.

34.2.37 windowsMenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the window menu if one is registered.

34.2.38 Properties

34.2.39 allowsContextMenuPlugIns as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the popup menu allows appending of contextual menu plugin items.
Notes:

Value is true if the popup menu allows appending of contextual menu plugin items, otherwise false.
Available in Mac OS X v10.6 and later.

(Read and Write property)

34.2.40 autoenablesItems as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether menu items are automatically enabled and disabled.
Notes:

Mac OS X 10.5 only.
(Read and Write property)

34.2.41 Font as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The font used to display the menu and its submenus.
Notes:

This font will be used to display the menu and any submenus that have not had their font set explicitly.
Available in Mac OS X v10.6 and later.
(Read and Write property)

34.2.42 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSMenu object.
Notes: (Read and Write property)

34.2.43 highlightedItem as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the highlighted item in the receiver.
Notes:

Returns the highlighted item in the receiver, or nil if no item in the menu is highlighted.
Available in Mac OS X v10.5 and later.
(Read only property)

34.2.44 menuBarHeight as Double

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the menu bar height for the current application's main menu.
Notes:

Returns the receiver's main menu bar height or 0.0 if the receiver is some other menu.
This method supersedes the menuBarHeight class method of the NSMenuView class.
Available in Mac OS X v10.4 and later.
(Read only property)

34.2.45 minimumWidth as Double

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minimum width of the menu.
Notes:

The menu will not draw smaller than its minimum width, but may draw larger if it needs more space. The default value is 0.
Available in Mac OS X v10.6 and later.
(Read and Write property)

34.2.46 numberOfItems as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of menu items in this menu.
Notes: (Read only property)

34.2.47 showsStateColumn as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver displays the state column.
Notes:

Available in Mac OS X v10.5 and later.
Returns true if the receiver displays the state column, otherwise false.

The state column is the area in the menu items, where state of menuitems are shown like a checkmark.
(Read and Write property)

34.2.48 size as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the size of the menu.
Notes:

Returns the size of the menu in screen coordinates.
The menu may draw at a smaller size when shown, depending on its positioning and display configuration.
Available in Mac OS X v10.6 and later.
(Read only property)

34.2.49 supermenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The parent menu of this menu.
Notes: (Read only property)

34.2.50 Title as String

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The title of the menu.
Notes: (Read and Write property)

34.2.51 userInterfaceLayoutDirection as Integer

MBS MacBase Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Configures the layout direction of menu items in the menu.
Notes:

This property configures the layout direction (a value of type NSUserInterfaceLayoutDirection) of menu items in the menu. If no layout direction is explicitly set for a menu, then the menu defaults to the layout direction specified for the application object. See userInterfaceLayoutDirection in NSApplication Class Reference.

NSUserInterfaceLayoutDirectionLeftToRight = 0
NSUserInterfaceLayoutDirectionRightToLeft = 1

Available in OS X v10.11 and later.
(Read and Write property)

34.2.52 Events

34.2.53 DidClose

MBS MacBase Plugin, Plugin Version: 14.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked after a menu closed.
Notes: Don't modify the structure of the menu or the menu items during this method.

34.2.54 EnableMenuItems

MBS MacBase Plugin, Plugin Version: 8.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called before the menu opens so you can edit the menu.

34.2.55 willHighlightItem(item as NSMenuItemMBS)

MBS MacBase Plugin, Plugin Version: 14.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked to indicate that a menu is about to highlight a given item.
Notes:

item: The item about to be highlighted.

Only one item per menu can be highlighted at a time. If item is nil, it means that all items in the menu are about to be unhighlighted.

34.2.56 WillOpen

MBS MacBase Plugin, Plugin Version: 14.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when a menu is about to open.
Notes: Don't modify the structure of the menu or the menu items during this method.

Chapter 35

Cocoa Networking

35.1 class NSCachedURLResponseMBS

35.1.1 class NSCachedURLResponseMBS

MBS MacBase Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A cached response to a URL request.
Notes:

A NSCachedURLResponseMBS object provides the server's response metadata in the form of a NSURLResponseMBS object, along with an NSData object containing the actual cached content data. Its storage policy determines whether the response should be cached on disk, in memory, or not at all.
Cached responses also contain a user info dictionary where you can store app-specific information about the cached item.
The NSURLCacheMBS class stores and retrieves instances of NSCachedURLResponseMBS.

35.1.2 Blog Entries

- MBS Xojo Plugins in version 19.0
- MBS Xojo Plugins, version 18.6pr2

35.1.3 Xojo Developer Magazine

- 17.2, page 11: News

35.1.4 Methods

35.1.5 Constructor(response as NSURLResponseMBS, data as MemoryBlock, userInfo as Dictionary = nil, storagePolicy as Integer = 0)

MBS MacBase Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a cached URL response instance.
Notes:

response: The response to cache.
data: The data to cache.

Returns a cached URL response object, containing the response and data.

The cache storage policy is set to the default, kCacheStorageAllowed, and the user info dictionary is set to nil.

35.1.6 copy as NSCachedURLResponseMBS

MBS MacBase Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the object.

35.1.7 Properties

35.1.8 Data as MemoryBlock

MBS MacBase Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The cached response's data.
Notes: (Read only property)

35.1.9 Handle as Integer

MBS MacBase Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

35.1.10 Response as NSURLResponseMBS

MBS MacBase Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The URL response object associated with the instance.
Notes: (Read only property)

35.1.11 StoragePolicy as Integer

MBS MacBase Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The cached response's storage policy.
Notes: (Read only property)

35.1.12 UserInfo as Dictionary

MBS MacBase Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The cached response's user info dictionary.
Notes:

This value is nil if there is no user info dictionary.
(Read only property)

35.1.13 Constants

35.1.14 kCacheStorageAllowed = 0

MBS MacBase Plugin, Plugin Version: 19.0. **Function:** One of the cache storage policy constants.
Notes: Allow caching.

35.1.15 kCacheStorageAllowedInMemoryOnly = 1

MBS MacBase Plugin, Plugin Version: 19.0. **Function:** One of the cache storage policy constants.
Notes: Allow caching only in memory.

35.1.16 kCacheStorageNotAllowed = 1

MBS MacBase Plugin, Plugin Version: 19.0. **Function:** One of the cache storage policy constants.
Notes: Caching is not allowed.

35.2 class NSHTTPCookieMBS

35.2.1 class NSHTTPCookieMBS

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An NSHTTPCookie object represents an HTTP cookie.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// we collect domain names
dim domains(-1) as string
for each cookie as NSHTTPCookieMBS in cookies
if domains.IndexOf(cookie.domain) <0 then
domains.Append cookie.domain
end if
next

// and display them
MsgBox "You have cookies from this domains: "+Join(domains, ", ")
```

Notes:

It's an immutable object initialized from a dictionary containing the cookie attributes.

Two versions of cookies are supported:

Version 0: This version refers to "traditional" or "old-style" cookies, the original cookie format defined by Netscape. The majority of cookies encountered are in this format.
Version 1: This version refers to cookies as defined in RFC 2965, HTTP State Management Mechanism.

35.2.2 Blog Entries

- Cookies in HTMLViewer

- MBS REALbasic Plugins, version 11.1pr3

35.2.3 Methods

35.2.4 comment as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the receiver's comment string.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display comment
MsgBox "Comment: "+Cookie.comment
```

Notes: The receiver's comment string or "" if the cookie has no comment. This string is suitable for presentation to the user, explaining the contents and purpose of this cookie.

35.2.5 commentURL as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the receiver's comment URL.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display comment URL
MsgBox "commentURL: "+Cookie.commentURL
```

Notes: The receiver's comment URL or "" if the cookie has none. This value specifies a URL which is suitable for presentation to the user as a link for further information about this cookie.

35.2.6 Constructor(properties as dictionary)

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an initialized NSHTTPCookie object using the provided properties.
Example:

```
// create dictionary with properties:
dim prop as new Dictionary
dim d as new date
d.Year = d.Year + 1

prop.Value(NSHTTPCookieMBS.NSHTTPCookieVersion)="0"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieName)="test"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieValue)="some value"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieOriginURL)="http://www.mbsplugins.de/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieDomain)="www.mbsplugins.de"
prop.Value(NSHTTPCookieMBS.NSHTTPCookiePath)="/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieExpires)=d

// create cookie from properties
dim cookie as new NSHTTPCookieMBS(prop)

// and display properties
dim dic as Dictionary = cookie.properties
dim list(-1) as string

for each key as Variant in dic.keys
List.Append key.StringValue+": "+dic.Value(key).StringValue
next

MsgBox Join(list,EndOfLine)
```

Notes:

properties: The properties for the new cookie object, expressed as key value pairs.

Handle is non zero on success.

35.2.7 cookiesWithResponseHeaderFields(headerFields as dictionary, URL as string) as NSHTTPCookieMBS()

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns an array of NSHTTPCookie objects corresponding to the provided response header fields for the provided URL.

Notes:

headerFields: The header fields used to create the NSHTTPCookie objects.
URL: The URL associated with the created cookies.

Returns the array of created cookies.

This method ignores irrelevant header fields in headerFields, allowing dictionaries to contain additional data.

If headerFields does not specify a domain for a given cookie, the cookie is created with a default domain value of theURL.

If headerFields does not specify a path for a given cookie, the cookie is created with a default path value of "/".

35.2.8 cookieWithProperties(dic as dictionary) as NSHTTPCookieMBS

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates and initializes an NSHTTPCookie object using the provided properties.
Example:

```
// create dictionary with properties:
dim prop as new Dictionary
dim d as new date
d.Year = d.Year + 1

prop.Value(NSHTTPCookieMBS.NSHTTPCookieVersion)="0"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieName)="test"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieValue)="some value"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieOriginURL)="http://www.mbsplugins.de/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieDomain)="www.mbsplugins.de"
prop.Value(NSHTTPCookieMBS.NSHTTPCookiePath)="/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieExpires)=d

// create cookie from properties
dim cookie as NSHTTPCookieMBS = NSHTTPCookieMBS.cookieWithProperties(prop)

// and display properties
dim dic as Dictionary = cookie.properties
dim list(-1) as string

for each key as Variant in dic.keys
List.Append key.StringValue+": "+dic.Value(key).StringValue
next
```

```
MsgBox Join(list,EndOfLine)
```

Notes:

dic: The properties for the new cookie object, expressed as key value pairs.

Returns the newly created cookie object. Returns nil if the provided properties are invalid.

See NSHTTPCookie* shared method for more information on the available header field constants and the constraints imposed on the values in the dictionary.

35.2.9 domain as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the domain of the receiver's cookie.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display domain:
MsgBox "Domain: "+Cookie.Domain
```

Notes: If the domain does not start with a dot, then the cookie is only sent to the exact host specified by the domain. If the domain does start with a dot, then the cookie is sent to other hosts in that domain as well, subject to certain restrictions. See RFC 2965 for more detail.

35.2.10 expiresDate as date

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the receiver's expiration date.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)
```

```
// display date:
MsgBox "Domain: "+Cookie.expiresDate.ShortTime+" "+Cookie.expiresDate.LongTime
```

Notes: The receiver's expiration date, or nil if there is no specific expiration date such as in the case of "session-only" cookies. The expiration date is the date when the cookie should be deleted.

35.2.11 isHTTPOnly as boolean

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the receiver should only be sent to HTTP servers per RFC 2965.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display isHTTPOnly value:
MsgBox "isHTTPOnly: "+str(Cookie.isHTTPOnly)
```

Notes:

Returns true if this cookie should only be sent via HTTP headers, false otherwise.

Cookies may be marked as HTTP only by a server (or by a javascript). Cookies marked as such must only be sent via HTTP Headers in HTTP requests for URL's that match both the path and domain of the respective cookies.

Important: Cookies specified as HTTP only should not be delivered to any javascript applications to prevent cross-site scripting vulnerabilities.

35.2.12 isSecure as boolean

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns whether his cookie should only be sent over secure channels.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies
```

```
// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display isSecure value:
MsgBox "isSecure: "+str(Cookie.isSecure)
```

Notes: True if this cookie should only be sent over secure channels, otherwise false.

35.2.13 isSessionOnly as boolean

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the receiver should be discarded at the end of the session (regardless of expiration date).
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display isSessionOnly value:
MsgBox "isSessionOnly: "+str(Cookie.isSessionOnly)
```

Notes: True if the receiver should be discarded at the end of the session (regardless of expiration date), otherwise false.

35.2.14 name as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the receiver's name.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display name:
```

MsgBox "name: "+Cookie.name

35.2.15 NSHTTPCookieComment as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the dictionary constants for cookies.
Notes:

An String containing the comment for the cookie.
Only valid for Version 1 cookies and later. This header field is optional.

35.2.16 NSHTTPCookieCommentURL as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the dictionary constants for cookies.
Notes:

An String containing the comment URL for the cookie.
Only valid for Version 1 cookies or later. This header field is optional.

35.2.17 NSHTTPCookieDiscard as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the dictionary constants for cookies.
Notes:

An String stating whether the cookie should be discarded at the end of the session.
String value must be either "TRUE" or "FALSE". This header field is optional. Default is "FALSE", unless this is cookie is version 1 or greater and a value for NSHTTPCookieMaximumAge is not specified, in which case it is assumed "TRUE".

35.2.18 NSHTTPCookieDomain as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the dictionary constants for cookies.
Notes:

An String containing the domain for the cookie.
A value must be specified for either NSHTTPCookieDomain or NSHTTPCookieOriginURL. If this header

field is missing the domain is inferred from the value for NSHTTPCookieOriginURL.

35.2.19 NSHTTPCookieExpires as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the dictionary constants for cookies.
Notes:

An Date object or String specifying the expiration date for the cookie.
This header field is only used for Version 0 cookies. This header field is optional.

35.2.20 NSHTTPCookieMaximumAge as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the dictionary constants for cookies.
Notes:

An String containing an integer value stating how long in seconds the cookie should be kept, at most.
Only valid for Version 1 cookies and later. Default is "0". This field is optional.

35.2.21 NSHTTPCookieName as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the dictionary constants for cookies.
Notes: An String object containing the name of the cookie. This field is required.

35.2.22 NSHTTPCookieOriginURL as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the dictionary constants for cookies.
Notes:

An String containing the URL that set this cookie.
A value must be specified for either NSHTTPCookieDomain or NSHTTPCookieOriginURL.

35.2.23 NSHTTPCookiePath as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the dictionary constants for cookies.

Notes:

An String containing the path for the cookie. This field is required if you are using the NSHTTPCookieDomain key instead of the NSHTTPCookieOriginURL key.
If you are using the NSHTTPCookieOriginURL key, the path is inferred if it is not provided. The default value is "/".

35.2.24 NSHTTPCookiePort as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the dictionary constants for cookies.
Notes:

An String containing comma-separated integer values specifying the ports for the cookie.
Only valid for Version 1 cookies or later. The default value is an empty string (""). This header field is optional.

35.2.25 NSHTTPCookieSecure as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the dictionary constants for cookies.
Notes:

An String indicating that the cookie should be transmitted only over secure channels.
Providing any value for this key indicates that the cookie should remain secure.

35.2.26 NSHTTPCookieValue as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the dictionary constants for cookies.
Notes:

An String containing the value of the cookie.
This header field is required.

35.2.27 NSHTTPCookieVersion as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the dictionary constants for cookies.
Notes:

An String that specifies the version of the cookie.
Must be either "0" or "1". The default is "0". This header field is optional.

35.2.28 path as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the receiver's path.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display path:
MsgBox "path: "+Cookie.path
```

Notes: The cookie will be sent with requests for this path in the cookie's domain, and all paths that have this prefix. A path of "/" means the cookie will be sent for all URLs in the domain.

