175.2.16 ReadTimeOut(MaxLength as Integer, TimeoutMS as Integer) as MemoryBlock

MBS USB Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Read an Input report from a HID device with timeout.
Notes:

Input reports are returned to the host through the INTERRUPT IN endpoint. The first byte will contain the Report number if the device uses numbered reports.

MaxLength: The number of bytes to read. For devices with multiple reports, make sure to read an extra byte for the report number.

TimeoutMS: timeout in milliseconds or -1 for blocking wait.

This function returns the actual number of bytes read and -1 on error. If no packet was available to be read

within the timeout period, this function returns 0.

175.2.17 SendFeatureReport(data as MemoryBlock) as Integer

MBS USB Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Send a Feature report to the device.
Notes:

Feature reports are sent over the Control endpoint as a Set_Report transfer. The first byte of Data must contain the Report ID. For devices which only support a single report, this must be set to 0. The remaining bytes contain the report data. Since the Report ID is mandatory, calls to SendFeatureReport() will always contain one more byte than the report contains. For example, if a hid report is 16 bytes long, 17 bytes must be passed to SendFeatureReport(): the Report ID (or 0, for devices which do not use numbered reports), followed by the report data (16 bytes). In this example, the length passed in would be 17.

dat:a The data to send, including the report number as the first byte.

This function returns the actual number of bytes written and -1 on error.
See also:

- 175.2.18 SendFeatureReport(data as String) as Integer 21488

175.2.18 SendFeatureReport(data as String) as Integer

MBS USB Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Send a Feature report to the device.
Notes:

Feature reports are sent over the Control endpoint as a Set_Report transfer. The first byte of Data must contain the Report ID. For devices which only support a single report, this must be set to 0. The remaining bytes contain the report data. Since the Report ID is mandatory, calls to SendFeatureReport() will always contain one more byte than the report contains. For example, if a hid report is 16 bytes long, 17 bytes must be passed to SendFeatureReport(): the Report ID (or 0, for devices which do not use numbered reports), followed by the report data (16 bytes). In this example, the length passed in would be 17.

dat:a The data to send, including the report number as the first byte.

This function returns the actual number of bytes written and -1 on error.
See also:

- 175.2.17 SendFeatureReport(data as MemoryBlock) as Integer 21488

175.2.19 Shutdown as Integer

MBS USB Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Finalize the HIDAPI library.
Notes:

This function frees all of the static data associated with HIDAPI. It should be called at the end of execution to avoid memory leaks.
This function returns 0 on success and -1 on error.

175.2.20 Write(data as MemoryBlock) as Integer

MBS USB Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Write an Output report to a HID device.
Notes:

The first byte of data must contain the Report ID. For devices which only support a single report, this must be set to 0x0. The remaining bytes contain the report data. Since the Report ID is mandatory, calls to Write() will always contain one more byte than the report contains. For example, if a hid report is 16 bytes long, 17 bytes must be passed to Write(), the Report ID (or 0x0, for devices with a single report), followed by the report data (16 bytes). In this example, the length passed in would be 17.
Write() will send the data on the first OUT endpoint, if one exists. If it does not, it will send the data through the Control Endpoint (Endpoint 0).

data: The data to send, including the report number as the first byte.

This function returns the actual number of bytes written and -1 on error.
Length of data to send is data.size.
See also:

- 175.2.21 Write(data as String) as Integer 21489

175.2.21 Write(data as String) as Integer

MBS USB Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Write an Output report to a HID device.
Notes:

The first byte of data must contain the Report ID. For devices which only support a single report, this must be set to 0x0. The remaining bytes contain the report data. Since the Report ID is mandatory, calls to Write() will always contain one more byte than the report contains. For example, if a hid report is 16 bytes long, 17 bytes must be passed to Write(), the Report ID (or 0x0, for devices with a single report), followed by the report data (16 bytes). In this example, the length passed in would be 17.
Write() will send the data on the first OUT endpoint, if one exists. If it does not, it will send the data

through the Control Endpoint (Endpoint 0).

data: The data to send, including the report number as the first byte.

This function returns the actual number of bytes written and -1 on error.
Length of data to send is LenB(data).
See also:

- 175.2.20 Write(data as MemoryBlock) as Integer 21489

175.2.22 WriteAsync(data as MemoryBlock)

MBS USB Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Write an Output report to a HID device asynchronously.
Notes:

For MacOS, we use 10 second timeout.
For Windows, it uses the default OS timeout.
Linux just falls back to synchronous method.
See also:

- 175.2.23 WriteAsync(data as String) 21490

175.2.23 WriteAsync(data as String)

MBS USB Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Write an Output report to a HID device asynchronously.
Notes:

For MacOS, we use 10 second timeout.
For Windows, it uses the default OS timeout.
Linux just falls back to synchronous method.
See also:

- 175.2.22 WriteAsync(data as MemoryBlock) 21490

175.2.24 Properties

175.2.25 DeviceHandle as Integer

MBS USB Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The device handle used.
Notes:

For Windows a HANDLE to the open device, for Mac a IOHIDDeviceRef reference and Linux the handle from open function.
(Read only property)

175.2.26 Error as String

MBS USB Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get a string describing the last error which occurred.
Notes:

This function returns a string containing the last error which occurred or "" if none has occurred.
(Read only property)

175.2.27 FeatureReportLength as Integer

MBS USB Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The length of a feature report.
Notes:

Not implemented for Linux.
Returns -1 if unknown.
On Mac this is more the maximum report length.
(Read only property)

175.2.28 Handle as Integer

MBS USB Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read only property)

175.2.29 InputReportLength as Integer

MBS USB Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The length of an input report.
Notes:

Not implemented for Linux.
Returns -1 if unknown.
On Mac this is more the maximum report length.
(Read only property)

175.2.30 ManufacturerString as String

MBS USB Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Manufacturer String from a HID device.
Notes: (Read only property)

175.2.31 NonBlocking as Boolean

MBS USB Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set the device handle to be non-blocking.
Notes:

In non-blocking mode calls to Read() will return immediately with a value of 0 if there is no data to be read.
In blocking mode, Read() will wait (block) until there is data to read before returning.
Nonblocking can be turned on and off at any time.

Value true: enable or not the nonblocking reads.
Value false: to disable nonblocking.
(Read and Write property)

175.2.32 OutputReportLength as Integer

MBS USB Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The length of an output report.
Notes:

Not implemented for Linux.
Returns -1 if unknown.
On Mac this is more the maximum report length.
(Read only property)

175.2.33 ProductString as String

MBS USB Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Product String from a HID device.
Notes: (Read only property)

175.2.34 SerialNumber as String

MBS USB Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Serial Number String from a HID device.
Notes: (Read only property)

175.3 class LibUSBConfigDescriptorMBS

175.3.1 class LibUSBConfigDescriptorMBS

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class representing the standard USB configuration descriptor.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

175.3.2 Methods

175.3.3 Constructor

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

175.3.4 GetInterface(index as Integer) as LibUSBInterfaceMBS

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries interface by index.

175.3.5 Properties

175.3.6 AttributesBitmap as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Configuration characteristics.
Notes: (Read only property)

175.3.7 Configuration as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Index of string descriptor describing this configuration.
Notes: (Read only property)

175.3.8 ConfigurationValue as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Identifier value for this configuration.
Notes: (Read only property)

175.3.9 DescriptorType as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Descriptor type.
Notes: (Read only property)

175.3.10 extra as MemoryBlock

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Extra descriptors.
Notes: (Read only property)

175.3.11 extraLength as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Length of the extra descriptors, in bytes.
Notes: (Read only property)

175.3.12 InterfaceDescriptors as Variant

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Array of interfaces supported by this configuration.
Notes: (Read only property)

175.3.13 Length as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Size of this descriptor (in bytes)
Notes: (Read only property)

175.3.14 MaxPower as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Maximum power consumption of the USB device from this bus in this configuration when the device is fully opreation.
Notes:

Expressed in units of 2 mA when the device is operating in high-speed mode and in units of 8 mA when the device is operating in super-speed mode.
(Read only property)

175.3.15 NumInterfaces as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Number of interfaces supported by this configuration.
Notes: (Read only property)

175.3.16 TotalLength as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Total length of data returned for this configuration.
Notes: (Read only property)

175.4 class LibUSBDeviceDescriptorMBS

175.4.1 class LibUSBDeviceDescriptorMBS

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class representing the standard USB device descriptor.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

175.4.2 Methods

175.4.3 Constructor

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

175.4.4 Properties

175.4.5 DescriptorType as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Descriptor type.
Notes: (Read only property)

175.4.6 DeviceClass as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** USB-IF class code for the device.
Notes: (Read only property)

175.4.7 DeviceProtocol as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** USB-IF protocol code for the device, qualified by the DeviceClass and DeviceSubClass values.
Notes: (Read only property)

175.4.8 DeviceReleaseNumber as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Device release number in binary-coded decimal.
Notes: (Read only property)

175.4.9 DeviceSubClass as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** USB-IF subclass code for the device, qualified by the DeviceClass value.
Notes: (Read only property)

175.4.10 IndexManufacturer as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Index of string descriptor describing manufacturer.
Notes: (Read only property)

175.4.11 IndexProduct as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Index of string descriptor describing product.
Notes: (Read only property)

175.4.12 IndexSerialNumber as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Index of string descriptor containing device serial number.
Notes: (Read only property)

175.4.13 Length as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Size of this descriptor (in bytes).
Notes: (Read only property)

175.4.14 MaxPacketSize0 as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Maximum packet size for endpoint 0.
Notes: (Read only property)

175.4.15 NumConfigurations as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Number of possible configurations.
Notes: (Read only property)

175.4.16 ProductID as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** USB-IF product ID.
Notes: (Read only property)

175.4.17 USBReleaseNumber as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** USB specification release number in binary-coded decimal.
Notes: (Read only property)

175.4.18 VendorID as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** USB-IF vendor ID.
Notes: (Read only property)

175.4.19 Constants

175.4.20 kClassApplication = & hfe

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: Application

175.4.21 kClassAudio = 1

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: Audio

175.4.22 kClassComm = 2

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: Comm

175.4.23 kClassContentSecurity = 13

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: Security

175.4.24 kClassData = 10

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: Data

175.4.25 kClassDiagnosticDevice = & hdc

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: Diagnostic Device

175.4.26 kClassHID = 3

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: HID

175.4.27 kClassHUB = 9

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: HUB

175.4.28 kClassImage = 6

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: Image

175.4.29 kClassMassStorage = 8

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: Storage

175.4.30 kClassPerInterface = 0

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: Classes per Interface

175.4.31 kClassPersonalHealthcare = 15

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: Personal Healthcare

175.4.32 kClassPhysical = 5

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: Physical

175.4.33 kClassPrinter = 7

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: Printer

175.4.34 kClassPTP = 6

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: PTP

175.4.35 kClassSmartCard = 11

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: SmartCard

175.4.36 kClassVendorSpecific = 255

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: Vendor Specific

175.4.37 kClassVideo = 14

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: Video

175.4.38 kClassWireless = & he0

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the USB class constants.
Notes: Wireless

175.5 class LibUSBDeviceMBS

175.5.1 class LibUSBDeviceMBS

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a device.
Notes:

This is both for a device as general and an open connection.

LibUSB abstracts on Mac, Windows and Linux for using USB devices. SO far it's the best generic USB interface we have.
You need libUSB dylib (mac), dll (Windows) and so (Linux) files from LibUSB. For Linux the LibUSB library is usually preinstalled with a LibUSB package, so the plugin finds it automatically.

175.5.2 Blog Entries

- MBS Xojo Plugins, version 18.1pr4
- LibUSB for Xojo in next MBS Plugins

175.5.3 Methods

175.5.4 AttachKernelDriver(interfaceNumber as Integer)

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Re-attach an interface's kernel driver, which was previously detached using libusb_detach_kernel_driver().
Notes:

This call is only effective on Linux and returns kErrorNotSupported on all other platforms.

This functionality is not available on Darwin or Windows.

Parameters:
interfaceNumber: the interface to attach the driver from

Lasterror is set:
0 on success
kErrorNotFound if no kernel driver was active
kErrorInvalidParam if the interface does not exist
kErrorNoDevice if the device has been disconnected
kErrorNotSupported on platforms where the functionality is not available
kErrorBusy if the driver cannot be attached because the interface is claimed by a program or driver

another error code on other failure

175.5.5 BulkTransfer(endpoint as Integer, data as Ptr, Length as Integer, byref ActualLength as Integer, Timeout as Integer)

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Perform a USB bulk transfer.
Notes:

The direction of the transfer is inferred from the direction bits of the endpoint address.

For bulk reads, the length field indicates the maximum length of data you are expecting to receive. If less data arrives than expected, this function will return that data, so be sure to check the transferred output parameter.

You should also check the transferred parameter for bulk writes. Not all of the data may have been written.

Also check transferred when dealing with a timeout error code. libusb may have to split your transfer into a number of chunks to satisfy underlying O/S requirements, meaning that the timeout may expire after the first few chunks have completed. libusb is careful not to lose any data that may have been transferred; do not assume that timeout conditions indicate a complete lack of I/O.

Parameters:

endpoint	the address of a valid endpoint to communicate with
data	a suitably-sized data buffer for either input or output (depending on endpoint)
length	for bulk writes, the number of bytes from data to be sent. for bulk reads, the maximum number of bytes to receive into the data buffer.
transferred	output location for the number of bytes actually transferred.
timeout	timeout (in millseconds) that this function should wait before giving up due to no response being received. For an unlimited timeout, use value 0.

Lasterror is set to:
0 on success (and populates transferred)
kErrorTimeout if the transfer timed out (and populates transferred)
kErrorPipe if the endpoint halted
kErrorOverflow if the device offered more data, see Packets and overflows
kErrorNoDevice if the device has been disconnected
another error code on other failures

175.5.6 ClaimInterface(interfaceNumber as Integer)

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Claim an interface on a given device handle.
Notes:

You must claim the interface you wish to use before you can perform I/O on any of its endpoints.

It is legal to attempt to claim an already-claimed interface, in which case libusb just returns 0 without doing anything.

Claiming of interfaces is a purely logical operation; it does not cause any requests to be sent over the bus. Interface claiming is used to instruct the underlying operating system that your application wishes to take ownership of the interface.

This is a non-blocking function.

Parameters:
interfaceNumber: the bInterfaceNumber of the interface you wish to claim

Lasterror is set:
0 on success
kErrorNotFound if the requested interface does not exist
kErrorBusy if another program or driver has claimed the interface
kErrorNoDevice if the device has been disconnected
a error code on other failure

175.5.7 ClearHalt(endpoint as Integer)

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clear the halt/stall condition for an endpoint.
Notes:

Endpoints with halt status are unable to receive or transmit data until the halt condition is stalled.

You should cancel all pending transfers before attempting to clear the halt condition.

This is a blocking function.

Parameters:
endpoint: the endpoint to clear halt status

Returns:
0 on success
kErrorNotFound if the endpoint does not exist
kErrorNoDevice if the device has been disconnected
another error code on other failure

175.5.8 Close

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Close a device handle.
Notes:

Should be called on all open handles before your application exits.
Internally, this function destroys the reference that was added by Open on the given device.
This is a non-blocking function; no requests are sent over the bus.

175.5.9 ControlTransfer(requestType as Integer, Request as Integer, Value as Integer, Index as Integer, data as Ptr, Length as Integer, Timeout as Integer) as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Perform a USB control transfer.
Notes:

The direction of the transfer is inferred from the RequestType field of the setup packet.

The Value, Index and Length fields values should be given in host-endian byte order.

Parameters:

RequestType	the request type field for the setup packet
Request	the request field for the setup packet
Value	the value field for the setup packet
Index	the index field for the setup packet
data	a suitably-sized data buffer for either input or output (depending on direction bits within bmRequestType)
Length	the length field for the setup packet. The data buffer should be at least this size.
timeout	timeout (in millseconds) that this function should wait before giving up due to no response being received. For an unlimited timeout, use value 0.

on success, the number of bytes actually transferred is returned.

Lasterror is set to:
kErrorTimeout if the transfer timed out
kErrorPipe if the control request was not supported by the device
kErrorNoDevice if the device has been disconnected
another error code on other failures

175.5.10 DetachKernelDriver(interfaceNumber as Integer)

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Detach a kernel driver from an interface.
Notes:

If successful, you will then be able to claim the interface and perform I/O.
This functionality is not available on Darwin or Windows.

Parameters:
interfaceNumber: the interface to detach the driver from

Lasterror is set:
0 on success
kErrorNotFound if no kernel driver was active
kErrorInvalidParam if the interface does not exist
kErrorNoDevice if the device has been disconnected
kErrorNotSupported on platforms where the functionality is not available
another error code on other failure

175.5.11 Devices as LibUSBDeviceMBS()

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a list of USB devices currently attached to the system.
Notes:

This is your entry point into finding a USB device to operate.

This return value of this function indicates the number of devices in the resultant list.

The number of devices in the outputted list.
Lasterror is set to zero on success or or any error codes according to errors encountered by the backend.

175.5.12 ErrorName(ErrorCode as Integer) as String

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a constant string with the ASCII name of a libusb error code.

175.5.13 GetActiveConfigDescriptor as LibUSBConfigDescriptorMBS

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the USB configuration descriptor for the currently active configuration.
Notes:

This is a non-blocking function which does not involve any requests being sent to the device.

Lasterror is set to:
0 on success
kErrorNotFound if the device is in unconfigured state
another error code on error.

175.5.14 GetConfigDescriptor(Index as Integer) as LibUSBConfigDescriptorMBS

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get a USB configuration descriptor based on its index.
Notes:

This is a non-blocking function which does not involve any requests being sent to the device.

Parameters:

Index the index of the configuration you wish to retrieve

Lasterror is set to:
0 on success
kErrorNotFound if the configuration does not exist
another error code on error

175.5.15 GetConfigDescriptorByValue(Value as Integer) as LibUSBConfigDescriptorMBS

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get a USB configuration descriptor with a specific ConfigurationValue.
Notes:

This is a non-blocking function which does not involve any requests being sent to the device.

Value: the bConfigurationValue of the configuration you wish to retrieve.

Lasterror is set to:
0 on success
kErrorNotFound if the configuration does not exist
another error code on error

175.5.16 GetConfiguration as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Determine the bConfigurationValue of the currently active configuration.
Notes:

You could formulate your own control request to obtain this information, but this function has the advantage that it may be able to retrieve the information from operating system caches (no I/O involved).

If the OS does not cache this information, then this function will block while a control transfer is submitted to retrieve the information.

This function will return a value of 0 in the config output parameter if the device is in unconfigured state.

Returns Configuration value of the active configuration (only valid for return code 0)

The lasterror is set to:
0 on success
kErrorNoDevice if the device has been disconnected
another error code on other failure

175.5.17 GetDescriptor(descType as Integer, descIndex as Integer, data as Ptr, Length as Integer) as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve a descriptor from the default control pipe.
Notes:

This is a convenience function which formulates the appropriate control message to retrieve the descriptor.

Parameters:

descType	the descriptor type, see libusb_descriptor_type
descIndex	the index of the descriptor to retrieve
data	output buffer for descriptor
length	size of data buffer

Returns number of bytes returned in data or zero.
Sets lasterror to error code on failure

175.5.18 GetDeviceDescriptor as LibUSBDeviceDescriptorMBS

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the USB device descriptor for a given device.
Notes:

This is a non-blocking function; the device descriptor is cached in memory.

Returns 0 on success or a error code on failure.

175.5.19 GetMaxISOPacketSize(EndPoint as Integer) as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Calculate the maximum packet size which a specific endpoint is capable is sending or receiving in the duration of 1 microframe.
Notes:

Only the active configution is examined. The calculation is based on the wMaxPacketSize field in the endpoint descriptor as described in section 9.6.6 in the USB 2.0 specifications.

If acting on an isochronous or interrupt endpoint, this function will multiply the value found in bits 0:10 by the number of transactions per microframe (determined by bits 11:12). Otherwise, this function just returns

the numeric value found in bits 0:10.

This function is useful for setting up isochronous transfers, for example you might pass the return value from this function to libusb_set_iso_packet_lengths() in order to set the length field of every isochronous packet in a transfer.

Since v1.0.3.

Parameters:
endpoint: address of the endpoint in question

Returns the maximum packet size which can be sent/received on this endpoint.

The lasterror is set to:
0 for success.
kErrorNotFound if the endpoint does not exist
kErrorOther on other failure

175.5.20 GetMaxPacketSize(EndPoint as Integer) as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convenience function to retrieve the wMaxPacketSize value for a particular endpoint in the active device configuration.
Notes:

This function was originally intended to be of assistance when setting up isochronous transfers, but a design mistake resulted in this function instead. It simply returns the wMaxPacketSize value without considering its contents. If you're dealing with isochronous transfers, you probably want libusb_get_max_iso_packet_size() instead.

Parameters:
endpoint: address of the endpoint in question

Returns the Max Packet Size value.

The lasterror is set:
0 for success.
kErrorNotFound if the endpoint does not exist
kErrorOther on other failure

175.5.21 GetStringDescriptor(descIndex as Integer, LangID as Integer = 0) as String

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve a descriptor from a device.
Notes:

This is a convenience function which formulates the appropriate control message to retrieve the descriptor. The string returned is Unicode, as detailed in the USB specifications.

Parameters:

descIndex	the index of the descriptor to retrieve
LangID	the language ID for the string descriptor

Returns string.
Lasterror is set to zero or error code on failure.
See also:

- 175.5.22 GetStringDescriptor(descIndex as Integer, LangID as Integer = 0, data as Ptr, Length as Integer) as Integer 21512

175.5.22 GetStringDescriptor(descIndex as Integer, LangID as Integer = 0, data as Ptr, Length as Integer) as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve a descriptor from a device.
Notes:

This is a convenience function which formulates the appropriate control message to retrieve the descriptor. The string returned is Unicode, as detailed in the USB specifications.

Parameters:

descIndex	the index of the descriptor to retrieve
LangID	the language ID for the string descriptor
data	output buffer for descriptor
length	size of data buffer

Returns number of bytes returned in data.
Lasterror is set to zero or error code on failure.

See also:

- 175.5.21 GetStringDescriptor(descIndex as Integer, LangID as Integer = 0) as String 21512

175.5.23 GetStringDescriptorAscii(descIndex as Integer) as String

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve a string descriptor in ASCII.
Notes:

Wrapper around GetStringDescriptor(). Uses the first language supported by the device.

Parameters:

descIndex	the index of the descriptor to retrieve

Returns string.
Lasterror is set to error code on failure and zero on success.
See also:

- 175.5.24 GetStringDescriptorAscii(descIndex as Integer, data as Ptr, Length as Integer) as Integer 21513

175.5.24 GetStringDescriptorAscii(descIndex as Integer, data as Ptr, Length as Integer) as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve a string descriptor in ASCII.
Notes:

Wrapper around GetStringDescriptor(). Uses the first language supported by the device.

Parameters:

descIndex	the index of the descriptor to retrieve
data	output buffer for ASCII string descriptor
length	size of data buffer

Returns number of bytes returned in data.
Lasterror is set to error code on failure and zero on success.
See also:

• 175.5.23 GetStringDescriptorAscii(descIndex as Integer) as String 21513

175.5.25 HasCapability(Capability as UInt32) as Boolean

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Check at runtime if the loaded library has a given capability.
Notes: Returns true if the running library has the capability, false otherwise.

175.5.26 Initialize as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Initialize libusb.

175.5.27 InterruptTransfer(endpoint as Integer, data as Ptr, Length as Integer, byref ActualLength as Integer, Timeout as Integer)

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Perform a USB interrupt transfer.
Notes:

The direction of the transfer is inferred from the direction bits of the endpoint address.

For interrupt reads, the length field indicates the maximum length of data you are expecting to receive. If less data arrives than expected, this function will return that data, so be sure to check the transferred output parameter.

You should also check the transferred parameter for interrupt writes. Not all of the data may have been written.

Also check transferred when dealing with a timeout error code. libusb may have to split your transfer into a number of chunks to satisfy underlying O/S requirements, meaning that the timeout may expire after the first few chunks have completed. libusb is careful not to lose any data that may have been transferred; do not assume that timeout conditions indicate a complete lack of I/O.

The default endpoint bInterval value is used as the polling interval.

Parameters:

The lasterror property is set to:

endpoint	the address of a valid endpoint to communicate with
data	a suitably-sized data buffer for either input or output (depending on endpoint)
length	for bulk writes, the number of bytes from data to be sent. for bulk reads, the maximum number of bytes to receive into the data buffer.
transferred	output location for the number of bytes actually transferred.
timeout	timeout (in millseconds) that this function should wait before giving up due to no response being received. For an unlimited timeout, use value 0.

0 on success (and populates transferred)
kErrorTimeout if the transfer timed out
kErrorPipe if the endpoint halted
kErrorOverflow if the device offered more data, see Packets and overflows
kErrorNoDevice if the device has been disconnected
another error code on other error

175.5.28 KernelDriverActive(interfaceNumber as Integer) as Boolean

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Determine if a kernel driver is active on an interface.
Notes:

If a kernel driver is active, you cannot claim the interface, and libusb will be unable to perform I/O.

This functionality is not available on Windows.

Parameters:
interfaceNumber: the interface to check

Lasterror is set:
0 if no kernel driver is active
1 if a kernel driver is active
kErrorNoDevice if the device has been disconnected
kErrorNotSupported on platforms where the functionality is not available
another error code on other failure

175.5.29 LibraryLoaded as Boolean

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether library is loaded.

175.5.30 LibraryLoadErrorMessage as String

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The last error message from loading library.

175.5.31 LibVersion as LibUSBVersionMBS

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries version of library.

175.5.32 LoadLibrary(file as folderitem) as boolean

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads the libusb library.
Notes:

Returns true on success or false on failure.
The LibraryLoadErrorMessage function returns error message on failure.
See also:

- 175.5.33 LoadLibrary(path as string) as boolean 21516

175.5.33 LoadLibrary(path as string) as boolean

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads the libusb library.
Notes:

Returns true on success or false on failure.
The LibraryLoadErrorMessage function returns error message on failure.
See also:

- 175.5.32 LoadLibrary(file as folderitem) as boolean 21516

175.5.34 Open as Boolean

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Open a device and obtain a device handle.
Notes:

A handle allows you to perform I/O on the device in question.

Internally, this function adds a reference to the device. This reference is removed during Close().

This is a non-blocking function; no requests are sent over the bus.

The last error to:
0 on success
kErrorNoMemory on memory allocation failure
kErrorAccess if the user has insufficient permissions
kErrorNoDevice if the device has been disconnected
another error code on other failure

175.5.35 OpenDevice(VID as Integer, PID as Integer) as LibUSBDeviceMBS

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convenience function for finding a device with a particular VID/PID combination.
Notes:

This function is intended for those scenarios where you are using libusb to knock up a quick test application - it allows you to avoid calling libusb_get_device_list() and worrying about traversing/freeing the list.

This function has limitations and is hence not intended for use in real applications: if multiple devices have the same IDs it will only give you the first one, etc.

Parameters:

VID	the idVendor value to search for
PID	the idProduct value to search for

Returns:
a handle for the first found device, or NULL on error or if the device could not be found.

175.5.36 ReleaseInterface(interfaceNumber as Integer)

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Release an interface previously claimed with ClaimInterface.
Notes:

You should release all claimed interfaces before closing a device handle.

This is a blocking function. A SET_INTERFACE control request will be sent to the device, resetting interface state to the first alternate setting.

Parameters:
interfaceNumber: the bInterfaceNumber of the previously-claimed interface

The lasterror:
0 on success
kErrorNotFound if the interface was not claimed
kErrorNoDevice if the device has been disconnected
another error code on other failure

175.5.37 Reset

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Perform a USB port reset to reinitialize a device.
Notes:

The system will attempt to restore the previous configuration and alternate settings after the reset has completed.

If the reset fails, the descriptors change, or the previous state cannot be restored, the device will appear to be disconnected and reconnected. This means that the device handle is no longer valid (you should close it) and rediscover the device. An error code of kErrorNotFound indicates when this is the case.

This is a blocking function which usually incurs a noticeable delay.

Lasterror is set:
0 on success
kErrorNotFound if re-enumeration is required, or if the device has been disconnected
another error code on other failure

175.5.38 SetConfiguration(configuration as Integer)

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set the active configuration for a device.
Notes:

The operating system may or may not have already set an active configuration on the device. It is up to your application to ensure the correct configuration is selected before you attempt to claim interfaces and perform other operations.

If you call this function on a device already configured with the selected configuration, then this function will act as a lightweight device reset: it will issue a SET_CONFIGURATION request using the current configuration, causing most USB-related device state to be reset (altsetting reset to zero, endpoint halts cleared, toggles reset).

You cannot change/reset configuration if your application has claimed interfaces - you should free them with libusb_release_interface() first. You cannot change/reset configuration if other applications or drivers have claimed interfaces.

A configuration value of -1 will put the device in unconfigured state. The USB specifications state that a configuration value of 0 does this, however buggy devices exist which actually have a configuration 0.

You should always use this function rather than formulating your own SET_CONFIGURATION control request. This is because the underlying operating system needs to know when such changes happen.

This is a blocking function.

Parameters:
configuration: the bConfigurationValue of the configuration you wish to activate, or -1 if you wish to put the device in unconfigured state

The lasterror is set to:
0 on success
kErrorNotFound if the requested configuration does not exist
kErrorBusy if interfaces are currently claimed
kErrorNoDevice if the device has been disconnected
another error code on other failure

175.5.39 SetDebug(level as integer)

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set message verbosity.
Notes:

Level 0: no messages ever printed by the library (default)
Level 1: error messages are printed to stderr
Level 2: warning and error messages are printed to stderr
Level 3: informational messages are printed to stdout, warning and error messages are printed to stderr
The default level is 0, which means no messages are ever printed. If you choose to increase the message verbosity level, ensure that your application does not close the stdout/stderr file descriptors.

You are advised to set level 3. libusb is conservative with its message logging and most of the time, will only

log messages that explain error conditions and other oddities. This will help you debug your software.

If the LIBUSB_DEBUG environment variable was set when libusb was initialized, this function does nothing: the message verbosity is fixed to the value in the environment variable.

If libusb was compiled without any message logging, this function does nothing: you'll never get any messages.
If libusb was compiled with verbose debug message logging, this function does nothing: you'll always get messages from all levels.

175.5.40 SetInterfaceAltSetting(interfaceNumber as Integer, alternateSetting as Integer)

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Activate an alternate setting for an interface.
Notes:

The interface must have been previously claimed with ClaimInterface().

You should always use this function rather than formulating your own SET_INTERFACE control request. This is because the underlying operating system needs to know when such changes happen.

This is a blocking function.

Parameters:

interfaceNumber	the InterfaceNumber of the previously-claimed interface
alternateSetting	the AlternateSetting of the alternate setting to activate

The lasterror:
0 on success
kErrorNotFound if the interface was not claimed, or the requested alternate setting does not exist
kErrorNoDevice if the device has been disconnected
another error code on other failure

175.5.41 Shutdown

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Deinitialize libusb.

Notes: Should be called after closing all open devices and before your application terminates.

175.5.42 Properties

175.5.43 BusNumber as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the number of the bus that a device is connected to.
Notes: (Read only property)

175.5.44 DeviceAddress as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the address of the device on the bus it is connected to.
Notes: (Read only property)

175.5.45 DeviceHandle as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The handle to the device.
Notes: (Read only property)

175.5.46 DeviceSpeed as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the negotiated connection speed for a device.
Notes:

a speed value, where kSpeedUnknown means that the OS doesn't know or doesn't support returning the negotiated speed.
(Read only property)

175.5.47 Handle as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The handle to the open device.
Notes: (Read only property)

175.5.48 IsOpen as Boolean

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether device is open.
Notes:

True if you called OpenDevice successful.
(Read only property)

175.5.49 Lasterror as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The last error code.
Notes: (Read and Write property)

175.5.50 Constants

175.5.51 kCapabilitiesHasCapabilities = 0

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the capabilities constants.
Notes: The HasCapability() API is available.

175.5.52 kCapabilitiesHasHIDAccess = 256

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the capabilities constants.
Notes:

The library can access HID devices without requiring user intervention.
Note that before being able to actually access an HID device, you may still have to call additional libusb functions such as
DetachKernelDriver.

175.5.53 kCapabilitiesHasHotplug = 1

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the capabilities constants.
Notes: Hotplug support is available on this platform.

175.5.54 kCapabilitiesSupportsDetachKernelDriver = 257

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the capabilities constants.
Notes: The library supports detaching of the default USB driver, using DetachKernelDriver, if one is set by the OS kernel.

175.5.55 kDescriptorTypeBOS = 6

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the descriptor type constants.
Notes: BOS descriptor

175.5.56 kDescriptorTypeConfig = 2

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the descriptor type constants.
Notes: Configuration descriptor.

175.5.57 kDescriptorTypeDevice = 1

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the descriptor type constants.
Notes: Device descriptor.

175.5.58 kDescriptorTypeDeviceCapabilities = 16

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the descriptor type constants.
Notes: Device Capability descriptor

175.5.59 kDescriptorTypeEndpoint = 5

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the descriptor type constants.
Notes: Endpoint descriptor.

175.5.60 kDescriptorTypeHID = & h21

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the descriptor type constants.
Notes: HID descriptor.

175.5.61 kDescriptorTypeHub = & h29

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the descriptor type constants.
Notes: Hub descriptor.

175.5.62 kDescriptorTypeInterface = 4

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the descriptor type constants.
Notes: Interface descriptor.

175.5.63 kDescriptorTypePhysical = & h23

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the descriptor type constants.
Notes: Physical descriptor.

175.5.64 kDescriptorTypeReport = & h22

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the descriptor type constants.
Notes: HID report descriptor.

175.5.65 kDescriptorTypeString = 3

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the descriptor type constants.
Notes: String descriptor.

175.5.66 kDescriptorTypeSuperSpeedEndpointCompanion = & h30

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the descriptor type constants.
Notes: SuperSpeed Endpoint Companion descriptor

175.5.67 kDescriptorTypeSuperSpeedHub = & h2A

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the descriptor type constants.
Notes: SuperSpeed Hub descriptor

175.5.68 kErrorAccess = -3

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the error constants.
Notes: Access

175.5.69 kErrorBusy = -6

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the error constants.
Notes: Busy

175.5.70 kErrorInterrupted = -10

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the error constants.
Notes: Interrupted

175.5.71 kErrorInvalidParam = -2

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the error constants.
Notes: Invalid parameter

175.5.72 kErrorIO = -1

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the error constants.
Notes: I/O Error

175.5.73 kErrorNoDevice = -4

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the error constants.
Notes: No device.

175.5.74 kErrorNoMemory = -11

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the error constants.
Notes: Out of Memory

175.5.75 kErrorNotFound = -5

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the error constants.
Notes: Not found

175.5.76 kErrorNotSupported = -12

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the error constants.
Notes: Function not supported

175.5.77 kErrorOther = -99

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the error constants.
Notes: Other errors

175.5.78 kErrorOverflow = -8

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the error constants.
Notes: Overflow

175.5.79 kErrorPipe = -9

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the error constants.
Notes: Pipe

175.5.80 kErrorTimeout = -7

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the error constants.
Notes: Timeout

175.5.81 kLogLevelDebug = 4

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the debug log level constants.
Notes: debug and informational messages are printed to stdout, warnings and errors to stderr

175.5.82 kLogLevelError = 1

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the debug log level constants.
Notes: error messages are printed to stderr

175.5.83 kLogLevelInfo = 3

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the debug log level constants.
Notes: informational messages are printed to stdout, warning and error messages are printed to stderr

175.5.84 kLogLevelNone = 0

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the debug log level constants.
Notes: no messages ever printed by the library (default)

175.5.85 kLogLevelWarning = 2

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the debug log level constants.
Notes: warning and error messages are printed to stderr

175.5.86 kSpeedFull = 2

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the constants indicates the speed at which the device is operating.
Notes: The device is operating at full speed (12MBit/s).

175.5.87 kSpeedHigh = 3

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the constants indicates the speed at which the device is operating.
Notes: The device is operating at high speed (480MBit/s).

175.5.88 kSpeedLow = 1

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the constants indicates the speed at which the device is operating.

Notes: The device is operating at low speed (1.5MBit/s).

175.5.89 kSpeedSuper = 4

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the constants indicates the speed at which the device is operating.
Notes: The device is operating at super speed (5000MBit/s).

175.5.90 kSpeedUnknown = 0

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the constants indicates the speed at which the device is operating.
Notes: The OS doesn't report or know the device speed.

175.6 class LibUSBEndpointDescriptorMBS

175.6.1 class LibUSBEndpointDescriptorMBS

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class representing the standard USB endpoint descriptor.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

175.6.2 Methods

175.6.3 Constructor

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

175.6.4 Properties

175.6.5 AttributesBitmap as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Attributes which apply to the endpoint when it is configured using the bConfigurationValue.
Notes: (Read only property)

175.6.6 DescriptorType as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Descriptor type.
Notes: (Read only property)

175.6.7 EndpointAddress as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The address of the endpoint described by this descriptor.
Notes: (Read only property)

175.6.8 EndpointDirection as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The transfer direction.
Notes: (Read only property)

175.6.9 extra as MemoryBlock

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Extra descriptors.
Notes: (Read only property)

175.6.10 extraLength as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Length of the extra descriptors, in bytes.
Notes: (Read only property)

175.6.11 Interval as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Interval for polling endpoint for data transfers.
Notes: (Read only property)

175.6.12 Length as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Size of this descriptor (in bytes)
Notes: (Read only property)

175.6.13 MaxPacketSize as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Maximum packet size this endpoint is capable of sending/receiving.
Notes: (Read only property)

175.6.14 Refresh as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** For audio devices only: the rate at which synchronization feedback is provided.
Notes: (Read only property)

175.6.15 SynchAddress as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** For audio devices only: the address if the synch endpoint.
Notes: (Read only property)

175.6.16 TransferType as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The transfer type.
Notes: (Read only property)

175.6.17 Constants

175.6.18 kEndpointDirectionIn = 0

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the Endpoint Directions constants.
Notes: In: device-to-host

175.6.19 kEndpointDirectionOut = 128

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the Endpoint Directions constants.
Notes: Out: host-to-device.

175.6.20 kTransferTypeBulk = 2

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the Transfer Type constants.
Notes: Bulk endpoint.

175.6.21 kTransferTypeBulkStream = 4

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the Transfer Type constants.
Notes: Bulk stream transfer.

175.6.22 kTransferTypeControl = 0

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the Transfer Type constants.
Notes: Control endpoint.

175.6.23 kTransferTypeInterrupt = 3

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the Transfer Type constants.
Notes: Interrupt endpoint.

175.6.24 kTransferTypeISOChronous = 1

MBS USB Plugin, Plugin Version: 18.1. **Function:** One of the Transfer Type constants.
Notes: Isochronous endpoint.

175.7 class LibUSBInterfaceDescriptorMBS

175.7.1 class LibUSBInterfaceDescriptorMBS

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class representing the standard USB interface descriptor.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

175.7.2 Methods

175.7.3 Constructor

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

175.7.4 EndpointDescriptor(index as Integer) as LibUSBEndpointDescriptorMBS

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries endpoint descriptors by index.

175.7.5 Properties

175.7.6 AlternateSetting as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Value used to select this alternate setting for this interface.
Notes: (Read only property)

175.7.7 DescriptorType as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Descriptor type.
Notes: (Read only property)

175.7.8 Endpoints as Variant

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Array of endpoint descriptors.
Notes: (Read only property)

175.7.9 extra as MemoryBlock

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Extra descriptors.
Notes: (Read only property)

175.7.10 ExtraLength as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Length of the extra descriptors, in bytes.
Notes: (Read only property)

175.7.11 IndexInterface as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Index of string descriptor describing this interface.
Notes: (Read only property)

175.7.12 InterfaceClass as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** USB-IF class code for this interface.
Notes: (Read only property)

175.7.13 InterfaceNumber as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Number of this interface.
Notes: (Read only property)

175.7.14 InterfaceProtocol as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** USB-IF protocol code for this interface, qualified by the InterfaceClass and InterfaceSubClass values.
Notes: (Read only property)

175.7.15 InterfaceSubClass as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** USB-IF subclass code for this interface, qualified by the InterfaceClass value.
Notes: (Read only property)

175.7.16 Length as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Size of this descriptor (in bytes)
Notes: (Read only property)

175.7.17 NumEndpoints as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Number of endpoints used by this interface (excluding the control endpoint).
Notes: (Read only property)

175.8 class LibUSBInterfaceMBS

175.8.1 class LibUSBInterfaceMBS

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A collection of alternate settings for a particular USB interface.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

175.8.2 Methods

175.8.3 Constructor

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

175.8.4 InterfaceDescriptor(index as Integer) as LibUSBInterfaceDescriptorMBS

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries interface descriptor by index.

175.8.5 Properties

175.8.6 Count as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The number of alternate settings that belong to this interface.
Notes: (Read only property)

175.8.7 InterfaceDescriptors as Variant

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Array of interface descriptors.
Notes: (Read only property)

175.9 class LibUSBVersionMBS

175.9.1 class LibUSBVersionMBS

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Class representing the libusb version.

175.9.2 Methods

175.9.3 Constructor

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor.
Notes: Queries library version if possible.

175.9.4 Properties

175.9.5 Describe as String

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Output of git describe –tags at library build time.
Notes: (Read only property)

175.9.6 Major as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Library major version.
Notes:

Currently 1.
(Read only property)

175.9.7 Micro as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Library micro version.
Notes: (Read only property)

175.9.8 Minor as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Library minor version.
Notes: (Read only property)

175.9.9 Nano as Integer

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Library nano version.
Notes: (Read only property)

175.9.10 RC as String

MBS USB Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Library release candidate suffix string, e.g. ”-rc4”.
Notes: (Read only property)

175.10 class LinuxHIDInterfaceMBS

175.10.1 class LinuxHIDInterfaceMBS

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The class for linux to connect to USB HID devices.
Notes:

For newer development, please use our HIDAPIMBS class.

The constructor does the initialisation of the HID Library and the destructor does the cleanup. This works with several instances, too.

The plugin tries to load one of libhid.so, libhid.so.0 or libhid.so.0.0.0 and one of libusb.so or libusb-0.1.so.4 from your /usr/lib folder (or where else the path environment variable points to). If the libraries are missing, this class will not work properly.

175.10.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr12
- MBS REALbasic Plugins, version 10.6pr1
- MBS REALbasic Plugins, version 10.4pr2
- MBS REALbasic Plugins, version 10.3pr4

175.10.3 Methods

175.10.4 Available as boolean

MBS USB Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Whether libhid is available.
Notes: Not all Linux distribution have libusb and libhid installed by default.

175.10.5 Close as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Closes the device.
Notes: Returns error code. See kError* constants.

175.10.6 DumpTreeToStderr as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Dumps the device tree to stderr.
Example:

```
dim h as LinuxHIDInterfaceMBS
// open device
call h.DumpTreeToStderr
```

Notes: Returns error code. See kError* constants.

175.10.7 DumpTreeToStdout as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Dumps the device tree to stdout.
Example:

```
dim h as LinuxHIDInterfaceMBS
// open device
call h.DumpTreeToStdout
```

Notes: Returns error code. See kError* constants.

175.10.8 ForceOpen(theInterface as Integer, Vendor as Integer, Product as Integer, retries as Integer) as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Opens the USB device with the given interface index, vendor and product codes.
Example:

```
dim h as new LinuxHIDInterfaceMBS

const vendor = & h7C0
const product = & h1500
const retries = 3

dim e as Integer = h.ForceOpen(0, vendor, product, retries)
```

Notes:

Vendor or Product code can be kMatchAny (0) to match all devices.
You can use the MatchDevice event to learn which devices are there and return true there to select one.
Returns error code. See kError* constants.

175.10.9 GetInputReport(path() as Integer, data as memoryblock, offset as Integer, size as Integer) as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Reads an input report.
Notes:

Path: The path to the endpoint.
Data: the memoryblock to store the data.
Offset: The offset where to start inside the memoryblock.
Size: the length of the data int he memoryblock.

Returns error code. See kError* constants.

175.10.10 InterruptRead(EndPoint as Integer, mem as memoryblock, size as Integer, timeout as Integer) as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Reads data from an endpoint with timeout.
Notes:

EndPoint: The index of the endpoint.
mem: the memoryblock where to store the data.
size: the length of the data block to read.
timeout: the timeout in milliseconds.

Returns error code. See kError* constants.

175.10.11 InterruptWrite(EndPoint as Integer, mem as memoryblock, size as Integer, timeout as Integer) as Integer

MBS USB Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Writes data from an endpoint with timeout.
Notes:

EndPoint: The index of the endpoint.
mem: the memoryblock where to store the data.

size: the length of the data block to read.
timeout: the timeout in milliseconds.

Returns error code. See kError* constants.

175.10.12 IsInitialised as boolean

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Whether the HID library was initialised in the constructor.
Notes: Should always be true on linux.

175.10.13 IsOpen as boolean

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Whether the device is opened.
Notes: True if open, false if closed.

175.10.14 Open(theInterface as Integer, Vendor as Integer, Product as Integer) as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Opens the USB device with the given interface index, vendor and product codes.
Example:

```
dim h as new LinuxHIDInterfaceMBS

const vendor = & h7C0
const product = & h1500

dim e as Integer = h.Open(0, vendor, product)
```

Notes:

Vendor or Product code can be kMatchAny (0) to match all devices.
You can use the MatchDevice event to learn which devices are there and return true there to select one.
Returns error code. See kError* constants.

175.10.15 Reset

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Resets the device.
Notes: Returns error code. See kError* constants.

175.10.16 SetDebugLevel(level as Integer)

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Sets the debug level.
Example:

```
dim h as new LinuxHIDInterfaceMBS
h.SetDebugLevel(h.kDebugWarnings)
```

175.10.17 SetDebugOutputToStderr

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Tells HID library to write debug output to stderr.
Example:

```
dim h as new LinuxHIDInterfaceMBS
h.SetDebugOutputToStderr
```

175.10.18 SetDebugOutputToStdout

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Tells HID library to write debug output to stdout.
Example:

```
dim h as new LinuxHIDInterfaceMBS
h.SetDebugOutputToStdout
```

175.10.19 SetOutputReport(path() as Integer, data as memoryblock, offset as Integer, size as Integer) as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Writes data to the output.

Example:

```
dim h as LinuxHIDInterfaceMBS // your interface
dim n as Integer // some value

const IOW_PIPE_IO_PINS=0

dim m as MemoryBlock = NewMemoryBlock(4) // a device with 4 byte packets

m.Byte(3)=n
m.Byte(0)=IOW_PIPE_IO_PINS

dim path(-1) as Integer

path.Append & h00010000
path.Append 0

dim e as Integer = h.SetOutputReport(path, m, 0, m.size)
```

Notes:

Path: The path to the endpoint.
Data: the data to write.
Offset: The offset where to start inside the memoryblock.
Size: the length of the data int he memoryblock.

Returns error code. See kError* constants.
See also:

- 175.10.20 SetOutputReport(path() as Integer, data as string) as Integer 21544

175.10.20 SetOutputReport(path() as Integer, data as string) as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Writes data to the output.
Notes:

Path: The path to the endpoint.
Data: the data to write.

Returns error code. See kError* constants.
See also:

- 175.10.19 SetOutputReport(path() as Integer, data as memoryblock, offset as Integer, size as Integer) as Integer 21543

175.10.21 WriteIdentificationToStderr as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Writes identification to stderr.
Notes: Returns error code. See kError* constants.

175.10.22 WriteIdentificationToStdout as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Writes identification to stdout.
Notes: Returns error code. See kError* constants.

175.10.23 Properties

175.10.24 Handle as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The internal handle to the device connection.
Notes: (Read and Write property)

175.10.25 Events

175.10.26 MatchDevice(usbdev as LinuxUSBDeviceHandleMBS) as boolean

MBS USB Plugin, Plugin Version: 10.3, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The event called to decide whether you want to connect to this device.
Example:

```
Function MatchDevice(usbdev as LinuxUSBDeviceHandleMBS) As boolean
MsgBox usbdev.Device.Descriptor.SerialNumber
End Function
```

Notes:

If several devices match the given vendor/product codes in Open/ForceOpen, you can decide here which one you accept.
Return true to accept a device.

175.10.27 Constants

175.10.28 kDebugAll = 31

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the debug level constants.
Notes: same as kDebugWarnings + kDebugTraces + kDebugNotices + kDebugErrors + kDebugAsserts

175.10.29 kDebugAsserts = 16

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the debug level constants.

175.10.30 kDebugErrors = 1

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the debug level constants.

175.10.31 kDebugNone = 0

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the debug level constants.

175.10.32 kDebugNotices = 4

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the debug level constants.

175.10.33 kDebugNoTraces = 23

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the debug level constants.
Notes: same as kDebugWarnings + kDebugNotices + kDebugErrors + kDebugAsserts

175.10.34 kDebugTraces = 8

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the debug level constants.

175.10.35 kDebugWarnings = 2

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the debug level constants.

175.10.36 kErrorAlreadyInitialised = 3

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Device alreay initialised.

175.10.37 kErrorDeviceAlreadyOpened = 9

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Device already opened.

175.10.38 kErrorDeviceNotFound = 7

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Device is not found.

175.10.39 kErrorDeviceNotOpened = 8

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Device is not opened.

175.10.40 kErrorFailAlloc = 17

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Failed to allocate.

175.10.41 kErrorFailClaimIFace = 11

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Failed to claim the interface.

175.10.42 kErrorFailCloseDevice = 10

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Failed to close device.

175.10.43 kErrorFailDetachDriver = 12

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Failed to detach driver.

175.10.44 kErrorFailFindBusses = 4

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Failed to find buses.

175.10.45 kErrorFailFindDevices = 5

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Failed to find devices.

175.10.46 kErrorFailGetReport = 20

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Get Report failed.

175.10.47 kErrorFailIntRead = 21

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.

175.10.48 kErrorFailOpenDevice = 6

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Failed to open device.

175.10.49 kErrorFailSetReport = 19

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Set Report failed.

175.10.50 kErrorHIDDescShort = 14

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.

175.10.51 kErrorInvalidParameter = 1

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Invalid Parameter.

175.10.52 kErrorNotFound = 22

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Device not found.

175.10.53 kErrorNotHIDDevice = 13

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Not a HID Device.

175.10.54 kErrorNotInitialised = 2

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Not initialised.

175.10.55 kErrorOutOfSpace = 18

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Out of space.

175.10.56 kErrorReportDescLong = 16

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.

175.10.57 kErrorReportDescShort = 15

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.

175.10.58 kErrorSuccess = 0

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the error codes.
Notes: Success. No error.

175.10.59 kMatchAny = 0

MBS USB Plugin, Plugin Version: 10.3. **Function:** The vendor/product ID to match any device.

175.11 class LinuxUSBBusMBS

175.11.1 class LinuxUSBBusMBS

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The class for an USB Bus on Linux.
Notes: This class only works, if the plugin could load one of libusb.so or libusb-0.1.so.4 from your /usr/lib folder (or where else the path environment variable points to). If the libraries are missing, this class will not work properly.

175.11.2 Blog Entries

- MBS Real Studio Plugins, version 11.3pr7
- MBS REALbasic Plugins, version 10.3pr4

175.11.3 Methods

175.11.4 Buses as LinuxUSBBusMBS

MBS USB Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Returns the buses list.
Notes:

This function allows you to query the current buses and devices.
No device is opened and you just read through libusb data structures.

175.11.5 RescanBusses as Integer

MBS USB Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Finds all USB busses on system.
Notes:

RescanBusses will find all of the busses on the system.
Returns the number of changes since previous call to this function (total of new busses and busses removed).

The plugin performs RescanBusses and RescanDevices automatically on application launch.

175.11.6 RescanDevices as Integer

MBS USB Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Find all devices on all USB devices.
Notes:

RescanDevices will find all of the devices on each bus.
This should be called after RescanBusses.
Returns the number of changes since the previous call to this function (total of new device and devices removed).

The plugin performs RescanBusses and RescanDevices automatically on application launch. So you can call RescanDevices at any time.

175.11.7 Properties

175.11.8 Devices as LinuxUSBDeviceMBS

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The devices attached to this bus.
Notes: (Read and Write property)

175.11.9 DirName as String

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The dir name.
Notes: (Read and Write property)

175.11.10 Location as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The location value.
Notes: (Read and Write property)

175.11.11 NextBus as LinuxUSBBusMBS

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The next bus.

Notes: (Read and Write property)

175.11.12 PrevBus as LinuxUSBBusMBS

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The previous bus.
Notes: (Read and Write property)

175.11.13 RootDevice as LinuxUSBDeviceMBS

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The root device on this device.
Notes: (Read and Write property)

175.12 class LinuxUSBDeviceDescriptionMBS

175.12.1 class LinuxUSBDeviceDescriptionMBS

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** A class for an USB device description.
Notes: Some linux installations require app to be run with sudo to allow reading USB device strings.

175.12.2 Blog Entries

- MBS Real Studio Plugins, version 12.1pr6
- MBS REALbasic Plugins, version 10.3pr4

175.12.3 Properties

175.12.4 cdDevice as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The device version.
Notes:

Identifies the version of the device. This value is a binary-coded decimal number.
(Read and Write property)

175.12.5 cdUSB as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The USB version.
Notes:

Identifies the version of the USB specification that this descriptor structure complies with. This value is a binary-coded decimal number.
(Read and Write property)

175.12.6 DescriptorType as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The descriptor type.
Notes:

Specifies the descriptor type. Must be set to USB_DEVICE_DESCRIPTOR_TYPE.
(Read and Write property)

175.12.7 DeviceClass as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The device class.
Notes:

Specifies the class code of the device as assigned by the USB specification group.
See the kDeviceClass* constants.
(Read and Write property)

175.12.8 DeviceProtocol as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The device protocol.
Notes:

Specifies the protocol code of the device as assigned by the USB specification group.
(Read and Write property)

175.12.9 DeviceSubClass as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The device sub class.
Notes:

Specifies the subclass code of the device as assigned by the USB specification group.
(Read and Write property)

175.12.10 Manufacturer as String

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The manufacturer name string.
Notes:

A string containing the name of the manufacturer of this device.
Some linux installations require app to be run with sudo to allow reading USB device strings.
(Read and Write property)

175.12.11 MaxPacketSize0 as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The maximum packet size.
Notes:

Specifies the maximum packet size, in bytes, for endpoint zero of the device. The value must be set to 8, 16, 32, or 64.
(Read and Write property)

175.12.12 NumConfigurations as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The number of configurations.
Notes:

Specifies the total number of possible configurations for the device.
(Read and Write property)

175.12.13 Product as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The product ID for this device.
Notes:

Specifies the product identifier. This value is assigned by the manufacturer and is device-specific.
Only available when the device has been opened.
(Read and Write property)

175.12.14 ProductName as String

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The product name for this device.
Notes:

A string that contains a description of the device.
Some linux installations require app to be run with sudo to allow reading USB device strings.
(Read and Write property)

175.12.15 SerialNumber as String

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The serial number string for this device.
Notes:

A string that contains a manufacturer-determined serial number for the device.
Can be empty if the library does not know it.
Some linux installations require app to be run with sudo to allow reading USB device strings.
(Read and Write property)

175.12.16 Vendor as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The vendor code for this device.
Notes:

Specifies the vendor identifier for the device as assigned by the USB specification committee.
Only available when the device has been opened.
(Read and Write property)

175.12.17 Constants

175.12.18 kDeviceClassAudio = 1

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the device class constants.
Notes: Audio device.

175.12.19 kDeviceClassCOMM = 2

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the device class constants.
Notes: COMM device.

175.12.20 kDeviceClassDATA = 10

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the device class constants.
Notes: DATA device.

175.12.21 kDeviceClassHID = 3

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the device class constants.
Notes: HID device.

175.12.22 kDeviceClassHUB = 9

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the device class constants.
Notes: The device is an USB HUB.

175.12.23 kDeviceClassMassStorage = 8

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the device class constants.
Notes: A mass storage device.

175.12.24 kDeviceClassPerInterface = 0

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the device class constants.

175.12.25 kDeviceClassPrinter = 7

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the device class constants.
Notes: Printer device.

175.12.26 kDeviceClassVendorSpecific = 255

MBS USB Plugin, Plugin Version: 10.3. **Function:** One of the device class constants.
Notes: Some vendor specific device.

175.13 class LinuxUSBDeviceHandleMBS

175.13.1 class LinuxUSBDeviceHandleMBS

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The class for a device handle.

175.13.2 Blog Entries

- MBS REALbasic Plugins, version 10.3pr4

175.13.3 Properties

175.13.4 AltSetting as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Some alt setting value.
Notes: (Read and Write property)

175.13.5 Bus as LinuxUSBBusMBS

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The bus for this device handle.
Notes: (Read and Write property)

175.13.6 Config as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** A config value.
Notes: (Read and Write property)

175.13.7 Device as LinuxUSBDeviceMBS

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The device.
Notes: (Read and Write property)

175.13.8 InterfaceIndex as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The interface index.
Notes: (Read and Write property)

175.14 class LinuxUSBDeviceMBS

175.14.1 class LinuxUSBDeviceMBS

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The class for an USB device information on Linux.

175.14.2 Blog Entries

- Showing USB Devices

175.14.3 Methods

175.14.4 Children(index as Integer) as LinuxUSBDeviceMBS

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Returns the child device with the given index.
Notes: Index is zero based and from 0 to ChildrenCount-1.

175.14.5 Properties

175.14.6 Bus as LinuxUSBBusMBS

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The bus this device is attached to.
Notes: (Read and Write property)

175.14.7 ChildrenCount as Integer

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The number of child devices.
Notes: (Read and Write property)

175.14.8 Descriptor as LinuxUSBDeviceDescriptionMBS

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The descriptior for this device.
Notes: (Read and Write property)

175.14.9 Filename as String

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The filename for this device.
Notes: (Read and Write property)

175.14.10 NextDevice as LinuxUSBDeviceMBS

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The next device on the same level.
Notes: (Read and Write property)

175.14.11 PrevDevice as LinuxUSBDeviceMBS

MBS USB Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The previous device on the same level.
Notes: (Read and Write property)

175.15 class MacHIDMBS

175.15.1 class MacHIDMBS

MBS USB Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to work with HID devices on Mac OS X.
Notes: For newer development, please use our HIDAPIMBS class.

175.15.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.0pr11
- MBS Xojo / Real Studio Plugins, version 14.0pr3

175.15.3 Methods

175.15.4 Close

MBS USB Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the active connection.

175.15.5 Connect

MBS USB Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a connection to the current device.
Example:

```
Function OpenUSBDevice() As boolean
dim i as Integer
dim h as MacHIDMBS

h=FindDevice // see FindFirst example

if h=nil then
MsgBox "No XYZ device found."
Return false
end if

h.Connect

if h.Lasterror<>0 then
```

```
MsgBox "Failed to connect to USB Device."
Return false
end if

h.InstallCallback

Return true

End Function
```

Notes:

Lasterror is set.

Lasterror values for this function:

-1	Not supported (Windows and Linux).
0	Everything okay.
1	Failed to get IOKit Plugin Interface for this IO object.
2	Failed to query interface
3	Failed to open interface
4	Failed to create async port
5	Failed to create async event source
6	no longer used
7	Failed to start queue

175.15.6 Disconnect

MBS USB Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Disconnets current USB device.
Notes: Lasterror is set.

175.15.7 FindFirstDevice as boolean

MBS USB Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Finds the first device and loads the properties.
Example:

```
Function FindDevice() As MyMacHIDMBS
dim h as MyMacHIDMBS
dim p as string

h=new MyMacHIDMBS // your own subclass of MacHIDMBS so you can get events

if h.FindFirstDevice then

p=h.Product
if p="MyProduct" then
Return h
end if

while h.FindNextDevice

p=h.Product
if p="MyProduct" then
Return h
end if

wend

end if
End Function
```

Notes: Returns true on success and false on failure.

175.15.8 FindNextDevice as boolean

MBS USB Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Finds next device.
Notes: Returns true on success and false on failure.

175.15.9 HIDProperties as Variant

MBS USB Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries HID properties dictionary.
Notes:

Value is a CFDictionaryMBS with details about current device. Returned as Variant to reduce plugin dependencies.

The plugin queries this dictionary to return SerialNumber, ProductID, Manufacturer, Product, VendorID and VersionNumber.

175.15.10 InstallCallback

MBS USB Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Installs the callback used for the event handler.
Notes:

Lasterror is set.
Please use after connect. For use with ReceivedData event.

175.15.11 Manufacturer as string

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The manufacturer name.
Notes: On any error an empty string is returned.

175.15.12 Product as string

MBS USB Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The product string of the selected device.
Notes: Lasterror is set.

175.15.13 ProductID as Integer

MBS USB Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The product ID of the selected device.
Notes: Lasterror is set.

175.15.14 ReadMessage(ReportID as Integer, reportType as Integer, length as Integer) as string

MBS USB Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reads a message from usb device.
Notes:

This is for synchronously operation without the event/callback.
You can specify report id, report type and the maximum length to read.
Also set timeout property.

Doesn't work if InstallCallback with event is used.

175.15.15 ReadMessageMemory(ReportID as Integer, reportType as Integer, length as Integer) as memoryblock

MBS USB Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reads a message from usb device.
Notes:

This is for synchronously operation without the event/callback.
You can specify report id, report type and the maximum length to read.
Also set timeout property.

Doesn't work if InstallCallback with event is used.

175.15.16 SendMessage(data as string)

MBS USB Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sends a message to the USB device.
Notes:

A connection must be open.
Lasterror is set. Lasterror -536854447 is an USB timeout.
Uses kIOHIDReportTypeOutput.
See also:

- 175.15.17 SendMessage(ReportID as Integer, reportType as Integer, data as string) 21567

175.15.17 SendMessage(ReportID as Integer, reportType as Integer, data as string)

MBS USB Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sends a message to the USB device.
Notes:

A connection must be open.
Lasterror is set. Lasterror -536854447 is an USB timeout.
ReportType can be kIOHIDReportTypeOutput or kIOHIDReportTypeFeature.
See also:

- 175.15.16 SendMessage(data as string) 21567

175.15.18 SendMessageMemory(data as memoryblock, offset as Integer, length as Integer)

MBS USB Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sends a message to the USB device.
Notes:

A connection must be open.
Lasterror is set. Lasterror -536854447 is an USB timeout.
Internally ReportID=0 is used.

While writing a crossplatform application for one specific device we saw the following thing: The data buffer for the SendMessageMemory call must be 8 bytes long on Mac (with MacHIDMBS) and 61 bytes long for Windows (with WinHIDMBS) for our HID device. We have 1 byte for the ReportID and 60 data bytes where the first 8 are set like on the Mac. So if the calls fail on Windows, try with a higher length and check the WinHIDMBS.OutputReportByteLength property.
Uses kIOHIDReportTypeOutput.
See also:

- 175.15.19 SendMessageMemory(ReportID as Integer, reportType as Integer, data as memoryblock, offset as Integer, length as Integer) 21568

175.15.19 SendMessageMemory(ReportID as Integer, reportType as Integer, data as memoryblock, offset as Integer, length as Integer)

MBS USB Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sends a message to the USB device.
Notes:

A connection must be open.
Lasterror is set. Lasterror -536854447 is an USB timeout.
ReportType can be kIOHIDReportTypeOutput or kIOHIDReportTypeFeature.
See also:

- 175.15.18 SendMessageMemory(data as memoryblock, offset as Integer, length as Integer) 21568

175.15.20 SerialNumber as string

MBS USB Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The serial number of the current selected device.
Notes: Lasterror is set.

175.15.21 VendorID as Integer

MBS USB Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The vendor ID of the selected device.
Notes: Lasterror is set.

175.15.22 VersionNumber as Integer

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The device specific version number.
Notes:

Value can be anything.
On any error, 0 is returned.

175.15.23 Properties

175.15.24 IOHIDDeviceInterface122Handle as Integer

MBS USB Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal handle for the device interface object.
Notes:

This is of type IOHIDDeviceInterface122** from IOKit.
(Read only property)

175.15.25 IOHIDObjectIteratorHandle as Integer

MBS USB Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The iterator used to find USB devices.
Notes:

This is of type io_iterator_t from IOKit.
(Read only property)

175.15.26 IOObjectHandle as Integer

MBS USB Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference for current device.
Notes:

This is of type io_object_t from IOKit.
(Read only property)

175.15.27 Lasterror as Integer

MBS USB Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Last error code.
Notes:

0 is success.
-1 means that the function is not available.
else Mac OS USB error codes.
error -536854447 is an USB timeout.
(Read and Write property)

175.15.28 OnlyOneEventPerTick as Boolean

MBS USB Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether to limit ReceivedData event.
Notes:

Some devices send a lot of measurement data.
This option allows to slow down and limit to 60 events per second.
So if device sends a thousand data records per second, we can ignore over 90% and just pick a few to display.
(Read and Write property)

175.15.29 TimeOut as Integer

MBS USB Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Timeout value to use for sending/reading USB data.
Notes:

Please specify time in Milliseconds. Default is 500ms.
(Read and Write property)

175.15.30 Events

175.15.31 DeviceRemoved(result as Integer)

MBS USB Plugin, Plugin Version: 8.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called whenever the device is removed.

Notes: You need to call connect to install the callback which raises this event.

175.15.32 ReceivedData(data as string, size as Integer)

MBS USB Plugin, Plugin Version: 6.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Data was received and is available for processing.
Example:

```
Sub ReceivedData(data as string, size as Integer)
dim m as MemoryBlock
dim s as string
dim n,i as Integer

// Debug Output data received:

m=data

n=lenb(data)-1
for i=0 to n
s=s+str(m.Byte(i))+" "
next

s=s+"= "+data

System.DebugLog s

End Sub
```

Notes: Event is only called when InstallCallback was used and a connection is open.

175.15.33 Constants

175.15.34 kIOHIDReportTypeFeature = 2

MBS USB Plugin, Plugin Version: 14.0. **Function:** One of the report type constants.
Notes: Feature report.

175.15.35 kIOHIDReportTypeInput = 0

MBS USB Plugin, Plugin Version: 14.0. **Function:** One of the report type constants.
Notes: Input report.

175.15.36 kIOHIDReportTypeOutput = 1

MBS USB Plugin, Plugin Version: 14.0. **Function:** One of the report type constants.
Notes: Output report.

175.16 class MacUSBDeviceMBS

175.16.1 class MacUSBDeviceMBS

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for an USB Device on Mac OS X.
Example:

```
// iterate over all devices without recursion and count devices
dim devices(-1) as MacUSBDeviceMBS

devices.Append MacUSBDeviceMBS.root

dim count as Integer = -1 // do not count Mac itself

while UBound(devices)>=0
dim dev as MacUSBDeviceMBS = devices.Pop

count = count + 1

for each child as MacUSBDeviceMBS in dev.children
devices.Append child
next
wend

MsgBox str(Count)+" USB devices."
```

Notes:

Use the root method to get the device hierarchy.

For Windows you can take a look on the WindowsDeviceMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

175.16.3 Methods

175.16.4 children as MacUSBDeviceMBS()

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The array with all the USB device having the current device as parent.

175.16.5 Constructor

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
Notes:

This constructor makes sure you don't create useless MacUSBDeviceMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

175.16.6 root as MacUSBDeviceMBS

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The root of the device tree.
Example:

```
// display devices with serialnumbers.
dim devices(-1) as MacUSBDeviceMBS

devices.Append MacUSBDeviceMBS.root

dim lines(-1) as string

while UBound(devices)>=0
dim dev as MacUSBDeviceMBS = devices.Pop

if len(dev.SerialNumber)>0 then
lines.Append dev.name+": "+dev.serialnumber
end if

for each child as MacUSBDeviceMBS in dev.children
devices.Append child
next
wend

MsgBox Join(lines,EndOfLine)
```

Notes: Root is the Mac itself. Below root you find the built in USB hubs.

175.16.7 Properties

175.16.8 Address as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The device address number.
Notes: (Read and Write property)

175.16.9 BusPowerAvailable as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The available bus power.
Notes:

Value is in milli ampere.
(Read and Write property)

175.16.10 ClassName as String

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class name for this device.
Notes:

Basicly this is what driver Apple uses.
(Read and Write property)

175.16.11 DeviceClass as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The device class.
Notes:

See kUSB*Class constants.

And read here:
http://www.usb.org/developers/defined_class

(Read and Write property)

175.16.12 DeviceMaxPacketSize as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum device packet size.
Notes: (Read and Write property)

175.16.13 DeviceNumConfigs as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of configurations for this device.
Notes: (Read and Write property)

175.16.14 DeviceProtocol as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The device protocol.
Notes: (Read and Write property)

175.16.15 DeviceReleaseNumber as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The device release number.
Notes: (Read and Write property)

175.16.16 DeviceSpeed as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The device speed.
Notes: (Read and Write property)

175.16.17 DeviceSubClass as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The device sub class.

Notes:

See kUSB*SubClass constants.
(Read and Write property)

175.16.18 ExtraPowerForPorts as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The extra power asked for ports.
Notes:

Value is in milli ampere.
(Read and Write property)

175.16.19 Name as String

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of this device node.
Example:

```
// show all names of all devices in a msgbox
dim names(-1) as string

// iterate over all devices without recursion
dim devices(-1) as MacUSBDeviceMBS

devices.Append MacUSBDeviceMBS.root

while UBound(devices)>=0
dim dev as MacUSBDeviceMBS = devices.Pop
names.Append dev.name

for each child as MacUSBDeviceMBS in dev.children
devices.Append child
next
wend

MsgBox Join(names,", ")
```

Notes: (Read and Write property)

175.16.20 NumEndpoints as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of endpoints.
Notes: (Read and Write property)

175.16.21 Path as String

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The object path.
Notes:

This is internally used by the kernel.
(Read and Write property)

175.16.22 Ports as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of ports on an USB hub.
Notes: (Read and Write property)

175.16.23 ProductID as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The product ID
Notes: (Read and Write property)

175.16.24 ProductName as String

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The product name.
Notes: (Read and Write property)

175.16.25 Properties as Dictionary

MBS MacOSX Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates dictionary with all the properties associated for this USB device in IORegistry.

Notes: (Read and Write property)

175.16.26 RequestedPower as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Requested power.
Notes:

Value is in milli ampere.
(Read and Write property)

175.16.27 SerialNumber as String

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The device serial number.
Notes: (Read and Write property)

175.16.28 VendorID as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The vendor ID.
Notes:

Assigned by USB Org.
(Read and Write property)

175.16.29 VendorName as String

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The vendor name.
Notes: (Read and Write property)

175.16.30 Constants

175.16.31 kUSBApplicationSpecificClass = 254

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.

175.16.32 kUSBATMNetworkingSubClass = 7

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBCommunicationDataInterfaceClass.

175.16.33 kUSBAudioControlSubClass = 1

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBAudioInterfaceClass.

175.16.34 kUSBAudioStreamingSubClass = 2

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBAudioInterfaceClass.

175.16.35 kUSBCommAbstractSubClass = 2

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBCommunicationDataInterfaceClass.

175.16.36 kUSBCommCAPISubClass = 5

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBCommunicationDataInterfaceClass.

175.16.37 kUSBCommDirectLineSubClass = 1

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBCommunicationDataInterfaceClass.

175.16.38 kUSBCommEthernetNetworkingSubClass = 6

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBCommunicationDataInterfaceClass.

175.16.39 kUSBCommMultiChannelSubClass = 4

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBCommunicationDataInterfaceClass.

175.16.40 kUSBCommonClassSubClass = 2

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBMiscellaneousClass.

175.16.41 kUSBCommTelephoneSubClass = 3

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBCommunicationDataInterfaceClass.

175.16.42 kUSBCommunicationClass = 2

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.

175.16.43 kUSBCompositeClass = 0

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.

175.16.44 kUSBCompositeSubClass = 0

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.

175.16.45 kUSBDataClass = 10

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.

175.16.46 kUSBDFUSubClass = 1

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.
Notes: For kUSBApplicationSpecificInterfaceClass.

175.16.47 kUSBDiagnosticClass = 220

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.

175.16.48 kUSBHIDBootInterfaceSubClass = 1

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.
Notes: For kUSBHIDBootInterfaceSubClass.

175.16.49 kUSBHubClass = 9

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.

175.16.50 kUSBHubSubClass = 0

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.

175.16.51 kUSBIrDABridgeSubClass = 2

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.
Notes: For kUSBApplicationSpecificInterfaceClass.

175.16.52 kUSBMassStorageATAPISubClass = 2

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.
Notes: For kUSBMassStorageInterfaceClass.

175.16.53 kUSBMassStorageQIC157SubClass = 3

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBMassStorageInterfaceClass.

175.16.54 kUSBMassStorageRBCSubClass = 1

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBMassStorageInterfaceClass.

175.16.55 kUSBMassStorageSCSISubClass = 6

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBMassStorageInterfaceClass.

175.16.56 kUSBMassStorageSFF8070iSubClass = 5

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBMassStorageInterfaceClass.

175.16.57 kUSBMassStorageUFISubClass = 4

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBMassStorageInterfaceClass.

175.16.58 kUSBMIDIStreamingSubClass = 3

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBAudioInterfaceClass.

175.16.59 kUSBMiscellaneousClass = 239

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.

175.16.60 kUSBPersonalHealthcareClass = 15

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.

175.16.61 kUSBReprogrammableDiagnosticSubClass = 1

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.
Notes: For kUSBDiagnosticDeviceInterfaceClass.

175.16.62 kUSBRFControllerSubClass = 1

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.
Notes: For kUSBWirelessControllerInterfaceClass.

175.16.63 kUSBTestMeasurementSubClass = 3

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.
Notes: For kUSBApplicationSpecificInterfaceClass.

175.16.64 kUSBVendorSpecificClass = 255

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.

175.16.65 kUSBVideoControlSubClass = 1

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.

175.16.66 kUSBVideoInterfaceCollectionSubClass = 3

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.

175.16.67 kUSBVideoStreamingSubClass = 2

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.

175.16.68 kUSBWirelessControllerClass = 224

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.

175.17 class MacUSBMBS

175.17.1 class MacUSBMBS

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to talk to an USB device.
Notes: Written for a client and probably not yet universally useable, so it may not work with your device.

175.17.3 Methods

175.17.4 AbortPipe(PipeRef as Integer) as boolean

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Aborts any outstanding transactions on the pipe with status kIOReturnAborted.
Notes:

If there are outstanding asynchronous transactions on the pipe, the callbacks will happen.
Note that this command will also clear the halted bit on the endpoint in the controller, but will NOT clear the data toggle bit. If you want to clear the data toggle bit as well, see ClearPipeStall or ClearPipeStallBothEnds for more information. The interface must be open for the pipe to exist.
pipeRef: Index for the desired pipe (1 - GetNumEndpoints).
Lasterror is set to kIOReturnSuccess if successful, kIOReturnNoDevice if there is no connection to an IOService, or kIOReturnNotOpen if the interface is not open for exclusive access.

175.17.5 ClearPipeStall(PipeRef as Integer) as boolean

MBS USB Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clears the halted bit and the data toggle bit on the pipe's endpoint in the controller.
Notes:

This function also returns any outstanding transactions on the pipe with status kIOUSBTransactionReturned.
If there are outstanding asynchronous transactions on the pipe, the callbacks will happen. The data toggle may need to be resynchronized. The driver may handle this by sending a ClearFeature(ENDPOINT_HALT) to the default control pipe, specifying the device's endpoint for this pipe.

pipeRef: Index for the desired pipe (1 - NumEndpoints).
Lasterror is set to kIOReturnSuccess if successful, kIOReturnNoDevice if there is no connection to an IOService, or kIOReturnNotOpen if the interface is not open for exclusive access.

175.17.6 Close

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes connection to the device.

175.17.7 ConfigurationValue as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current configuration value set in the device (the interface will be part of that configuration.)
Notes:

The interface does not have to be open to use this function.
Lasterror is set.

175.17.8 Connect as boolean

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Connects to the first device matching product and vendor IDs.
Notes: Returns true on success.

175.17.9 DeviceProduct as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the USB Product ID (idProduct) of the device.
Notes:

The device does not have to be open to use this function.
Lasterror is set. Returns the actual product ID of the device.

175.17.10 DeviceReleaseNumber as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Device Release Number (bcdDevice) of the device.
Notes:

The device does not have to be open to use this function.
Lasterror is set.

175.17.11 DeviceVendor as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the USB Vendor ID (idVendor) of the device.
Notes:

The device does not have to be open to use this function.
Lasterror is set. Returns the actual vendor ID of the device.

175.17.12 InterfaceClass as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the USB Class of the interface.
Notes: Lasterror is set.

175.17.13 InterfaceNumber as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the interface number (zero-based index) of this interface within the current configuration of the device.
Notes: Lasterror is set.

175.17.14 InterfaceProtocol as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the USB Protocol of the interface.
Notes: Lasterror is set.

175.17.15 InterfaceSubClass as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the USB Subclass of the interface.
Notes: Lasterror is set.

175.17.16 LocationID as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the location ID.
Notes:

The location ID is a 32 bit number which is unique among all USB devices in the system, and which will not change on a system reboot unless the topology of the bus itself changes. The interface does not have to be open to use this function.
Lasterror is set.

175.17.17 NumEndpoints as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of endpoints in this interface.
Notes:

The interface does not have to be open to use this function.
Lasterror is set.

175.17.18 ReadPacket(PipeRef as Integer, MaxSize as Integer = 1024) as Memoryblock

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reads data packet.
Notes: We developed this function for a client, so it's probably useless for everyone else.

175.17.19 ReadRaw(PipeRef as Integer, MaxSize as Integer = 1024) as Memoryblock

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reads data on a BULK IN or an INTERRUPT pipe.
Notes: Reads up to MaxSize bytes from the given pipe. Pipe is in range 1 to GetNumEndpoints.

175.17.20 ResetPipe(PipeRef as Integer) as boolean

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Equivalent to ClearPipeStall.
Notes:

The interface must be open for the pipe to exist.
pipeRef: Index for the desired pipe (1 - GetNumEndpoints).
Lasterror is set to kIOReturnSuccess if successful, kIOReturnNoDevice if there is no connection to an IOService, or kIOReturnNotOpen if the interface is not open for exclusive access.

175.17.21 WritePacket(PipeRef as Integer, Data as Memoryblock) as boolean

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sends data packet.
Notes:

We developed this function for a client, so it's probably useless for everyone else.
Lasterror is set.
See also:

- 175.17.22 WritePacket(PipeRef as Integer, Data as string) as boolean 21590

175.17.22 WritePacket(PipeRef as Integer, Data as string) as boolean

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sends data packet.
Notes:

We developed this function for a client, so it's probably useless for everyone else.
Lasterror is set.
See also:

- 175.17.21 WritePacket(PipeRef as Integer, Data as Memoryblock) as boolean 21590

175.17.23 WriteRaw(PipeRef as Integer, Data as Memoryblock) as boolean

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes data on a BULK OUT or INTERRUPT OUT pipe.
Notes:

The interface must be open for the pipe to exist.
PipeRef: Index for the desired pipe (1 - GetNumEndpoints).
Data: the buffer of data to send.

Lasterror is set.
See also:

- 175.17.24 WriteRaw(PipeRef as Integer, Data as string) as boolean 21591

175.17.24 WriteRaw(PipeRef as Integer, Data as string) as boolean

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes data on a BULK OUT or INTERRUPT OUT pipe.
Notes:

The interface must be open for the pipe to exist.
PipeRef: Index for the desired pipe (1 - GetNumEndpoints).
Data: the buffer of data to send.
Lasterror is set.
See also:

- 175.17.23 WriteRaw(PipeRef as Integer, Data as Memoryblock) as boolean 21590

175.17.25 Properties

175.17.26 completionTimeout as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The completion timeout.
Notes:

Specifies a time value in milliseconds. Once the request is queued on the bus, if the entire request is not completed in this amount of time, the request will be aborted and returned.
Default is 1000.
(Read and Write property)

175.17.27 LastError as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last error code.
Notes: (Read and Write property)

175.17.28 noDataTimeout as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The timeout for no data.

Notes:

Specifies a time value in milliseconds. Once the request is queued on the bus, if no data is transferred in this amount of time, the request will be aborted and returned.
Default is 1000.
(Read and Write property)

175.17.29 ProductID as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The product ID for connecting to the device.
Notes: (Read and Write property)

175.17.30 VendorID as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The vendor ID for connecting to the device.
Notes: (Read and Write property)

175.17.31 Constants

175.17.32 kIOReturnSuccess = 0

MBS USB Plugin, Plugin Version: 12.5. **Function:** The error constant for no error.

175.17.33 kIOUSBConfigNotFound = & he0004056

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: Configuration Not found.

175.17.34 kIOUSBDeviceNotHighSpeed = & he0004049

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: The device is not a high speed device, so the EHCI driver returns an error.

175.17.35 kIOUSBDevicePortWasNotSuspended = & he0004050

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: Port was not suspended.

175.17.36 kIOUSBEndpointNotFound = & he0004057

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: Endpoint Not found.

175.17.37 kIOUSBHighSpeedSplitError = & he000404b

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: Error to hub on high speed bus trying to do split transaction.

175.17.38 kIOUSBInterfaceNotFound = & he000404e

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: Interface ref not recognized.

175.17.39 kIOUSBLowLatencyBufferNotPreviouslyAllocated = & he000404d

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: Attempted to use user land low latency isoc calls w/out calling PrepareBuffer (on the data buffer) first.

175.17.40 kIOUSBLowLatencyFrameListNotPreviouslyAllocated = & he000404c

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: Attempted to use user land low latency isoc calls w/out calling PrepareBuffer (on the frame list) first.

175.17.41 kIOUSBNoAsyncPortErr = & he000405f

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: No async port.

175.17.42 kIOUSBNotEnoughPipesErr = & he000405e

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: Not enough pipes in interface.

175.17.43 kIOUSBNotEnoughPowerErr = & he000405d

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: Not enough power for selected configuration.

175.17.44 kIOUSBPipeStalled = & he000404f

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: Pipe has stalled, error needs to be cleared.

175.17.45 kIOUSBSyncRequestOnWLThread = & he000404a

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: A synchronous USB request was made on the workloop thread (from a callback?). Only async requests are permitted in that case.

175.17.46 kIOUSBTooManyPipesErr = & he0004060

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: Too many pipes.

175.17.47 kIOUSBTransactionReturned = & he0004050

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: The transaction has been returned to the caller.

175.17.48 kIOUSBTransactionTimeout = & he0004051

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: Transaction timed out.

175.17.49 kIOUSBUnknownPipeErr = & he0004061

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
Notes: Pipe ref not recognized.

175.18 class MacUSBNotificationMBS

175.18.1 class MacUSBNotificationMBS

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for receiving notifications if an USB device has been attached or removed.
Notes:

Please make a subclass so you can put your own code in the events.

Use WinUSBNotificationMBS for Windows.

175.18.2 Blog Entries

- Showing USB Devices
- MBS Real Studio Plugins, version 11.2pr3

175.18.3 Methods

175.18.4 Constructor(vendor as Integer = 0, product as Integer = 0)

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Setup the notification system so you are informed about USB devices being attached or removed.
Example:

```
// look only for device with this vendor/product ID
dim m as new MyMacUSBNotificationMBS(& h5AC, & h263)
```

Notes:

You can use vendor and product IDs to limit the class to look only for devices with matching IDs.
Lasterror is set.

175.18.5 GetUSBDeviceInfo(DeviceHandle as Integer, byref Vendor as string, byref Product as string, byref SerialNumber as string, byref Revision as Integer) as boolean

MBS USB Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries USB details for a given handle.
Notes:

This is a convenience function to query details on the devices found within the events.
Returns true on success.

175.18.6 QueryBSDName(DeviceHandle as Integer) as string

MBS USB Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Function to query BSDName of a given device.
Notes:

If the device is a disk or USB stick and has been mounted, this would give the bsd name of the disk.
Returns "" on any error.

175.18.7 Release(DeviceHandle as Integer)

MBS USB Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Releases an object reference when you don't need it any longer.
Notes:

Please call Retain and Release in pairs.
Does nothing if handle is zero or when called on Linux/Windows.

175.18.8 Retain(DeviceHandle as Integer)

MBS USB Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Retains an object reference so it is available later.
Notes:

Please call Retain and Release in pairs.
Does nothing if handle is zero or when called on Linux/Windows.

175.18.9 Properties

175.18.10 LastError as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last error code.
Notes:

Zero is no error while other values are Mac OS error codes.
(Read and Write property)

175.18.11 Events

175.18.12 DeviceAdded(properties as dictionary, NewDevice as boolean, ClassName as string, DeviceName as string, DeviceHandle as Integer)

MBS USB Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called when the device is added.
Notes:

You find properties like product and vendor in the dictionary.
This event can be called from the constructor for existing devices with NewDevice = false. Later events have NewDevice = true so you see that this is a new device.

DeviceName and ClassName give details on the USB item found.
DeviceHandle is the internal object reference which can be used with other helper functions in this class (io_service_t).

175.18.13 DeviceRemoved(properties as dictionary, NewDevice as boolean, ClassName as string, DeviceName as string, DeviceHandle as Integer)

MBS USB Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called when the device is removed.
Notes:

You find properties like product and vendor in the dictionary.
This event can be called from the constructor for existing devices with NewDevice = false. Later events have NewDevice = true so you see that this is a new device.

DeviceName and ClassName give details on the USB item found.
DeviceHandle is the internal object reference which can be used with other helper functions in this class (io_service_t).

175.19 class WinHIDMBS

175.19.1 class WinHIDMBS

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to work with HID devices on Windows.
Example:

```
dim m as new WinHIDMBS
dim s as string

# if not TargetWin32
MsgBox "This example requires Windows."
# endif

if m.FindFirstDevice then

do
ListBox1.AddRow ""

ListBox1.Cell(ListBox1.LastIndex,0)=hex(m.ProductID)
ListBox1.Cell(ListBox1.LastIndex,1)=hex(m.VendorID)
ListBox1.cell(ListBox1.LastIndex,2)=m.Product
ListBox1.cell(ListBox1.LastIndex,3)=m.Manufacturer
ListBox1.cell(ListBox1.LastIndex,4)=m.SerialNumber
ListBox1.cell(ListBox1.LastIndex,5)=hex(m.VersionNumber)

if left(m.Product,3)="RF1" then // my test device

if m.Connect then
// write 9 bytes report
// first byte is report ID plus 8 byte data
s=chr(0)+"P"+chr(0)+chr(0)+chr(0)+chr(0)+chr(0)+chr(0)+chr(0)

MsgBox "Send bytes: "+str(m.SendMessage(s))

do
s=m.ReadMessage(17)
loop until lenb(s)>0 // until we got something
MsgBox midb(s,2) // shows result. First byte is ReportID again

m.Disconnect
end if
end if

loop until not m.FindNextDevice

end if
```

Title=str(ListBox1.ListCount)+" devices found."

Notes:

For newer development, please use our HIDAPIMBS class.

Updated in version 10.4 of plugins to ignore devices which you don't have permissions to access them. So you will now see devices with VendorID=0 and ProductID=0.

This class can be used in three different ways. First normal with Connect and ReadMessage/SendMessage. Second with InstallListener and SendMessage/Poll functions. Third low level via GetInputReport and SetOutputReport.

175.19.4 Methods

175.19.5 Close

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Closes the active connection.

175.19.6 Connect as boolean

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a connection to the current device.
Example:

```
Function OpenUSBDevice() As boolean
dim i as Integer
dim h as WinHIDMBS

h=FindDevice // see FindFirst example

if h=nil then
MsgBox "No XYZ device found."
Return false
end if

call h.Connect

if h.Lasterror<>0 then
MsgBox "Failed to connect to USB Device."
Return false
end if

Return true

End Function
```

Notes:

Lasterror is set.
Returns true on success and false on failure.

The plugin tries to open a read and a write connection. If both fail, connect returns false. If one is okay, it returns true.

Some devices don't allow read or write because of missing permissions.

175.19.7 DevicePath as string

MBS USB Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal path used by Windows to identify the device.
Notes: Only for debugging.

175.19.8 Disconnect

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Disconnets current USB device.
Notes: Lasterror is set.

175.19.9 FindFirstDevice as boolean

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Finds the first device and loads the properties.
Example:

```
Function FindDevice() As MyWinHIDMBS
dim h as MyWinHIDMBS
dim p as string

h=new MyWinHIDMBS // your own subclass of MacHIDMBS so you can get events

if h.FindFirstDevice then

p=h.Product
if p="MyProduct" then
Return h
end if

while h.FindNextDevice

p=h.Product
if p="MyProduct" then
Return h
end if

wend

end if
End Function
```

Notes:

Returns true on success and false on failure.
On Windows finds only devices which can be opened for Read/Write.

175.19.10 FindNextDevice as boolean

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Finds next device.
Notes: Returns true on success and false on failure.

175.19.11 GetInputReport(data as MemoryBlock, Offset as Integer = 0, Length as Integer = 0) as boolean

MBS USB Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns an input reports from a top-level collection.
Notes:

This is very low level.
First byte of data block is report ID.
If Length is 0, we use size of memoryblock.
Returns true on success.

see also:
https://msdn.microsoft.com/en-us/library/windows/hardware/ff538945(v=vs.85).aspx

175.19.12 InstallListener(PollSize as Integer) as boolean

MBS USB Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Installs a second thread which performs Read.
Example:

```
dim h as new WinHIDMBS

call h.InstallListener 9 // 8 bytes + Report ID
```

Notes:

Use PollString or PollMemory in a timer or a loop to get the data.
This is an alternative way compared to ReadMessage functions.

175.19.13 Manufacturer as string

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The manufacturer name.
Notes:

On any error an empty string is returned.
Lasterror is set.

175.19.14 PollMemory as memoryblock

MBS USB Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads a message from the device.
Notes:

A connection must be open and InstallListener must be used.
Lasterror is set.
You may want to try this function in a loop or a timer till you get data.

175.19.15 PollString as string

MBS USB Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads a message from the device.
Example:

```
dim m as WinHIDMBS // your WinHIDMBS object
dim s as string

do
s=m.PollString
loop until lenb(s)>0 // until we got something
MsgBox midb(s,2) // shows result. First byte is ReportID again
```

Notes:

A connection must be open and InstallListener must be used.
Lasterror is set.
You may want to try this function in a loop or a timer till you get data.

175.19.16 Product as string

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The product string of the selected device.
Notes: Lasterror is set.

175.19.17 ProductID as Integer

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The product ID of the selected device.
Notes: Lasterror is set.

175.19.18 ReadMessage(length as Integer, timeOut as Integer = 0) as string

MBS USB Plugin, Plugin Version: 13.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads a message from the device.
Example:

```
dim m as WinHIDMBS
dim s as string

do
s=m.ReadMessage(48)
loop until lenb(s)>0 // until we got something
MsgBox midb(s,2) // shows result. First byte is ReportID again
```

Notes:

Length is the length of the receive buffer you want to use.
The string returned is 0 to length bytes long.
A connection must be open.
Lasterror is set.
You may want to try this function in a loop till you get data.
Timeout is a timeout value in milliseconds.

175.19.19 ReadMessageMemory(length as Integer, timeOut as Integer = 0) as memoryblock

MBS USB Plugin, Plugin Version: 13.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads a message from the device.
Example:

```
dim m as WinHIDMBS
dim s as memoryblock

do
s=m.ReadMessageMemory(48)
loop until s<>nil // until we got something
MsgBox midb(s,2) // shows result. First byte is ReportID again
```

Notes:

Length is the length of the receive buffer you want to use.
The memoryblock returned has a size of 0 to length bytes.
A connection must be open.
Lasterror is set.
You may want to try this function in a loop till you get data.
Timeout is a timeout value in milliseconds.

175.19.20 SendMessage(data as string) as Integer

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sends a message to the USB device.
Example:

```
dim m as WinHIDMBS // your hid object
dim s as string
// write 9 bytes report
// first byte is report ID plus 8 byte data
s=chr(0)+"P"+chr(0)+chr(0)+chr(0)+chr(0)+chr(0)+chr(0)+chr(0)
MsgBox "Send bytes: "+str(m.SendMessage(s))
```

Notes:

A connection must be open.
Returns number of bytes sent.

The first byte must be the Report ID which seems to be zero for most devices.

175.19.21 SendMessageMemory(data as memoryblock, Offset as Integer = 0, length as Integer = 0) as Integer

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sends a message to the USB device.
Notes:

A connection must be open.
Lasterror is set.
Returns number of bytes sent.

While writing a crossplatform application we saw the following thing: The data buffer for the SendMessageMemory call must be 8 bytes long on Mac for our device (with MacHIDMBS) and 61 bytes long for Windows (with WinHIDMBS) for our HID device. We have 1 byte for the ReportID and 60 data bytes where the first 8 are set like on the Mac. So if the calls fail on Windows, try with a higher length and check the WinHIDMBS.OutputReportByteLength property.

The first byte must be the Report ID which seems to be zero for most devices.
If length is zero, we use the length of memoryblock.

175.19.22 SerialNumber as string

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The serial number of the current selected device.
Notes: Lasterror is set.

175.19.23 SetOutputReport(data as MemoryBlock, Offset as Integer = 0, Length as Integer = 0) as boolean

MBS USB Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sends an output report.
Notes:

This is very low level.
First byte of data block is report ID.
If Length is 0, we use size of memoryblock.
Returns true on success.

see also
https://msdn.microsoft.com/en-us/library/windows/hardware/ff539690(v=vs.85).aspx

175.19.24 VendorID as Integer

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The vendor ID of the selected device.
Notes: Lasterror is set.

175.19.25 VersionNumber as Integer

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device specific version number.
Notes:

Value can be anything.
On any error, 0 is returned.
Lasterror is set.

175.19.26 Properties

175.19.27 FeatureReportByteLength as Integer

MBS USB Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Maximum length, in bytes, of all the feature reports, including the report identifier, if report identifiers are used, which is added to the beginning of the report data.
Notes: (Read and Write property)

175.19.28 HidHandle as Integer

MBS USB Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle for the HID device.
Notes: (Read and Write property)

175.19.29 InputReportByteLength as Integer

MBS USB Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Maximum size, in bytes, of the input reports, including the report identifier, if report identifiers are used, which is added to the beginning of the report data.
Notes: (Read and Write property)

175.19.30 Lasterror as Integer

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Last error code.
Notes:

0 is success.
-1 means that the function is not available.

else Windows error codes like 5 for Access Denied.
(Read and Write property)

175.19.31 LasterrorString as String

MBS USB Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code in a formatted and localized string.
Notes:

This does not work for plugin error codes.
Like -1 if the function is not available.
(Read only property)

175.19.32 OutputReportByteLength as Integer

MBS USB Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Maximum size, in bytes, of all the output reports, including the report identifier, if report identifiers are used, which is added to the beginning of the report data.
Notes: (Read and Write property)

175.19.33 PnPHandle as Integer

MBS USB Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle for Plug and Play.
Notes: (Read and Write property)

175.19.34 ReadHandle as Integer

MBS USB Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle of the stream for reading data from the USB device.
Notes: (Read and Write property)

175.19.35 ThreadHandle as Integer

MBS USB Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle for the thread which waits in the background for new data.
Notes: (Read and Write property)

175.19.36 WriteHandle as Integer

MBS USB Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle of the stream for writing data to the USB device.
Notes: (Read and Write property)

175.20 class WinUSBDeviceMBS

175.20.1 class WinUSBDeviceMBS

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class to query USB devices.
Example:

```
dim devices(-1) as WinUSBDeviceMBS = WinUSBDeviceMBS.Devices

for each d as WinUSBDeviceMBS in devices
MsgBox d.Vendor+" - "+d.Product
next
```

175.20.2 Blog Entries

- Showing USB Devices
- MBS Real Studio Plugins, version 11.2pr6

175.20.3 Methods

175.20.4 Devices as WinUSBDeviceMBS()

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries a list of all USB Devices.
Example:

```
dim devices() as WinUSBDeviceMBS = WinUSBDeviceMBS.devices
for each d as WinUSBDeviceMBS in devices
msgbox d.vendor+" "+d.product+" "+d.serialnumber
next
```

Notes: Returns an emtpy array on errors.

175.20.5 Properties

175.20.6 cdUSB as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device USB version.

Notes:

USB Specification Number which device complies too.

The cdUSB field reports the highest version of USB the device supports. The value is in binary coded decimal with a format of 0xJJMN where JJ is the major version number, M is the minor version number and N is the sub minor version number. e.g. USB 2.0 is reported as & h0200, USB 1.1 as 0x0110 and USB 1.0 as & h0100.
(Read and Write property)

175.20.7 DescriptorType as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device descriptor type.
Notes:

Device Descriptor (0x01)
(Read and Write property)

175.20.8 DeviceClass as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device class.
Notes:

See constants in MacUSBDeviceMBS class.
Assigned by USB Org
(Read and Write property)

175.20.9 DeviceID as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device ID.
Notes: (Read and Write property)

175.20.10 DeviceProtocol as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device protocol.
Notes:

Assigned by USB Org
(Read and Write property)

175.20.11 DeviceSubClass as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device sub class.
Notes:

See constants in MacUSBDeviceMBS class.
Assigned by USB Org
(Read and Write property)

175.20.12 MaxEP0Size as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Maximum Packet Size for Zero Endpoint.
Notes:

Valid Sizes are 8, 16, 32, 64
(Read and Write property)

175.20.13 Product as String

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The product name.
Notes: (Read and Write property)

175.20.14 ProductID as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The product ID of the device.
Notes: (Read and Write property)

175.20.15 SerialNumber as String

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The serial number of the USB device.
Example:

```
dim devices(-1) as WinUSBDeviceMBS = WinUSBDeviceMBS.Devices

for each d as WinUSBDeviceMBS in devices
MsgBox d.Vendor+" - "+d.Product+": "+d.SerialNumber
next
```

Notes:

Not all vendors save the serial number in the device.
(Read and Write property)

175.20.16 Vendor as String

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The vendor name of the USB device.
Notes: (Read and Write property)

175.20.17 VendorID as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The vendor ID of the USB device.
Notes:

Assigned by USB Org.
(Read and Write property)

175.21 class WinUSBInterfaceDescriptionMBS

175.21.1 class WinUSBInterfaceDescriptionMBS

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This class is used by USB clients to retrieve a USB-defined interface descriptor.

175.21.2 Properties

175.21.3 AlternateSetting as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The index number of the alternate setting of the interface.
Notes: (Read and Write property)

175.21.4 DescriptorType as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The descriptor type.
Notes:

Descriptor must be set to USB_INTERFACE_DESCRIPTOR_TYPE.
(Read and Write property)

175.21.5 InterfaceClass as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class code of the device that the USB specification group assigned.
Notes: (Read and Write property)

175.21.6 InterfaceIndex as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The index of a string descriptor that describes the interface.
Notes:

For information about this field, see section 9.6.5 in the "Universal Serial Bus Revision 2.0" specification at USB Technology.
(Read and Write property)

175.21.7 InterfaceNumber as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The index number of the interface.
Notes: (Read and Write property)

175.21.8 InterfaceProtocol as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The protocol code of the device that the USB specification group assigned.
Notes: (Read and Write property)

175.21.9 InterfaceSubClass as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The subclass code of the device that the USB specification group assigned.
Notes: (Read and Write property)

175.21.10 Length as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The length, in bytes, of the descriptor.
Notes: (Read and Write property)

175.21.11 NumEndpoints as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of endpoints that are used by the interface, excluding the default status endpoint.
Notes: (Read and Write property)

175.22 class WinUSBMBS

175.22.1 class WinUSBMBS

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Provides access to any USB device on Windows.
Notes:

This class provides funtions exposed by Winusb.dll, which user-mode client drivers and applications can use to communicate with USB devices.
WinUSB functions require Windows XP or later.

175.22.3 Methods

175.22.4 AbortPipe(PipeID as Integer)

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Aborts all of the pending transfers for a pipe. This is a synchronous operation.
Notes:

To reset a pipe associated with an endpoint in the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by

GetAssociatedInterface.

PipeID: The identifier (ID) of the control pipe. The PipeID parameter is an 8-bit value that consists in a 7-bit address and a direction bit. This parameter corresponds to the EndpointAddress field in the endpoint descriptor.

Lasterror is zero on success and false on failure.

175.22.5 Available as boolean

MBS USB Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if winusb.dll has been found and loaded.
Notes: Always false on Linux and Mac OS X.

175.22.6 Constructor(path as string)

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a WinUSB object for the device specified by a device path.
Example:

```
Dim path As String = "\\?\usb# vid_0e0f& pid_0003# 6& 30c8ca5f& 0& 5# { a5dcbf10-6530-11d2-901f-00c04fb951ed } "
Dim w As New WinUSBMBS(path)

If w.Lasterror <>0 Then
MsgBox "Lasterror: "+Str(w.Lasterror)
else
MsgBox "DeviceHandle: "+Hex(w.DeviceHandle)
End If
```

Notes:

Use WindowsDeviceMBS class to find USB devices and their device paths.
Lasterror is set.
On success DeviceHandle and Handle properties are not nil.

When Constructor is called, the policy settings of the interface are reset to the default values.
The Constructor call queries the underlying USB stack for various descriptors and allocates enough memory to store the retrieved descriptor data.
Constructor first retrieves the device descriptor and then gets the associated configuration descriptor. From the configuration descriptor, the call derives the associated interface descriptors and stores them in an array.

The interfaces in the array are identified by zero-based indexes. An index value of 0 indicates the first interface (the default interface), a value of 1 indicates the second associated interface, and so on. Constructor parses the default interface descriptor for the endpoint descriptors and caches information such as the associated pipes or state specific data. The handle received in the InterfaceHandle parameter is a pointer to the memory block allocated for the first interface in the array.

If an application wants to use another interface on the device, it must call GetAssociatedInterface, specify the index of the interface, and retrieve a handle to the memory block allocated for the specified interface.

e.g. path like this format.
\\?\usb# vid_0e0f& pid_0003# 6& 30c8ca5f& 0& 5# { a5dcbf10-6530-11d2-901f-00c04fb951ed }

175.22.7 ControlTransfer(SetupPacket as WinUSBSetupPacketMBS, Buffer as MemoryBlock) as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Transmits control data over a default control endpoint.
Notes:

To send a control request to the entire device or the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

SetupPacket: The 8-byte setup packet of type WinUSBSetupPacketMBS.
Buffer: A buffer that contains the data to transfer. Can be empty.

Returns the actual number of transferred bytes.
Lasterror property is set.
See also:

- 175.22.8 ControlTransfer(SetupPacket as WinUSBSetupPacketMBS, Buffer as String) as Integer 21619

175.22.8 ControlTransfer(SetupPacket as WinUSBSetupPacketMBS, Buffer as String) as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Transmits control data over a default control endpoint.
Notes:

To send a control request to the entire device or the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

SetupPacket: The 8-byte setup packet of type WinUSBSetupPacketMBS.
Buffer: A buffer that contains the data to transfer. Can be empty.

Returns the actual number of transferred bytes.
Lasterror property is set.
See also:

- 175.22.7 ControlTransfer(SetupPacket as WinUSBSetupPacketMBS, Buffer as MemoryBlock) as Integer 21619

175.22.9 DeviceSpeed as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries device speed.
Notes:

Lasteror is set.
Use constants LowSpeed, HighSpeed and FullSpeed.

175.22.10 FlushPipe(PipeID as Integer)

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Discards any data that is cached in a pipe. This is a synchronous operation.
Notes:

To reset a pipe associated with an endpoint in the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

PipeID: The identifier (ID) of the control pipe. The PipeID parameter is an 8-bit value that consists in a 7-bit address and a direction bit. This parameter corresponds to the EndpointAddress field in the endpoint descriptor.

Lasterror is zero on success and false on failure.

175.22.11 GetAssociatedInterface(index as Integer) as WinUSBMBS

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves a WinUSBMBS object for an associated interface.
Notes:

This is a synchronous operation.

AssociatedInterfaceIndex: An index that specifies the associated interface to retrieve. A value of 0 indicates the first associated interface, a value of 1 indicates the second associated interface, and so on.

Returns new WinUBSMBS object.
The first associated interface is the interface that immediately follows the interface whose handle the WinUsb_Initialize routine retrieves.

Callers of GetAssociatedInterfacecan retrieve only one handle for each interface. If a caller attempts to retrieve more than one handle for the same interface, the routine will fail with an error of ERROR_ALREADY_EXISTS.

175.22.12 QueryInterfaceSettings(index as Integer) as WinUSBInterfaceDescriptionMBS

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the interface descriptor for the specified alternate interface settings for a particular interface handle.
Notes:

To retrieve the settings of the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

AlternateSettingNumber: A value that indicates which alternate settings to return. A value of 0 indicates the first alternate setting, a value of 1 indicates the second alternate setting, and so on.

Returns WinUSBInterfaceDescriptionMBS object on success or nil on any error.

175.22.13 QueryPipe(AlternateInterfaceNumber as Integer, PipeIndex as Integer) as WinUSBPipeInformationMBS

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves information about the specified endpoint and the associated pipe for an interface.
Notes:

To query a pipe associated with an endpoint in the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

AlternateInterfaceNumber: A value that specifies the alternate interface to return the information for.
PipeIndex: A value that specifies the pipe to return information about. This value is not the same as the

bEndpointAddress field in the endpoint descriptor. A PipeIndex value of 0 signifies the first endpoint that is associated with the interface, a value of 1 signifies the second endpoint, and so on. PipeIndex must be less than the value in the NumEndpoints field of the interface descriptor.

Returns pipe information or nil on error. Also sets Lasterror property.

The QueryPipe function does not retrieve information about the control pipe.

Each interface on the USB device can have multiple endpoints. To communicate with each of these endpoints, the bus driver creates pipes for each endpoint on the interface. The pipe indices are zero-based. Therefore for n number of endpoints, the pipes' indices are set from n-1. WinUsb_QueryPipe parses the configuration descriptor to get the interface specified by the caller. It searches the interface descriptor for the endpoint descriptor associated with the caller-specified pipe. If the endpoint is found, the function populates a WinUSBPipeInformationMBS object with information from the endpoint descriptor.

175.22.14 ReadPipeMemory(PipeID as Integer, BufferLength as Integer) as Memoryblock

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads data from the specified pipe.
Notes:

To read a pipe associated with an endpoint in the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

PipeID: PipeID corresponds to the EndpointAddress field in the endpoint descriptor. For information about the layout of this field, see Table 9-13 in "Universal Serial Bus Specification Revision 2.0" at USB Technology. In the EndpointAddress field, Bit 7 indicates the direction of the endpoint: 0 for OUT; 1 for IN.
BufferLength: The maximum number of bytes to read.

Returns memoryblock with the data read. This may be shorter than BufferLength.
Lasterror is set.

Lasterror is 0 if the operation succeeds. Otherwise, lasterror has the Windows error code.

If the data returned by the device is greater than a maximum transfer length, WinUSB divides the request into smaller requests of maximum transfer length and submits them serially. If the transfer length is not a multiple of the endpoint's maximum packet size (retrievable through the WinUSBPipeInformationMBS class's MaximumPacketSize member), WinUSB increases the size of the transfer to the next multiple of MaximumPacketSize.
USB packet size does not factor into the transfer for a read request. If the device responds with a packet

that is too large for the client buffer, the behavior of the read request corresponds to the type of policy set on the pipe. If policy type for the pipe is ALLOW_PARTIAL_READS, WinUSB adds the remaining data to the beginning of the next transfer. If ALLOW_PARTIAL_READS is not set, the read request fails. For more information about policy types, see WinUSB Functions for Pipe Policy Modification.

When no data is available in the endpoint (pipe is empty), ReadPipe does not return until there is data in the pipe. If an error condition occurs or the application-specified timeout expires, ReadPipe always returns false. To determine the actual reason for that return value, always check LastError. For example, in these cases the GetLastError error value indicates the actual reason:
If the application specified a timeout value in the pipe policy and that timeout expires, ReadPipe returns false and LastError is ERROR_SEM_TIMEOUT.
If an error condition occurs while reading data from the pipe, ReadPipe returns false and LastError is ERROR_GEN_FAILURE.

175.22.15 ReadPipePacket(PipeID as Integer, MaxSize as Integer = 1024) as Memoryblock

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads a data packet.
Notes: We developed this function for a client, so it's probably useless for everyone else.

175.22.16 ReadPipeString(PipeID as Integer, BufferLength as Integer) as string

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads data from the specified pipe.
Notes:

To read a pipe associated with an endpoint in the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

PipeID: PipeID corresponds to the EndpointAddress field in the endpoint descriptor. For information about the layout of this field, see Table 9-13 in "Universal Serial Bus Specification Revision 2.0" at USB Technology. In the EndpointAddress field, Bit 7 indicates the direction of the endpoint: 0 for OUT; 1 for IN.
BufferLength: The maximum number of bytes to read.

Returns string with the data read. This may be shorter than BufferLength.
Lasterror is set.

Lasterror is 0 if the operation succeeds. Otherwise, lasterror has the Windows error code.

If the data returned by the device is greater than a maximum transfer length, WinUSB divides the request into smaller requests of maximum transfer length and submits them serially. If the transfer length is not a multiple of the endpoint's maximum packet size (retrievable through the WinUSBPipeInformationMBS class's MaximumPacketSize member), WinUSB increases the size of the transfer to the next multiple of MaximumPacketSize.
USB packet size does not factor into the transfer for a read request. If the device responds with a packet that is too large for the client buffer, the behavior of the read request corresponds to the type of policy set on the pipe. If policy type for the pipe is ALLOW_PARTIAL_READS, WinUSB adds the remaining data to the beginning of the next transfer. If ALLOW_PARTIAL_READS is not set, the read request fails. For more information about policy types, see WinUSB Functions for Pipe Policy Modification.

When no data is available in the endpoint (pipe is empty), ReadPipe does not return until there is data in the pipe. If an error condition occurs or the application-specified timeout expires, ReadPipe always returns false. To determine the actual reason for that return value, always check LastError. For example, in these cases the GetLastError error value indicates the actual reason:
If the application specified a timeout value in the pipe policy and that timeout expires, ReadPipe returns false and LastError is ERROR_SEM_TIMEOUT.
If an error condition occurs while reading data from the pipe, ReadPipe returns false and LastError is ERROR_GEN_FAILURE.

175.22.17 ResetPipe(PipeID as Integer)

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Resets the data toggle and clears the stall condition on a pipe.
Notes:

To reset a pipe associated with an endpoint in the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

PipeID: The identifier (ID) of the control pipe. The PipeID parameter is an 8-bit value that consists in a 7-bit address and a direction bit. This parameter corresponds to the EndpointAddress field in the endpoint descriptor.

Lasterror is zero on success and false on failure.

175.22.18 WritePipe(PipeID as Integer, Buffer as MemoryBlock) as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Writes data to a pipe.
Notes:

To write to a pipe associated with an endpoint in the first interface, use the WinUSBMBS object created

with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

PipeID: PipeID corresponds to the EndpointAddress field in the endpoint descriptor. For information about the layout of this field, see Table 9-13 in "Universal Serial Bus Specification Revision 2.0" at USB Technology. In the bEndpointAddress field, Bit 7 indicates the direction of the endpoint: 0 for OUT; 1 for IN.
Buffer: A buffer that contains the data to write.

Returns the actual number of bytes that were written to the pipe.
Lasterror is set. Zero for success.

To create a write request, your the application must allocate a buffer, fill it with the data that you want to write to the device, and send the buffer to the host controller by calling WritePipe.
The following restrictions apply to the size of the buffer if RAW_IO is set:

- The buffer length must be a multiple of the maximum endpoint packet size.
- The length must be less than or equal to the value of MAXIMUM_TRANSFER_SIZE retrieved by GetPipePolicy.

There are no restrictions on the size of the buffer if RAW_IO is not set as the pipe's policy type. If the size of the buffer is greater than the maximum transfer length reported by MAXIMUM_TRANSFER_SIZE, WinUSB divides the request into smaller requests and submits them serially to the host controller.
A write request that contains zero-length data is forwarded down the USB stack.
See also:

- 175.22.19 WritePipe(PipeID as Integer, Buffer as String) as Integer 21625

175.22.19 WritePipe(PipeID as Integer, Buffer as String) as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Writes data to a pipe.
Notes:

To write to a pipe associated with an endpoint in the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

PipeID: PipeID corresponds to the EndpointAddress field in the endpoint descriptor. For information about the layout of this field, see Table 9-13 in "Universal Serial Bus Specification Revision 2.0" at USB Technology. In the bEndpointAddress field, Bit 7 indicates the direction of the endpoint: 0 for OUT; 1 for IN.
Buffer: A buffer that contains the data to write.

Returns the actual number of bytes that were written to the pipe.
Lasterror is set. Zero for success.

To create a write request, your the application must allocate a buffer, fill it with the data that you want to write to the device, and send the buffer to the host controller by calling WritePipe.
The following restrictions apply to the size of the buffer if RAW_IO is set:

- The buffer length must be a multiple of the maximum endpoint packet size.
- The length must be less than or equal to the value of MAXIMUM_TRANSFER_SIZE retrieved by GetPipePolicy.

There are no restrictions on the size of the buffer if RAW_IO is not set as the pipe's policy type. If the size of the buffer is greater than the maximum transfer length reported by MAXIMUM_TRANSFER_SIZE, WinUSB divides the request into smaller requests and submits them serially to the host controller.
A write request that contains zero-length data is forwarded down the USB stack.

- 175.22.18 WritePipe(PipeID as Integer, Buffer as MemoryBlock) as Integer 21624

175.22.20 WritePipePacket(PipeID as Integer, Buffer as MemoryBlock) as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sends data packet.
Notes: We developed this function for a client, so it's probably useless for everyone else.
See also:

- 175.22.21 WritePipePacket(PipeID as Integer, Buffer as String) as Integer 21626

175.22.21 WritePipePacket(PipeID as Integer, Buffer as String) as Integer

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sends data packet.
Notes: We developed this function for a client, so it's probably useless for everyone else.
See also:

- 175.22.20 WritePipePacket(PipeID as Integer, Buffer as MemoryBlock) as Integer 21626

175.22.22 Properties

175.22.23 DeviceHandle as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal handle to the device.
Notes: (Read and Write property)

175.22.24 Lasterror as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code.
Notes: (Read and Write property)

175.22.25 LasterrorMessage as String

MBS USB Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error message.
Notes: (Read and Write property)

175.22.26 Parent as WinUSBMBS

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Parent usb object.
Notes:

Objects created with GetAssociatedInterface have here the parent object, so you can go back to main interface.
(Read and Write property)

175.22.27 Tag as Variant

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The attached value.
Notes:

You can use this property as you like.
(Read and Write property)

175.22.28 USBHandle as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal handle to the USB device.
Notes: (Read and Write property)

175.22.29 CurrentAlternateSetting as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current alternate interface setting for an interface.
Notes:

To get the current alternate setting in the first (default) interface on the device, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

Lasterror is set. You can set and get the value.
(Read and Write computed property)

175.22.30 PipePolicyAllowPartialReads(PipeID as Integer) as boolean

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to allow partial reads.
Notes:

The default value is true. To disable set to false.
Disabling AllowPartialReads causes the read requests to fail whenever the device returns more data (on bulk and interrupt IN endpoints) than the caller requested.
Enabling AllowPartialReads causes WinUSB to save or discard the extra data when the device returns more data (on bulk and interrupt IN endpoints) than the caller requested. This behavior is defined by setting the auto flush value.
Lasterror is set.
(Read and Write computed property)

175.22.31 PipePolicyAutoClearStall(PipeID as Integer) as boolean

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether WinUSB resets the pipe in order to automatically clear the stall condition.
Notes:

Data continues to flow on the bulk and interrupt IN endpoints again as soon as a new or a queued transfer arrives on the endpoint. This policy parameter does not affect control pipes.

Disabling AutoClearStall causes all transfers (that arrive to the endpoint after the stalled transfer) to fail until the caller manually resets the endpoint's pipe by calling ResetPipe.
Lasterror is set.
(Read and Write computed property)

175.22.32 PipePolicyAutoFlush(PipeID as Integer) as boolean

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to use auto flush.
Notes:

The default value is false (zero). To enable auto flush set to true.
auto flush must be used with AllowPartialReads enabled. If AllowPartialReads is TRUE, the value of auto flush determines the action taken by WinUSB when the device returns more data than the caller requested.
Disabling AllowPartialReads causes WinUSB to ignore the auto flush value.
Disabling auto flush with AllowPartialReads enabled causes WinUSB to save the extra data, add the data to the beginning of the caller's next read request, and send it to the caller in the next read operation.
Enabling auto flush with AllowPartialReads enabled causes WinUSB to discard the extra data remaining from the read request.
Lasterror is set.
(Read and Write computed property)

175.22.33 PipePolicyIgnoreShortPackets(PipeID as Integer) as boolean

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Enabling IgnoreShortPackets causes the host controller to not complete a read operation after it receives a short packet.
Notes:

Instead, the host controller completes the operation only after the host has read the specified number of bytes.
Disabling IgnoreShortPackets causes the host controller to complete a read operation when either the host has read the specified number of bytes or the host has received a short packet.
The default value is false. To enable set to true.
Lasterror is set.
(Read and Write computed property)

175.22.34 PipePolicyMaximumTransferSize(PipeID as Integer) as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets the maximum size of a USB transfer supported by WinUSB.
Notes:

This is a read-only policy.
Lasterror is set.
(Read and Write computed property)

175.22.35 PipePolicyPipeTransferTimeout(PipeID as Integer) as UInt32

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies the time-out interval.
Notes:

The default value is zero.
The PipeTransferTimeout value specifies the time-out interval, in milliseconds. The host controller cancels transfers that do not complete within the specified time-out interval.
A value of zero (default) indicates that transfers do not time out because the host controller never cancels the transfer.
Lasterror is set.
(Read and Write computed property)

175.22.36 PipePolicyRawIO(PipeID as Integer) as boolean

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to use Raw IO.
Notes:

The default value is false.
Enabling raw IO causes WinUSB to send data directly to the USB driver stack, bypassing WinUSB's queuing and error handling mechanism.
The buffers that are passed to ReadPipe must be configured by the caller as follows:

- The buffer length must be a multiple of the maximum endpoint packet size.
- The length must be less than or equal to the value of PipePolicyMaximumTransferSize.

Disabling raw IO (false) does not impose any restriction on the buffers that are passed to ReadPipe.
Lasterror is set.
(Read and Write computed property)

175.22.37 PipePolicyResetPipeOnResume(PipeID as Integer) as boolean

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to reset pipe on resume.
Notes:

True indicates that on resume from suspend, WinUSB resets the endpoint before it allows the caller to send new requests to the endpoint.
Lasterror is set.
(Read and Write computed property)

175.22.38 PipePolicyShortPacketTerminate(PipeID as Integer) as boolean

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the driver sends a zero-length packet at the end of every write request to the host controller.
Notes:

Lasterror is set.
(Read and Write computed property)

175.22.39 Constants

175.22.40 AutoSuspend = & h81

MBS USB Plugin, Plugin Version: 12.2. **Function:** One of the power policy type constants.

175.22.41 FullSpeed = 2

MBS USB Plugin, Plugin Version: 12.2. **Function:** One of the Device Speed Constants
Notes: Full Speed

175.22.42 HighSpeed = 3

MBS USB Plugin, Plugin Version: 12.2. **Function:** One of the Device Speed Constants
Notes: High Speed

175.22.43 LowSpeed = 1

MBS USB Plugin, Plugin Version: 12.2. **Function:** One of the Device Speed Constants
Notes: Low Speed

175.22.44 SuspendDelay = & h83

MBS USB Plugin, Plugin Version: 12.2. **Function:** One of the power policy type constants.

175.23 class WinUSBNotificationMBS

175.23.1 class WinUSBNotificationMBS

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for getting notifications about USB devices being connected or removed.
Notes: Use MacUSBNotificationMBS for Mac OS X.

175.23.2 Blog Entries

- Showing USB Devices
- MBS Real Studio Plugins, version 11.3pr15
- MBS Real Studio Plugins, version 11.2pr3

175.23.3 Methods

175.23.4 Constructor

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor initializes the notification engine.
Notes: On success WindowHandle and NotifyHandle is not zero.

175.23.5 Properties

175.23.6 NotifyHandle as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Internal handle to the notification system.
Notes: (Read and Write property)

175.23.7 WindowHandle as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Internal handle to the dummy window for receiving notification.
Notes: (Read only property)

175.23.8 Events

175.23.9 DeviceAdded(Name as string)

MBS USB Plugin, Plugin Version: 11.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** This event is called when a device has been attached.
Notes:

Name is typically for an USB device: "\\?\USB# Vid_05ac& Pid_8403# 000000009833# { a5dcbf10-6530-11d2-901f-00c04fb951ed } ".
That means you can get Vendor ID and Product ID from this string. Also the unique ID and finally the class GUID.

175.23.10 DeviceRemoved(Name as string)

MBS USB Plugin, Plugin Version: 11.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** This event is called when a device has been removed.
Notes:

Name is typically for an USB device: "\\?\USB# Vid_05ac& Pid_8403# 000000009833# { a5dcbf10-6530-11d2-901f-00c04fb951ed } ".
That means you can get Vendor ID and Product ID from this string. Also the unique ID and finally the class GUID.

175.24 class WinUSBPipeInformationMBS

175.24.1 class WinUSBPipeInformationMBS

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for pipe details.

175.24.2 Properties

175.24.3 Interval as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The pipe interval.
Notes: (Read and Write property)

175.24.4 MaximumPacketSize as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The maximum size, in bytes, of the packets that are transmitted on the pipe.
Notes: (Read and Write property)

175.24.5 PipeId as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The pipe identifier (ID).
Notes: (Read and Write property)

175.24.6 PipeType as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The pipe type.
Notes: (Read and Write property)

175.24.7 Constants

175.24.8 UsbdPipeTypeBulk = 2

MBS USB Plugin, Plugin Version: 12.2. **Function:** One of the pipe type constants.
Notes: Indicates that the pipe is a bulk transfer pipe.

175.24.9 UsbdPipeTypeControl = 0

MBS USB Plugin, Plugin Version: 12.2. **Function:** One of the pipe type constants.
Notes: Indicates that the pipe is a control pipe.

175.24.10 UsbdPipeTypeInterrupt = 3

MBS USB Plugin, Plugin Version: 12.2. **Function:** One of the pipe type constants.
Notes: Indicates that the pipe is a interrupt pipe.

175.24.11 UsbdPipeTypeIsochronous = 1

MBS USB Plugin, Plugin Version: 12.2. **Function:** One of the pipe type constants.
Notes: Indicates that the pipe is an isochronous transfer pipe.

175.25 class WinUSBSetupPacketMBS

175.25.1 class WinUSBSetupPacketMBS

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The metadata needed to create an USB packet.

175.25.2 Properties

175.25.3 Index as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The meaning of this member varies according to the request.
Notes:

For an explanation of this member, see the Universal Serial Bus (USB) specification.
(Read and Write property)

175.25.4 Length as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of bytes to transfer.
Notes: (Read and Write property)

175.25.5 Request as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device request.
Notes:

The values that are assigned to this member are defined in Table 9.3 of section 9.4 of the Universal Serial Bus (USB) specification.
(Read and Write property)

175.25.6 RequestType as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The request type.
Notes:

The values that are assigned to this member are defined in Table 9.2 of section 9.3 of the Universal Serial Bus (USB) specification (www.usb.org).
(Read and Write property)

175.25.7 Value as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The meaning of this member varies according to the request.
Notes:

For an explanation of this member, see the Universal Serial Bus (USB) specification.
(Read and Write property)

Chapter 176

User Notifications

176.1 class NSUserNotificationActionMBS

176.1.1 class NSUserNotificationActionMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An action shown to the user as part of a NSUserNotification in the additionalActions property.
Notes: Available on Mac OS X 10.10 and newer.

176.1.2 Blog Entries

- MBS Xojo Plugins, version 19.2pr4
- New for Mac OS X 10.10 in MBS Xojo Plugins

176.1.3 Methods

176.1.4 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.10 or newer. False in all other cases.

176.1.5 Constructor(identifier as string, title as string)

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

176.1.6 copy as NSUserNotificationActionMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a copy of this object.

176.1.7 Properties

176.1.8 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

176.1.9 Identifier as String

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal identifier for this action.
Notes: (Read only property)

176.1.10 Title as String

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The localized title of the action.
Notes: (Read only property)

176.2 class NSUserNotificationCenterDelegateMBS

176.2.1 class NSUserNotificationCenterDelegateMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: This class allows you to react to events from the user notification center.
Notes: This is for sending user notifications to the Mac your Xojo application runs on. Not for remote notifications or notifications to iOS devices.

176.2.2 Blog Entries

- Mac OS X 10.8 User Notifications with Filemaker and Real Studio

176.2.3 Methods

176.2.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: Must be called to have the class register itself.

176.2.5 Destructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The destructor.

176.2.6 Properties

176.2.7 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

176.2.8 Events

176.2.9 didActivateNotification(center as NSUserNotificationCenterMBS, notification as NSUserNotificationMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent to the delegate when a user clicks on a user notification presented by the user notification center.
Example:

```
Sub applicationDidFinishLaunching(Notification as NSNotificationMBS)
dim userInfo as Dictionary = Notification.userInfo
dim key as string = NSApplicationMBS.NSApplicationLaunchUserNotificationKey
dim UserNotification as NSUserNotificationMBS = userInfo.Lookup(key, nil)

if UserNotification <>nil then
MsgBox UserNotification.identifier+": "+UserNotification.informativeText
end if
End Sub
```

Notes:

center: The user notification center.
notification: The user notification object.

This would be a good time to take action in response to user interacting with a specific notification.

To take an action when your application is launched as a result of a user clicking on a notification, be sure to implement the applicationDidFinishLaunching method in the application class that implements the NSApplicationDelegateMBS class. The notification parameter to that method has a userInfo dictionary, and if that dictionary has the NSApplicationLaunchUserNotificationKey key. The value of that key is the NSUserNotification object that caused the application to launch. The NSUserNotification object is delivered to the NSApplication delegate because that message will be sent before your application has a chance to set a delegate for the NSUserNotificationCenter.

Available in OS X v10.8 and later.

176.2.10 didDeliverNotification(center as NSUserNotificationCenterMBS, notification as NSUserNotificationMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent to the delegate when a notification delivery date has arrived.

Notes:

center: The user notification center.
notification: The user notification object.

This method is always called, regardless of your application state and even if you deliver the user notification yourself using deliverNotification:.

This event is invoked before the shouldPresentNotification event.
Available in OS X v10.8 and later.

176.2.11 shouldPresentNotification(center as NSUserNotificationCenterMBS, notification as NSUserNotificationMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sent to the delegate when the user notification center has decided not to present your notification.
Notes:

center: The user notification center.
notification: The user notification object.

Return true if the user notification should be displayed regardless; false otherwise.
Available in OS X v10.8 and later.

176.3 class NSUserNotificationCenterMBS

176.3.1 class NSUserNotificationCenterMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The NSUserNotificationCenterMBS class delivers user notifications to the user from applications or helper applications.
Example:

```
dim u as new NSUserNotificationMBS

u.Title = "Hello World"
u.subtitle = "from Xojo."
u.informativeText = "Our first Notification from Xojo."

dim d as new date
d.Second = d.Second + 10
u.deliveryDate = d

dim c as new NSUserNotificationCenterMBS
c.scheduleNotification u
```

Notes:

When a user notifications is delivery date has been reached, or it is manually delivered, the notification center it may display the notification to the user. The user notification center reserves the right to decide if a delivered user notification is presented to the user. For example, it may suppress the notification if the application is already frontmost (the delegate can override this action). The application can check the result of this decision by examining the presented property of a delivered user notification.

NSUserNotificationMBS instances the NSUserNotificationCenterMBS are tracking will be in one of two states: scheduled or delivered. A scheduled user notification has a deliveryDate. On that delivery date, the notification will move from being scheduled to being delivered. Note that the user notification may be displayed later than the delivery date depending on a number of factors.

A delivered user notification has an actualDeliveryDate. That is the date when it moved from being scheduled to delivered, or when it was manually delivered using the deliverNotification method.

The application and the user notification center are both ultimately subject to the user's preferences. If the user decides to hide all alerts from your application, the presented property will still behave as above, but the user will not see any animation or hear any sound.

The NSUserNotificationCenterDelegateMBS class provides more information about the delivered user notification and allows forcing the display of a user notification even if the application is frontmost.

Note: It the user wakes more than 15 minutes after a scheduled notification is scheduled to fire, it is discarded. If the notification repeats with an interval less than 15 minutes, then it expires in 1 minute. Expired notifications are just discarded, unless they repeat, in which case, they stay in the scheduled list and just fire again later.
Important Many of the NSUserNotificationCenterMBS class's methods involve talking to a server process, so calling them repeatedly can have a negative effect on performance.

This is for sending user notifications to the Mac your Xojo application runs on. Not for remote notifications or notifications to iOS devices.

The NSUserNotificationCenterMBS class and the NSUserNotificationMBS class are both thread safe.

176.3.2 Blog Entries

- MBS Xojo Plugins, version 19.2pr3
- Mac OS X 10.8 User Notifications with Filemaker and Real Studio

176.3.3 Methods

176.3.4 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether user notification framework is available.
Notes: Returns true on Mac OS X 10.8 and false otherwise.

176.3.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes:

Initializes this object to point to the default user notification center.
Available in OS X v10.8 and later.

176.3.6 defaultUserNotificationCenter as NSUserNotificationCenterMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the default user notification center.

Notes: Available in OS X v10.8 and later.

176.3.7 deliveredNotifications as NSUserNotificationMBS()

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An array of all user notifications delivered to the notification center.
Notes:

The number of notifications the user actually sees in the user interface may be less than the size of this array.

Note that these may or may not have been actually presented to the user. See the presented property in the NSUserNotificationMBS class.

Note: A scheduled user notification that specifies a deliveryRepeatInterval remains in the scheduledNotifications list, even though it has been delivered. The item that goes into the deliveredNotifications list is a copy of the user notification item.

Available in OS X v10.8 and later.

176.3.8 deliverNotification(notification as NSUserNotificationMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Deliver the specified user notification.
Example:

```
dim u as new NSUserNotificationMBS

u.Title = "Hello World"
u.subtitle = "just a test"

dim c as new NSUserNotificationCenterMBS
c.deliverNotification u
```

Notes:

notification: The user notification.

The notification will be presented to the user (subject to the user's preferences). The presented property of the NSUserNotification object will always be set to true if a notification is delivered using this method.

Available in OS X v10.8 and later.

176.3.9 removeAllDeliveredNotifications

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Remove all delivered user notifications from the user notification center.
Notes: Available in OS X v10.8 and later.

176.3.10 removeAllScheduledNotifications

MBS MacFrameworks Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Remove all scheduled user notifications from the user notification center.
Notes: Available in OS X v10.8 and later.

176.3.11 removeDeliveredNotification(notification as NSUserNotificationMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Remove a delivered user notification from the user notification center.
Notes:

notification: The user notification.

If the user notification is not in deliveredNotifications, nothing happens.

Available in OS X v10.8 and later.

176.3.12 removeScheduledNotification(notification as NSUserNotificationMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes the specified user notification for the scheduled notifications.
Notes:

notification: The user notification.

If the user notification's deliveryDate occurs before the cancellation finishes, the notification may still be delivered.
If the notification is not in the scheduled list, nothing happens.

Available in OS X v10.8 and later.

176.3.13 scheduledNotifications as NSUserNotificationMBS()

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Specifies an array of scheduled user notifications that have not yet been delivered.
Notes:

Newly scheduled notifications are added to the end of the array. You may also bulk-schedule notifications by setting this array. Bulk setting new scheduled notifications unschedules existing notifications.

Note: The scheduled user notification could be changing to a delivered notification at the time you are calling this method. and if that case the user notification will still be delivered.

Available in OS X v10.8 and later.

176.3.14 scheduleNotification(notification as NSUserNotificationMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Schedules the specified user notification.
Notes:

notification: The user notification.

Scheduled notifications are added to the end of the notification queue.
Available in OS X v10.8 and later.

176.3.15 Properties

176.3.16 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

176.4 class NSUserNotificationMBS

176.4.1 class NSUserNotificationMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The NSUserNotificationMBS class is used to configure a notification that is scheduled for display by the NSUserNotificationCenterMBS class.
Example:

```
dim u as new NSUserNotificationMBS

u.Title = "Hello World"
u.subtitle = "from Xojo."
u.informativeText = "Our first Notification from Xojo."

dim d as new date
d.Second = d.Second + 10
u.deliveryDate = d

dim c as new NSUserNotificationCenterMBS
c.scheduleNotification u
```

Notes:

The NSUserNotificationMBS object not only configures the notification, when the notification is delivered information about when the notification was actually presented to the user (if at all) and other details are provided in the notification object. User applications can create NSUserNotification objects and register them with the NSUserNotificationCenterMBS object to notify the user when an application requires attention.

See NSUserNotificationCenterMBS Class Reference for more information.

Threading Information
The NSUserNotificationCenterMBS class and the NSUserNotificationMBS class are both thread safe.

This is for sending user notifications to the Mac your Xojo application runs on. Not for remote notifications or notifications to iOS devices.

176.4.4 Methods

176.4.5 additionalActions as NSUserNotificationActionMBS()

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Queries the array of additional actions.
Notes:

For Mac OS X 10.10 and newer. Will not cause exception if called on older versions, but simply return empty array.

An array of NSUserNotificationActionMBS objects that describe the different actions that can be taken on a notification in addition to the default action described by actionButtonTitle.

176.4.6 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether this class is available.
Notes:

Returns true on Mac OS X 10.8 and newer.
Returns false on other operation systems, e.g. older OS X, Windows or Linux.

176.4.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor to create a new notification.

176.4.8 copy as NSUserNotificationMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a clone of the notification object.

176.4.9 NSUserNotificationDefaultSoundName as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The default sound played by the user notification center for this notification.
Notes:

The default notification sound.
Available in OS X v10.8 and later.

176.4.10 Print

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Prints description of notification object to console for debugging.

176.4.11 setAdditionalActions(additionalActions() as NSUserNotificationActionMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets the array of additional actions.
Notes:

For Mac OS X 10.10 and newer. Will not cause exception if called on older versions.

An array of NSUserNotificationActionMBS objects that describe the different actions that can be taken on a notification in addition to the default action described by actionButtonTitle.

176.4.12 Properties

176.4.13 actionButtonTitle as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Specifies the title of the action button displayed in the notification.
Notes:

This value should localized as it will be presented to the user. The string will be truncated to a length appropriate for display and the property will be modified to reflect the truncation.

Available in OS X v10.8 and later.
(Read and Write property)

176.4.14 activationType as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Specifies what caused a user notification to occur.
Notes:

This property specifies why the user notification was sent to to the NSUserNotificationCenterDelegateMBS didActivateNotification event. The supported values are described in constants.

Available in OS X v10.8 and later.
(Read only property)

176.4.15 actualDeliveryDate as date

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The date this notification was actually delivered.
Notes:

The notification center will set this value if a notification is put in the scheduled list and the delivery time arrives.

If the notification is delivered directly using the deliverNotification: method of the NSUserNotificationCenterMBS class, this value will be set to the deliveryDate value. If the deliveryDate value nil this value is set to the current date.

This value is used to sort the list of notifications in the user interface.

Available in OS X v10.8 and later.
(Read only property)

176.4.16 additionalActivationAction as NSUserNotificationActionMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Queries which additional action was selected.

Notes:

For Mac OS X 10.10 and newer. Will not cause exception if called on older versions, but always return nil.

When a user selects an additional action that action will be set on the notification's additionalActivationAction property when passed into the delegate event didActivateNotification.
(Read only property)

176.4.17 contentImage as NSImageMBS

MBS MacFrameworks Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Image shown in the content of the notification.
Notes: (Read and Write property)

176.4.18 deliveryDate as date

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Specifies when the notification should be delivered.
Notes:

The delivery date is specified in an absolute time.
After a notification is delivered, it may be presented to the user.
Available in OS X v10.8 and later.
(Read and Write property)

176.4.19 deliveryRepeatInterval as NSDateComponentsMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Specifies the date components that control how often a user notification is repeated.
Notes:

This value may be nil if the notification should not repeat.

The date component values are relative to the date the notification was delivered.

If the calendar value of the deliveryRepeatInterval is nil, the current calendar will be used to calculate the repeat interval. For example, if a notification should repeat every hour, set the hour property of the deliveryRepeatInterval to 1.

This value is ignored unless the user notification is scheduled with the NSUserNotificationCenterMBS object.
Available in OS X v10.8 and later.

(Read and Write property)

176.4.20 deliveryTimeZone as NSTimeZoneMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Specify the time zone to interpret the delivery date in.
Notes:

If this value is nil and the user switches time zones, the notification center will adjust the time of presentation to account for the time zone change.

If a notification should be delivered at a time in a specific time zone (regardless of whether the user switches time zones), set this value to the specific time zone, for example the current time zone.

Available in OS X v10.8 and later.
(Read and Write property)

176.4.21 description as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Description of notification object for debugging.
Notes: (Read only property)

176.4.22 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

176.4.23 hasActionButton as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Specifies whether the notification displays an action button.
Notes:

Set to false if the notification has no action button. This will be the case for notifications that are purely for informational purposes and have no user action.

The default value is true.

Available in OS X v10.8 and later.
(Read and Write property)

176.4.24 hasReplyButton as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Set to true if the notification has a reply button.
Notes:

The default value is false. If both this and hasActionButton are true, the reply button will be shown.
(Read and Write property)

176.4.25 identifier as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: This identifier is used to uniquely identify a notification.
Notes:

A notification delivered with the same identifier as an existing notification will replace that notification, rather then display a new one.

Available in OS X 10.9 and newer.
(Read and Write property)

176.4.26 informativeText as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The body text of the notification.
Notes:

This value should localized as it will be presented to the user. The string will be truncated to a length appropriate for display and the property will be modified to reflect the truncation.
Available in OS X v10.8 and later.
(Read and Write property)

176.4.27 otherButtonTitle as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Specifies a custom title for the close button in an alert-style notification.
Notes:

This value should localized as it will be presented to the user. The string will be truncated to a length appropriate for display and the property will be modified to reflect the truncation.

An empty string will cause the default localized text to be used.

Available in OS X v10.8 and later.
(Read and Write property)

176.4.28 Presented as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Specifies whether the user notification has been presented.
Notes:

In some cases, for example when your application is frontmost, the notification center may decide not to actually present a delivered notification. In that case, the value of this property will be false. It will be set to true if the notification was presented according to user preferences.

Available in OS X v10.8 and later.
(Read only property)

176.4.29 remote as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Specifies whether the remote was generated by a push notification.
Notes:

If this property is true then the user notification was generated by a push notification (that is, remotely); if false it was generated locally.
Available in OS X v10.8 and later.
(Read only property)

176.4.30 response as NSAttributedStringMBS

MBS MacFrameworks Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The response text.
Notes:

When a notification has been responded to, the NSUserNotificationCenter event didActivateNotification will be called with the notification with the activationType set to NSUserNotificationActivationTypeReplied and the response set on the response property.
(Read only property)

176.4.31 responsePlaceholder as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Optional placeholder for inline reply field.
Notes: (Read and Write property)

176.4.32 soundName as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Specifies the name of the sound to play when the notification is delivered.
Notes:

Passing the NSUserNotificationDefaultSoundName constant causes the default notification center sound to be played.
A value of nil means no sound is played.
Available in OS X v10.8 and later.
(Read and Write property)

176.4.33 subtitle as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Specifies the subtitle of the notification.
Notes:

This value should localized as it will be presented to the user. The string will be truncated to a length appropriate for display and the property will be modified to reflect the truncation.
Available in OS X v10.8 and later.
(Read and Write property)

176.4.34 title as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Specifies the title of the notification.
Notes:

This value should localized as it will be presented to the user. The string will be truncated to a length appropriate for display and the property will be modified to reflect the truncation.
Available in OS X v10.8 and later.
(Read and Write property)

176.4.35 userInfo as dictionary

MBS MacFrameworks Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Application-specific user info that can be attached to the notification.
Example:

```
dim u as new NSUserNotificationMBS
dim d as new dictionary
d.value("Key") = "Value"
u.userinfo = d
```

Notes:

All items must be property list types or an exception will be thrown.
The userInfo content must be of reasonable serialized size (less than 1k) or an exception will be thrown.
Available in OS X v10.8 and later.
(Read and Write property)

176.4.36 Constants

176.4.37 NSUserNotificationActivationTypeActionButtonClicked = 2

MBS MacFrameworks Plugin, Plugin Version: 12.3. **Function:** One of the activation type constants.
Notes:

The user clicked on the action button of the notification alert.
Available in OS X v10.8 and later.

176.4.38 NSUserNotificationActivationTypeAdditionalActionClicked = 4

MBS MacFrameworks Plugin, Plugin Version: 14.3. **Function:** One of the activation type constants.
Notes:

User did select an additional action.
Only for Mac OS X 10.10 and newer.