35.2.29 portList as Integer()

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the receiver's port list.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display port list

dim PortList(-1) as Integer = cookie.portList
if UBound(PortList)=-1 then
MsgBox "Port List: all ports."
else
dim list(-1) as string
for each port as Integer in portList
List.Append str(port)
next
```

```
MsgBox "Port List: "+Join(list, ", ")
end if
```

Notes: The list of ports for the cookie, returned as an array of integers. If the cookie has no port list this method returns nil and the cookie will be sent to any port. Otherwise, the cookie is only sent to ports specified in the port list.

35.2.30 properties as dictionary

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the receiver's cookie properties.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display properties

dim dic as Dictionary = cookie.properties
dim list(-1) as string

for each key as Variant in dic.keys
List.Append key.StringValue+": "+dic.Value(key).StringValue
next

MsgBox Join(list,EndOfLine)
```

Notes:

Returns dictionary representation of the receiver's cookie properties.
This dictionary can be used with Constructor or cookieWithProperties to create an equivalent NSHTTP-Cookie object.

35.2.31 requestHeaderFieldsWithCookies(cookies() as NSHTTPCookieMBS) as dictionary

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a dictionary of header fields corresponding to a provided array of cookies.
Example:

```
// create dictionary with properties:
dim prop as new Dictionary
dim d as new date
d.Year = d.Year + 1

prop.Value(NSHTTPCookieMBS.NSHTTPCookieVersion)="0"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieName)="test"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieValue)="some value"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieOriginURL)="http://www.mbsplugins.de/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieDomain)="www.mbsplugins.de"
prop.Value(NSHTTPCookieMBS.NSHTTPCookiePath)="/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieExpires)=d

// create cookie from properties
dim cookie as new NSHTTPCookieMBS(prop)
dim cookies(-1) as NSHTTPCookieMBS
cookies.Append cookie

// get request headers
dim dic as Dictionary = NSHTTPCookieMBS.requestHeaderFieldsWithCookies(cookies)

// and show them:
dim list(-1) as string

for each key as Variant in dic.keys
List.Append key.StringValue+": "+dic.Value(key).StringValue
next

MsgBox Join(list,EndOfLine)
```

Notes:

cookies: The cookies from which the header fields are created.

Returns the dictionary of header fields created from the provided cookies. This dictionary can be used to add cookies to a request.

35.2.32 value as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the receiver's value.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display value
MsgBox "Value: "+Cookie.value
```

35.2.33 version as Integer

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the receiver's version.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display version value:
MsgBox "Version: "+str(Cookie.Version)
```

Notes: Returns the receiver's version. Version 0 maps to "old-style" Netscape cookies. Version 1 maps to RFC 2965 cookies.

35.2.34 Properties

35.2.35 Handle as Integer

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

35.3 class NSHTTPCookieStorageMBS

35.3.1 class NSHTTPCookieStorageMBS

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: NSHTTPCookieStorage implements a singleton object (shared instance) that manages the shared cookie storage.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// we collect values
dim list(-1) as string
for each cookie as NSHTTPCookieMBS in cookies
List.Append cookie.name+": "+cookie.value
next

// and display them
MsgBox join(list, EndOfLine)
```

Notes:

These cookies are shared among all applications and are kept in sync cross-process.

Note: Changes made to the cookie accept policy affect all currently running applications using the cookie storage.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

35.3.2 Blog Entries

- Cookies in HTMLViewer
- MBS REALbasic Plugins, version 11.1pr3

35.3.3 Methods

35.3.4 Constructor

MBS MacControls Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

35.3.5 cookies as NSHTTPCookieMBS()

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the cookie storage's cookies.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// we collect values
dim list(-1) as string
for each cookie as NSHTTPCookieMBS in cookies
List.Append cookie.name+": "+cookie.value
next

// and display them
MsgBox join(list, EndOfLine)
```

Notes: Returns an array containing all of the cookie storage's cookies.

35.3.6 cookiesForURL(URL as string) as NSHTTPCookieMBS()

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns all the cookie storage's cookies that are sent to a specified URL.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookiesForURL("http://www.apple.com/")

// we collect values for apple.com:
dim list(-1) as string
for each cookie as NSHTTPCookieMBS in cookies
List.Append cookie.name+": "+cookie.value
next

// and display them
MsgBox join(list, EndOfLine)
```

Notes: An application can use NSHTTPCookie method requestHeaderFieldsWithCookies to turn this array into a set of header fields to add to an NSMutableURLRequest object.

35.3.7 cookiesToArray(cookies() as NSHTTPCookieMBS) as Integer

MBS MacControls Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Puts the cookie storage's cookies in the given array.
Example:

```
// get storage
dim s as NSHTTPCookieStorageMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage

// predim an array with a lot of space
dim cookies(5000) as NSHTTPCookieMBS

// now ask plugin to put cookies inside
dim c as Integer = s.cookiesToArray(cookies)

// show count
MsgBox str(c)+" cookies"

// pick first and show name
dim cookie as NSHTTPCookieMBS = cookies(0)
MsgBox cookie.name
```

Notes:

Returns total number of cookies.
This is for Xojo 2007 where the cookies function doesn't work.
For Xojo and Xojo you can use cookies function.

35.3.8 deleteCookie(cookie as NSHTTPCookieMBS)

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Deletes the specified cookie from the cookie storage.

35.3.9 NSHTTPCookieManagerAcceptPolicyChangedNotification as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names you can register with the NSNotificationObserverMBS class.
Notes:

This notification is posted when the acceptance policy of the NSHTTPCookieStorage instance has changed. In Mac OS X, cookies are shared among applications, meaning this notification can be sent in response to another application's actions. Cookies are not shared among applications in iOS.

The notification object is the NSHTTPCookieStorage instance. This notification does not contain a userInfo dictionary.

35.3.10 NSHTTPCookieManagerCookiesChangedNotification as string

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the notification names you can register with the NSNotificationObserverMBS class.
Notes:

This notification is posted when the cookies stored in the NSHTTPCookieStorage instance have changed. In Mac OS X, cookies are shared among applications, meaning this notification can be sent in response to another application's actions. Cookies are not shared among applications in iOS.

The notification object is the NSHTTPCookieStorage instance. This notification does not contain a userInfo dictionary.

35.3.11 removeCookiesSinceDate(d as date)

MBS MacControls Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Delete all cookies from the cookie storage since the provided date.
Notes: Available on macOS 10.10 or newer.

35.3.12 setCookie(cookie as NSHTTPCookieMBS)

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Stores a specified cookie in the cookie storage if the cookie accept policy permits.
Notes: The cookie replaces an existing cookie with the same name, domain, and path, if one exists in the cookie storage. This method accepts the cookie only if the receiver's cookie accept policy is NSHTTPCookieAcceptPolicyAlways or NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain. The cookie is ignored if the receiver's cookie accept policy is NSHTTPCookieAcceptPolicyNever.

35.3.13 setCookies(cookies() as NSHTTPCookieMBS, URL as string, mainDocumentURL as string)

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Adds an array of cookies to the receiver if the receiver's cookie acceptance policy permits.
Notes:

cookies: The cookies to add.
URL: The URL associated with the added cookies.

mainDocumentURL: The URL of the main HTML document for the top-level frame, if known. Can be "". This URL is used to determine if the cookie should be accepted if the cookie accept policy is NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain.

The cookies will replace existing cookies with the same name, domain, and path, if one exists in the cookie storage. The cookie will be ignored if the receiver's cookie accept policy is NSHTTPCookieAcceptPolicyNever.

To store cookies from a set of response headers, an application can use cookiesWithResponseHeaderFields passing a header field dictionary and then use this method to store the resulting cookies in accordance with the receiver's cookie acceptance policy.

35.3.14 sharedHTTPCookieStorage as NSHTTPCookieStorageMBS

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the shared cookie storage instance.
Example:

```
dim s as NSHTTPCookieStorageMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage
dim cookies() as NSHTTPCookieMBS = s.cookies
MsgBox str(UBound(cookies)+1)+" cookies"
```

35.3.15 Properties

35.3.16 Handle as Integer

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal reference to the NSHTTPCookieStorage object.
Notes: (Read and Write property)

35.3.17 cookieAcceptPolicy as Integer

MBS MacControls Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The cookie storage's cookie accept policy.
Example:

```
Select case NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookieAcceptPolicy
case NSHTTPCookieStorageMBS.NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain
MsgBox "Cookies: only from main document domain"
case NSHTTPCookieStorageMBS.NSHTTPCookieAcceptPolicyNever
```

```
MsgBox "Cookies: never"
case NSHTTPCookieStorageMBS.NSHTTPCookieAcceptPolicyAlways
MsgBox "Cookies: always"
else
MsgBox "Cookies: unknown setting"
end Select
```

Notes:

The default cookie accept policy is NSHTTPCookieAcceptPolicyAlways.

Changing the cookie policy affects all currently running applications using the cookie storage.
(Read and Write computed property)

35.3.18 Constants

35.3.19 NSHTTPCookieAcceptPolicyAlways = 0

MBS MacControls Plugin, Plugin Version: 11.1. **Function:** One of the cookie accept policy constants. **Notes:** Accept all cookies. This is the default cookie accept policy.

35.3.20 NSHTTPCookieAcceptPolicyNever = 1

MBS MacControls Plugin, Plugin Version: 11.1. **Function:** One of the cookie accept policy constants. **Notes:** Reject all cookies.

35.3.21 NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain = 2

MBS MacControls Plugin, Plugin Version: 11.1. **Function:** One of the cookie accept policy constants. **Notes:** Accept cookies only from the main document domain.

35.4 class NSURLAuthenticationChallengeMBS

35.4.1 class NSURLAuthenticationChallengeMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for an authentication challenge.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

35.4.2 Methods

35.4.3 cancelAuthenticationChallenge

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Tells the system to cancel this challenge.

35.4.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

35.4.5 continueWithoutCredentialForAuthenticationChallenge

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Tells the system to continue this challenge without a password.

35.4.6 error as NSErrorMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NSError object representing the last authentication failure.
Notes:

This method returns nil if the protocol doesn't use errors to indicate an authentication failure.

Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

35.4.7 failureResponse as NSURLResponseMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the response representing authentication failure.
Notes: If there was a previous authentication failure, and this protocol uses responses to indicate authentication failure, then this method will return the response. Otherwise it will return nil.

35.4.8 previousFailureCount as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get count of previous failed authentication attempts.

35.4.9 proposedCredential as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the proposed credential for this challenge.
Notes: proposedCredential may be nil, if there is no default credential to use for this challenge (either stored or in the URL). If the credential is not nil and returns true for hasPassword, this means the NSURLConnection thinks the credential is ready to use as-is. If it returns false for hasPassword, then the credential is not ready to use as-is, but provides a default username the client could use when prompting.

35.4.10 protectionSpace as NSURLProtectionSpaceMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get a description of the protection space that requires authentication.
Notes: Returns the protection space that needs authentication.

35.4.11 useCredential(credential as NSURLCredentialMBS)

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Tells the system to use a certain credential for this challenge.

35.4.12 Properties

35.4.13 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal used handle for this challenge.
Notes: (Read and Write property)

35.5 class NSURLCacheMBS

35.5.1 class NSURLCacheMBS

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for the caching.
Notes:

NSURLCache implements the caching of responses to URL load requests by mapping NSURLRequest objects to NSCachedURLResponse objects. It is a composite of an in-memory and an on-disk cache.
Methods are provided to manipulate the sizes of each of these caches as well as to control the path on disk to use for persistent storage of cache data.

35.5.2 Blog Entries

- MBS Xojo Plugins in version 19.0
- MBS Xojo Plugins, version 18.6pr2

35.5.3 Xojo Developer Magazine

- 17.5, page 10: News

35.5.4 Methods

35.5.5 cachedResponseForRequest(request as NSURLRequestMBS) as NSCachedURLResponseMBS

MBS MacBase Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the cached URL response in the cache for the specified URL request.
Notes:

request: The URL request whose cached response is desired.

Returns the cached URL response for request, or nil if no response has been cached.

35.5.6 Constructor(memoryCapacity as UInt64, diskCapacity as UInt64, diskPath as folderitem)

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an NSURLCache object with the specified values.
Notes:

memoryCapacity: The memory capacity of the cache, in bytes.
diskCapacity: The disk capacity of the cache, in bytes.
path: The location at which to store the on-disk cache.

The returned NSURLCache is backed by disk, so developers can be more liberal with space when choosing the capacity for this kind of cache. A disk cache measured in the tens of megabytes should be acceptable in most cases.

35.5.7 removeAllCachedResponses

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clears the receiver's cache, removing all stored cached URL responses.

35.5.8 removeCachedResponseForRequest(request as NSURLRequestMBS)

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the cached URL response for a specified URL request.
Notes: request: The URL request whose cached URL response should be removed. If there is no corresponding cached URL response, no action is taken.

35.5.9 removeCachedResponsesSinceDate(d as date)

MBS MacBase Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clears the given cache of any cached responses since the provided date.
Notes:

d: The earliest date of responses that should remain in the cache. Any responses with dates later than this parameter should be removed.

Available in macOS 10.10 or newer.

35.5.10 setSharedURLCache(cache as NSURLCacheMBS)

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the shared NSURLCache instance to a specified cache object.
Notes: Applications that have special caching requirements or constraints should use this method to specify an NSURLCache instance with customized cache settings.

35.5.11 sharedURLCache as NSURLCacheMBS

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the shared NSURLCache instance.
Notes:

The disk path is set to: <user_home_directory>/Library/Caches/<current_process_name>. The user's home directory is determined by calling NSHomeDirectory and the current process name is determined using NSProcessInfoMBS.processName.

Applications that do not have special caching requirements or constraints should find the default shared cache instance acceptable. Applications with more specific needs can create a custom NSURLCache object and set it as the shared cache instance using setSharedURLCache.

35.5.12 storeCachedResponse(cachedResponse as NSCachedURLResponseMBS, request as NSURLRequestMBS)

MBS MacBase Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stores a cached URL response for a specified request.
Notes:

cachedResponse: The cached URL response to store.
request: The request for which the cached URL response is being stored.

If you override this method, you should also override storeCachedResponse.

35.5.13 Properties

35.5.14 currentDiskUsage as UInt64

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current size of the receiver's on-disk cache, in bytes.
Notes: (Read only property)

35.5.15 currentMemoryUsage as UInt64

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current size of the receiver's in-memory cache, in bytes.
Notes: (Read only property)

35.5.16 diskCapacity as UInt64

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The on-disk cache capacity.
Notes: (Read and Write property)

35.5.17 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal handle to the NSURLCache object.
Notes: (Read and Write property)

35.5.18 memoryCapacity as UInt64

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The in-memory cache capacity.
Notes: (Read and Write property)

35.5.19 Constants

35.5.20 NSURLCacheStorageAllowed = 0

MBS MacBase Plugin, Plugin Version: 9.7. **Function:** One of the constants for the cache strategy.
Notes: Specifies that storage in an NSURLCache is allowed without restriction.

35.5.21 NSURLCacheStorageAllowedInMemoryOnly = 1

MBS MacBase Plugin, Plugin Version: 9.7. **Function:** One of the constants for the cache strategy.
Notes: Specifies that storage in an NSURLCache is allowed; however storage should be done in memory only, no disk storage should be done.

35.5.22 NSURLCacheStorageNotAllowed = 2

MBS MacBase Plugin, Plugin Version: 9.7. **Function:** One of the constants for the cache strategy.
Notes: Specifies that storage in an NSURLCache is not allowed in any fashion, either in memory or on disk.

35.6 class NSURLConnectionFilterMBS

35.6.1 class NSURLConnectionFilterMBS

MBS MacCocoa Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class to filter URL connections.
Notes: This class is designed to allow you to intercept your application creating NSURLConnection objects and change the NSURLRequest used. This can be useful to change timeouts on Xojo.Net.HTTPSocket class.

35.6.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 18.2
- MBS Xojo Plugins, version 18.2pr3
- Xojo.Net.HTTPSocket and Timeouts

35.6.3 Properties

35.6.4 Enabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the event is enabled.
Notes:

Default is true.
(Read and Write property)

35.6.5 Events

35.6.6 FilterConnection(request as NSURLRequestMBS) as NSURLRequestMBS

MBS MacCocoa Plugin, Plugin Version: 18.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when a new connection is made.
Example:

```
Function FilterConnection(request as NSURLRequestMBS) Handles FilterConnection as NSURLRequestMBS
system.debuglog CurrentMethodName
system.debuglog "URL: "+request.URL

dim newRequest as NSMutableURLRequestMBS = request.mutableCopy

// change to 10 minutes
```

```
newRequest.setTimeoutInterval 600

return newRequest
End Function
```

Notes:

You get the current request and you can return a new request.
If you return nil, we pass through the existing one.
Only requests on main thread trigger the event.

35.7 class NSURLConnectionMBS

35.7.1 class NSURLConnectionMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSURLConnection object provides support to perform the loading of a URL request.
Notes:

The interface for NSURLConnection is sparse, providing only the controls to start and cancel asynchronous loads of a URL request.

NSURLConnection's events allow an object to receive informational callbacks about the asynchronous load of a URL request. Other events provide facilities that allow the subclass to customize the process of performing an asynchronous URL load. These events are called on the thread that started the asynchronous load operation for the associated NSURLConnection object.

NSURLConnection also has a convenience class method, sendSynchronousRequest, to load a URL request synchronously.

The following contract governs the events defined in this class:

- Zero or more willSendRequest events are called before any further event is called if it is determined that the download must redirect to a new location. The delegate can allow the redirect, modify the destination, or deny the redirect.
- Zero or more willSendRequestForAuthenticationChallenge events are called before a request for an authentication challenge is sent. The delegate can call the appropriate NSURLAuthenticationChallengeMBS method and perform any other required task related to credentials.
- Zero or more didReceiveAuthenticationChallenge vents are called if it is necessary to authenticate in order to download the request and the connection does not already have authenticated credentials.
- Zero or more didCancelAuthenticationChallenge vents are called if the connection cancels the authentication challenge due to the protocol implementation encountering an error.
- Zero or more didReceiveResponse events are called before receiving a didReceiveData message. The only case where didReceiveResponse is not sent to a delegate is when the protocol implementation encounters an error before a response can be created.
- Zero or more didReceiveData events are called before any of the following messages are sent to the delegate: willCacheResponse, DidFinishLoading, didFailWithError.
- Zero or one willCacheResponse events are called to the delegate after didReceiveData is sent but before a DidFinishLoading message is sent.

Unless an NSURLConnection object receives a cancel message, the subclasses receives one and only one of DidFinishLoading, or didFailWithError message, but never both. In addition, once either of these messages

is sent, the delegate receives no further messages for the connection.

35.7.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr3
- MBS Real Studio Plugins, version 11.3pr7

35.7.3 Methods

35.7.4 cancel

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Cancels an asynchronous load of a request.
Notes: After this method is called, the connection's delegate no longer receives any messages for the connection. If you want to reattempt the connection, you should create a new connection object.

35.7.5 canHandleRequest(request as NSURLRequestMBS) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether a request can be handled based on a preflight evaluation.
Notes:

request: The request to evaluate.

Returns true if a preflight operation determines that a connection with request can be created and the associated I/O can be started, false otherwise.

The result of this method is valid as long as no NSURLProtocol classes are registered or unregistered, and request remains unchanged. Applications should be prepared to handle failures even if they have performed request preflighting by calling this method.

35.7.6 Constructor(request as NSURLRequestMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates URL connection and begins to load the data for the URL request.
Notes:

request: The URL request to load. The request object is deep-copied as part of the initialization process. Changes made to request after this method returns do not affect the request that is used for the loading

process.

On success handle property is not zero.

This is equivalent to calling Constructor and passing true for optional startImmediately.
See also:

- 35.7.7 Constructor(request as NSURLRequestMBS, startImmediately as boolean) 7570

35.7.7 Constructor(request as NSURLRequestMBS, startImmediately as boolean)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates URL connection and begins to load the data for the URL request, if specified.
Notes:

request: The URL request to load. The request object is deep-copied as part of the initialization process. Changes made to request after this method returns do not affect the request that is used for the loading process.
startImmediately: True if the connection should being loading data immediately, otherwise false.

On success the handle property is not zero.

Available in Mac OS X v10.5 and later.
See also:

- 35.7.6 Constructor(request as NSURLRequestMBS) 7569

35.7.8 data as MemoryBlock

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The data downloaded so far.
Notes: The plugin adds the new data it gets in the didReceiveData event to a big memoryblock and gives you access to it using this event.

35.7.9 sendSynchronousRequest(request as NSURLRequestMBS, byref response as NSURLResponseMBS, byref error as NSErrorMBS) as Memoryblock

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Performs a synchronous load of the specified URL request.
Example:

```
dim request as new NSURLRequestMBS("http://www.monkeybreadsoftware.de/images/MBSLogo.jpg")
dim error as NSErrorMBS
dim response as NSURLResponseMBS
dim d as MemoryBlock = NSURLConnectionMBS.sendSynchronousRequest(request, response, error)

if d<>Nil then
dim pic as Picture = JPEGStringToPictureMBS(d, true)
window1.Backdrop = pic
end if