176.4.39 NSUserNotificationActivationTypeContentsClicked = 1

MBS MacFrameworks Plugin, Plugin Version: 12.3. **Function:** One of the activation type constants.
Notes:

The user clicked on the contents of the notification alert.
Available in OS X v10.8 and later.

176.4.40 NSUserNotificationActivationTypeNone = 0

MBS MacFrameworks Plugin, Plugin Version: 12.3. **Function:** One of the activation type constants.
Notes:

The user did not interact with the notification alert.
Available in OS X v10.8 and later.

176.4.41 NSUserNotificationActivationTypeReplied = 3

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** The activation type for a notification which got a reply.

176.5 class UNCalendarNotificationTriggerMBS

176.5.1 class UNCalendarNotificationTriggerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A trigger condition that causes a notification to be delivered at a specific date and time.
Notes:

Create a UNCalendarNotificationTriggerMBS object when you want to schedule the delivery of a local notification at the specified date and time. You specify the temporal information using an NSDateComponentsMBS object, which lets you specify only the time values that matter to you. The system uses the provided information to determine the next date and time that matches the specified information.
Subclass of the UNNotificationTriggerMBS class.

176.5.2 Methods

176.5.3 Constructor(dateComponents as NSDateComponentsMBS, repeats as boolean)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a calendar trigger from the specified date components.
Notes:

dateComponents: The temporal information to use when constructing the trigger. Provide only the date components that are relevant for your trigger.
repeats: Specify false to deliver the notification one time. Specify YES to reschedule the notification request each time the notification is delivered.

Returns a new calendar trigger based on the specified temporal information.

If you specify true for the repeats parameter, you must explicitly remove the notification request to stop the delivery of the associated notification. Use the methods of UNUserNotificationCenterMBS to remove notification requests that are no longer needed.

176.5.4 trigger(dateComponents as NSDateComponentsMBS, repeats as boolean) as UNCalendarNotificationTriggerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a calendar trigger from the specified date components.
Notes:

dateComponents: The temporal information to use when constructing the trigger. Provide only the date

components that are relevant for your trigger.
repeats: Specify false to deliver the notification one time. Specify YES to reschedule the notification request each time the notification is delivered.

Returns a new calendar trigger based on the specified temporal information.

If you specify true for the repeats parameter, you must explicitly remove the notification request to stop the delivery of the associated notification. Use the methods of UNUserNotificationCenterMBS to remove notification requests that are no longer needed.

176.5.5 Properties

176.5.6 dateComponents as NSDateComponentsMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The date components used to construct this object.
Notes:

Use this property to review the date components associated with this trigger.
(Read only property)

176.5.7 nextTriggerDate as Date

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The next date at which the trigger conditions will be met.
Notes:

Use this property to find out when a notification associated with this trigger will next be delivered.
(Read only property)

176.6 class UNMutableNotificationContentMBS

176.6.1 class UNMutableNotificationContentMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The editable content for a notification.
Notes:

Create a UNMutableNotificationContent object when you want to specify the payload for a local notification. Specifically, use this object to specify the title and message for an alert, the sound to play, or the value to assign to your app's badge. You might also provide details about how the system handles the notification. For example, you can specify a custom launch image and a thread identifier for visually grouping related notifications.
After creating your content object, assign it to a UNNotificationRequest object, add a trigger condition, and schedule your notification. The trigger condition defines when the notification is delivered to the user. Listing 1 shows the scheduling of a local notification that displays an alert and plays a sound after a delay of five seconds. The strings for the alert's title and body are stored in the app's Localizable.strings file.
Subclass of the UNNotificationContentMBS class.

176.6.2 Methods

176.6.3 addAttachment(attachment as UNNotificationAttachmentMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Adds an attachment.

176.6.4 clearBadge

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Clears the badge.

176.6.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

176.6.6 setAttachments(attachments() as UNNotificationAttachmentMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets an array of attachments to display in an alert-based notification.
Notes:

Use this property to include images or movies, or to include playable audio files, with the contents of an alert. The system displays the attachments alongside the title and body of your alert. You can also customize the presentation of attachments using a notification content app extension.
All attachments must reside locally on the current device before they can be added. For local notifications, modify this property before scheduling the notification. For remote notifications, use a notification service app extension to locate and download the specified files and modify the notification content before it is delivered.
For more information on how to specify attachments, see UNNotificationAttachmentMBS.

176.6.7 Properties

176.6.8 badge as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The number to apply to the app's icon.
Notes:

Use this property to specify the number to apply to the app's icon when the notification arrives. If your app is not authorized to display badge-based notifications, this property is ignored.
Specify the number 0 to remove the current badge, if present. Specify a number greater than 0 to display a badge with that number. Use clearBadge to leave the current badge unchanged.
(Read and Write property)

176.6.9 body as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The localized message to display in the notification alert.
Notes:

Use this property to specify the body of the notification alert. If your app is not authorized to display alert-based notifications, this property is ignored.
The body text should contain the final text that you want to display, and should not contain any placeholder characters. To include a percent symbol (%) in the message body, use two percent symbols (% %). The system strips all other printf style escape characters from your string prior to display.
(Read and Write property)

176.6.10 categoryIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The identifier of the category object that represents the notification's type.
Notes:

Use notification types to distinguish between the different types of notifications your app supports. You use this support primarily to create actionable notifications—that is, notifications with custom action buttons—and to redirect your notifications through either your notification service app extension or your notification content app extension.
Assign a value to this property that matches the identifier property of one of the UNNotificationCategory objects you previously registered with your app. If you assign a string that does not match one of your registered categories, the system displays your notification without custom actions and without routing it through your app extensions.
(Read and Write property)

176.6.11 sound as UNNotificationSoundMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The sound to play when the notification is delivered.
Notes:

Use this property to specify the sound that you want played when the notification arrives. If your app is not authorized to play sounds for notifications, this property is ignored.
For information on how to specify sounds for your notifications, see UNNotificationSoundMBS.
(Read and Write property)

176.6.12 subtitle as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The localized subtitle, containing a secondary description of the reason for the alert.
Notes:

Use this property to specify additional context about the purpose of the notification. Subtitles offer additional context in cases where the title alone is not clear. Subtitles are not displayed in all cases. If your app is not authorized to display alert-based notifications, this property is ignored.
(Read and Write property)

176.6.13 summaryArgument as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The string the notification adds to the category's summary format string.

Notes: (Read and Write property)

176.6.14 summaryArgumentCount as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The number of items the notification adds to the category's summary format string.
Notes: (Read and Write property)

176.6.15 threadIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An identifier that you use to group related notifications together.
Notes:

You may specify any value for the string, but assign the same thread identifier string to all notifications that you want to group together visually.
(Read and Write property)

176.6.16 title as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The localized title, containing the reason for the alert.
Notes:

Use this property to specify the title of your notification alert. If your app is not authorized to display alert-based notifications, this property is ignored.
Title strings should be short, usually only a couple of words describing the reason for the notification. In watchOS, the title string is displayed as part of the short look notification interface, which has limited space.
(Read and Write property)

176.6.17 userInfo as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A dictionary of custom information associated with the notification.
Notes:

Use this property to associate custom information with the notification. The contents of the dictionary are not seen by the user, but are accessible to your app or to any notification-related app extensions.
The keys in this dictionary must be property-list types—that is, they must be types that can be serialized into the property-list format.

(Read and Write property)

176.7 class UNNotificationActionMBS

176.7.1 class UNNotificationActionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The class for an action for a notification.
Notes:

Use UNNotificationAction objects to define the actions that your app can perform in response to a delivered notification. You define the actions that your app supports. For example, a meeting app might define actions for accepting or rejecting a meeting invitation. The action object itself contains the title to display in an action button and the button's appearance. After creating action objects, add them to a UNNotificationCategory object and register your categories with the system.
For information on how to define actions and categories, see Declaring Your Actionable Notification Types.

When the user selects one of your actions in response to a notification, the system notifies the delegate of the shared UNUserNotificationCenterMBS object. Specifically, the system calls the didReceiveNotificationResponse event. The response object passed to your delegate includes the identifier string of the action that was selected, which you can use to perform the corresponding task.

176.7.2 Methods

176.7.3 action(identifier as string, title as string, options as integer) as UNNotificationActionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an action object with the specified title and options.
Notes:

identifier: The string that you use internally to identify the action. This string must be unique among all of your app's supported actions. When the user selects the action, the system passes this string to your app and asks you to perform the related task. This parameter must not be nil or an empty string.
title: The localized string to display to the user. This string is used as the title of a button, which is added to the notification interface. This parameter must not be nil.
options: Additional options describing how the action behaves. Include options when you need the related behavior. For a list of possible values, see constants.

176.7.4 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the UNNotificationAction class is available.
Notes: Returns true on MacOS 10.14 or newer in 64-bit MacOS application.

176.7.5 Constructor(identifier as string, title as string, options as integer)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an action object with the specified title and options.
Notes:

identifier: The string that you use internally to identify the action. This string must be unique among all of your app's supported actions. When the user selects the action, the system passes this string to your app and asks you to perform the related task. This parameter must not be nil or an empty string.
title: The localized string to display to the user. This string is used as the title of a button, which is added to the notification interface. This parameter must not be nil.
options: Additional options describing how the action behaves. Include options when you need the related behavior. For a list of possible values, see constants.

176.7.6 copy as UNNotificationActionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a copy of the object.

176.7.7 Properties

176.7.8 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

176.7.9 identifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The unique string that your app uses to identify the action.
Notes:

When the user selects an action, the system reports the value of this string to your app. Because all actions are handled by a single delegate method, the identifier strings for all of your app's actions must be unique.
(Read only property)

176.7.10 options as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The behaviors associated with the action.
Notes:

Options should be applied to an action when the corresponding behavior is required.
(Read only property)

176.7.11 title as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The localized string to use as the title of the action.
Notes:

This string is used as the title of the button that the user taps or selects in the notification interface.
(Read only property)

176.7.12 Constants

176.7.13 OptionAuthenticationRequired = 1

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the option constants.
Notes:

The action can be performed only on an unlocked device.
When the user selects an action with this option, the system prompts the user to unlock the device. After unlocking, the system notifies your app of the selected action. You might use option to perform actions that require accessing data that is encrypted while the device is locked.

176.7.14 OptionDestructive = 2

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the option constants.
Notes:

The action performs a destructive task.
Use this option for actions that delete user data or change the app irrevocably. The action button is displayed with special highlighting to indicate that it performs a destructive task.

176.7.15 OptionForeground = 4

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the option constants.
Notes:

The action causes the app to launch in the foreground.
When the user selects an action containing this option, the system brings the app to the foreground, asking the user to unlock the device as needed. Use this option for actions that require the user to interact further with your app. Do not use this option simply to bring your app to the foreground.

176.7.16 OptionNone = 0

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the option constants.
Notes: The action has the default behavior.

176.8 class UNNotificationAttachmentMBS

176.8.1 class UNNotificationAttachmentMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A media file associated with a notification.
Notes:

Create a UNNotificationAttachmentMBS object when you want to include audio, image, or video content together in an alert-based notification. When creating the UNNotificationAttachmentMBS object, the file you specify must be on disk, and the file format must be one of the supported types.

You are responsible for supplying attachments before the system displays your notification's alert. For local notifications, add attachments when creating the notification's content. For remote notifications, use a notification service app extension to download the attached files and then add them to the notification's content before delivery.

The system validates attachments before displaying the associated notification. If you attach a file to a local notification request that is corrupted, invalid, or of an unsupported file type, the system doesn't schedule your request. For remote notifications, the system validates attachments after your notification service app extension finishes. Once validated, attached files are moved into the attachment data store so that they can be accessed by all of the appropriate processes. Attachments located inside an app's bundle are copied instead of moved.

Supported File Types
Table lists the types of files you can include as an attachment and the supported file formats. The table also lists the maximum size allowed for attachments of each type. An image file may contain a static image or an animated image sequence.

Supported attachment file types

Attachment	Supported file types	Maximum size
Audio	kUTTypeAudioInterchangeFileFormat, kUTTypeWaveformAudio, kUTTypeMP3 and kUTTypeMPEG4Audio	5 MB
Image	kUTTypeJPEG, kUTTypeGIF and kUTTypePNG	10 MB
Movie	kUTTypeMPEG, kUTTypeMPEG2Video, kUTTypeMPEG4 and kUTTypeAVIMovie	50 MB

When creating an attachment, you can specify optional details about how to present the thumbnail image for the image or movie. Use the UNNotificationAttachmentOptionsThumbnailClippingRectKey option to use only the specified portion of an image as a thumbnail. For animated images and movies, use the UNNotificationAttachmentOptionsThumbnailTimeKey option to select which frame to use for the thumbnail image.

The amount of storage space allocated for attachments is limited for each app. To delete attachments, use the methods of the UNUserNotificationCenterMBS class to remove the notification requests that contain those attachments.

176.8.2 Blog Entries

- MBS Xojo Plugins, version 19.2pr1

176.8.3 Methods

176.8.4 attachment(identifier as String, File as FolderItem, options as Dictionary = nil, byref error as NSErrorMBS) as UNNotificationAttachmentMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an attachment object from the specified file and options.
Notes:

identifier: The unique identifier of the attachment. Use this string to identify the attachment later. If you specify an empty string, this method creates a unique identifier string for you.
URL: The URL of the file you want to attach to the notification. The URL must be a file URL and the file must be readable by the current process. This parameter must not be nil. For a list of supported file types, see Supported File Types.
options: A dictionary of options related to the attached file. Use the options to specify meta information about the attachment, such as the clipping rectangle to use for the resulting thumbnail.
error: An error object indicating whether a problem occurred. If the attachment was created successfully, this parameter is set to nil. If an error occurs, it is set to an error object containing information about why the attachment was not created. You may specify nil for this parameter if you do not want the error information.

Returns an attachment object containing information about the specified file or nil if the attachment could not be created.

This method verifies that the specified file is readable and that the file format is one of the supported types. When errors occur, the method provides an appropriate error object.
When you schedule a notification request containing the attachment, the attachment's file is moved to a new location to facilitate access by the appropriate processes. After the move, the only way to access the file is using the methods of the UNUserNotificationCenterMBS object.

- 176.8.5 attachment(identifier as String, URL as String, options as Dictionary = nil, byref error as NSErrorMBS) as UNNotificationAttachmentMBS

176.8.5 attachment(identifier as String, URL as String, options as Dictionary = nil, byref error as NSErrorMBS) as UNNotificationAttachmentMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an attachment object from the specified file and options.
Notes:

identifier: The unique identifier of the attachment. Use this string to identify the attachment later. If you specify an empty string, this method creates a unique identifier string for you.
URL: The URL of the file you want to attach to the notification. The URL must be a file URL and the file must be readable by the current process. This parameter must not be nil. For a list of supported file types, see Supported File Types.
options: A dictionary of options related to the attached file. Use the options to specify meta information about the attachment, such as the clipping rectangle to use for the resulting thumbnail.
error: An error object indicating whether a problem occurred. If the attachment was created successfully, this parameter is set to nil. If an error occurs, it is set to an error object containing information about why the attachment was not created. You may specify nil for this parameter if you do not want the error information.

Returns an attachment object containing information about the specified file or nil if the attachment could not be created.

This method verifies that the specified file is readable and that the file format is one of the supported types. When errors occur, the method provides an appropriate error object.
When you schedule a notification request containing the attachment, the attachment's file is moved to a new location to facilitate access by the appropriate processes. After the move, the only way to access the file is using the methods of the UNUserNotificationCenterMBS object.

- 176.8.4 attachment(identifier as String, File as FolderItem, options as Dictionary = nil, byref error as NSErrorMBS) as UNNotificationAttachmentMBS 21672

176.8.6 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the UNNotificationAttachment class is available.
Notes: Returns true on MacOS 10.14 or newer in 64-bit MacOS application.

176.8.7 Constructor(identifier as String, File as FolderItem, options as Dictionary = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an attachment object from the specified file and options.
Notes:

identifier: The unique identifier of the attachment. Use this string to identify the attachment later. If you specify an empty string, this method creates a unique identifier string for you.
URL: The URL of the file you want to attach to the notification. The URL must be a file URL and the file must be readable by the current process. This parameter must not be nil. For a list of supported file types, see Supported File Types.
options: A dictionary of options related to the attached file. Use the options to specify meta information about the attachment, such as the clipping rectangle to use for the resulting thumbnail.
error: An error object indicating whether a problem occurred. If the attachment was created successfully, this parameter is set to nil. If an error occurs, it is set to an error object containing information about why the attachment was not created. You may specify nil for this parameter if you do not want the error information.

Returns an attachment object containing information about the specified file or nil if the attachment could not be created.

This method verifies that the specified file is readable and that the file format is one of the supported types. When errors occur, the method provides an appropriate error object.
When you schedule a notification request containing the attachment, the attachment's file is moved to a new location to facilitate access by the appropriate processes. After the move, the only way to access the file is using the methods of the UNUserNotificationCenterMBS object.
See also:

- 176.8.8 Constructor(identifier as String, URL as String, options as Dictionary = nil) 21674

176.8.8 Constructor(identifier as String, URL as String, options as Dictionary = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an attachment object from the specified file and options.
Notes:

identifier: The unique identifier of the attachment. Use this string to identify the attachment later. If you specify an empty string, this method creates a unique identifier string for you.
URL: The URL of the file you want to attach to the notification. The URL must be a file URL and the file must be readable by the current process. This parameter must not be nil. For a list of supported file types, see Supported File Types.
options: A dictionary of options related to the attached file. Use the options to specify meta information about the attachment, such as the clipping rectangle to use for the resulting thumbnail.
error: An error object indicating whether a problem occurred. If the attachment was created successfully, this parameter is set to nil. If an error occurs, it is set to an error object containing information about why the attachment was not created. You may specify nil for this parameter if you do not want the error information.

Returns an attachment object containing information about the specified file or nil if the attachment could not be created.

This method verifies that the specified file is readable and that the file format is one of the supported types.

When errors occur, the method provides an appropriate error object.
When you schedule a notification request containing the attachment, the attachment's file is moved to a new location to facilitate access by the appropriate processes. After the move, the only way to access the file is using the methods of the UNUserNotificationCenterMBS object.

- 176.8.7 Constructor(identifier as String, File as FolderItem, options as Dictionary = nil) 21673

176.8.9 copy as UNNotificationAttachmentMBS

MBS MacFrameworks Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a copy of the object.

176.8.10 UNNotificationAttachmentOptionsThumbnailClippingRectKey as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The clipping rectangle for a thumbnail image.
Notes: The value of this key is a dictionary containing a normalized CGRectMBS—that is, a unit rectangle whose values are in the range 0.0 to 1.0 and represent the portion of the original image that you want to display. For example, specifying an origin of (0.25, 0.25) and a size of (0.5, 0.5) defines a clipping rectangle that shows only the center portion of the image.

176.8.11 UNNotificationAttachmentOptionsThumbnailHiddenKey as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the attachment's thumbnail is hidden.
Notes: The value of this key is a number containing a Boolean value. When set to true, the attachment's thumbnail is not displayed. If you do not include this key, the thumbnail is shown.

176.8.12 UNNotificationAttachmentOptionsThumbnailTimeKey as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The frame number of an animation to use as a thumbnail image.
Notes: For animated images, the value of this key is an number containing the frame number to use as the thumbnail. For movies, the value of this key is the time (in seconds) into the movie from which to grab the thumbnail image.

176.8.13 UNNotificationAttachmentOptionsTypeHintKey as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A hint about an attachment's file type.
Notes: The value of this key is a string containing a Uniform Type Identifier (UTI) that describes the file's type. If you do not include this key, the attachment's filename extension is used to determine its type.

176.8.14 Properties

176.8.15 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

176.8.16 identifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The unique identifier for the attachment.
Notes: (Read only property)

176.8.17 type as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The UTI type of the attachment.
Notes:

The value of this property is derived from the attachment data.
(Read only property)

176.8.18 URL as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The URL of the file for this attachment.
Notes:

The file at the specified URL is security scoped to your app. Before you access it, call the startAccessingSecurityScopedResource method of NSURL.
(Read only property)

176.9 class UNNotificationCategoryMBS

176.9.1 class UNNotificationCategoryMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A type of notification that your app supports and the custom actions to display with it.
Notes:

A UNNotificationCategoryMBS object defines a type of notification that your executable can receive. You create category objects to define your app's actionable notifications—that is, notifications that have action buttons that the user can select in response to the notification. Each category object you create stores the actions and other behaviors associated with a specific type of notification. Register your category objects using the setNotificationCategories method of UNUserNotificationCenterMBS. You can register as many category objects as you want.

To apply category objects to your notifications, include the category's identifier string in the payload of any notifications you create. For local notifications, put this string in the categoryIdentifier property of the UNMutableNotificationContentMBS object that you use to specify the notification's content. For remote notifications, use this string as the value of the category key in the aps dictionary of your payload.

Categories can have associated actions, which define custom buttons to display for notifications of that category. When space is unlimited, the system displays up to 10 actions. When space is limited, the system displays at most two actions.

176.9.2 Methods

176.9.3 actions as UNNotificationActionMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The actions to display when a notification of this type is presented.
Notes:

When displaying a notification assigned to this category, the system adds a button to the notification interface for each action in this property. These buttons are displayed after the notification's content but before the Dismiss button.
When displaying banner notifications, the system displays only the first two actions.

176.9.4 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the UNNotificationCategory class is available.
Notes: Returns true on MacOS 10.14 or newer in 64-bit MacOS application.

176.9.5 category(identifier as String, actions() as UNNotificationActionMBS, intentIdentifiers() as string, hiddenPreviewsBodyPlaceholder as String, categorySummaryFormat as String, options as Integer) as UNNotificationCategoryMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a category object containing the specified actions and options, a hidden previous placeholder, and the category's summary format string.
See also:

- 176.9.6 category(identifier as String, actions() as UNNotificationActionMBS, intentIdentifiers() as string, hiddenPreviewsBodyPlaceholder as String, options as Integer) as UNNotificationCategoryMBS 21678
- 176.9.7 category(identifier as String, actions() as UNNotificationActionMBS, intentIdentifiers() as string, options as Integer) as UNNotificationCategoryMBS 21679

176.9.6 category(identifier as String, actions() as UNNotificationActionMBS, intentIdentifiers() as string, hiddenPreviewsBodyPlaceholder as String, options as Integer) as UNNotificationCategoryMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a category object containing the specified actions, options, and a hidden previous placeholder.
Notes:

identifier: The unique identifier for the category. Each category that your app uses must have a unique identifier. Do not specify an empty string.
actions: The actions to display when notifications of this type are delivered. When minimal space is available, only the first two actions in the array are displayed. You may specify nil for this parameter if you do not want to display custom actions.
intentIdentifiers: The intent identifier strings that you want to associate with notifications of this type. The Intents framework defines constants for each type of intent that you can associate with your notifications.
hiddenPreviewsBodyPlaceholder: A placeholder string to display when the user has disabled notification previews for the app. Include the characters % u in the string to represent the number of notifications with the same thread identifier. (No other formatting characters are supported.) For example, the string "% u Messages" becomes "2 Messages" when there are two messages.
To specify different strings for the singular and plural cases, use the localizedUserNotificationStringForKey method of string to specify the value for this parameter. The key passed to that method contains the identifier of an entry in a .stringsdict property list of your project. A strings dictionary lets you specify different formatted strings based on the language rules, and is as described in Internationalization and Localization Guide.
options: Additional options for handling notifications of this type. For a list of possible values, see UNNoti-

ficationCategoryOptions.
See also:

- 176.9.5 category(identifier as String, actions() as UNNotificationActionMBS, intentIdentifiers() as string, hiddenPreviewsBodyPlaceholder as String, categorySummaryFormat as String, options as Integer) as UNNotificationCategoryMBS 21678
- 176.9.7 category(identifier as String, actions() as UNNotificationActionMBS, intentIdentifiers() as string, options as Integer) as UNNotificationCategoryMBS 21679

176.9.7 category(identifier as String, actions() as UNNotificationActionMBS, intentIdentifiers() as string, options as Integer) as UNNotificationCategoryMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a category object containing the specified actions and options.
Notes:

identifier: The unique identifier for the category. Each category that your app uses must have a unique identifier. Do not specify an empty string.
actions: The actions to display when notifications of this type are delivered. When minimal space is available, only the first two actions in the array are displayed. You may specify nil for this parameter if you do not want to display custom actions.
intentIdentifiers: The intent identifier strings that you want to associate with notifications of this type. The Intents framework defines constants for each type of intent that you can associate with your notifications.
options: Additional options for handling notifications of this type. For a list of possible values, see UNNotificationCategoryOptions.

Returns an initialized category object.
See also:

- 176.9.5 category(identifier as String, actions() as UNNotificationActionMBS, intentIdentifiers() as string, hiddenPreviewsBodyPlaceholder as String, categorySummaryFormat as String, options as Integer) as UNNotificationCategoryMBS 21678

176.9.8 Constructor(identifier as String, actions() as UNNotificationActionMBS, intentIdentifiers() as string, hiddenPreviewsBodyPlaceholder as String, categorySummaryFormat as String, options as Integer)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a category object containing the specified actions and options, a hidden previous

placeholder, and the category's summary format string.
See also:

- 176.9.9 Constructor(identifier as String, actions() as UNNotificationActionMBS, intentIdentifiers() as string, hiddenPreviewsBodyPlaceholder as String, options as Integer) 21680

176.9.9 Constructor(identifier as String, actions() as UNNotificationActionMBS, intentIdentifiers() as string, hiddenPreviewsBodyPlaceholder as String, options as Integer)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a category object containing the specified actions, options, and a hidden previous placeholder.
Notes:

identifier: The unique identifier for the category. Each category that your app uses must have a unique identifier. Do not specify an empty string.
actions: The actions to display when notifications of this type are delivered. When minimal space is available, only the first two actions in the array are displayed. You may specify nil for this parameter if you do not want to display custom actions.
intentIdentifiers: The intent identifier strings that you want to associate with notifications of this type. The Intents framework defines constants for each type of intent that you can associate with your notifications.
hiddenPreviewsBodyPlaceholder: A placeholder string to display when the user has disabled notification previews for the app. Include the characters % u in the string to represent the number of notifications with the same thread identifier. (No other formatting characters are supported.) For example, the string "% u Messages" becomes "2 Messages" when there are two messages.
To specify different strings for the singular and plural cases, use the localizedUserNotificationStringForKey method of string to specify the value for this parameter. The key passed to that method contains the identifier of an entry in a .stringsdict property list of your project. A strings dictionary lets you specify different formatted strings based on the language rules, and is as described in Internationalization and Localization Guide.
options: Additional options for handling notifications of this type. For a list of possible values, see UNNotificationCategoryOptions.
See also:

- 176.9.8 Constructor(identifier as String, actions() as UNNotificationActionMBS, intentIdentifiers() as string, hiddenPreviewsBodyPlaceholder as String, categorySummaryFormat as String, options as Integer) 21679

- 176.9.10 Constructor(identifier as String, actions() as UNNotificationActionMBS, intentIdentifiers() as string, options as Integer) 21681

176.9.10 Constructor(identifier as String, actions() as UNNotificationActionMBS, intentIdentifiers() as string, options as Integer)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a category object containing the specified actions and options.
Notes:

identifier: The unique identifier for the category. Each category that your app uses must have a unique identifier. Do not specify an empty string.
actions: The actions to display when notifications of this type are delivered. When minimal space is available, only the first two actions in the array are displayed. You may specify nil for this parameter if you do not want to display custom actions.
intentIdentifiers: The intent identifier strings that you want to associate with notifications of this type. The Intents framework defines constants for each type of intent that you can associate with your notifications.
options: Additional options for handling notifications of this type. For a list of possible values, see UNNotificationCategoryOptions.

Returns an initialized category object.
See also:

- 176.9.8 Constructor(identifier as String, actions() as UNNotificationActionMBS, intentIdentifiers() as string, hiddenPreviewsBodyPlaceholder as String, categorySummaryFormat as String, options as Integer) 21679

- 176.9.9 Constructor(identifier as String, actions() as UNNotificationActionMBS, intentIdentifiers() as string, hiddenPreviewsBodyPlaceholder as String, options as Integer) 21680

176.9.11 copy as UNNotificationCategoryMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a copy of the object.

176.9.12 intentIdentifiers as String()

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The intents related to notifications of this category.
Notes: When a notification is delivered, the presence of an intent identifier lets the system know that the notification is potentially related to the handling of a request made through Siri.

176.9.13 Properties

176.9.14 categorySummaryFormat as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A format string for the summary description used when the system groups the category's notifications.
Notes: (Read only property)

176.9.15 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

176.9.16 hiddenPreviewsBodyPlaceholder as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The placeholder text to display when notification previews are disabled for the app.
Notes:

The string in this property may contain the special characters % u as a placeholder for the number of messages with the same thread identifier. If the string in this property is declared in a .stringsdict property list, the system formats the preview message using the information in that file. For more information about specifying a .stringsdict property file, see Internationalization and Localization Guide.
(Read only property)

176.9.17 identifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The unique string assigned to the category.
Notes:

Use this string to differentiate the different types of notifications that your app can send. To assign a category to a local notification, assign this string to the categoryIdentifier property of the content object. To assign a category to a remote notification, use the string as the value of the category key in the aps dictionary of the notification payload.
(Read only property)

176.9.18 options as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Options for how to handle notifications of this type.
Notes: (Read only property)

176.9.19 Constants

176.9.20 OptionAllowInCarPlay = 2

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate how to handle notifications associated with this category.
Notes:

Allow CarPlay to display notifications of this type.
Apps must be approved for CarPlay overall and then you must enable CarPlay for the notification types you want displayed. If a category does not explicitly contain this option, notifications of that type are not displayed in a CarPlay environment.

176.9.21 OptionCustomDismissAction = 1

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate how to handle notifications associated with this category.
Notes: Send dismiss actions to the UNUserNotificationCenter object's delegate for handling.

176.9.22 OptionHiddenPreviewsShowSubtitle = 8

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate how to handle notifications associated with this category.
Notes: Show the notification's subtitle, even if the user has disabled notification previews for the app.

176.9.23 OptionHiddenPreviewsShowTitle = 4

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate how to handle notifications associated with this category.
Notes: Show the notification's title, even if the user has disabled notification previews for the app.

176.9.24 OptionNone = 0

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate how to handle notifications associated with this category.
Notes: No options.

176.10 class UNNotificationContentMBS

176.10.1 class UNNotificationContentMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The uneditable content of a notification.
Notes:

A UNNotificationContent object contains the data associated with a notification. When your app receives a notification, the associated UNNotificationRequestMBS object contains an object of this type with the content that your app received. Use the content object to get the details of the notification, including the type of notification that was delivered, any custom data you stored in the userInfo dictionary before scheduling the notification, and any attachments.
Don't create instances of this class directly. For remote notifications, the contents of this object are derived from the JSON payload that your server sends to the APNS server. For local notifications, create a UNMutableNotificationContentMBS object, and configure the contents of that object instead.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

176.10.2 Methods

176.10.3 attachment(Index as integer) as UNNotificationAttachmentMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Queries attachment with given index.
Notes: Index from 0 to attachmentCount-1.

176.10.4 attachments as UNNotificationAttachmentMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An array of attachments to display with the notification.
Notes: Use this property to retrieve the images, movies, and audio files associated with your notification's content. A notification content app extension might use these values to add the associated content to its view controller.

176.10.5 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the UNNotificationContent class is available.
Notes: Returns true on MacOS 10.14 or newer in 64-bit MacOS application.

176.10.6 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

176.10.7 copy as UNNotificationContentMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a copy of the object.

176.10.8 mutableCopy as UNMutableNotificationContentMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a mutable copy of the object.

176.10.9 Properties

176.10.10 attachmentCount as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The attachment count.
Notes: (Read only property)

176.10.11 badge as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The number to display as the app's icon badge.
Notes:

When the number in this property is 0, the system does not display a badge. When the number is greater than 0, the system displays the badge with the specified number. When the value in this property is not set, the system leaves the current badge unchanged.
(Read only property)

176.10.12 body as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The message displayed in the notification alert.

Notes:

The body text contains the final text that you want to display. If your app is not authorized to display alert-based notifications, this property is ignored.
If you specified two percent symbols (% %) in the message body, the system replaces it with a single percent symbol (%). The system strips all other printf style escape characters from your string prior to display.
(Read only property)

176.10.13 categoryIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The identifier of the app-defined category object.
Notes:

Use notification types to distinguish between the different types of notifications your app supports. You use this support primarily to create actionable notifications—that is, notifications with custom action buttons—and to redirect your notifications through either your notification service app extension or your notification content app extension.
For remote notifications, this property is set to the value of the category key in the aps dictionary.
(Read only property)

176.10.14 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

176.10.15 sound as UNNotificationSoundMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The sound to play when the notification is delivered.
Notes:

Notifications can play a default sound or a custom sound. For information on how to specify custom sounds for your notifications, see UNNotificationSoundMBS.
(Read only property)

176.10.16 subtitle as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A secondary description of the reason for the alert.

Notes:

Subtitles offer additional context in cases where the title alone is not clear. Subtitles are not displayed in all cases. If your app is not authorized to display alert-based notifications, this property is ignored.
(Read only property)

176.10.17 summaryArgument as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The string the notification adds to the category's summary format string.
Notes: (Read only property)

176.10.18 summaryArgumentCount as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The number of items the notification adds to the category's summary format string.
Notes: (Read only property)

176.10.19 threadIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An identifier that you use to group related notifications together.
Notes:

For remote notifications, this property is set to the value of the thread-id key in the aps dictionary.
(Read only property)

176.10.20 title as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A short description of the reason for the alert.
Notes:

When a title is present, the system attempts to display a notification alert. If your app is not authorized to display alert-based notifications, this property is ignored.
Title strings should be short, usually only a couple of words describing the reason for the notification. In watchOS, the title string is displayed as part of the short look notification interface, which has limited space.
(Read only property)

176.10.21 userInfo as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A dictionary of custom information associated with the notification.
Notes:

For remote notifications, this property contains the entire notification payload. For local notifications, you configure the property directly before scheduling the notification.
The keys in this dictionary must be property-list types—that is, they must be types that can be serialized into the property-list format.
(Read only property)

176.11 class UNNotificationMBS

176.11.1 class UNNotificationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The data for a local or remote notification that was delivered to your app.
Notes:

A UNNotification object contains the initial notification request, which contains the notification's payload, and the date on which the notification was delivered.
Don't create notification objects directly. When handling notifications, the system delivers notification objects to your events. The UNUserNotificationCenterMBS object also maintains the list of notifications that were previously delivered, and you use the getDeliveredNotifications method to retrieve those objects.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

176.11.4 Methods

176.11.5 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the UNNotification class is available.
Notes: Returns true on MacOS 10.14 or newer in 64-bit MacOS application.

176.11.6 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

176.11.7 copy as UNNotificationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a copy of the object.

176.11.8 UNErrorDomain as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The error domain for notifications.

176.11.9 Properties

176.11.10 Date as Date

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The delivery date of the notification.
Notes:

This date is displayed to the user in Notification Center.
(Read only property)

176.11.11 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

176.11.12 request as UNNotificationRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The notification request containing the payload and trigger condition for the notification.
Notes:

For local notifications, the request object is a copy of the one you originally configured. For remote notifications, the request object is synthesized from information received from Apple Push Notification service.
(Read only property)

176.11.13 Constants

176.11.14 UNErrorCodeAttachmentCorrupt = 105

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the error constants for notifications. **Notes:** The file for an attachment is corrupt.

176.11.15 UNErrorCodeAttachmentInvalidFileSize = 102

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the error constants for notifications. **Notes:** An attachment is too large.

176.11.16 UNErrorCodeAttachmentInvalidURL = 100

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the error constants for notifications. **Notes:** The URL for an attachment was invalid.

176.11.17 UNErrorCodeAttachmentMoveIntoDataStoreFailed = 104

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the error constants for notifications. **Notes:** An error occurred when trying to move an attachment to the system data store.

176.11.18 UNErrorCodeAttachmentNotInDataStore = 103

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the error constants for notifications. **Notes:** The specified attachment is not in the system data store.

176.11.19 UNErrorCodeAttachmentUnrecognizedType = 101

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the error constants for notifications. **Notes:** The file type of an attachment is not supported.

176.11.20 UNErrorCodeNotificationInvalidNoContent = 1401

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the error constants for notifications. **Notes:** The notification has no user-facing content, but should.

176.11.21 UNErrorCodeNotificationInvalidNoDate = 1400

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the error constants for notifications. **Notes:** The notification does not have an associated date, but should.

176.11.22 UNErrorCodeNotificationsNotAllowed = 1

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the error constants for notifications. **Notes:**

Notifications are not allowed.
This error occurs when you try to submit a notification request and your app or app extension is not authorized to schedule notifications.

176.12 class UNNotificationRequestMBS

176.12.1 class UNNotificationRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A request to schedule a local notification, which includes the content of the notification and the trigger conditions for delivery.
Notes:

Create a UNNotificationRequestMBS object when you want to schedule the delivery of a local notification. A notification request object contains a UNNotificationContentMBS object with the payload to be delivered, and it contains the UNNotificationTriggerMBS object with the conditions that trigger the delivery of the notification. To schedule the delivery of your notification, pass your request object to the addNotificationRequest method of the shared user notification center object.

After scheduling a request, you interact with UNNotificationRequestMBS objects in the following ways:

- View your app's pending notifications by calling the getPendingNotificationRequestsWithCompletionHandler: method of your shared user notification center object.
- When a notification is delivered to your app, the provided UNNotificationMBS object contains a UNNotificationRequest object that you can inspect to get the notification details.
- Use the request's identifier to remove delivered notifications from Notification Center.

When receiving a local or remote notification, use the provided UNNotificationRequestMBS object to fetch details about the notification.

176.12.2 Methods

176.12.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the UNNotificationRequest class is available.
Notes: Returns true on MacOS 10.14 or newer in 64-bit MacOS application.

176.12.4 Constructor(identifier as string, content as UNNotificationContentMBS, trigger as UNNotificationTriggerMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a notification request object that you use to schedule a notification.
Notes:

identifier: An identifier for the request; this parameter must not be nil. You can use this identifier to cancel the request if it is still pending (see the removePendingNotificationRequests method).
content: The content of the notification. This parameter must not be nil.
trigger: The condition that causes the notification to be delivered. Specify nil to deliver the notification right away.

Returns a new notification request object.

Use this method when you want to schedule the delivery of a local notification. This method creates the request object that you subsequently pass to the addNotificationRequest method.
The system uses the identifier parameter to determine how to handle the request:

- If you provide a unique identifier, the system creates a new notification.
- If the identifier matches a previously delivered notification, the system alerts the user again, replaces the old notification with the new one, and places the new notification at the top of the list.
- If the identifier matches a pending request, the new request replaces the pending request.

176.12.5 Copy as UNNotificationRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a copy of the object.

176.12.6 request(identifier as string, content as UNNotificationContentMBS, trigger as UNNotificationTriggerMBS) as UNNotificationRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a notification request object that you use to schedule a notification.
Notes:

identifier: An identifier for the request; this parameter must not be nil. You can use this identifier to cancel the request if it is still pending (see the removePendingNotificationRequests method).
content: The content of the notification. This parameter must not be nil.
trigger: The condition that causes the notification to be delivered. Specify nil to deliver the notification right away.

Returns a new notification request object.

Use this method when you want to schedule the delivery of a local notification. This method creates the request object that you subsequently pass to the addNotificationRequest method.
The system uses the identifier parameter to determine how to handle the request:

- If you provide a unique identifier, the system creates a new notification.
- If the identifier matches a previously delivered notification, the system alerts the user again, replaces the old notification with the new one, and places the new notification at the top of the list.
- If the identifier matches a pending request, the new request replaces the pending request.

176.12.7 Properties

176.12.8 content as UNNotificationContentMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The content associated with the notification.
Notes:

Use this property to access the contents of the notification.
(Read only property)

176.12.9 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

176.12.10 identifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The unique identifier for this notification request.
Notes:

Use this string to identify notifications in your app. For example, you can pass this string to the removePendingNotificationRequests method to cancel a previously scheduled notification.
If you use the same identifier when scheduling a new notification, the system removes the previously scheduled notification with that identifier and replaces it with the new one.
For local notifications, this property is set to the value passed to the request's initializer (see the request method). For remote notifications, it is set to the value of the apns-collapse-id key that you specified in the APNs request header when generating the remote notification. If no value is set, the system automatically assigns an identifier.
(Read only property)

176.12.11 trigger as UNNotificationTriggerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The conditions that trigger the delivery of the notification.
Notes:

For notifications that have already been delivered, use this property to determine what caused the delivery to occur. For remote notifications, this property contains a UNPushNotificationTriggerMBS object. For other notifications, the type is based on the trigger condition specified in the original request.
(Read only property)

176.13 class UNNotificationResponseMBS

176.13.1 class UNNotificationResponseMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The user's response to an actionable notification.
Notes:

When the user interacts with a delivered notification, the system delivers a UNNotificationResponseMBS object to your app so that you can process the response. Users can interact with delivered notifications in many ways. If the notification's category had associated action buttons, they can select one of those buttons. Users can also dismiss the notification without selecting one of your actions and they can open your app. A response object tells you which option the user selected.

You don't create UNNotificationResponseMBS objects yourself. Instead, the shared user notification center object creates them and delivers them to the didReceiveNotificationResponse event. Use that method to extract any needed information from the response object and take appropriate action.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

176.13.2 Methods

176.13.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the UNNotificationResponse class is available.
Notes: Returns true on MacOS 10.14 or newer in 64-bit MacOS application.

176.13.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

176.13.5 copy as UNNotificationResponseMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a copy of the object.

176.13.6 UNNotificationDefaultActionIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An action that indicates the user opened the app from the notification interface.
Notes: The delivery of this action does not require any special configuration of notification categories. Use the didReceiveNotificationResponse event to receive this action.

176.13.7 UNNotificationDismissActionIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The action that indicates the user explicitly dismissed the notification interface.
Notes:

This action is delivered only if the notification's category object was configured with the UNNotificationCategoryOptionCustomDismissAction option. To trigger this action, the user must explicitly dismiss the notification interface. For example, the user must tap the Dismiss button or swipe down on the notification interface in watchOS to trigger this action.
Ignoring a notification or flicking away a notification banner does not trigger this action.

176.13.8 Properties

176.13.9 actionIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The identifier string of the action that the user selected.
Notes:

This parameter may contain one the identifier of one of your UNNotificationActionMBS objects or it may contain a system-defined identifier. The system defined identifiers are UNNotificationDefaultActionIdentifier and UNNotificationDismissActionIdentifier, which indicate that the user opened the app or dismissed the notification without any further actions.
(Read only property)

176.13.10 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

176.13.11 notification as UNNotificationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The notification to which the user responded.
Notes: (Read only property)

176.14 class UNNotificationSettingsMBS

176.14.1 class UNNotificationSettingsMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The object for managing notification-related settings and the authorization status of your app.
Notes:

A UNNotificationSettingsMBS object contains the current authorization status and notification-related settings for your app. Apps must receive authorization to schedule notifications and to interact with the user. Apps that run in CarPlay must similarly receive authorization to do so. You use this object to determine what notification-related actions your app is allowed to perform. You might then use that information to enable, disable, or adjust your app's notification-related behaviors. Regardless of whether you take action, the system enforces your app's settings by preventing denied interactions from occurring.
You don't create instances of this class directly. Instead, call the getNotificationSettings method of your app's UNUserNotificationCenterMBS object to get the current settings.
For more information about requesting authorization for user interactions, see UNUserNotificationCenter.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

176.14.2 Methods

176.14.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the UNNotificationSettings class is available.
Notes: Returns true on MacOS 10.14 or newer in 64-bit MacOS application.

176.14.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

176.14.5 copy as UNNotificationSettingsMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a copy of the object.

176.14.6 settings as UNNotificationSettingsMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The last settings received via getNotificationSettingsCompleted event.
Notes: You call getNotificationSettings and whether you implement and handle the event or not, the settings are stored by plugin in a global variable, so you can query them here.

176.14.7 Properties

176.14.8 alertSetting as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The authorization status for displaying alerts.
Notes:

When the value of this property is NotificationSettingEnabled, the app is authorized to display alerts. Authorization does not guarantee that alerts always appear on the user's screen. When a device is unlocked, the alertStyle property determines the presentation style for the alert, which can include not displaying the alert at all.
The system tries to display an alert when the title, subtitle, or body properties of a UNNotificationContentMBS object contain values, or when the aps dictionary in a remote notification contains the alert key.
(Read only property)

176.14.9 alertStyle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The type of alert that the app may display when the device is unlocked.
Notes:

When alerts are authorized, this property specifies the presentation style for alerts when the device is unlocked. The user may choose to display alerts as automatically disappearing banners or as modal windows that require explicit dismissal. The user may also choose not to display alerts at all.
(Read only property)

176.14.10 authorizationStatus as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The app's ability to schedule and receive local and remote notifications.
Notes:

When the value of this property is AuthorizationStatusAuthorized, your app is allowed to schedule and receive local and remote notifications. When authorized, use the alertSetting, badgeSetting, and soundSetting

properties to specify which types of interactions are allowed. When the value of the property is AuthorizationStatusDenied, the system doesn't deliver notifications to your app, and the system ignores any attempts to schedule local notifications.
The value of this property is AuthorizationStatusNotDetermined if your app has never requested authorization using the requestAuthorization method.
(Read only property)

176.14.11 badgeSetting as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The authorization status for badging your app's icon.
Notes:

When the value of this property is NotificationSettingEnabled, the app is authorized to badge its icon. The system tries to badge your app's icon when the badge property of a UNNotificationContentMBS object contain a value, or when the aps dictionary in a remote notification contains the badge key.
(Read only property)

176.14.12 criticalAlertSetting as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The authorization status to play sounds for critical alerts.
Notes:

When NotificationSettingEnabled, this property authorizes the app to play critical sounds that ignore Do Not Disturb and the device's mute switch.
For local notifications, the system attempts to play a critical sound when the sound property of the UNNotificationContentMBS object contains an object returned by the defaultCriticalSound property, the criticalSoundNamed method, or a related method.
For remote notifications, the system attempts to play a critical sound when the notification's payload contains a sound directory that contains the critical key.
Critical alerts require a special entitlement issued by Apple.
(Read only property)

176.14.13 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

176.14.14 lockScreenSetting as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The setting that indicates whether your app's notifications appear onscreen when the device is locked.
Notes:

Even if the user disables lock screen notifications, your notifications may still appear onscreen when the device is unlocked.
(Read only property)

176.14.15 notificationCenterSetting as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The setting that indicates whether your app's notifications are displayed in Notification Center.
Notes:

The default value of this property is NotificationSettingEnabled.
(Read only property)

176.14.16 providesAppNotificationSettings as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating the system displays a button for in-app notification settings.
Notes: (Read only property)

176.14.17 showPreviewsSetting as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The setting that indicates whether the app shows a preview of the notification's content.
Notes: (Read only property)

176.14.18 soundSetting as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The authorization status for playing sounds for incoming notifications.
Notes:

When the value of this property is NotificationSettingEnabled, the app is authorized to play sounds. The system tries to play a sound when the sound property of the UNNotificationContentMBS object contains a value, or when the aps dictionary in a remote notification contains the sound key.

(Read only property)

176.14.19 Constants

176.14.20 AlertStyleAlert = 2

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate the presentation styles for alerts.
Notes:

Modal alerts.
Alerts are displayed in a modal window that must be dismissed explicitly by the user.

176.14.21 AlertStyleBanner = 1

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate the presentation styles for alerts.
Notes:

Banner alerts.
Alerts are displayed as a slide-down banner. Banners appear for a short time and then disappear automatically if the user does nothing.

176.14.22 AlertStyleNone = 0

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate the presentation styles for alerts.
Notes: No alert.

176.14.23 AuthorizationStatusAuthorized = 2

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate whether the app is allowed to schedule notifications.
Notes: The app is authorized to schedule or receive notifications.

176.14.24 AuthorizationStatusDenied = 1

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate whether the app is allowed to schedule notifications.
Notes: The app isn't authorized to schedule or receive notifications.

176.14.25 AuthorizationStatusNotDetermined = 0

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate whether the app is allowed to schedule notifications.
Notes: The user hasn't yet made a choice about whether the app is allowed to schedule notifications.

176.14.26 AuthorizationStatusProvisional = 3

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate whether the app is allowed to schedule notifications.
Notes: The application is provisionally authorized to post noninterruptive user notifications.

176.14.27 NotificationSettingDisabled = 1

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate the current status of a notification setting.
Notes: The setting is disabled.

176.14.28 NotificationSettingEnabled = 2

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate the current status of a notification setting.
Notes: The setting is enabled.

176.14.29 NotificationSettingNotSupported = 0

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate the current status of a notification setting.
Notes: The setting is not available to your app.

176.14.30 ShowPreviewsSettingAlways = 0

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate the style previewing a notification's content.
Notes: The notification's content is always shown, even when the device is locked.

176.14.31 ShowPreviewsSettingNever = 2

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate the style previewing a notification's content.
Notes: The notification's content is never shown, even when the device is unlocked.

176.14.32 ShowPreviewsSettingWhenAuthenticated = 1

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate the style previewing a notification's content.
Notes: The notification's content is shown only when the device is unlocked.

176.15 class UNNotificationSoundMBS

176.15.1 class UNNotificationSoundMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The sound played when a notification is delivered.
Notes:

Create a UNNotificationSoundMBS object when you want the delivery of your notification to be accompanied by a specific sound. To play the default system sound, create your sound object using the defaultSound method. If you want to play a custom sound, create a new sound object and specify the name of the audio file that you want to play.

For local notifications, assign the sound object to the sound property of your UNMutableNotificationContentMBS object. For a remote notification, assign the name of your sound file to the sound key in the aps dictionary. You can also use a notification service app extension to add a sound file to a notification shortly before delivery. In your extension, create a UNNotificationSound object and add it to your notification content in the same way that you would for a local notification.
Audio files must already be on the user's device before they can be played. If you use a predefined set of sounds for your notifications, include the audio files in your app's bundle. For all other sounds, place a copy of the audio file in the Library/Sounds folder of your app's container directory. The UNNotificationSound object looks only in those two locations.

Prepare Sound Resources
The system sound facility plays custom alert sounds, so they must be in one of the following audio data formats:

- Linear PCM
- MA4 (IMA/ADPCM)
- µLaw
- aLaw

You can package the audio data in an aiff, wav, or caf file. Sound files must be less than 30 seconds in length. If the sound file is longer than 30 seconds, the system plays the default sound instead.

You can use the afconvert command-line tool to convert sounds. For example, to convert the system sound Submarine.aiff to IMA4 audio in a CAF file, use the following command in Terminal:

afconvert /System/Library/Sounds/Submarine.aiff
textasciitilde /Desktop/sub.caf -d ima4 -f caff -v
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

176.15.2 Methods

176.15.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the UNNotificationSound class is available.
Notes: Returns true on MacOS 10.14 or newer in 64-bit MacOS application.

176.15.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

176.15.5 copy as UNNotificationSoundMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a copy of the object.

176.15.6 criticalSoundNamed(name as string) as UNNotificationSoundMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a custom sound object for critical alerts.
Notes:

name: The name of the sound file to play. This file must be located in the current executable's main bundle or in the Library/Sounds directory of the current app container directory. If files exist at both locations, the system uses the file from the Library/Sounds directory. This parameter must not be nil.

Returns a sound object representing a custom critical alert sound.

Critical alerts ignore the mute switch and Do Not Disturb. They require a special entitlement issued by Apple.
See also:

- 176.15.7 criticalSoundNamed(name as string, volume as double) as UNNotificationSoundMBS 21710

176.15.7 criticalSoundNamed(name as string, volume as double) as UNNotificationSoundMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a custom sound object for critical alerts with the specified volume.
Notes:

name: The name of the sound file to play. This file must be located in the current executable's main bundle or in the Library/Sounds directory of the current app container directory. If files exist at both locations, the system uses the file from the Library/Sounds directory. This parameter must not be nil.
volume: The volume must be a value between 0.0 and 1.0.

Returns a sound object representing a custom critical alert sound at the specified volume.

Critical alerts ignore the mute switch and Do Not Disturb. They require a special entitlement issued by Apple.
See also:

- 176.15.6 criticalSoundNamed(name as string) as UNNotificationSoundMBS 21709

176.15.8 defaultCriticalSound as UNNotificationSoundMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The default sound used for critical alerts.
Notes: Critical alerts ingore the mute switch and Do Not Disturb. They require a special entitlement issued by Apple.

176.15.9 defaultCriticalSoundWithAudioVolume(volume as double) as UNNotificationSoundMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a sound object that plays the default critical alert sound at the specified volume.
Notes:

volume: The volume must be a value between 0.0 and 1.0.

Returns a sound object representing the default critical alert sound at the specified volume.

Critical alerts ignore the mute switch and Do Not Disturb. They require a special entitlement issued by Apple.

176.15.10 defaultSound as UNNotificationSoundMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns an object representing the default sound for notifications.

176.15.11 soundNamed(name as string) as UNNotificationSoundMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a sound object that represents a custom sound file.
Notes:

name: The name of the sound file to play. This file must be located in the current executable's main bundle or in the Library/Sounds directory of the current app container directory. This parameter must not be nil.

Returns a sound object representing the custom sound.

If a sound file with the given name exists both in the current bundle and in the Library/Sounds folder, this method chooses the file in the Library/Sounds folder.

176.15.12 Properties

176.15.13 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

176.16 class UNNotificationTriggerMBS

176.16.1 class UNNotificationTriggerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The common behavior for subclasses that trigger the delivery of a local or remote notification.
Notes:

The UNNotificationTrigger class is an abstract class for representing an event that triggers the delivery of a notification. You don't create instances of this class directly. Instead, you instantiate the concrete subclass that defines the trigger condition you want for your notification. You then assign the resulting object to the UNNotificationRequestMBS object that you use to schedule your notification.

Concrete trigger classes include the following:

- UNTimeIntervalNotificationTriggerMBS
- UNCalendarNotificationTriggerMBS
- UNLocationNotificationTriggerMBS
- UNPushNotificationTriggerMBS

This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

176.16.2 Methods

176.16.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the UNNotificationTrigger class is available.
Notes: Returns true on MacOS 10.14 or newer in 64-bit MacOS application.

176.16.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

176.16.5 copy as UNNotificationTriggerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a copy of the object.

176.16.6 Properties

176.16.7 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

176.16.8 repeats as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the system reschedules the notification after it is delivered.
Notes:

When this property is NO, the notification is delivered only once. When this property is YES, the notification request is rescheduled automatically, resulting in the notification being delivered each time the trigger condition is met. To unschedule the notification request, use the methods of the UNUserNotificationCenterMBS to remove the notification request.
(Read only property)

176.17 class UNPushNotificationTriggerMBS

176.17.1 class UNPushNotificationTriggerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A trigger condition that indicates the notification was sent from Apple Push Notification Service (APNs).
Notes:

You don't create instances of this class yourself. The system creates UNPushNotificationTrigger objects and associates them with requests that originated from Apple Push Notification service. You encounter instances of this class when managing your app's delivered notification requests, which store an object of this type in their trigger property.
Subclass of the UNNotificationTriggerMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

176.17.2 Methods

176.17.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

176.18 class UNTextInputNotificationActionMBS

176.18.1 class UNTextInputNotificationActionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An action that can accept user-typed text.
Notes:

Use UNTextInputNotificationActionMBS objects to define an action that allows the user to provide a custom text-based response. When the user selects an action of this type, the system displays controls for the user to enter or dictate the text content. That text is then included in the response object that is delivered to your app.
Subclass of the UNNotificationActionMBS class.

176.18.2 Methods

176.18.3 action(identifier as string, title as string, options as integer, textInputButtonTitle as string, textInputPlaceholder as string) as UNTextInputNotificationActionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an action object that accepts text input from the user.
Notes:

identifier: The string that you use internally to identify the action. This string must be unique among all of your app's supported actions. When the user selects the action, the system passes this string to your app and asks you to perform the related task. This parameter must not be nil or an empty string.
title: The localized string to display to the user. This string is used as the title of a button, which is added to the notification interface. This parameter must not be nil.
options: Additional options describing how the action behaves. Include options when you need the related behavior. For a list of possible values, see options.
textInputButtonTitle: The localized title of the text input button that is displayed to the user.
textInputPlaceholder: The localized placeholder text to display in the text input field.

Returns a new text input action object.

176.18.4 Constructor(identifier as string, title as string, options as integer, textInputButtonTitle as string, textInputPlaceholder as string)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates an action object that accepts text input from the user.
Notes:

identifier: The string that you use internally to identify the action. This string must be unique among all of your app's supported actions. When the user selects the action, the system passes this string to your app and asks you to perform the related task. This parameter must not be nil or an empty string.
title: The localized string to display to the user. This string is used as the title of a button, which is added to the notification interface. This parameter must not be nil.
options: Additional options describing how the action behaves. Include options when you need the related behavior. For a list of possible values, see options.
textInputButtonTitle: The localized title of the text input button that is displayed to the user.
textInputPlaceholder: The localized placeholder text to display in the text input field.

Returns a new text input action object.

176.18.5 Properties

176.18.6 textInputButtonTitle as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The localized title of the text input button that is displayed to the user.
Notes: (Read only property)

176.18.7 textInputPlaceholder as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The localized placeholder text to display in the text input field.
Notes: (Read only property)

176.19 class UNTextInputNotificationResponseMBS

176.19.1 class UNTextInputNotificationResponseMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The user's response to an actionable notification, including any custom text that the user typed or dictated.
Notes:

The system delivers a UNTextInputNotificationResponse object to your app so that you can process user-provided text content. When defining your categories, you can specify an UNTextInputNotificationActionMBS object instead of an UNNotificationActionMBS object for your action. If you do, the system creates an UNTextInputNotificationResponseMBS object when the user selects the accompanying action, and it fills the userText property with any user-entered text.

You don't create UNTextInputNotificationResponseMBS objects yourself. Instead, the shared user notification center object creates them and delivers them to the didReceiveNotificationResponse event. Use that method to extract any needed information from the response object and take appropriate action.
Subclass of the UNNotificationResponseMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

176.19.2 Methods

176.19.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

176.19.4 Properties

176.19.5 userText as String

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The text response provided by the user.
Notes:

If the user does not specify any text, this property contains an empty string.
(Read only property)

176.20 class UNTimeIntervalNotificationTriggerMBS

176.20.1 class UNTimeIntervalNotificationTriggerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A trigger condition that causes a notification to be delivered after the specified amount of time elapses.
Notes:

Create a UNTimeIntervalNotificationTrigger object when you want to schedule the delivery of a local notification after the specified number of seconds elapse. You use this type of trigger to implement timers.
Subclass of the UNNotificationTriggerMBS class.

176.20.2 Methods

176.20.3 Constructor(timeInterval as double, repeats as boolean)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a time interval trigger from the specified time value.
Notes:

timeInterval: The time (in seconds) that must elapse from the current time before the trigger fires. This value must be greater than zero.
repeats: Specify false to deliver the notification one time. Specify true to reschedule the notification request each time the notification is delivered. If this parameter is true, the value in the timeInterval parameter must be 60 seconds or greater.

Return Value:
A new time interval trigger based on the specified temporal information.

If you specify true for the repeats parameter, you must explicitly remove the notification request to stop the delivery of the associated notification. Use the methods of UNUserNotificationCenterMBS to remove notification requests that are no longer needed.

176.20.4 trigger(timeInterval as double, repeats as boolean) as UNTimeIntervalNotificationTriggerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a time interval trigger from the specified time value.
Notes:

timeInterval: The time (in seconds) that must elapse from the current time before the trigger fires. This value must be greater than zero.

repeats: Specify false to deliver the notification one time. Specify true to reschedule the notification request each time the notification is delivered. If this parameter is true, the value in the timeInterval parameter must be 60 seconds or greater.

Return Value:
A new time interval trigger based on the specified temporal information.

If you specify true for the repeats parameter, you must explicitly remove the notification request to stop the delivery of the associated notification. Use the methods of UNUserNotificationCenterMBS to remove notification requests that are no longer needed.

176.20.5 Properties

176.20.6 nextTriggerDate as Date

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The next date at which the trigger conditions will be met.
Notes:

Use this property to find out when a notification associated with this trigger will next be delivered.
(Read only property)

176.20.7 timeInterval as Double

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The time interval used to create the trigger.
Notes:

This property contains the original time interval that you specified when creating the trigger object. The value in this property is not updated as time counts down. To find out when the trigger will fire next, call the nextTriggerDate method.
(Read only property)

176.21 class UNUserNotificationCenterMBS

176.21.1 class UNUserNotificationCenterMBS

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The central object for managing notification-related activities for your app or app extension.
Notes:

see also
https://developer.apple.com/documentation/usernotifications/unusernotificationcenter?language=objc

176.21.2 Blog Entries

- MBS Xojo Plugins, version 19.2pr4

176.21.3 Methods

176.21.4 addNotificationRequest(request as UNNotificationRequestMBS, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Schedules a local notification for delivery.
Notes:

This method schedules local notifications only; you cannot use it to schedule the delivery of remote notifications. Upon calling this method, the system begins tracking the trigger conditions associated with your request. When the trigger condition is met, the system delivers your notification. If the request does not contain a UNNotificationTriggerMBS object, the notification is delivered right away.
You may call this method from any thread of your app.

request: The request object containing the notification payload and trigger information. This parameter must not be nil.

Calls addNotificationRequestCompleted event later. Request and tag parameter is passed through.

176.21.5 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the UNUserNotificationCenter class is available.
Notes: Returns true on MacOS 10.14 or newer in 64-bit MacOS application.

176.21.6 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the shared user notification center object for your app or app extension.

176.21.7 Destructor

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The destructor.

176.21.8 getDeliveredNotifications(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a list of the app's notifications that are still displayed in Notification Center.
Notes:

This method executes asynchronously, returning immediately and executing the provided block on a background thread when the results become available.

Calls getDeliveredNotificationsCompleted event later. Tag parameter is

176.21.9 getNotificationCategories(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Retrieves the app's currently registered notification categories.
Notes:

Use this method to retrieve your app's currently registered notification types. You might use this method when you want to augment the current set of categories with new categories later on. Simply merge the returned set with any new category objects and register the updated set.

Calls getNotificationCategoriesCompleted event later. Tag parameter is passed through.

176.21.10 getNotificationSettings(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Requests the notification settings for this app.
Notes:

Use this method to determine the user interactions and notification-related features that your app is authorized to use. You might then use this information to enable or disable specific notification-related features of your app.
When the user initially grants authorization to your app, the system gives your app a set of default notification-related settings. The user may change those settings at any time to enable or disable specific capabilities. For example, the user might disable the playing of sounds when a notification arrives.

Calls getNotificationSettingsCompleted event later. Tag parameter is passed through.

176.21.11 getPendingNotificationRequests(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns a list of all notification requests that are scheduled and waiting to be delivered.
Notes:

This method executes asynchronously, returning immediately and executing the provided block on a secondary thread when the results are available.

Calls getPendingNotificationRequestsCompleted event later. Tag parameter is passed through.

176.21.12 removeAllDeliveredNotifications

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes all of the app's delivered notifications from Notification Center.
Notes: Use this method to remove all of your app's delivered notifications from Notification Center. The method executes asynchronously, returning immediately and removing the identifiers on a background thread. This method does not affect any notification requests that are scheduled, but have not yet been delivered.

176.21.13 removeAllPendingNotificationRequests

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Unschedules all pending notification requests.
Notes: This method executes asynchronously, removing all pending notification requests on a secondary thread.

176.21.14 removeDeliveredNotifications(identifiers() as string)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes the specified notification requests from Notification Center.

Notes:

identifiers: An array of strings, each of which corresponds to a value in the identifier property of a UNNotificationRequestMBS object. This method ignores the identifiers of requests whose notifications are not currently displayed in Notification Center.

Use this method to selectively remove notifications that you no longer want displayed in Notification Center. The method executes asynchronously, returning immediately and removing the specified notifications on a background thread.

176.21.15 removePendingNotificationRequests(identifiers() as string)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Unschedules the specified notification requests.
Notes:

identifiers: An array of strings, each of which contains the identifier of an active UNNotificationRequestMBS object. If the identifier belongs to a non repeating request, and the trigger condition for that request has already been met, this method ignores the identifier.

This method executes asynchronously, removing the pending notification requests on a secondary thread.

176.21.16 requestAuthorization(options as integer, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Requests authorization to interact with the user when local and remote notifications are delivered to the user's device.
Notes:

options: The authorization options your app is requesting. You may combine the available constants to request authorization for multiple items. Request only the authorization options that you plan to use. For a list of possible values, see UNAuthorizationOptions.

Calls requestAuthorizationCompleted event later. The tag parameter is passed through.

If your app's local or remote notifications involve user interactions, you must request authorization for the system to perfom those interactions on your app's behalf. Interactions include displaying an alert, playing a sound, or badging the app's icon.

Always call this method before scheduling any local notifications and before registering with the Apple Push Notification service. Typically, you call this method at launch time when configuring your app's notification support.

The first time your app ever calls the method, the system prompts the user to authorize the requested interactions. The user may grant or deny authorization, and the system stores the user's response so that subsequent calls to this method do not prompt the user again. After determining the authorization status, the user notification center object executes the block in the completionHandler parameter. Use that block to make any adjustments to your app's behavior. For example, if authorization was denied, you might notify a remote notification server not to send notifications to the user's device.

The user may change the allowed interactions at any time in system settings. Use the getNotificationSettings method to determine what interactions are currently allowed for your app.

176.21.17 setNotificationCategories(categories() as UNNotificationCategoryMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Registers your app's notification types and the custom actions that they support.
Notes:

categories: A set of UNNotificationCategoryMBS objects, each of which contains the actions that are displayed with the notification interface. This parameter must contain all of your app's supported categories.

Call this method at launch time to register your app's actionable notification types. This method registers all of your categories at once, replacing any previously registered categories with the new ones in the categories parameter. Typically, you call this method only once.

Each object in the categories parameter contains a string for identifying the notification's type. It also contains one or more custom actions that the user may perform in response to notifications of that type. When the system displays an alert for a notification, it looks in the notification payload for one of the identifier strings from your category objects. If it finds one, it adds user-selectable buttons for each action associated with that category object. Tapping a button notifies your app of the selected action, without bringing your app to the foreground.

176.21.18 Properties

176.21.19 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

176.21.20 supportsContentExtensions as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean value indicating whether the current device supports notification content extensions.
Notes:

Notification content extensions let you customize the appearance of the alerts displayed for your app's notifications. The value of this property is YES for devices that support notification content extensions and NO for devices that do not support them.
(Read only property)

176.21.21 Events

176.21.22 addNotificationRequestCompleted(request as UNNotificationRequestMBS, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called by addNotificationRequest method when completed.
Notes: error: An error object indicating whether a problem occurred. If the notification was scheduled successfully, this parameter is nil; otherwise, it is set to an error object indicating the reason for the failure.

176.21.23 didReceiveNotificationResponse(response as UNNotificationResponseMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks you to process the user's response to a delivered notification.
Notes:

response: The user's response to the notification. This object contains the original notification and the identifier string for the selected action. If the action allowed the user to provide a textual response, this parameter contains a UNTextInputNotificationResponseMBS object.

Use this method to process the user's response to a notification. If the user selected one of your app's custom actions, the response parameter contains the identifier for that action. (The response can also indicate that the user dismissed the notification interface, or launched your app, without selecting a custom action.) At the end of your implementation, call the completionHandler block to let the system know that you are done processing the user's response. If you do not implement this method, your app never responds to custom actions.

You specify your app's notification types at app launch using UNNotificationCategoryMBS objects, and you specify the custom actions for each type using UNNotificationActionMBS objects.

176.21.24 getDeliveredNotificationsCompleted(notifications() as UNNotificationMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called by getDeliveredNotifications method.
Notes: notifications: An array of UNNotificationMBS objects representing the local and remote notifications of your app that have been delivered and are still visible in Notification Center. If none of your app's notifications are visible in Notification Center, the array is empty.

176.21.25 getNotificationCategoriesCompleted(categories() as UNNotificationCategoryMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called by getNotificationCategories method later.
Notes: categories: The array of UNNotificationCategoryMBS objects containing your registered notification types. If your app has not yet registered any categories, this parameter is an empty set.

176.21.26 getNotificationSettingsCompleted(settings as UNNotificationSettingsMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called by getNotificationSettings when finished.

176.21.27 getPendingNotificationRequestsCompleted(requests() as UNNotificationRequestMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called by getPendingNotificationRequests method.
Notes: requests: An array of UNNotificationRequestMBS objects representing the scheduled notification requests. If there are no scheduled requests, this array is empty.

176.21.28 openSettingsForNotification(notification as UNNotificationMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks the delegate to display the in-app notification settings.

176.21.29 requestAuthorizationCompleted(granted as boolean, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called by requestAuthorization method when completed.
Notes:

granted: A Boolean value indicating whether authorization was granted. The value of this parameter is YES when authorization was granted for one or more options. The value is false when authorization is denied for all options.
error: An object containing error information or nil if no error occurred.

176.21.30 willPresentNotification(notification as UNNotificationMBS, byref options as Integer)

MBS MacFrameworks Plugin, Plugin Version: 19.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Asks you how to handle a notification that arrived while the app was running in the foreground.
Notes:

notification: The notification that is about to be delivered. Use the information in this object to determine an appropriate course of action. For example, you might use the information to update your app's interface.

options
The option for notifying the user. Specify NotificationPresentationOptionNone to silence the notification completely. Specify other values to interact with the user. For a list of possible options, see constants.

If your app is in the foreground when a notification arrives, the shared user notification center calls this method to deliver the notification directly to your app. If you implement this method, you can take whatever actions are necessary to process the notification and update your app. When you finish, call the completionHandler block and specify how you want the system to alert the user, if at all.
If your event does not implement this method, the system behaves as if you had passed the UNNotificationPresentationOptionNone option to the completionHandler block. If you do not provide a delegate at all for the UNUserNotificationCenterMBS object, the system uses the notification's original options to alert the user.

176.21.31 Constants

176.21.32 AuthorizationOptionAlert = 4

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants for requesting authorization to interact with the user.
Notes: The ability to display alerts.

176.21.33 AuthorizationOptionBadge = 1

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants for requesting authorization to interact with the user.
Notes: The ability to update the app's badge.

176.21.34 AuthorizationOptionCarPlay = 8

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants for requesting authorization to interact with the user.
Notes: The ability to display notifications in a CarPlay environment.

176.21.35 AuthorizationOptionCriticalAlert = 16

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants for requesting authorization to interact with the user.
Notes:

The ability to play sounds for critical alerts.
Critical alerts ignore the mute switch and Do Not Disturb; the system plays a critical alert's sound regardless of the device's mute or Do Not Disturb settings. You can specify a custom sound and volume.
Critical alerts require a special entitlement issued by Apple.

176.21.36 AuthorizationOptionNone = 0

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants for requesting authorization to interact with the user.
Notes: No options.

176.21.37 AuthorizationOptionProvidesAppNotificationSettings = 32

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants for requesting authorization to interact with the user.
Notes: An option indicating the system should display a button for in-app notification settings.

176.21.38 AuthorizationOptionProvisional = 64

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants for requesting authorization to interact with the user.
Notes: The ability to post noninterrupting notifications provisionally to the Notification Center.

176.21.39 AuthorizationOptionSound = 2

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants for requesting authorization to interact with the user.
Notes: The ability to play sounds.

176.21.40 NotificationPresentationOptionAlert = 4

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate how to present a notification in a foreground app.
Notes: Display the alert using the content provided by the notification.

176.21.41 NotificationPresentationOptionBadge = 1

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate how to present a notification in a foreground app.
Notes: Apply the notification's badge value to the app's icon.

176.21.42 NotificationPresentationOptionNone = 0

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate how to present a notification in a foreground app.
Notes:

No alert.
Specify this constant when you want to silence any user interactions for a notification.

176.21.43 NotificationPresentationOptionSound = 2

MBS MacFrameworks Plugin, Plugin Version: 19.1. **Function:** One of the constants to indicate how to present a notification in a foreground app.

Notes: Play the sound associated with the notification.

176.22 class WinUserNotificationCenterMBS

176.22.1 class WinUserNotificationCenterMBS

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for the window notification center.

176.22.2 Blog Entries

- MBS Xojo Plugins, version 18.3pr1

176.22.3 Methods

176.22.4 Available as Boolean

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this Windows version has required functions.
Notes: Returns true on Windows 8.1 and Windows 10.

176.22.5 configureAUMI(Company as String, Name as String, SurName as String, VersionInfo as String) as String

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Configures the AppUserModelID for Constructor.
Notes:

Concats strings with dot between.
Please be aware of maximum ID length of 128 characters.

176.22.6 Constructor(appName as string, aumi as string)

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor.
Notes: Please pass your AppUserModelID and application name.

176.22.7 Destructor

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The destructor.

176.22.8 HideNotification(notification as WinUserNotificationMBS) as boolean

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Hides a notification.
Notes: Returns true on success.

176.22.9 Setting as Integer

MBS Win Plugin, Plugin Version: 18.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets a value that tells you whether there is an app, user, or system block that prevents the display of a toast notification.
Notes:

Returns Enabled value, if you can show notifications.

When toast notifications have been disabled at more than one level, this property value reflects the setting with the largest scope. Precedence is as follows, from largest scope to smallest:

DisabledByManifest
DisabledByGroupPolicy
DisabledForUser
DisabledForApplication

If toast notifications have been disabled both by the user and by group policy, this property returns DisabledByGroupPolicy.

176.22.10 ShowNotification(notification as WinUserNotificationMBS) as boolean

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Shows a notification.
Notes: Returns true on success.

176.22.11 Properties

176.22.12 appName as String

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The application name used.
Notes: (Read only property)

176.22.13 aumi as String

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The unique id.
Notes: (Read only property)

176.22.14 Handle as Integer

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal object handle.
Notes: (Read only property)

176.22.15 Events

176.22.16 Activated(Notification as WinUserNotificationMBS)

MBS Win Plugin, Plugin Version: 17.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The notification was activated.

176.22.17 Dismissed(Notification as WinUserNotificationMBS, Reason as Integer)

MBS Win Plugin, Plugin Version: 17.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The notification was dismissed.
Notes: See DismissalReason* constants.

176.22.18 Failed(Notification as WinUserNotificationMBS, ErrorCode as Integer)

MBS Win Plugin, Plugin Version: 17.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Called when notification failed.

176.22.19 Constants

176.22.20 DismissalReasonApplicationHidden = 1

MBS Win Plugin, Plugin Version: 17.2. **Function:** One of the dismissal reasons.
Notes: The application hid the notification using hide method.

176.22.21 DismissalReasonTimedOut = 2

MBS Win Plugin, Plugin Version: 17.2. **Function:** One of the dismissal reasons.
Notes: The notification has expired.

176.22.22 DismissalReasonUserCanceled = 0

MBS Win Plugin, Plugin Version: 17.2. **Function:** One of the dismissal reasons.
Notes: The user dismissed the notification.

176.22.23 SettingDisabledByGroupPolicy = 3

MBS Win Plugin, Plugin Version: 18.3. **Function:** One of the constants to specify the limitations on tile or toast notification display.
Notes: An administrator has disabled all notifications on this computer through group policy. The group policy setting overrides the user's setting.

176.22.24 SettingDisabledByManifest = 4

MBS Win Plugin, Plugin Version: 18.3. **Function:** One of the constants to specify the limitations on tile or toast notification display.
Notes: This app has not declared itself toast capable in its package.appxmanifest file. This setting is found on the manifest's Application UI page, under the Notification section. For an app to send toast, the Toast

Capable option must be set to ”Yes”.

176.22.25 SettingDisabledForApplication = 1

MBS Win Plugin, Plugin Version: 18.3. **Function:** One of the constants to specify the limitations on tile or toast notification display.
Notes: The user has disabled notifications for this app.

176.22.26 SettingDisabledForUser = 2

MBS Win Plugin, Plugin Version: 18.3. **Function:** One of the constants to specify the limitations on tile or toast notification display.
Notes: The user or administrator has disabled all notifications for this user on this computer.

176.22.27 SettingEnabled = 0

MBS Win Plugin, Plugin Version: 18.3. **Function:** One of the constants to specify the limitations on tile or toast notification display.
Notes: All notifications raised by this app can be displayed.

176.23 class WinUserNotificationMBS

176.23.1 class WinUserNotificationMBS

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for the notification.
Example:

```
dim n as new WinUserNotificationMBS

n.Image = "C:\test.png"
n.text(0) = "Hello World"
n.text(1) = "Greetings from Xojo"
```

176.23.4 Properties

176.23.5 Image as String

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The image file path.
Notes:

Leave empty if you don't need a picture.

May not be a network path as system needs to load it independent of your permissions.
Maybe better use image coming with application or put one in temp folder.
(Read and Write property)

176.23.6 Text as String

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The text to display.
Notes:

Same as text(0).
(Read and Write property)

Chapter 177

Vision

177.1 module VisionModuleMBS

177.1.1 module VisionModuleMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The Vision module.
Notes:

Global declarations for the Vision framework on MacOS.
Requires MacOS 10.13 or newer.

177.1.2 Blog Entries

- Vision Framework for Xojo

177.1.3 Methods

177.1.4 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the Vision module is available.
Notes: Returns true on MacOS 10.13 or newer.

177.1.5 ElementSize(ElementType as Integer) as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Queries byte size of an element type.
Notes:

Returns 4 for floats and 8 for double.
Otherwise returns zero.

177.1.6 ImagePointForNormalizedPoint(normalizedPoint as CGPointMBS, imageWidth as Integer, imageHeight as Integer) as CGPointMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Projects a point from normalized coordinate space into image coordinates.
Notes:

normalizedPoint: The input point, in normalized coordinate space.
imageWidth: The width of the image into whose coordinate space you're projecting the input point.
imageHeight: The height of the image into whose coordinate space you're projecting the input point.

Returns the input point projected into image coordinates.

The resulting point in image coordinate space may have nonintegral (floating-point) coordinates.

177.1.7 ImageRectForNormalizedRect(normalizedRect as CGRectMBS, imageWidth as Integer, imageHeight as Integer) as CGRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Projects a rectangle from normalized coordinate space into image coordinates.
Notes:

normalizedRect: The input rect, in normalized coordinate space.
imageWidth: The width of the image into whose coordinate space you're projecting the input rect.
imageHeight: The height of the image into whose coordinate space you're projecting the input rect.

Returns the input rect projected into image (pixel) coordinates.

177.1.8 NormalizedIdentityRect as CGRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The normalized identity rectangle with origin (0,0) and unit length and width.

177.1.9 NormalizedRectForImageRect(imageRect as CGRectMBS, imageWidth as Integer, imageHeight as Integer) as CGRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Normalizes a rectangle from image coordinates.
Notes:

imageRect: The input rect, in image coordinate space.
imageWidth: The width of the image in whose coordinates the input rect resides.
imageHeight: The height of the image in whose coordinates the input rect resides.

Returns the input rect projected into normalized coordinates.

177.1.10 NormalizedRectIsIdentityRect(rect as CGRectMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns true if the rectangle has origin (0,0) and unit length and width.
Notes:

normalizedRect: Normalized input rect to test for identity.

Returns a Boolean value that indicates whether the input normalized rect is the identity rect.

177.1.11 VNErrorDomain as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The domain for NSError objects produced by Vision framework methods.

177.1.12 Properties

177.1.13 VersionNumber as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The current version number of the Vision framework.
Notes: (Read only property)

177.1.14 Constants

177.1.15 VNErrorDataUnavailable = 17

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying unavailable data.

177.1.16 VNErrorInternalError = 9

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying an error internal to the Vision system.

177.1.17 VNErrorInvalidArgument = 14

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying an invalid parameter passed to a Vision request.

177.1.18 VNErrorInvalidFormat = 2

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying an invalid image format.

177.1.19 VNErrorInvalidImage = 13

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying a problematic image.

177.1.20 VNErrorInvalidModel = 15

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying an invalid model.

177.1.21 VNErrorInvalidOperation = 12

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying an unsupported operation for a Vision request.

177.1.22 VNErrorInvalidOption = 5

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying an invalid option in a Vision request.

177.1.23 VNErrorIOError = 6

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying an input or output error for an image, image sequence, or Core ML model.

177.1.24 VNErrorMissingOption = 7

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying that a Vision request is missing a required option.

177.1.25 VNErrorNotImplemented = 8

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying a method not implemented in the underlying model.

177.1.26 VNErrorOK = 0

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying no error.

177.1.27 VNErrorOperationFailed = 3

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying that a request operation failed.

177.1.28 VNErrorOutOfBoundsError = 4

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying an out-of-bounds access.

177.1.29 VNErrorOutOfMemory = 10

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying insufficient memory to complete a Vision request.

177.1.30 VNErrorRequestCancelled = 1

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying a canceled Vision request.

177.1.31 VNErrorUnknownError = 11

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying an unidentifiable error.

177.1.32 VNErrorUnsupportedRevision = 16

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the error codes.
Notes: Error code signifying an unsupported revision number.

177.1.33 Delegates

177.1.34 VNPerformRequestsCompletedMBS(Requests() as VNRequestMBS, result as boolean, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The delegate used for completed event calls.
Notes: You declare a method with (Requests() as VNRequestMBS, result as boolean, error as NSErrorMBS) as parameters and pass the method reference with addressOf or weakAddressOf to the plugin method. Later the plugin may invoke the delegate and call your method.

177.1.35 VNProgressHandlerMBS(Request as VNRequestMBS, fractionCompleted as double, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The delegate used for progress event calls.
Notes: You declare a method with (Request as VNRequestMBS, fractionCompleted as double, error as NSErrorMBS) as parameters and pass the method reference with addressOf or weakAddressOf to the plugin method. Later the plugin may invoke the delegate and call your method.

177.1.36 VNRequestCompletedMBS(Request as VNRequestMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The delegate used for completed event calls.
Notes: You declare a method with (Request as VNRequestMBS, error as NSErrorMBS) as parameters and pass the method reference with addressOf or weakAddressOf to the plugin method. Later the plugin may invoke the delegate and call your method.

177.2 class VNBarcodeObservationMBS

177.2.1 class VNBarcodeObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Barcode information detected by an image analysis request.
Notes:

This type of observation results from a VNDetectBarcodesRequest. It contains information about the detected barcode, including parsed payload data for supported symbology.
Available on MacOS 10.13 or newer.
Subclass of the VNRectangleObservationMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

177.2.2 Blog Entries

- Vision Framework for Xojo

177.2.3 Methods

177.2.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

177.2.5 VNBarcodeSymbologyAztec as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for Aztec code recognition.

177.2.6 VNBarcodeSymbologyCode128 as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for standard Code 128 barcode recognition.

177.2.7 VNBarcodeSymbologyCode39 as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for standard Code 39 barcode recognition.

177.2.8 VNBarcodeSymbologyCode39Checksum as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for recognizing barcodes in standard Code 39 with checksum.

177.2.9 VNBarcodeSymbologyCode39FullASCII as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for recognizing barcodes in full ASCII Code 39.

177.2.10 VNBarcodeSymbologyCode39FullASCIIChecksum as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for recognizing barcodes in full ASCII Code 39 with checksum.

177.2.11 VNBarcodeSymbologyCode93 as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for standard Code 93 barcode recognition.

177.2.12 VNBarcodeSymbologyCode93i as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for standard Code 93i barcode recognition.

177.2.13 VNBarcodeSymbologyDataMatrix as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for Data Matrix barcode recognition.

177.2.14 VNBarcodeSymbologyEAN13 as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for EAN-13 barcode recognition.

177.2.15 VNBarcodeSymbologyEAN8 as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for EAN-8 barcode recognition.

177.2.16 VNBarcodeSymbologyI2of5 as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for Interleaved 2 of 5 (ITF) barcode recognition.

177.2.17 VNBarcodeSymbologyI2of5Checksum as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for recognizing barcodes in Interleaved 2 of 5 (ITF) with checksum.

177.2.18 VNBarcodeSymbologyITF14 as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for ITF-14 barcode recognition.

177.2.19 VNBarcodeSymbologyPDF417 as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for PDF417 barcode recognition.

177.2.20 VNBarcodeSymbologyQR as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for QR code recognition.

177.2.21 VNBarcodeSymbologyUPCE as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: One of the Symbologies supported by the Vision framework.
Notes: A symbol indicating support for UPC-E barcode recognition.

177.2.22 Properties

177.2.23 barcodeDescriptor as Variant

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A CIBarcodeDescriptorMBS object with low-level details about the barcode and its data.
Notes:

This object is sufficient for Core Image to regenerate the observed barcode.
(Read only property)

177.2.24 payloadStringValue as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The string representation of the barcode's payload.
Notes:

Depending on the symbology of the barcode or the payload data itself, a string representation of the payload may not be available.
(Read only property)

177.2.25 symbology as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The symbology of the observed barcode.
Notes:

To detect specific barcode symbologies in a Vision request, add the corresponding VNBarcodeSymbology to the supportedSymbologies property of your VNDetectBarcodesRequestMBS.
(Read only property)

177.3 class VNClassificationObservationMBS

177.3.1 class VNClassificationObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Classification information produced by an image analysis request.
Notes:

This type of observation results from performing a VNCoreMLRequestMBS image analysis with a Core ML model whose role is classification (rather than prediction or image-to-image processing). Vision infers that an MLModel object is a classifier model if that model predicts a single feature. That is, the model's modelDescription object has a non-nil value for its predictedFeatureName property.
Subclass of the VNObservationMBS class.

177.3.2 Blog Entries

- Vision Framework for Xojo

177.3.3 Methods

177.3.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

177.3.5 hasMinimumPrecision(minimumPrecision as single, recall as single) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Determines whether the observation for a specific recall has a minimum precision value.
Notes:

minimumPrecision: The minimum percentage of classification results that are relevant.
recall: The percentage of relevant results that the algorithm correctly classified.

Returns a Boolean indicating whether or not this classification observation provides a minimum percentage of relevant results that meet the desired recall criterion.

177.3.6 hasMinimumRecall(minimumRecall as single, precision as single) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Determines whether the observation for a specific precision has a minimum recall value.
Notes:

minimumRecall: The minimum percentage of relevant results that the algorithm correctly classified.
precision: The percentage of classification results that are relevant.

Returns a Boolean indicating whether or not this classification observation provides a minimum percentage of relevant results that meet the desired precision criterion.

177.3.7 Properties

177.3.8 hasPrecisionRecallCurve as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean variable indicating whether the observation contains precision and recall curves.
Notes:

Precision refers to the percentage of your classification results that are relevant, while recall refers to the percentage of total relevant results correctly classified.
If this property is true, then you can call precision and recall-related methods in this observation. If this property is false, then the precision and recall-related methods won't return meaningful data.
(Read only property)

177.3.9 identifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Classification label identifying the type of observation.
Notes:

An example classification could be a string like cat or hotdog. The model used for the classification defines the domain of strings that may result. Usually, these strings are unlocalized technical labels not meant for direct presentation to the end user.
(Read only property)

177.4 class VNClassifyImageRequestMBS

177.4.1 class VNClassifyImageRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A request to classify an image.
Notes:

This type of request produces a collection of VNClassificationObservationMBS objects that describe an image. Access the classifications through knownClassificationsForRevision function.

Available on MacOS 10.15 or newer.
Subclass of the VNImageBasedRequestMBS class.

177.4.2 Blog Entries

- Vision Framework for Xojo

177.4.3 Methods

177.4.4 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether this class is available.
Notes: Returns true on MacOS 10.15 or newer.

177.4.5 Constructor(DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.4.6 knownClassificationsForRevision(requestRevision as Integer = 1, byref error as NSErrorMBS) as VNClassificationObservationMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Requests the collection of classifications that the Vision framework recognizes.
Notes:

requestRevision: The revision of the request for which classifications should be reported.
error: The address of the error variable to populate should the call fail.

Returns an array of classifications for the given revision, or nil if an error occurred.

177.5 class VNCoreMLFeatureValueObservationMBS

177.5.1 class VNCoreMLFeatureValueObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A collection of key-value information produced by a Core ML image analysis request.
Notes:

This type of observation results from performing a VNCoreMLRequestMBS image analysis with a Core ML model whose role is prediction rather than classification or image-to-image processing.
Vision infers that an MLModel object is a predictor model if that model predicts multiple features. You can tell that a model predicts multiple features when its modelDescription object has a nil value for its predictedFeatureName property, or when it inserts its output in an outputDescriptionsByName dictionary.
Subclass of the VNObservationMBS class.

177.5.2 Blog Entries

- Vision Framework for Xojo

177.5.3 Methods

177.5.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

177.5.5 Properties

177.5.6 featureName as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The name used in the model description of the CoreML model that produced this observation.
Notes: (Read only property)

177.5.7 featureValue as Variant

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The feature result of a VNCoreMLRequestMBS that outputs neither a classification nor an image.
Notes:

Refer to Core ML documentation and the model itself to learn about proper handling of the content.
Value is a MLFeatureValueMBS object.
(Read only property)

177.6 class VNCoreMLModelMBS

177.6.1 class VNCoreMLModelMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A container for a Core ML model used with Vision requests.
Notes: A Core ML model encapsulates the information trained from a data set used to drive Vision recognition requests. See Getting a Core ML Model for instructions on training your own. Once you have the trained model, use this class to initialize a VNCoreMLRequestMBS for identification.

177.6.2 Blog Entries

- Vision Framework for Xojo

177.6.3 Methods

177.6.4 Constructor(MLModel as Variant)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a model container to be used with VNCoreMLRequestMBS.
Notes:

Please pass MLModelMBS object.

This method may fail if Vision does not support the created CoreML model. For example, a model that does not accept an image as any of its inputs will yield an VNErrorInvalidModel error.

177.6.5 modelForMLModel(MLModel as Variant) as VNCoreMLModelMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a model container to be used with VNCoreMLRequestMBS.
Notes:

Please pass MLModelMBS object.

This method may fail if Vision does not support the created CoreML model. For example, a model that does not accept an image as any of its inputs will yield an VNErrorInvalidModel error.

177.6.6 Properties

177.6.7 featureProvider as Variant

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An optional object to support inputs outside Vision.
Notes:

An MLFeatureProviderMBS object.

This optional object conforms to the MLFeatureProvider protocol that the model uses to predict inputs that are not supplied by Vision. Vision provides the MLModel with the image for the inputImageFeatureName via the VNRequestHandlerMBS.
A feature provider is necessary for models that have more than one required input. Models with only one image input won't use the feature provider.

Available on MacOS 10.15 or newer.
(Read only property)

177.6.8 inputImageFeatureName as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The name of the MLFeatureValueMBS that Vision sets from the request handler.
Notes:

By default, Vision uses the first input found, but you can manually set that input to another featureName instead.
(Read and Write property)

177.7 class VNCoreMLRequestMBS

177.7.1 class VNCoreMLRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An image analysis request that uses a Core ML model to process images.
Notes:

The results array of a Core ML-based image analysis request contains a different observation type depending on the kind of MLModel object you create the request with:

- If the model predicts a single feature (that is, the model's modelDescription object has a non-nil value for its predictedFeatureName property), Vision treats that model as a classifier: the results are VNClassificationObservationMBS objects.
- If the model's outputs include at least one output whose feature type is MLFeatureTypeImage, Vision treats that model as an image-to-image model: the results are VNPixelBufferObservationMBS objects.
- Otherwise, Vision treats the model as a general predictor model: the results are VNCoreMLFeatureValueObservationMBS objects.

Subclass of the VNImageBasedRequestMBS class.

177.7.2 Blog Entries

- Vision Framework for Xojo

177.7.3 Methods

177.7.4 Constructor(model as VNCoreMLModelMBS, DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.7.5 Properties

177.7.6 imageCropAndScaleOption as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Determine what type of croping and scaling action should be applied to the image before generating the feature print.
Notes:

The default value for this property is VNImageCropAndScaleOptionScaleFill.
(Read and Write property)

177.7.7 model as VNCoreMLModelMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Core ML model on which the request is based, wrapped in a VNCoreMLModel.
Notes: (Read only property)

177.7.8 Constants

177.7.9 VNImageCropAndScaleOptionCenterCrop = 0

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the different ways Vision can crop and scale an input image.
Notes: A scaling option that maintains aspect ratio to fit the short side, and crops the centered image on its long side.

177.7.10 VNImageCropAndScaleOptionScaleFill = 2

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the different ways Vision can crop and scale an input image.
Notes: A scaling option that scales an image proportionally so that its shorter dimension fills the canvas, potentially cropping along the longer dimension.

177.7.11 VNImageCropAndScaleOptionScaleFit = 1

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the different ways Vision can crop and scale an input image.
Notes:

An option that scales an image to fit the input image dimensions while maintaining aspect ratio.
This option ensures the entire image fits into the Vision algorithm's input image dimensions by scaling down the longer dimension until it fits. This option pads the image along the shorter dimension to maintain aspect ratio.

177.8 class VNDetectBarcodesRequestMBS

177.8.1 class VNDetectBarcodesRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An image analysis request that finds and recognizes barcodes in an image.
Notes:

By default, a barcode request first locates all barcodes in the input image, then analyzes each to decode payload. To specify or limit the types of barcodes sought in the request, set the symbologies property to an array of barcode types you would like to support.
Subclass of the VNImageBasedRequestMBS class.

177.8.2 Blog Entries

- Vision Framework for Xojo

177.8.3 Methods

177.8.4 Constructor(DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.8.5 setSymbologies(symbologies() as String)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets an array of symbologies that Vision should detect in the image.
Notes: Use this array to specify or restrict the types of symbols you want the Vision algorithm to detect. The default value leads Vision to scan for all possible symbologies.

177.8.6 supportedSymbologies as String()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An array of VNBarcodeSymbology objects describing the symbologies that Vision currently supports.

Notes: Calling this method could be an expensive operation.

177.8.7 symbologies as String()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An array of symbologies that Vision should detect in the image.
Notes: Use this array to specify or restrict the types of symbols you want the Vision algorithm to detect. The default value leads Vision to scan for all possible symbologies.

177.9 class VNDetectedObjectObservationMBS

177.9.1 class VNDetectedObjectObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An image analysis result that provides the position and extent of a detected image feature.
Notes:

This type of observation results from a VNTrackObjectRequestMBS. It represents a detected object that the Vision request should track.
Subclass of the VNObservationMBS class.

177.9.2 Blog Entries

- Vision Framework for Xojo

177.9.3 Methods

177.9.4 Constructor(boundingBox as CGRectMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a detected object observation based on bounding box coordinates.
Notes: boundingBox: The observation's bounding box, in coordinates normalized to the dimensions of the processed image, with its origin at the image's lower-left corner.
See also:

- 177.9.5 Constructor(requestRevision as Integer, boundingBox as CGRectMBS) 21764

177.9.5 Constructor(requestRevision as Integer, boundingBox as CGRectMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a detected object observation with the specified revision number and bounding box coordinates.
See also:

- 177.9.4 Constructor(boundingBox as CGRectMBS) 21764

177.9.6 Properties

177.9.7 boundingBox as CGRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The bounding box of the detected object.
Notes:

The coordinates are normalized to the dimensions of the processed image, with the origin at the image's lower-left corner.
(Read only property)

177.10 class VNDetectFaceCaptureQualityRequestMBS

177.10.1 class VNDetectFaceCaptureQualityRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A request that produces a floating-point number representing the capture quality of a given face in a photo.
Notes:

This request produces or updates a VNFaceObservationMBS object's property faceCaptureQuality with a floating-point value. The float will be a value between 0 and 1. Faces with quality closer to 1 are better lit, sharper, and centrally positioned than faces with quality closer to 0. If the request fails, or the face observation has never been processed, the property faceCaptureQuality will be nil.
Subclass of the VNImageBasedRequestMBS class.

177.10.2 Blog Entries

- Vision Framework for Xojo

177.10.3 Methods

177.10.4 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether this class is available.
Notes: Returns true on MacOS 10.15 or newer.

177.10.5 Constructor(DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.10.6 inputFaceObservations as VNFaceObservationMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An array of VNFaceObservation objects to process as part of the request.

177.10.7 setInputFaceObservations(faces() as VNFaceObservationMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets an array of VNFaceObservation objects to process as part of the request.

177.11 class VNDetectFaceLandmarksRequestMBS

177.11.1 class VNDetectFaceLandmarksRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An image analysis request that finds facial features (such as the eyes and mouth) in an image.
Notes:

By default, a face landmarks request first locates all faces in the input image, then analyzes each to detect facial features.
If you've already located all the faces in an image, or want to detect landmarks in only a subset of the faces in the image, set the inputFaceObservations property to an array of VNFaceObservationMBS objects representing the faces you want to analyze. (You can either use face observations output by a VNDetectFaceRectanglesRequestMBS or manually create VNFaceObservation instances with the bounding boxes of the faces you want to analyze.)
Subclass of the VNImageBasedRequestMBS class.

177.11.2 Blog Entries

- Vision Framework for Xojo

177.11.3 Methods

177.11.4 Constructor(DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.11.5 inputFaceObservations as VNFaceObservationMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An array of VNFaceObservation objects to process as part of the request.

177.11.6 setInputFaceObservations(faces() as VNFaceObservationMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets an array of VNFaceObservation objects to process as part of the request.

177.11.7 supportsConstellation(requestRevision as Integer = 1, constellation as Integer) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean variable that indicates whether the Vision framework supports a given constellation type for a given request revision.

177.11.8 Properties

177.11.9 constellation as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A variable describing how a face landmarks request orders or enumerates the resulting features.
Notes:

Set this variable to one of the supported constellation types detailed in VNRequestFaceLandmarksConstellation. The default value is VNRequestFaceLandmarksConstellationNotDefined.
(Read and Write property)

177.11.10 Constants

177.11.11 VNRequestFaceLandmarksConstellation65Points = 1

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the constants of face landmarks in a constellation object.
Notes: A constellation with 65 points.

177.11.12 VNRequestFaceLandmarksConstellation76Points = 2

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the constants of face landmarks in a constellation object.
Notes: A constellation with 76 points.

177.11.13 VNRequestFaceLandmarksConstellationNotDefined = 0

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the constants of face landmarks in a constellation object.
Notes: An undefined constellation.

177.12 class VNDetectFaceRectanglesRequestMBS

177.12.1 class VNDetectFaceRectanglesRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An image analysis request that finds faces within an image.
Notes:

This request returns faces as rectangular bounding boxes with origin and size.
Subclass of the VNImageBasedRequestMBS class.

177.12.2 Blog Entries

- Vision Framework for Xojo

177.12.3 Methods

177.12.4 Constructor(DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.13 class VNDetectHorizonRequestMBS

177.13.1 class VNDetectHorizonRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An image analysis request that determines the horizon angle in an image.
Notes:

This request returns the horizon angle detected in an image.
Subclass of the VNImageBasedRequestMBS class.

177.13.2 Blog Entries

- Vision Framework for Xojo

177.13.3 Methods

177.13.4 Constructor(DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.14 class VNDetectHumanRectanglesRequestMBS

177.14.1 class VNDetectHumanRectanglesRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An image analysis request that finds rectangular regions containing humans in an image.
Notes: Subclass of the VNImageBasedRequestMBS class.

177.14.2 Blog Entries

- Vision Framework for Xojo

177.14.3 Methods

177.14.4 Constructor(DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.15 class VNDetectRectanglesRequestMBS

177.15.1 class VNDetectRectanglesRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An image analysis request that finds projected rectangular regions in an image.
Notes:

A rectangle detection request locates regions of an image with rectangular shape, like credit cards, business cards, documents, and signs. The request returns its observations in the form of VNRectangleObservationMBS objects, which contain normalized coordinates of bounding boxes containing the rectangle.
Use this type of request to find the bounding boxes of rectangles in an image. Vision returns observations for rectangles found in all orientations and sizes, along with a confidence level to indicate how likely it is that the observation contains an actual rectangle.
To further configure or restrict the types of rectangles found, set properties on the request specifying a range of aspect ratios, sizes, and quadrature tolerance.
Subclass of the VNImageBasedRequestMBS class.

177.15.2 Blog Entries

- Vision Framework for Xojo

177.15.3 Methods

177.15.4 Constructor(DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.15.5 Properties

177.15.6 maximumAspectRatio as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A float specifying the maximum aspect ratio of the rectangle to detect, defined as the shorter dimension over the longer dimension.
Notes:

The value should range from 0.0 to 1.0, inclusive. The default value is 0.5.

(Read and Write property)

177.15.7 maximumObservations as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An integer specifying the maximum number of rectangles Vision returns.
Notes:

The default value is 1.
Setting this property to 0 allows Vision algorithms to return an unlimited number of observations.
(Read and Write property)

177.15.8 minimumAspectRatio as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A float specifying the minimum aspect ratio of the rectangle to detect, defined as the shorter dimension over the longer dimension.
Notes:

The value should range from 0.0 to 1.0, inclusive. The default value is 0.5.
(Read and Write property)

177.15.9 minimumConfidence as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A value specifying the minimum acceptable confidence level.
Notes:

Vision won't return rectangles with a confidence score lower than the specified minimum.
The confidence score ranges from 0.0 to 1.0, inclusive, where 0.0 represents no confidence, and 1.0 represents full confidence.
(Read and Write property)

177.15.10 minimumSize as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A float specifying the minimum size of the rectangle to be detected, as a proportion of the smallest dimension.
Notes:

The value should range from 0.0 to 1.0 inclusive. The default minimum size is 0.2.

Any smaller rectangles that Vision may have detected aren't returned.
(Read and Write property)

177.15.11 quadratureTolerance as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A float specifying the number of degrees a rectangle corner angle can deviate from 90°.
Notes:

The tolerance value should range from 0 to 45, inclusive. The default tolerance is 30.
(Read and Write property)

177.16 class VNDetectTextRectanglesRequestMBS

177.16.1 class VNDetectTextRectanglesRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An image analysis request that finds regions of visible text in an image.
Notes:

This request returns detected text characters as rectangular bounding boxes with origin and size.
Subclass of the VNImageBasedRequestMBS class.

177.16.2 Blog Entries

- Vision Framework for Xojo

177.16.3 Methods

177.16.4 Constructor(DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.16.5 Properties

177.16.6 reportCharacterBoxes as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean variable indicating interest in detecting character bounding boxes.
Notes:

Set to true to have the detector return character bounding boxes as an array of VNRectangleObservationMBS objects.
(Read and Write property)

177.17 class VNFaceLandmarkRegion2DMBS

177.17.1 class VNFaceLandmarkRegion2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: 2D geometry information for a specific facial feature.
Notes:

This class represents the set of all facial landmark regions in 2D, exposed as properties.
Subclass of the VNFaceLandmarkRegionMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

177.17.2 Blog Entries

- Vision Framework for Xojo

177.17.3 Methods

177.17.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

177.17.5 normalizedPoints as CGPointMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A buffer in memory containing normalized landmark points.
Notes: Returns array with CGPointMBS representing landmark points.

177.17.6 pointsInImageOfSize(imageSize as CGSizeMBS) as CGPointMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A buffer in memory containing landmark points in the coordinate space of the specified image size.
Notes: imageSize: The pixel dimensions of the image in which to present landmark points.

177.17.7 precisionEstimatesPerPoint as Variant()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An array of precision estimates for each landmark point.
Notes: This property is only populated when you configure your VNDetectFaceLandmarksRequestMBS object with VNRequestFaceLandmarksConstellation76Points. For other constellation types, this array is set to nil.

177.18 class VNFaceLandmarkRegionMBS

177.18.1 class VNFaceLandmarkRegionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The abstract superclass for information about a specific face landmark.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

177.18.2 Blog Entries

- Vision Framework for Xojo

177.18.3 Methods

177.18.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

177.18.5 copy as VNFaceLandmarkRegionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a copy of the object.

177.18.6 Properties

177.18.7 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

177.18.8 pointCount as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The number of points in the face region.
Notes:

The value is zero if no points for a region could be found.
(Read only property)

177.18.9 requestRevision as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The revision of the VNRequest subclass used to generate the implementing object.
Notes: (Read only property)

177.19 class VNFaceLandmarks2DMBS

177.19.1 class VNFaceLandmarks2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A collection of all facial features detected in a face observation, with 2D geometry information for each.
Notes:

This class represents the set of all detectable 2D face landmarks and regions, exposed as properties. The coordinates of the face landmarks are normalized to the dimensions of the face observation's boundingBox, with the origin at the bounding box's lower-left corner. Use the VNImagePointForFaceLandmarkPointMBS function to convert normalized face landmark points into absolute points within the image's coordinate system.
Subclass of the VNFaceLandmarksMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

177.19.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

177.19.5 Properties

177.19.6 allPoints as VNFaceLandmarkRegion2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The region containing all face landmark points.
Notes: (Read only property)

177.19.7 faceContour as VNFaceLandmarkRegion2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The region containing points that trace the face contour from the left cheek, over the chin, to

the right cheek.
Notes: (Read only property)

177.19.8 innerLips as VNFaceLandmarkRegion2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The region containing points that outline the space between the lips.
Notes: (Read only property)

177.19.9 leftEye as VNFaceLandmarkRegion2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The region containing points that outline the left eye.
Notes: (Read only property)

177.19.10 leftEyebrow as VNFaceLandmarkRegion2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The region containing points that trace the left eyebrow.
Notes: (Read only property)

177.19.11 leftPupil as VNFaceLandmarkRegion2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The region containing the point where the left pupil is located.
Notes:

This value may be inaccurate if the eye is blinking.
(Read only property)

177.19.12 medianLine as VNFaceLandmarkRegion2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The region containing points that trace a vertical line down the center of the face.
Notes: (Read only property)

177.19.13 nose as VNFaceLandmarkRegion2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The region containing points that outline the nose.
Notes: (Read only property)

177.19.14 noseCrest as VNFaceLandmarkRegion2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The region containing points that trace the center crest of the nose.
Notes: (Read only property)

177.19.15 outerLips as VNFaceLandmarkRegion2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The region containing points that outline the outside of the lips.
Notes: (Read only property)

177.19.16 rightEye as VNFaceLandmarkRegion2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The region containing points that outline the right eye.
Notes: (Read only property)

177.19.17 rightEyebrow as VNFaceLandmarkRegion2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The region containing points that trace the right eyebrow.
Notes: (Read only property)

177.19.18 rightPupil as VNFaceLandmarkRegion2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The region containing the point where the right pupil is located.
Notes:

This value may be inaccurate if the eye is blinking.
(Read only property)

177.20 class VNFaceLandmarksMBS

177.20.1 class VNFaceLandmarksMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The abstract superclass for containers of face landmark information.
Notes:

This class represents the set of all detectable facial landmarks and regions, exposed as properties.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

177.20.2 Blog Entries

- Vision Framework for Xojo

177.20.3 Methods

177.20.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

177.20.5 copy as VNFaceLandmarksMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a copy of the object.

177.20.6 Properties

177.20.7 confidence as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A confidence estimate for the detected landmarks.
Notes:

A value of 0 indicates no confidence. A value of 1 indicates full confidence.
(Read only property)

177.20.8 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

177.20.9 requestRevision as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The revision of the VNRequestMBS subclass used to generate the implementing object.
Notes: (Read only property)

177.21 class VNFaceObservationMBS

177.21.1 class VNFaceObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Face or facial-feature information detected by an image analysis request.
Notes:

This type of observation results from a VNDetectFaceRectanglesRequestMBS. It contains information about facial landmarks and regions found in the image.
Subclass of the VNDetectedObjectObservationMBS class.

177.21.2 Blog Entries

- Vision Framework for Xojo

177.21.3 Methods

177.21.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

177.21.5 faceObservationWithRequestRevision(requestRevision as Integer = 2, boundingBox as CGRectMBS, roll as Variant, yaw as Variant) as VNFaceObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a face observation with the given revision number, bounding box, roll, and yaw.

177.21.6 Properties

177.21.7 faceCaptureQuality as Variant

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The capture quality of the face, normalized between 0.0 and 1.0.
Notes:

The capture quality of the face allows you to compare the quality of the face in terms of its capture attributes: lighting, blur, and prime positioning. Use this metric to compare the capture quality of a face against other

captures of the same face in a given set. Faces with quality closer to 1.0 are better lit, sharper, and centrally positioned than faces with quality closer to 0.0.
(Read only property)

177.21.8 landmarks as VNFaceLandmarks2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The facial features found in the detected face.
Notes:

This property's value is nil for face observations produced by a VNDetectFaceRectanglesRequestMBS analysis. Use the VNDetectFaceLandmarksRequestMBS class to find facial features.
(Read only property)

177.21.9 roll as Variant

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The detected face's roll angle, as populated by the VNDetectFaceRectanglesRequestMBS.
Notes:

The roll is reported in radians. A positive angle corresponds to counterclockwise roll. The range is [-Pi, Pi). A nil value indicates that the roll angle hasn't been computed.
(Read only property)

177.21.10 yaw as Variant

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The detected face's yaw angle, as populated by the VNDetectFaceRectanglesRequestMBS.
Notes:

The yaw is reported in radians. A positive angle corresponds to counterclockwise roll. The range is [-Pi/2, Pi/2). A nil value indicates that the yaw angle hasn't been computed.
(Read only property)

177.22 class VNFeaturePrintObservationMBS

177.22.1 class VNFeaturePrintObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The observation resulting from a VNGenerateImageFeaturePrintRequestMBS.
Notes:

The observations returned from a VNGenerateImageFeaturePrintRequestMBS are of this class.
Subclass of the VNObservationMBS class.

177.22.2 Blog Entries

- Vision Framework for Xojo

177.22.3 Methods

177.22.4 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether this class is available.
Notes: Returns true on MacOS 10.15 or newer.

177.22.5 computeDistance(byref outDistance as Single, featurePrint as VNFeaturePrintObservationMBS, byref error as NSErrorMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Computes the distance between two observations.
Notes: The larger the distance the more dissimlar the feature prints are. In case of an error this method returns false with an error describing the error condition, for instance comparing two non-comparable feature prints.

177.22.6 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

177.22.7 Values as Double()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Queries values as a double array.
Notes: Floats are expanded to doubles for your convenience.

177.22.8 Properties

177.22.9 data as MemoryBlock

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The feature print data.
Notes:

The data is divided into separate elements. Determine the type of element using elementType, and the number of elements using elementCount.
(Read only property)

177.22.10 elementCount as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The total number of elements in the data.
Notes: (Read only property)

177.22.11 elementType as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The type of each element in the data.
Notes: (Read only property)

177.22.12 Constants

177.22.13 ElementTypeDouble = 2

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the element types.
Notes: The elements are double-precision floating-point numbers.

177.22.14 ElementTypeFloat = 1

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the element types.
Notes: The elements are floating-point numbers.

177.22.15 ElementTypeUnknown = 0

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the element types.
Notes: The element type isn't known.

177.23 class VNGenerateAttentionBasedSaliencyImageRequestMBS

177.23.1 class VNGenerateAttentionBasedSaliencyImageRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Generates a heat map that identifies the parts of an image most likely to draw attention.
Notes:

The resulting observation, VNSaliencyImageObservationMBS, encodes this data as a heat map, which you can use to highlight regions of interest.
Subclass of the VNImageBasedRequestMBS class.

177.23.2 Blog Entries

- Vision Framework for Xojo

177.23.3 Methods

177.23.4 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether this class is available.
Notes: Returns true on MacOS 10.15 or newer.

177.23.5 Constructor(DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.24 class VNGenerateImageFeaturePrintRequestMBS

177.24.1 class VNGenerateImageFeaturePrintRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An image-based request to generate feature prints from an image.
Notes:

This request returns an array of feature print elements in the form of data wrapped in VNFeaturePrintObservationMBS objects.
Available in MacOS 10.15 or newer.
Subclass of the VNImageBasedRequestMBS class.

177.24.2 Blog Entries

- Vision Framework for Xojo

177.24.3 Methods

177.24.4 Constructor(DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.24.5 Properties

177.24.6 imageCropAndScaleOption as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Determine what type of croping and scaling action should be applied to the image before generating the feature print.
Notes:

The default value for this property is VNImageCropAndScaleOptionScaleFill.
(Read and Write property)

177.24.7 Constants

177.24.8 VNImageCropAndScaleOptionCenterCrop = 0

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the different ways Vision can crop and scale an input image.
Notes: A scaling option that maintains aspect ratio to fit the short side, and crops the centered image on its long side.

177.24.9 VNImageCropAndScaleOptionScaleFill = 2

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the different ways Vision can crop and scale an input image.
Notes: A scaling option that scales an image proportionally so that its shorter dimension fills the canvas, potentially cropping along the longer dimension.

177.24.10 VNImageCropAndScaleOptionScaleFit = 1

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the different ways Vision can crop and scale an input image.
Notes:

An option that scales an image to fit the input image dimensions while maintaining aspect ratio.
This option ensures the entire image fits into the Vision algorithm's input image dimensions by scaling down the longer dimension until it fits. This option pads the image along the shorter dimension to maintain aspect ratio.

177.25 class VNGenerateObjectnessBasedSaliencyImageRequestMBS

177.25.1 class VNGenerateObjectnessBasedSaliencyImageRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Generates a heat map that identifies the parts of an image most likely to represent objects.
Notes:

The resulting observation, VNSaliencyImageObservationMBS, encodes this data as a heat map, which you can use to highlight regions of interest.
Subclass of the VNImageBasedRequestMBS class.

177.25.2 Blog Entries

- Vision Framework for Xojo

177.25.3 Methods

177.25.4 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether this class is available.
Notes: Returns true on MacOS 10.15 or newer.

177.25.5 Constructor(DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.26 class VNHomographicImageRegistrationRequestMBS

177.26.1 class VNHomographicImageRegistrationRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An image analysis request that determines the perspective warp matrix needed to align the content of two images.
Notes:

Create and perform a homographic image registration request to align content in two images through a homography. A homography is an isomorphism of projected spaces, a bijection that maps lines to lines.
Requires MacOS 10.13 or newer.
Subclass of the VNImageRegistrationRequestMBS class.

177.26.2 Blog Entries

- Vision Framework for Xojo

177.26.3 Methods

177.26.4 Constructor(DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.27 class VNHorizonObservationMBS

177.27.1 class VNHorizonObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Horizon angle information detected by an image analysis request.
Notes:

Instances of this class result from invoking a VNDetectHorizonRequestMBS and report the angle and transform of the horizon in an image.
Subclass of the VNObservationMBS class.

177.27.2 Blog Entries

- Vision Framework for Xojo

177.27.3 Methods

177.27.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

177.27.5 Properties

177.27.6 angle as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Angle of the observed horizon.
Notes:

Use the angle to orient the image in an upright position and make the detected horizon level.
(Read only property)

177.27.7 transform as CGAffineTransformMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Transform applied to the detected horizon.
Notes:

Apply the transform's inverse to orient the image in an upright position and make the detected horizon level. (Read only property)

177.28 class VNImageAlignmentObservationMBS

177.28.1 class VNImageAlignmentObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The abstract superclass for image analysis results that describe the relative alignment of two images.
Notes:

This abstract superclass forms the basis of image alignment or registration output. You receive its subclasses, such as VNImageTranslationAlignmentObservationMBS and VNImageHomographicAlignmentObservationMBS, by performing specific registration requests. Don't create one of these classes yourself.
Subclass of the VNObservationMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

177.28.2 Blog Entries

- Vision Framework for Xojo

177.28.3 Methods

177.28.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

177.29 class VNImageBasedRequestMBS

177.29.1 class VNImageBasedRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The abstract superclass for image analysis requests that focus on a specific part of an image.
Notes:

Other Vision request handlers that operate on still images inherit from this abstract base class. Don't use it directly.
Subclass of the VNRequestMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

177.29.2 Blog Entries

- Vision Framework for Xojo

177.29.3 Methods

177.29.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

177.29.5 Properties

177.29.6 regionOfInterest as CGRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The region of the image in which Vision will perform the request.
Notes:

The rectangle is normalized to the dimensions of the processed image. Its origin is specified relative to the image's lower-left corner.

The default value is { { 0, 0 } , { 1, 1 } } .

Important
The request will fail to perform if you set this property to a rectangle outside the normalized coordinate space.

(Read and Write property)

177.30 class VNImageHomographicAlignmentObservationMBS

177.30.1 class VNImageHomographicAlignmentObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Perspective warp information produced by an image alignment request.
Notes:

This type of observation results from a VNHomographicImageRegistrationRequestMBS, informing the warpTransform performed to align the input images.
Subclass of the VNImageAlignmentObservationMBS class.

177.30.2 Blog Entries

- Vision Framework for Xojo

177.30.3 Methods

177.30.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

177.30.5 Properties

177.30.6 warpTransform as MemoryBlock

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The warp transform matrix to morph the floating image into the reference image.
Notes:

This is a 3x3 float matrix wrapped into a memoryblock.
(Read and Write property)

177.31 class VNImageRegistrationRequestMBS

177.31.1 class VNImageRegistrationRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The abstract superclass for image analysis requests that align images based on their content.
Notes:

This abstract superclass forms the basis of image alignment or registration requests. Make specific requests through one of its subclasses, VNTranslationalImageRegistrationRequestMBS or VNHomographicImageRegistrationRequestMBS. Don't create an instance of this superclass yourself.
Subclass of the VNTargetedImageRequestMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

177.31.2 Blog Entries

- Vision Framework for Xojo

177.31.3 Methods

177.31.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

177.32 class VNImageRequestHandlerMBS

177.32.1 class VNImageRequestHandlerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An object that processes one or more image analysis requests pertaining to a single image.
Notes:

Instantiate this handler to perform Vision requests on a single image. You specify the image and, optionally, a completion handler at the time of creation, and call performRequests to begin executing the request.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

177.32.2 Blog Entries

- Vision Framework for Xojo

177.32.3 Methods

177.32.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

177.32.5 performRequests(requests() as VNRequestMBS, byref error as NSErrorMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Schedules Vision requests to be performed.
Notes:

requests: A nonempty array of VNRequestMBS instances to perform.
error: An optional error parameter populated when problems arise in scheduling the requests. Check if the return value is false.

Returns true if all requests were scheduled and performed. If the return value is false, check the error parameter.

The function returns after all requests have either completed or failed. Check individual requests and errors for their respective successes and failures.

177.32.6 performRequestsAsync(requests() as VNRequestMBS, DelegateHandler as VNPerformRequestsCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Schedules Vision requests to be performed asynchronously in background.
Notes:

requests: A nonempty array of VNRequestMBS instances to perform.
error: An optional error parameter populated when problems arise in scheduling the requests. Check if the return value is false.

Returns true if all requests were scheduled and performed. If the return value is false, check the error parameter.

The function returns immediately. Delegate will be called when finished.

177.32.7 RequestWithCGImage(CGImage as CGImageMBS, orientation as Integer = 0, Options as Dictionary = nil) as VNImageRequestHandlerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a handler to be used for performing requests on a Core Graphics image.
Notes:

image: A CGImageMBS containing the image to be used for performing the requests. Image content is immutable.
orientation: The orientation of the input image. Pass zero if unknown.
options: An optional dictionary containing VNImageOption keys to auxiliary image data.

177.32.8 RequestWithCIImage(CIImage as Variant, orientation as Integer = 0, Options as Dictionary = nil) as VNImageRequestHandlerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a handler to be used for performing requests on CIImage data.
Notes:

image: A CIImageMBS containing the image to be used for performing the requests. Image content is immutable.
orientation: The orientation of the input image. Pass zero if unknown.
options: An optional dictionary containing VNImageOption keys to auxiliary image data.

177.32.9 RequestWithCVPixelBuffer(CVPixelBuffer as Variant, orientation as Integer = 0, Options as Dictionary = nil) as VNImageRequestHandlerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a handler to be used for performing requests on a Core Video pixel buffer of a known orientation.
Notes:

pixelBuffer: A CVPixelBufferMBS containing the image to be used for performing the requests. Buffer contents can't be changed for the lifetime of the request handler.
orientation: The orientation of the input image. Pass zero if unknown.
options: An optional dictionary containing VNImageOption keys to auxiliary image data.

177.32.10 RequestWithData(Data as MemoryBlock, orientation as Integer = 0, Options as Dictionary = nil) as VNImageRequestHandlerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a handler to be used for performing requests on an image, contained in a memoryblock.
Notes:

imageData: Data containing the image to be used for performing the requests. Image content is immutable.
orientation: The orientation of the input image. Pass zero if unknown.
options: An optional dictionary containing VNImageOption keys to auxiliary image data.

The intended use cases of this type of initializer include compressed images and network downloads, where a client may receive a JPEG from a website or the cloud.

177.32.11 RequestWithFile(File as FolderItem, orientation as Integer = 0, Options as Dictionary = nil) as VNImageRequestHandlerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a handler to be used for performing requests on an image, at the specified folderitem.
Notes:

File: A folderitem pointing to the image to be used for performing the requests. The image must be in a format supported by Image I/O. Image content is immutable.
orientation: The orientation of the input image. pass zero if unknown.
options: An optional dictionary containing VNImageOption keys to auxiliary image data.

177.32.12 RequestWithPicture(Picture as Picture, orientation as Integer = 0, Options as Dictionary = nil) as VNImageRequestHandlerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a handler to be used for performing requests on a picture.
Notes:

image: A Picture containing the image to be used for performing the requests. Image content is immutable.
orientation: The orientation of the input image. Pass zero if unknown.
options: An optional dictionary containing VNImageOption keys to auxiliary image data.

177.32.13 VNImageOptionCameraIntrinsics as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An option to specify the camera intrinstics as an MemoryBlock object representing a matrix_float3x3.
Notes:

see
https://developer.apple.com/documentation/vision/vnimageoptioncameraintrinsics?language=objc

177.32.14 VNImageOptionCIContext as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An option key to specify the CIContextMBS to be used in the handler's Core Image operations.
Notes:

If this key isn't specified, Vision will create its own CIContext.
Specify a CIContextMBS when you've used one in processing an input CIImageMBS or executing a CIFilterMBS chain, so you can save the cost of creating a new context.

177.32.15 VNImageOptionProperties as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The dictionary from CGImageSourceCopyPropertiesAtIndex containing metadata for algorithms like horizon detection.

177.32.16 Properties

177.32.17 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

177.32.18 Constants

177.32.19 kOrientationDown = 3

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the image orientations.
Notes: The encoded image data is rotated 180° from the image's intended display orientation.

177.32.20 kOrientationDownMirrored = 4

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the image orientations.
Notes: The encoded image data is vertically flipped from the image's intended display orientation.

177.32.21 kOrientationLeft = 8

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the image orientations.
Notes: The encoded image data is rotated 90° clockwise from the image's intended display orientation.

177.32.22 kOrientationLeftMirrored = 5

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the image orientations.
Notes: The encoded image data is horizontally flipped and rotated 90° counter-clockwise from the image's intended display orientation.

177.32.23 kOrientationRight = 6

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the image orientations.
Notes: The encoded image data is rotated 90° clockwise from the image's intended display orientation.

177.32.24 kOrientationRightMirrored = 7

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the image orientations.
Notes: The encoded image data is horizontally flipped and rotated 90° clockwise from the image's intended display orientation.

177.32.25 kOrientationUp = 1

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the image orientations.
Notes: The encoded image data matches the image's intended display orientation.

177.32.26 kOrientationUpMirrored = 2

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the image orientations.
Notes: The encoded image data is horizontally flipped from the image's intended display orientation.

177.33 class VNImageTranslationAlignmentObservationMBS

177.33.1 class VNImageTranslationAlignmentObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Affine transform information produced by an image alignment request.
Notes:

This type of observation results from a VNTranslationalImageRegistrationRequestMBS, informing the alignmentTransform performed to align the input images.
Subclass of the VNImageAlignmentObservationMBS class.

177.33.2 Blog Entries

- Vision Framework for Xojo

177.33.3 Methods

177.33.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

177.33.5 Properties

177.33.6 alignmentTransform as CGAffineTransformMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The alignment transform to align the floating image with the reference image.
Notes: (Read only property)

177.34 class VNObservationMBS

177.34.1 class VNObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The abstract superclass for analysis results.
Notes:

Observations resulting from Vision image analysis requests inherit from this abstract base class. Do not use this abstract superclass directly.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

177.34.2 Blog Entries

- Vision Framework for Xojo

177.34.3 Methods

177.34.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

177.34.5 copy as VNObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a copy of the object.

177.34.6 Properties

177.34.7 className as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Queries class name of the observation.
Notes: (Read only property)

177.34.8 Confidence as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The level of confidence in the observation's accuracy, normalized to [0, 1.0] .
Notes:

A value of 0.0 indicates no confidence.
A value of 1.0 indicates the highest confidence. An observation that doesn't support or assign meaning to confidence also returns 1.0.
(Read only property)

177.34.9 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

177.34.10 requestRevision as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The revision used in request.
Notes: (Read only property)

177.34.11 UUID as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A unique identifier assigned to the Vision observation.
Notes: (Read only property)

177.35 class VNPixelBufferObservationMBS

177.35.1 class VNPixelBufferObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An output image produced by a Core ML image analysis request.
Notes:

This type of observation results from performing a VNCoreMLRequestMBS image analysis with a Core ML model whose role is image-to-image processing. For example, this observation would result from a model that analyzes the style of one image and then transfers that style to a different image.
Vision infers that an MLModel object is an image-to-image model if that model includes an image. Its modelDescription object includes an image-typed feature description in its outputDescriptionsByName dictionary.
Subclass of the VNObservationMBS class.

177.35.2 Blog Entries

- Vision Framework for Xojo

177.35.3 Methods

177.35.4 CIImage as Variant

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates CIImageMBS object for given pixel buffer.

177.35.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

177.35.6 Properties

177.35.7 featureName as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The name used in the model description of the CoreML model that produced this observation.
Notes:

This value can be empty if the observation is not the result of a VNCoreMLRequest operation.
Available in MacOS 10.15 or later.
(Read only property)

177.35.8 pixelBuffer as Variant

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The image that results from a request with image output.
Notes:

VNCoreMLRequestMBS produces observations that contain images in pixel buffer format. The confidence level is always 1.0.
(Read only property)

177.36 class VNRecognizeAnimalsRequestMBS

177.36.1 class VNRecognizeAnimalsRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A request that will recognize various animals in an image.
Notes:

The list of animals supported by the recognition algorithm can be queried by knownAnimalIdentifiersFor-Revision.
This request will generate VNRecognizedObjectObservationMBS objects with a defined boundingBox, label and confidence level.

Availalble on MacOS 10.15.
Subclass of the VNImageBasedRequestMBS class.

177.36.2 Blog Entries

- Vision Framework for Xojo

177.36.3 Methods

177.36.4 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether this class is available.
Notes: Returns true on MacOS 10.15 or newer.

177.36.5 Constructor(DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.36.6 knownAnimalIdentifiersForRevision(requestRevision as Integer = 1, byref error as NSErrorMBS) as String()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: This class method returns a list of all animals supported by the recognition algorithm
Notes: This request will generate a collection of names for supported animals by current recognition algorithm.

177.36.7 VNAnimalIdentifierCat as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The identifier for cats.

177.36.8 VNAnimalIdentifierDog as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The identifier for dogs.

177.37 class VNRecognizedObjectObservationMBS

177.37.1 class VNRecognizedObjectObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A detected object observation with an array of classification labels that classify the recognized object.
Notes:

The confidence of the classifications sum up to 1.0. Multiply the classification confidence with the confidence of this observation.

Available on MacOS 10.14 or newer.
Subclass of the VNDetectedObjectObservationMBS class.

177.37.2 Blog Entries

- Vision Framework for Xojo

177.37.3 Methods

177.37.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

177.37.5 labels as VNClassificationObservationMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An array of observations that classify the recognized object.

177.38 class VNRecognizedTextMBS

177.38.1 class VNRecognizedTextMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A block of recognized text.
Notes: There can be multiple VNRecognizedTextMBS objects returned in a VNRecognizedTextObservationMBS - one for each candidate.

177.38.2 Blog Entries

- Vision Framework for Xojo

177.38.3 Methods

177.38.4 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether this class is available.
Notes: Returns true on MacOS 10.15 or newer.

177.38.5 boundingBoxForRange(range as NSRangeMBS, byref error as NSErrorMBS) as VNRectangleObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Calculate the bounding box around the characters in the range of the string.
Notes:

The bounding boxes are not guaranteed to be an exact fit around the characters and are purely meant for UI purposes and not for image processing.
Range is zero based!

177.38.6 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

177.38.7 copy as VNRecognizedTextMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a copy of the object.

177.38.8 Properties

177.38.9 confidence as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The level of confidence normalized to [0.0, 1.0] where 1.0 is most confident.
Notes: (Read only property)

177.38.10 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

177.38.11 string as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Field that contains recognized text.
Notes:

This is the top candidate of the recognized text.
(Read only property)

177.39 class VNRecognizedTextObservationMBS

177.39.1 class VNRecognizedTextObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A request that detects and recognizes regions of text in an image.
Notes:

This type of observation results from a VNRecognizeTextRequestMBS. It contains information about both the location and content of text and glyphs that Vision recognized in the input image.
Subclass of the VNRectangleObservationMBS class.

177.39.2 Blog Entries

- Vision Framework for Xojo

177.39.3 Methods

177.39.4 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether this class is available.
Notes: Returns true on MacOS 10.15 or newer.

177.39.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

177.39.6 topCandidates(maxCandidateCount as integer) as VNRecognizedTextMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Requests the n top candidates for a recognized text string.
Notes:

maxCandidateCount: The maximum number of candidates to return. This can't exceed 10.

Returns an array of the n top candidates, sorted by decreasing confidence score.

This function returns no more than n candidates, but it may return fewer than n candidates.

177.39.7 Properties

177.39.8 string as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The top candidate's string.
Notes:

For your convenience.
(Read only property)

177.39.9 topCanditate as VNRecognizedTextMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: First top candidate.
Notes:

For your convenience.
Same as first element of topCanditates(1).
(Read only property)

177.40 class VNRecognizeTextRequestMBS

177.40.1 class VNRecognizeTextRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An image analysis request that finds and recognizes text in an image.
Notes:

By default, a text recognition request first locates all possible glyphs or characters in the input image, then analyzes each string. To specify or limit the languages sought in the request, set the recognitionLanguages property to an array containing the names of the languages of text you'd like to recognize. Vision returns the result of this request in a VNRecognizedTextObservationMBS object.

Available on MacOS 10.15.
Subclass of the VNImageBasedRequestMBS class.

177.40.2 Blog Entries

- Vision Framework for Xojo

177.40.3 Methods

177.40.4 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether this class is available.
Notes: Returns true on MacOS 10.15 or newer.

177.40.5 Constructor(DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.
Notes: When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.40.6 customWords as String()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An array of strings to supplement the recognized languages at the word recognition stage.

Notes: The customWords list takes precedence over the standard lexicon.

177.40.7 recognitionLanguages as String()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An array of languages to detect, in priority order.
Notes:

The order of the languages in the array defines the order in which languages are used during language processing and text recognition.
Specify the languages as ISO language codes.

177.40.8 setCustomWords(customWords() as String)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets an array of strings to supplement the recognized languages at the word recognition stage.
Notes: The customWords list takes precedence over the standard lexicon.

177.40.9 setProgressHandler(ProgressHandler as VNProgressHandlerMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets progress handler.
Notes: The progress handler is an optional delegate that allows clients of the request to report progress to the user or to display partial results as they become available.

177.40.10 setRecognitionLanguages(recognitionLanguages() as String)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Sets array of languages to detect, in priority order.
Notes:

The order of the languages in the array defines the order in which languages are used during language processing and text recognition.
Specify the languages as ISO language codes.

177.40.11 supportedRecognitionLanguages(recognitionLevel as Integer, requestRevision as Integer = 1, byref error as NSErrorMBS) as String()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Requests a list of languages recognized by the specified revision.
Example:

```
Dim recognitionLevel As Integer = VNRecognizeTextRequestMBS.RecognitionLevelAccurate
Dim languages() As String
Dim error As NSErrorMBS

languages = VNRecognizeTextRequestMBS.supportedRecognitionLanguages(recognitionLevel, error)

MsgBox Join(languages, EndOfLine)

If error <>Nil Then
MsgBox error.LocalizedDescription
End If
```

Notes:

recognitionLevel: The level of recognition to prioritize. Set this level to RecognitionLevelFast to prioritize speed over accuracy, and to RecognitionLevelAccurate to prioritize accuracy at the expense of speed.
requestRevision: The revision of the text recognition algorithm for the Vision framework to use.
error: An error that contains information about failed language support, or nil if no error occurred.

Returns an array of supported languages, listed as ISO language codes.

A language supported in one recognition level may not be available in another recognition level.

May show just "en-US".

177.40.12 Properties

177.40.13 indeterminate as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean set to true when a request can't determine its progress in fractions completed.
Notes:

A value of true doesn't mean that the request will run forever. Rather, it means that the nature of the request can't be broken down into identifiable fractions to report. The progressHandler will still be called at suitable intervals.

(Read only property)

177.40.14 minimumTextHeight as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The minimum height of the text expected to be recognized, relative to the image height.
Notes:

Specify a floating-point number relative to the image height. For example, to limit recognition to text that is half of the image height, use 0.5. Increasing the size reduces memory consumption and expedites recognition with the tradeoff of ignoring text smaller than the minimum height. The default value is 1/32, or 0.03125.
(Read and Write property)

177.40.15 recognitionLevel as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A value that determines whether the request prioritizes accuracy or speed in text recognition.
Notes:

The recognition level determines which techniques are used during the text recognition. Set this value to RecognitionLevelFast to prioritize speed over accuracy, and to RecognitionLevelAccurate for longer, more computationally intensive recognition.
(Read and Write property)

177.40.16 usesLanguageCorrection as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean indicating whether Vision applies language correction during the recognition process.
Notes:

When this Boolean is set to true, Vision applies language correction during the recognition process. Disabling this property returns the raw recognition results, which provides performance benefits but less accurate results.
(Read and Write property)

177.40.17 Constants

177.40.18 RecognitionLevelAccurate = 0

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the recognition levels.
Notes: Accurate text recognition takes more time to produce a more comprehensive result.

177.40.19 RecognitionLevelFast = 1

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the recognition levels.
Notes: Fast text recognition returns results more quickly at the expense of accuracy.

177.41 class VNRectangleObservationMBS

177.41.1 class VNRectangleObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Information about projected rectangular regions detected by an image analysis request.
Notes:

This type of observation results from a VNDetectRectanglesRequestMBS. It defines the four vertices of a detected rectangle.
Subclass of the VNDetectedObjectObservationMBS class.

177.41.2 Blog Entries

- Vision Framework for Xojo

177.41.3 Methods

177.41.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

177.41.5 rectangleObservationWithRequestRevision(requestRevision as Integer = 1, topLeft as CGPointMBS, bottomLeft as CGPointMBS, bottomRight as CGPointMBS, topRight as CGPointMBS) as VNRectangleObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A convenience initializer for creating a rectangle observation from its corner points.
Notes:

requestRevision: The rectangle detector revision number. A higher revision indicates more recent iterations of the framework.
topLeft: The upper-left corner point.
bottomLeft: The lower-left corner point.
bottomRight: The lower-right corner point.
topRight: The upper-right corner point.

Available on MacOS 10.15 or newer.

177.41.6 Properties

177.41.7 bottomLeft as CGPointMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The coordinates of the lower-left corner of the observation bounding box.
Notes: (Read only property)

177.41.8 bottomRight as CGPointMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The coordinates of the lower-right corner of the observation bounding box.
Notes: (Read only property)

177.41.9 topLeft as CGPointMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The coordinates of the upper-left corner of the observation bounding box.
Notes: (Read only property)

177.41.10 topRight as CGPointMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The coordinates of the upper-right corner of the observation bounding box.
Notes: (Read only property)

177.42 class VNRequestMBS

177.42.1 class VNRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The abstract superclass for analysis requests.
Notes:

Other Vision request handlers that perform image analysis inherit from this abstract base class. Instantiate one of its subclasses to perform image analysis.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

177.42.2 Blog Entries

- Vision Framework for Xojo

177.42.3 Methods

177.42.4 cancel

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Cancels the request before it can finish executing.

177.42.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

177.42.6 copy as VNRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a copy of the object.

177.42.7 currentRevision as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The current revison supported by the request.
Notes: Available on MacOS 10.14 or newer.

177.42.8 defaultRevision as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The revision of the latest request for the particular SDK linked with the client application.
Notes: Available on MacOS 10.14 or newer.

177.42.9 results as VNObservationMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The collection of VNObservationMBS results generated by request processing.
Notes:

If the request fails, this property is nil. Otherwise, it contains an array of VNObservationMBS subclasses specific to the VNRequest subclass.
Don't access this property until the request has finished processing.

177.42.10 supportedRevisions as NSIndexSetMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The collection of currently-supported algorithm versions for the class of request.
Notes:

This method allows clients to inspect at runtime what capabilities are available for each class of VNRequest in the Vision framework.
Available on MacOS 10.14 or newer.

177.42.11 Properties

177.42.12 className as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Queries class name of the request.
Notes: (Read only property)

177.42.13 ClassPath as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The class path.
Notes:

Useful for debugging to know what super classes the request has.
(Read only property)

177.42.14 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

177.42.15 preferBackgroundProcessing as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A hint to minimize the resource burden of the request.
Notes:

If set to true, this property reduces the request's memory footprint, processing footprint, and CPU/GPU contention at the potential cost of longer execution time.
Setting this value can help ensure that Vision processing doesn't block UI updates and other rendering on the main thread.
(Read and Write property)

177.42.16 revision as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The specific algorithm or implementation revision that is to be used to perform the request.
Notes: (Read and Write property)

177.42.17 usesCPUOnly as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean signifying that the Vision request should execute exclusively on the CPU.
Notes:

This value defaults to false to signify that the Vision request is free to leverage the GPU to accelerate its processing.
(Read and Write property)

177.43 class VNSaliencyImageObservationMBS

177.43.1 class VNSaliencyImageObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An observation containing a grayscale heat map of important areas across an image.
Notes:

The heat map is a CVPixelBufferRef in a one-component floating-point pixel format. Its dimensions are 64 x 64 when fetched in real time, or 68 x 68 when requested in its deferred form.
Available on MacOS 10.15 or later.
Subclass of the VNPixelBufferObservationMBS class.

177.43.2 Blog Entries

- Vision Framework for Xojo

177.43.3 Methods

177.43.4 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether this class is available.
Notes: Returns true on MacOS 10.15 or newer.

177.43.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

177.43.6 salientObjects as VNRectangleObservationMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A collection of objects describing the distinct areas of the saliency heat map.
Notes:

The objects in this array don't follow any specific ordering. It's up to your app to iterate across the observations and apply desired ordering.
Requesting this array lazily computes the bounds of salient objects within the image.

177.44 class VNSequenceRequestHandlerMBS

177.44.1 class VNSequenceRequestHandlerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An object that processes image analysis requests for each frame in a sequence.
Notes: Instantiate this handler to perform Vision requests on a series of images. Unlike the VNImageRequestHandlerMBS, you don't specify the image on creation. Instead, you supply each image frame one by one as you continue to call one of the perform methods.

177.44.2 Blog Entries

177.44.3 Methods

177.44.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

177.44.5 performRequestsOnCGImage(requests() as VNRequestMBS, CGImage as CGImageMBS, orientation as Integer = 0, byref error as NSErrorMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Schedules one or more Vision requests to be performed on a Core Graphics image with known orientation.
Notes:

requests: An array of VNRequestMBS requests to perform.
image: The input CGImageMBS on which to perform the request.
orientation: The orientation of the input image. Pass zero if unknown.
error: An optional error parameter populated when problems arise in scheduling the requests. Check if the return value is false.

Returns true if all requests were scheduled and performed. Check the error parameter if the return value is false.

177.44.6 performRequestsOnCIImage(requests() as VNRequestMBS, CIImage as Variant, orientation as Integer = 0, byref error as NSErrorMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Schedules one or more Vision requests to be performed on CIImageMBS data with known orientation.
Notes:

requests: An array of VNRequestMBS requests to perform.
image: The input CIImageMBS on which to perform the request.
orientation: The orientation of the input image. Pass zero if unknown.
error: An optional error parameter populated when problems arise in scheduling the requests. Check if the return value is false.

Returns true if all requests were scheduled and performed. Check the error parameter if the return value is false.

177.44.7 performRequestsOnCVPixelBuffer(requests() as VNRequestMBS, CVPixelBuffer as Variant, orientation as Integer = 0, byref error as NSErrorMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Schedules one or more Vision requests to be performed on a Core Video pixel buffer with known orientation.
Notes:

requests: An array of VNRequestMBS requests to perform.
pixelBuffer: The input CVPixelBufferMBS on which to perform the request.
orientation: The orientation of the input image. Pass zero if unknown.
error: An optional error parameter populated when problems arise in scheduling the requests. Check if the return value is false.