if error<>Nil then
MsgBox "Error: "+error.description
end if
```

Notes:

request: The URL request to load. The request object is deep-copied as part of the initialization process. Changes made to request after this method returns do not affect the request that is used for the loading process.
response: Out parameter for the URL response returned by the server.
error: Out parameter used if an error occurs while processing the request.

Returns the downloaded data for the URL request. Returns nil if a connection could not be created or if the download fails.

A synchronous load is built on top of the asynchronous loading code made available by the class. The calling thread is blocked while the asynchronous loading system performs the URL load on a thread spawned specifically for this load request. No special threading or run loop configuration is necessary in the calling thread in order to perform a synchronous load.

Important: Because this call can potentially take several minutes to fail (particularly when using a cellular network in iOS), you should never call this function from the main thread of a GUI application.

If authentication is required in order to download the request, the required credentials must be specified as part of the URL. If authentication fails, or credentials are missing, the connection will attempt to continue without credentials.

35.7.10 start

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Causes the connection to begin loading data, if it has not already.
Notes:

Calling this method is necessary only if you create a connection with the Constructor method and provide false for the startImmediately parameter.

Available in Mac OS X v10.5 and later.

35.7.11 Properties

35.7.12 Handle as Integer

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

35.7.13 Events

35.7.14 canAuthenticateAgainstProtectionSpace(protectionSpace as NSURLProtectionSpaceMBS) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent to determine whether the delegate is able to respond to a protection space's form of authentication.
Notes:

protectionSpace: The protection space that generates an authentication challenge.

Return true if you are able to respond to a protection space's form of authentication, otherwise false.

This method is called before didReceiveAuthenticationChallenge, allowing the class to inspect a protection space before attempting to authenticate against it. By returning true, the event indicates that it can handle the form of authentication, which it does in the subsequent call to didReceiveAuthenticationChallenge. If the event returns false, the system attempts to use the user's keychain to authenticate. If your delegate does not implement this method and the protection space uses client certificate authentication or server trust authentication, the system behaves as if you returned false. The system behaves as if you returned true for all other authentication methods.

Available in Mac OS X v10.6 and later.

35.7.15 didCancelAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a connection cancels an authentication challenge.
Notes: challenge: The challenge that was canceled.

35.7.16 didFailWithError(error as NSErrorMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a connection fails to load its request successfully.
Notes:

error: An error object containing details of why the connection failed to load the request successfully.

Once the delegate receives this message, it will receive no further messages for connection.

35.7.17 didFinishLoading

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a connection has finished loading successfully.

35.7.18 didReceiveAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a connection must authenticate a challenge in order to download its request.
Notes:

challenge: The challenge that connection must authenticate in order to download its request.

This method gives the class the opportunity to determine the course of action taken for the challenge provide credentials, continue without providing credentials, or cancel the authentication challenge and the download.

The delegate can determine the number of previous authentication challenges by sending the message previousFailureCount to challenge.

If the previous failure count is 0 and the value returned by proposedCredential is nil, the delegate can create a new NSURLCredential object, providing information specific to the type of credential, and send a useCredential:forAuthenticationChallenge: message to [challenge sender] , passing the credential and challenge as

parameters. If proposedCredential is not nil, the value is a credential from the URL or the shared credential storage that can be provided to the user as feedback.

The delegate may decide to abandon further attempts at authentication at any time by sending [challenge sender] a continueWithoutCredentialForAuthenticationChallenge: or a cancelAuthenticationChallenge: message. The specific action is implementation dependent.

If the delegate implements this method, the download will suspend until [challenge sender] is sent one of the following messages: useCredential:forAuthenticationChallenge:, continueWithoutCredentialForAuthenticationChallenge: or cancelAuthenticationChallenge:.

If the delegate does not implement this method the default implementation is used. If a valid credential for the request is provided as part of the URL, or is available from the NSURLCredentialStorage the [challenge sender] is sent a useCredential:forAuthenticationChallenge: with the credential. If the challenge has no credential or the credentials fail to authorize access, then continueWithoutCredentialForAuthenticationChallenge: is sent to [challenge sender] instead.

35.7.19 didReceiveData(newData as Memoryblock)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent as a connection loads data incrementally.
Notes:

newdata: The newly available data.

The data property is updated before this event is called and gives you a way to see all data received so far.

35.7.20 didReceiveResponse(response as NSURLResponseMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the connection has received sufficient data to construct the URL response for its request.
Notes:

response: The URL response for the connection's request. This object is immutable and will not be modified by the URL loading system once it is presented to the delegate.

In rare cases, for example in the case of an HTTP load where the content type of the load data is multipart/x-mixed-replace, the delegate will receive more than one didReceiveResponse message. In the event this occurs, delegates should discard all data previously delivered by didReceiveData, and should be prepared to handle the, potentially different, MIME type reported by the newly reported URL response.

The only case where this message is not sent to the delegate is when the protocol implementation encounters an error before a response could be created.

35.7.21 didSendBodyData(bytesWritten as Int64, totalBytesWritten as Int64, totalBytesExpectedToWrite as Int64)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent as the body (message data) of a request is transmitted (such as in an http POST request).
Notes:

bytesWritten: The number of bytes written in the latest write.
totalBytesWritten: The total number of bytes written for this connection.
totalBytesExpectedToWrite: The number of bytes the connection expects to write.

This method provides an estimate of the progress of a URL upload.
The value of totalBytesExpectedToWrite may change during the upload if the request needs to be retransmitted due to a lost connection or an authentication challenge from the server.
Available in Mac OS X v10.6 and later.

35.7.22 shouldUseCredentialStorage as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent to determine whether the URL loader should consult the credential storage for authenticating the connection.
Notes:

This method is called before any attempt to authenticate is made. By returning false, the delegate tells the connection not to consult the credential storage and makes itself responsible for providing credentials for any authentication challenges. Not implementing this method is the same as returning true. The delegate is free to consult the credential storage itself when it receives a didReceiveAuthenticationChallenge event.

Available in Mac OS X v10.6 and later.

35.7.23 willCacheResponse(cachedResponse as NSCachedURLResponseMBS) as NSCachedURLResponseMBS

MBS MacBase Plugin, Plugin Version: 19.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The connection will cache this response.
Notes: If you implement this event, please return request to cache or nil to not cache.

35.7.24 willSendRequest(request as NSURLRequestMBS, redirectResponse as NSURLResponseMBS) as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the connection determines that it must change URLs in order to continue loading a request.
Notes:

request: The proposed redirected request. You should inspect the redirected request to verify that it meets its needs, and create a copy with new attributes to return to the connection if necessary.
redirectResponse: The URL response that caused the redirect. May be nil in cases where this method is not being sent as a result of involving the delegate in redirect processing.

The actual URL request to use in light of the redirection response. The event may return request unmodified to allow the redirect, return a new request, or return nil to reject the redirect and continue processing the connection.

If you wish to cancel the redirect connection, it should call the connection object's cancel method. Alternatively, the delegate method can return nil to cancel the redirect connection, and the original connection will continue to process. This has special relevance in the case where redirectResponse is not nil. In this case, any data that is loaded for the connection will be sent to the delegate, and the delegate will receive a connectionDidFinishLoading or didFailLoadingWithError message, as appropriate.

Note: Prior to Mac OS X version 10.5, returning nil in this method sometimes would cancel the connection but other times would cause the connection to use the given request unmodified. In addition, prior to version 10.5, NSURLConnection would often modify the incoming NSURLRequest object before transmission without notifying the delegate. In version 10.5 and later, it always notifies the delegate via willSendRequest, and thus the delegate might receive this message before the connection has even properly begun, prior to transmitting the request to the remote server.
The delegate can receive this message as a result of modifying a request before it is sent, for example to transform the request's URL to its canonical form. To detect this case, examine redirectResponse; if it is nil, the message was not sent due to a redirect.

The delegate should be prepared to receive this message multiple times.

35.7.25 willSendRequestForAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Tells the delegate that the connection will send a request for an authentication challenge.
Notes:

challenge: The authentication challenge for which a request is being sent.

This method allows the delegate to make an informed decision about connection authentication at once. If the delegate implements this method, it has no need to implement canAuthenticateAgainstProtectionSpace, didReceiveAuthenticationChallenge, shouldUseCredentialStorage. In fact, these other methods are not invoked.

In this method,you must invoke one of the challenge-responder methods (NSURLAuthenticationChallengeSenderMBS):

useCredential
continueWithoutCredentialForAuthenticationChallenge
cancelAuthenticationChallenge
performDefaultHandlingForAuthenticationChallenge
rejectProtectionSpaceAndContinueWithChallenge

You might also want to analyze challenge for the authentication scheme and the proposed credential before calling a NSURLAuthenticationChallengeSenderMBS method. You should never assume that a proposed credential is present. You can either create your own credential and respond with that, or you can send the proposed credential back. (Because this object is immutable, if you want to change it you must copy it and then modify the copy.)

35.8 class NSURLCredentialMBS

35.8.1 class NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a stored password.
Notes:

dim u as NSURLCredentialMBS
dim p as Integer = NSURLCredentialMBS.NSURLCredentialPersistenceForSession

u = NSURLCredentialMBS.credential("Christian", "teddy123", p)

MsgBox u.user+EndOfLine+u.password+EndOfLine+str(u.persistence)
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

35.8.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.4pr6

35.8.3 Methods

35.8.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

35.8.5 copy as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the credential object.

35.8.6 credential(User as string, password as string, persistence as Integer = 0) as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create a new NSURLCredential with a user and password.
Example:

dim u as NSURLCredentialMBS
dim p as Integer = NSURLCredentialMBS.NSURLCredentialPersistenceForSession

u = NSURLCredentialMBS.credential("Christian", "teddy123", p)

MsgBox u.user+EndOfLine+u.password+EndOfLine+str(u.persistence)

Notes:

user: the username
password: the password
persistence: Integer that says to store per session, permanently or not at all.
Can be NSURLCredentialPersistenceForSession, NSURLCredentialPersistenceNone or NSURLCredentialPersistencePermanent.

35.8.7 hasPassword as Boolean

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Find out if this credential has a password, without trying to get it.
Notes:

Returns true if this credential has a password, otherwise false.

If this credential's password is actually kept in an external store, the password method may return "" even if this method returns true, since getting the password may fail, or the user may refuse access.

35.8.8 password as string

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the password.
Notes: This method might actually attempt to retrieve the password from an external store, possible resulting in prompting, so do not call it unless needed.

35.8.9 persistence as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Determine whether this credential is or should be stored persistently.
Notes:

Use the constants:
NSURLCredentialPersistenceNone
NSURLCredentialPersistenceForSession

NSURLCredentialPersistencePermanent

35.8.10 user as string

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the username.

35.8.11 Properties

35.8.12 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal used handle for this class.
Notes: (Read and Write property)

35.8.13 Constants

35.8.14 NSURLCredentialPersistenceForSession = 1

MBS MacBase Plugin, Plugin Version: 7.5. **Function:** This credential will only be stored for this session.

35.8.15 NSURLCredentialPersistenceNone = 0

MBS MacBase Plugin, Plugin Version: 7.5. **Function:** This credential won't be saved.

35.8.16 NSURLCredentialPersistencePermanent = 2

MBS MacBase Plugin, Plugin Version: 7.5. **Function:** This credential will be stored permanently and shared with other applications.

35.9 class NSURLCredentialStorageMBS

35.9.1 class NSURLCredentialStorageMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSURLCredentialStorage implements a singleton object (shared instance) which manages the shared credentials cache.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

35.9.2 Methods

35.9.3 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

35.9.4 defaultCredentialForProtectionSpace(space as NSURLProtectionSpaceMBS) as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the default credential for the specified protection space.

35.9.5 sharedCredentialStorage as NSURLCredentialStorageMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the shared singleton authentication storage.

35.9.6 Properties

35.9.7 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal used handle for this class.
Notes: (Read and Write property)

35.10 class NSURLDownloadMBS

35.10.1 class NSURLDownloadMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSURL Download class which handles downloads for Webkit.
Notes:

NSURLDownload downloads a request asynchronously and saves the data to a file. The interface for NSURLDownload is sparse, providing methods to initialize a download, set the destination path and cancel loading the request.

NSURLDownload's delegate methods—defined by the NSURLDownloadDelegate—allow an object to receive informational callbacks about the asynchronous load of the URL request. Other delegate methods provide facilities that allow the delegate to customize the process of performing an asynchronous URL load.

Note that these delegate methods are called on the thread that started the asynchronous load operation for the associated NSURLDownload object.

The MBS Plugins currently only implement a part of this class for use with WebDownloadDelegateMBS. So please contact us if you need more.

35.10.2 Blog Entries

- Notes from the last days
- MBS Real Studio Plugins, version 11.3pr6
- MBS Real Studio Plugins, version 11.3pr5

35.10.3 Methods

35.10.4 cancel

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Cancels the receiver's download and deletes the downloaded file.

35.10.5 canResumeDownloadDecodedWithEncodingMIMEType(MimeType as string) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether a URL download object can resume a download that was decoded with the specified MIME type.
Notes:

MIMEType: The MIME type the caller wants to know about.
Returns true if the URL download object can resume a download that was decoded with the specified MIME type, false otherwise.
NSURLDownload cannot resume a download that was partially decoded in the gzip format.

35.10.6 Constructor(request as NSURLRequestMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an initialized URL download for a URL request and begins to download the data for the request.
Notes:

request: The URL request to download. The request object is deep-copied as part of the initialization process. Changes made to request after this method returns do not affect the request that is used for the loading process.

On success the handle property is not zero.
See also:

- 35.10.7 Constructor(resumeData as Memoryblock, path as folderitem) 7583
- 35.10.8 Constructor(resumeData as Memoryblock, path as string) 7584

35.10.7 Constructor(resumeData as Memoryblock, path as folderitem)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an initialized NSURLDownload object that will resume downloading the specified data to the specified file and begins the download.
Notes:

resumeData: Specifies the data to resume downloading.
path: The location for the downloaded data.

On success the handle property is not zero.
See also:

- 35.10.6 Constructor(request as NSURLRequestMBS) 7583

- 35.10.8 Constructor(resumeData as Memoryblock, path as string) 7584

35.10.8 Constructor(resumeData as Memoryblock, path as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an initialized NSURLDownload object that will resume downloading the specified data to the specified file and begins the download.
Notes:

resumeData: Specifies the data to resume downloading.
path: The location for the downloaded data.

On success the handle property is not zero.
See also:

- 35.10.6 Constructor(request as NSURLRequestMBS) 7583

35.10.9 request as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the request that initiated the receiver's download.

35.10.10 resumeData as Memoryblock

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the resume data for a download that is not yet complete.
Notes:

The resume data for a download that is not yet complete. This data represents the necessary state information that an NSURLDownload object needs to resume a download. The resume data can later be used when initializing a download with Constructor. Returns nil if the download is not able to be resumed.

Resume data will only be returned if the protocol of the download as well as the server support resuming. In order to later resume a download you must call setDeletesFileUponFailure passing false so the partially downloaded data is not deleted when the initial connection is lost or canceled.

35.10.11 setDestination(path as folderitem, allowOverwrite as boolean)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the destination path of the downloaded file.

Notes:

path: The path for the downloaded file.
allowOverwrite: true if an existing file at path can be replaced, false otherwise.

If allowOverwrite is false and a file already exists at path, a unique filename will be created for the downloaded file by appending a number to the filename. The delegate can implement didCreateDestination to determine the filename used when the file is written to disk.

An NSURLDownload instance ignores multiple calls to this method.
See also:

- 35.10.12 setDestination(path as string, allowOverwrite as boolean) 7585

35.10.12 setDestination(path as string, allowOverwrite as boolean)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the destination path of the downloaded file.
Notes:

path: The path for the downloaded file.
allowOverwrite: true if an existing file at path can be replaced, false otherwise.

If allowOverwrite is false and a file already exists at path, a unique filename will be created for the downloaded file by appending a number to the filename. The delegate can implement didCreateDestination to determine the filename used when the file is written to disk.

An NSURLDownload instance ignores multiple calls to this method.
See also:

- 35.10.11 setDestination(path as folderitem, allowOverwrite as boolean) 7584

35.10.13 Properties

35.10.14 Handle as Integer

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

35.10.15 deletesFileUponFailure as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver deletes partially downloaded files when a download stops prematurely.
Notes:

True if partially downloaded files should be deleted when a download stops prematurely, false otherwise. The default is true.
(Read and Write computed property)

35.10.16 Events

35.10.17 canAuthenticateAgainstProtectionSpace(protectionSpace as NSURLProtectionSpaceMBS) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent to determine whether the delegate is able to respond to a protection space's form of authentication. (required)
Notes:

protectionSpace: The protection space that generates an authentication challenge.

This method is called before didReceiveAuthenticationChallenge, allowing the delegate to inspect a protection space before attempting to authenticate against it. By returning true, the delegate indicates that it can handle the form of authentication, which it does in the subsequent call to didReceiveAuthenticationChallenge. Not implementing this method is the same as returning false, in which case default authentication handling is used.

Available in Mac OS X v10.6 and later.

35.10.18 decideDestinationWithSuggestedFilename(filename as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The delegate receives this message when download has determined a suggested filename for the downloaded file. (required)
Notes:

filename: The suggested filename for the download.

The suggested filename is either derived from the last path component of the URL and the MIME type or, if the download was encoded, from the encoding. If the delegate wishes to modify the path, it should send setDestination to download.

The delegate will not receive this message if setDestination has already been called for the download.

Available in Mac OS X v10.2 and later.

35.10.19 DidBegin

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent immediately after a download object begins a download. (required)
Notes: Available in Mac OS X v10.2 and later.

35.10.20 didCancelAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent if an authentication challenge is canceled due to the protocol implementation encountering an error. (required)
Notes:

challenge: The authentication challenge that caused the download object to cancel the download.

If the delegate receives this message the download will fail and the delegate will receive a didFailWithError message.

Available in Mac OS X v10.2 and later.

35.10.21 didCreateDestination(path as string, file as folderitem)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the destination file is created. (required)
Notes:

path: The path to the destination file.
file: The path to the destination file as folderitem.

Available in Mac OS X v10.2 and later.

35.10.22 didFailWithError(error as NSErrorMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent if the download fails or if an I/O error occurs when the file is written to disk. (required)
Notes:

error: The error that caused the failure of the download.

Any partially downloaded file will be deleted.

Once the delegate receives this message, it will receive no further messages for download.
Available in Mac OS X v10.2 and later.

35.10.23 DidFinish

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a download object has completed downloading successfully and has written its results to disk. (required)
Notes:

The delegate will receive no further messages for download.
Available in Mac OS X v10.2 and later.

35.10.24 didReceiveAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the URL download must authenticate a challenge in order to download the request. (required)
Notes:

challenge: The URL authentication challenge that must be authenticated in order to download the request.

This method gives the delegate the opportunity to determine the course of action taken for the challenge: provide credentials, continue without providing credentials or cancel the authentication challenge and the download.

The delegate can determine the number of previous authentication challenges by sending the message previousFailureCount to challenge.

If the previous failure count is 0 and the value returned by proposedCredential is nil, the delegate can create a new NSURLCredential object, providing information specific to the type of credential, and send a useCredential message to challenge, passing the credential and challenge as parameters. If proposedCredential is

not nil, the value is a credential from the URL or the shared credential storage that can be provided to the user as feedback.

The delegate may decide to abandon further attempts at authentication at any time by sending challenge a continueWithoutCredentialForAuthenticationChallenge or a cancelAuthenticationChallenge message. The specific action is implementation dependent.

If the delegate implements this method, the download will suspend until [challenge sender] is sent one of the following messages: useCredential, continueWithoutCredentialForAuthenticationChallenge or cancelAuthenticationChallenge.

If the delegate does not implement this method the default implementation is used. If a valid credential for the request is provided as part of the URL, or is available from the NSURLCredentialStorage the challenge is sent a useCredential:forAuthenticationChallenge with the credential. If the challenge has no credential or the credentials fail to authorize access, then continueWithoutCredentialForAuthenticationChallenge is sent to challenge sender instead.

Available in Mac OS X v10.2 and later.

35.10.25 didReceiveDataOfLength(length as UInt64)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent as a download object receives data incrementally. (required)
Notes:

length: The amount of data received in this increment of the download, measured in bytes.

Available in Mac OS X v10.2 and later.

35.10.26 didReceiveResponse(response as NSURLResponseMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a download object has received sufficient load data to construct the NSURLResponse object for the download. (required)
Notes:

response: The URL response object received as part of the download. response is immutable and will not be modified after this method is called.

In some rare cases, multiple responses may be received for a single download. In this case, the client should assume that each new response resets the download progress to 0 and should check the new response for the

expected content length.
Available in Mac OS X v10.2 and later.

35.10.27 shouldDecodeSourceDataOfMIMEType(encodingType as string) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a download object determines that the downloaded file is encoded to inquire whether the file should be automatically decoded. (required)
Notes:

encodingType: The type of encoding used by the downloaded file. The supported encoding formats are MacBinary ("application/macbinary"), Binhex ("application/mac-binhex40") and gzip ("application/gzip").

Return true to decode the file, false otherwise.

The delegate may receive this message more than once if the file has been encoded multiple times. This method is not called if the downloaded file is not encoded.
Available in Mac OS X v10.2 and later.

35.10.28 shouldUseCredentialStorage as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent to determine whether the URL loader should consult the credential storage to authenticate the download. (required)
Notes:

This method is called before any attempt to authenticate is made. By returning false, the delegate tells the download not to consult the credential storage and makes itself responsible for providing credentials for any authentication challenges. Not implementing this method is the same as returing true. The delegate is free to consult the credential storage itself when it receives a didReceiveAuthenticationChallenge message.

Available in Mac OS X v10.6 and later.

35.10.29 willResumeWithResponse(response as NSURLResponseMBS, startingByte as Int64)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a download object has received a response from the server after attempting to resume a download. (required)
Notes:

response: The URL response received from the server in response to an attempt to resume a download.

The location of the start of the resumed data, in bytes.
Available in Mac OS X v10.4 and later.

35.10.30 willSendRequest(request as NSURLRequestMBS, redirectResponse as NSURLResponseMBS) as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the download object determines that it must change URLs in order to continue loading a request. (required)
Notes:

request: The proposed redirected request. The delegate should inspect the redirected request to verify that it meets its needs, and create a copy with new attributes to return to the connection if necessary.
redirectResponse: The URL response that caused the redirect. May be nil in cases where this method is not being sent as a result of involving the delegate in redirect processing.

Return the actual URL request to use in light of the redirection response. The delegate may copy and modify request as necessary to change its attributes, return request unmodified, or return nil.