Returns true if all requests were scheduled and performed. Check the error parameter if the return value is false.

177.44.8 performRequestsOnImageData(requests() as VNRequestMBS, Data as MemoryBlock, orientation as Integer = 0, byref error as NSErrorMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Schedules one or more Vision requests to be performed on raw data containing an image with

known orientation.
Notes:

requests: An array of VNRequestMBS requests to perform.
imageData: The input MemoryBlock on which to perform the request.
orientation: The orientation of the input image. Pass zero if unknown.
error: An optional error parameter populated when problems arise in scheduling the requests. Check if the return value is false.

Returns true if all requests were scheduled and performed. Check the error parameter if the return value is false.

177.44.9 performRequestsOnImageFile(requests() as VNRequestMBS, File as FolderItem, orientation as Integer = 0, byref error as NSErrorMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Schedules one or more Vision requests to be performed on an image with known orientation, at a specific file.
Notes:

requests: An array of VNRequestMBS requests to perform.
File: A folderitem pointing to the image on which to perform the request.
orientation: The orientation of the input image. Pass zero if unknown.
error: An optional error parameter populated when problems arise in scheduling the requests. Check if the return value is NO.

Returns true if all requests were scheduled and performed. Check the error parameter if the return value is false.

177.44.10 performRequestsOnPicture(requests() as VNRequestMBS, Picture as Picture, orientation as Integer = 0, byref error as NSErrorMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Schedules one or more Vision requests to be performed on a Core Graphics image with known orientation.
Notes:

requests: An array of VNRequestMBS requests to perform.
image: The input CGImageMBS on which to perform the request.
orientation: The orientation of the input image. Pass zero if unknown.
error: An optional error parameter populated when problems arise in scheduling the requests. Check if the

return value is false.

Returns true if all requests were scheduled and performed. Check the error parameter if the return value is false.

177.44.11 Properties

177.44.12 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal object reference.
Notes: (Read and Write property)

177.44.13 Constants

177.44.14 kOrientationDown = 3

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the image orientations.
Notes: The encoded image data is rotated 180° from the image's intended display orientation.

177.44.15 kOrientationDownMirrored = 4

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the image orientations.
Notes: The encoded image data is vertically flipped from the image's intended display orientation.

177.44.16 kOrientationLeft = 8

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the image orientations.
Notes: The encoded image data is rotated 90° clockwise from the image's intended display orientation.

177.44.17 kOrientationLeftMirrored = 5

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the image orientations.
Notes: The encoded image data is horizontally flipped and rotated 90° counter-clockwise from the image's intended display orientation.

177.44.18 kOrientationRight = 6

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the image orientations.
Notes: The encoded image data is rotated 90° clockwise from the image's intended display orientation.

177.44.19 kOrientationRightMirrored = 7

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the image orientations.
Notes: The encoded image data is horizontally flipped and rotated 90° clockwise from the image's intended display orientation.

177.44.20 kOrientationUp = 1

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the image orientations.
Notes: The encoded image data matches the image's intended display orientation.

177.44.21 kOrientationUpMirrored = 2

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the image orientations.
Notes: The encoded image data is horizontally flipped from the image's intended display orientation.

177.45 class VNTargetedImageRequestMBS

177.45.1 class VNTargetedImageRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The abstract superclass for image analysis requests that operate on both the processed image and a secondary image.
Notes:

Other Vision request handlers that operate on both the processed image and a secondary image inherit from this abstract base class. Instantiate one of its subclasses to perform image analysis, and pass in auxiliary image data by filling in the options dictionary at initialization.
Subclass of the VNImageBasedRequestMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

177.45.2 Blog Entries

- Vision Framework for Xojo

177.45.3 Methods

177.45.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

177.45.5 TargetedImageRequestWithCGImage(CGImage as CGImageMBS, orientation as Integer = 0, options as Dictionary, DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil) as VNTargetedImageRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new request targeting a Core Graphics image of known orientation, executing the completion handler when done.
Notes:

cgImage: The targeted Core Graphics image.
orientation: The orientation of the image buffer, based on EXIF specification and superseding other orientation information. The value must be an integer from 1 to 8; see kCGImagePropertyOrientation for details. Value 0 means unknown.
options: A dictionary with options specifying auxiliary information for the image.

When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.45.6 TargetedImageRequestWithCIImage(CIImage as Variant, orientation as Integer = 0, options as Dictionary, DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil) as VNTargetedImageRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new request targeting a CIImageMBS of known orientation, executing the completion handler when done.
Notes:

ciImage: The CIImage encapsulating the targeted image. Variant must be CIImageMBS.
orientation: The orientation of the image buffer, based on EXIF specification and superseding other orientation information. The value must be an integer from 1 to 8; see kCGImagePropertyOrientation for details. Pass zero if unknown.
options: A dictionary with options specifying auxiliary information for the image.

When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.45.7 TargetedImageRequestWithCVPixelBuffer(CVPixelBuffer as Variant, orientation as Integer = 0, options as Dictionary, DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil) as VNTargetedImageRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new request targeting an image in a CVPixelBufferMBS of known orientation, executing the completion handler when done.
Notes:

pixelBuffer: The pixel buffer containing the targeted image. Variant must be CVPixelBufferMBS.
orientation: The orientation of the image buffer, based on EXIF specification and superseding other orientation information. The value must be an integer from 1 to 8; see kCGImagePropertyOrientation for details. Pass zero if unknown.
options: A dictionary with options specifying auxiliary information for the image.

When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.45.8 TargetedImageRequestWithImageData(Data as MemoryBlock, orientation as Integer = 0, options as Dictionary, DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil) as VNTargetedImageRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new request targeting a raw data image of known orientation, executing the completion handler when done.
Notes:

imageData: The data containing the targeted image.
orientation: The orientation of the image buffer, based on EXIF specification and superseding other orientation information. The value must be an integer from 1 to 8; see kCGImagePropertyOrientation for details. Pass zero if unknown.
options: A dictionary with options specifying auxiliary information for the image.

When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.45.9 TargetedImageRequestWithImageFile(File as FolderItem, orientation as Integer = 0, options as Dictionary, DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil) as VNTargetedImageRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new request targeting an image of known orientation, at the specified file, executing the completion handler when done.
Notes:

File: The file of the targeted image.
orientation: The orientation of the image buffer, based on EXIF specification and superseding other orientation information. The value must be an integer from 1 to 8; see kCGImagePropertyOrientation for details. Pass 0 if unknown.
options: A dictionary with options specifying auxiliary information for the image.

When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.45.10 TargetedImageRequestWithPicture(Picture as Picture, orientation as Integer = 0, options as Dictionary, DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil) as VNTargetedImageRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new request targeting a Core Graphics image of known orientation, executing the completion handler when done.
Notes:

Picture: The targeted Core Graphics image.
orientation: The orientation of the image buffer, based on EXIF specification and superseding other orientation information. The value must be an integer from 1 to 8; see kCGImagePropertyOrientation for details. Value 0 means unknown.
options: A dictionary with options specifying auxiliary information for the image.

When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.46 class VNTextObservationMBS

177.46.1 class VNTextObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Information about regions of text detected by an image analysis request.
Notes:

This type of observation results from a VNDetectTextRectanglesRequestMBS. It expresses the location of each detected character by its bounding box.
Available on MacOS 10.13 or newer.
Subclass of the VNRectangleObservationMBS class.

177.46.2 Blog Entries

- Vision Framework for Xojo

177.46.3 Methods

177.46.4 characterBoxes as VNRectangleObservationMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An array of detected individual character bounding boxes.
Notes: If the associated VNDetectTextRectanglesRequestMBS request indicates interest in character boxes by setting the option VNRequestOptionReportCharacterBoxes to true, this property is non-nil. If no characters are found, it remains empty.

177.46.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor.

177.47 class VNTrackingRequestMBS

177.47.1 class VNTrackingRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The abstract superclass for image analysis requests that track unique features across multiple images or video frames.
Notes:

Instantiate a tracking request subclass to perform object tracking across multiple frames of an image. After initialization, configure the degree of accuracy by setting trackingLevel, and provide observations you would like to track by setting the inputObservation initial bounding box.
Subclass of the VNImageBasedRequestMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

177.47.2 Blog Entries

- Vision Framework for Xojo

177.47.3 Methods

177.47.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The private constructor.

177.47.5 Properties

177.47.6 inputObservation as VNDetectedObjectObservationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The observation object defining a region to track.
Notes:

Providing an observation not returned from a tracker, such as a user-defined observation, begins a new tracker for the sequence. Providing an observation that was returned from a tracker continues the use of that tracker, to track the region to the next frame.
In general, unless specified in the request's documentation or header file, you must define the rectangle in normalized coordinates, with the origin at the lower-left corner.
(Read only property)

177.47.7 LastFrame as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A Boolean that indicates the last frame in a tracking sequence.
Notes:

If set to true, the current tracker will be released to the pool of available trackers when the current frame finishes processing.
(Read and Write property)

177.47.8 trackingLevel as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A value for specifying whether to prioritize speed or location accuracy.
Notes:

Use VNRequestTrackingLevelAccurate or VNRequestTrackingLevelFast.
(Read only property)

177.47.9 Constants

177.47.10 VNRequestTrackingLevelAccurate = 0

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the tracking levels.
Notes: Tracking level that favors location accuracy over speed.

177.47.11 VNRequestTrackingLevelFast = 1

MBS MacFrameworks Plugin, Plugin Version: 19.4. **Function:** One of the tracking levels.
Notes: Tracking level that favors speed over location accuracy.

177.48 class VNTrackObjectRequestMBS

177.48.1 class VNTrackObjectRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An image analysis request that tracks movement of a previously identified arbitrary object across multiple images or video frames.
Notes:

Use this type of request to track the bounding boxes around objects previously identified in an image. Vision will attempt to locate the same object from the input observation throughout the sequence.
Subclass of the VNTrackingRequestMBS class.

177.48.2 Blog Entries

- Vision Framework for Xojo

177.48.3 Methods

177.48.4 Constructor(observation as VNDetectedObjectObservationMBS, DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new object tracking request with a detected object observation.
Notes:

observation: A detected object observation with bounding box information.

When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.49 class VNTrackRectangleRequestMBS

177.49.1 class VNTrackRectangleRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An image analysis request that tracks movement of a previously identified rectangular object across multiple images or video frames.
Notes:

Use this type of request to track the bounding boxes of rectangles throughout a sequence of images. Vision returns locations for rectangles found in all orientations and sizes.
Subclass of the VNTrackingRequestMBS class.

177.49.2 Blog Entries

- Vision Framework for Xojo

177.49.3 Methods

177.49.4 Constructor(observation as VNRectangleObservationMBS, DelegateHandler as VNRequestCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new rectangle tracking request with a rectangle observation.
Notes:

observation: A rectangle observation with bounding box and corner location information.

When work is done, the optional delegate method is invoked to provide result on success or error on failure.

177.50 class VNTranslationalImageRegistrationRequestMBS

177.50.1 class VNTranslationalImageRegistrationRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An image analysis request that determines the affine transform needed to align the content of two images.
Notes:

Create and perform a translational image registration request to align content in two images through translation.
Subclass of the VNImageRegistrationRequestMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

177.50.2 Blog Entries

VLC

178.1 class VLCAudioOutputDeviceMBS

178.1.1 class VLCAudioOutputDeviceMBS

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for details on audio output devices.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

178.1.2 Methods

178.1.3 Constructor

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

178.1.4 Destructor

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

178.1.5 Properties

178.1.6 Description as String

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The User-friendly device description.
Notes: (Read and Write property)

178.1.7 Device as String

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The output device ID.
Notes: (Read and Write property)

178.1.8 NextOutput as VLCAudioOutputDeviceMBS

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The next entry in the list.
Notes:

You can loop over entries. Last one has nil in this property.
(Read and Write property)

178.2 class VLCAudioOutputMBS

178.2.1 class VLCAudioOutputMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Description for audio output.
Notes:

It contains name, description and pointer to next record.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

178.2.2 Methods

178.2.3 Constructor

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

178.2.4 Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

178.2.5 Properties

178.2.6 Description as String

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The description for this audio output.
Notes: (Read and Write property)

178.2.7 Name as String

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The name of this audio output.
Notes: (Read and Write property)

178.2.8 NextOutput as VLCAudioOutputMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The next audio output reference.
Notes: (Read and Write property)

178.3 class VLCEqualizerMBS

178.3.1 class VLCEqualizerMBS

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for equalizer in VLC.
Notes: Requires VLC 2.2.

178.3.2 Blog Entries

- MBS Xojo Plugins, version 18.0pr8

178.3.3 Methods

178.3.4 BandFrequency(index as Integer) as Double

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get a particular equalizer band frequency.
Notes:

This value can be used, for example, to create a label for an equalizer band control in a user interface.

Index: index of the band, counting from zero
Returns equalizer band frequency (Hz), or -1 if there is no such band

Requires LibVLC 2.2.0 or later

178.3.5 Constructor(index as Integer, vlc as VLCInstanceMBS = nil)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create a new equalizer, with initial frequency values copied from an existing preset.
Notes:

The new equalizer can subsequently be applied to a media player by invoking VLCMediaPlayerMBS.SetEqualizer.

Index: index of the preset, counting from zero.

Requires VLC 2.2.
See also:

- 178.3.6 Constructor(vlc as VLCInstanceMBS = nil) 21854

178.3.6 Constructor(vlc as VLCInstanceMBS = nil)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create a new default equalizer, with all frequency values zeroed.
Notes:

The new equalizer can subsequently be applied to a media player by invoking VLCMediaPlayerMBS.SetEqualizer.
Requires VLC 2.2.
See also:

- 178.3.5 Constructor(index as Integer, vlc as VLCInstanceMBS = nil) 21853

178.3.7 Destructor

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

178.3.8 PresetName(index as Integer) as string

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the name of a particular equalizer preset.
Notes:

This name can be used, for example, to prepare a preset label or menu in a user interface.

index: index of the preset, counting from zero
Returns name, or "" if there is no such preset
Requires LibVLC 2.2.0 or later.

178.3.9 Properties

178.3.10 BandCount as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the number of distinct frequency bands for an equalizer.
Notes:

Requires LibVLC 2.2.0 or later.
(Read only property)

178.3.11 Handle as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

178.3.12 Preamp as Single

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set a new pre-amplification value for an equalizer.
Notes:

The new equalizer settings are subsequently applied to a media player by invoking VLCMediaPlayer.SetEqualizer.

The supplied amplification value will be clamped to the -20.0 to +20.0 range.

preamp value (-20.0 to 20.0 Hz)
Returns zero on success, -1 on error.

Requires LibVLC 2.2.0 or later
(Read and Write property)

178.3.13 PresetCount as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the number of equalizer presets.
Notes:

Requires LibVLC 2.2.0 or later
(Read only property)

178.3.14 VLC as VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The reference to the parent VLC instance object.
Notes: (Read only property)

178.3.15 Map(Index as Integer) as Single

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set a new amplification value for a particular equalizer frequency band.
Notes:

The new equalizer settings are subsequently applied to a media player by invoking VLCMediaPlayerMBS.SetEqualizer.

The supplied amplification value will be clamped to the -20.0 to +20.0 range.

Value: amplification value (-20.0 to 20.0 Hz)
index, counting from zero, of the frequency band to set

Requires LibVLC 2.2.0 or later
(Read and Write computed property)

178.4 class VLCEventManagerMBS

178.4.1 class VLCEventManagerMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for getting event with VLC.
Notes:

Only the events which the parent object sends are delivered.
With 12.3pr5 and newer plugins, this function sends events to main thread as it should be.

178.4.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.1pr5
- MBS Real Studio Plugins, version 12.3pr5

178.4.3 Methods

178.4.4 Constructor(Media as VLCMediaMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Initializes event manager for media.
See also:

178.4.9 Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

178.4.10 Listen

MBS VLC Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Registers internally events.
Notes:

This is normally called in the constructor.
If you add event handlers later via AddHandler command, you need to call this method to have those event handlers also registered.

178.4.11 Properties

178.4.12 Handle as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

178.4.13 Parent as Variant

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The parent object.
Notes:

Just a reference back, so the target object is not released too early.
(Read and Write property)

178.4.14 VLC as VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The reference to the VLC instance.
Notes: (Read only property)

178.4.15 Events

178.4.16 Log(Message as String, level as Integer, Name as String, Header as String, ModuleName as String, FileName as String, Line as Integer)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A log message arrived.

Notes:

message: The message to log.
level: message level, e.g. kLogLevelError
Name: object name
Header: object header or empty.
ModuleName: module name
FileName: The source code file name.
Line: The source code line number.

Enable this event using VLCInstanceMBS.SetLogEvent method.

178.4.17 MediaDiscovererEnded

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media discovered ended.

178.4.18 MediaDiscovererStarted

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media discoverer started.

178.4.19 MediaDurationChanged(newDuration as Int64)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Duration of media changed.

178.4.20 MediaFreed(media as VLCMediaMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media was released.

178.4.21 MediaListItemAdded(item as VLCMediaMBS, index as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media list item added.

178.4.22 MediaListItemDeleted(item as VLCMediaMBS, index as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media list item deleted.

178.4.23 MediaListPlayerNextItemSet(item as VLCMediaMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

178.4.24 MediaListPlayerPlayed

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media list player played.

178.4.25 MediaListPlayerStopped

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media list player stopped.

178.4.26 MediaListWillAddItem(item as VLCMediaMBS, index as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media list will add item.

178.4.27 MediaListWillDeleteItem(item as VLCMediaMBS, index as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media list will delete item.

178.4.28 MediaMetaChanged(metatype as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Metadata changed.

178.4.29 MediaParsedChanged(newStatus as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Parsed status changed.

178.4.30 MediaPlayerBackward

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media player moved backwards.

178.4.31 MediaPlayerBuffering

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

178.4.32 MediaPlayerEncounteredError

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

178.4.33 MediaPlayerEndReached

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media player reached end of media.

178.4.34 MediaPlayerForward

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Player moved forward.

178.4.35 MediaPlayerLengthChanged(NewLength as Int64)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The length of the media changed.

178.4.36 MediaPlayerMediaChanged(item as VLCMediaMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The media changed in the media player.

178.4.37 MediaPlayerNothingSpecial

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

178.4.38 MediaPlayerOpening

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Media player is opening.

178.4.39 MediaPlayerPausableChanged(pausable as boolean)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media player's pausable state changed.

178.4.40 MediaPlayerPaused

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The player was paused.

178.4.41 MediaPlayerPlaying

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The player is playing.

178.4.42 MediaPlayerPositionChanged(newPosition as Double)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Position changed.
Notes: This event does not fire if you assigned new position. It is only to inform you that position changed

due to playing video.

178.4.43 MediaPlayerScrambledChanged(newScrambled as Integer)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The scrambled property changed.

178.4.44 MediaPlayerSeekableChanged(seekable as boolean)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media Player's seekable status changed.

178.4.45 MediaPlayerSnapshotTaken(filename as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A snapshot has been taken.

178.4.46 MediaPlayerStopped

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media player stopped.

178.4.47 MediaPlayerTimeChanged(newTime as Int64)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media player reached a new time.

178.4.48 MediaPlayerTitleChanged(newTitle as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The title changed.

178.4.49 MediaPlayerVout(newCount as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

178.4.50 MediaStateChanged(newState as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** State changed on media.

178.4.51 MediaSubItemAdded(media as VLCMediaMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media got a new subitem.

178.4.52 MediaSubItemTreeAdded(media as VLCMediaMBS)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A media item got new sub items.

178.4.53 VlmMediaAdded(MediaName as string, InstanceName as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

178.4.54 VlmMediaChanged(MediaName as string, InstanceName as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

178.4.55 VlmMediaInstanceStarted(MediaName as string, InstanceName as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

178.4.56 VlmMediaInstanceStatusEnd(MediaName as string, InstanceName as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

178.4.57 VlmMediaInstanceStatusError(MediaName as string, InstanceName as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

178.4.58 VlmMediaInstanceStatusInit(MediaName as string, InstanceName as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

178.4.59 VlmMediaInstanceStatusOpening(MediaName as string, InstanceName as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

178.4.60 VlmMediaInstanceStatusPause(MediaName as string, InstanceName as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

178.4.61 VlmMediaInstanceStatusPlaying(MediaName as string, InstanceName as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

178.4.62 VlmMediaInstanceStopped(MediaName as string, InstanceName as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

178.4.63 VlmMediaRemoved(MediaName as string, InstanceName as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media was removed.

178.4.64 Constants

178.4.65 kLogLevelDebug = 0

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the log levels.
Notes: Debug message

178.4.66 kLogLevelError = 4

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the log levels.
Notes: Error message.

178.4.67 kLogLevelNotice = 2

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the log levels.
Notes: Important informational message

178.4.68 kLogLevelWarning = 3

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the log levels.
Notes: Warning (potential error) message

178.5 class VLCExitHandlerMBS

178.5.1 class VLCExitHandlerMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class to receive exit events from VLC user interface.
Notes: As you probably use this plugin with your own user interface, you don't need this class.

178.5.2 Events

178.5.3 ExitEvent

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** An exit event was received from VLC user interface.

178.6 class VLCInstanceMBS

178.6.1 class VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The main VLC class.
Notes:

Keep the instance in memory as long as you use any other VLC classes.
Only one instance per app, please.

178.6.2 Blog Entries

- MBS Xojo Plugins, version 18.6pr4

178.6.3 Methods

178.6.4 AddUserInterface(name as string) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Try to start a user interface for the libvlc instance.
Notes:

name: interface name, or nil for default.
Return true on success, false on error.

178.6.5 AudioOutputDevices(ModuleName as string) as VLCAudioOutputDeviceMBS

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets a list of audio output devices for a given audio output module.
Notes:

Not all audio outputs support this. In particular, an empty (nil)
list of devices does not imply that the specified audio output does
not work.

The list might not be exhaustive.

Some audio output devices in the list might not actually work in some circumstances. By default, it is recommended to not specify any explicit audio device.

Modulename: audio output name.

Returns a nil-terminated linked list of potential audio output devices.
Requires VLC 2.1.

178.6.6 ClearError

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clears the LibVLC error status for the current thread.
Notes:

This is optional.
By default, the error status is automatically overridden when a new error occurs, and destroyed when the thread exits.

178.6.7 ClearLog

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Unsets the logging callback for a LibVLC instance.
Notes:

This is rarely needed: the callback is implicitly unset when the instance is destroyed.
This function will wait for any pending callbacks invocation to complete
(causing a deadlock if called from within the callback).

Requires VLC 2.1.

178.6.8 Clock as Int64

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Return the current time as defined by LibVLC.
Notes:

The unit is the microsecond.
Time increases monotonically (regardless of time zone changes and RTC adjustements).
The origin is arbitrary but consistent across the whole system (e.g. the system uptim, the time since the system was booted). On systems that support it, the POSIX monotonic clock is used.

178.6.9 Constructor(args() as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create and initialize a libvlc instance.
Notes:

This functions accept a list of "command line" arguments similar to the main(). These arguments affect the LibVLC instance default configuration.

Arguments are meant to be passed from the command line to LibVLC, just like VLC media player does. The list of valid arguments depends on the LibVLC version, the operating system and platform, and set of available LibVLC plugins. Invalid or unsupported arguments will cause the function to fail (i.e. return nil). Also, some arguments may alter the behaviour or otherwise interfere with other LibVLC functions.

There is absolutely no warranty or promise of forward, backward and cross-platform compatibility with regards to this Constructor() arguments. We recommend that you do not use them, other than when debugging.

On success handle property is not nil.
For Version 19.0 of the plugins, please do not pass app path as first argument.

For MacOS, please set VLC_PLUGIN_PATH environment variable for the path to the plugins folder.

178.6.10 Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

178.6.11 ErrorMessage as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns an human-readable error message for the last VLC error in the calling thread.

178.6.12 GetAudioFilterList as VLCModuleDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a list of audio filters that are available.
Notes: Return a list of module descriptions.

178.6.13 GetAudioOutputDeviceCount(AudioOutputName as string) as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get count of devices for audio output, these devices are hardware oriented like analor or digital output of sound card.
Notes:

AudioOutputName: name of audio output.
Returns number of devices.

178.6.14 GetAudioOutputDeviceID(AudioOutputName as string, index as Integer) as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get id name of device.
Notes:

AudioOutputName: name of audio output.
Index: device index.
Returns id name of device, use for setting device.

178.6.15 GetAudioOutputDeviceLongName(AudioOutputName as string, index as Integer) as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get long name of device, if not available short name given.
Notes:

AudioOutputName: name of audio output.
Index: Device Index.
Returns long name of device.

178.6.16 GetAudioOutputList as VLCAudioOutputMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the list of available audio outputs.
Notes: Returns list of available audio outputs. In case of error, nil is returned.

178.6.17 GetChangeset as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve libvlc changeset.
Notes:

Example: "aa9bce0bc4"
Return a string containing the libvlc changeset.

178.6.18 GetCompiler as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve libvlc compiler version.
Notes:

Example: "gcc version 4.2.3 (Ubuntu 4.2.3-2ubuntu6)"
Return a string containing the libvlc compiler version.

178.6.19 getenv(name as string) as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries the environment variable with given name.

178.6.20 GetLoadError as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns error string from LoadLibrary function.

178.6.21 GetVersion as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve libvlc version.
Notes:

Example: "1.1.0-git The Luggage"
Return a string containing the libvlc version.

178.6.22 GetVideoFilterList as VLCModuleDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a list of video filters that are available.
Notes: Return a list of module descriptions

178.6.23 LoadLibrary(path as folderitem) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads the vlc library.
Notes:

Returns true on success and false on failure.
Please point to libVLC.dylib on Mac and libVLC.dll on Windows.
See also:

- 178.6.24 LoadLibrary(path as string) as boolean 21874

178.6.24 LoadLibrary(path as string) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads the vlc library.
Notes:

Returns true on success and false on failure.
Please point to libVLC.dylib on Mac and libVLC.dll on Windows.
See also:

- 178.6.23 LoadLibrary(path as folderitem) as boolean 21874

178.6.25 SetAppID(ID as string, Version as string, Icon as String)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets some meta-information about the application.
Notes:

See also SetUserAgent().

id: Java-style application identifier, e.g. "com.acme.foobar"
version: application version numbers, e.g. "1.2.3"
icon: application icon name, e.g. "foobar"

Requires VLC 2.1.

178.6.26 setlocale(category as Integer, locale as string) as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the locale to use.
Notes:

The Setlocale function sets the C library's notion of natural language formatting style for particular sets of routines. Each such style is called a 'locale' and is invoked using an appropriate name passed as a C string.

The setlocale() function recognizes several categories of routines. These are the categories and the sets of routines they select:

LocaleAll	Set the entire locale generically.
LocaleCollate	Set a locale for string collation routines. This controls alphabetic ordering in strcoll() and strxfrm().
LocaleCType	Set a locale for the ctype and multibyte functions. This controls recognition of upper and lower case, alphabetic or non-alphabetic characters, and so on.
LocaleMessages	Set a locale for message catalogs, see catopen function.
LocaleMonetary	Set a locale for formatting monetary values; this affects the localeconv() function.
LocaleNumeric	Set a locale for formatting numbers. This controls the formatting of decimal points in input and output of floating point numbers in functions such as printf() and scanf(), as well as values returned by localeconv().
LocaleTime	Set a locale for formatting dates and times using the strftime() function.

Only three locales are defined by default: the empty string "" (which denotes the native environment) and the "C" and "POSIX" locales (which denote the C-language environment). By default, C programs start in the "C" locale.

178.6.27 SetLogEvent

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the logging callback for a LibVLC instance.
Notes:

This function is thread-safe: it will wait for any pending callbacks
invocation to complete.

Some log messages (especially debug) are emitted by LibVLC while
is being initialized. These messages cannot be captured with this interface.

A deadlock may occur if this function is called from the event.

Requires VLC 2.1.

178.6.28 SetLogFile(File as FolderItem)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets up logging to a file.
Notes: Requires VLC 2.1.

178.6.29 SetUserAgent(AppName as string, httpUserAgent as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the application name.
Notes:

VLC passes this as the user agent string when a protocol requires it.

name: human-readable application name, e.g. "FooBar player 1.2.3"
http: HTTP User Agent, e.g. "FooBar/1.2.3 Python/2.6.0"

178.6.30 WaitUserInterface

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Waits until an interface causes the instance to exit.
Notes: You should start at least one interface first, using AddUserInterface.

178.6.31 Properties

178.6.32 Handle as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

178.6.33 ExitHandler as VLCExitHandlerMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Registers a callback for the LibVLC exit event.
Notes:

This is mostly useful if you have started at least one interface with AddUserInterface. Typically, this function will wake up your application main loop (from another thread).

This function and WaitUserInterface() cannot be used at the same time.
Use either or none of them but not both.
(Read and Write computed property)

178.7 class VLCMediaDiscovererMBS

178.7.1 class VLCMediaDiscovererMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The plugin class for the VLC media discovery.
Notes:

LibVLC media discovery finds available media via various means.
This corresponds to the service discovery functionality in VLC media player.
Different plugins find potential medias locally (e.g. user media directory), from peripherals (e.g. video capture device), on the local network (e.g. SAP) or on the Internet (e.g. Internet radios).

178.7.2 Methods

178.7.3 Constructor(vlc as VLCInstanceMBS, name as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Discover media service by name.
Notes:

vlc: The VLC instance.
Name: service name.
Handle is not nil on success.

178.7.4 Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

178.7.5 IsRunning as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Query if media service discover object is running.
Notes: Returns true if running, false if not.

178.7.6 LocalizedName as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the localized name.

178.7.7 MediaList as VLCMediaListMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get media service discover media list.

178.7.8 Properties

178.7.9 Handle as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Internal object reference.
Notes: (Read and Write property)

178.7.10 VLC as VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The reference to the VLC instance.
Notes: (Read only property)

178.8 class VLCMediaLibraryMBS

178.8.1 class VLCMediaLibraryMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for VLC media library.

178.8.2 Methods

178.8.3 Constructor(vlc as VLCInstanceMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create an new Media Library object.
Notes: On success handle property is not nil.

178.8.4 Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

178.8.5 Load as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Load media library.
Notes: Return true on success, false on error.

178.8.6 MediaList as VLCMediaListMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get media library subitems.

178.8.7 Properties

178.8.8 Handle as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

178.8.9 VLC as VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The reference to the VLC instance.
Notes: (Read only property)

178.9 class VLCMediaListMBS

178.9.1 class VLCMediaListMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a media list.

178.9.2 Methods

178.9.3 AddMedia(item as VLCMediaMBS) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Add media instance to media list.
Notes:

item: a media instance
Return true on success, false if the media list is read-only.
The Lock should be held upon entering this function.

178.9.4 Constructor(vlc as VLCInstanceMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create an empty media list.
Notes: On success the handle property is not zero.

178.9.5 Count as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get count on media list items.
Notes:

The Lock should be held upon entering this function.
Return number of items in media list.

178.9.6 Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

178.9.7 GetMedia as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get media instance from this media list instance.
Notes:

The Lock should NOT be held upon entering this function.
Returns media instance or nil.

178.9.8 IndexOfItem(item as VLCMediaMBS) as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Find index position of List media instance in media list.
Notes:

Warning: the function will return the first matched position.
The Lock should be held upon entering this function.

Returns position of media instance or -1 if media not found.

178.9.9 InsertMedia(item as VLCMediaMBS, index as Integer) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Insert media instance in media list on a position.
Notes:

The Lock should be held upon entering this function.
item: a media instance
index: position in array where to insert

Return true on success, false if the media list is read-only.

178.9.10 isReadOnly as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether this media list is read-only from a user point of view.
Notes: Returns true if readonly and false if read/write.

178.9.11 ItemAtIndex(index as Integer) as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** List media instance in media list at a position.
Notes:

The Lock should be held upon entering this function.
index: position in array where to get item.
Returns instance at position index, or nil if not found.

178.9.12 Lock

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get lock on media list items.

178.9.13 Remove(index as Integer) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Remove media instance from media list on a position.
Notes:

The Lock should be held upon entering this function.
index: position in array where to insert
Returns true on success, false if the list is read-only or the item was not found.

178.9.14 SetMedia(item as VLCMediaMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Associate media instance with this media list instance.
Notes:

If another media instance was present it will be released.
The Lock should NOT be held upon entering this function.

178.9.15 Unlock

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Release lock on media list items.
Notes: The Lock should be held upon entering this function.

178.9.16 Properties

178.9.17 Handle as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Internal object reference.
Notes: (Read and Write property)

178.9.18 VLC as VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The reference to the VLC instance.
Notes: (Read only property)

178.10 class VLCMediaListPlayerMBS

178.10.1 class VLCMediaListPlayerMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a VLC media list player.
Notes:

This is required to especially support playlist files.
The normal media player can only play a single media, and does not handle playlist files properly.

178.10.2 Methods

178.10.3 Constructor(vlc as VLCInstanceMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create new media list player.

178.10.4 Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

178.10.5 IsPlaying as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Is media list playing?
Notes: Return true for playing and false for not playing.

178.10.6 MoveNext as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Play next item from media list.
Notes: Return true upon success false if there is no next item.

178.10.7 MovePrevious as Boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Play previous item from media list.
Notes: Return true upon success false if there is no previous item.

178.10.8 Pause

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Pause media list

178.10.9 Play

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Play media list.

178.10.10 PlayItem(item as VLCMediaMBS) as Boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Play the given media item.
Notes: Return true upon success, false if the media is not part of the media list.

178.10.11 PlayItemAtIndex(index as Integer) as Boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Play media list item at position index.
Notes:

index: index in media list to play.
Return true upon success false if the item wasn't found.

178.10.12 SetMediaList(list as VLCMediaListMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set the media list associated with the player.

178.10.13 SetMediaPlayer(player as VLCMediaPlayerMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Replace media player in media list player with this instance.

178.10.14 SetPlaybackMode(mode as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the playback mode for the playlist.
Notes: See kPlaybackMode* constants.

178.10.15 State as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get current State of media list player.

178.10.16 Stop

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Stop playing media list.

178.10.17 Properties

178.10.18 Handle as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

178.10.19 List as VLCMediaListMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The list assigned to this media list player.
Notes: (Read and Write property)

178.10.20 Player as VLCMediaPlayerMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The player assigned to this media list player.
Notes: (Read and Write property)

178.10.21 VLC as VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The reference to the VLC instance.
Notes: (Read only property)

178.10.22 Constants

178.10.23 kPlaybackModeDefault = 0

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the playback mode constants.
Notes: Default

178.10.24 kPlaybackModeLoop = 1

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the playback mode constants.
Notes: Loop

178.10.25 kPlaybackModeRepeat = 2

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the playback mode constants.
Notes: Repeat

178.11 class VLCMediaMBS

178.11.1 class VLCMediaMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The VLC class for a media item.

178.11.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.0pr5

178.11.3 Methods

178.11.4 AddOption(options as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Add an option to the media.
Notes:

This option will be used to determine how the media_player will read the media. This allows to use VLC's advanced reading/streaming options on a per-media basis.

The options are detailed in vlc –long-help, for instance "–sout-all"

178.11.5 AddOptionFlag(options as string, flags as UInt32)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Add an option to the media with configurable flags.
Notes:

This option will be used to determine how the media_player will read the media. This allows to use VLC's advanced reading/streaming options on a per-media basis.

The options are detailed in vlc –long-help, for instance "–sout-all"

178.11.6 Clone as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a duplicate of media object.

178.11.7 Constructor(original as VLCMediaMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a copy of the media object.
See also:

- 178.11.8 Constructor(vlc as VLCInstanceMBS, URL as string) 21891

178.11.8 Constructor(vlc as VLCInstanceMBS, URL as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create a media with a certain given media resource location, for instance a valid URL.
Notes:

Do not pass a file path here! This is for URLs.

URL: the media location

To refer to a local file with this function, the file://... URI syntax must be used (see IETF RFC3986).
We recommend using MediaWithPath() instead when dealing with local files.
See also:

- 178.11.7 Constructor(original as VLCMediaMBS) 21891

178.11.9 Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor to cleanup the media.

178.11.10 Duration as Int64

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get duration (in ms) of media descriptor object item.
Notes: Return duration of media item or -1 on error.

178.11.11 IsParsed as Boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get Parsed status for media descriptor object.
Notes: Returns true if media object has been parsed otherwise it returns false.

178.11.12 MediaWithData(vlc as VLCInstanceMBS, data as memoryblock) as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create a media for a certain data.
Notes:

Internally creates temp file for the data and opens the file.
File is later deleted when VLCMediaMBS goes out of scope.
Returns new media object or nil.
See also:

- 178.11.13 MediaWithData(vlc as VLCInstanceMBS, data as string) as VLCMediaMBS 21892

178.11.13 MediaWithData(vlc as VLCInstanceMBS, data as string) as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create a media for a certain data.
Notes:

Internally creates temp file for the data and opens the file.
File is later deleted when VLCMediaMBS goes out of scope.
Returns new media object or nil.
See also:

- 178.11.12 MediaWithData(vlc as VLCInstanceMBS, data as memoryblock) as VLCMediaMBS 21892

178.11.14 MediaWithFile(vlc as VLCInstanceMBS, file as folderitem) as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create a media for a certain file path.
Notes:

file: local filesystem path as folderitem.
Returns new media object or nil.

178.11.15 MediaWithFileDescriptor(vlc as VLCInstanceMBS, fd as Integer) as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create a media for an already open file descriptor.
Notes:

The file descriptor shall be open for reading (or reading and writing).

Regular file descriptors, pipe read descriptors and character device descriptors (including TTYs) are supported on all platforms. Block device descriptors are supported where available.
Directory descriptors are supported on systems that provide fdopendir(). Sockets are supported on all platforms where they are file descriptors, i.e. all except Windows.

This library will not automatically close the file descriptor under any circumstance. Nevertheless, a file descriptor can usually only be rendered once in a media player. To render it a second time, the file descriptor should probably be rewound to the beginning with lseek().

Returns new media object or nil.

178.11.16 MediaWithPath(vlc as VLCInstanceMBS, Path as string) as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create a media for a certain file path.
Notes:

path: local filesystem path
Returns new media object or nil.

178.11.17 MediaWithURL(vlc as VLCInstanceMBS, URL as string) as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create a media with a certain given media resource location, for instance a valid URL.
Example:

```
dim v as VLCInstanceMBS // your vlc object
dim m as VLCMediaMBS

// load with URL
m = VLCMediaMBS.MediaWithURL(v, "http://www.mbsplugins.com/WriteInvoice-iPhone.m4v")

// or with file URL:
m = VLCMediaMBS.MediaWithURL(v, moviefile.URLPath)
```

Notes:

URL: the media location
Returns the new media object or nil.
To refer to a local file with this function, the file://... URI syntax must be used (see IETF RFC3986).
We recommend using MediaWithPath() instead when dealing with local files.

178.11.18 Meta(type as Integer) as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Read the meta of the media.
Notes:

If the media has not yet been parsed this will return an empty string.

This methods automatically calls ParseAsync(), so after calling it you may receive a MediaMetaChanged event. If you prefer a synchronous version ensure that you call Parse() before get_meta().

178.11.19 MRL as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the media resource locator (mrl) from a media descriptor object.

178.11.20 NewAsNode(vlc as VLCInstanceMBS, name as string) as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create a media as an empty node with a given name.
Notes:

Name: The name of the new node.
Returns new media object or nil.

178.11.21 Parse

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Parse a media.
Notes:

This fetches (local) meta data and tracks information.
The method is synchronous.

178.11.22 ParseAsync

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Parse a media.
Notes:

This fetches (local) meta data and tracks information.
The method is the asynchronous of Parse.
To track when this is over you can listen to MediaParsedChanged event. However if the media was already parsed you will not receive this event.

178.11.23 SaveMeta as Boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Save the meta previously set.
Notes: Return true if the write operation was successfull.

178.11.24 SetMeta(meta as Integer, value as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set the meta of the media
Notes:

This function will not save the meta, call SaveMeta in order to save the meta.

meta: Which meta data. See kMeta* constants.
Value: the media's meta

178.11.25 State as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get current state of media descriptor object.
Notes: See kState* constants.

178.11.26 Stats as VLCMediaStatsMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the current statistics about the media.
Notes: Returns statistics for media.

178.11.27 SubItems as VLCMediaListMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get subitems of media descriptor object.

178.11.28 TrackInfos as VLCMediaTrackInfoMBS()

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get media descriptor's elementary streams description.
Notes:

Note, you need to call Parse or play the media at least once before calling this function.
Not doing this will result in an empty array.

178.11.29 Tracks as VLCMediaTrackMBS()

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get media descriptor's elementary streams description.
Notes:

Note, you need to call Parse or play the media at least once before calling this function.
Not doing this will result in an empty array.

Requires LibVLC 2.1.0 and later.

Returns an array of track objects.

178.11.30 Properties

178.11.31 Handle as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

178.11.32 Tag as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The media descriptor's user_data.

Notes:

This is a value you can use as you like.
This value survives even if the VLCMediaMBS object is destroyed and later recreated with the same VLC media object behind.
(Read and Write property)

178.11.33 VLC as VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The reference to the VLC instance.
Notes: (Read only property)

178.11.34 Constants

178.11.35 kMetaActors = 22

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the Metadata Types Constants
Notes: Actors

178.11.36 kMetaAlbum = 4

178.12.4 Methods

178.12.5 Constructor(media as VLCMediaMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create a Media Player object from a Media.
Notes: On success handle is not nil.
See also:

- 178.12.6 Constructor(VLCInstance as VLCInstanceMBS) 21904

178.12.6 Constructor(VLCInstance as VLCInstanceMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create an empty Media Player object.
Notes: On success handle is not nil.
See also:

- 178.12.5 Constructor(media as VLCMediaMBS) 21904

178.12.7 CopyCGImage as Variant

MBS VLC Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies current frame as CGImageMBS.
Notes: This method set HasNewFrame to false.

178.12.8 CopyMemory as memoryblock

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies current frame as memoryblock.
Notes:

This method set HasNewFrame to false.
The format depends on what you passed to VideoSetFormat.
Byte order usually is BGRA.

178.12.9 CopyPicture as Picture

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies current frame as picture.
Notes:

This method set HasNewFrame to false.
If using CGContext, this returns a CGImageMBS. Else a Picture.

With version 19.0, this returns always a picture.

178.12.10 CopyToMemory(dest as Ptr, offset as Integer, RowBytes as Integer) as boolean

MBS VLC Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies current frame into a given memory block.
Notes:

Offset: Position of first byte in memoryblock.
RowBytes: The row size in bytes of your memoryblock.

This way you can have your frame go into a buffer of bigger width/height representing an OpenGL texture for example.
Byte order usually is BGRA.

178.12.11 Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

178.12.12 GetChapterCountForTitle(title as Integer) as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get title chapter count.
Notes: Return number of chapters in title, or -1.

178.12.13 GetChapterDescription(index as Integer) as VLCTrackDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the description of available chapters for specific title.
Notes: Return list containing description of available chapter for title with index.

178.12.14 GetMemory as Ptr

MBS VLC Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns pointer to memory with current frame.
Notes:

This method set HasNewFrame to false.
The format depends on what you passed to VideoSetFormat.

178.12.15 Navigate(Navigate as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Navigate through DVD Menu.

178.12.16 NextChapter

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set next chapter (if applicable)

178.12.17 NextFrame

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Display the next frame (if supported)

178.12.18 Pause

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Toggle pause (no effect if there is no media)
See also:

- 178.12.19 Pause(pause as boolean) 21907

178.12.19 Pause(pause as boolean)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Pause or resume (no effect if there is no media)
Notes: pause: play/resume if false, pause if true.
See also:

- 178.12.18 Pause 21907

178.12.20 Play as Boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Plays video.
Notes: Return true if playback started (and was already started), or false on error.

178.12.21 PreviousChapter

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set previous chapter (if applicable)

178.12.22 SetAudioOutput(AudioOutputName as string) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set the audio output.
Notes:

Change will be applied after stop and play.
Name: name of audio output.
Return true on success.

178.12.23 SetAudioOutputDevice(AudioOutputName as string, deviceID as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set audio output device. Changes are only effective after stop and play.
Notes:

AudioOutputName: name of audio output.
deviceID: device ID.

178.12.24 SetEqualizer(Equalizer as VLCEqualizerMBS = nil)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Apply new equalizer settings to a media player.
Notes:

It is possible to apply new equalizer settings to a media player whether the media player is currently playing media or not.
Invoking this method will immediately apply the new equalizer settings to the audio output of the currently playing media if there is any.
If there is no currently playing media, the new equalizer settings will be applied later if and when new media is played.

Equalizer settings will automatically be applied to subsequently played media.

To disable the equalizer for a media player invoke this method passing nil for the equalizer parameter.

The media player does not keep a reference to the supplied equalizer so it is safe for an application to release the equalizer reference any time after this method returns.

Requires VLC 2.2.

178.12.25 SetSubtitleFile(filename as string) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set new video subtitle file.
Notes:

filename: new video subtitle file
Returns the success status.

178.12.26 SetVideoTitleDisplay(position as Integer, timeout as Integer)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set if, and how, the video title will be shown when media is played.
Notes:

position: position at which to display the title, or kVideoTitleDisplayPositionDisable to prevent the title from being displayed.
timeout: title display timeout in milliseconds (ignored if libvlc_position_disable)

Requires VLC 2.1.

178.12.27 Stop

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Stop (no effect if there is no media)

178.12.28 ToggleFullScreen

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Toggle fullscreen status on non-embedded video outputs.
Notes: See also Fullscreen property.

178.12.29 ToggleMute

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Toggle mute status.

178.12.30 ToggleTeletext

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Toggle teletext transparent status on video output.

178.12.31 VideoGetCursor(num as Integer, byref px as Integer, byref py as Integer) as Boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the mouse pointer coordinates over a video.
Notes:

Coordinates are expressed in terms of the decoded video resolution, not in terms of pixels on the screen/viewport (to get the latter, you can query your windowing system directly).

Either of the coordinates may be negative or larger than the corresponding dimension of the video, if the cursor is outside the rendering area.

The coordinates may be out-of-date if the pointer is not located on the video rendering area. LibVLC does not track the pointer if it is outside of the video widget.

LibVLC does not support multiple pointers (it does of course support multiple input devices sharing the same pointer) at the moment.

num: number of the video (starting from, and most commonly 0)
px: get the abscissa.
py: get the ordinate.
Returns true on success, false if the specified video does not exist

178.12.32 VideoGetSize(num as Integer, byref px as UInt32, byref py as UInt32) as Boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the pixel dimensions of a video.
Notes:

num: number of the video (starting from, and most commonly 0)
px: get the pixel width [OUT]
py: get the pixel height [OUT]
Return true on success, false if the specified video does not exist.

178.12.33 VideoSetCallback(width as integer, height as integer, CGContextHandle as integer = 0)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets video callbacks, so the plugin can provide current frame with CopyPicture method.
Notes:

You can use CopyPicture and CopyMemory methods to query new frame content.
The hasNewFrame property tells you whether a new frame is available.
The plugin will optionally draw the frames into the CGContext you provide.
Please use CopyCGImage to get a CGImage from image buffer.

178.12.34 VideoSetDeinterlace(Mode as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Enable or disable deinterlace filter.
Notes: Mode: Type of deinterlace filter, "" to disable.

178.12.35 VideoSetFormat(chroma as string, width as UInt32, height as UInt32, pitch as UInt32)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set decoded video chroma and dimensions.
Notes:

This only works in combination with SetVideoCallbacks().
chroma: a four-characters string identifying the chroma (e.g. "RV32" or "YUYV")
width: pixel width
height: pixel height
pitch: line pitch (in bytes)

All pixel planes are expected to have the same pitch.

178.12.36 VideoSetKeyInput(on as boolean)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Enable or disable key press events handling, according to the LibVLC hotkeys configuration.
Notes:

By default and for historical reasons, keyboard events are handled by the LibVLC video widget.

On X11, there can be only one subscriber for key press and mouse click events per window. If your application has subscribed to those events for the X window ID of the video widget, then LibVLC will not be able to handle key presses and mouse clicks in any case.

This function is only implemented for X11 and Win32 at the moment.

on: true to handle key press events, false to ignore them.

178.12.37 VideoSetLogoString(option as Integer, logo as String)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set logo option as string.
Notes: Options that take a different type value are ignored.

178.12.38 VideoSetMouseInput(on as boolean)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Enable or disable mouse click events handling.
Notes:

By default, those events are handled. This is needed for DVD menus to work, as well as a few video filters such as "puzzle".

This function is only implemented for X11 and Win32 at the moment.

on: true to handle mouse click events, false to ignore them.

178.12.39 VideoTakeSnapshot(num as Integer, path as string, width as Integer, height as Integer) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Take a snapshot of the current video window.
Notes:

If width AND height is 0, original size is used.
If width XOR height is 0, original aspect-ratio is preserved. (e.g. width = 0 and height = -1)

num: number of video output (typically 0 for the first/only one)
Path: the path where to save the screenshot to
Width: the snapshot's width
Height: the snapshot's height

Returns true on success, false if the video was not found

178.12.40 Properties

178.12.41 AGL as UInt32

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set the agl handler where the media player should render its video output.
Notes:

Returns the agl handler or 0 if none where set.
(Read and Write property)

178.12.42 AspectRatio as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/set current video aspect ratio.
Notes:

Set new video aspect-ratio or "" to reset to default. Invalid aspect ratios are ignored.
Get the video aspect ratio or "" if unspecified.

The value must be something like "4:3", "16:9", "16:10", ...
(Read and Write property)

178.12.43 AudioChannel as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Current audio channel.
Notes: (Read and Write property)

178.12.44 AudioDelay as Int64

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Current audio delay in microseconds.
Notes:

The audio delay will be reset to zero each time the media changes.
(Read and Write property)

178.12.45 AudioOutputDevices as VLCAudioOutputDeviceMBS

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets a list of potential audio output devices,
Notes:

See also SetAudioOutputDevice method.

Not all audio outputs support enumerating devices.
The audio output may be functional even if the list is empty (nil).

The list may not be exhaustive.

Some audio output devices in the list might not actually work in some circumstances. By default, it is recommended to not specify any explicit audio device.

Returns a nil-terminated linked list of potential audio output devices.
Requires LibVLC 2.2.0 or later.
(Read only property)

178.12.46 AudioOutputDeviceType as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set/Get current audio device type.
Notes:

Device type describes something like character of output sound - stereo sound, 2.1, 5.1 etc.
(Read and Write property)

178.12.47 AudioTrack as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Current audio track.
Notes:

Get or set current audio track.
(Read and Write property)

178.12.48 AudioTrackCount as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get number of available audio tracks.
Notes:

Returns the number of available audio tracks (int), or -1 if unavailable.
(Read only property)

178.12.49 CanPause as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Can this media player be paused?
Notes:

Returns true if the media player can pause.
(Read only property)

178.12.50 Chapter as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/set movie chapter.
Notes:

Returns chapter number currently playing, or -1 if there is no media.
Sets movie chapter (if applicable).
(Read and Write property)

178.12.51 ChapterCount as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get movie chapter count.
Notes:

Returns number of chapters in movie, or -1.
(Read only property)

178.12.52 CropGeometry as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set current crop filter geometry.

Notes:

Returns the crop filter geometry or "" if unset.
Set with new crop filter geometry ("" to unset).

Seems to be broken in our tests inside libVLC.
(Read and Write property)

178.12.53 FPS as Double

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get movie fps rate
Notes:

Returns frames per second (fps) for this playing movie, or 0 if unspecified.
(Read only property)

178.12.54 FullScreen as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Enable or disable fullscreen.
Notes:

With most window managers, only a top-level windows can be in full-screen mode. Hence, this function will not operate properly if XWindow property was used to embed the video in a non-top-level window. In that case, the embedding window must be reparented to the root window before fullscreen mode is enabled. You will want to reparent it back to its normal parent when disabling fullscreen.
(Read and Write property)

178.12.55 GetAudioTrackDescription as VLCTrackDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the description of available audio tracks.
Notes:

Returns list with description of available audio tracks, or nil.
(Read only property)

178.12.56 GetSPUDescription as VLCTrackDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the description of available video subtitles.
Notes:

Return list containing description of available video subtitles or nil.
(Read only property)

178.12.57 GetVideoTitleDescription as VLCTrackDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the description of available titles.
Notes:

Return list containing description of available titles.
(Read only property)

178.12.58 Handle as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

178.12.59 HasNewFrame as Boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether a new frame is available.
Notes: (Read and Write property)

178.12.60 HasVOut as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** How many video outputs does this media player have?
Notes:

Return the number of video outputs.
(Read only property)

178.12.61 Height as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get current video height.
Notes:

Returns the video pixel height or 0 if not applicable.
(Read only property)

178.12.62 HWND as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set a Win32/Win64 API window handle (HWND) where the media player should render its video output.
Notes:

If LibVLC was built without Win32/Win64 API output support, then this has no effects.

Get the Windows API window handle (HWND) previously set with this property. The handle will be returned even if LibVLC is not currently outputting any video to it.
Currently not supported by our plugin.
(Read and Write property)

178.12.63 IsPlaying as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether player is playing.
Notes: (Read only property)

178.12.64 IsSeekable as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Is this media player seekable?
Notes:

Returns true if the media player can seek.
(Read only property)

178.12.65 Length as Int64

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the current movie length (in ms).
Notes:

Return the movie length (in ms), or -1 if there is no media.
(Read only property)

178.12.66 Media as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set current media.
Notes: (Read and Write property)

178.12.67 Mute as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Current mute status.
Notes:

If true then mute, otherwise unmute.
(Read and Write property)

178.12.68 NSObject as Ptr

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set the NSView handler where the media player should render its video output.
Notes:

Currently not supported by our plugin.
(Read and Write property)

178.12.69 Position as Double

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set movie position.
Notes:

Movie position as percentage between 0.0 and 1.0.
Returns movie position, or -1. in case of error.

Set movie position. This has no effect if playback is not enabled. This might not work depending on the underlying input format and protocol.
(Read and Write property)

178.12.70 ProgramScrambled as boolean

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Check if the current program is scrambled.
Notes:

true if the current program is scrambled.
Requires VLC 2.2.
(Read only property)

178.12.71 Rate as Double

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set the requested movie play rate.
Notes:

Depending on the underlying media, the requested rate may be different from the real playback rate.
(Read and Write property)

178.12.72 Scale as Double

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set the current video scaling factor.
Notes:

That is the ratio of the number of pixels on screen to the number of pixels in the original decoded video in each dimension. Zero is a special value; it will adjust the video to the output window/drawable (in windowed mode) or the entire screen.

Note that not all video outputs support scaling.
(Read and Write property)

178.12.73 SPU as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set current video subtitle.

Notes:

Returns the video subtitle selected, or -1 if none.
(Read and Write property)

178.12.74 SPUCount as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the number of available video subtitles.
Notes: (Read only property)

178.12.75 SPUDelay as Int64

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set the current subtitle delay.
Notes:

This affects the timing of when the subtitle will be displayed.
Positive values means subtitles are being displayed later, while negative values will result in subtitles being displayed earlier.
The subtitle delay will be reset to zero each time the media changes.
(Read and Write property)

178.12.76 State as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get current movie state.
Notes:

Returns the current state of the media player (playing, paused, ...)
(Read only property)

178.12.77 Tag as Variant

MBS VLC Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The tag value.
Notes:

You can store whatever you like in this property.
(Read only property)

178.12.78 Time as Int64

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set the current movie time (in ms).
Notes:

Return the movie time (in ms), or -1 if there is no media.
Set the movie time (in ms). This has no effect if no media is being played.
Not all formats and protocols support this.
(Read and Write property)

178.12.79 Title as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set/Get movie title.
Notes:

Returns title number currently playing, or -1.
(Read and Write property)

178.12.80 TitleCount as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get movie title count.
Notes:

Returns title number count, or -1.
(Read only property)

178.12.81 VideoTeleText as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set current teletext page requested.
Notes: (Read and Write property)

178.12.82 VideoTrack as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set video track.
Notes: (Read and Write property)

178.12.83 VideoTrackCount as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get number of available video tracks.
Notes:

Returns the number of available video tracks.
(Read only property)

178.12.84 VideoTrackDescription as VLCTrackDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the description of available video tracks.
Notes:

Returns list with description of available video tracks, or nil on error.
(Read only property)

178.12.85 VLC as VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The reference to the VLC instance.
Notes: (Read only property)

178.12.86 Volume as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Current software audio volume.
Notes:

The volume in percents.
0 = mute, 100 = nominal / 0dB.
(Read and Write property)

178.12.87 Width as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get current video width.
Notes:

Returns the video pixel width or 0 if not applicable.

(Read only property)

178.12.88 WillPlay as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Is the player able to play.
Notes: (Read only property)

178.12.89 XWindow as UInt32

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set an X Window System drawable where the media player should render its video output.
Notes:

If LibVLC was built without X11 output support, then this has no effects.

The specified identifier must correspond to an existing Input/Output class X11 window. Pixmaps are not supported. The caller shall ensure that the X11 server is the same as the one the VLC instance has been configured with. This function must be called before video playback is started; otherwise it will only take effect after playback stop and restart.

Get the X Window System window identifier previously set with this property. Note that this will return the identifier even if VLC is not currently using it (for instance if it is playing an audio-only input).
Currently not supported by our plugin.
(Read and Write property)

178.12.90 VideoAdjust(option as Integer) as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/set adjust option as Integer.
Notes:

option: See kAdjust* constants.
Options that take a different type value are ignored.

Using kAdjustEnable with value 0 stops adjust filter. With other values you start adjust filter.
(Read and Write computed property)

178.12.91 VideoAdjustFloat(option as Integer) as single

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/set adjust option as float.
Notes:

option: See kAdjust* constants.
Options that take a different type value are ignored.
(Read and Write computed property)

178.12.92 VideoLogo(option as Integer) as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set logo option as Integer.
Notes:

Options that take a different type value are ignored.
Passing kLogoEnable as option value has the side effect of starting (arg not 0) or stopping (arg 0) the logo filter.
(Read and Write computed property)

178.12.93 VideoMarquee(option as Integer) as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get, Enable, disable or set an integer marquee option.
Notes:

Setting kMarqueeEnable has the side effect of enabling (arg not 0) or disabling (arg 0) the marq filter.
(Read and Write computed property)

178.12.94 VideoMarqueeString(option as Integer) as String

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set a string marquee option value
Notes: (Read and Write computed property)

178.12.95 Constants

178.12.96 kAdjustBrightness = 2

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the adjust parameter constants.
Notes: Brightness

178.12.97 kAdjustContrast = 1

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the adjust parameter constants.
Notes: Contrast

178.12.98 kAdjustEnable = 0

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the adjust parameter constants.
Notes: Enable

178.12.99 kAdjustGamma = 5

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the adjust parameter constants.
Notes: Gamma

178.12.100 kAdjustHue = 3

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the adjust parameter constants.
Notes: Hue

178.12.101 kAdjustSaturation = 4

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the adjust parameter constants.
Notes: Saturation

178.12.102 kAudioChannelDolbys = 5

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the audio channels constants.
Notes: Dolbys

178.12.103 kAudioChannelError = -1

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the audio channels constants.
Notes: Error

178.12.104 kAudioChannelLeft = 3

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the audio channels constants.
Notes: Left channel

178.12.105 kAudioChannelRight = 4

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the audio channels constants.
Notes: Right channel

178.12.106 kAudioChannelRStereo = 2

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the audio channels constants.
Notes: RStereo

178.12.107 kAudioChannelStereo = 1

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the audio channels constants.
Notes: Stereo

178.12.108 kAudioOutputDevice_2F2R = 4

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Audio device type constants.
Notes: 2F2R

178.12.109 kAudioOutputDevice_3F2R = 5

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Audio device type constants.
Notes: 3F2R

178.12.110 kAudioOutputDevice_5_1 = 6

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Audio device type constants.
Notes: 5/1

178.12.111 kAudioOutputDevice_6_1 = 7

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Audio device type constants.
Notes: 6/1

178.12.112 kAudioOutputDevice_7_1 = 8

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Audio device type constants.
Notes: 7/1

178.12.113 kAudioOutputDevice_Error = -1

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Audio device type constants.
Notes: Error

178.12.114 kAudioOutputDevice_Mono = 1

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Audio device type constants.
Notes: Mono

178.12.115 kAudioOutputDevice_SPDIF = 10

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Audio device type constants.
Notes: SPDIF

178.12.116 kAudioOutputDevice_Stereo = 2

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Audio device type constants.
Notes: Stereo

178.12.117 kLogoDelay = 4

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Option Parameters for VideoLogo.
Notes: Delay

178.12.118 kLogoEnable = 0

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Option Parameters for VideoLogo.
Notes: Enable/Disable

178.12.119 kLogoFile = 1

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Option Parameters for VideoLogo.
Notes:

File path.
Use with VideoSetLogoString: "file,d,t;file,d,t;..."

178.12.120 kLogoOpacity = 6

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Option Parameters for VideoLogo.
Notes: Opacity

178.12.121 kLogoPosition = 7

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Option Parameters for VideoLogo.
Notes: Position

178.12.122 kLogoRepeat = 5

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Option Parameters for VideoLogo.
Notes: Repeat

178.12.123 kLogoX = 2

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Option Parameters for VideoLogo.
Notes: X Position

178.12.124 kLogoY = 3

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Option Parameters for VideoLogo.
Notes: Y Position

178.12.125 kMarqueeColor = 2

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Marq options definition constants.
Notes: Color

178.12.126 kMarqueeEnable = 0

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Marq options definition constants.
Notes: Enable

178.12.127 kMarqueeOpacity = 3

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Marq options definition constants. **Notes:** Opacity

178.12.128 kMarqueePosition = 4

Notes: Paused

178.12.146 kStatePlaying = 3

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the state constants.
Notes: Playing

178.12.147 kStateStopped = 5

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the state constants.
Notes: Stopped

178.12.148 kVideoTitleDisplayPositionBottom = 6

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the video title display positions.
Notes: Bottom

178.12.149 kVideoTitleDisplayPositionBottomLeft = 7

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the video title display positions.
Notes: Bottom Left

178.12.150 kVideoTitleDisplayPositionBottomRight = 8

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the video title display positions.
Notes: Bottom Right

178.12.151 kVideoTitleDisplayPositionCenter = 0

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the video title display positions.
Notes: Center

178.12.152 kVideoTitleDisplayPositionDisable = -1

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the video title display positions.
Notes: Disabled

178.12.153 kVideoTitleDisplayPositionLeft = 1

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the video title display positions.
Notes: Left

178.12.154 kVideoTitleDisplayPositionRight = 2

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the video title display positions.
Notes: Right

178.12.155 kVideoTitleDisplayPositionTop = 3

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the video title display positions.
Notes: Top

178.12.156 kVideoTitleDisplayPositionTopLeft = 4

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the video title display positions.
Notes: Top Left

178.12.157 kVideoTitleDisplayPositionTopRight = 5

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the video title display positions.
Notes: Top Right

178.13 class VLCMediaStatsMBS

178.13.1 class VLCMediaStatsMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for media statistics.

178.13.2 Properties

178.13.3 DecodedAudio as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Decoded audio.
Notes: (Read and Write property)

178.13.4 DecodedVideo as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Decoded video.
Notes: (Read and Write property)

178.13.5 DemuxBitrate as Single

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Bitrate for demux input.
Notes: (Read and Write property)

178.13.6 DemuxCorrupted as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Demux corrupted.
Notes: (Read and Write property)

178.13.7 DemuxDiscontinuity as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The demux discontinuity.

Notes: (Read and Write property)

178.13.8 DemuxRead_bytes as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Number of read bytes by demuxer.
Notes: (Read and Write property)

178.13.9 DisplayedPictures as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Number of displayed video frames.
Notes: (Read and Write property)

178.13.10 InputBitrate as Single

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The input bit rate.
Notes: (Read and Write property)

178.13.11 LostAbuffers as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Number of lost audio buffers.
Notes: (Read and Write property)

178.13.12 LostPictures as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Number of lost video frames.
Notes: (Read and Write property)

178.13.13 PlayedAbuffers as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Number of played Audio buffers.

Notes: (Read and Write property)

178.13.14 ReadBytes as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Number of bytes read from input.
Notes: (Read and Write property)

178.13.15 SendBitrate as Single

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The sending bit rate.
Notes: (Read and Write property)

178.13.16 SentBytes as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Number of bytes sent.
Notes: (Read and Write property)

178.13.17 SentPackets as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Number of packets sent.
Notes: (Read and Write property)

178.14 class VLCMediaTrackInfoMBS

178.14.1 class VLCMediaTrackInfoMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for track information.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

178.14.2 Blog Entries

- MBS Real Studio Plugins, version 12.3pr2

178.14.3 Methods

178.14.4 Constructor

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

178.14.5 Destructor

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

178.14.6 Properties

178.14.7 Channels as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The number of channels in an audio track.
Notes: (Read and Write property)

178.14.8 Codec as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The track's codec identifier.

Notes: (Read and Write property)

178.14.9 CodecString as String

MBS VLC Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The track's codec identifier as string.
Notes: (Read and Write property)

178.14.10 Height as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The height in pixel of a video track.
Notes: (Read and Write property)

178.14.11 ID as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The track'S ID.
Notes: (Read and Write property)

178.14.12 Level as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The codec's level.
Notes: (Read and Write property)

178.14.13 Profile as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The codec's profile.
Notes: (Read and Write property)

178.14.14 Rate as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The rate for an audio track.

Notes:

e.g. 44000 Hz.
(Read and Write property)

178.14.15 Type as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The track type.
Notes:

Can be TrackAudio, TrackText, TrackVideo or TrackUnknown.
(Read and Write property)

178.14.16 Width as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The width in pixel of a video track.
Notes: (Read and Write property)

178.14.17 Constants

178.14.18 TrackAudio = 0

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the track types.
Notes: Audio

178.14.19 TrackText = 2

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the track types.
Notes: Text track, e.g. subtitles.

178.14.20 TrackUnknown = -1

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the track types.
Notes: Unknown

178.14.21 TrackVideo = 1

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the track types.
Notes: Video

178.15 class VLCMediaTrackMBS

178.15.1 class VLCMediaTrackMBS

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for the media track.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

178.15.2 Methods

178.15.3 Constructor

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

178.15.4 Destructor

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

178.15.5 Properties

178.15.6 Bitrate as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The bitrate.
Notes: (Read and Write property)

178.15.7 Channels as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The number of channels.
Notes: (Read and Write property)

178.15.8 Codec as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The codec ID.
Notes: (Read and Write property)

178.15.9 CodecString as String

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The codec ID as 4 letter text.
Notes: (Read and Write property)

178.15.10 Description as String

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The track description.
Notes: (Read and Write property)

178.15.11 Encoding as String

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The text encoding for subtitles.
Notes: (Read and Write property)

178.15.12 FrameRate as Double

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The framerate.
Notes: (Read and Write property)

178.15.13 FrameRateDen as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The framerate.
Notes: (Read and Write property)

178.15.14 FrameRateNum as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The framerate.
Notes: (Read and Write property)

178.15.15 Height as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The height of a video track.
Notes: (Read and Write property)

178.15.16 ID as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The ID of the track.
Notes: (Read and Write property)

178.15.17 Language as String

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The language for this track.
Notes: (Read and Write property)

178.15.18 Level as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The codec specific level value.
Notes: (Read and Write property)

178.15.19 OriginalCode as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The original code for codec.
Notes: (Read and Write property)

178.15.20 Profile as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Codec specific profile value.
Notes: (Read and Write property)

178.15.21 Rate as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The sound rate in Hz.
Notes: (Read and Write property)

178.15.22 Sar as Double

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The aspect ratio.
Notes: (Read and Write property)

178.15.23 SarDen as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The aspect ratio.
Notes: (Read and Write property)

178.15.24 SarNum as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The aspect ratio.
Notes: (Read and Write property)

178.15.25 Type as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The track type.
Notes: (Read and Write property)

178.15.26 Width as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The width of a video track.
Notes: (Read and Write property)

178.15.27 Constants

178.15.28 TrackAudio = 0

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the track types.
Notes: Audio

178.15.29 TrackText = 2

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the track types.
Notes: Text

178.15.30 TrackUnknown = -1

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the track types.
Notes: Unknown type

178.15.31 TrackVideo = 1

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the track types.
Notes: Video

178.16 class VLCMissingFunctionExceptionMBS

178.16.1 class VLCMissingFunctionExceptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The exception which is raised if you call a function which is not available.
Notes:

Either your VLC shared library does not have the function or you did not yet load the library.
Subclass of the RuntimeException class.

178.17 class VLCModuleDescriptionMBS

178.17.1 class VLCModuleDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a module description.

178.17.2 Methods

178.17.3 Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

178.17.4 Properties

178.17.5 Help as String

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The help text.
Notes: (Read and Write property)

178.17.6 LongName as String

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The long name.
Notes: (Read and Write property)

178.17.7 Name as String

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The name of the module.
Notes: (Read and Write property)

178.17.8 NextModule as VLCModuleDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The link to the next module.
Notes: (Read and Write property)

178.17.9 ShortName as String

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The short name.
Notes: (Read and Write property)

178.18 class VLCNotInitializedExceptionMBS

178.18.1 class VLCNotInitializedExceptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This exception is raised if you call a method on an uninitialized object.
Notes:

Should not happen. And if it happens, you have a bug in your code.
Subclass of the RuntimeException class.

178.19 class VLCTrackDescriptionMBS

178.19.1 class VLCTrackDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Description for video, audio tracks and subtitles.
Notes: It contains id, name (description string) and reference to next record.

178.19.2 Methods

178.19.3 Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

178.19.4 Properties

178.19.5 ID as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The track ID.
Notes: (Read and Write property)

178.19.6 Name as String

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The track name.
Notes: (Read and Write property)

178.19.7 NextTrack as VLCTrackDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The next track in the list.
Notes: (Read and Write property)

Chapter 179

WebKit2

179.1 class WKBackForwardListItemMBS

179.1.1 class WKBackForwardListItemMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A WKBackForwardListItem object represents a webpage in the back-forward list of a web view.
Notes:

For 32-bit a WebHistoryItem object, for 64-bit a WKBackForwardListItem object.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

179.1.2 Blog Entries

- MBS Xojo Plugins, version 20.0r5

179.1.3 Methods

179.1.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

179.1.5 Properties

179.1.6 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read only property)

179.1.7 initialURL as String

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The URL of the initial request that created this item.
Notes: (Read only property)

179.1.8 title as String

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The title of the webpage represented by this item.
Notes: (Read only property)

179.1.9 URL as String

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The URL of the webpage represented by this item.
Notes: (Read only property)

179.2 class WKBackForwardListMBS

179.2.1 class WKBackForwardListMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A WKBackForwardList object is a list of webpages previously visited in a web view that can be reached by going back or forward.
Notes: For 32-bit a WebBackForwardList object, for 64-bit a WKBackForwardList object.

179.2.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 20.0
- MBS Xojo Plugins, version 20.0r5

179.2.3 Methods

179.2.4 backList as WKBackForwardListItemMBS()

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The portion of the list preceding the current item.
Notes: The items are in the order in which they were originally visited.

179.2.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.
See also:

- 179.2.6 Constructor(WKWebView as WKWebViewMBS) 21955

179.2.6 Constructor(WKWebView as WKWebViewMBS)

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Queries back forward list for a web view.
See also:

- 179.2.5 Constructor 21955

179.2.7 forwardList as WKBackForwardListItemMBS()

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The portion of the list following the current item.
Notes: The items are in the order in which they were originally visited.

179.2.8 itemAtIndex(index as Integer) as WKBackForwardListItemMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the item at a specified distance from the current item.
Notes:

index: Index of the desired list item relative to the current item:
0 for the current item, -1 for the immediately preceding item, 1 for the immediately following item, and so on.

Returns the item at the specified distance from the current item, or nil if the index parameter exceeds the limits of the list.

179.2.9 Properties

179.2.10 backItem as WKBackForwardListItemMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The item immediately preceding the current item, or nil if there isn't one.
Notes: (Read only property)

179.2.11 currentItem as WKBackForwardListItemMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The current item.
Notes: (Read only property)

179.2.12 forwardItem as WKBackForwardListItemMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The item immediately following the current item, or nil if there isn't one.
Notes: (Read only property)

179.2.13 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read only property)

179.3 class WKHTTPCookieStoreMBS

179.3.1 class WKHTTPCookieStoreMBS

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An object that manages the HTTP cookies associated with a particular WKWebsiteDataStore.
Example:

```
Dim CookieStore As WKHTTPCookieStoreMBS = WKWebViewControlMBS1.WKWebView.HTTPCookieStore
Dim cookies() As NSHTTPCookieMBS = CookieStore.AllCookies
Dim cookie As NSHTTPCookieMBS = cookies(0)

// now check in debugger
Break
```

179.3.2 Blog Entries

- MBS Xojo Plugins, version 20.1pr4

179.3.3 Methods

179.3.4 AllCookies as NSHTTPCookieMBS()

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Fetches all stored cookies.
Example:

```
Dim CookieStore As WKHTTPCookieStoreMBS = WKWebViewControlMBS1.WKWebView.HTTPCookieStore
Dim cookies() As NSHTTPCookieMBS = CookieStore.AllCookies
Dim cookie As NSHTTPCookieMBS = cookies(0)

// now check in debugger
Break
```

179.3.5 Constructor(WKWebView as WKWebViewMBS)

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.
Notes:

Creates an object for the http cookie store used by web view.
Adds an observer to the cookie store to call DidChange event.

179.3.6 deleteCookie(cookie as NSHTTPCookieMBS, wait as boolean = true)

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Deletes the specified cookie.
Notes:

By default waits for this to complete.
Otherwise this is set asynchronously.

179.3.7 Destructor

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

179.3.8 setCookie(cookie as NSHTTPCookieMBS, wait as boolean = true)

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets a cookie.
Notes:

By default waits for this to complete.
Otherwise this is set asynchronously.

179.3.9 Properties

179.3.10 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read only property)

179.3.11 Events

179.3.12 DidChange

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when the cookies in the cookie store have changed.

179.4 class WKNavigationResponseMBS

179.4.1 class WKNavigationResponseMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A WKNavigationResponse object contains information about a navigation response, used for making policy decisions.

179.4.2 Blog Entries

- MBS Xojo Plugins, version 20.0r5

179.4.3 Methods

179.4.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

179.4.5 Properties

179.4.6 canShowMIMEType as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether WebKit can display the response's MIME type natively.
Notes: (Read only property)

179.4.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read only property)

179.4.8 isForMainFrame as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the frame being navigated is the main frame.

Notes: (Read only property)

179.4.9 response as NSURLResponseMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The frame's response.
Notes:

Allowing a navigation response with a MIME type that can't be shown will cause the navigation to fail. (Read only property)

179.5 class WKPreferencesMBS

179.5.1 class WKPreferencesMBS

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A WKPreferences object encapsulates the preference settings for a web view.
Notes:

The preferences object associated with a web view is specified by its web view configuration.
Available on MacOS 10.10 or newer.

179.5.2 Blog Entries

- MBS Xojo Plugins, version 20.1pr4

179.5.3 Methods

179.5.4 Constructor(WKWebView as WKWebViewMBS)

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Queries preferences object for a web view.

179.5.5 Properties

179.5.6 FraudulentWebsiteWarningEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether warnings should be shown for suspected fraudulent content such as phishing or malware.
Notes:

The default value is true. This feature is currently available in the following region: China.
(Read and Write property)

179.5.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read only property)

179.5.8 javaEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether Java is enabled.
Example:

WKWebViewControlMBS1.WKWebView.Preferences.javaEnabled = False

Notes:

The default value is false.
Deprecated for macOS 10.15.
(Read and Write property)

179.5.9 javaScriptCanOpenWindowsAutomatically as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether JavaScript can open windows without user interaction.
Example:

WKWebViewControlMBS1.WKWebView.Preferences.javaScriptCanOpenWindowsAutomatically = False

Notes:

The default value is false in iOS and true in macOS.
(Read and Write property)

179.5.10 javaScriptEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether JavaScript is enabled.
Example:

WKWebViewControlMBS1.WKWebView.Preferences.javaScriptEnabled = False

Notes:

The default value is true. Setting this property to false disables JavaScripts that are loaded or executed by the web page. This setting does not affect user scripts. See WKUserScriptMBS class.
(Read and Write property)

179.5.11 minimumFontSize as Double

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The minimum font size in points.
Example:

WKWebViewControlMBS1.WKWebView.Preferences.minimumFontSize = 20

Notes:

The default value is 0.
(Read and Write property)

179.5.12 plugInsEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether plug-ins are enabled.
Example:

WKWebViewControlMBS1.WKWebView.Preferences.plugInsEnabled = False

Notes:

The default value is false.
Deprecated for macOS 10.15.
(Read and Write property)

179.5.13 tabFocusesLinks as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** If tabFocusesLinks is true, the tab key will focus links and form controls.
Notes:

The Option key temporarily reverses this preference.
(Read and Write property)

179.6 class WKUserScriptMBS

179.6.1 class WKUserScriptMBS

MBS Mac64bit Plugin, Plugin Version: 19.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A WKUserScript object represents a script that can be injected into a webpage.
Notes:

Requires MacOS 10.10 or newer.
64-bit target only.

179.6.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 19.5
- MBS Xojo Plugins, version 19.5pr8

179.6.3 Methods

179.6.4 Constructor(Source as String, injectionTime as Integer, isForMainFrameOnly as Boolean)

MBS Mac64bit Plugin, Plugin Version: 19.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns an initialized user script that can be added to a user content controller.
Notes:

source: The script's source code.
injectionTime: The time when the script should be injected into the webpage. Either InjectionTimeAtDocumentStart
or InjectionTimeAtDocumentEnd.
isForMainFrameOnly: A Boolean value indicating whether the script should be injected only into the main frame (YES) or into all frames (NO).

179.6.5 Properties

179.6.6 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read only property)

179.6.7 injectionTime as Integer

MBS Mac64bit Plugin, Plugin Version: 19.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The time when the script should be injected into the webpage.
Notes:

Either InjectionTimeAtDocumentStart or InjectionTimeAtDocumentEnd.
(Read only property)

179.6.8 isForMainFrameOnly as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the script should be injected only into the main frame (true) or into all frames (false).
Notes: (Read only property)

179.6.9 Source as String

MBS Mac64bit Plugin, Plugin Version: 19.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The script's source code.
Notes: (Read only property)

179.6.10 Constants

179.6.11 InjectionTimeAtDocumentEnd = 1

MBS Mac64bit Plugin, Plugin Version: 19.5. **Function:** One of the constants for the time when a user script should be injected into a webpage.
Notes: Inject the script after the document finishes loading, but before other subresources finish loading.

179.6.12 InjectionTimeAtDocumentStart = 0

MBS Mac64bit Plugin, Plugin Version: 19.5. **Function:** One of the constants for the time when a user script should be injected into a webpage.
Notes: Inject the script after the document element is created, but before any other content is loaded.

179.7 class WKWebViewConfigurationMBS

179.7.1 class WKWebViewConfigurationMBS

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A collection of properties used to initialize a web view.
Notes:

Using the WKWebViewConfiguration class, you can determine how soon a webpage is rendered, how media playback is handled, the granularity of items that the user can select, and many other options.
WKWebViewConfiguration is only used when a web view is first initialized. You cannot use this class to change the web view's configuration after it has been created.

179.7.2 Blog Entries

- MBS Xojo Plugins, version 20.1pr4

179.7.3 Methods

179.7.4 Constructor(WKWebView as WKWebViewMBS)

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates Xojo object referencing configuration object for web viewer.

179.7.5 copy as WKWebViewConfigurationMBS

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the configuration object.

179.7.6 Properties

179.7.7 allowsAirPlayForMediaPlayback as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether AirPlay is allowed.
Notes:

The default value is true.
(Read and Write property)

179.7.8 applicationNameForUserAgent as String

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The name of the application as used in the user agent string.
Notes: (Read and Write property)

179.7.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
Notes: (Read only property)

179.7.10 mediaTypesRequiringUserActionForPlayback as Integer

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Determines which media types require a user gesture to begin playing.
Notes:

Use AudiovisualMediaTypeNone to indicate that no user gestures are required to begin playing media.
(Read and Write property)

179.7.11 Preferences as WKPreferencesMBS

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The preference object to be used by the web view.
Notes: (Read and Write property)

179.7.12 suppressesIncrementalRendering as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the web view suppresses content rendering until it is fully loaded into memory.
Notes:

The default value is false.
(Read and Write property)

179.7.13 userInterfaceDirectionPolicy as Integer

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The directionality of user interface elements.
Notes:

The default value is serInterfaceDirectionPolicyContent. For other possible values, see constants.
Available on MacOS 10.12 or newer.

The policy used to determine the directionality of user interface elements in a web view.
When UserInterfaceDirectionPolicyContent is specified, the directionality of user interface elements is affected by the dir attribute or the direction CSS property. When UserInterfaceDirectionPolicySystem is specified, the directionality of user interface elements is affected by the direction of the view.
(Read and Write property)

179.7.14 Constants

179.7.15 AudiovisualMediaTypeAll = -1

MBS Mac64bit Plugin, Plugin Version: 20.1. **Function:** One of the media type constants.
Notes: All media types require a user gesture to begin playing.

179.7.16 AudiovisualMediaTypeAudio = 1

MBS Mac64bit Plugin, Plugin Version: 20.1. **Function:** One of the media type constants.
Notes: Media types containing audio require a user gesture to begin playing.

179.7.17 AudiovisualMediaTypeNone = 0

MBS Mac64bit Plugin, Plugin Version: 20.1. **Function:** One of the media type constants.
Notes: No media types require a user gesture to begin playing.

179.7.18 AudiovisualMediaTypeVideo = 2

MBS Mac64bit Plugin, Plugin Version: 20.1. **Function:** One of the media type constants.
Notes: Media types containing video require a user gesture to begin playing.

179.7.19 UserInterfaceDirectionPolicyContent = 0

MBS Mac64bit Plugin, Plugin Version: 20.1. **Function:** One of the User Interface Direction Policy constants.
Notes: The directionality follows the CSS/HTML/XHTML specifications. This is the default value of userInterfaceDirectionPolicy.

179.7.20 UserInterfaceDirectionPolicySystem = 1

MBS Mac64bit Plugin, Plugin Version: 20.1. **Function:** One of the User Interface Direction Policy constants.
Notes: The directionality follows the view's userInterfaceLayoutDirection property

179.8 control WKWebViewControlMBS

179.8.1 control WKWebViewControlMBS

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A WKWebView object displays interactive web content, such as for an in-app browser.
Example:

```
// print a WKWebViewControlMBS to PDF file:

dim browser as WKWebViewControlMBS // your control showing website
Dim pi As NSPrintInfoMBS = NSPrintInfoMBS.sharedPrintInfo

Dim f As FolderItem = SpecialFolder.Desktop.Child("test.pdf")
pi.SetSaveDestination f

Dim po As NSPrintOperationMBS = browser.printOperation(pi)

po.showsPrintPanel = False
po.showsProgressPanel = False

If po.runOperation Then
f.launch
End If
```

Notes:

This is a control to use WebKit in 32-bit and WebKit 2 in 64-bit.
Most of the events provided by Xojo for the control will not work.
But we can add features over time as needed.
Let us know if you need a method from WKWebView or an event from WKNavigationDelegate or WKUIDelegate.

179.8.4 Methods

179.8.5 addScriptMessageHandler(Name as String)

MBS Mac64bit Plugin, Plugin Version: 18.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Adds a script message handler.
Example:

```
// register once
browser.addScriptMessageHandler "test"
// later use in javascript:
browser.EvaluateJavaScript("window.webkit.messageHandlers.test.postMessage('Hello');")
```

Notes:

Name: The name of the message handler.

Adding a script message handler with name name causes the JavaScript function window.webkit.messageHandlers.name.postMessage(messageBody) to be defined in all frames in all web views that use the user content controller.

179.8.6 addUserScript(userScript as WKUserScriptMBS)

MBS Mac64bit Plugin, Plugin Version: 19.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Adds an user script.

179.8.7 EvaluateJavaScript(JavaScript as String, byref Error as NSErrorMBS) as Variant

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Evaluates JavaScript.
Example:

```
Dim e As NSErrorMBS

// returns array of variants with doubles
Dim v As Variant = WKWebViewControlMBS1.EvaluateJavaScript("o = [ 1,2,3 ] ;", e)
Dim vd() As Variant = v

// returns array of variants with strings
Dim vv As Variant = WKWebViewControlMBS1.EvaluateJavaScript("o = [ ""a"",""b"",""d"" ] ;", e)
Dim vs() As Variant = vv

// returns dictionary
Dim v3 As Variant = WKWebViewControlMBS1.EvaluateJavaScript("o = { a:1 } ", e)
Dim dd As Dictionary = v3

Break
```

Notes:

Synchronous version which waits for JavaScript to return the value.
Error is set in case of errors.

Result is converted from JavaScript data types to Xojo datatypes, usually variants, dictionaries or array of variants.
See also:

- 179.8.8 EvaluateJavaScript(JavaScript as String, Tag as String = "") 21974

179.8.8 EvaluateJavaScript(JavaScript as String, Tag as String = "")

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Evaluates JavaScript.
Notes:

Calls later JavaScriptEvaluated event with result and passed tag value.

Result is converted from JavaScript data types to Xojo datatypes, usually variants, dictionaries or array of variants.
See also:

• 179.8.7 EvaluateJavaScript(JavaScript as String, byref Error as NSErrorMBS) as Variant 21974

179.8.9 goBack

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Navigates to the back item in the back-forward list.

179.8.10 goForward

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Navigates to the forward item in the back-forward list.

179.8.11 goToBackForwardListItem(Item as WKBackForwardListItemMBS)

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Navigates to an item from the back-forward list and sets it as the current item.
Notes: item: The item to which to navigate. Must be one of the items in the web view's back-forward list.

179.8.12 LoadData(Data as MemoryBlock, MIMEType as String, textEncodingName as String, baseURL as string = "")

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the webpage contents and base URL.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

browser.LoadData "<p>Hello World</p>", "text/html", "UTF-8", ""
```

Notes:

data: The data to use as the contents of the webpage.
MIMEType: The MIME type of the data.
characterEncodingName: The data's character encoding name.
baseURL: A URL used to resolve relative URLs within the document.

179.8.13 LoadFileURL(File as FolderItem, readAccessItem as FolderItem)

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Navigates to a requested file.
Notes:

Navigates to the requested file URL on the filesystem.
file: The file URL to which to navigate.
readAccessItem: The file or folder to allow read access to.
If readAccessItem references a single file, only that file may be loaded by WebKit.
If readAccessItem references a directory, files inside that file may be loaded by WebKit.

179.8.14 LoadHTML(htmlText as String, baseURL as string = "")

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the webpage contents and base URL.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

browser.LoadHTML "<p>Hello World</p>"
```

Notes:

htmlText: The string to use as the contents of the webpage.
baseURL: A URL used to resolve relative URLs within the document.

179.8.15 LoadURL(URL as string)

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Navigates to a requested URL.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

browser.LoadURL "https://www.mbs-plugins.de/"
```

179.8.16 LoadURLRequest(Request as NSURLRequestMBS)

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Navigates to a requested URL.

179.8.17 printOperation(printInfo as NSPrintInfoMBS) as NSPrintOperationMBS

MBS Mac64bit Plugin, Plugin Version: 19.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a print operation for the current web viewer.
Example:

```
dim browser as WKWebViewControlMBS // your web viewer
Dim pi As NSPrintInfoMBS = NSPrintInfoMBS.sharedPrintInfo
Dim po As NSPrintOperationMBS = browser.printOperation(pi)

po.showsPrintPanel = True
po.showsProgressPanel = True

po.runOperationModalForWindow(Self)
```

Notes:

Works for WebKit 1.x and 2.x.

For WebKit 2.x may run into endless loop for some websites due to bugs in Apple's WebKit framework.

179.8.18 reload

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Reloads the current page.
Example:

```
Public Sub Reload(browser as WKWebViewControlMBS, force as Boolean)
If force Then
browser.reloadFromOrigin
Else
browser.reload
End If
End Sub
```

179.8.19 reloadFromOrigin

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Reloads the current page, performing end-to-end revalidation using cache-validating conditionals if possible.
Example:

```
Public Sub Reload(browser as WKWebViewControlMBS, force as Boolean)
If force Then
browser.reloadFromOrigin
Else
browser.reload
End If
End Sub
```

179.8.20 removeAllUserScripts

MBS Mac64bit Plugin, Plugin Version: 19.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Removes all associated user scripts.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

browser.removeAllUserScripts
```

179.8.21 removeScriptMessageHandler(Name as String)

MBS Mac64bit Plugin, Plugin Version: 18.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Removes a script message handler.
Notes: name: The name of the message handler to remove.

179.8.22 setMagnification(magnification as double, pointX as double, pointY as double)

MBS Mac64bit Plugin, Plugin Version: 19.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Scales the page content by a specified factor and centers the result on a specified point.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

// zoom to 200% on 100/100
```

```
browser.setMagnification(2, 100, 100)
```

Notes:

magnification: The factor by which to scale the content.
x/y: The point (in view space) to center magnification on. As usual with Cocoa, bottom is y = 0.

For MacOS 64-bit only.

179.8.23 stopLoading

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Stops loading all resources on the current page.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

browser.stopLoading
```

179.8.24 takeSnapshot(byref error as NSErrorMBS) as NSImageMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Requests a snapshot.
Notes:

This is synchronous version which waits for image to be finished.
In case of error the result is nil and error may be set.
See also:

- 179.8.25 takeSnapshot(tag as string = "") 21979

179.8.25 takeSnapshot(tag as string = "")

MBS Mac64bit Plugin, Plugin Version: 17.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Requests a snapshot.
Notes:

Calls later takeSnapshotCompleted event.
Tag is passed to event to distinguish various snapshot requests.
See also:

• 179.8.24 takeSnapshot(byref error as NSErrorMBS) as NSImageMBS 21979

179.8.26 userScripts as WKUserScriptMBS()

MBS Mac64bit Plugin, Plugin Version: 19.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The user scripts associated with the user content controller.

179.8.27 Properties

179.8.28 allowFileAccessFromFileURLs as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Allow file access for file URLs.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

browser.allowFileAccessFromFileURLs = True
```

Notes:

Access to files is allowed for some files.
Please check WebKit documentation for details.

Set allowFileAccessFromFileURLs and allowUniversalAccessFromFileURLs to true to disable all the security checks to block local file access for websites. allowUniversalAccessFromFileURLs would allow all file URLs. allowFileAccessFromFileURLs would only allow in same path.
(Read and Write property)

179.8.29 allowsBackForwardNavigationGestures as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether horizontal swipe gestures will trigger back-forward list navigations.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

browser.allowsBackForwardNavigationGestures = True
```

Notes:

The default value is false.
Available for 64-bit on macOS 10.10 or newer.
(Read and Write property)

179.8.30 allowsLinkPreview as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that determines whether pressing on a link displays a preview of the destination for the link.
Example:

```
Dim browser As WKWebViewMBS // your instance

browser.allowsLinkPreview = True
```

Notes: (Read and Write property)

179.8.31 allowsMagnification as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether magnify gestures will change the web view's magnification.
Example:

```
Dim browser As WKWebViewMBS // your instance

browser.allowsMagnification = True
```

Notes:

The default value is false. You can set the magnification property even if allowsMagnification is set to false.
For MacOS 64-bit only.
(Read and Write property)

179.8.32 allowUniversalAccessFromFileURLs as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Allow universal file access for URLs.
Notes:

Any file URL will be loaded if true.

Please check WebKit documentation for details.

Does not work in MacOS 10.14.
(Read and Write property)

179.8.33 backForwardList as WKBackForwardListMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The web view's back-forward list.
Notes: (Read only property)

179.8.34 CanGoBack as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether there is a back item in the back-forward list that can be navigated to.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

MsgBox "CanGoBack: "+If(Browser.CanGoBack, "yes", "no")
```

Notes: (Read only property)

179.8.35 CanGoForward as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether there is a forward item in the back-forward list that can be navigated to.
Example:

```
'Dim browser As WKWebViewControlMBS // your instance

MsgBox "CanGoForward: "+If(Browser.CanGoForward, "yes", "no")
```

Notes: (Read only property)

179.8.36 customUserAgent as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The custom user agent string.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

browser.customUserAgent = "MyBrowser/1.0"
```

Notes:

If no custom user agent string has been set, this is set to "".
Available in 32-bit. Available in 64-bit for macOS 10.11 or newer.
(Read and Write property)

179.8.37 developerExtrasEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether developer extras are enabled.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

// enable context menu entry to show developer extras
browser.developerExtrasEnabled = True
```

Notes:

For WebKit 2 (64bit) to enable the context menu to inspect items.
(Read and Write property)

179.8.38 EstimatedProgress as Double

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An estimate of what fraction of the current navigation has been loaded.
Notes:

This value ranges from 0.0 to 1.0 based on the total number of bytes expected to be received, including the main document and all of its potential subresources. After a navigation loading completes, the estimatedProgress remains at 1.0 until a new navigation starts, at which point the estimatedProgress is reset to 0.0.
(Read only property)

179.8.39 hasOnlySecureContent as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether all resources on the page have been loaded through securely encrypted connections.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

MsgBox "hasOnlySecureContent: "+If(Browser.hasOnlySecureContent, "yes", "no")
```

Notes:

Only set for 64-bit, always false on 32-bit.
(Read only property)

179.8.40 IsLoading as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the view is currently loading content.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

// load a page
browser.LoadURL "https://www.mbs-plugins.de"

// wait synchronously for website loading
While browser.IsLoading
DelayMBS 0.1
Wend

MsgBox "loaded"
```

Notes: (Read only property)

179.8.41 javaEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether java is enabled.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

MsgBox "JavaScript Enabled: "+If(Browser.javaEnabled, "yes", "no")
```

Notes: (Read and Write property)

179.8.42 javaScriptCanOpenWindowsAutomatically as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether javascript can open new windows.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

// disable popup windows
Browser.javaScriptCanOpenWindowsAutomatically = False
```

Notes: (Read and Write property)

179.8.43 javaScriptEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether javascript is enabled.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

MsgBox "JavaScript Enabled: "+If(Browser.javaScriptEnabled, "yes", "no")
```

Notes: (Read and Write property)

179.8.44 loadsImagesAutomatically as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether to load images automatically.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

// disable loading of images
browser.loadsImagesAutomatically = False#
```

Notes: (Read and Write property)

179.8.45 magnification as Double

MBS Mac64bit Plugin, Plugin Version: 19.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The factor by which the page content is currently scaled.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

browser.magnification = 2.0
```

Notes:

The default value is 1.0.
For MacOS 64-bit only.
(Read and Write property)

179.8.46 minimumFontSize as Double

MBS Mac64bit Plugin, Plugin Version: 17.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The minimum font size to use.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

browser.minimumFontSize = 20
```

Notes: (Read and Write property)

179.8.47 plugInsEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether plugins are enabled.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

MsgBox "plugInsEnabled: "+If(Browser.plugInsEnabled, "yes", "no")
```

Notes: (Read and Write property)

179.8.48 privateBrowsing as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether private browsing is enabled.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

MsgBox "privateBrowsing: "+If(Browser.privateBrowsing, "yes", "no")
```

Notes:

If enabled, no data should be stored for cookies or cache on disk, so it's cleared when web viewer is destroyed.
Default is non-private mode for the web viewer.

For WebKit 2.x, it looks like you can't change mode after web viewer was created.
So use UsePrivateBrowsing there.
(Read and Write property)

179.8.49 Title as String

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The page title.
Example:

```
Dim browser As WKWebViewControlMBS // your instance
```

MsgBox Browser.Title

Notes: (Read only property)

179.8.50 URL as String

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The active URL.
Example:

```
Dim browser As WKWebViewControlMBS // your instance

MsgBox Browser.URL
```

Notes:

This is the URL that should be reflected in the user interface.
(Read only property)

179.8.51 UsePrivateBrowsing as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether to create WKWebViewControlMBS with private browsing enabled.
Example:

```
WVWebViewModuleMBS.UsePrivateBrowsing = True
```

Notes:

Set this property to true before creating the WKWebViewControlMBS control, so the plugin can enable private browsing.
Set to false later to create a normal control again.

You may want to set this to true or false before the window opens and control initialized.

Due to a bug in Xojo 2019r2 and older, please use WVWebViewModuleMBS.UsePrivateBrowsing property instead.
(Read and Write property)

179.8.52 View as NSViewMBS

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The used view.
Notes:

Should be either a WebView (32bit) or WKWebView (64bit).
(Read only property)

179.8.53 WKWebView as WKWebViewMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The used WKWebViewMBS view.
Notes:

Always a WKWebViewMBS in 64-bit, but nil for 32-bit applications.
(Read only property)

179.8.54 Events

179.8.55 BoundsChanged

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the bounds, but not the frame, changed.

179.8.56 Close

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The webviewer should close.
Notes:

Notifies your app that the DOM window object's close() method completed successfully.

Your app should remove the web view from the view hierarchy and update the UI as needed, such as by closing the containing browser tab or window.

179.8.57 CreateWebView(URL as String, request as NSURLRequestMBS) as WKWebViewControlMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new web view.
Notes:

If needed we can add configuration, windowFeatures and navigationAction parameters in future version.

Return a web viewer control or nil.

The web view returned must be created with the specified configuration. WebKit will load the request in the returned web view.

If you do not implement this method or return nil, the web view will cancel the navigation.

179.8.58 decidePolicyForNavigationAction(URL as String, NavigationType as String, modifierFlags as Integer, buttonNumber as Integer, newWindow as boolean, frameName as string, request as NSURLRequestMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Decides whether to allow or cancel a navigation.
Notes:

Return true to cancel or false to allow.
URL is the URL to load.
NavigationType defines what navigation is happening: LinkClicked, FormSubmitted, BackForward, Reload, FormResubmitted or Other.
modifierFlags: The keyboard modifiers.
buttonNumber: Which mouse button was clicked: 0 for left button, 1 for middle button, 2 for right button
newWindow: True if a new window should be opened or false if not.
frameName: The frame name. (32-bit only)
request: the URL request. (added in v20.0)

179.8.59 decidePolicyForNavigationResponse(navigationResponse as WKNavigationResponseMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Decides whether to allow or cancel a navigation after its response is known.
Notes:

navigationResponse: Descriptive information about the navigation response.

Return true to block or return false to allow.

179.8.60 didCommitNavigation

MBS Mac64bit Plugin, Plugin Version: 17.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when content starts arriving for the main frame.

179.8.61 didFailNavigation(Error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 17.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when an error occurs during a committed main frame navigation.

179.8.62 didFailProvisionalNavigation(Error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 17.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when an error occurs while starting to load data for the main frame.

179.8.63 didFinishNavigation

MBS Mac64bit Plugin, Plugin Version: 17.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when a main frame navigation completes.
Notes: Same as DocumentComplete in HTMLViewer.

179.8.64 didReceiveScriptMessage(Body as Variant, name as String)

MBS Mac64bit Plugin, Plugin Version: 18.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when a script message is received from a webpage.
Notes:

body: The body of the message. Automatic translated from Javascript types.
name: The name of the message handler to which the message is sent.

179.8.65 didReceiveServerRedirectForProvisionalNavigation

MBS Mac64bit Plugin, Plugin Version: 17.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when a server redirect is received for the main frame.

179.8.66 didStartProvisionalNavigation

MBS Mac64bit Plugin, Plugin Version: 17.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when a main frame navigation starts.

179.8.67 EnableMenuItems

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event where you can enable menu items.

179.8.68 EstimatedProgressChanged(estimatedProgress as double, oldEstimatedProgress as double)

MBS Mac64bit Plugin, Plugin Version: 19.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The estimated progress for loading the webpage changed.
Notes: This event may be called often, so don't do much here!

179.8.69 FrameChanged

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the frame changed.

179.8.70 GotFocus

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

179.8.71 JavaScriptEvaluated(JavaScript as String, Result as Variant, Error as NSErrorMBS, Tag as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** JavaScript was evaluated.
Notes:

Error is only set with 64-bit, not with 32-bit.
Tag is passed from EvaluateJavaScript call.

Result is converted from JavaScript data types to Xojo datatypes, usually variants, dictionaries or array of variants.

179.8.72 LostFocus

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

179.8.73 MenuAction(HitItem as MenuItem) As Boolean

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

179.8.74 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The mouse button was pressed inside the control's region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

179.8.75 MouseDrag(x as Integer, y as Integer)

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

179.8.76 MouseUp(x as Integer, y as Integer)

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

179.8.77 runJavaScriptAlertPanel(message as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Displays a JavaScript alert panel.
Notes:

message: The message to display.

If you do not implement this method, the web view will behave as if the user selected the OK button.

179.8.78 runJavaScriptConfirmPanel(message as String) as boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Displays a JavaScript confirm panel.
Notes:

message: The message to display.

Return true if the user chose OK, false if the user chose Cancel.

If you do not implement this method, the web view will behave as if the user selected the Cancel button.

179.8.79 runJavaScriptTextInputPanel(prompt as String, defaultText as String) as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Displays a JavaScript text input panel.
Notes:

message: The message to display.
defaultText: The initial text to display in the text entry field.

Return the entered text if the user chose OK, otherwise "".

If you do not implement this method, the web view will behave as if the user selected the Cancel button.

179.8.80 ScaleFactorChanged(NewFactor as Double)

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

179.8.81 takeSnapshotCompleted(image as NSImageMBS, error as NSErrorMBS, tag as string)

MBS Mac64bit Plugin, Plugin Version: 17.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when snapshot of website is completed.
Notes: If snapshot creation failed, error is set.

179.8.82 TitleChanged(Title as String, oldTitle as string)

MBS Mac64bit Plugin, Plugin Version: 19.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The title of the webpage changed.

179.9 class WKWebViewMBS

179.9.1 class WKWebViewMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An object that displays interactive web content, such as for an in-app browser.
Notes:

see
https://developer.apple.com/documentation/webkit/wkwebview

If something is missing, please let us know and we can add it for you.
Subclass of the NSViewMBS class.

179.9.2 Blog Entries

- New in the MBS Xojo Plugins 20.0
- Upgrading our HTMLViewer functions for Internet Explorer

179.9.3 Methods

179.9.4 addUserScript(userScript as WKUserScriptMBS)

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Adds an user script.

179.9.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new web view with size 100/100 and position 0/0
Example:

```
dim x as new WebViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 179.9.6 Constructor(Handle as Integer) 21997
- 179.9.7 Constructor(left as double, top as double, width as double, height as double) 21997

179.9.6 Constructor(Handle as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates an object based on the given WKWebView handle.
Example:

```
dim t as new WKWebViewMBS(0, 0, 100, 100)
dim v as new WKWebViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a WKWebView and the plugin retains this handle.
See also:

- 179.9.5 Constructor 21996
- 179.9.7 Constructor(left as double, top as double, width as double, height as double) 21997

179.9.7 Constructor(left as double, top as double, width as double, height as double)

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new button with the given size and position.
Example:

```
dim w as new WKWebViewMBS(0,0,800,600)

w.LoadHTMLString "Hello World",""
```

Notes: On success the handle property is not zero.
See also:

- 179.9.5 Constructor 21996
- 179.9.6 Constructor(Handle as Integer) 21997

179.9.8 EvaluateJavaScript(JavaScript as String, byref Error as NSErrorMBS) as Variant

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Evaluates JavaScript.
Example:

```
Dim w As WKWebViewMBS = WKWebViewControlMBS1.WKWebView
Dim e As NSErrorMBS

// returns array of variants with doubles
Dim v As Variant = w.EvaluateJavaScript("o = [ 1,2,3 ] ;", e)
Dim vd() As Variant = v

// returns array of variants with strings
Dim vv As Variant = w.EvaluateJavaScript("o = [ ""a"",""b"",""d"" ] ;", e)
Dim vs() As Variant = vv

// returns dictionary
Dim v3 As Variant = w.EvaluateJavaScript("o = { a:1 } ", e)
Dim dd As Dictionary = v3

Break
```

Notes:

Synchronous version which waits for JavaScript to return the value.
Error is set in case of errors.

Result is converted from JavaScript data types to Xojo datatypes, usually variants, dictionaries or array of variants.

179.9.9 goBack

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Navigates to the back item in the back-forward list.

179.9.10 goForward

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Navigates to the forward item in the back-forward list.

179.9.11 goToBackForwardListItem(Item as WKBackForwardListItemMBS)

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Navigates to an item from the back-forward list and sets it as the current item.

Notes: item: The item to which to navigate. Must be one of the items in the web view's back-forward list.

179.9.12 handlesURLScheme(urlScheme as String) as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Checks whether or not WKWebViews handle the given URL scheme by default.
Notes:

urlScheme: The URL scheme to check.

Returns true if supported.

179.9.13 LoadData(Data as MemoryBlock, MIMEType as String, textEncodingName as String, baseURL as string = "")

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the webpage contents and base URL.
Example:

```
Dim browser As WKWebViewMBS // your instance

browser.LoadData "<p>Hello World</p>", "text/html", "UTF-8", ""
```

Notes:

data: The data to use as the contents of the webpage.
MIMEType: The MIME type of the data.
characterEncodingName: The data's character encoding name.
baseURL: A URL used to resolve relative URLs within the document.

179.9.14 LoadFileURL(File as FolderItem, readAccessItem as FolderItem)

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Navigates to a requested file.
Notes:

Navigates to the requested file URL on the filesystem.
file: The file URL to which to navigate.
readAccessItem: The file or folder to allow read access to.
If readAccessItem references a single file, only that file may be loaded by WebKit.

If readAccessItem references a directory, files inside that file may be loaded by WebKit.

179.9.15 LoadHTML(htmlText as String, baseURL as string = "")

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the webpage contents and base URL.
Example:

```
Dim browser As WKWebViewMBS // your instance

browser.LoadHTML "<p>Hello World</p>"
```

Notes:

htmlText: The string to use as the contents of the webpage.
baseURL: A URL used to resolve relative URLs within the document.

179.9.16 LoadURL(URL as string)

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Navigates to a requested URL.
Example:

```
Dim browser As WKWebViewMBS // your instance

browser.LoadURL "https://www.mbs-plugins.de/"
```

179.9.17 LoadURLRequest(Request as NSURLRequestMBS)

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Navigates to a requested URL.

179.9.18 printOperation(printInfo as NSPrintInfoMBS) as NSPrintOperationMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a print operation for the current web viewer.
Example:

```
dim browser as WKWebViewMBS // your web viewer
Dim pi As NSPrintInfoMBS = NSPrintInfoMBS.sharedPrintInfo
Dim po As NSPrintOperationMBS = browser.printOperation(pi)

po.showsPrintPanel = True
po.showsProgressPanel = True

po.runOperationModalForWindow(Self)
```

Notes:

Works for WebKit 1.x and 2.x.

For WebKit 2.x may run into endless loop for some websites due to bugs in Apple's WebKit framework.

179.9.19 reload

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Reloads the current page.
Example:

```
Public Sub Reload(browser as WKWebViewMBS, force as Boolean)
If force Then
browser.reloadFromOrigin
Else
browser.reload
End If
End Sub
```

179.9.20 reloadFromOrigin

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Reloads the current page, performing end-to-end revalidation using cache-validating conditionals if possible.
Example:

```
Public Sub Reload(browser as WKWebViewMBS, force as Boolean)
If force Then
browser.reloadFromOrigin
Else
browser.reload
End If
```

```
End Sub
```

179.9.21 removeAllUserScripts

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Removes all associated user scripts.
Example:

```
Dim browser As WKWebViewMBS // your instance

browser.removeAllUserScripts
```

179.9.22 setMagnification(magnification as double, pointX as double, pointY as double)

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Scales the page content by a specified factor and centers the result on a specified point.
Example:

```
Dim browser As WKWebViewMBS // your instance

// zoom to 200% on 100/100
browser.setMagnification(2, 100, 100)
```

Notes:

magnification: The factor by which to scale the content.
x/y: The point (in view space) to center magnification on. As usual with Cocoa, bottom is y = 0.

For MacOS 64-bit only.

179.9.23 stopLoading

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Stops loading all resources on the current page.
Example:

```
Dim browser As WKWebViewMBS // your instance
```

browser.stopLoading

179.9.24 takeSnapshot(byref error as NSErrorMBS) as NSImageMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Requests a snapshot.
Notes:

This is synchronous version which waits for image to be finished.
In case of error the result is nil and error may be set.

179.9.25 userScripts as WKUserScriptMBS()

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The user scripts associated with the user content controller.

179.9.26 Properties

179.9.27 allowFileAccessFromFileURLs as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Allow file access for file URLs.
Example:

```
Dim browser As WKWebViewMBS // your instance

browser.allowFileAccessFromFileURLs = True
```

Notes:

Access to files is allowed for some files.
Please check WebKit documentation for details.

Set allowFileAccessFromFileURLs and allowUniversalAccessFromFileURLs to true to disable all the security checks to block local file access for websites. allowUniversalAccessFromFileURLs would allow all file URLs. allowFileAccessFromFileURLs would only allow in same path.
(Read and Write property)

179.9.28 allowsBackForwardNavigationGestures as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether horizontal swipe gestures will trigger back-forward list navigations.
Example:

```
Dim browser As WKWebViewMBS // your instance

browser.allowsBackForwardNavigationGestures = True
```

Notes:

The default value is false.
(Read and Write property)

179.9.29 allowsLinkPreview as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that determines whether pressing on a link displays a preview of the destination for the link.
Example:

```
Dim browser As WKWebViewMBS // your instance

browser.allowsLinkPreview = True
```

Notes: (Read and Write property)

179.9.30 allowsMagnification as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether magnify gestures will change the web view's magnification.
Example:

```
Dim browser As WKWebViewMBS // your instance

browser.allowsMagnification = True
```

Notes:

The default value is false. You can set the magnification property even if allowsMagnification is set to false.

For MacOS 64-bit only.
(Read and Write property)

179.9.31 allowUniversalAccessFromFileURLs as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Allow universal file access for URLs.
Notes:

Any file URL will be loaded if true.
Please check WebKit documentation for details.

Does not work in MacOS 10.14.
(Read and Write property)

179.9.32 backForwardList as WKWebViewMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The web view's back-forward list.
Notes: (Read only property)

179.9.33 CanGoBack as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether there is a back item in the back-forward list that can be navigated to.
Example:

```
Dim browser As WKWebViewMBS // your instance

MsgBox "CanGoBack: "+If(Browser.CanGoBack, "yes", "no")
```

Notes: (Read only property)

179.9.34 CanGoForward as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether there is a forward item in the back-forward list that can be

navigated to.
Example:

```
Dim browser As WKWebViewMBS // your instance

MsgBox "CanGoForward: "+If(Browser.CanGoForward, "yes", "no")
```

Notes: (Read only property)

179.9.35 Configuration as WKWebViewConfigurationMBS

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the configuration used to initialize the WKWebView.
Notes: (Read only property)

179.9.36 customUserAgent as String

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The custom user agent string.
Example:

```
Dim browser As WKWebViewMBS // your instance

browser.customUserAgent = "MyBrowser/1.0"
```

Notes:

If no custom user agent string has been set, this is set to "".
Available in 32-bit. Available in 64-bit for macOS 10.11 or newer.
(Read and Write property)

179.9.37 developerExtrasEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether developer extras are enabled.
Example:

```
Dim browser As WKWebViewMBS // your instance

// enable context menu entry to show developer extras
```

browser.developerExtrasEnabled = True

Notes:

Enables the context menu to inspect items.
(Read and Write property)

179.9.38 EstimatedProgress as Double

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An estimate of what fraction of the current navigation has been loaded.
Notes:

This value ranges from 0.0 to 1.0 based on the total number of bytes expected to be received, including the main document and all of its potential subresources. After a navigation loading completes, the estimatedProgress remains at 1.0 until a new navigation starts, at which point the estimatedProgress is reset to 0.0.
(Read only property)

179.9.39 hasOnlySecureContent as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether all resources on the page have been loaded through securely encrypted connections.
Example:

```
Dim browser As WKWebViewMBS // your instance

MsgBox "hasOnlySecureContent: "+If(Browser.hasOnlySecureContent, "yes", "no")
```

Notes:

Only set for 64-bit, always false on 32-bit.
(Read only property)

179.9.40 HTTPCookieStore as WKHTTPCookieStoreMBS

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Convenience property to directly query HTTP cookie store for WKWebview configuration.
Notes:

```
Dim CookieStore As WKHTTPCookieStoreMBS = WKWebViewControlMBS1.WKWebView.HTTPCookieStore
Dim cookies() As NSHTTPCookieMBS = CookieStore.AllCookies
Dim cookie As NSHTTPCookieMBS = cookies(0)

// now check in debugger
Break
```

(Read only property)

179.9.41 IsLoading as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the view is currently loading content.
Example:

```
Dim browser As WKWebViewMBS // your instance

// load a page
browser.LoadURL "https://www.mbs-plugins.de"

// wait synchronously for website loading
While browser.IsLoading
DelayMBS 0.1
Wend

MsgBox "loaded"
```

Notes: (Read only property)

179.9.42 javaEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether java is enabled.
Example:

```
Dim browser As WKWebViewMBS // your instance

MsgBox "JavaScript Enabled: "+If(Browser.javaEnabled, "yes", "no")
```

Notes: (Read and Write property)

179.9.43 javaScriptCanOpenWindowsAutomatically as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether javascript can open new windows.
Example:

```
Dim browser As WKWebViewMBS // your instance

// disable popup windows
Browser.javaScriptCanOpenWindowsAutomatically = False
```

Notes: (Read and Write property)

179.9.44 javaScriptEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** JavaScript was evaluated.
Example:

```
Dim browser As WKWebViewMBS // your instance

MsgBox "JavaScript Enabled: "+If(Browser.javaScriptEnabled, "yes", "no")
```

Notes:

Error is only set with 64-bit, not with 32-bit.
Tag is passed from EvaluateJavaScript call.
(Read and Write property)

179.9.45 loadsImagesAutomatically as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether to load images automatically.
Example:

```
Dim browser As WKWebViewMBS // your instance

// disable loading of images
browser.loadsImagesAutomatically = False
```

Notes: (Read and Write property)

179.9.46 magnification as Double

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The factor by which the page content is currently scaled.
Example:

```
Dim browser As WKWebViewMBS // your instance

browser.magnification = 2.0
```

Notes:

The default value is 1.0.
For MacOS 64-bit only.
(Read and Write property)

179.9.47 minimumFontSize as Double

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The minimum font size to use.
Example:

```
Dim browser As WKWebViewMBS // your instance

browser.minimumFontSize = 20
```

Notes: (Read and Write property)

179.9.48 plugInsEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether plugins are enabled.
Example:

```
Dim browser As WKWebViewMBS // your instance

MsgBox "plugInsEnabled: "+If(Browser.plugInsEnabled, "yes", "no")
```

Notes: (Read and Write property)

179.9.49 Preferences as WKPreferencesMBS

MBS Mac64bit Plugin, Plugin Version: 20.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Convenience property to directly query HTTP cookie store for WKWebview preferences.
Notes: (Read only property)

179.9.50 privateBrowsing as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether private browsing is enabled.
Example:

```
Dim browser As WKWebViewMBS // your instance

MsgBox "privateBrowsing: "+If(Browser.privateBrowsing, "yes", "no")
```

Notes:

If enabled, no data should be stored for cookies or cache on disk, so it's cleared when web viewer is destroyed. Default is non-private mode for the web viewer.

It looks like you can't change mode after web viewer was created.
(Read and Write property)

179.9.51 Title as String

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The page title.
Example:

```
Dim browser As WKWebViewMBS // your instance

MsgBox Browser.Title
```

Notes: (Read only property)

179.9.52 URL as String

MBS Mac64bit Plugin, Plugin Version: 20.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The active URL.
Example:

```
Dim browser As WKWebViewMBS // your instance

MsgBox Browser.URL
```

Notes:

This is the URL that should be reflected in the user interface.
(Read only property)

179.10 module WVWebViewModuleMBS

179.10.1 module WVWebViewModuleMBS

MBS Mac64bit Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The module for global options to WKWebView.
Example:

WVWebViewModuleMBS.UsePrivateBrowsing = True

179.10.2 Blog Entries

- MBS Xojo Plugins, version 19.5pr5

179.10.3 Properties

179.10.4 UsePrivateBrowsing as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether to create WKWebViewControlMBS with private browsing enabled.
Example:

WVWebViewModuleMBS.UsePrivateBrowsing = True

Notes:

Set this property to true before creating the WKWebViewControlMBS control, so the plugin can enable private browsing.
Set to false later to create a normal control again.

You may want to set this to true or false before the window opens and control initialized.
(Read and Write property)

Chapter 180

Window

180.1 class GTKWindowMBS

180.1.1 class GTKWindowMBS

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The class to control a GTKWindow.
Notes:

We can directly modify a window on Linux using this class.
If you need methods to do something special, please do not hesitate to email us.

180.1.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo / Real Studio plug-ins in version 14.0
- MBS Xojo / Real Studio Plugins, version 14.0pr1
- MBS Real Studio Plugins, version 13.0pr1

180.1.3 Xojo Developer Magazine

- 12.2, page 10: News

180.1.4 Methods

180.1.5 Constructor(win as window)

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Creates a new GTKWindow object pointing to a given window.
Notes: Raises exception on Mac/Win to prevent you from creating invalid object.

180.1.6 Deiconify

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to deiconify (i.e. unminimize) the specified window.
Notes: Note that you shouldn't assume the window is definitely deiconified afterward, because other entities (e.g. the user or window manager) could iconify it again before your code which assumes deiconification gets to run.

180.1.7 Fullscreen

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to place window in the fullscreen state.
Notes: Note that you shouldn't assume the window is definitely full screen afterward, because other entities (e.g. the user or window manager) could unfullscreen it again, and not all window managers honor requests to fullscreen windows. But normally the window will end up fullscreen. Just don't write code that crashes if not.

180.1.8 Iconify

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to iconify (i.e. minimize) the specified window.
Notes:

Note that you shouldn't assume the window is definitely iconified afterward, because other entities (e.g. the user or window manager) could deiconify it again, or there may not be a window manager in which case iconification isn't possible, etc. But normally the window will end up iconified. Just don't write code that crashes if not.

It's permitted to call this function before showing a window, in which case the window will be iconified before it ever appears onscreen.

180.1.9 IsComposited as Boolean

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Whether this window can rely on having its alpha channel drawn correctly.
Notes: On X11 this function returns whether a compositing manager is running for window's screen.

180.1.10 Maximize

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to maximize window, so that it becomes full-screen.
Notes:

Note that you shouldn't assume the window is definitely maximized afterward, because other entities (e.g. the user or window manager) could unmaximize it again, and not all window managers support maximization. But normally the window will end up maximized. Just don't write code that crashes if not.

It's permitted to call this function before showing a window, in which case the window will be maximized when it appears onscreen initially.

180.1.11 SetIcon(pic as picture)

MBS Linux Plugin, Plugin Version: 14.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Assigns an icon to the picture.
Notes:

The operation system will scale the picture to required size, so please use bigger images.
Please use picture with alpha channel for best result.

180.1.12 SetKeepAbove(setting as boolean)

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to keep window above, so that it stays on top.
Notes:

Note that you shouldn't assume the window is definitely above afterward, because other entities (e.g. the user or window manager) could not keep it above, and not all window managers support keeping windows above. But normally the window will end kept above. Just don't write code that crashes if not.

It's permitted to call this function before showing a window, in which case the window will be kept above when it appears onscreen initially.

Note that, according to the Extended Window Manager Hints specification, the above state is mainly meant for user preferences and should not be used by applications e.g. for drawing attention to their dialogs.

180.1.13 SetKeepBelow(setting as boolean)

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to keep window below, so that it stays in bottom.
Notes:

Note that you shouldn't assume the window is definitely below afterward, because other entities (e.g. the user or window manager) could not keep it below, and not all window managers support putting windows below. But normally the window will be kept below. Just don't write code that crashes if not.

It's permitted to call this function before showing a window, in which case the window will be kept below when it appears onscreen initially.

Note that, according to the Extended Window Manager Hints specification, the above state is mainly meant for user preferences and should not be used by applications e.g. for drawing attention to their dialogs.

180.1.14 Stick

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to stick window, which means that it will appear on all user desktops.
Notes:

Note that you shouldn't assume the window is definitely stuck afterward, because other entities (e.g. the user or window manager) could unstick it again, and some window managers do not support sticking windows. But normally the window will end up stuck. Just don't write code that crashes if not.

It's permitted to call this function before showing a window.

180.1.15 Unfullscreen

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to toggle off the fullscreen state for window.
Notes: Note that you shouldn't assume the window is definitely not full screen afterward, because other entities (e.g. the user or window manager) could fullscreen it again, and not all window managers honor requests to unfullscreen windows. But normally the window will end up restored to its normal state. Just don't write code that crashes if not.

180.1.16 Unmaximize

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to unmaximize window.
Notes: Note that you shouldn't assume the window is definitely unmaximized afterward, because other entities (e.g. the user or window manager) could maximize it again, and not all window managers honor requests to unmaximize. But normally the window will end up unmaximized. Just don't write code that crashes if not.

180.1.17 Unstick

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to unstick window, which means that it will appear on only one of the user's desktops.
Notes: Note that you shouldn't assume the window is definitely unstuck afterward, because other entities (e.g. the user or window manager) could stick it again. But normally the window will end up stuck. Just don't write code that crashes if not.

180.1.18 Properties

180.1.19 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The internal window handle.
Notes: (Read and Write property)

180.1.20 AcceptFocus as Boolean

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Get/Set whether window should receive focus.
Notes:

Windows may set a hint asking the desktop environment not to receive the input focus. This function sets this hint.
(Read and Write computed property)

180.1.21 Opacity as Double

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Get or set the Opacity of this window.
Notes:

Request the windowing system to make window partially transparent, with opacity 0 being fully transparent and 1 fully opaque. (Values of the opacity parameter are clamped to the [0,1] range.) On X11 this has any effect only on X screens with a compositing manager running. See isComposited.
(Read and Write computed property)

180.1.22 Resizable as Boolean

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Get or set whether the user can resize a window.
Notes: (Read and Write computed property)

180.1.23 Title as string

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Get or set the window title.
Notes:

The title of a window will be displayed in its title bar; on the X Window System, the title bar is rendered by the window manager, so exactly how the title appears to users may vary according to a user's exact configuration. The title should help a user distinguish this window from other windows they may have open. A good title might include the application name and current document filename, for example.
(Read and Write computed property)

180.2 class MAAttachedWindowMBS

180.2.1 class MAAttachedWindowMBS

MBS MacExtras Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A class for attached windows in Cocoa.
Notes:

For Mac OS X 10.7 you can use NSPopoverMBS. This class does something similar for Mac OS X 10.4 to 10.7.

Base on MAAttachedWindow code by Matt Gemmell.
See his website http://mattgemmell.com/

Below are the positions the attached window can be displayed at.

ote that these positions are relative to the point passed to the constructor, e.g. MAPositionBottomRight will put the window below the point and towards the right, MAPositionTop will horizontally center the window above the point, MAPositionRightTop will put the window to the right and above the point, and so on.

You can also pass MAPositionAutomatic and the attached window will try to position itself sensibly, based on available screen-space.

Notes regarding automatically-positioned attached windows:

(a) The window prefers to position itself horizontally centered below the specified point. This gives a certain enhanced visual sense of an attachment/relationship.

(b) The window will try to align itself with its parent window (if any); i.e. it will attempt to stay within its parent window's frame if it can.

(c) The algorithm isn't perfect. :) If in doubt, do your own calculations and then explicitly request that the window attach itself to a particular side.

Notes regarding accessor methods:

1. The border is drawn inside the viewMargin area, expanding inwards; it does not increase the width/height of the window. You can use the BorderWidth and ViewMargin methods together to achieve the exact look/geometry you want. (viewMargin is the distance between the edge of the view and the window edge.)

2. The specified setter methods are primarily intended to be used _before_ the window is first shown. If you use them while the window is already visible, be aware that they may cause the window to move and/or

resize, in order to stay anchored to the point specified in the initializer. They may also cause the view to move within the window, in order to remain centered there.

Note that the HasArrow method can safely be used at any time, and will not cause moving/resizing of the window. This is for convenience, in case you want to add or remove the arrow in response to user interaction. For example, you could make the attached window movable by its background, and if the user dragged it away from its initial point, the arrow could be removed. This would duplicate how Aperture's attached windows behave.

3. drawsRoundCornerBesideArrow takes effect when the arrow is being drawn at a corner, i.e. when it's not at one of the four primary compass directions. In this situation, if drawsRoundCornerBesideArrow is true (the default), then that corner of the window will be rounded just like the other three corners, thus the arrow will be inset slightly from the edge of the window to allow room for the rounded corner. If this value is false, the corner beside the arrow will be a square corner, and the other three corners will be rounded.

This is useful when you want to attach a window very near the edge of another window, and don't want the attached window's edge to be visually outside the frame of the parent window.

4. Note that to retrieve the background color of the window, you should use the windowBackgroundColor method, instead of backgroundColor. This is because we draw the entire background of the window (rounded path, arrow, etc) in an NSColor pattern image, and set it as the backgroundColor of the window.
Subclass of the NSWindowMBS class.

180.2.2 Blog Entries

180.2.3 Methods

180.2.4 attachedWindow(view as NSViewMBS, point as NSPointMBS = nil, window as NSWindowMBS = nil, onSide as Integer = 12, distance as Double = 0.0) as MAAttachedWindowMBS

MBS MacExtras Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new attached window.
Notes:

view: The view to display in the attached window. Must not be nil.
point: The point to which the attached window should be attached. If you are also specifying a parent window, the point should be in the coordinate system of that parent window. If you are not specifying a window, the point should be in the screen's coordinate space. This value is required.
window: The parent window to attach this one to. Note that no actual relationship is created (particularly, this window is not made a childWindow of the parent window). Default: nil.
onSide: The side of the specified point on which to attach this window. Default: MAPositionAutomatic.
distance: How far from the specified point this window should be. Default: 0.

Returns a new attached window.

180.2.5 Constructor(view as NSViewMBS, point as NSPointMBS = nil, window as NSWindowMBS = nil, onSide as Integer = 12, distance as Double = 0.0)

MBS MacExtras Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new attached window.
Notes:

After constructor finished without exception, please check handle property for success. Handle is zero on failure.

view: The view to display in the attached window. Must not be nil.
point: The point to which the attached window should be attached. If you are also specifying a parent window, the point should be in the coordinate system of that parent window. If you are not specifying a window, the point should be in the screen's coordinate space. This value is required.
window: The parent window to attach this one to. Note that no actual relationship is created (particularly, this window is not made a childWindow of the parent window). Default: nil.
onSide: The side of the specified point on which to attach this window. Default: MAPositionAutomatic.
distance: How far from the specified point this window should be. Default: 0.

180.2.6 setBackgroundImage(image as NSImageMBS)

MBS MacExtras Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Here you can set the background image.

180.2.7 setPoint(point as NSPointMBS, side as Integer)

MBS MacExtras Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the position and redraws window.

180.2.8 side as Integer

MBS MacExtras Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Which side the attached window is showing at.
Notes: If you passed automatic side mode to Constructor or attachedWindow method, you can query here which side was chosen.

180.2.9 Properties

180.2.10 arrowBaseWidth as Double

MBS MacExtras Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The arrow base width.
Notes:

Default is 20.
(Read and Write computed property)

180.2.11 arrowHeight as Double

MBS MacExtras Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The height of the arrow.
Notes:

Default is 16.
(Read and Write computed property)

180.2.12 borderColor as NSColorMBS

MBS MacExtras Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The border color.
Notes:

Default is white.
(Read and Write computed property)

180.2.13 borderWidth as Double

MBS MacExtras Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The border width.
Notes:

Default is 2.
(Read and Write computed property)

180.2.14 cornerRadius as Double

MBS MacExtras Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The corner radius.
Notes:

Default is 8.
(Read and Write computed property)

180.2.15 drawsRoundCornerBesideArrow as boolean

MBS MacExtras Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether to draw round corners beside arrow.
Notes:

Default is true.
(Read and Write computed property)

180.2.16 hasArrow as boolean

MBS MacExtras Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether the window shows an arrow.
Notes:

Default is true.
(Read and Write computed property)

180.2.17 viewMargin as Double

MBS MacExtras Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The view margin.
Notes:

Default is 2.
(Read and Write computed property)

180.2.18 windowBackgroundColor as NSColorMBS

MBS MacExtras Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The window background color.
Notes:

Default is 25% dark gray.
(Read and Write computed property)

180.2.19 Constants

180.2.20 MAPositionAutomatic = 12

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants.
Notes: automatic

180.2.21 MAPositionBottom = 1

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants.
Notes: bottom

180.2.22 MAPositionBottomLeft = 10

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants.
Notes: bottom left

180.2.23 MAPositionBottomRight = 11

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants.
Notes: bottom right

180.2.24 MAPositionLeft = 0

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants.
Notes: left

180.2.25 MAPositionLeftBottom = 5

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants. **Notes:** left bottom

180.2.26 MAPositionLeftTop = 4

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants. **Notes:** left top

180.2.27 MAPositionRight = 2

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants. **Notes:** right

180.2.28 MAPositionRightBottom = 7

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants. **Notes:** right bottom

180.2.29 MAPositionRightTop = 6

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants. **Notes:** right top

180.2.30 MAPositionTop = 3

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants. **Notes:** top

180.2.31 MAPositionTopLeft = 8

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants. **Notes:** top left

180.2.32 MAPositionTopRight = 9

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants.
Notes: top right

180.3 Globals

180.3.1 DisableScreenUpdatesMBS

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Temporarily disables redraw of the screen after changes to window geometry or window contents.
Notes:

It is appropriate to disable updates if you are moving or resizing multiple windows and you want all of the geometry changes to appear onscreen simulataneously. In most other cases, you should strive to avoid disabling screen updates. The window server will automatically re-enable updates (and print a message to the Console log) if you leave updates disabled for a sufficiently long period of time, currently about 1 second.

The window server records the number of calls to DisableScreenUpdates and does not re-enable updates until a matching number of calls to EnableScreenUpdates have been made.

Updated for 64-bit in plugin version 18.3.

180.3.2 EnableScreenUpdatesMBS

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Re-enables redraw of the screen after changes to window geometry or window contents.
Notes:

Screen redraw is not actually enabled until the number of calls to EnableScreenUpdatesMBS matches the number of calls to DisableScreenUpdatesMBS.

Updated for 64-bit in plugin version 18.3.

180.4 class OverlayMBS

180.4.1 class OverlayMBS

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This class gives you a window overlaying all other windows with an alpha channel.
Example:

```
dim o as OverlayMBS
dim p as Picture

o=new OverlayMBS(100,100,300,300)
```

```
p=New Picture(300,300,32)
p.Graphics.ForeColor=& c000000
p.Graphics.FillRect 0,0,300,300

o.Pict=p

p=New Picture(300,300,32)
p.Graphics.ForeColor=& c000000
p.Graphics.FillOval 0,0,300,300
p.Graphics.ForeColor=& cFFFFFF
p.Graphics.FillOval 100,100,100,100

o.Mask=p

o.UpdateShow

// wait 5 seconds to see the window
DelayMBS 5
```

Notes:

Requires Mac OS X 10.3.9 or Windows 2000 or newer.

Cocoa implementation added with Mac OS X 10.4 class.
To support high resolution mode on Mac OS X high resolution displays, please make the picture+mask exact the double width and height of the window.

180.4.5 Close

MBS Overlay Plugin, Plugin Version: 8.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Calls the destructor.
Notes: Closes the window and releases all memory used from the overlay.

180.4.6 Constructor(left as Integer, top as Integer, width as Integer, height as Integer, MacAttributes as Integer, WinExStyle as Integer, WinStyle as Integer)

MBS Overlay Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The advanced constructor where you can pass flags for Mac and Windows directly.
Notes:

Windows ExStyle flags:

Windows Style flags:

See also:

- 180.4.7 Constructor(left as Integer, top as Integer, width as Integer, height as Integer, WindowsNoActivate as boolean = false, WindowsTopMost as boolean=true) 22031

180.4.7 Constructor(left as Integer, top as Integer, width as Integer, height as Integer, WindowsNoActivate as boolean = false, WindowsTopMost as boolean=true)

MBS Overlay Plugin, Plugin Version: 8.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Creates a new window.
Example:

```
// a dark window with round edges
```

WS_EX_DLGMODALFRAME	& h00000001
WS_EX_NOPARENTNOTIFY	& h00000004
WS_EX_TOPMOST	& h00000008
WS_EX_ACCEPTFILES	& h00000010
WS_EX_TRANSPARENT	& h00000020
WS_EX_MDICHILD	& h00000040
WS_EX_TOOLWINDOW	& h00000080
WS_EX_WINDOWEDGE	& h00000100
WS_EX_CLIENTEDGE	& h00000200
WS_EX_CONTEXTHELP	& h00000400
WS_EX_RIGHT	& h00001000
WS_EX_LEFT	& h00000000
WS_EX_RTLREADING	& h00002000
WS_EX_LTRREADING	& h00000000
WS_EX_LEFTSCROLLBAR	& h00004000
WS_EX_RIGHTSCROLLBAR	& h00000000
WS_EX_CONTROLPARENT	& h00010000
WS_EX_STATICEDGE	& h00020000
WS_EX_APPWINDOW	& h00040000
WS_EX_OVERLAPPEDWINDOW	(WS_EX_WINDOWEDGE + WS_EX_CLIENTEDGE)
WS_EX_PALETTEWINDOW	(WS_EX_WINDOWEDGE + WS_EX_TOOLWINDOW + WS_EX_TOPMOST)
WS_EX_LAYERED	& h00080000

WS_THICKFRAME	& h00040000
WS_GROUP	& h00020000
WS_TABSTOP	& h00010000
WS_MINIMIZEBOX	& h00020000
WS_MAXIMIZEBOX	& h00010000

```
// make the text not transparent
m.Graphics.ForeColor=& c000000
m.Graphics.DrawString "Hello",10,20

o=new OverlayMBS(200,200,rect_width, rect_height, true)
o.Pict=p
o.Mask=m
o.UpdateShow
```

Notes:

Requires Mac OS X 10.3.9 or Windows 2000 or newer.
On success the handle property is not zero.

If WindowsNoActivate the window is setup to not become the front window. This may be a better setup for a toolbar like window.
If WindowsTopMost is false the window is not floating in front of all other windows.

Seems like WindowsNoActivate on Windows works better if you call Show(4) right after the constructor.

For proper support of high resolutions, the pictures used here may need to be 2x or 3x times the window size.

See also:

- 180.4.6 Constructor(left as Integer, top as Integer, width as Integer, height as Integer, MacAttributes as Integer, WinExStyle as Integer, WinStyle as Integer) 22031

180.4.8 Hide

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Hides the window.

180.4.9 InvalidateShadow

MBS Overlay Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invalidates the shadow of the window.
Notes:

As soon as possible the operation system will recalculate the shadow.
Works only on Mac OS X with Carbon or Cocoa window.

180.4.10 Move(left as Integer, top as Integer)

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Moves the window on the screen to the given position.

180.4.11 Resize(width as Integer, height as Integer)

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Resizes the window.
Notes: You need to provide bigger picture before you call this method.

180.4.12 SetFocus

MBS Overlay Plugin, Plugin Version: 17.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The method to call to set focus to the overlay window.
Notes: Works for Windows and macOS Cocoa.

180.4.13 Show(WindowsShowMode as Integer = 0)

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Shows the window onscreen.
Notes:

Values for the Windows show mode:

default 0
SW_SHOWNORMAL 1
SW_NORMAL 1
SW_SHOWMINIMIZED 2
SW_SHOWMAXIMIZED 3
SW_MAXIMIZE 3
SW_SHOWNOACTIVATE 4
SW_SHOW 5
SW_MINIMIZE 6
SW_SHOWMINNOACTIVE 7
SW_SHOWNA 8
SW_RESTORE 9
SW_SHOWDEFAULT 10
SW_FORCEMINIMIZE 11

180.4.14 Update

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Updates the window.
Notes: After you draw new content into the pict and mask pictures, you call this method to apply changes to the window.
See also:

- 180.4.15 Update(NSImage as Variant) 22035

180.4.15 Update(NSImage as Variant)

MBS Overlay Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Updates overlay window with given NSImage.
Notes:

Please pass NSImageMBS object.

Version 16.2 and newer also accepts CGImageMBS object here.
If you pass picture, we use it as CGImage or NSImage depending on what picture type you pass.
See also:

- 180.4.14 Update 22035

180.4.16 UpdateShow

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Shows the window and performs an update.
Notes: Runs Update and Show internally.

180.4.17 Properties

180.4.18 Alpha as Double

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The alpha value of the window.
Notes:

0 is invisible and 1.0 is visible.
(Read and Write property)

180.4.19 AutoCaptureMouse as Boolean

MBS Overlay Plugin, Plugin Version: 9.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Whether the mouse should be captured automatically on Windows.
Notes:

If you return true from MouseDown the mouse is catched. This way you can get the drag events even if the mouse moves out of the window.
On MouseUp the mouse is released.
(Read and Write property)

180.4.20 CurrentImage as Variant

MBS Overlay Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Last image drawn.
Notes:

For debugging only.
CGImageMBS or NSImageMBS depending on what you set.
(Read only property)

180.4.21 Height as Integer

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The height of the window.
Notes:

Using Resize method is more efficient than assigning width and height properties.
(Read and Write property)

180.4.22 IgnoreMouseClicks as Boolean

MBS Overlay Plugin, Plugin Version: 8.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Whether this window should react to mouse clicks.
Notes:

In Mac OS X 10.7 and newer setting IgnoreMouseClicks = false does not give the same behavior as without setting this property before.
(Read and Write property)

180.4.23 Left as Integer

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The position of the window.
Example:

```
static o as OverlayMBS // keep the variable global somewhere. Static or part of a module or in app class.

o = new OverlayMBS(100,100,100,100)

o.Pict = LogoMBS(100)
o.mask = LogoMBS(100)

o.Left = 200

o.UpdateShow
```

Notes:

Using Move method is more efficient than assigning left and top properties.
(Read and Write property)

180.4.24 Mask as Picture

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The mask for the window.
Notes:

You need to create and assign your own image.
If you assign nil for the mask, the plugin uses the mask or alpha channel of the picture.

For proper support of high resolutions, the pictures used here may need to be 2x or 3x times the window size.
(Read and Write property)

180.4.25 NSView as Variant

MBS Overlay Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The NSView showing the content of the overlay.
Notes: (Read only property)

180.4.26 NSWindow as Variant

MBS Overlay Plugin, Plugin Version: 10.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns a reference to the NSWindowMBS object which you can use to make additional settings to the overlay window.
Example:

```
dim o as OverlayMBS // your window

dim n as NSWindowMBS = o.NSWindow
// this window should not hide if app hides
n.canHide = false
```

Notes:

Only for the Cocoa target in Xojo.
(Read only property)

180.4.27 Pict as Picture

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The picture for the window content.

Notes:

You need to provide your own picture here.
Pict and Mask pictures must have the same size.

Alpha Channel Pictures are not really supported.
But for Mac OS X an alpha channel picture does currently work.

For proper support of high resolutions, the pictures used here may need to be 2x or 3x times the window size.
(Read and Write property)

180.4.28 Top as Integer

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The position of the window.
Example:

```
static o as OverlayMBS // keep the variable global somewhere. Static or part of a module or in app class.

o = new OverlayMBS(100,100,100,100)

o.Pict = LogoMBS(100)
o.mask = LogoMBS(100)

o.top = 200

o.UpdateShow
```

Notes:

Using Move method is more efficient than assigning left and top properties.
(Read and Write property)

180.4.29 Visible as Boolean

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Whether the window is visible.
Example:

```
dim o as OverlayMBS
// ....
o.visible=true
```

Notes:

True if visible, false if hidden.
(Read and Write property)

180.4.30 Width as Integer

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The width of the window.
Notes:

Using Resize method is more efficient than assigning width and height properties.
(Read and Write property)

180.4.31 WindowHandle as Integer

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The internal used window handle.
Notes:

On Mac OS a WindowRef and on Windows a HWND.
(Read only property)

180.4.32 WindowID as Integer

MBS Overlay Plugin, Plugin Version: 10.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Queries the CoreGraphics Window ID for the given window.
Notes:

Returns 0 on any error.
This ID can be used for CGWindowListCreateImageMBS.
(Read only property)

180.4.33 WindowsClassName as String

MBS Overlay Plugin, Plugin Version: 18.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The Windows' window class name.
Notes: (Read only property)

180.4.34 hasShadow as boolean

MBS Overlay Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the window has a shadow.
Notes: (Read and Write computed property)

180.4.35 Title as string

MBS Overlay Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The title of the window.
Notes:

This name is not visible as the window has no title bar.
But if you see the window in some window list, this title property will give your overlay window a name.
(Read and Write computed property)

180.4.36 WinIsTopMost as boolean

MBS Overlay Plugin, Plugin Version: 12.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Whether a window is staying on the top of the other windows.
Notes:

If true the window stays in front of other windows. Default is false for Xojo windows and true for overlays.
(Read and Write computed property)

180.4.37 Events

180.4.38 Draw(CGContext as Variant, NSGraphicsContext as Variant)

MBS Overlay Plugin, Plugin Version: 18.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Draws the content of the window.
Example:

```
Sub Draw(CGContext as Variant, NSGraphicsContext as Variant)
dim c as CGContextMBS = CGContext
dim n as NSGraphicsMBS = NSGraphicsContext
// draw here
End Sub
```

Notes:

The drawing area is cleared for you.
Please put the given parameters in the local variables with correct type.
We use variants here to reduce plugin dependencies.

With version 19.5, the don't clear content anymore for you, so you may need to call ClearRect if needed.

180.4.39 GotFocus

MBS Overlay Plugin, Plugin Version: 17.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The event called when focus is set on the overlay window.
Notes: Works for Windows and macOS Cocoa.

180.4.40 KeyDown(key as String, keyCode as Integer, modifiers as integer) as Boolean

MBS Overlay Plugin, Plugin Version: 17.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The key down event.
Notes:

The plugin translates keycodes into key as text, but also provides keycode and modifier flags.
Works for Windows and macOS Cocoa.

180.4.41 KeyUp(key as String, keyCode as Integer, modifiers as integer) as Boolean

MBS Overlay Plugin, Plugin Version: 17.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The key up event.
Notes:

The plugin translates keycodes into key as text, but also provides keycode and modifier flags.
Works for Windows and macOS Cocoa.

180.4.42 LostFocus

MBS Overlay Plugin, Plugin Version: 17.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The event called when focus is lost on the overlay window.
Notes: Works for Windows and macOS Cocoa.

180.4.43 menuForEvent(NSEvent as variant) as Variant

MBS Overlay Plugin, Plugin Version: 17.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Provide a contextual menu for Cocoa Mac.
Notes:

NSEvent is an NSEventMBS object.
Please return NSMenuMBS object. (and please keep a reference somewhere)

180.4.44 MouseDown(x as Integer, y as Integer, modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This event is called when the user clicks with the mouse inside the window.
Notes:

Return true if you handled this event.
modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

180.4.45 MouseDragged(x as Integer, y as Integer, modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This event is called when the user moves the mouse over the window while the mouse is pressed.
Notes:

Return true if you handled this event.
modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

180.4.46 MouseEnter(x as Integer, y as Integer, modifiers as Integer)

MBS Overlay Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This is event is called when mouse enters window.
Notes:

modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

180.4.47 MouseExit(x as Integer, y as Integer, modifiers as Integer)

MBS Overlay Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This is event is called when mouse leaves window.
Notes:

modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

180.4.48 MouseMoved(x as Integer, y as Integer, modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This event is called when the user moves the mouse over the window.
Notes:

Return true if you handled this event.
modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

180.4.49 MouseUp(x as Integer, y as Integer, modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This event is called when the user releases the mousebutton inside the window.
Notes:

Return true if you handled this event.

modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

180.4.50 MouseWheel(x as Integer, y as Integer, dx as Double, dy as Double, modifiers as Integer)

MBS Overlay Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This event is called when the user uses the mouse wheel inside the window.
Notes:

modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

180.4.51 WindowBoundsChanged

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This event is called whenever the size of the window changes.
Notes: Can also be called on position changes.

180.4.52 WindowClosed

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This event is called when the window is closed.

180.4.53 WindowHidden

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This event is called when the window is hidden.
Notes: Cocoa support added for version 14.0.

180.4.54 WindowShown

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This event is called when the window is shown.
Notes: Cocoa support added for version 14.0.

180.4.55 Constants

180.4.56 kModifierFlagCommand = 1048576

MBS Overlay Plugin, Plugin Version: 17.4. **Function:** One of the modifier constants.
Notes:

The command key is pressed.
Use with BitwiseAnd(Modifiers, kModifierFlagCommand) <>0 to check if the flag is set in key events.

180.4.57 kModifierFlagControl = 262144

MBS Overlay Plugin, Plugin Version: 17.4. **Function:** One of the modifier constants.
Notes:

The control key is pressed.
Use with BitwiseAnd(Modifiers, kModifierFlagControl) <>0 to check if the flag is set in key events.

180.4.58 kModifierFlagOption = 524288

MBS Overlay Plugin, Plugin Version: 17.4. **Function:** One of the modifier constants.
Notes:

The option (alt) key is pressed.
Use with BitwiseAnd(Modifiers, kModifierFlagOption) <>0 to check if the flag is set in key events.

180.4.59 kModifierFlagShift = 131072

MBS Overlay Plugin, Plugin Version: 17.4. **Function:** One of the modifier constants.
Notes:

The shift key is pressed.
Use with BitwiseAnd(Modifiers, kModifierFlagShift) <>0 to check if the flag is set in key events.

180.5 class Window

180.5.1 class Window

Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Extends Xojo's Window Class.
Example:

window1.HasNoTitleBarMBS = true

Notes: In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

180.5.2 Methods

180.5.3 ActivateWindowMBS

MBS Util Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Activates the window.
Notes:

This function does more than just show. if the window has been minimized, it will restore it. Also the window is moved to front and made the current window for keyboard input.

Sadly windows limits which windows can go to front, so some windows may not come to front unless they are clicked on.

As activation can be asynchronously, the window may activate later, e.g. after current method ends.

For MacOS Cocoa apps, we simply bring the window to the front.

180.5.4 BackingScaleFactorMBS as Double

MBS Util Plugin, Plugin Version: 12.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the scale factor representing the number of backing store pixels corresponding to each linear unit in window space on this window.
Notes:

This is generally only necessary when building a bitmap context or image whose resolution needs to match that of a particular Window. Note that a Window's backing scale factor can change over time, such as when the window moves from one display to another, or when a display's resolution changes, so clients should not

cache the value returned by this function.

If platform does not support scaling factor, we return 1.0. (on Windows, Linux and older Mac OS X)
Supported for Carbon and Cocoa windows.

For apps which are not enabled for retina support, the function returns 1. So you only see 2 here if app is Cocoa, display is retina and info.plist has the NSHighResolutionCapable key.

180.5.5 CGContextMBS as CGContextMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CGContextMBS object for the given Window.
Example:

```
dim CGContext as CGContextMBS
dim OverlayPic as Picture=LogoMBS(500)
dim contentpicture as CGImageMBS= CGCreateImageMBS(OverlayPic)

CGContext=window1.CGContextMBS

CGContext.ClearRect CGMakeRectMBS(0, 0, OverlayPic.width, OverlayPic.height)
CGContext.DrawPicture contentpicture, CGMakeRectMBS(0, 0, OverlayPic.width, OverlayPic.height)
```

Notes:

Requires Mac OS X to work.
Please make sure the CGContextMBS object is released in the paint event if you use it there, so all the drawings are flushed. Not releasing it my be visible in missing statictext or other strange graphics effects.

Version 9.8 adds support for Cocoa target.
But on a Cocoa window the context is not always available, so in the window paint event, you can use GetCurrentCGContextMBS.

180.5.6 CleanUpTransparentMBS(refValue as Integer)

MBS Util Plugin, Plugin Version: 5.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Cleans up transparency support for a Xojo window.
Example:

```
dim p as Integer // property on Windows

p = window1.MakeTransparentMBS
```

```
// later in close event

window1.CleanUpTransparentMBS p
```

Notes:

Call this in the close event of a window passing the value you got from the MakeTransparentMBS call.
Linux supported added with 14.0, but works only with Linux desktop which support alpha channel.

180.5.7 ClearTransparencyMBS

MBS Util Plugin, Plugin Version: 5.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Clears transparency of a window.

180.5.8 CollapsableMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if this window can be collapsed.
Example:

```
MsgBox str(window1.CollapsableMBS)
```

Notes:

Collapseable windows are the normal document windows.
You can't collapse dialogs or floating windows well.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.

180.5.9 ConstrainWindowToScreenMBS(animate as boolean)

MBS Util Plugin, Plugin Version: 10.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Makes sure the window is on one screen visible.
Notes: Implemented on Mac for both Carbon and Cocoa.

180.5.10 GTKWindow as GTKWindowMBS

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Queries a GTKWindow object for this window.
Notes:

Returns only a valid object on linux.
On other platforms, this function returns nil.

180.5.11 InvalidateRectThreadSafeMBS(X As Integer, Y As Integer, Width As Integer, Height As Integer, EraseBackground as boolean = true)

MBS Util Plugin, Plugin Version: 19.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invalidate the rectangle.
Notes:

This method is to allow you to invalidate in a thread without a problem.

If called on main thread, the plugin will simply call InvalidateRect method directly.
If called on other threads the plugin will schedule to call InvalidateRect method a short time later on the main thread.

180.5.12 InvalidateShadowMBS

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This method causes a window's shadow to be recalculated.
Notes:

InvalidateShadowMBS is not typically used by applications. However, it may be useful for applications with customized window frames that change shape dynamically; in this case, after the application has drawn the new window shape, the window shadow must be recalculated to follow the new window shape.

This method causes the window shadow to be immediately recalculated and redrawn based on the current contents of the window's back buffer. For best performance and visual appearance, you should follow these steps when invalidating a window shadow: disable updates with DisableScreenUpdatesMBS, draw, flush, invalidate the shadow, and enable updates. For a compositing window, after invalidating any views that should be redrawn, you will need to explicitly draw and flush using HIWindowFlush, rather than waiting for the event loop to draw and flush the window, because you cannot disable updates or invalidate the window shadow if drawing is done via the event loop.

Requires Mac OS X 10.4 and should do nothing on 10.3.

180.5.13 InvalidateThreadSafeMBS(EraseBackground as boolean = true)

MBS Util Plugin, Plugin Version: 19.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invalidate the window.
Notes:

This method is to allow you to invalidate in a thread without a problem.

If called on main thread, the plugin will simply call Invalidate method directly.
If called on other threads the plugin will schedule to call Invalidate method a short time later on the main thread.

180.5.14 IsFullScreenMBS as Boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Queries whether window is fullscreen.
Notes:

Indicates that a window has fullscreen appearance.
A fullscreen window does not draw its titlebar, and may have special handling for its toolbar.
Available in Mac OS X v10.7 and later.

180.5.15 MakeTransparentMBS as Integer

MBS Util Plugin, Plugin Version: 5.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Installs transparency support to a Xojo window.
Example:

```
dim p as Integer // property on Windows

p = window1.MakeTransparentMBS

// later in close event

window1.CleanUpTransparentMBS p
```

Notes:

Will return non zero value if successfull.
The window doesn't change if you don't use the CGContextMBS property.

Requires Mac OS X, Windows 2000 or Windows XP to work. The window must be a document window.

Set MacProcID of the window to 1104 and you can make it transparent without a title bar. (on Mac OS X)

With plugin version 11.1, we now return a value which should store with the window. Later in the Close event, you call CleanUpTransparentMBS passing this value.

Added Cocoa support in 11.3 plugins.
Linux supported added with 14.0, but works only with Linux desktop which support alpha channel. Calls to MakeTransparentMBS and CleanUpTransparentMBS are not required for Linux.

180.5.16 NSPanelMBS as NSPanelMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSPanel for the given Xojo window.
Example:

MsgBox window1.NSPanelMBS.Title

Notes: Works only for Cocoa Windows in Cocoa target which are floating panels.

180.5.17 NSToolbarMBS as NSToolbarMBS

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The window's toolbar.
Notes:

So you can get the toolbar without going over NSWindowMBS.
But there you can assign a new toolbar...

180.5.18 NSWindowMBS as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSWindow for the given Xojo window.
Example:

MsgBox window1.NSWindowMBS.Title

Notes: Works only for Cocoa Windows in Cocoa target and for Carbon Windows in carbon targets.

180.5.19 RefreshRectThreadSafeMBS(X As Integer, Y As Integer, Width As Integer, Height As Integer, EraseBackground as boolean = true)

MBS Util Plugin, Plugin Version: 19.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Refresh the rectangle.
Notes:

This method is to allow you to refresh in a thread without a problem.

If called on main thread, the plugin will simply call RefreshRect method directly.
If called on other threads the plugin will schedule to call RefreshRect method a short time later on the main thread.

180.5.20 RefreshThreadSafeMBS(EraseBackground as boolean = true)

MBS Util Plugin, Plugin Version: 19.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Refresh the rectangle.
Notes:

This method is to allow you to refresh in a thread without a problem.

If called on main thread, the plugin will simply call Refresh method directly.
If called on other threads the plugin will schedule to call Refresh method a short time later on the main thread.

180.5.21 RemoveWindowProxyIconMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Removes any Proxy Icon from the Window.
Example:

mainwindow.RemoveWindowProxyIconMBS

Notes:

Requires Mac OS 8.5 or newer.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

180.5.22 ScreenshotWindowMBS as picture

MBS MacOSX Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the content of the window buffer on Mac OS X.
Example:

```
dim p as Picture
p=mainwindow.screenshotWindowMBS
```

Notes:

Only for Mac OS X. Image is taken from window back buffer.
This will not capture overlay windows.

On Xojo 2006 or newer, please add a self. on front of the method call in case you want to use the method on the current window.

180.5.23 ScreenshotWindowRectMBS(left as Integer, top as Integer, width as Integer, height as Integer) as picture

MBS MacOSX Plugin, Plugin Version: 3.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns a part of the content of the window buffer on Mac OS X.
Example:

```
dim p as picture
p=mainwindow.ScreenshotWindowRectMBS(100,100,200,200)
```

Notes:

Only for Mac OS X. Image is taken from window back buffer.
This will not capture overlay windows.

On Xojo 2006 or newer, please add a self. on front of the method call in case you want to use the method on the current window.

180.5.24 SetTransparencyMBS(value as Integer) as boolean

MBS Util Plugin, Plugin Version: 5.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Your window can have transparency on Mac OS X.
Example:

```
if window1.SetTransparencyMBS(127) then
'fine
else
'error
end if
```

Notes:

Use values between 0 and 255.
Requires Mac OS X, Windows 2000 or Windows XP to work.
May be limited to simple windows like normal document windows.
You need to call MakeTransparent before to install transparency.
(this function was replaced in v4.4)
Linux supported added with 14.0, but works only with Linux desktop which support alpha channel.

180.5.25 SetWindowFeedbackSettingMBS(Feedback as Integer, value as Variant) as Boolean

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the feedback configuration for a window.
Example:

```
const FEEDBACK_TOUCH_CONTACTVISUALIZATION = 1
const FEEDBACK_PEN_BARRELVISUALIZATION = 2
const FEEDBACK_PEN_TAP = 3
const FEEDBACK_PEN_DOUBLETAP = 4
const FEEDBACK_PEN_PRESSANDHOLD = 5
const FEEDBACK_PEN_RIGHTTAP = 6
const FEEDBACK_TOUCH_TAP = 7
const FEEDBACK_TOUCH_DOUBLETAP = 8
const FEEDBACK_TOUCH_PRESSANDHOLD = 9
const FEEDBACK_TOUCH_RIGHTTAP = 10
const FEEDBACK_GESTURE_PRESSANDTAP = 11

dim r as Boolean = self.SetWindowFeedbackSettingMBS(FEEDBACK_TOUCH_TAP, true)

if r then
dim value as Boolean
dim b as Boolean = self.WindowFeedbackSettingMBS(FEEDBACK_TOUCH_TAP, value)
if b then
MsgBox "WindowFeedbackSettingMBS: "+str(value)
end if
end if
```

Notes:

Returns true if successful; otherwise, returns false.

Value can be nil to reset value. Or true/false to set it.
Requires Windows 8 or Windows Server 2012 in desktop apps only.

Constant Name	Value	Description
FEEDBACK_TOUCH_CONTACTVISUALIZATION	1	Feedback for a touch contact event.
FEEDBACK_PEN_BARRELVISUALIZATION	2	Feedback for a pen barrel-button event.
FEEDBACK_PEN_TAP	3	Feedback for a pen tap event.
FEEDBACK_PEN_DOUBLETAP	4	Feedback for a pen double-tap event.
FEEDBACK_PEN_PRESSANDHOLD	5	Feedback for a pen press-and-hold event.
FEEDBACK_PEN_RIGHTTAP	6	Feedback for a pen right-tap event.
FEEDBACK_TOUCH_TAP	7	Feedback for a touch tap event.
FEEDBACK_TOUCH_DOUBLETAP	8	Feedback for a touch double-tap event.
FEEDBACK_TOUCH_PRESSANDHOLD	9	Feedback for a touch press-and-hold event.
FEEDBACK_TOUCH_RIGHTTAP	10	Feedback for a touch right-tap event.
FEEDBACK_GESTURE_PRESSANDTAP	11	Feedback for a press-and-tap gesture.

180.5.26 SetWindowIconMBS(Type as Integer, File as FolderItem, IconID as Integer) as Boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sets the window icon using the icon in the file.
Example:

```
call window1.SetWindowIconMBS(0,getfolderitem("icon.ico"),1)
```

Notes:

Returns true on success and false on failure.
What image depths are used and supported depends on the Windows version.

Type is 0 for a small icon and 1 for a big icon.
See also:

- 180.5.27 SetWindowIconMBS(Type as Integer, Icon as Picture, Mask as Picture) as Boolean 22056

180.5.27 SetWindowIconMBS(Type as Integer, Icon as Picture, Mask as Picture) as Boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sets the window icon using the given picture with mask.

Example:

```
dim p as Picture
dim m as Picture

// random colored circle image
p=New Picture(16,16,32)
p.Graphics.ForeColor=& c000000
p.Graphics.FillRect 0,0,16,16
p.Graphics.ForeColor=rgb(rnd*256,rnd*256,rnd*256)
p.Graphics.Filloval 0,0,16,16

// circle mask
m=New Picture(16,16,32)
m.Graphics.ForeColor=& cFFFFFF // transparent
m.Graphics.Fillrect 0,0,16,16
m.Graphics.ForeColor=& c000000 // color
m.Graphics.Filloval 0,0,16,16

Canvas1.Backdrop=p // show in canvas
Canvas2.Backdrop=m

call window1.SetWindowIconMBS(0,p,m)
```

Notes:

The mask picture ist converted to black/white.
What image depths are used and supported depends on the Windows version.
Returns true on success and false on failure.

Possible values for type:

ICON_BIG = 1	Set the large icon for the window.
ICON_SMALL = 0	Set the small icon for the window.

See also:

- 180.5.26 SetWindowIconMBS(Type as Integer, File as FolderItem, IconID as Integer) as Boolean 22056

180.5.28 SetWindowMaskMBS(p as picture, redraw as Boolean, transparentColor as color) as Boolean

MBS Win Plugin, Plugin Version: 3.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sets the mask of a window.

Notes:

Redraw decides whether the window is redrawn after it has been changed.
Returns true if successfull.

If you want to do the same on Mac OS X, check the example projects "transparent window" and the Photoshop Splash Screen example.

On Mac OS 9 you need a solution with a WDEF Resource which is not part of the plugin collection.

180.5.29 ShowHideToolbarMBS(animate as boolean, value as boolean)

MBS Util Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Shows or hides the toolbar.
Notes: Only working on Mac OS X.

180.5.30 SmoothResizeCenteredMBS(width as Integer,height as Integer)

MBS Util Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Resizes the window smoothly to all directions.
Example:

```
dim w,h as Integer

// get destination dimension

w=300
h=200

// Resize

window1.SmoothResizeCenteredMBS w,h

// Now resize via RB to make it permament.

width=w
height=h
```

Notes:

You need to set the new size using Xojo's Windows properties, too. (no longer needed with Xojo)
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

180.5.31 SmoothResizeMBS(width as Integer,height as Integer)

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Resizes the window smoothly.
Example:

```
dim w,h as Integer

// get destination dimension

w=300
h=200

// Resize

window1.SmoothResizeMBS w,h

// Now resize via RB to make it permament.

width=w
height=h
```

Notes:

You need to set the new size using Xojo's Windows properties, too. (no longer needed with Xojo)
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Works on Cocoa on 10.4 and newer.

180.5.32 ToggleFullScreenMBS as Boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Toggles fullscreen mode for this window.
Notes:

Returns true on success.
If an application supports fullscreen, it should add a menu item to the View menu with toggleFullScreen as the action.
Available in Mac OS X v10.7 and later.
This method does not much if you don't mark a window to be the primary fullscreen window.

180.5.33 UpdateNowMBS

MBS MacOSX Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** On Mac OS X all Windows are doublebuffered and the OS updates the screen from time to time. This method forces a screen update.
Example:

Mainwindow.UpdateNowMBS

Notes: Updated for 64-bit in plugin version 18.3.

180.5.34 UpdateNowRectMBS(left as Integer, top as Integer, width as Integer, height as Integer)

MBS MacOSX Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** On Mac OS X all Windows are doublebuffered and the OS updates the screen from time to time. This method forces a screen update for a part of your window.
Example:

Mainwindow.UpdateNowRectMBS Mainwindow.text.left, Mainwindow.text.top, Mainwindow.text.width, Mainwindow.text.height

Notes: Updated for 64-bit in plugin version 18.3.

180.5.35 WinAnimateWindowMBS(Flags as Integer, Time as Integer=200) as boolean

MBS Win Plugin, Plugin Version: 9.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The AnimateWindow function enables you to produce special effects when showing or hiding windows.
Example:

```
dim flags as Integer

const AW_SLIDE = & h040000 // Uses slide animation. By default, roll animation is used. This flag is ignored when used with AW_CENTER.
const AW_ACTIVATE = & h020000 // Activates the window. Do not use this value with AW_HIDE.
const AW_BLEND = & h080000 // Uses a fade effect. This flag can be used only if hwnd is a top-level window.
const AW_HIDE = & h010000 //Hides the window. By default, the window is shown.
const AW_CENTER = & h10 // Makes the window appear to collapse inward if AW_HIDE is used or expand outward if the AW_HIDE is not used. The various direction flags have no effect.
```

```
const AW_HOR_POSITIVE = 1 // Animates the window from left to right. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
const AW_HOR_NEGATIVE = 2 // Animates the window from right to left. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
const AW_VER_POSITIVE = 4 // Animates the window from top to bottom. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
const AW_VER_NEGATIVE = 8 // Animates the window from bottom to top. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.

window2.hide

flags=BitwiseOr(AW_SLIDE, AW_HOR_POSITIVE)

if window2.WinAnimateWindowMBS(flags, 1000) then
window2.show
else
MsgBox "Animatin failed."
end if
```

Notes:

There are four types of animation: roll, slide, collapse or expand, and alpha-blended fade.

self: The window to animate. The calling thread must own this window.
Time: Specifies how long it takes to play the animation, in milliseconds. Typically, an animation takes 200 milliseconds to play.
Flags: Specifies the type of animation. This parameter can be one or more of the following values. Note that, by default, these flags take effect when showing a window. To take effect when hiding a window, use AW_HIDE and a bitwiseor operator with the appropriate flags.

AW_SLIDE	= & h040000	Uses slide animation. By default, roll animation is used. This flag is ignored when used with AW_CENTER.
AW_ACTIVATE	= & h020000	Activates the window. Do not use this value with AW_HIDE.
AW_BLEND	= & h080000	Uses a fade effect. This flag can be used only if hwnd is a top-level window.
AW_HIDE	= & h010000	Hides the window. By default, the window is shown.
AW_CENTER	= & h10	Makes the window appear to collapse inward if AW_HIDE is used or expand outward if the AW_HIDE is not used. The various direction flags have no effect.
AW_HOR_POSITIVE	= 1	Animates the window from left to right. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
AW_HOR_NEGATIVE	= 2	Animates the window from right to left. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
AW_VER_POSITIVE	= 4	Animates the window from top to bottom. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
AW_VER_NEGATIVE	= 8	Animates the window from bottom to top. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.

Return Value:
If the function succeeds, the return value is true.
If the function fails, the return value is false.
The function will fail in the following situations:

- If the window uses the window region. Windows XP: This does not cause the function to fail.
- If the window is already visible and you are trying to show the window.
- If the window is already hidden and you are trying to hide the window.
- If there is no direction specified for the slide or roll animation.
- When trying to animate a child window with AW_BLEND.
- If the thread does not own the window. Note that, in this case, AnimateWindow fails but GetLastError returns ERROR_SUCCESS. To get extended error information, call the GetLastError function.

To show or hide a window without special effects, use Show.
When using slide or roll animation, you must specify the direction. It can be either AW_HOR_POSITIVE, AW_HOR_NEGATIVE, AW_VER_POSITIVE, or AW_VER_NEGATIVE.
You can combine AW_HOR_POSITIVE or AW_HOR_NEGATIVE with AW_VER_POSITIVE or AW_VER_NEGATIVE to animate a window diagonally.
The window procedures for the window and its child windows should handle any WM_PRINT or WM_PRINTCLIENT messages. Dialog boxes, controls, and common controls already handle WM_PRINTCLIENT. The default window procedure already handles WM_PRINT.
If a child window is displayed partially clipped, when it is animated it will have holes where it is clipped.
AnimateWindow supports RTL windows.
Avoid animating a window that has a drop shadow because it produces visually distracting, jerky animations.

180.5.36 WindowFeedbackSettingMBS(Feedback as Integer, byref value as boolean, IncludeAncestors as Boolean = false) as Boolean

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Retrieves the feedback configuration for a window.
Notes:

IncludeAncestors: Specifies that the parent window chain should be checked.

Returns true if the specified feedback setting is configured on the specified window. Otherwise, it returns false (and config won't be modified).

Requires Windows 8 [desktop apps only] or Windows Server 2012 [desktop apps only] .

Constant Name	Value	Description
FEEDBACK_TOUCH_CONTACTVISUALIZATION	1	Feedback for a touch contact event.
FEEDBACK_PEN_BARRELVISUALIZATION	2	Feedback for a pen barrel-button event.
FEEDBACK_PEN_TAP	3	Feedback for a pen tap event.
FEEDBACK_PEN_DOUBLETAP	4	Feedback for a pen double-tap event.
FEEDBACK_PEN_PRESSANDHOLD	5	Feedback for a pen press-and-hold event.
FEEDBACK_PEN_RIGHTTAP	6	Feedback for a pen right-tap event.
FEEDBACK_TOUCH_TAP	7	Feedback for a touch tap event.
FEEDBACK_TOUCH_DOUBLETAP	8	Feedback for a touch double-tap event.
FEEDBACK_TOUCH_PRESSANDHOLD	9	Feedback for a touch press-and-hold event.
FEEDBACK_TOUCH_RIGHTTAP	10	Feedback for a touch right-tap event.
FEEDBACK_GESTURE_PRESSANDTAP	11	Feedback for a press-and-tap gesture.

180.5.37 WinFlashWindowMBS(Invert as boolean)

MBS Util Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Flashes Window.
Example:

window1.WinFlashWindowMBS true

Notes:

Flashes the specified window one time. It does not change the active state of the window.

Invert: If this parameter is true, the window is flashed from one state to the other. If it is false, the window is returned to its original state (either active or inactive).

When an application is minimized and this parameter is true, the taskbar window button flashes active/inactive. If it is false, the taskbar window button flashes inactive, meaning that it does not change colors. It flashes, as if it were being redrawn, but it does not provide the visual invert clue to the user.

Flashing a window means changing the appearance of its caption bar as if the window were changing from inactive to active status, or vice versa. (An inactive caption bar changes to an active caption bar; an active caption bar changes to an inactive caption bar.)
Typically, a window is flashed to inform the user that the window requires attention but that it does not currently have the keyboard focus.
The FlashWindow function flashes the window only once; for repeated flashing, the application should create a system timer.

180.5.38 WinHideTooltipMBS as Integer

MBS Win Plugin, Plugin Version: 16.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Hides all tooltips.
Notes:

You can call that in window.deactivate event to hide tooltips which did not hide themselves.
Returns number of hidden tooltips.

180.5.39 Properties

180.5.40 CanBeVisibleWithoutLoginMBS as Boolean

MBS Util Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window can be visible before login.
Example:

```
window1.CanBeVisibleWithoutLoginMBS = true
```

Notes:

This window can be made visible prior to user login. By default, in Mac OS X 10.5 and later no windows can be visible before a user logs into the system; this protects the user against certain types of malicious use of insecure applications. However, some software, such as input methods or other accessibility software, may need to deliberately make windows available prior to user login. Such software should add this window attribute to its windows. Available for all windows in Mac OS X 10.5 and later.
(Read and Write computed property)

180.5.41 CGColorSpaceMBS as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 10.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Get or set the colorspace profile for this window.
Example:

```
dim c as CGColorSpaceMBS = window1.CGColorSpaceMBS

if c<>Nil then
MsgBox str(c.NumberOfComponents)
else
MsgBox "nil"
end if
```

Notes:

Requires Mac OS X 10.6.

On Cocoa, the NSColorSpace is queried and the matching CGColorspace is returned. For setting a NSCol-

orSpace is created for the given CGColorspace.
In Carbon applications, the CoreGraphics color space is passed directly.
(Read and Write computed property)

180.5.42 collapsedMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if this window is collapsed. You can set it.
Example:

mainwindow.collapsedMBS=false 'show window

Notes:

Collapseable windows are the normal document windows.
You can't collapse dialogs or floating windows well.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.
(Read and Write computed property)

180.5.43 FullScreenAuxiliaryMBS as Boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window is setup as being the auxiliary fullscreen window.
Notes: (Read and Write computed property)

180.5.44 FullScreenPrimaryMBS as Boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window is setup as being the primary fullscreen window.
Notes:

If true, the window receives the fullscreen widget in the title bar.
(Read and Write computed property)

180.5.45 HasborderMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Decides whether the window has a border.
Example:

mainwindow.HasborderMBS=false ' Remove border

Notes:

This property has only an effect on Windows. The window needs to be redrawn before the change is visible (for example move it). This option removes the title bar. HasCaptionMBS removes even more.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

180.5.46 HasCaptionMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Whether the window has a caption (a title bar)
Example:

Window1.HasCaptionMBS=false

Notes:

This property has only an effect on Windows. The window needs to be redrawn before the change is visible (for example move it).

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

180.5.47 HasCloseBoxMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window has a CloseBox.
Example:

mainwindow.HasCloseboxMBS=false 'remove closebox

Notes:

You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

180.5.48 HasCollapseBoxMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window has a Collapsebox.
Example:

mainwindow.HasCollapseBoxMBS=false 'remove Collapsebox

Notes:

You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

180.5.49 HasMaximizeBoxMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if this window has a Maximize Button.
Example:

mainwindow.HasMaximizeBoxMBS=false 'remove Maximize button

Notes:

This property has only an effect on Windows. The window needs to be redrawn before the change is visible (for example move it).

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

180.5.50 HasMinimizeBoxMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if this window has a Minimize Button.
Example:

mainwindow.HasMinimizeBoxMBS=false 'remove Minimize button

Notes:

This property has only an effect on Windows. The window needs to be redrawn before the change is visible (for example move it).

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

180.5.51 HasNoShadowMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window has no shadow.
Example:

mainwindow.HasNoShadowMBS=true 'remove shadow

Notes:

Available for all windows on Mac OS X. This attribute is automatically given to windows of kOverlayWindowClass.

Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.

(Read and Write computed property)

180.5.52 HasNoTitleBarMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** For Document, Floating, and Utility windows, this attribute allows you to hide the title bar of a window.
Example:

```
window1.HasNoTitleBarMBS = true

// for Cocoa:
window1.HasCloseBoxMBS = false
window1.HasCollapseBoxMBS = false
window1.IsResizableMBS = false
window1.HasNoTitleBarMBS = true
```

Deprecated: This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead. **Notes:**

For Mac OS X 10.4 or later.

You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in Plugin version 10.4.
(Read and Write computed property)

180.5.53 HasSystemMenuMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Whether the window has a system menu inside the title bar.
Example:

```
Window1.HasSystemMenuMBS=false
```

Notes:

This property has only an effect on Windows. It will disable the system menu and also the minimize, maxi-

mize and close buttons. The window needs to be redrawn before the change is visible (for example move it).

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

180.5.54 HasToolbarButtonMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window has a toolbar button.
Example:

mainwindow.HasToolbarButtonMBS=true 'shows Toolbar Button

Notes:

You can read the state on Mac Classic, but you can only change it on Mac Carbon.
The Button is shown on next redraw of the window frame.

Use the CarbonWindowsEventsMBS class to receive events when the button is pressed.

Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

180.5.55 IgnoreClicksMBS as Boolean

MBS Util Plugin, Plugin Version: 3.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Can be used to control whether mouse clicks are ignored for this window.
Example:

Window1.IgnoreClicksMBS=true

Notes:

Whether this window never receives mouse events, even in areas that are opaque. Instead, clicks on the window will be passed through to windows beneath it. Available for all windows on Mac OS X 10.2 and later.

You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.
(Read and Write computed property)

180.5.56 IsIconicMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if this window is inside the taskbar.
Example:

```
MsgBox str(window1.IsIconicMBS)
```

Notes:

If you set IsIconic to true the window is minimized and if you set it to false the window size and position is restored.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

180.5.57 IsMetalWindowMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window uses the Metal appearance.
Example:

```
if window1.Frame = window.FrameTypeMetal then
MsgBox "Window is metal. "+str(window1.IsMetalWindowMBS)
else
MsgBox "Window is not metal. "+str(window1.IsMetalWindowMBS)
end if
```

Notes:

Available for document windows on Mac OS X 10.2 and later, and for floating windows on Mac OS X 10.3 and later. Drawers can also be metal, but dynamically adjust their appearance based on their parent win-

dow's appearance; it is not necessary to specify this attribute for a metal drawer.

You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

180.5.58 IsResizableMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window is resizeable.
Example:

Window1.IsResizableMBS=false

Notes:

You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

Use GrowBoxTransparentMBS on Composite Mac OS X windows to enable the transparent grow box.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Works in Cocoa.
(Read and Write computed property)

180.5.59 IsZoomedMacMBS as boolean

MBS Util Plugin, Plugin Version: 3.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the window is zoomed.
Example:

MsgBox str(window1.IsZoomedMacMBS)

Notes:

Requires Mac OS 8.5 or newer.
Seems not to work correctly on RB 5.5.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.
(Read and Write computed property)

180.5.60 IsZoomedMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if this window has been maximized.
Example:

MsgBox str(window1.IsZoomedMBS)

Notes:

If you set IsZoomed to true the window is maximized and if you set it to false the window size and position is restored.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Works on Cocoa.
(Read and Write computed property)

180.5.61 ModifiedMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** You can set or get the value of the modified state.
Example:

mainwindow.modifiedMBS=true

Notes:

Requires Mac OS 8.5 or newer.
As long as you don't set modified to false the window keeps to tell you that it's modified. Not sure why, so just set modified to false early in creating the window.

Added Cocoa support in plugin version 10.0.
(Read and Write computed property)

180.5.62 ToolbarVisibleMBS as boolean

MBS Util Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the toolbar is shown in this window or not.
Notes:

Value is false on any error.
Only working on Mac OS X.
(Read and Write computed property)

180.5.63 TransparencyMBS as single

MBS Util Plugin, Plugin Version: 5.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The transparency of the window on Mac OS X, Windows 2000 and Windows XP.
Notes:

1 for opaque, 0 for invisible.
Return 1 on any error. On Windows it returns always 1 as the current transparency value can't be queried.
You need to call MakeTransparent before to install transparency.
(added Windows support in version 4.4)
Linux supported added with 14.0, but works only with Linux desktop which support alpha channel.
(Read and Write computed property)

180.5.64 UnifiedTitleAndToolbarMBS as Boolean

MBS Util Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window has an unified title and toolbar look.
Example:

```
window1.UnifiedTitleAndToolbarMBS = true
```

Notes:

This window draws its window title and toolbar using a unified appearance that has no separator between the two areas. A window may not have both UnifiedTitleAndToolbar and Metal appearance. If a window already has the metal attribute, attempting to set the Unified attribute will cause ChangeWindows to return an error, and vice versa. This constant was not added to this header file until Mac OS X 10.5, but it is actually available at runtime on Mac OS X 10.4 and later for windows of kDocumentWindowClass. However, on Mac OS X 10.5 and later, kHIWindowBitUnifiedTitleAndToolbar no longer has any effect, since all windows with toolbars now have a unified look.

(Read and Write computed property)

180.5.65 WindowProxyIconFileMBS as folderitem

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** That's the icon to the window which belongs to the file.
Example:

```
dim f as folderItem

f=getopenFolderItem("special/any")
if f<>nil then
window1.WindowProxyIconFileMBS=f
end if
```

Notes:

Requires Mac OS 8.5 or newer.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.
(Read and Write computed property)

180.5.66 WinMenuHandleMBS as Integer

MBS Util Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** A property to access the handle used for the menu of a Window.
Example:

```
dim menu as Integer // global

if menu=0 then
menu=Window1.WinMenuHandleMBS // read it on the first window
else
Window1.winmenuHandleMBS=menu // set it on the second window
end if
```

Notes:

Used in the example "Menu in every Window" to have a menubar in every window on Windows. But never forget to quit your app after all windows were closed.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not

accepted.
(Read and Write computed property)

180.5.67 WinTopMostWindowMBS as boolean

MBS Win Plugin, Plugin Version: 9.6, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Whether a window is staying on the top of the other windows.
Example:

window1.WinTopMostWindowMBS=true

Notes:

If true the window stays in front of other windows. Default is false for Xojo windows and true for overlays.
(Read and Write computed property)

Chapter 181

Windows

181.1 class MapiFileMBS

181.1.1 class MapiFileMBS

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class contain information about a file containing a message attachment stored as a temporary file.
Notes:

Important:
Simple MAPI is not installed by Exchange Server 2003 or later. However, Simple MAPI is supported for use with Exchange 2003. To function properly, the underlying Exchange or Microsoft Outlook® MAPI subsystem must be properly installed on the client computer.

181.1.2 Properties

181.1.3 Filename as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The attachment filename seen by the recipient, which may differ from the filename in the PathName member if temporary files are being used.
Notes:

If the FileName member is empty, the filename from PathName is used.
(Read and Write property)

181.1.4 Flags as Integer

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The flags.
Notes:

Currently not used with the plugin.
(Read and Write property)

181.1.5 Path as FolderItem

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The path of the attached file.
Notes:

When this property is set the PathName property is filled with the absolute path. If you query this property, you get the PathName property as a folderitem.
So this property was made for your convenience.
(Read and Write property)

181.1.6 PathName as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The fully qualified path of the attached file.
Notes:

This path should include the disk drive letter and directory name.
(Read and Write property)

181.1.7 Position as Integer

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** An integer used to indicate where in the message text to render the attachment.
Notes:

Attachments replace the character found at a certain position in the message text. That is, attachments replace the character in the MapiMessage NoteText property at offset nPosition (nPosition is zero based!). A value of -1 means the attachment position is not indicated; the client application will have to provide a way for the user to access the attachment.
(Read and Write property)

181.2 class MapiMessageMBS

181.2.1 class MapiMessageMBS

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a message.

181.2.2 Blog Entries

- MBS Xojo Plugins, version 18.5pr6
- Problems with killing Xojo threads with plugin calls.
- MBS Xojo / Real Studio Plugins, version 15.1pr1

181.2.3 Methods

181.2.4 AddFile(file as MapiFileMBS)

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Adds a file to the message file list.
Notes: file must be not nil.

181.2.5 AddRecipient(recipient as MapiRecipientMBS)

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Adds a recipient to the message.
Notes: recipient must be nil.

181.2.6 IsAvailable as boolean

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether MAPI is available.
Notes:

Checks whether the library was loaded and whether the MAPI Registry key exists, so this has been initialized.
(mail account may not exist)

Returns true if MAPI can be used.

181.2.7 IsUnicodeAvailable as boolean

MBS Win Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether MAPI is available with unicode.
Notes:

Checks whether the library was loaded and whether the MAPI Registry key exists, so this has been initialized.
(mail account may not exist)

Returns true if MAPI can be used with unicode.

181.2.8 SendMail(parent as window, SendFlags as Integer, Threaded as Boolean) as integer

MBS Win Plugin, Plugin Version: 18.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sends an email.
Notes:

Parameters:

parent:
The parent window for the dialogs used. If not nil the dialogs used will be modal.

SendFlags: Send flags. Default in older plugin versions was kSendFlagDialog when DisplayDialog parameter is true and kSendFlagLogonDialog if DisplayLogonDialog parameter was true.

Error codes:

The MAPI SendMail function sends a standard message, with or without any user interaction. The profile must be configured so that MAPISendMail can open the default service providers without requiring user interaction.

Client applications can provide a full or partial list of recipient names, subject text, file attachments, or message text. If any information is missing, MAPISendMail can prompt the user for it. If no information is missing, either the message can be sent as is or the user can be prompted to verify the information, changing values if necessary.

A successful return from MAPISendMail does not necessarily imply recipient validation. The message might not have been sent to all recipients. Depending on the transport provider, recipient validation can be a lengthy process.

const SUCCESS_SUCCESS = 0	No error.
const MAPI_USER_ABORT = 1	The user canceled one of the dialog boxes. No message was sent.
const MAPI_E_FAILURE = 2	One or more unspecified errors occurred. No message was sent.
const MAPI_E_LOGON_FAILURE = 3	There was no default logon, and the user failed to log on successfully when the logon dialog box was displayed. No message was sent.
const MAPI_E_DISK_FULL = 4	
const MAPI_E_INSUFFICIENT_MEMORY = 5	There was insufficient memory to proceed. No message was sent.
const MAPI_E_ACCESS_DENIED = 6	
const MAPI_E_TOO_MANY_SESSIONS = 8	
const MAPI_E_TOO_MANY_FILES = 9	There were too many file attachments. No message was sent.
const MAPI_E_TOO_MANY_RECIPIENTS = 10	There were too many recipients. No message was sent.
const MAPI_E_ATTACHMENT_NOT_FOUND = 11	The specified attachment was not found. No message was sent.
const MAPI_E_ATTACHMENT_OPEN_FAILURE = 12	The specified attachment could not be opened. No message was sent.
const MAPI_E_ATTACHMENT_WRITE_FAILURE = 13	
const MAPI_E_UNKNOWN_RECIPIENT = 14	
const MAPI_E_BAD_RECIPTYPE = 15	The type of a recipient was not TypeTO, TypeCC, or TypeBCC. No message was sent.
const MAPI_E_NO_MESSAGES = 16	
const MAPI_E_INVALID_MESSAGE = 17	
const MAPI_E_TEXT_TOO_LARGE = 18	The text in the message was too large. No message was sent.
const MAPI_E_INVALID_SESSION = 19	
const MAPI_E_TYPE_NOT_SUPPORTED = 20	
const MAPI_E_AMBIGUOUS_RECIPIENT = 21	A recipient matched more than one of the recipient descriptor structures and Dialog is false. No message was sent.
const MAPI_E_MESSAGE_IN_USE = 22	
const MAPI_E_NETWORK_FAILURE = 23	
const MAPI_E_INVALID_EDITFIELDS = 24	
const MAPI_E_INVALID_RECIPS = 25	One or more recipients were invalid or did not resolve to any address.
const MAPI_E_NOT_SUPPORTED = 26	

A "" value for the Subject indicates that there is no text for the subject of the message. A "" value for the NoteText member indicates that there is no message text. Some client applications can truncate subject lines that are too long or contain carriage returns, line feeds, or form feeds.

Each paragraph should be terminated with a CR (0x0d), an LF (0x0a), or a CRLF pair (0x0d0a). MAPISendMail wraps lines as appropriate. If the text exceeds system limits, the function returns the MAPI_E_TEXT_TOO_LARGE value.

The MessageType property is used only by non-IPM applications. Applications that handle IPM messages can set it to "".

The number of attachments per message can be limited in some messaging systems. If the limit is exceeded, the MAPI_E_TOO_MANY_FILES value is returned. File attachments are copied to the message before MAPISendMail returns; therefore, later changes to the files do not affect the contents of the message. The files must be closed when they are copied. Do not attempt to display attachments outside the range of the message text.

Some messaging systems can limit the number of recipients per message. If the client application passes a non-nil value indicating a number of recipients exceeding the system limit, MAPISendMail returns the MAPI_E_TOO_MANY_RECIPIENTS value. If the recipient array is empty, the Dialog parameter must be true in the call to MAPISendMail.

Note that the recipients can include either an entry identifier, the recipient's name, an address, or a name and address pair. The following table shows how MAPISendMail handles the variety of information that can be specified:

Information	Action
entry identifier	No name resolution; the name and address are ignored.
name	Name resolved using the Simple MAPI resolution rules.
address	No name resolution; address is used for both message delivery and for displaying the recipient name.
name and address	No name resolution; name used only for displaying the recipient name.

Client applications that send messages to custom recipients can avoid name resolution. Such clients should set the Address member of the recipient to the custom address.

MAPISendMail does not require an originator-type recipient to send a message.

Important Simple MAPI is not installed by Exchange Server 2003 or later. However, Simple MAPI is supported for use with Exchange 2003. To function properly, the underlying Exchange or Microsoft Outlook® MAPI subsystem must be properly installed on the client computer.
See also:

- 181.2.9 SendMail(SendFlags as Integer, Threaded as Boolean) as integer 22082

181.2.9 SendMail(SendFlags as Integer, Threaded as Boolean) as integer

MBS Win Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sends an email.
Notes: This method is without parent window for dialogs, so you can use it in a console project.
See also:

- 181.2.8 SendMail(parent as window, SendFlags as Integer, Threaded as Boolean) as integer 22080

181.2.10 Properties

181.2.11 ConversationID as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string identifying the conversation thread to which the message belongs.
Notes:

Some messaging systems can ignore and not return this member.
(Read and Write property)

181.2.12 DateReceived as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string indicating the date when the message was received.
Notes:

The format is YYYY/MM/DD HH:MM, using a 24-hour clock.
(Read and Write property)

181.2.13 Flags as Integer

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Bitmask of message status flags.
Notes:

Can be a combination of kFlagsReceiptRequested, kFlagsSent and kFlagsUnread.
(Read and Write property)

181.2.14 MessageType as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string indicating a non-IPM type of message.
Notes:

Client applications can select message types for their non-IPM messages. Clients that only support IPM messages can ignore the MessageType member when reading messages and set it to empty when sending messages.
(Read and Write property)

181.2.15 NoteText as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string containing the message text.
Notes:

If this member is empty, there is no message text.
(Read and Write property)

181.2.16 Originator as MapiRecipientMBS

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The reference to the originator of this message.
Notes: (Read and Write property)

181.2.17 Subject as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The text string describing the message subject, typically limited to 256 characters or less.
Notes:

If this member is empty, the user has not entered subject text.
(Read and Write property)

181.2.18 UseUnicode as Boolean

MBS Win Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to use Unicode API.
Notes:

Microsoft offers both unicode and ANSI interfaces.
By default UseUnicode is true and you can set it to false to use ANSI interface if needed.
If no unicode interface is needed, we automatically use the ANSI interface.
(Read and Write property)

181.2.19 Constants

181.2.20 kFlagsReceiptRequested = 2

MBS Win Plugin, Plugin Version: 8.3. **Function:** One of the constants for the flags property.
Notes:

A receipt notification is requested. Client applications set this flag when sending a message.

Note: Most email applications ignore the receipt notifications.

181.2.21 kFlagsSent = 4

MBS Win Plugin, Plugin Version: 8.3. **Function:** One of the constants for the flags property.
Notes: The message has been sent.

181.2.22 kFlagsUnread = 1

MBS Win Plugin, Plugin Version: 8.3. **Function:** One of the constants for the flags property.
Notes: The message has not been read.

181.2.23 kSendFlagDialog = 8

MBS Win Plugin, Plugin Version: 18.5. **Function:** One of the flags for SendMail.
Notes:

Display a send note UI
A dialog box should be displayed to prompt the user for recipients and other sending options. When Dialog is false, at least one recipient must be specified.

181.2.24 kSendFlagLogonDialog = 1

MBS Win Plugin, Plugin Version: 18.5. **Function:** One of the flags for SendMail.
Notes:

Display logon UI.
A dialog box should be displayed to prompt the user to log on if required. When the DisplayLogonDialog is false, the client application does not display a logon dialog box and returns an error value if the user is not logged on. SendMail ignores this flag if the MessageID parameter is empty.

181.2.25 kSendFlagNewSession = 2

MBS Win Plugin, Plugin Version: 18.5. **Function:** One of the flags for SendMail.
Notes:

Don't use shared session
Create a new session.

181.3 class MapiRecipientMBS

181.3.1 class MapiRecipientMBS

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This class contains information about a message sender or recipient.

181.3.2 Properties

181.3.3 Address as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Optional the recipient or sender's address.
Example:

```
dim o as new MapiRecipientMBS
o.Address="SMTP:sender@example.com"
o.Name="Me"
o.Type=o.TypeOriginator
```

Notes:

This address is provider-specific message delivery data. Generally, the messaging system provides such addresses for inbound messages. For outbound messages, the Address member can point to an address entered by the user for a recipient not in an address book (that is, a custom recipient). The format of an address pointed to by the Address member is [address type] [e-mail address] . Examples of valid addresses are FAX:206-555-1212 and SMTP:M@X.COM.
(Read and Write property)

181.3.4 Name as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The name of the recipient.
Notes: (Read and Write property)

181.3.5 Type as Integer

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Contains a numeric value that indicates the type of recipient.
Example:

```
dim o as new MapiRecipientMBS
o.Address="SMTP:you@example.com"
o.Name="You"
o.Type=o.TypeTo
```

Notes:

Use one of the Type constants.
(Read and Write property)

181.3.6 Constants

181.3.7 TypeBCC=3

MBS Win Plugin, Plugin Version: 8.3. **Function:** One of the constants for the type property.
Notes: Indicates a recipient of a blind copy.

181.3.8 TypeCC=2

MBS Win Plugin, Plugin Version: 8.3. **Function:** One of the constants for the type property.
Notes: Indicates a recipient of a message copy.

181.3.9 TypeOriginator=0

MBS Win Plugin, Plugin Version: 8.3. **Function:** One of the constants for the type property.
Example:

```
dim o as new MapiRecipientMBS
o.Address="SMTP:sender@example.com"
o.Name="Me"
o.Type=o.TypeOriginator
```

Notes: Indicates the original sender of the message.

181.3.10 TypeTo=1

MBS Win Plugin, Plugin Version: 8.3. **Function:** One of the constants for the type property.
Example:

```
dim o as new MapiRecipientMBS
o.Address="SMTP:you@example.com"
o.Name="You"
o.Type=o.TypeTo
```

Notes: Indicates a primary message recipient.

181.4 class TaskDialogButtonMBS

181.4.1 class TaskDialogButtonMBS

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a button.

181.4.2 Properties

181.4.3 Default as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this is default button.
Notes:

Only one button can be default.
(Read and Write property)

181.4.4 Enabled as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to enable this button.
Notes:

Default: true.

This is a live property. Setting it while dialog is open changes the button state.
(Read and Write property)

181.4.5 ID as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The unique ID for the button.
Notes:

The IDs should be unique for all buttons.
(Read and Write property)

181.4.6 Text as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The caption for the button.
Notes: (Read and Write property)

181.4.7 Visible as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this button is visible.
Notes:

Default true.
(Read and Write property)

181.5 class TaskDialogMBS

181.5.1 class TaskDialogMBS

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a dialog in Windows.
Notes:

This class function creates, displays, and operates a task dialog. The task dialog contains application-defined icons, messages, title, verification check box, command links, push buttons, and radio buttons.

Requires Windows Vista or newer.

181.5.2 Blog Entries

- MBS Xojo / Real Studio plug-ins version 16.2
- MBS Xojo / Real Studio Plugins, version 16.2pr2
- New TaskDialog Class

181.5.3 Methods

181.5.4 AppendButton(button as TaskDialogButtonMBS)

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Adds a button.
Example:

```
dim td as TaskDialogMBS

dim b as new TaskDialogButtonMBS
b.Text = "Hello"
b.ID = 123

td.AppendButton b
```

181.5.5 AppendRadioButton(button as TaskDialogButtonMBS)

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Adds a radio button.
Example:

```
dim td as TaskDialogMBS

dim b as new TaskDialogButtonMBS
b.Text = "Hello"
b.ID = 123

td.AppendRadioButton b
```

181.5.6 CloseDialog

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Closes the dialog.

181.5.7 FindButtonByID(ID as Integer) as TaskDialogButtonMBS

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Finds button by ID.
Notes:

This searches buttons and radiobuttons for given ID.
It will not find common buttons.
Returns button if found or nil if not found.

181.5.8 ShowDialog as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Shows the dialog.
Example:

```
dim td as new TaskDialogMBS

td.CommonButtons = BitwiseOr(td.kCommonButtonOK, td.kCommonButtonCancel)
td.Content = "Hello World"

if td.ShowDialog then

if td.SelectedButton = td.kIDOK then
MsgBox "OK"
else
MsgBox "Cancel"
end if
```

```
else
MsgBox "Failed"
end if
```

Notes:

Returns true if everything worked right.
Returns false if creation of dialog failed.

Requires Windows Vista or newer.

181.5.9 Properties

181.5.10 AllowDialogCancellation as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to allow cancel.
Notes:

Indicates that the dialog should be able to be closed using Alt-F4, Escape, and the title bar's close button even if no cancel button is specified in either the CommonButtons or Buttons members.
(Read and Write property)

181.5.11 CanBeMinimized as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the task dialog can be minimized.
Notes: (Read and Write property)

181.5.12 CollapsedControlText as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string to be used to label the button for expanding the expandable information.
Notes:

This member is ignored when the ExpandedInformation member is empty. If this member is empty and the CollapsedControlText is specified, then the CollapsedControlText value will be used for this member as well.
(Read and Write property)

181.5.13 CommonButtons as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies the push buttons displayed in the task dialog.
Example:

```
dim td as new TaskDialogMBS

td.CommonButtons = BitwiseOr(td.kCommonButtonOK, td.kCommonButtonCancel)
td.Content = "Hello World"

if td.ShowDialog then

if td.SelectedButton = td.kIDOK then
MsgBox "OK"
else
MsgBox "Cancel"
end if

else
MsgBox "Failed"
end if
```

Notes:

If no common buttons are specified and no custom buttons are specified through buttons array, the task dialog will contain the OK button by default. This parameter may be a combination of flags from the following group:

kCommonButtonOK	The task dialog contains the push button: OK.
kCommonButtonYes	The task dialog contains the push button: Yes.
kCommonButtonNo	The task dialog contains the push button: No.
kCommonButtonCancel	The task dialog contains the push button: Cancel. If this button is specified, the task dialog will respond to typical cancel actions (Alt-F4 and Escape).
kCommonButtonRetry	The task dialog contains the push button: Retry.
kCommonButtonClose	The task dialog contains the push button: Close.

(Read and Write property)

181.5.14 Content as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string to be used for the dialog's primary content.

Example:

```
dim td as new TaskDialogMBS

td.CommonButtons = BitwiseOr(td.kCommonButtonOK, td.kCommonButtonCancel)
td.Content = "Hello World"

if td.ShowDialog then

if td.SelectedButton = td.kIDOK then
MsgBox "OK"
else
MsgBox "Cancel"
end if

else
MsgBox "Failed"
end if
```

Notes:

If the EnableHyperlinks flag is true, then this string may contain hyperlinks in the form: <A HREF="executablestring">Hyperlink Text</A>.
WARNING: Enabling hyperlinks when using content from an unsafe source may cause security vulnerabilities.
(Read and Write property)

181.5.15 DefaultButton as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The default button for the task dialog.
Notes:

This may be any of the values specified in ID of one of the buttons, or one of the IDs corresponding to the buttons specified in the CommonButtons property.

kIDCancel	Make the Cancel button the default.
kIDNo	Make the No button the default.
kIDOk	Make the OK button the default.
kIDRetry	Make the Retry button the default.
kIDYes	Make the Yes button the default.
kIDClose	Make the Close button the default.

You can also mark buttons default with their default flag.
(Read and Write property)

181.5.16 DefaultRadioButton as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The button ID of the radio button that is selected by default.
Notes:

If this value does not correspond to a button ID, the first button in the array is selected by default.
You can also mark buttons default with their default flag.
(Read and Write property)

181.5.17 DialogHandle as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle of the dialog.
Notes:

This is only valid (and non zero) while dialog is visible.
(Read only property)

181.5.18 EnableHyperlinks as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to enable hyperlinks.
Notes:

Enables hyperlink processing for the strings specified in the Content, ExpandedInformation and Footer members. When enabled, these members may point to strings that contain hyperlinks in the following form:

<A HREF="executablestring">Hyperlink Text</A>

Warning: Enabling hyperlinks when using content from an unsafe source may cause security vulnerabilities.

Note: Task Dialogs will not actually execute any hyperlinks. Hyperlink execution must be handled in the HyperlinkClicked event.
(Read and Write property)

181.5.19 ExpandedByDefault as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the string specified by the ExpandedInformation member is displayed when the dialog is initially displayed.
Notes:

This flag is ignored if the ExpandedInformation member is empty.
(Read and Write property)

181.5.20 ExpandedControlText as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string to be used to label the button for collapsing the expandable information.
Notes:

This member is ignored when the ExpandedInformation member is empty. If this member is empty and the CollapsedControlText is specified, then the CollapsedControlText value will be used for this member as well.
(Read and Write property)

181.5.21 ExpandedInformation as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string to be used for displaying additional information.
Notes:

The additional information is displayed either immediately below the content or below the footer text depending on whether the ExpandFooterArea flag is true. If the EnableHyperlinks flag is true, then this string may contain hyperlinks in the form: <A HREF="executablestring">Hyperlink Text</A>.
WARNING: Enabling hyperlinks when using content from an unsafe source may cause security vulnerabilities.
(Read and Write property)

181.5.22 ExpandFooterArea as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether expand footer area is displayed at the bottom.
Notes:

Indicates that the string specified by the ExpandedInformation member is displayed at the bottom of the dialog's footer area instead of immediately after the dialog's content. This flag is ignored if the ExpandedInformation member is empty.

(Read and Write property)

181.5.23 Flags as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The flags.
Notes:

You should not need to set flags as we have properties for all relevant flags.
(Read and Write property)

181.5.24 Footer as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string to be used in the footer area of the task dialog.
Notes:

If EnableHyperlinks is true, this can show clickable links.
(Read and Write property)

181.5.25 FooterIconPicture as Picture

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A picture to be used as Icon that is to be displayed in the footer of the task dialog.
Notes:

The picture must have a valid mask.
(Read and Write property)

181.5.26 Icon as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The icon to be displayed in the task dialog.
Notes:

Can be one of the kIcon* constants.
Or you set IconPicture property.
(Read and Write property)

181.5.27 IconPicture as Picture

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The icon to be displayed in the task dialog.
Notes:

The picture must have a valid mask.
(Read and Write property)

181.5.28 MainInstruction as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string to be used for the main instruction.
Notes: (Read and Write property)

181.5.29 NoDefaultRadioButton as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that no default item will be selected.
Notes: (Read and Write property)

181.5.30 parent as Window

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Parent window.
Notes: (Read and Write property)

181.5.31 parentHandle as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Parent window handle.
Notes: (Read and Write property)

181.5.32 PositionRelativeToWindow as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the task dialog is positioned (centered) relative to the window specified by parent.
Notes:

If the flag is not supplied (or no parent member is specified), the task dialog is positioned (centered) relative to the monitor.
(Read and Write property)

181.5.33 ProgressbarMax as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The maximum of progress bar.
Notes:

Default is 100.
This is a live property. Setting it while dialog is open will change the control.
(Read and Write property)

181.5.34 ProgressbarMin as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The minimum value of the progress bar.
Notes:

This is a live property. Setting it while dialog is open will change the control.
(Read and Write property)

181.5.35 ProgressbarState as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The state of the progress bar.
Notes:

Default kProgressbarNone.
Can be set to other states to turn on progressbar.
(Read and Write property)

181.5.36 ProgressbarValue as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current value of the progress bar.
Notes:

This is a live property. Setting it while dialog is open will change the control.
(Read and Write property)

181.5.37 RightToLeftLayout as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that text is displayed reading right to left.
Notes: (Read and Write property)

181.5.38 SelectedButton as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The ID of the clicked button.
Example:

```
dim td as new TaskDialogMBS

td.CommonButtons = BitwiseOr(td.kCommonButtonOK, td.kCommonButtonCancel)
td.Content = "Hello World"

if td.ShowDialog then

if td.SelectedButton = td.kIDOK then
MsgBox "OK"
else
MsgBox "Cancel"
end if

else
MsgBox "Failed"
end if
```

Notes: (Read and Write property)

181.5.39 SelectedRadioButton as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The ID of the selected radio button.
Notes: (Read and Write property)

181.5.40 Showing as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether dialog is currently showing.
Notes: (Read and Write property)

181.5.41 TimedOut as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether we got a timeout.
Notes: (Read only property)

181.5.42 timeoutMS as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The timeout for the dialog.
Notes:

In Milliseconds. The dialog closes after given time.
(Read and Write property)

181.5.43 VerificationChecked as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The state of the verification checkbox.
Example:

```
dim td as new TaskDialogMBS

td.CommonButtons = td.kCommonButtonOK
td.Content = "Hello World"

'td.VerificationChecked = true
td.VerificationText = "Don't show again"

call td.ShowDialog

if td.VerificationChecked then
MsgBox "and we will not show again"
end if
```

Notes:

Before: Indicates whether the verification checkbox in the dialog is checked when the dialog is initially displayed.
After: True if the verification checkbox was checked when the dialog was dismissed.

This is a live property. Changing it while the dialog is open will change the checkbox.
(Read and Write property)

181.5.44 VerificationEnabled as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The enable state of the verification checkbox.
Notes:

Can be true to enable the checkbox or false to disable.
(Read and Write property)

181.5.45 VerificationText as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string to be used to label the verification checkbox.
Example:

```
dim td as new TaskDialogMBS

td.CommonButtons = td.kCommonButtonOK
td.Content = "Hello World"

'td.VerificationChecked = true
td.VerificationText = "Don't show again"

call td.ShowDialog

if td.VerificationChecked then
MsgBox "and we will not show again"
end if
```

Notes:

If this parameter is empty, the verification checkbox is not displayed in the task dialog. If the VerificationEnabled is false, the checkbox is not enabled.
(Read and Write property)

181.5.46 Width as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The width of the task dialog's client area, in dialog units.
Notes:

If 0, the task dialog manager will calculate the ideal width.
(Read and Write property)

181.5.47 WindowTitle as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string to be used for the task dialog title.
Notes: (Read and Write property)

181.5.48 Yield as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to yield time.
Notes:

Whether the plugin should yield time to other Xojo threads while dialog is open.
(Read and Write property)

181.5.49 Button(index as Integer) as TaskDialogButtonMBS

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Array of the custom buttons that are to be displayed in the task dialog.
Notes:

You can create TaskDialogButtonMBS objects and assign them to indexes in the array.
(Read and Write computed property)

181.5.50 RadioButton(index as Integer) as TaskDialogButtonMBS

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Array of the custom radio buttons that are to be displayed in the task dialog.
Notes:

You can create TaskDialogButtonMBS objects and assign them to indexes in the array.
(Read and Write computed property)

181.5.51 Events

181.5.52 ButtonClicked(ID as Integer) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that a button has been selected.
Notes:

The command ID of the button is specified by ID.
To prevent the task dialog from closing, the application must return true, otherwise the task dialog is closed and the button ID is returned via the original application call.

181.5.53 Close

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the Task Dialog has been destroyed.

181.5.54 Constructed

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the Task Dialog has been created but has not been displayed yet.
Notes: You can adjust here if you need.

181.5.55 ExpandButtonClicked(Expanded as Boolean)

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the expand button has been selected.

181.5.56 Help

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the F1 key has been pressed while the Task Dialog has focus.

181.5.57 HyperlinkClicked(link as string)

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that a hyperlink has been selected.

181.5.58 Navigated

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that navigation has occurred.

181.5.59 Open

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the Task Dialog has been created.

181.5.60 RadioButtonClicked(ID as Integer) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that a radio button has been selected.
Notes: The command ID of the radio button is specified by ID.

181.5.61 Timer(Time as Integer)

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the Task Dialog timer has fired.
Notes:

The total elapsed time is specified by Time. You can update the progress bar by setting ProgressbarValue.

This is called regularly so you can do background work.
(or check time and dismiss dialog automatically)

181.5.62 VerificationClicked(Checked as Boolean)

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the Task Dialog verification check box has been selected.

181.5.63 Constants

181.5.64 kCommonButtonCancel = 8

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the common button constants.
Notes: The task dialog contains the push button: Cancel. If this button is specified, the task dialog will respond to typical cancel actions (Alt-F4 and Escape).

181.5.65 kCommonButtonClose = 32

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the common button constants.
Notes: The task dialog contains the push button: Close.

181.5.66 kCommonButtonNo = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the common button constants.
Notes: The task dialog contains the push button: No.

181.5.67 kCommonButtonOK = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the common button constants.
Example:

```
dim td as new TaskDialogMBS

td.CommonButtons = td.kCommonButtonOK
td.Content = "Hello World"

'td.VerificationChecked = true
td.VerificationText = "Don't show again"

call td.ShowDialog

if td.VerificationChecked then
MsgBox "and we will not show again"
end if
```

Notes: The task dialog contains the push button: OK.

181.5.68 kCommonButtonRetry = 16

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the common button constants.
Notes: The task dialog contains the push button: Retry.

181.5.69 kCommonButtonYes = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the common button constants.
Notes: The task dialog contains the push button: Yes.

181.5.70 kIconApplication = 5

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the icon constants.
Notes: An application icon appears in the task dialog.

181.5.71 kIconError = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the icon constants.
Notes: A stop-sign icon appears in the task dialog.

181.5.72 kIconInformation = 3

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the icon constants.
Notes: An icon consisting of a lowercase letter i in a circle appears in the task dialog.

181.5.73 kIconNone = 0

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the icon constants.
Notes: No icon.

181.5.74 kIconShield = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the icon constants.
Notes: A shield icon appears in the task dialog.

181.5.75 kIconWarning = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the icon constants.
Notes: An exclamation-point icon appears in the task dialog.

181.5.76 kIDAbort = 3

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the standard button IDs.
Notes: Abort button

181.5.77 kIDCancel = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the standard button IDs.
Notes: Cancel button

181.5.78 kIDIgnore = 5

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the standard button IDs.
Notes: Ignore button

181.5.79 kIDNo = 7

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the standard button IDs.
Notes: No button

181.5.80 kIDOK = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the standard button IDs.
Notes: OK Button

181.5.81 kIDRetry = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the standard button IDs.
Notes: Retry Button

181.5.82 kIDYes = 6

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the standard button IDs.
Notes: Yes Button

181.5.83 kProgressbarError = 3

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the progressbar states.
Notes: Error state.

181.5.84 kProgressbarMarquee = 8

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the progressbar states.
Notes: Marquee state

181.5.85 kProgressbarNone = 0

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the progressbar states.
Notes: No progress bar.

181.5.86 kProgressbarNormal = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the progressbar states.
Notes: Normal progressbar

181.5.87 kProgressbarPause = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the progressbar states.
Notes: Paused progress bar

181.6 class TimerMBS

181.6.1 class TimerMBS

MBS Win Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a timer.
Notes:

This timer can work with smaller periods than the normal Xojo timers on Windows.
Works on Mac OS X and Linux, too.

181.6.4 Methods

181.6.5 Constructor(Period as Integer)

MBS Win Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor.
Notes:

Please pass a period between 1 and 999 Milliseconds.

The timer will try to be as exact as possible, but if main thread is busy, action events are delayed.

181.6.6 Destructor

MBS Win Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

181.6.7 Properties

181.6.8 Enabled as Boolean

MBS Win Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether timer is enabled.
Notes:

Default is true, but you can set to false to disable the timer for some time.
(Read and Write property)

181.6.9 Period as Integer

MBS Win Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The period used.
Notes:

In milliseconds.
(Read only property)

181.6.10 Events

181.6.11 Action

MBS Win Plugin, Plugin Version: 14.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The action event.

181.7 Globals

181.7.1 GetWindowsErrorMessageMBS(ErrorCode as Integer) as String

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Formats a windows error message for the given error code.
Example:

```
EditField1.text = GetWindowsErrorMessageMBS(-2147352567)
```

Notes: Returns empty string for unknown error codes.

181.7.2 InitMessageFilterMBS

MBS Win Plugin, Plugin Version: 18.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Initializes COM message filter.
Notes: If a COM message can't be handled right away, COM may show a standard dialog to retry, switch task or cancel, which may bring your app in an endless dialog series. MBS Plugin implements a message filter which delays messages till the current processing is done and avoids the dialog. So long running options can perform well.

181.7.3 WindowsExecuteMBS(ApplicationName as string, CommandLine as string, CurrentDirectory as string, byref PID as Integer, Flags as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new process and its primary thread. The new process runs in the security context of the calling process.
Example:

```
dim error, pid as Integer

pid = 0

error = WindowsExecuteMBS("", "explorer.exe", "", pid)
if error = 0 then
MsgBox "Launched explorer with process id: "+str(pid)
else
MsgBox "Error: "+str(error)
end if

pid = 0
```

```
error = WindowsExecuteMBS("", "notepad.exe ""C:\boot.ini""", "", pid)
if error = 0 then
MsgBox "Launched Notepad with process id: "+str(pid)
else
MsgBox "Error: "+str(error)
end if
```

Notes:

ApplicationName:
The name of the module to be executed. This module can be a Windows-based application. It can be some other type of module (for example, MS-DOS or OS/2) if the appropriate subsystem is available on the local computer.

The string can specify the full path and file name of the module to execute or it can specify a partial name. In the case of a partial name, the function uses the current drive and current directory to complete the specification. The function will not use the search path. This parameter must include the file name extension; no default extension is assumed.

The ApplicationName parameter can be empty. In that case, the module name must be the first white space–delimited token in the CommandLine string. If you are using a long file name that contains a space, use quoted strings to indicate where the file name ends and the arguments begin; otherwise, the file name is ambiguous. For example, consider the string "c:\program files\sub dir\program name". This string can be interpreted in a number of ways. The system tries to interpret the possibilities in the following order:

- c:\program.exe files\sub dir\program name
- c:\program files\sub.exe dir\program name
- c:\program files\sub dir\program.exe name
- c:\program files\sub dir\program name.exe

If the executable module is a 16-bit application, ApplicationName should be empty, and the string pointed to by CommandLine should specify the executable module as well as its arguments.

To run a batch file, you must start the command interpreter; set ApplicationName to cmd.exe and set CommandLine to the following arguments: /c plus the name of the batch file.

CommandLine:
The command line to be executed. The maximum length of this string is 32,767 characters.. If ApplicationName is empty, the module name portion of CommandLine is limited to MAX_PATH (256) characters.

The CommandLine parameter can be empty. In that case, the function uses the string pointed to by ApplicationName as the command line.

If both ApplicationName and CommandLine are non-empty, the ApplicationName string specifies the module to execute, and the CommandLine string specifies the command line. The new process can use GetCommandLine to retrieve the entire command line. Console processes written in C can use the argc and argv arguments to parse the command line. Because argv [0] is the module name, C programmers generally repeat the module name as the first token in the command line.

If ApplicationName is empty, the first white space–delimited token of the command line specifies the module name. If you are using a long file name that contains a space, use quoted strings to indicate where the file name ends and the arguments begin (see the explanation for the ApplicationName parameter). If the file name does not contain an extension, .exe is appended. Therefore, if the file name extension is .com, this parameter must include the .com extension. If the file name ends in a period (.) with no extension, or if the file name contains a path, .exe is not appended. If the file name does not contain a directory path, the system searches for the executable file in the following sequence:

- The directory from which the application loaded.
- The current directory for the parent process.
- The 32-bit Windows system directory. Use the GetSystemDirectory function to get the path of this directory.
- The 16-bit Windows system directory. There is no function that obtains the path of this directory, but it is searched. The name of this directory is System.
- The Windows directory. Use the GetWindowsDirectory function to get the path of this directory.
- The directories that are listed in the PATH environment variable. Note that this function does not search the per-application path specified by the App Paths registry key. To include this per-application path in the search sequence, use the ShellExecute function.
- The system adds a terminating null character to the command-line string to separate the file name from the arguments. This divides the original string into two strings for internal processing.

CurrentDirectory:
The full path to the current directory for the process. The string can also specify a UNC path.

If this parameter is empty, the new process will have the same current drive and directory as the calling process. (This feature is provided primarily for shells that need to start an application and specify its initial drive and working directory.)

pid:
The variable to store the process ID of the new process.

Returns 0 for success or a windows error code for any error.

Note that the function returns before the process has finished initialization. If a required DLL cannot be located or fails to initialize, the process is terminated. To get the termination status of a process, call GetExitCodeProcess.

Possible Flags:

181.7.4 WindowsRunAsMBS(Username as string, Domain as string, Password as string, LoginFlags as Integer, ApplicationName as string, CommandLine as string, CurrentDirectory as string, byref PID as Integer, Flags as Integer = -1) as Integer

MBS Win Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Runs an application with a different user login.
Notes:

Please see Microsoft website for details:
http://msdn.microsoft.com/en-us/library/windows/desktop/ms682431(v=vs.85).aspx

The plugin passes parameters. If Flags is -1, we use CREATE_DEFAULT_ERROR_MODE Or CREATE_NEW_CONSOLE Or CREATE_NEW_PROCESS_GROUP.
The StartupInfo handles are closed and the PID is returned in the PID parameter.
Returns the Windows error code on failure. Else we return zero for success. On Mac and Linux the result is always -1.

181.7.5 WinGetSysColorMBS(Index as Integer) as Color

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the current color of the specified display element.
Notes:

Display elements are the parts of a window and the display that appear on the system display screen.

Index: The display element whose color is to be retrieved. This parameter can be one of the following values.

Specifies the left side color in the color gradient of an active window's title bar if the gradient effect is enabled.

Specifies the left side color in the color gradient of an inactive window's title bar if the gradient effect is enabled.

Windows 2000: This value is not supported.

Windows 2000: This value is not supported.

The function returns the red, green, blue (RGB) color value of the given element.

181.7.6 WinOpenFolderAndSelectItemsMBS(folder as folderitem, files() as folderItem, ShowOnDesktop as Boolean = false, EditName as Boolean = false) as Integer

MBS Win Plugin, Plugin Version: 14.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Opens a Windows Explorer window with specified items in a particular folder selected.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
dim folder as FolderItem = file.Parent

dim r as Integer = WinOpenFolderAndSelectItemsMBS(folder, array(file))

if r = 0 then
MsgBox "OK"
else
MsgBox "Error: "+str(r)
end if
```

Notes:

Please pass a folder to open. Pass the files you want to select in that folder.
Returns Windows error code. Zero for success.