If the delegate wishes to cancel the redirect, it should call the download object's cancel method. Alternatively, the delegate method can return nil to cancel the redirect, and the download will continue to process. This has special relevance in the case where redirectResponse is not nil. In this case, any data that is loaded for the download will be sent to the delegate, and the delegate will receive a downloadDidFinish: or download:didFailWithError: message, as appropriate.

The delegate can receive this message as a result of transforming a request's URL to its canonical form, or for protocol-specific reasons, such as an HTTP redirect. The delegate implementation should be prepared to receive this message multiple times.

Available in Mac OS X v10.2 and later.

35.11 class NSURLMBS

35.11.1 class NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for URL.
Notes:

An NSURL object represents a URL that can potentially contain the location of a resource on a remote server, the path of a local file on disk, or even an arbitrary piece of encoded data.

Please also review Apples documentation on this class:
https://developer.apple.com/library/mac/documentation/Cocoa/Reference/Foundation/Classes/NSURL_Class/index.html

MBS Plugin only includes a part of the original class. EMail us if you miss something.

35.11.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.4pr4
- MBS Xojo / Real Studio Plugins, version 15.2pr1

35.11.3 Methods

35.11.4 checkResourceIsReachableAndReturnError as NSErrorMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether the URL's resource exists and is reachable.
Notes: This method synchronously checks if the resource's backing store is reachable. Checking reachability is appropriate when making decisions that do not require other immediate operations on the resource, e.g. periodic maintenance of UI state that depends on the existence of a specific document. When performing operations such as opening a file or copying resource properties, it is more efficient to simply try the operation and handle failures. If this method returns false, the optional error is populated. This method is currently applicable only to URLs for file system resources. For other URL types, NO is returned. Symbol is present in iOS 4, but performs no operation.

35.11.5 Constructor(item as folderitem)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an URL based on folderItem.
See also:

- 35.11.6 Constructor(scheme as string, host as string, path as string) 7593
- 35.11.7 Constructor(url as string) 7593
- 35.11.8 Constructor(url as string, baseURL as NSURLMBS) 7593

35.11.6 Constructor(scheme as string, host as string, path as string)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a newly created NSURL with a specified scheme, host, and path.
Notes:

scheme: The scheme for the NSURL object. For example, in the URL http://www.example.com/index.html, the scheme is http.
host: The host for the NSURL object (for example, www.example.com). May be the empty string.
path: The path for the NSURL object (for example, /index.html). If the path begins with a tilde, you must first expand it by calling stringByExpandingTildeInPath.
See also:

- 35.11.5 Constructor(item as folderitem) 7592
- 35.11.7 Constructor(url as string) 7593
- 35.11.8 Constructor(url as string, baseURL as NSURLMBS) 7593

35.11.7 Constructor(url as string)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSURL object initialized with a provided URL string.
See also:

- 35.11.5 Constructor(item as folderitem) 7592
- 35.11.6 Constructor(scheme as string, host as string, path as string) 7593
- 35.11.8 Constructor(url as string, baseURL as NSURLMBS) 7593

35.11.8 Constructor(url as string, baseURL as NSURLMBS)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSURL object initialized with a base URL and a relative string.
Notes:

This method allows you to create a URL relative to a base path or URL. For example, if you have the URL for a folder on disk and the name of a file within that folder, you can construct a URL for the file by providing the folder's URL as the base path (with a trailing slash) and the filename as the string part.

This method expects URLString to contain only characters that are allowed in a properly formed URL. All other characters must be properly percent escaped. Any percent-escaped characters are interpreted using UTF-8 encoding.
See also:

- 35.11.5 Constructor(item as folderitem) 7592
- 35.11.6 Constructor(scheme as string, host as string, path as string) 7593
- 35.11.7 Constructor(url as string) 7593

35.11.9 copy as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the URL object.

35.11.10 fileURLWithFileSystemRepresentation(path as string, isDirectory as boolean, relativeToURL as NSURLMBS) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a newly created URL referencing the local file or directory at the file system representation of the path.
Notes: File system representation is a string with canonical UTF-8 encoding.

35.11.11 fileURLWithPath(path as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Builds a file URL with given file path.
Notes: Better to use fileURLWithPath with directory parameter if you know if the path is a directory vs non-directory, as it saves an i/o.
See also:

- 35.11.12 fileURLWithPath(path as string, isDirectory as boolean) as NSURLMBS 7594

35.11.12 fileURLWithPath(path as string, isDirectory as boolean) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Builds a file URL based on a given file path.
See also:

- 35.11.11 fileURLWithPath(path as string) as NSURLMBS 7594

35.11.13 fileURLWithPathComponents(components() as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Builds an URL based on given components.

35.11.14 getResourceValue(byref value as Variant, key as string, byref error as NSErrorMBS) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the value of the resource property for the specified key.
Notes:

value: The location where the value for the resource property identified by key should be stored.
key: The name of one of the URL's resource properties.
error: The error that occurred if the resource value could not be retrieved.

Returns true if value is successfully populated; otherwise, false.

This method first checks if the URL object already caches the resource value. If so, it returns the cached resource value to the caller. If not, then this method synchronously obtains the resource value from the backing store, adds the resource value to the URL object's cache, and returns the resource value to the caller.

The type of the returned resource value varies by resource property; for details, see the documentation for the key you want to access.

If this method returns true and the value is populated with nil, it means that the resource property is not available for the specified resource, and that no errors occurred when determining that the resource property was unavailable.

If this method returns false, an error occurred. The object pointer referenced by error is populated with additional information.

This method applies only to URLs that represent file system resources.

Available in OS X v10.6 and later.

Automatic type translation applies (See FAQ about NSDictionary).
e.g. NSNumber can be converted to Integer or Boolean depending on content.

35.11.15 isEqual(other as NSURLMBS) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Tests if two NSURLs are equal.
Notes: Returns a Boolean value that indicates whether the receiver and a given object have identical URL strings and base URLs.

35.11.16 Items(byref error as NSErrorMBS, VisibleItemsOnly as boolean = false) as NSURLMBS()

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries list of items in the directory the URL points to on disk.
Notes: Error is optional.
See also:

- 35.11.17 Items(VisibleItemsOnly as boolean = false) as NSURLMBS() 7596

35.11.17 Items(VisibleItemsOnly as boolean = false) as NSURLMBS()

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries list of items in the directory the URL points to on disk.
See also:

- 35.11.16 Items(byref error as NSErrorMBS, VisibleItemsOnly as boolean = false) as NSURLMBS() 7596

35.11.18 mountedVolumeURLs(SkipHidden as boolean = true) as NSURLMBS()

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries array of all NSURLs for mounted volumes.
Notes:

if SkipHidden is true, hidden volumes are skipped.
Returns nil in case of error.

35.11.19 NSThumbnail1024x1024SizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible keys for the NSURLThumbnailDictionaryKey dictionary.
Notes:

A 1024 x 1024 pixel thumbnail as an NSImage on OS X.
Available in OS X v10.10 and later.

35.11.20 NSURLAddedToDirectoryDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The time at which the resource's was created or renamed into or within its parent directory, returned as an date. Inconsistent behavior may be observed when this attribute is requested on hard-linked items. This property is not supported by all volumes. (read-only)

Available in OS X v10.10.

35.11.21 NSURLAttributeModificationDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The time at which the resource's attributes were most recently modified, returned as an NSDate object if the volume supports attribute modification dates, or nil if attribute modification dates are unsupported (read-write).

Available in OS X v10.6 and later.

35.11.22 NSURLContentAccessDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The time at which the resource was most recently accessed, returned as a date object if the volume supports access dates, or nil if access dates are unsupported (read-only).

Available in OS X v10.6 and later.

35.11.23 NSURLContentModificationDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The time at which the resource was most recently modified, returned as a date object if the volume supports modification dates, or nil if modification dates are unsupported (read-write).

Available in OS X v10.6 and later.

35.11.24 NSURLCreationDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The resource's creation date, returned as an NSDate object if the volume supports creation dates, or nil if creation dates are unsupported (read-write).

Available in OS X v10.6 and later.

35.11.25 NSURLCustomIconKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The icon stored with the resource, returned as an NSImage object, or nil if the resource has no custom icon. Available in OS X v10.6 and later.

35.11.26 NSURLDocumentIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The document identifier returned as a number (read-only).

The document identifier is a value assigned by the kernel to a file or directory. This value is used to identify the document regardless of where it is moved on a volume. The identifier persists across system restarts. It

is not transferred when the file is copied, but it survives "safe save" operations. For example, it remains on the path to which it was assigned, even after calling the replaceItemAtURL:withItemAtURL:backupItemName:options:resultingItemURL:error: method. Document identifiers are only unique within a single volume. This property is not supported by all volumes.

Available in OS X v10.10 and iOS 8.0.

35.11.27 NSURLEffectiveIconKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The resource's normal icon, returned as an NSImage object (read-only).

Available in OS X v10.6 and later.

35.11.28 NSURLFileAllocatedSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that apply to properties of files.
Notes:

Key for the total size allocated on disk for the file, returned as an NSNumber object (read-only).

Available in OS X v10.6 and later.

35.11.29 NSURLFileResourceIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The resource's unique identifier, returned as an id (read-only).

This identifier can be used to determine equality between file system resources with the isEqual: method. Two resources are equal if they have the same file-system path or if their paths link to the same inode on the same file system.

The value of this identifier is not persistent across system restarts.

Available in OS X v10.7 and later.

35.11.30 NSURLFileResourceTypeBlockSpecial as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible values for the NSURLFileResourceTypeKey key.
Notes:

The resource is a block special file.
Available in OS X v10.7 and later.

35.11.31 NSURLFileResourceTypeCharacterSpecial as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible values for the NSURLFileResourceTypeKey key.
Notes:

The resource is a character special file.
Available in OS X v10.7 and later.

35.11.32 NSURLFileResourceTypeDirectory as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible values for the NSURLFileResourceTypeKey key.
Notes:

The resource is a directory.
Available in OS X v10.7 and later.

35.11.33 NSURLFileResourceTypeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The resource's object type, returned as an NSString object. See File Resource Types for possible values.
Available in OS X v10.7 and later.

35.11.34 NSURLFileResourceTypeNamedPipe as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible values for the NSURLFileResourceTypeKey key.
Notes:

The resource is a named pipe.
Available in OS X v10.7 and later.

35.11.35 NSURLFileResourceTypeRegular as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible values for the NSURLFileResourceTypeKey key.
Notes:

The resource is a regular file.
Available in OS X v10.7 and later.

35.11.36 NSURLFileResourceTypeSocket as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible values for the NSURLFileResourceTypeKey key.
Notes:

The resource is a socket.
Available in OS X v10.7 and later.

35.11.37 NSURLFileResourceTypeSymbolicLink as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible values for the NSURLFileResourceTypeKey key.
Notes:

The resource is a symbolic link.
Available in OS X v10.7 and later.

35.11.38 NSURLFileResourceTypeUnknown as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible values for the NSURLFileResourceTypeKey key.
Notes:

The resource's type is unknown.
Available in OS X v10.7 and later.

35.11.39 NSURLFileScheme as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** These schemes are the ones that NSURL can parse.
Notes: Identifies a URL that points to a file on a mounted volume.

35.11.40 NSURLFileSecurityKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The resource's security information, returned as an NSFileSecurity object (read-write).
Available in OS X v10.7 and later.

35.11.41 NSURLFileSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that apply to properties of files.
Notes:

Key for the file's size in bytes, returned as an NSNumber object (read-only).
Available in OS X v10.6 and later.

35.11.42 NSURLGenerationIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

An opaque generation identifier, returned as an id (read-only)

The generation identifier can be compared using isEqual to determine if the data in a document has been modified. For URLs which refer to the same file inode, the generation identifier changes when the data in the file's data fork is changed. Changes to extended attributes or other file system metadata do not change the identifier. For URLs which refer to the same directory inode, the generation identifier changes when direct children of that directory are added, removed or renamed. Changes to the data of the direct children

of that directory does not change the generation identifier. The identifier persists across system restarts. It is tied to a specific document on a specific volume and is not transferred when the document is copied to another volume. This property is not supported by all volumes.

Available in OS X v10.10 and iOS 8.0.

35.11.43 NSURLHasHiddenExtensionKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes: Key for determining whether the resource's extension is normally removed from its localized name, returned as a Boolean (read-write).

35.11.44 NSURLIsAliasFileKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that apply to properties of files.
Notes:

Key for determining whether the file is an alias, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.6 and later.

35.11.45 NSURLIsDirectoryKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

Key for determining whether the resource is a directory, returned as a Boolean- (read-only).
Available in OS X v10.6 and later.

35.11.46 NSURLIsExcludedFromBackupKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

Key for determining whether the resource is excluded from all backups of app data, returned as a Boolean NSNumber object (read-write).

You can use this property to exclude cache and other app support files which are not needed in a backup. Some operations commonly made to user documents cause this property to be reset to false; consequently, do not use this property on user documents.

Available in OS X v10.8 and later.

35.11.47 NSURLIsExecutableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

Key for determining whether the current process (as determined by the EUID) can execute the resource (if it is a file) or search the resource (if it is a directory), returned as a Boolean (read-only).

Available in OS X v10.7 and later.

35.11.48 NSURLIsHiddenKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

Key for determining whether the resource is normally not displayed to users, returned as a Boolean NSNumber object (read-write).

If the resource is hidden because its name begins with a period, setting this value has no effect.
Available in OS X v10.6 and later.

35.11.49 NSURLIsMountTriggerKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

Key for determining whether the URL is a file system trigger directory, returned as a Boolean NSNumber object (read-only). Traversing or opening a file system trigger directory causes an attempt to mount a file system on the directory.

Available in OS X v10.7 and later.

35.11.50 NSURLIsPackageKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

Key for determining whether the resource is a file package, returned as a Boolean NSNumber object (read-write in OS X v10.8 and later, read-only in previous versions). A true value means that the resource is a file package.

If you attempt to set or clear this key's value on a file instead of a directory, the system ignores your attempt. If the directory is defined as a package by way of its filename extension or other reason apart from this key, setting this key's value to false has no effect.

Available in OS X v10.6 and later.

35.11.51 NSURLIsReadableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

Key for determining whether the current process (as determined by the EUID) can read the resource, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

35.11.52 NSURLIsRegularFileKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

Key for determining whether the resource is a regular file, as opposed to a directory or a symbolic link. Returned as a Boolean NSNumber object (read-only).

Available in OS X v10.6 and later.

35.11.53 NSURLIsSymbolicLinkKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

Key for determining whether the resource is a symbolic link, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.6 and later.

35.11.54 NSURLIsSystemImmutableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

Key for determining whether the resource's system immutable bit is set, returned as a Boolean NSNumber object (read-write).

Available in OS X v10.6 and later.

35.11.55 NSURLIsUbiquitousItemKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for files.
Notes:

A boolean that contains true if this item is in iCloud storage, false if it is a local item (read-only).

Available in OS X v10.7 and later.

35.11.56 NSURLIsUserImmutableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

Key for determining whether the resource's user immutable bit is set, returned as a Boolean NSNumber object (read-write).
Available in OS X v10.6 and later.

35.11.57 NSURLIsVolumeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

Key for determining whether the resource is the root directory of a volume, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.6 and later.

35.11.58 NSURLIsWritableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

Key for determining whether the current process (as determined by the EUID) can write to the resource, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.7 and later.

35.11.59 NSURLKeysOfUnsetValuesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the resource properties that have not been set after setResourceValues returns an error, returned as an array of of strings.

35.11.60 NSURLLabelColorKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The resource's label color, returned as an NSColor object, or nil if the resource has no label color (read-only).
Available in OS X v10.6 and later.

35.11.61 NSURLLabelNumberKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The resource's label number, returned as an NSNumber object (read-write).

Available in OS X v10.6 and later.

35.11.62 NSURLLinkCountKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The number of hard links to the resource, returned as an NSNumber object (read-only).
Available in OS X v10.6 and later.

35.11.63 NSURLLocalizedLabelKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The resource's localized label text, returned as an NSString object, or nil if the resource has no localized label text (read-only).

Available in OS X v10.6 and later.

35.11.64 NSURLLocalizedNameKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The resource's localized or extension-hidden name, returned as an NSString object (read-only).

Available in OS X v10.6 and later.

35.11.65 NSURLLocalizedTypeDescriptionKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The resource's localized type description, returned as an NSString object (read-only).
Available in OS X v10.6 and later.

35.11.66 NSURLNameKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The resource's name in the file system, returned as an NSString object (read-write).
Available in OS X v10.6 and later.

35.11.67 NSURLParentDirectoryURLKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The parent directory of the resource, returned as an NSURL object, or nil if the resource is the root directory of its volume (read-only).
Available in OS X v10.6 and later.

35.11.68 NSURLPathKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The file system path for the URL, returned as an NSString object (read-only).

Available in OS X v10.8 and later.

35.11.69 NSURLPreferredIOBlockSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The optimal block size to use when reading or writing this file's data, returned as an NSNumber object, or nil if the preferred size is not available (read-only).
Available in OS X v10.7 and later.

35.11.70 NSURLQuarantinePropertiesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A key for quarantine properties.
Notes:

The quarantine properties as defined in LSQuarantine.h. To remove quarantine information from a file, pass NSNull as the value when setting this property. (Read-write, value type dictionary)
Available on Mac OS X 10.10 and later.

35.11.71 NSURLTagNamesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The names of tags attached to the resource, returned as an array of String values (read-write).

Available in OS X v10.9 and later.

35.11.72 NSURLThumbnailDictionaryKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

A dictionary of NSImage objects keyed by size (read-write).
See Thumbnail Property Keys for a list of possible keys.
Available in OS X v10.10.

35.11.73 NSURLThumbnailKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

All thumbnails as a single NSImage (read-write).
Available in OS X v10.10.

35.11.74 NSURLTotalFileAllocatedSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that apply to properties of files.
Notes:

Key for the total allocated size of the file in bytes, returned as an NSNumber object (read-only). This includes the size of any file metadata.

Available in OS X v10.7 and later.

35.11.75 NSURLTotalFileSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that apply to properties of files.
Notes:

Key for the total displayable size of the file in bytes, returned as an NSNumber object (read-only). This includes the size of any file metadata.

Available in OS X v10.7 and later.

35.11.76 NSURLTypeIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The resource's uniform type identifier (UTI), returned as a string (read-only).
Available in OS X v10.6 and later.

35.11.77 NSURLUbiquitousItemContainerDisplayNameKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.
Notes:

A string containing the name of the item's container, as it is displayed to the user.

Available in OS X v10.10 and later.

35.11.78 NSURLUbiquitousItemDownloadingErrorKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.
Notes:

An error object that indicates why downloading the item from iCloud failed.

Available in OS X v10.9 and later.

35.11.79 NSURLUbiquitousItemDownloadingStatusCurrent as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Values that describe the iCloud storage state of a file.
Notes:

A local copy of this item exists and is the most up-to-date version known to the device.

Available in OS X v10.9 and later.

35.11.80 NSURLUbiquitousItemDownloadingStatusDownloaded as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Values that describe the iCloud storage state of a file.
Notes:

A local copy of this item exists, but it is stale. The most recent version will be downloaded as soon as possible.

Available in OS X v10.9 and later.

35.11.81 NSURLUbiquitousItemDownloadingStatusKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.
Notes:

The current download state for the item, indicating whether a local copy exists and whether that copy is the most current version of the item. The possible values for this key are described in Ubiquitous Item Downloading Status Constants.

Available in OS X v10.9 and later.

35.11.82 NSURLUbiquitousItemDownloadingStatusNotDownloaded as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Values that describe the iCloud storage state of a file.
Notes:

This item has not been downloaded yet. Use startDownloadingUbiquitousItemAtURL to download it.

Available in OS X v10.9 and later.

35.11.83 NSURLUbiquitousItemDownloadRequestedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.
Notes:

A Boolean indicating whether a call to startDownloadingUbiquitousItemAtURL has already been made to download the item. The value of this key is read-only.

Available in OS X v10.10 and later.

35.11.84 NSURLUbiquitousItemHasUnresolvedConflictsKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.
Notes:

A boolean NSNumber that contains true if this item has conflicts outstanding, false otherwise (read-only).
Available in OS X v10.7 and later.

35.11.85 NSURLUbiquitousItemIsDownloadedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.
Notes:

A boolean NSNumber that contains true if this item's data has been downloaded to a ubiquity container, false otherwise (read-only).

Available in OS X v10.7 and later.
Deprecated in OS X v10.9.

35.11.86 NSURLUbiquitousItemIsDownloadingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.
Notes:

A boolean NSNumber that contains true if this item is being downloaded from iCloud, false otherwise (read-only).

Available in OS X v10.7 and later.

35.11.87 NSURLUbiquitousItemIsUploadedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.
Notes:

A boolean NSNumber that contains true if this item's data has been uploaded to iCloud storage, false otherwise (read-only).

When waiting for an upload to complete, do not poll this key from within a block passed to coordinateReadingItemAtURL, because the coordinated read required to obtain this value cannot be performed until that block completes and returns. Instead, use NSMetadataQuery or an NSFilePresenter delegate to asynchronously notify your app when the status changes.

Available in OS X v10.7 and later.

35.11.88 NSURLUbiquitousItemIsUploadingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.
Notes:

A boolean NSNumber that contains true if this item is being uploaded to iCloud, false otherwise (read-only).

Available in OS X v10.7 and later.

35.11.89 NSURLUbiquitousItemPercentDownloadedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.
Notes:

An NSNumber in the range 0–100 that indicates the percentage of the data that has been downloaded (read-only).

Use the NSMetadataQuery class to search for NSMetadataItem objects that have the NSMetadataUbiquitousItemPercentDownloadedKey attribute instead.

Available in OS X v10.7 and later.
Deprecated in OS X v10.8.

35.11.90 NSURLUbiquitousItemPercentUploadedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.
Notes:

An NSNumber in the range 0–100 that indicates the percentage of the data that has been uploaded (read-only).

Use the NSMetadataQuery class to search for NSMetadataItem objects that have the NSMetadataUbiquitousItemPercentUploadedKey attribute instead.

Available in OS X v10.7 and later.
Deprecated in OS X v10.8.

35.11.91 NSURLUbiquitousItemUploadingErrorKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.
Notes:

An error object that indicates why uploading the item to iCloud failed.
Available in OS X v10.9 and later.

35.11.92 NSURLVolumeAvailableCapacityKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for the volume's available capacity in bytes, returned as an Int64 (read-only).
Available in OS X v10.6 and later.

35.11.93 NSURLVolumeCreationDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for the volume's creation date, returned as a date, or nil if it cannot be determined (read-only).

Available in OS X v10.7 and later.

35.11.94 NSURLVolumeIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The unique identifier of the resource's volume, returned as an id (read-only).
This identifier can be used with the isEqual method to determine whether two file system resources are on the same volume.
The value of this identifier is not persistent across system restarts.
Available in OS X v10.7 and later.

35.11.95 NSURLVolumeIsAutomountedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume is automounted, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

35.11.96 NSURLVolumeIsBrowsableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume is visible in GUI-based file-browsing environments, such as the Desktop or the Finder application, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

35.11.97 NSURLVolumeIsEjectableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume is ejectable from the drive mechanism under software control, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

35.11.98 NSURLVolumeIsInternalKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume is connected to an internal bus, returned as a Boolean, or nil if it cannot be determined (read-only).

Available in OS X v10.7 and later.

35.11.99 NSURLVolumeIsJournalingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume is currently journaling, returned as a Boolean.
Available in OS X v10.6 and later.

35.11.100 NSURLVolumeIsLocalKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Example:

```
dim f as FolderItem = GetFolderItem("/Volumes/Ablage1", FolderItem.PathTypeNative)

dim n as NSURLMBS = NSURLMBS.URLWithItem(f)
dim value as Variant
dim error as NSErrorMBS

dim Local as Boolean

// network volumes are not local
if n.getResourceValue(value, n.NSURLVolumeIsLocalKey, error) then
MsgBox "Local: "+value.StringValue
Local = value.BooleanValue
else
MsgBox error.LocalizedDescription
end if

// network volumes have an URL
if n.getResourceValue(value, n.NSURLVolumeURLForRemountingKey, error) then
MsgBox "URLForRemounting: "+value.StringValue
else
MsgBox error.LocalizedDescription
end if
```

Notes:

Key for determining whether the volume is stored on a local device, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

35.11.101 NSURLVolumeIsReadOnlyKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume is read-only, returned as a Boolean (read-only).
Available in OS X v10.7 and later.

35.11.102 NSURLVolumeIsRemovableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Example:

```
dim f as FolderItem = GetFolderItem("/Volumes/Test", FolderItem.PathTypeNative)

dim n as NSURLMBS = NSURLMBS.URLWithItem(f)
dim value as Variant
dim error as NSErrorMBS

if n.getResourceValue(value, n.NSURLVolumeIsRemovableKey, error) then
MsgBox "Removable: "+value.StringValue
else
MsgBox error.LocalizedDescription
end if
```

Notes:

Key for determining whether the volume is removable from the drive mechanism, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

35.11.103 NSURLVolumeLocalizedFormatDescriptionKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for the volume's descriptive format name, returned as a string (read-only).
Available in OS X v10.6 and later.

35.11.104 NSURLVolumeLocalizedNameKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

The name of the volume as it should be displayed in the user interface, returned as a string (read-only).
Available in OS X v10.7 and later.

35.11.105 NSURLVolumeMaximumFileSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for the largest file size supported by the volume in bytes, returned as a Boolean, or nil if it cannot be determined (read-only).

Available in OS X v10.7 and later.

35.11.106 NSURLVolumeNameKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

The name of the volume, returned as an NSString object (read-write). Settable only if NSURLVolumeSupportsRenamingKey is true.

Available in OS X v10.7 and later.

35.11.107 NSURLVolumeResourceCountKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for the total number of resources on the volume, returned as an integer (read-only).
Available in OS X v10.6 and later.

35.11.108 NSURLVolumeSupportsAdvisoryFileLockingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume implements whole-file advisory locks in the style of flock, along with the O_EXLOCK and O_SHLOCK flags of the open function, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.7 and later.

35.11.109 NSURLVolumeSupportsCasePreservedNamesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Example:

```
dim f as FolderItem = Volume(0)
dim n as new NSURLMBS(f)

dim v as Variant
dim e as NSErrorMBS
if n.getResourceValue(v, n.NSURLVolumeSupportsCasePreservedNamesKey, e) then
MsgBox "VolumeSupportsCasePreservedNames: "+str(v.BooleanValue)
else
MsgBox "Failed to query: "+e.LocalizedDescription
end if
```

Notes:

Key for determining whether the volume supports case-preserved names, returned as a Boolean (read-only). Available in OS X v10.6 and later.

35.11.110 NSURLVolumeSupportsCaseSensitiveNamesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Example:

```
dim f as FolderItem = Volume(0)
dim n as new NSURLMBS(f)
```

```
dim v as Variant
dim e as NSErrorMBS
if n.getResourceValue(v, n.NSURLVolumeSupportsCaseSensitiveNamesKey, e) then
MsgBox "VolumeSupportsCaseSensitiveNames: "+str(v.BooleanValue)
else
MsgBox "Failed to query: "+e.LocalizedDescription
end if
```

Notes:

Key for determining whether the volume supports case-sensitive names, returned as a Boolean (read-only).
Available in OS X v10.6 and later.

35.11.111 NSURLVolumeSupportsExtendedSecurityKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume supports extended security (access control lists), returned as a Boolean (read-only) (read-only).

Available in OS X v10.7 and later.

35.11.112 NSURLVolumeSupportsHardLinksKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume supports hard links, returned as a Boolean.
Available in OS X v10.6 and later.

35.11.113 NSURLVolumeSupportsJournalingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume supports journaling, returned as a Boolean.
Available in OS X v10.6 and later.

35.11.114 NSURLVolumeSupportsPersistentIDsKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume supports persistent IDs, returned as a Boolean (read-only).
Available in OS X v10.6 and later.

35.11.115 NSURLVolumeSupportsRenamingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume can be renamed, returned as a Boolean (read-only).
Available in OS X v10.7 and later.

35.11.116 NSURLVolumeSupportsRootDirectoryDatesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume supports reliable storage of times for the root directory, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

35.11.117 NSURLVolumeSupportsSparseFilesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume supports sparse files, returned as a Boolean.
Available in OS X v10.6 and later.

35.11.118 NSURLVolumeSupportsSymbolicLinksKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume supports symbolic links, returned as a Boolean.
Available in OS X v10.6 and later.

35.11.119 NSURLVolumeSupportsVolumeSizesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume supports returning volume size information, returned as a Boolean (read-only). If true, volume size information is available as values of the NSURLVolumeTotalCapacityKey and NSURLVolumeAvailableCapacityKey keys.

Available in OS X v10.7 and later.

35.11.120 NSURLVolumeSupportsZeroRunsKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for determining whether the volume supports zero runs, returned as a Boolean. (read-only).
Available in OS X v10.6 and later.

35.11.121 NSURLVolumeTotalCapacityKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for the volume's capacity in bytes, returned as an Int64 (read-only).

Available in OS X v10.6 and later.

35.11.122 NSURLVolumeURLForRemountingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for the URL needed to remount the network volume, returned as an NSURL object, or nil if a URL is not available (read-only).

Available in OS X v10.7 and later.

35.11.123 NSURLVolumeURLKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
Notes:

The root directory of the resource's volume, returned as an NSURL object (read-only).
Available in OS X v10.6 and later.

35.11.124 NSURLVolumeUUIDStringKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.
Notes:

Key for the volume's persistent UUID, returned as an NSString object, or nil if a persistent UUID is not available (read-only).

Available in OS X v10.7 and later.

35.11.125 pathComponents as string()

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array containing the path components. (read-only)
Notes: This property contains an array containing the individual path components of the URL. For example, in the URL file:///directory/directory2/file, the path components array would be "/", "directory", "directory2", "file".

35.11.126 removeAllCachedResourceValues

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all cached resource values and temporary resource values from the URL object.
Notes:

This method is applicable only to URLs that represent file system resources.
Available in OS X v10.9 and later.

35.11.127 removeCachedResourceValueForKey(key as string)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the cached resource value identified by a given key from the URL object.
Notes:

key: The resource value key whose cached values you want to remove.

Removing a cached resource value may remove other cached resource values because some resource values are cached as a set of values, and because some resource values depend on other resource values. (Temporary resource values have no dependencies.)

This method is currently applicable only to URLs for file system resources.

Available in OS X v10.9 and later.

35.11.128 resourceValuesForKeys(keys() as string, byref error as NSErrorMBS) as Dictionary

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the resource values for the properties identified by specified array of keys.
Notes:

Returns a dictionary of resource values indexed by key.

This method first checks if the URL object already caches the specified resource values. If so, it returns the cached resource values to the caller. If not, then this method synchronously obtains the resource values from the backing store, adds the resource values to the URL object's cache, and returns the resource values to the caller.

The type of the returned resource value varies by resource property; for details, see the documentation for the key you want to access.

If the result dictionary does not contain a resource value for one or more of the requested resource keys, it means those resource properties are not available for the URL, and no errors occurred when determining those resource properties were not available.

If an error occurs, this method returns nil and populates the object pointer referenced by error with additional information.

This method applies only to URLs that represent file system resources.
Available in OS X v10.6 and later.
See also:

- 35.11.129 resourceValuesForKeys(keys() as string, targetDelegate as ResourceValuesForKeysDelegateMBS, tag as Variant = nil, PrecacheIcons as boolean = false) 7628

35.11.129 resourceValuesForKeys(keys() as string, targetDelegate as ResourceValuesForKeysDelegateMBS, tag as Variant = nil, PrecacheIcons as boolean = false)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Query keys asynchronously.
Notes:

The plugin will query values on a different preemptive thread and call your delegate on main thread with results as soon as possible. This way you can keep app responsive while system e.g. loads icons.
For icons, you can set PrecacheIcons to true. In that case plugin will draw icon on the preemptive thread, so icon data is really loaded from disk. When you than draw on main thread, it's really quick.

The delegate has this parameters:
ResourceValuesForKeysDelegateMBS(URL as NSURLMBS, keys() as String, Values as Dictionary, Error as NSErrorMBS, tag as Variant)
See also:

- 35.11.128 resourceValuesForKeys(keys() as string, byref error as NSErrorMBS) as Dictionary 7627

35.11.130 setResourceValue(value as Variant, key as string, byref error as NSErrorMBS) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the URL's resource property for a given key to a given value.
Notes:

value: The value for the resource property defined by key.
key: The name of one of the URL's resource properties.

error: The error that occurred if the resource value could not be set.

Returns true if the resource property named key is successfully set to value; otherwise, false.

This method synchronously writes the new resource value out to disk. Attempts to set a read-only resource property or to set a resource property that is not supported by the resource are ignored and are not considered errors.

If an error occurs, this method returns NO and populates the object pointer referenced by error with additional information.

This method applies only to URLs for file system resources.
Available in OS X v10.6 and later.

Automatic type translation applies (See FAQ about NSDictionary).

35.11.131 setResourceValues(keyedValues as Dictionary, byref error as NSErrorMBS) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the URL's resource properties for a given set of keys to a given set of values.
Notes:

keyedValues: A dictionary of resource values to be set.
error: The error that occurred if one or more resource values could not be set.

Returns true if all resource values in keyedValues are successfully set; otherwise, false.

This method synchronously writes the new resource value out to disk. If an error occurs after some resource properties have been successfully changed, the userInfo dictionary in the returned error object contains a kCFURLKeysOfUnsetValuesKey key whose value is an array of the resource values that were not successfully set.

Attempts to set a read-only resource property or to set a resource property that is not supported by the resource are ignored and are not considered errors.

The order in which the resource values are set is not defined. If you need to guarantee the order in which resource values are set, you should make multiple requests to this method or setResourceValue:forKey:error:.

This method applies only to URLs for file system resources.

Available in OS X v10.6 and later.

Automatic type translation applies (See FAQ about NSDictionary).

35.11.132 setTemporaryResourceValue(value as Variant, key as string)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets a temporary resource value on the URL object.
Notes:

value: The value to store.
key: The key where the value should be stored. This key must be unique and must not conflict with any system-defined keys. Reverse-domain-name notation is recommended.

Your app can use a temporary resource value to temporarily store a value for an app-defined resource value key in memory without modifying the actual resource that the URL represents. Once set, you can copy the temporary resource value from the URL object just as you would copy system-defined keys—by calling getResourceValue or resourceValuesForKeys.

Your app can remove a temporary resource value from the URL object by calling removeCachedResourceValueForKey or removeAllCachedResourceValues (to remove all temporary values).

This method is applicable only to URLs for file system resources.
Available in OS X v10.9 and later.

35.11.133 startAccessingSecurityScopedResource as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Starts accessing a security scoped bookmark URL.
Notes: Given a NSURL created by resolving a bookmark data created with security scope, make the resource referenced by the url accessible to the process. When access to this resource is no longer needed the client must call stopAccessingSecurityScopedResource. Each call to startAccessingSecurityScopedResource must be balanced with a call to stopAccessingSecurityScopedResource (Note: this is not reference counted).

35.11.134 stopAccessingSecurityScopedResource

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Revokes the access granted to the url by a prior successful call to startAccessingSecurityScopedResource.

35.11.135 TagNames as string()

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The names of tags attached to the resource, returned as an array of String values.
Notes: Available in OS X v10.9 and later.

35.11.136 URLByAppendingPathComponent(pathComponent as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new URL made by appending a path component to the original URL.
Notes:

pathComponent: The path component to add to the URL, in its original form (not URL encoded).

Returns a new URL with pathComponent appended.

If the original URL does not end with a forward slash and pathComponent does not begin with a forward slash, a forward slash is inserted between the two parts of the returned URL, unless the original URL is the empty string.

Available in OS X v10.6 and later.
See also:

- 35.11.137 URLByAppendingPathComponent(pathComponent as string, isDirectory as boolean) as NSURLMBS 7631

35.11.137 URLByAppendingPathComponent(pathComponent as string, isDirectory as boolean) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new URL made by appending a path component to the original URL, along with a trailing slash if the component is designated a directory.
Notes:

pathComponent: The path component to add to the URL.
isDirectory: If true, a trailing slash is appended after pathComponent.

Returns a new URL with pathComponent appended.

If the original URL does not end with a forward slash and pathComponent does not begin with a forward slash, a forward slash is inserted between the two parts of the returned URL, unless the original URL is the empty string.

Available in OS X v10.7 and later.
On Mac OS X 10.6 the plugin falls back
See also:

- 35.11.136 URLByAppendingPathComponent(pathComponent as string) as NSURLMBS 7631

35.11.138 URLByAppendingPathExtension(PathExtension as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new URL made by appending a path extension to the original URL.
Notes:

pathExtension: The path extension to add to the URL.

Returns a new URL with pathExtension appended.

If the original URL ends with one or more forward slashes, these are removed from the returned URL. A period is inserted between the two parts of the new URL.
Available in OS X v10.6 and later.

35.11.139 URLByDeletingLastPathComponent as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A URL created by taking the receiver and removing the last path component.
Notes:

If the receiver's URL represents the root path, this property contains a copy of the original URL. Otherwise, if the original URL has only one path component, this property contains the empty string.

Available in OS X v10.6 and later.

35.11.140 URLByDeletingPathExtension as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A URL created by taking the receiver and removing the path extension, if any.
Notes:

If the receiver represents the root path, this property contains a copy of the original URL. If the URL has multiple path extensions, only the last one is removed.

Available in OS X v10.6 and later.

35.11.141 URLByResolvingSymlinksInPath as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A URL that points to the same resource as the receiver and includes no symbolic links.
Notes:

If the receiver has no symbolic links, this property contains a copy of the original URL.

If some symbolic links cannot be resolved, this property contains those broken symbolic links.

If the name of the receiving path begins with /private, this property strips off the /private designator, provided the result is the name of an existing file.

This property only works on URLs with the file: path scheme. For all other URLs, it contains a copy of the receiver.
Available in OS X v10.6 and later.

35.11.142 URLByStandardizingPath as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A URL that points to the same resource as the original URL using an absolute path.
Notes:

This property only works on URLs with the file: path scheme. For all other URLs, it returns a copy of the original URL.

Like stringByStandardizingPath, this property can make the following changes in the provided URL:

- Expand an initial tilde expression using stringByExpandingTildeInPath.
- Reduce empty components and references to the current directory (that is, the sequences "//" and "/./") to single path separators.
- In absolute paths only, resolve references to the parent directory (that is, the component "..") to the real parent directory if possible using stringByResolvingSymlinksInPath, which consults the file system to resolve each potential symbolic link.
- In relative paths, because symbolic links can't be resolved, references to the parent directory are left in place.

- Remove an initial component of "/private" from the path if the result still indicates an existing file or directory (checked by consulting the file system).

Note that the path contained by this property may still have symbolic link components in it. Note also that this property only works with file paths (not, for example, string representations of URLs).

Available in OS X v10.6 and later.

35.11.143 URLsResourceValuesForKeys(URLs() as NSURLMBS, keys() as string, targetDelegate as URLsResourceValuesForKeysDelegateMBS, tag as Variant = nil, PrecacheIcons as boolean = false)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries several URLs for values.
Notes:

Similar to resourceValuesForKeys, this method will start a preemptive thread and queries values for all URLs on all keys in background. Once done it calls the delegate on main thread.

For icons, you can set PrecacheIcons to true. In that case plugin will draw icon on the preemptive thread, so icon data is really loaded from disk. When you than draw on main thread, it's really quick.

the delegate is declared like this:
URLsResourceValuesForKeysDelegateMBS(URLs() as NSURLMBS, keys() as String, Values() as Dictionary, Errors() as NSErrorMBS, tag as Variant)

35.11.144 URLWithHandle(Handle as Integer) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new URL object based on a handle value.
Notes: Will retain the reference.

35.11.145 URLWithItem(Item as FolderItem) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an URL based on folderItem.
Example:

```
dim f as FolderItem = GetFolderItem("/Volumes/Ablage1", FolderItem.PathTypeNative)
dim n as NSURLMBS = NSURLMBS.URLWithItem(f)
MsgBox n.absoluteString
```

35.11.146 URLWithString(URL as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSURL object initialized with a provided URL string.
See also:

- 35.11.147 URLWithString(URL as string, baseURL as NSURLMBS) as NSURLMBS 7635

35.11.147 URLWithString(URL as string, baseURL as NSURLMBS) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSURL object initialized with a base URL and a relative string.
Notes:

This method allows you to create a URL relative to a base path or URL. For example, if you have the URL for a folder on disk and the name of a file within that folder, you can construct a URL for the file by providing the folder's URL as the base path (with a trailing slash) and the filename as the string part.

This method expects URLString to contain only characters that are allowed in a properly formed URL. All other characters must be properly percent escaped. Any percent-escaped characters are interpreted using UTF-8 encoding.
See also:

- 35.11.146 URLWithString(URL as string) as NSURLMBS 7635

35.11.148 Properties

35.11.149 absoluteString as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The URL string for the receiver as an absolute URL.
Notes:

This property's value is calculated by resolving the receiver's string against its base according to the algorithm given in RFC 1808.
(Read only property)

35.11.150 absoluteURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An absolute URL that refers to the same resource as the receiver.
Notes:

If the URL is already absolute, this property contains a copy of the receiver. Resolution is performed per RFC 1808.
(Read only property)

35.11.151 AddedToDirectoryDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The time at which the resource's was created or renamed into or within its parent directory, returned as an date.
Notes:

Inconsistent behavior may be observed when this attribute is requested on hard-linked items. This property is not supported by all volumes. (read-only)

Available in OS X v10.10.
(Read only property)

35.11.152 AttributeModificationDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Modification date.
Notes:

The time at which the resource's attributes were most recently modified, returned as an NSDate object if the volume supports attribute modification dates, or nil if attribute modification dates are unsupported.

Available in OS X v10.6 and later.
(Read only property)

35.11.153 baseURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The base URL.
Notes:

This property contains the base URL. If the receiver is an absolute URL, this property contains nil.

(Read only property)

35.11.154 ContentAccessDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The time at which the resource was most recently accessed.
Notes:

Returned as date object if the volume supports access dates, or nil if access dates are unsupported.
Available in OS X v10.6 and later.
(Read only property)

35.11.155 ContentModificationDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The modification date.
Notes:

The time at which the resource was most recently modified, returned as a date object if the volume supports modification dates, or nil if modification dates are unsupported.

Available in OS X v10.6 and later.
(Read only property)

35.11.156 CreationDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The creation date.
Notes:

The resource's creation date, returned as an NSDate object if the volume supports creation dates, or nil if creation dates are unsupported.
Available in OS X v10.6 and later.
(Read only property)

35.11.157 DocumentIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The document identifier returned as a number.
Notes:

The document identifier is a value assigned by the kernel to a file or directory. This value is used to identify the document regardless of where it is moved on a volume. The identifier persists across system restarts. It is not transferred when the file is copied, but it survives "safe save" operations.
Document identifiers are only unique within a single volume. This property is not supported by all volumes.

Available in OS X v10.10 and iOS 8.0.
(Read only property)

35.11.158 EffectiveIcon as NSImageMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resource's normal icon, returned as an NSImage object.
Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.159 filePathURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A file path URL that points to the same resource as the URL object.
Notes:

If the receiver is a file reference URL, this property contains a copy of the URL converted to a file path URL. If the receiver's URL is a file path URL, this property contains the original URL. If the original URL is not a file URL, or if the resource is not reachable or no longer exists, this property contains nil.

Available in OS X v10.6 and later.
(Read only property)

35.11.160 fileReferenceURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new file reference URL that points to the same resource as the receiver.
Notes:

File reference URLs use a URL path syntax that identifies a file system object by reference, not by path. This form of file URL remains valid when the file system path of the URL's underlying resource changes.

If the original URL is a file path URL, this property contains a copy of the URL converted into a file reference URL. If the original URL is a file reference URL, this property contains the original. If the original URL is

not a file URL, this property contains nil.

File reference URLs cannot be created to file system objects which do not exist or are not reachable. This property contains nil instead.

In some areas of the file system hierarchy, file reference URLs cannot be generated to the leaf node of the URL path.

A file reference URL's path should never be persistently stored, because it is not valid across system restarts or remounts of volumes. If you need to store a persistent reference to a file system object, use a bookmark instead. You can create a bookmark by calling bookmarkDataWithOptions.

Available in OS X v10.6 and later.
(Read only property)

35.11.161 FileResourceIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resource's unique identifier, returned as an id.
Notes:

This identifier can be used to determine equality between file system resources with the isEqual: method. Two resources are equal if they have the same file-system path or if their paths link to the same inode on the same file system.

The value of this identifier is not persistent across system restarts.

Available in OS X v10.7 and later.
(Read only property)

35.11.162 FileResourceType as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resource's object type, returned as an NSString object.
Notes:

See File Resource Types for possible values.
Available in OS X v10.7 and later.
(Read only property)

35.11.163 fileSystemRepresentation as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A string containing the URL's file system path.
Notes: (Read only property)

35.11.164 fragment as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The fragment identifier, conforming to RFC 1808. (read-only)
Notes:

This property contains the URL's fragment. If the receiver does not conform to RFC 1808, this property contains nil. For example, in the URL http://www.example.com/index.html# jumpLocation, the fragment identifier is jumpLocation.
(Read only property)

35.11.165 GenerationIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An opaque generation identifier, returned as an id.
Notes:

The generation identifier can be compared using isEqual to determine if the data in a document has been modified. For URLs which refer to the same file inode, the generation identifier changes when the data in the file's data fork is changed. Changes to extended attributes or other file system metadata do not change the identifier. For URLs which refer to the same directory inode, the generation identifier changes when direct children of that directory are added, removed or renamed. Changes to the data of the direct children of that directory does not change the generation identifier. The identifier persists across system restarts. It is tied to a specific document on a specific volume and is not transferred when the document is copied to another volume. This property is not supported by all volumes.

Available in OS X v10.10 and iOS 8.0.
(Read only property)

35.11.166 Handle as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes:

Can be used as NSURL* or CFURLRef for declares.

(Read and Write property)

35.11.167 HasHiddenExtension as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resource's extension is normally removed from its localized name.
Notes:

Returned as a Boolean (read-write).
(Read only property)

35.11.168 host as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The host, conforming to RFC 1808. (read-only)
Notes:

This property contains the host. For example, in the URL http://www.example.com/index.html, the host is www.example.com.

If the receiver does not conform to RFC 1808, this property contains nil. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808—specifically, whether the first two characters of resourceSpecifier are slashes (//).
(Read only property)

35.11.169 IsDirectory as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resource is a directory.
Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.170 IsExcludedFromBackup as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resource is excluded from all backups of app data.
Notes:

You can use this property to exclude cache and other app support files which are not needed in a backup. Some operations commonly made to user documents cause this property to be reset to false; consequently, do not use this property on user documents.

Available in OS X v10.8 and later.
(Read only property)

35.11.171 IsExecutable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for determining whether the current process (as determined by the EUID) can execute the resource (if it is a file) or search the resource (if it is a directory), returned as a Boolean.
Notes:

Available in OS X v10.7 and later.
(Read only property)

35.11.172 isFileReferenceURL as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether the URL is a file reference URL. S
Notes: (Read only property)

35.11.173 isFileURL as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the scheme is file.
Notes:

if myURL.isFileURL is true, then myURL.path is suitable for input into NSFileManager or NSPathUtilities.
(Read only property)

35.11.174 IsHidden as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resource is normally not displayed to users.
Notes:

If the resource is hidden because its name begins with a period, setting this value has no effect.
Available in OS X v10.6 and later.

(Read only property)

35.11.175 IsMountTrigger as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the URL is a file system trigger directory, returned as a Boolean.
Notes:

Traversing or opening a file system trigger directory causes an attempt to mount a file system on the directory.

Available in OS X v10.7 and later.
(Read only property)

35.11.176 IsPackage as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resource is a file package
Notes:

A true value means that the resource is a file package.
Available in OS X v10.6 and later.
(Read only property)

35.11.177 IsReadable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the current process (as determined by the EUID) can read the resource.
Notes:

Available in OS X v10.7 and later.
(Read only property)

35.11.178 IsRegularFile as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Determining whether the resource is a regular file, as opposed to a directory or a symbolic link.
Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.179 IsSymbolicLink as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resource is a symbolic link.
Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.180 IsSystemImmutable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resource's system immutable bit is set.
Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.181 IsUserImmutable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resource's user immutable bit is set.
Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.182 IsVolume as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resource is the root directory of a volume.
Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.183 IsWritable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the current process (as determined by the EUID) can write to the resource.
Notes:

Available in OS X v10.7 and later.
(Read only property)

35.11.184 Item as FolderItem

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** For the file URLs the corresponding folderitem.
Notes: (Read only property)

35.11.185 LabelColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resource's label color, returned as an NSColor object, or nil if the resource has no label color.
Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.186 LabelNumber as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resource's label number.
Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.187 lastPathComponent as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last path component. (read-only)
Notes:

This property contains the last path component. For example, in the URL file:///path/to/file, the last path component is file.
Available in OS X v10.6 and later.
(Read only property)

35.11.188 LinkCount as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of hard links to the resource.
Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.189 LocalizedLabel as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resource's localized label text, returned as a string, or empty if the resource has no localized label text.
Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.190 LocalizedName as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resource's localized or extension-hidden name, returned as a string.
Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.191 LocalizedTypeDescription as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resource's localized type description, returned as a string.
Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.192 Name as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resource's name in the file system, returned as a string.

Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.193 parameterString as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The parameter string conforming to RFC 1808. (read-only)
Notes:

This property contains the parameter string. If the receiver does not conform to RFC 1808, this property contains nil. For example, in the URL file:///path/to/file;foo, the parameter string is foo.

This property should not be confused with the query property, which also often contains a string of parameters.
(Read only property)

35.11.194 ParentDirectoryURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The parent directory of the resource, returned as an NSURLMBS object, or nil if the resource is the root directory of its volume.
Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.195 password as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The password conforming to RFC 1808. (read-only)
Notes:

This property contains the password. If the receiver does not conform to RFC 1808, it contains nil. For example, in the URL http://username:password@www.example.com/index.html, the password is password.
(Read only property)

35.11.196 path as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path, conforming to RFC 1808. (read-only)
Notes:

This property contains the path, unescaped with the stringByReplacingPercentEscapesUsingEncoding: method. If the receiver does not conform to RFC 1808, this property contains nil.

If the receiver contains a file or file reference URL (as determined with isFileURL), this property's value is suitable for input into methods of NSFileManager or NSPathUtilities. If the path has a trailing slash, it is stripped.

If the receiver contains a file reference URL, this property's value provides the current path for the referenced resource, which may be nil if the resource no longer exists.

If the parameterString property contains a non-nil value, the path may be incomplete. If the receiver contains an unencoded semicolon, the path property ends at the character before the semicolon. The remainder of the URL is provided in the parameterString property.

To obtain the complete path, if parameterString contains a non-nil value, append a semicolon, followed by the parameter string.

Per RFC 3986, the leading slash after the authority (host name and port) portion is treated as part of the path. For example, in the URL http://www.example.com/index.html, the path is /index.html.

Available in OS X v10.8 and later.
(Read only property)

35.11.197 pathExtension as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path extension. (read-only)
Notes:

This property contains the path extension. For example, in the URL file:///path/to/file.txt, the path extension is txt.
Available in OS X v10.6 and later.
(Read only property)

35.11.198 port as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The port, conforming to RFC 1808. (read-only)
Notes:

This property contains the port number. For example, in the URL http://www.example.com:8080/index.php, the port number is 8080.

If the receiver does not conform to RFC 1808, this property contains nil. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808—specifically, whether the first two characters of resourceSpecifier are slashes (//).
(Read only property)

35.11.199 PreferredIOBlockSize as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The preferred block size.
Notes:

The optimal block size to use when reading or writing this file's data, returned as an integer, or zero if the preferred size is not available (read-only).
Available in OS X v10.7 and later.
(Read only property)

35.11.200 QuarantineProperties as Dictionary

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The quarantine properties as defined in LSQuarantine.h.
Notes:

Available on Mac OS X 10.10 and later.
(Read only property)

35.11.201 query as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The query string, conforming to RFC 1808. (read-only)
Notes:

This property contains the query string. If the receiver does not conform to RFC 1808, this property contains nil. For example, in the URL http://www.example.com/index.php?key1=value1& key2=value2, the query string is key1=value1& key2=value2.

(Read only property)

35.11.202 relativePath as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The relative path, conforming to RFC 1808. (read-only)
Notes:

This property contains the relative path of the receiver's URL without resolving against its base URL. If the path has a trailing slash it is stripped. If the receiver is an absolute URL, this property contains the same value as path. If the receiver does not conform to RFC 1808, it contains nil.
(Read only property)

35.11.203 relativeString as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A string representation of the relative portion of the URL. (read-only)
Notes:

This property contains a string representation of the relative portion of the URL. If the receiver is an absolute URL this method returns the same value as absoluteString.
(Read only property)

35.11.204 resourceSpecifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resource specifier. (read-only)
Notes:

This property contains the resource specifier. For example, in the URL http://www.example.com/index.html?key1=value1# jumplink, the resource specifier is //www.example.com/index.html?key1=value1# jumplink (everything after the colon).
(Read only property)

35.11.205 scheme as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The scheme. (read-only)
Notes:

This property contains the scheme. For example, in the URL http://www.example.com/index.html, the

scheme is http.

The full URL is the concatenation of the scheme, a colon (:), and the value of resourceSpecifier.

The term "protocol" is also sometimes used when talking about network-based URL schemes. However, not all URL schemes are networking protocols—data:// URLs, for example.
(Read only property)

35.11.206 standardizedURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A copy of the URL with any instances of ".." or "." removed from its path. (read-only)
Notes:

This property contains a new NSURL object, initialized using the receiver's path with any instances of ".." or "." removed.

If the URL conforms to RFC 1808 (the most common form of URL), this property contains the specified URL component; otherwise it contains nil. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808—specifically, whether the first two characters of resourceSpecifier are slashes (//).
(Read only property)

35.11.207 TypeIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resource's uniform type identifier (UTI), returned as a string.
Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.208 user as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The user name, conforming to RFC 1808. (read-only)
Notes:

This property contains the user name. For example, in the URL ftp://username@www.example.com/, the user name is username.

If the receiver's URL does not conform to RFC 1808, this property returns nil. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808—specifically, whether the first two characters of resourceSpecifier are slashes (//).
(Read only property)

35.11.209 VolumeIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The unique identifier of the resource's volume, returned as an id.
Notes:

The unique identifier of the resource's volume, returned as an id (read-only).
This identifier can be used with the isEqual method to determine whether two file system resources are on the same volume.
The value of this identifier is not persistent across system restarts.
Available in OS X v10.7 and later.
(Read only property)

35.11.210 VolumeURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The root directory of the resource's volume, returned as an NSURL object.
Notes:

Available in OS X v10.6 and later.
(Read only property)

35.11.211 Delegates

35.11.212 ResourceValuesForKeysDelegateMBS(URL as NSURLMBS, keys() as String, Values as Dictionary, Error as NSErrorMBS, tag as variant)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The delegate to use for resourceValuesForKeys method.

35.11.213 URLsResourceValuesForKeysDelegateMBS(URLs() as NSURLMBS, keys() as String, Values() as Dictionary, Errors() as NSErrorMBS, tag as variant)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The delegate to use with URLsResourceValuesForKeys method.

35.12 class NSURLProtectionSpaceMBS

35.12.1 class NSURLProtectionSpaceMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for the Cocoa URL protection space class.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

35.12.2 Methods

35.12.3 authenticationMethod as string

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the authentication method to be used for this protection space

35.12.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

35.12.5 host as string

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the proxy host if this is a proxy authentication, or the host from the URL.
Notes: Returns the host for this protection space.

35.12.6 isProxy as boolean

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Determine if this authenticating protection space is a proxy server
Notes: Returns true if a proxy, false otherwise.

35.12.7 port as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the proxy port if this is a proxy authentication, or the port from the URL.

Notes: Returns the port for this protection space, or 0 if not set.

35.12.8 protocol as string

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the protocol of this protection space, if not a proxy.
Notes: Returns the type string, or "" if a proxy.

35.12.9 proxyType as string

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the type of this protection space, if a proxy.
Notes: Returns the type string, or "" if not a proxy.

35.12.10 realm as string

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the authentication realm for which the protection space that needs authentication
Notes: This is generally only available for http authentication, and may be "" otherwise.

35.12.11 receivesCredentialSecurely as boolean

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Determine if the password for this protection space can be sent securely
Notes: True if a secure authentication method or protocol will be used, false otherwise.

35.12.12 Properties

35.12.13 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal used handle for this class.
Notes: (Read and Write property)

35.13 class NSURLRequestCertificateFilterMBS