Under Windows XP the flag parameters are ignored. They work in Windows Vista and newer:

Editname: Pass true to select an item and put its name in edit mode. This flag can only be used when a single item is being selected. For multiple item selections, it is ignored.

ShowOnDesktop: Pass true to select the item or items on the desktop rather than in a Windows Explorer window. Note that if the desktop is obscured behind open windows, it will not be made visible.

For Mac, please use NSWorkspaceMBS.selectfile function.

181.7.7 WinSetSysColorMBS(Index as Integer, value as Color) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the colors for the specified display elements.
Notes:

Display elements are the various parts of a window and the display that appear on the system display screen.
If the function succeeds, the return value is true.
For indexes, please check WinGetSysColorMBS.

181.7.8 WindowsShellExecuteMBS(ParentWindowHandle as Integer, Operation as string, File as string, Parameters as string, Directory as string, ShowCmd as Integer) as Integer

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Performs an operation on a specified file.
Example:

```
dim e as Integer
dim f as FolderItem

// show documents folder

f = SpecialFolder.Documents
e = WindowsShellExecuteMBS(0, "explore", f.NativePath, "", "", 10)

// Launch Notepad application

e = WindowsShellExecuteMBS(0, "", "notepad.exe", "", "", 10)

// launch file, folder or application

f = SpecialFolder.Desktop.Child("Auto1.JPG")
e = WindowsShellExecuteMBS(0, "", f.NativePath, "", "", 10)
```

Notes:

Use ConsoleExecuteMBS on Mac OS X and Linux.

ParentWindowHandle:
A handle to the owner window used for displaying a UI or error messages. This value can be 0 if the operation is not associated with a window. You can pass window.handle from a Xojo window.

Operation:

A string, referred to in this case as a verb, that specifies the action to be performed. The set of available verbs depends on the particular file or folder. Generally, the actions available from an object's shortcut menu are available verbs. The following verbs are commonly used:

File:
A string that specifies the file or object on which to execute the specified verb. To specify a Shell namespace object, pass the fully qualified parse name. Note that not all verbs are supported on all objects. For example, not all document types support the "print" verb. If a relative path is used for the Directory parameter do not use a relative path for File.

Parameters:
If File specifies an executable file, this parameter is a string that specifies the parameters to be passed to the application. The format of this string is determined by the verb that is to be invoked. If File specifies a document file, Parameters should be "".

Directory:
A string that specifies the default (working) directory for the action. If this value is NULL, the current working directory is used. If a relative path is provided at File, do not use a relative path for Directory.

ShowCmd:
The flags that specify how an application is to be displayed when it is opened. If File specifies a document file, the flag is simply passed to the associated application. It is up to the application to decide how to handle it.

Return Value:
If the function succeeds, it returns a value greater than 32. If the function fails, it returns an error value that indicates the cause of the failure. The return value is cast as an HINSTANCE for backward compatibility with 16-bit Windows applications.

This method allows you to execute any commands in a folder's shortcut menu or stored in the registry.
To open a folder, use either of the following calls:

WindowsShellExecuteMBS(handle, "", <fully_qualified_path_to_folder>, "", "", SW_SHOWNORMAL);
or
WindowsShellExecuteMBS(handle, "open", <fully_qualified_path_to_folder>, "", "", SW_SHOWNORMAL);

To explore a folder, use the following call:
WindowsShellExecuteMBS(handle, "explore", <fully_qualified_path_to_folder>, "", "", SW_SHOWNORMAL);
To launch the Shell's Find utility for a directory, use the following call.

WindowsShellExecuteMBS(handle, "find", <fully_qualified_path_to_folder>, "", "", 0);

If Operation is empty, the function opens the file specified by File. If Operation is "open" or "explore", the function attempts to open or explore the folder.

Note The Launch folder windows in a separate process setting in Folder Options affects ShellExecute. If that option is disabled (the default setting), ShellExecute uses an open Explorer window rather than launch a new one. If no Explorer window is open, ShellExecute launches a new one.

See also ConsoleExecuteMBS, WindowsProcessMBS (Windows only), NSTask (Mac only) and ShellMBS (cross platform).

181.7.9 DriveToUNCPathMBS(Driver as string) as string

MBS Win Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the system tables for which UNC network path belongs to a mapped drive.
Example:

```
msgbox DriveToUNCPathMBS("W:")
```

Notes:

Please pass the local drive name, which is drive letter and double colon.
Returns empty string on any error.

181.7.10 GetFullWindowsNameMBS(UserName as string, Domain as string) as string

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the full username of an user in a domain.
Example:

```
dim ShortName as string = "your short name"
dim Domain as string = "your domain"

MsgBox GetFullWindowsNameMBS(ShortName, Domain)
```

Notes:

Returns an empty string on any error.

Use a current Windows NT-style domain, and a username that exists on the PDC.

This will work with any NT-Style PDC (tested on XP bound to Mac OS X Server running SMB as PDC). Windows 2000/2003 and 2008 should also work.

181.8 class WindowsADSystemInfoMBS

181.8.1 class WindowsADSystemInfoMBS

MBS Win Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This class retrieves data about the local computer if it is running a Windows operating system in a Windows domain.
Notes: For example, you can get the domain, site, and distinguished name of the local computer.

181.8.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 19.3
- MBS Xojo Plugins, version 19.3pr2

181.8.3 Xojo Developer Magazine

- 17.5, page 10: News

181.8.4 Methods

181.8.5 AnyDCName as String

MBS Win Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the DNS name of a domain controller in the local computer's domain.
Notes: Lasterror is set.

181.8.6 Constructor

MBS Win Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor.

Notes: Raises unsupportedOperationException on failure.

181.8.7 DCSiteName(Server as String) as String

MBS Win Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the name of the Active Directory site that contains the local computer.
Notes:

Server: DNS name of the service server.

An Active Directory site is one or more well-connected TCP/IP subnets holding Active Directory domain controllers
Lasterror is set.

181.8.8 RefreshSchemaCache

MBS Win Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Refreshes the Active Directory schema cache.
Notes:

When you call this method, it does a Put() of the schemaUpdateNow function on the RootDSE. Normally, when you make changes to the schema, they are not updated to the RootDSE until the next automatic update. This method does an immediate update to the schema so that you can view the changes to the schema.
Lasterror is set.

181.8.9 Properties

181.8.10 ComputerName as String

MBS Win Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the distinguished name of the local computer.
Notes:

Lasterror is set.
(Read only property)

181.8.11 DomainDNSName as String

MBS Win Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the DNS name of the local computer's domain, such as "domainName.companyName.com".
Notes:

Lasterror is set.
(Read only property)

181.8.12 DomainShortName as String

MBS Win Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the short name of the local computer's domain, such as "domainName".
Notes:

Lasterror is set.
(Read only property)

181.8.13 ForestDNSName as String

MBS Win Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the DNS name of the local computer's forest.
Notes:

Lasterror is set.
(Read only property)

181.8.14 Handle as Integer

MBS Win Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

181.8.15 IsNativeMode as Boolean

MBS Win Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Determines whether the local computer's domain is in native or mixed mode.
Notes:

Lasterror is set.
(Read only property)

181.8.16 Lasterror as Integer

MBS Win Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error reported by any of the properties/methods.
Notes: (Read and Write property)

181.8.17 PDCRoleOwner as String

MBS Win Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the distinguished name of the directory service agent (DSA) object for the DC that owns the primary domain controller role in the local computer's domain.
Notes:

Lasterror is set.
(Read only property)

181.8.18 SchemaRoleOwner as String

MBS Win Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the distinguished name of the directory service agent (DSA) object for the DC that owns the schema master role in the local computer's forest.
Notes:

Lasterror is set.
(Read only property)

181.8.19 SiteName as String

MBS Win Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the site name of the local computer.
Notes:

Lasterror is set.
(Read only property)

181.8.20 UserName as String

MBS Win Plugin, Plugin Version: 19.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the Active Directory distinguished name of the current user, which is the logged-on user or the user impersonated by the calling thread.
Notes:

Lasterror is set.
(Read only property)

Constant	Value	Description
CREATE_BREAKAWAY_FROM_JOB	& h01000000	The child processes of a process associated with a job are not associated with the job. If the calling process is not associated with a job, this constant has no effect. If the calling process is associated with a job, the job must set the JOB_OBJECT_LIMIT_BREAKAWAY_OK limit.
CREATE_DEFAULT_ERROR_MODE	& h04000000	The new process does not inherit the error mode of the calling process. Instead, the new process gets the default error mode. This feature is particularly useful for multi-threaded shell applications that run with hard errors disabled. The default behavior is for the new process to inherit the error mode of the caller. Setting this flag changes that default behavior.
CREATE_NEW_CONSOLE	& h00000010	The new process has a new console, instead of inheriting its parent's console (the default). For more information, see Creation of a Console. This flag cannot be used with DETACHED_PROCESS.
CREATE_NEW_PROCESS_GROUP	& h00000200	The new process is the root process of a new process group. The process group includes all processes that are descendants of this root process. The process identifier of the new process group is the same as the process identifier, which is returned in the lpProcessInformation parameter. Process groups are used by the GenerateConsoleCtrlEvent function to enable sending a CTRL+BREAK signal to a group of console processes. If this flag is specified, CTRL+C signals will be disabled for all processes within the new process group. This flag is ignored if specified with CREATE_NEW_CONSOLE.
CREATE_NO_WINDOW	& h08000000	The process is a console application that is being run without a console window. Therefore, the console handle for the application is not set. This flag is ignored if the application is not a console application, or if it is used with either CREATE_NEW_CONSOLE or DETACHED_PROCESS.
CREATE_PROTECTED_PROCESS	& h00040000	The process is to be run as a protected process. The system restricts access to protected processes and the threads of protected processes. For more information on how processes can interact with protected processes, see Process Security and Access Rights. To activate a protected process, the binary must have a special signature. This signature is provided by Microsoft but not currently available for non-Microsoft binaries. There are currently four protected processes: media foundation, audio engine, Windows error reporting, and system. Components that load into these binaries must also be signed. Multimedia companies can leverage the first two protected processes. For more information, see Overview of the Protected Media Path. Windows Server 2003 and Windows XP/2000: This value is not supported.
CREATE_PRESERVE_CODE_AUTHZ_LEVEL	& h02000000	Allows the caller to execute a child process that bypasses the process restrictions that would normally be applied automatically to the process. Windows 2000: This value is not supported.
CREATE_SEPARATE_WOW_VDM	& h00000800	This flag is valid only when starting a 16-bit Windows-based application. If set, the new process runs in a private Virtual DOS Machine (VDM). By default, all 16-bit Windows-based applications run as threads in a single, shared VDM. The advantage of running separately is that a crash only terminates the single VDM; any other programs running in distinct VDMs continue to function normally. Also, 16-bit Windows-based applications that are run in separate VDMs have separate input queues. That means that if one application stops responding momentarily, applications in separate VDMs continue to receive input. The disadvantage of running separately is that it takes significantly more memory to do so. You should use this flag only if the user requests that 16-bit applications should run in their own VDM.
CREATE_SHARED_WOW_VDM	& h00001000	The flag is valid only when starting a 16-bit Windows-based application. If the DefaultSeparateVDM switch in the Windows section of WIN.INI is TRUE, this flag overrides the switch. The new process is run in the shared Virtual DOS Machine.
CREATE_SUSPENDED	& h00000004	The primary thread of the new process is created in a suspended state, and does not run until the ResumeThread function is called.
CREATE_UNICODE_ENVIRONMENT	& h00000400	If this flag is set, the environment block pointed to by lpEnvironment uses Unicode characters. Otherwise, the environment block uses ANSI characters.
DEBUG_ONLY_THIS_PROCESS	& h00000002	The calling thread starts and debugs the new process. It can receive all related debug events using the WaitForDebugEvent function.
DEBUG_PROCESS	& h00000001	The calling thread starts and debugs the new process and all child processes created by the new process. It can receive all related debug events using the WaitForDebugEvent function. A process that uses DEBUG_PROCESS becomes the root of a debugging chain. This continues until another process in the chain is created with DEBUG_PROCESS. If this flag is combined with DEBUG_ONLY_THIS_PROCESS, the caller debugs only the new process, not any child processes.
DETACHED_PROCESS	& h00000008	For console processes, the new process does not inherit its parent's console (the default). The new process can call the AllocConsole function at a later time to create a console. For more information, see Creation of a Console. This value cannot be used with CREATE_NEW_CONSOLE.
EXTENDED_STARTUPINFO_PRESENT	& h00080000	The process is created with extended startup information; the lpStartupInfo parameter specifies a STARTUPINFOEX structure. Windows Server 2003 and Windows XP/2000: This value is not supported.
INHERIT_PARENT_AFFINITY	& h00010000	The process inherits its parent's affinity. If the parent process has threads in more than one processor group, the new process inherits the group-relative affinity of an arbitrary group in use by the parent. Windows Server 2008, Windows Vista, Windows Server 2003, and Windows XP/2000: This value is not supported.
ABOVE_NORMAL_PRIORITY_CLASS	& h00008000	Process that has priority above NORMAL_PRIORITY_CLASS but below HIGH_PRIORITY_CLASS.
BELOW_NORMAL_PRIORITY_CLASS	& h00004000	Process that has priority above IDLE_PRIORITY_CLASS but below NORMAL_PRIORITY_CLASS.
HIGH_PRIORITY_CLASS	& h00000080	Process that has priority above [illegible]

Name	Value	Meaning
COLOR_3DDKSHADOW	21	Dark shadow for three-dimensional display elements.
COLOR_3DFACE	15	Face color for three-dimensional display elements and for dialog box backgrounds.
COLOR_3DHIGHLIGHT	20	Highlight color for three-dimensional display elements (for edges facing the light source.)
COLOR_3DHILIGHT	20	Highlight color for three-dimensional display elements (for edges facing the light source.)
COLOR_3DLIGHT	22	Light color for three-dimensional display elements (for edges facing the light source.)
COLOR_3DSHADOW	16	Shadow color for three-dimensional display elements (for edges facing away from the light source).
COLOR_ACTIVEBORDER	10	Active window border.
COLOR_ACTIVECAPTION	2	Active window title bar.
COLOR_APPWORKSPACE	12	Background color of multiple document interface (MDI) applications.
COLOR_BACKGROUND	1	Desktop.
COLOR_BTNFACE	15	Face color for three-dimensional display elements and for dialog box backgrounds.
COLOR_BTNHIGHLIGHT	20	Highlight color for three-dimensional display elements (for edges facing the light source.)
COLOR_BTNHILIGHT	20	Highlight color for three-dimensional display elements (for edges facing the light source.)
COLOR_BTNSHADOW	16	Shadow color for three-dimensional display elements (for edges facing away from the light source).
COLOR_BTNTEXT	18	Text on push buttons.
COLOR_CAPTIONTEXT	9	Text in caption, size box, and scroll bar arrow box.
COLOR_DESKTOP	1	Desktop.
COLOR_GRADIENTACTIVECAPTION	27	Right side color in the color gradient of an active window's title bar. COLOR_ACTIVECAPTION specifies the left side color. Use SPI_GETGRADIENTCAPTIONS with the SystemParametersInfo function to determine whether the gradient effect is enabled.
COLOR_GRADIENTINACTIVECAPTION	28	Right side color in the color gradient of an inactive window's title bar. COLOR_INACTIVECAPTION specifies the left side color.
COLOR_GRAYTEXT	17	Grayed (disabled) text. This color is set to 0 if the current display driver does not support a solid gray color.
COLOR_HIGHLIGHT	13	Item(s) selected in a control.
COLOR_HIGHLIGHTTEXT	14	Text of item(s) selected in a control.
COLOR_HOTLIGHT	26	Color for a hyperlink or hot-tracked item.
COLOR_INACTIVEBORDER	11	Inactive window border.
COLOR_INACTIVECAPTION	3	Inactive window caption.
COLOR_INACTIVECAPTIONTEXT	19	Color of text in an inactive caption.
COLOR_INFOBK	24	Background color for tooltip controls.
COLOR_INFOTEXT	23	Text color for tooltip controls.
COLOR_MENU	4	Menu background.
COLOR_MENUHILIGHT	29	The color used to highlight menu items when the menu appears as a flat menu (see SystemParametersInfo). The highlighted menu item is outlined with COLOR_HIGHLIGHT.
COLOR_MENUBAR	30	The background color for the menu bar when menus appear as flat menus (see SystemParametersInfo). However, COLOR_MENU continues to specify the background color of the menu popup.

COLOR_MENUTEXT	7	Text in menus.
COLOR_SCROLLBAR	0	Scroll bar gray area.
COLOR_WINDOW	5	Window background.
COLOR_WINDOWFRAME	6	Window frame.
COLOR_WINDOWTEXT	8	Text in windows.

edit	Launches an editor and opens the document for editing. If File is not a document file, the function will fail.
explore	Explores a folder specified by File.
find	Initiates a search beginning in the directory specified by Directory.
open	Opens the item specified by the File parameter. The item can be a file or folder.
print	Prints the file specified by File. If File is not a document file, the function fails.
""	In systems prior to Windows 2000, the default verb is used if it is valid and available in the registry. If not, the "open" verb is used. In Windows 2000 and later, the default verb is used if available. If not, the "open" verb is used. If neither verb is available, the system uses the first verb listed in the registry.

SW_HIDE	0	Hides the window and activates another window.
SW_MAXIMIZE	3	Maximizes the specified window.
SW_MINIMIZE	6	Minimizes the specified window and activates the next top-level window in the z-order.
SW_RESTORE	9	Activates and displays the window. If the window is minimized or maximized, Windows restores it to its original size and position. An application should specify this flag when restoring a minimized window.
SW_SHOW	5	Activates the window and displays it in its current size and position.
SW_SHOWDEFAULT	10	Sets the show state based on the SW_ flag specified in the STARTUPINFO structure passed to the CreateProcess function by the program that started the application. An application should call ShowWindow with this flag to set the initial show state of its main window.
SW_SHOWMAXIMIZED	3	Activates the window and displays it as a maximized window.
SW_SHOWMINIMIZED	2	Activates the window and displays it as a minimized window.
SW_SHOWMINNOACTIVE	7	Displays the window as a minimized window. The active window remains active.
SW_SHOWNA	8	Displays the window in its current state. The active window remains active.
SW_SHOWNOACTIVATE	4	Displays a window in its most recent size and position. The active window remains active.
SW_SHOWNORMAL	1	Activates and displays a window. If the window is minimized or maximized, Windows restores it to its original size and position. An application should specify this flag when displaying the window for the first time.

Return code	Description
0	The operating system is out of memory or resources.
ERROR_FILE_NOT_FOUND = 2	The specified file was not found.
ERROR_PATH_NOT_FOUND = 3	The specified path was not found.
ERROR_BAD_FORMAT = 11	The .exe file is invalid (non-Win32 .exe or error in .exe image).
SE_ERR_ACCESSDENIED = 5	The operating system denied access to the specified file.
SE_ERR_ASSOCINCOMPLETE = 27	The file name association is incomplete or invalid.
SE_ERR_DDEBUSY = 30	The DDE transaction could not be completed because other DDE transactions were being processed.
SE_ERR_DDEFAIL = 29	The DDE transaction failed.
SE_ERR_DDETIMEOUT = 28	The DDE transaction could not be completed because the request timed out.
SE_ERR_DLLNOTFOUND = 32	The specified DLL was not found.
SE_ERR_FNF = 2	The specified file was not found.
SE_ERR_NOASSOC = 31	There is no application associated with the given file name extension. This error will also be returned if you attempt to print a file that is not printable.
SE_ERR_OOM = 8	There was not enough memory to complete the operation.
SE_ERR_PNF = 3	The specified path was not found.
SE_ERR_SHARE = 26	A sharing violation occurred.

181.9 module WindowsBitmapMBS

181.9.1 module WindowsBitmapMBS

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Windows bitmap handling module.
Notes:

In this module we collect a few useful conversion functions for handling bitmap in Xojo.
Please contact us if you have idea for new function.

181.9.2 Blog Entries

- MBS Releases the MBS Xojo / Real Studio plug-ins in version 15.1

181.9.3 Xojo Developer Magazine

- 13.4, page 10: News

181.9.4 Methods

181.9.5 BitmapToDIB(HBitmap as Ptr, HPalette as Ptr = nil) as Ptr

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Converts a HBitmap to a HDIB.
Notes: HPalette is optional a color palette handle for images with 8 bit or less per pixel.

181.9.6 DeleteBitmap(HBitmap as Ptr)

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Frees a HDIB or HBITMAP.
Notes: You need to free the images you allocate to make sure memory is released.

181.9.7 DIBToBitmap(HDIB as Ptr, HPalette as Ptr = nil) as Ptr

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Converts a HDIB to HBitmap.
Notes:

HPalette is optional a color palette handle for images with 8 bit or less per pixel.
Returns nil in case of no memory.

181.9.8 DuplicateHBitmap(HBitmap as Ptr, Width as Integer, Height as Integer) as Ptr

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Duplicates a bitmap handle.
Notes: Please use DeleteBitmap later to free bitmap.

181.9.9 HBitmapInfo(HBitmap as Ptr, byref Width as Integer, byref Height as Integer, byref WidthBytes as Integer, byref Planes as Integer, byref BitsPixel as Integer) as Boolean

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries details about a bitmap handle.
Notes: Returns true on success.

181.9.10 HBitmapToPicture(HBitmap as Ptr, UsingDraw as boolean = false) as Picture

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Converts a HBITMAP to Xojo picture.
Notes:

If UsingDraw is true, the plugin creates a new HBitmap and draws picture inside.
Else if UsingDraw is false, the plugin copies picture and mask into a new picture.

UsingDraw with false works only for 24 or 32 bit images with one plane.
See also:

- 181.9.11 HBitmapToPicture(HBitmap as Ptr, Width as Integer, Height as Integer) as Picture 22131

181.9.11 HBitmapToPicture(HBitmap as Ptr, Width as Integer, Height as Integer) as Picture

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Converts a HBITMAP to Xojo picture.
Notes:

Draws the HBitmap in a new picture of the given size.
This method can be used to resize the bitmap on the fly while drawing.
See also:

- 181.9.10 HBitmapToPicture(HBitmap as Ptr, UsingDraw as boolean = false) as Picture 22131

181.9.12 PictureToHBitmap(Pic as Picture) as Ptr

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries HBitmap of a picture.
Notes:

As Xojo picture's are internally HBitmaps, the plugin returns the handle of the picture.
No copy is made and you should not free the image. If you need a copy, please use DuplicateHBitmap function.

181.10 class WindowsClipboardMBS

181.10.1 class WindowsClipboardMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The windows clipboard class.
Notes: Use it to access the clipboard on Windows.

181.10.3 Xojo Developer Magazine

- 15.6, page 9: News

181.10.4 Methods

181.10.5 Clear

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Clears the contents of the clipboard.

181.10.6 ClipboardFormats as Integer()

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns an array with all clipboard formats currently in the clipboard.

181.10.7 ClipboardSequenceNumber as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the clipboard sequence number for the current window station.
Notes:

The return value is the clipboard sequence number. If you do not have WINSTA_ACCESSCLIPBOARD access to the window station, the function returns zero.

The system keeps a serial number for the clipboard for each window station. This number is incremented whenever the contents of the clipboard change or the clipboard is emptied. You can track this value to determine whether the clipboard contents have changed and optimize creating DataObjects. If clipboard rendering is delayed, the sequence number is not incremented until the changes are rendered.

181.10.8 Constructor

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Connects to the clipboard.
Notes: As the clipboard has exclusive access, do not keep WindowsClipboardMBS objects around. Best you only use them within a method so once the method ends, everything is released.

181.10.9 CountClipboardFormats as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the number of different data formats currently on the clipboard.
Notes:

If the function succeeds, the return value is the number of different data formats currently on the clipboard.

If the function fails, the return value is zero.

181.10.10 Destructor

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Automatically closes the clipboard.

181.10.11 EnumClipboardFormats(format as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Enumerates the data formats currently available on the clipboard.
Notes:

Clipboard data formats are stored in an ordered list. To perform an enumeration of clipboard data formats, you make a series of calls to the EnumClipboardFormats function. For each call, the format parameter specifies an available clipboard format, and the function returns the next available clipboard format.

format: A clipboard format that is known to be available.

To start an enumeration of clipboard formats, set format to zero. When format is zero, the function retrieves the first available clipboard format. For subsequent calls during an enumeration, set format to the result of the previous EnumClipboardFormats call.

If the function succeeds, the return value is the clipboard format that follows the specified format, namely the next available clipboard format.

If the function fails, the return value is zero.
If there are no more clipboard formats to enumerate, the return value is zero.

You must open the clipboard before enumerating its formats. Use the OpenClipboard function to open the clipboard. The EnumClipboardFormats function fails if the clipboard is not open.

The EnumClipboardFormats function enumerates formats in the order that they were placed on the clipboard. If you are copying information to the clipboard, add clipboard objects in order from the most descriptive clipboard format to the least descriptive clipboard format. If you are pasting information from the clipboard, retrieve the first clipboard format that you can handle. That will be the most descriptive clipboard format that you can handle.

The system provides automatic type conversions for certain clipboard formats. In the case of such a format, this function enumerates the specified format, then enumerates the formats to which it can be converted. For more information, see Standard Clipboard Formats and Synthesized Clipboard Formats.

181.10.12 GetClipboardFormatName(format as Integer) as string

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves from the clipboard the name of the specified registered format. The function copies the name to the specified buffer.
Example:

```
// show items on clipboard

dim w as new WindowsClipboardMBS
dim types(-1) as integer = w.ClipboardFormats
dim names() as string

for each type as integer in types
dim n as string = w.GetClipboardFormatName(type)

n = str(type)+" "+n

names.append n
next

MsgBox Join(names,EndOfLine)
```

181.10.13 GetData(type as Integer) as string

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves data from the clipboard in a specified format.
Notes:

Format: A clipboard format.

If the function succeeds, the return value is the string with the clipboard data in the specified format.

If the function fails, the return value is "".

An application can enumerate the available formats in advance by using the EnumClipboardFormats function.

181.10.14 GetDIB as Picture

MBS Win Plugin, Plugin Version: 17.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Queries DIB picture on the clipboard.
Notes:

Returns nil on any error.
This is using DIB type in clipboard for a Device Independent Bitmap.

Please use GetPicture for bitmap handles.

181.10.15 GetFiles as string()

MBS Win Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries list of file paths on the clipboard.
Notes: This is for working with Explorers copy & paste feature.

181.10.16 GetPicture as Picture

MBS Win Plugin, Plugin Version: 14.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Queries bitmap on the clipboard.
Notes:

Returns nil on any error.
This is using BITMAP type in clipboard for a bitmap handle.

Please use GetDIB for Device Independent Bitmap.

181.10.17 IsClipboardFormatAvailable(type as Integer) as boolean

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Determines whether the clipboard contains data in the specified format.
Notes:

type: A standard or registered clipboard format.

If the clipboard format is available, the return value is true.
If the clipboard format is not available, the return value is false.

Typically, an application that recognizes only one clipboard format would call this function when processing the EnableMenuItems event. The application would then enable or disable the Paste menu item, depending on the return value.

181.10.18 RegisterClipboardFormat(type as string) as Integer

MBS Win Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Registers a new clipboard format. This format can then be used as a valid clipboard format.
Example:

```
dim TypeHTML as Integer
dim TypeRTF as Integer

TypeHTML = WindowsClipboardMBS.RegisterClipboardFormat("HTML Format")
TypeRTF = WindowsClipboardMBS.RegisterClipboardFormat("Rich Text Format")
```

Notes:

If the function succeeds, the return value identifies the registered clipboard format.
If the function fails, the return value is zero.

If a registered format with the specified name already exists, a new format is not registered and the return value identifies the existing format. This enables more than one application to copy and paste data using the same registered clipboard format. Note that the format name comparison is case-insensitive.
Registered clipboard formats are identified by values in the range & hC000 through & hFFFF.

181.10.19 SetData(type as Integer, rawData as string) as boolean

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Places data on the clipboard in a specified clipboard format.
Notes:

Format: The clipboard format. This parameter can be a registered format or any of the standard clipboard formats.
rawData: A string with the data in the specified format.

If the function succeeds, the return value is true.
If the function fails, the return value is false.

The system performs implicit data format conversions between certain clipboard formats when an application calls the GetClipboardData function. For example, if the kTypeOEMTEXT format is on the clipboard, a window can retrieve data in the kTypeTEXT format. The format on the clipboard is converted to the requested format on demand. For more information, see Synthesized Clipboard Formats.

181.10.20 SetDIB(pic as Picture) as boolean

MBS Win Plugin, Plugin Version: 17.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Puts a DIB picture on the clipboard.
Notes:

Returns true on success.
This is using DIB type in clipboard for a bitmap handle.

Please use SetPicture for Device Independent Bitmap.

181.10.21 SetFiles(paths() as string) as boolean

MBS Win Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Puts a list of file paths on the clipboard.
Notes:

This is for working with Explorers copy & paste feature.
Returns true on success.
Folder paths may work better if they have no training backslash.

181.10.22 SetPicture(pic as Picture) as boolean

MBS Win Plugin, Plugin Version: 14.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Puts a bitmap picture on the clipboard.
Notes:

Returns true on success.
This is using BITMAP type in clipboard for a bitmap handle.

Please use SetDIB for Device Independent Bitmap.

181.10.23 Properties

181.10.24 Valid as Boolean

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A flag whether the constructor got a clipboard connection.
Notes: (Read and Write property)

181.10.25 Constants

181.10.26 kTypeBitmap = 2

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.

Notes: A handle to a bitmap (HBITMAP).

181.10.27 kTypeDIB = 8

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
Notes: A memory object containing a BITMAPINFO structure followed by the bitmap bits.

181.10.28 kTypeDIBV5 = 17

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
Notes: A memory object containing a BITMAPV5HEADER structure followed by the bitmap color space information and the bitmap bits.

181.10.29 kTypeDIF = 5

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
Notes: Software Arts' Data Interchange Format.

181.10.30 kTypeENHMetaFile = 14

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
Notes: A handle to an enhanced metafile (HENHMETAFILE).

181.10.31 kTypeHDROP = 15

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
Notes: A handle to type HDROP that identifies a list of files. An application can retrieve information about the files by passing the handle to the DragQueryFile function.

181.10.32 kTypeLocale = 16

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
Notes:

The data is a handle to the locale identifier associated with text in the clipboard. When you close the clipboard, if it contains kTypeText data but no kTypeLocale data, the system automatically sets the kTypeLocale format to the current input language. You can use the kTypeLocale format to associate a different locale with the clipboard text.

An application that pastes text from the clipboard can retrieve this format to determine which character set was used to generate the text.

Note that the clipboard does not support plain text in multiple character sets. To achieve this, use a formatted text data type such as RTF instead.

The system uses the code page associated with kTypeLocale to implicitly convert from kTypeText to kTypeUnicodeText. Therefore, the correct code page table is used for the conversion.

181.10.33 kTypeMetaFilePict = 3

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
Notes: Handle to a metafile picture format as defined by the METAFILEPICT structure. When passing a kTypeMetaFilePict handle by means of DDE, the application responsible for deleting hMem should also free the metafile referred to by the kTypeMetaFilePict handle.

181.10.34 kTypeOEMText = 7

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
Notes: Text format containing characters in the OEM character set. Each line ends with a carriage return/linefeed (CR-LF) combination. A null character signals the end of the data.

181.10.35 kTypePalette = 9

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
Notes:

Handle to a color palette. Whenever an application places data in the clipboard that depends on or assumes a color palette, it should place the palette on the clipboard as well.

If the clipboard contains data in the kTypePalette (logical color palette) format, the application should use the SelectPalette and RealizePalette functions to realize (compare) any other data in the clipboard against that logical palette.

When displaying clipboard data, the clipboard always uses as its current palette any object on the clipboard that is in the kTypePalette format.

181.10.36 kTypePenData = 10

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
Notes: Data for the pen extensions to the Microsoft Windows for Pen Computing

181.10.37 kTypeRIFF = 11

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
Notes: Represents audio data more complex than can be represented in a CF_WAVE standard wave format.

181.10.38 kTypeSylk = 4

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
Notes: Microsoft Symbolic Link (SYLK) format.

181.10.39 kTypeText = 1

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
Notes: Text format. Each line ends with a carriage return/linefeed (CR-LF) combination. A null character signals the end of the data. Use this format for ANSI text.

181.10.40 kTypeTIFF = 6

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
Notes: Tagged-image file format.

181.10.41 kTypeUnicodeText = 13

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
Notes: Unicode text format. Each line ends with a carriage return/linefeed (CR-LF) combination. A null character signals the end of the data.

181.10.42 kTypeWAVE = 12

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
Notes: Represents audio data in one of the standard wave formats, such as 11 kHz or 22 kHz PCM.

181.11 class WindowsDeviceMBS

181.11.1 class WindowsDeviceMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This class is for device
Example:

```
dim devices(-1) as WindowsDeviceMBS = WindowsDeviceMBS.Devices
for each device as WindowsDeviceMBS in devices
msgbox device.Description
next
```

Notes: For Mac you can take a look on the MacUSBDeviceMBS class and the IORegistry classes.

181.11.2 Blog Entries

- MacUSBDeviceMBS
- MBS REALbasic Plugins, version 10.4pr4

181.11.3 Methods

181.11.4 CompatibleIDs as string()

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The list of compatible IDs for a device.
Notes: A device has only one device ID that is the most specific ID for a device. A device can also have less specific hardware IDs and compatible IDs. Windows first tries to find an INF file that matches the device ID. If it does not find such a match, Windows next tries to find a match to one of the less specific hardware IDs or compatible IDs.

181.11.5 Devices(ClassGUID as string, present as boolean = true) as WindowsDeviceMBS()

MBS Win Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries all devices on the system matching the given Class GUID.
Example:

```
const PortsGUID = " { 4D36E978-E325-11CE-BFC1-08002BE10318 } "
dim devices(-1) as WindowsDeviceMBS = WindowsDeviceMBS.Devices(PortsGUID)
```

Notes:

If present is true, only devices currently present on the system are returned.
The array is empty on any error.

Class	{ GUID }	Device Description
CDROM	{ 4D36E965-E325-11CE-BFC1-08002BE10318 }	CD/DVD/Blu-ray drives
DiskDrive	{ 4D36E967-E325-11CE-BFC1-08002BE10318 }	Hard drives
Display	{ 4D36E968-E325-11CE-BFC1-08002BE10318 }	Video adapters
FDC	{ 4D36E969-E325-11CE-BFC1-08002BE10318 }	Floppy controllers
FloppyDisk	{ 4D36E980-E325-11CE-BFC1-08002BE10318 }	Floppy drives
HDC	{ 4D36E96A-E325-11CE-BFC1-08002BE10318 }	Hard drive controllers

181.11.6 Devices(present as boolean = true) as WindowsDeviceMBS()

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries all devices on the system.
Notes:

If present is true, only devices currently present on the system are returned.
The array is empty on any error.
See also:

- 181.11.5 Devices(ClassGUID as string, present as boolean = true) as WindowsDeviceMBS() 22145

181.11.7 HardwareID as string()

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The list of hardware IDs for a device.

181.11.8 LocationPaths as string()

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The location of the device in the device tree.
Notes: Windows Server 2003 and later.

181.11.9 LowerFilters as string()

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The names of a device's lower-filter drivers.

181.11.10 UpperFilters as string()

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The names of a device's upper filter drivers.

181.11.11 Properties

181.11.12 Address as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device's address.
Notes: (Read and Write property)

181.11.13 BusNumber as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device's bus number.
Notes: (Read and Write property)

181.11.14 BusTypeGUID as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GUID for the device's bus type.
Notes: (Read and Write property)

181.11.15 Capabilities as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device capabilities.
Notes:

A combination of the kDeviceCapability* constants.
(Read and Write property)

181.11.16 Characteristics as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device characteristics.
Notes: (Read and Write property)

181.11.17 ClassGUID as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GUID that represents the device setup class of a device.
Notes: (Read and Write property)

181.11.18 ClassName as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device setup class of a device.
Notes:

(This property should be named Class, but was renamed ClassName as Class is a reserved word in Xojo)
(Read and Write property)

181.11.19 ConfigFlags as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device's configuration flags.
Notes: (Read and Write property)

181.11.20 Description as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The description of a device.
Notes:

Maybe localized.
(Read and Write property)

181.11.21 DeviceID as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** If a device is associated with this device entry, here you have the ID string for this device.
Notes: (Read and Write property)

181.11.22 DevicePath as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** For devices with device ID, this is the device path.
Notes: (Read and Write property)

181.11.23 DeviceType as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device's type.
Notes:

See kDeviceType* constants.
(Read and Write property)

181.11.24 Driver as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string that identifies the device's software key (sometimes called the driver key).
Notes: (Read and Write property)

181.11.25 EnumeratorName as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string that contains the name of the device's enumerator.
Notes: (Read and Write property)

181.11.26 Exclusive as Boolean

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether a user can obtain exclusive use of the device.
Notes:

The value is true if exclusive use is allowed, or false otherwise.
(Read and Write property)

181.11.27 FriendlyName as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The friendly name of a device.
Notes: (Read and Write property)

181.11.28 HID as Boolean

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the plugin found additional HID details on the device.
Notes: (Read and Write property)

181.11.29 HIDAccessible as Boolean

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the plugin was able to access the device and query the properties.
Notes:

HIDAccessible is true if and only if HID is also true.
(Read and Write property)

181.11.30 HIDFeatureReportByteLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The length of the HID feature reports for this USB HID device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

181.11.31 HIDInputReportByteLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The length of the HID input reports for this USB HID device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

181.11.32 HIDManufacturerName as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The manufacturer name for this device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

181.11.33 HIDOutputReportByteLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The length of the HID output reports for this USB HID device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

181.11.34 HIDProductID as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The product ID for this USB device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

181.11.35 HIDProductName as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The product name for this HID Device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

181.11.36 HIDSerialNumber as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The serial number for this USB device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

181.11.37 HIDVendorID as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The vendor ID for this USB device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

181.11.38 HIDVersionNumber as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The version number for this HID Device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

181.11.39 InstallState as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The install state of this device.
Notes:

See kInstallState* constants.
(Read and Write property)

181.11.40 LegacyBusType as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device's legacy bus type.
Notes: (Read and Write property)

181.11.41 LocationInformation as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The hardware location of a device.
Notes: (Read and Write property)

181.11.42 Manufacturer as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The name of the device manufacturer.
Notes: (Read and Write property)

181.11.43 PhysicalDeviceObjectName as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The name that is associated with the device's PDO.
Notes: (Read and Write property)

181.11.44 RemovalPolicy as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device's current removal policy.
Notes:

Windows XP and later
(Read and Write property)

181.11.45 RemovalPolicyHWDefault as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device's hardware-specified default removal policy.
Notes:

Windows XP and later
(Read and Write property)

181.11.46 RemovalPolicyOverride as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device's override removal policy (if it exists) from the registry.
Notes:

Windows XP and later
(Read and Write property)

181.11.47 SecurityDescriptor as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device's security descriptor.
Notes:

The format of security descriptor strings is described in Microsoft Windows SDK documentation.
(Read and Write property)

181.11.48 Service as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The service name for a device.

Notes: (Read and Write property)

181.11.49 UINumber as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The UINumber.
Notes:

Specifies a number associated with the device that can be displayed in the user interface.

This number is typically a user-perceived slot number, such as a number printed next to the slot on the board, or some other number that makes locating the physical device easier for the user. For buses with no such convention, or when the UINumber is unknown, the bus driver leaves this member at its default value of -1.
(Read and Write property)

181.11.50 Constants

181.11.51 kDeviceCapabilityDockDevice = 8

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the capabilities constants.
Notes: Dock Device

181.11.52 kDeviceCapabilityEjectSupported = 2

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the capabilities constants.
Notes: Eject Supported

181.11.53 kDeviceCapabilityHardwareDisabled = 256

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the capabilities constants.
Notes: Hardware Disabled

181.11.54 kDeviceCapabilityLockSupported = 1

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the capabilities constants.
Notes: Lock Supported

181.11.55 kDeviceCapabilityNonDynamic = 512

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the capabilities constants.
Notes: Non Dynamic

181.11.56 kDeviceCapabilityRAWDeviceOK = 64

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the capabilities constants.
Notes: Raw Device OK

181.11.57 kDeviceCapabilityRemovable = 4

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the capabilities constants.
Notes: Removable

181.11.58 kDeviceCapabilitySilentInstall = 32

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the capabilities constants.
Notes: Silent Install

181.11.59 kDeviceCapabilitySurpriseRemovalOK = 128

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the capabilities constants.
Notes: Surprise Removal OK

181.11.60 kDeviceCapabilityUniqueID = 16

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the capabilities constants.
Notes: Unique ID

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the device type constants.

181.11.116 kDeviceTypeVirtualDisk = & h24

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the device type constants.

181.11.117 kDeviceTypeWaveIn = & h25

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the device type constants.

181.11.118 kDeviceTypeWaveOut = & h26

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the device type constants.

181.11.119 kInstallStateFailedInstall = 2

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the constants for the device's installation state. **Notes:** The device did not install properly.

181.11.120 kInstallStateFinishInstall = 3

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the constants for the device's installation state. **Notes:** The installation of this device is not yet complete.

181.11.121 kInstallStateInstalled = 0

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the constants for the device's installation state. **Notes:** The device is installed.

181.11.122 kInstallStateNeedsReinstall = 1

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the constants for the device's installation state. **Notes:** The system will try to reinstall the device on a later enumeration.

181.12 class WindowsDiscInfoMBS

181.12.1 class WindowsDiscInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class to query details on a disc drive on Windows.
Example:

```
dim discs(-1) as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Devices

for each disc as WindowsDiscInfoMBS in discs
MsgBox disc.ModelNumber
next
```

181.12.2 Blog Entries

181.12.3 Methods

181.12.4 Device(file as folderitem) as WindowsDiscInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the device with the given path.
Example:

```
// volume(0) is boot volume
dim disc as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Device(volume(0))
```

Notes:

Returns nil on any error (like missing permissions).
Seems like on Windows Vista/7 you need admin rights to query this.
The path of the folderitem must be something starting with a drive letter.
See also:

- 181.12.5 Device(path as string) as WindowsDiscInfoMBS 22166

181.12.5 Device(path as string) as WindowsDiscInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the device with the given path.
Example:

```
dim disc as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Device("C")
```

Notes:

Returns nil on any error (like missing permissions).
Seems like on Windows Vista/7 you need admin rights to query this.
Path must be something starting with a drive letter.
See also:

- 181.12.4 Device(file as folderitem) as WindowsDiscInfoMBS 22165

181.12.6 Devices() as WindowsDiscInfoMBS()

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the device list.
Example:

```
// enumerate all drives
dim discs(-1) as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Devices
```

Notes:

Returns empty array on error.
May get more information on Windows Vista/7 if application runs as administrator.

181.12.7 Properties

181.12.8 BufferSize as Int64

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The buffer size of the disc controller.
Notes:

This value is set if Mode contains 1.
(Read only property)

181.12.9 BytesPerSector as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of bytes per sector.
Notes:

This value is set if Mode contains 4.
Typically 512 bytes, but that can increase in the future.
(Read and Write property)

181.12.10 Drive as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The drive number.
Notes: (Read and Write property)

181.12.11 Fixed as Boolean

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this device is fixed.
Notes:

This value is set if Mode contains 1 or 4.
(Read and Write property)

181.12.12 Mode as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This value shows which properties of the instance have been set with values.
Notes:

Mode is a bitwise or combination of values 1, 2 or 4. So value is 6 if mode 2 and 4 are set. You can test with bitwiseand(mode,mask). For example if bitwiseAnd(mode,4)=4 then BytesPerSector is valid.
(Read and Write property)

181.12.13 ModelNumber as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The model number string for this device.
Example:

```
dim discs(-1) as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Devices

for each disc as WindowsDiscInfoMBS in discs
MsgBox disc.ModelNumber
next
```

Notes:

This string is not available for all discs.
This value is set if Mode contains 1 or 2.
(Read and Write property)

181.12.14 ProductRevision as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The product revision string.
Notes:

This string is not available for all discs.
This value is set if Mode contains 2.
(Read and Write property)

181.12.15 Removable as Boolean

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this device is removable.
Notes:

This value is set if Mode contains 1 or 4.
(Read and Write property)

181.12.16 RevisionNumber as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The revision number of the disc.
Notes:

This string is not available for all discs.
This value is set if Mode contains 1.
(Read and Write property)

181.12.17 SectorsPerTrack as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of sectors per track.
Notes:

This value is set if Mode contains 4.
(Read and Write property)

181.12.18 SerialNumber as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The serial number of the device.
Notes:

This string is not available for all discs.
This value is set if Mode contains 1 or 2.
(Read and Write property)

181.12.19 Size as Int64

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The size of this disc in bytes.
Notes:

This value is set if Mode contains 1 or 4.
(Read only property)

181.12.20 TracksPerCylinder as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of tracks per cylinder.
Notes:

This value is set if Mode contains 4.
(Read and Write property)

181.12.21 VendorId as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The vendor ID of the disc.

Notes:

This value is set if Mode contains 2.
This string is not available for all discs.
(Read and Write property)

181.13 class WindowsDisplayMBS

181.13.1 class WindowsDisplayMBS

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for details on displays.

181.13.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 18.1
- MBS Xojo Plugins, version 18.1pr6
- MBS Xojo Plugins, version 18.1pr1

181.13.3 Methods

181.13.4 Displays as WindowsDisplayMBS()

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries list of displays.
Notes: Returns nil in case of error.

181.13.5 Properties

181.13.6 DeviceInstanceID as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device instance ID in setup database.
Notes: (Read only property)

181.13.7 DeviceName as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device name of display.
Notes: (Read only property)

181.13.8 DisplayAdapterActive as Boolean

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether a monitor is presented as being "on" by the respective GDI view.
Notes: (Read only property)

181.13.9 DisplayAdapterDeviceID as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device ID for the display adapter.
Notes: (Read only property)

181.13.10 DisplayAdapterDeviceKey as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The display adapter device key.
Notes: (Read only property)

181.13.11 DisplayAdapterDeviceName as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The adapter device name.
Notes: (Read only property)

181.13.12 DisplayAdapterDeviceString as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device context string.
Notes:

This is a description of the display adapter.
(Read only property)

181.13.13 DisplayAdapterRemovable as Boolean

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device is removable; it cannot be the primary display.

Notes: (Read only property)

181.13.14 DisplayAdapterStateFlags as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The state flags.
Notes: (Read only property)

181.13.15 DisplayMonitorActive as Boolean

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether a monitor is presented as being "on" by the respective GDI view.
Notes: (Read only property)

181.13.16 DisplayMonitorDeviceID as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device ID for the display monitor.
Notes: (Read only property)

181.13.17 DisplayMonitorDeviceKey as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The display monitor device key.
Notes: (Read only property)

181.13.18 DisplayMonitorDeviceName as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The monitor device name.
Notes: (Read only property)

181.13.19 DisplayMonitorDeviceString as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device context string.

Notes:

This is a description of the display monitor.
(Read only property)

181.13.20 DisplayMonitorRemovable as Boolean

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device is removable; it cannot be the primary display.
Notes: (Read only property)

181.13.21 DisplayMonitorStateFlags as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The state flags.
Notes: (Read only property)

181.13.22 Height as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The height of the display in pixels.
Notes: (Read only property)

181.13.23 HeightDPI as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The DPI for the display.
Notes:

Calculated based on HeightInch property.
(Read only property)

181.13.24 HeightInch as Double

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The physical height of the screen in inches.
Notes:

Value is zero if we don't know.
(Read only property)

181.13.25 HeightMM as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The physical height of the screen in millimeters.
Notes:

Value is zero if we don't know.
(Read only property)

181.13.26 LogPixelsX as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Number of pixels per logical inch along the screen width.
Notes:

In a system with multiple display monitors, this value is the same for all monitors.

e.g. 200% is 96 * 2 = 192
(Read only property)

181.13.27 LogPixelsY as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Number of pixels per logical inch along the screen height.
Notes:

In a system with multiple display monitors, this value is the same for all monitors.

e.g. 200% is 96 * 2 = 192
(Read only property)

181.13.28 MonitorHandle as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle for the monitor.
Notes: (Read only property)

181.13.29 MonitorHeight as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The monitor height.
Notes: (Read only property)

181.13.30 MonitorWidth as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The monitor width.
Notes: (Read only property)

181.13.31 MonitorX as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The position of monitor.
Notes:

The display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read only property)

181.13.32 MonitorY as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The position of monitor.
Notes:

The display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read only property)

181.13.33 Primary as Boolean

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this is primary display.
Notes: (Read only property)

181.13.34 Width as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The width of the display in pixels.
Notes: (Read only property)

181.13.35 WidthDPI as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The DPI for the display.
Notes:

Calculated based on WidthInch property.
(Read only property)

181.13.36 WidthInch as Double

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The physical width of the screen in inches.
Notes:

Value is zero if we don't know.
(Read only property)

181.13.37 WidthMM as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The physical width of the screen in millimeters.
Notes:

Value is zero if we don't know.
(Read only property)

181.13.38 WorkHeight as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The work area height in pixels.
Notes: (Read only property)

181.13.39 WorkWidth as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The work area width in pixels.
Notes: (Read only property)

181.13.40 WorkX as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The work area position.
Notes:

The work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area in rcMonitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read only property)

181.13.41 WorkY as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The work area position.
Notes:

The work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area in rcMonitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read only property)

181.13.42 X as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The position of the display in the virtual desktop space.
Notes:

Primary display is always at 0/0.
(Read only property)

181.13.43 Y as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The position of the display in the virtual desktop space.
Notes:

Primary display is always at 0/0.
(Read only property)

181.14 class WindowsFileCopyMBS

181.14.1 class WindowsFileCopyMBS

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to help you copying files on Windows using system functions.

181.14.3 Methods

181.14.4 CopyFileEx(ExistingFileName as folderitem, NewFileName as folderitem, Flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Copies an existing file to a new file, notifying the application of its progress through the progress event.
Notes:

Returns true on success and false on failure.

ExistingFileName: The name of an existing file.
NewFileName: The name of the new file.
Flags: Flags that specify how the file is to be copied. This parameter can be a combination of the CopyFile* constants.
See also:

- 181.14.5 CopyFileEx(ExistingFileName as String, NewFileName as String, Flags as Integer) as boolean

181.14.5 CopyFileEx(ExistingFileName as String, NewFileName as String, Flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Copies an existing file to a new file, notifying the application of its progress through the progress event.
Notes:

Returns true on success and false on failure.

ExistingFileName: The name of an existing file.
NewFileName: The name of the new file.
Flags: Flags that specify how the file is to be copied. This parameter can be a combination of the CopyFile* constants.
See also:

- 181.14.4 CopyFileEx(ExistingFileName as folderitem, NewFileName as folderitem, Flags as Integer) as boolean 22180

181.14.6 CopyFileSimple(ExistingFileName as folderitem, NewFileName as folderitem, FailIfExists as boolean=false) as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Copies an existing file to a new file.
Notes:

ExistingFileName: The name of an existing file.
NewFileName: The name of the new file.
FailIfExists: If this parameter is true and the new file specified by NewFileName already exists, the function fails. If this parameter is false and the new file already exists, the function overwrites the existing file and succeeds.

Returns true on success and false on failure.
See also:

- 181.14.7 CopyFileSimple(ExistingFileName as String, NewFileName as String, FailIfExists as boolean=false) as boolean 22181

181.14.7 CopyFileSimple(ExistingFileName as String, NewFileName as String, FailIfExists as boolean=false) as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Copies an existing file to a new file.
Notes:

ExistingFileName: The name of an existing file.

NewFileName: The name of the new file.
FailIfExists: If this parameter is true and the new file specified by NewFileName already exists, the function fails. If this parameter is false and the new file already exists, the function overwrites the existing file and succeeds.

Returns true on success and false on failure.
See also:

- 181.14.6 CopyFileSimple(ExistingFileName as folderitem, NewFileName as folderitem, FailIfExists as boolean=false) as boolean 22181

181.14.8 FileOperationCopy(source as folderitem, dest as folderitem, Flags as Integer, ProgressTitle as string="") as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Copy the files specified in the source parameter to the location specified in the dest parameter.
Notes:

This method has several varations so you can call it with a folderitem or a string to specify a file or folder. You can also pass an array of folderitems or strings to delete several files/folders in one operation.

source:
These names should be fully-qualified paths to prevent unexpected results.
Standard Microsoft MS-DOS wildcard characters, such as "*", are permitted only in the file-name position. Using a wildcard character elsewhere in the string will lead to unpredictable results.

dest:
The destination file or directory name. Wildcard characters are not allowed. Their use will lead to unpredictable results.

Copy and Move operations can specify destination directories that do not exist. In those cases, the system attempts to create them and normally displays a dialog box to ask the user if they want to create the new directory. To suppress this dialog box and have the directories created silently, set the FileOperationNoConfirmationMkDir flag in Flags.
For Copy and Move operations, the buffer can contain multiple destination file names if the fFlags member specifies FileOperationMultiDestFiles.
Use fully-qualified paths. Using relative paths is not prohibited, but can have unpredictable results.

Use the FileOperation* constants for the flags.
If a dialog is displayed, the window used in the parent property is used for the parent window.
If ProgressTitle is not empty, this string is used to specify the progress window title text.

Returns true on success and false on failure.

181.14.12 FileOperationCopy(source() as folderitem, dest() as folderitem, Flags as Integer, ProgressTitle as string="") as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Copy the files specified in the source parameter to the location specified in the dest parameter.
Notes:

This method has several varations so you can call it with a folderitem or a string to specify a file or folder. You can also pass an array of folderitems or strings to delete several files/folders in one operation.

source:
These names should be fully-qualified paths to prevent unexpected results.
Standard Microsoft MS-DOS wildcard characters, such as "*", are permitted only in the file-name position. Using a wildcard character elsewhere in the string will lead to unpredictable results.

dest:
The destination file or directory name. Wildcard characters are not allowed. Their use will lead to unpredictable results.

Copy and Move operations can specify destination directories that do not exist. In those cases, the system attempts to create them and normally displays a dialog box to ask the user if they want to create the new directory. To suppress this dialog box and have the directories created silently, set the FileOperationNoConfirmationMkDir flag in Flags.
For Copy and Move operations, the buffer can contain multiple destination file names if the fFlags member specifies FileOperationMultiDestFiles.
Use fully-qualified paths. Using relative paths is not prohibited, but can have unpredictable results.

Use the FileOperation* constants for the flags.
If a dialog is displayed, the window used in the parent property is used for the parent window.
If ProgressTitle is not empty, this string is used to specify the progress window title text.

Returns true on success and false on failure.

source:
These names should be fully-qualified paths to prevent unexpected results.
Standard Microsoft MS-DOS wildcard characters, such as "*", are permitted only in the file-name position. Using a wildcard character elsewhere in the string will lead to unpredictable results.

dest:
The destination file or directory name. Wildcard characters are not allowed. Their use will lead to unpredictable results.

Copy and Move operations can specify destination directories that do not exist. In those cases, the system attempts to create them and normally displays a dialog box to ask the user if they want to create the new directory. To suppress this dialog box and have the directories created silently, set the FileOperationNoConfirmationMkDir flag in Flags.
For Copy and Move operations, the buffer can contain multiple destination file names if the fFlags member specifies FileOperationMultiDestFiles.
Use fully-qualified paths. Using relative paths is not prohibited, but can have unpredictable results.

Use the FileOperation* constants for the flags.
If a dialog is displayed, the window used in the parent property is used for the parent window.
If ProgressTitle is not empty, this string is used to specify the progress window title text.

Returns true on success and false on failure.

181.14.26 FileOperationMove(source() as string, dest as string, Flags as Integer, ProgressTitle as string="") as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Move the files specified in the source parameter to the location specified in the dest parameter.
Notes:

This method has several varations so you can call it with a folderitem or a string to specify a file or folder. You can also pass an array of folderitems or strings to delete several files/folders in one operation.

source:

181.14.28 MoveFileSimple(ExistingFileName as folderitem, NewFileName as folderitem) as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Moves an existing file or a directory, including its children.
Notes:

ExistingFileName:The current name of the file or directory on the local computer.

NewFileName: The new name for the file or directory. The new name must not already exist. A new file may be on a different file system or drive. A new directory must be on the same drive.

Returns true on success and false on failure.

The MoveFile function will move (rename) either a file or a directory (including its children) either in the same directory or across directories. The one caveat is that the MoveFile function will fail on directory moves when the destination is on a different volume.

If a file is moved across volumes, MoveFile does not move the security descriptor with the file. The file will be assigned the default security descriptor in the destination directory.

The MoveFile function coordinates its operation with the link tracking service, so link sources can be tracked as they are moved.
See also:

- 181.14.29 MoveFileSimple(ExistingFileName as String, NewFileName as String) as boolean 22204

181.14.29 MoveFileSimple(ExistingFileName as String, NewFileName as String) as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Moves an existing file or a directory, including its children.
Notes:

ExistingFileName:The current name of the file or directory on the local computer.

NewFileName: The new name for the file or directory. The new name must not already exist. A new file may be on a different file system or drive. A new directory must be on the same drive.

Returns true on success and false on failure.

The MoveFile function will move (rename) either a file or a directory (including its children) either in the same directory or across directories. The one caveat is that the MoveFile function will fail on directory moves when the destination is on a different volume.

If a file is moved across volumes, MoveFile does not move the security descriptor with the file. The file will be assigned the default security descriptor in the destination directory.

The MoveFile function coordinates its operation with the link tracking service, so link sources can be tracked as they are moved.
See also:

- 181.14.28 MoveFileSimple(ExistingFileName as folderitem, NewFileName as folderitem) as boolean 22203

181.14.30 MoveFileWithProgress(ExistingFileName as folderitem, NewFileName as folderitem, Flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Moves a file or directory, including its children.
Notes:

ExistingFileName: The name of the existing file or directory on the local computer.

If Flags specifies MOVEFILE_DELAY_UNTIL_REBOOT, the file cannot exist on a remote share because delayed operations are performed before the network is available.

NewFileName: The new name of the file or directory on the local computer.

When moving a file, NewFileName can be on a different file system or volume. If NewFileName is on another drive, you must set the MOVEFILE_COPY_ALLOWED flag in Flags.

When moving a directory, ExistingFileName and NewFileName must be on the same drive.

If Flags specifies MOVEFILE_DELAY_UNTIL_REBOOT and NewFileName is nil, MoveFileWithProgress registers ExistingFileName to be deleted when the system restarts. The function fails if it cannot access the registry to store the information about the delete operation. If ExistingFileName refers to a directory, the system removes the directory at restart only if the directory is empty.

Flags: The move options. This parameter can be one or more of the following values: MoveFileCopyAllowed, MoveFileReplaceExisting, MoveFileCreateHardLink, MoveFileDelayUntilReboot and MoveFileWriteThrough.

Return Value: If the function succeeds, the return value is true. If the function fails, the return value is false.

When moving a file across volumes, if the Progress event returns PROGRESS_CANCEL due to the user canceling the operation, MoveFileWithProgress will return zero and GetLastError will return ERROR_REQUEST_ABORTED. The existing file is left intact.

When moving a file across volumes, if the Progress event returns PROGRESS_STOP due to the user stopping the operation, MoveFileWithProgress will return zero and GetLastError will return ERROR_REQUEST_ABORTED. The existing file is left intact.
See also:

- 181.14.31 MoveFileWithProgress(ExistingFileName as String, NewFileName as String, Flags as Integer) as boolean 22205

181.14.31 MoveFileWithProgress(ExistingFileName as String, NewFileName as String, Flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Moves a file or directory, including its children.
Notes:

ExistingFileName: The name of the existing file or directory on the local computer.

If Flags specifies MOVEFILE_DELAY_UNTIL_REBOOT, the file cannot exist on a remote share because delayed operations are performed before the network is available.

NewFileName: The new name of the file or directory on the local computer.

When moving a file, NewFileName can be on a different file system or volume. If NewFileName is on another

drive, you must set the MOVEFILE_COPY_ALLOWED flag in Flags.

When moving a directory, ExistingFileName and NewFileName must be on the same drive.

If Flags specifies MOVEFILE_DELAY_UNTIL_REBOOT and NewFileName is "", MoveFileWithProgress registers ExistingFileName to be deleted when the system restarts. The function fails if it cannot access the registry to store the information about the delete operation. If ExistingFileName refers to a directory, the system removes the directory at restart only if the directory is empty.

Flags: The move options. This parameter can be one or more of the following values: MoveFileCopyAllowed, MoveFileReplaceExisting, MoveFileCreateHardLink, MoveFileDelayUntilReboot and MoveFileWriteThrough.

Return Value: If the function succeeds, the return value is true. If the function fails, the return value is false.

When moving a file across volumes, if the Progress event returns PROGRESS_CANCEL due to the user canceling the operation, MoveFileWithProgress will return zero and GetLastError will return ERROR_REQUEST_ABORTED. The existing file is left intact.

When moving a file across volumes, if the Progress event returns PROGRESS_STOP due to the user stopping the operation, MoveFileWithProgress will return zero and GetLastError will return ERROR_REQUEST_ABORTED. The existing file is left intact.

181.14.32 Properties

181.14.33 Lasterror as Integer

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code.
Notes:

This value is typically zero on success and -1 if the function is not supported by the plugin.

The FileOperation* functions have special error codes as following, but other methods have normal Windows Error codes:

(Read and Write property)

DE_SAMEFILE	= & h71	The source and destination files are the same file.
DE_MANYSRC1DEST	= & h72	Multiple file paths were specified in the source buffer, but only one destination file path.
DE_DIFFDIR	= & h73	Rename operation was specified but the destination path is a different directory. Use the move operation instead.
DE_ROOTDIR	= & h74	The source is a root directory, which cannot be moved or renamed.
DE_OPCANCELLED	= & h75	The operation was cancelled by the user, or silently cancelled if the appropriate flags were supplied to SHFileOperation.
DE_DESTSUBTREE	= & h76	The destination is a subtree of the source.
DE_ACCESSDENIEDSRC	= & h78	Security settings denied access to the source.
DE_PATHTOODEEP	= & h79	The source or destination path exceeded or would exceed MAX_PATH.
DE_MANYDEST	= & h7A	The operation involved multiple destination paths, which can fail in the case of a move operation.
DE_INVALIDFILES	= & h7C	The path in the source or destination or both was invalid.
DE_DESTSAMETREE	= & h7D	The source and destination have the same parent folder.
DE_FLDDESTISFILE	= & h7E	The destination path is an existing file.
DE_FILEDESTISFLD	= & h80	The destination path is an existing folder.
DE_FILENAMETOOLONG	= & h81	The name of the file exceeds MAX_PATH.
DE_DEST_IS_CDROM	= & h82	The destination is a read-only CD-ROM, possibly unformatted.
DE_DEST_IS_DVD	= & h83	The destination is a read-only DVD, possibly unformatted.
DE_DEST_IS_CDRECORD	= & h84	The destination is a writable CD-ROM, possibly unformatted.
DE_FILE_TOO_LARGE	= & h85	The file involved in the operation is too large for the destination media or file system.
DE_SRC_IS_CDROM	= & h86	The source is a read-only CD-ROM, possibly unformatted.
DE_SRC_IS_DVD	= & h87	The source is a read-only DVD, possibly unformatted.
DE_SRC_IS_CDRECORD	= & h88	The source is a writable CD-ROM, possibly unformatted.
DE_ERROR_MAX	= & hB7	MAX_PATH was exceeded during the operation.
UnknownError	= & h402	An unknown error occurred. This is typically due to an invalid path in the source or destination. This error does not occur on Windows Vista and later.
ERRORONDEST	= & h10000	An unspecified error occurred on the destination.
DE_ROOTDIR | ERRORONDEST	= & h10074	Destination is a root directory and cannot be renamed.

181.14.34 MultiThreaded as Boolean

MBS Win Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to use helper thread for better GUI responsiveness.
Notes:

This property allows you to call this method in a Thread. The plugin will perform the actual operation on a helper thread, so it does not block Xojo's threading. Your GUI can continue to run this way. Progress event fires asynchronously.
(Read and Write property)

181.14.35 OperationsAborted as Boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This flag is set by the FileOperation method to indicate whether the operation was aborted.
Notes: (Read and Write property)

181.14.36 Parent as Window

MBS Win Plugin, Plugin Version: 9.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The parent window for the FileOperation methods.
Notes: (Read and Write property)

181.14.37 Events

181.14.38 Progress(TotalFileSize as int64, TotalBytesTransferred as int64, StreamSize as int64, StreamBytesTransferred as Int64, StreamNumber as Integer, Reason as Integer) as Integer

MBS Win Plugin, Plugin Version: 9.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** It is called when a portion of a copy or move operation is completed.
Notes:

This event is called by the CopyFileEx and the MoveFileWithProgress methods.

TotalFileSize: The total size of the file, in bytes.
TotalBytesTransferred: The total number of bytes transferred from the source file to the destination file since the copy operation began.
StreamSize: The total size of the current file stream, in bytes.
StreamBytesTransferred: The total number of bytes in the current stream that have been transferred from the source file to the destination file since the copy operation began.
StreamNumber: A handle to the current stream. The first time CopyProgressRoutine is called, the stream number is 1.
Reason: CallbackChunkFinished or CallbackStreamSwitched.

Return ProgressCancel, ProgressStop, ProgressContinue or ProgressQuiet.
If you use multithreading option, you may receive additional events after you cancelled or stopped the operation due to the events coming asynchronously.

181.14.39 Constants

181.14.40 CallbackChunkFinished=0

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the reason constants for the Progress event.
Notes: Another part of the data file was copied.

181.14.41 CallbackStreamSwitched=1

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the reason constants for the Progress event. **Notes:** Another stream was created and is about to be copied. This is the callback reason given when the callback routine is first invoked.

181.14.42 CopyFileAllowDecryptedDestination=8

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants used with CopyFileEx. **Notes:** An attempt to copy an encrypted file will succeed even if the destination copy cannot be encrypted. Windows 2000: This value is not supported.

181.14.43 CopyFileCopySymLink=& h800

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants used with CopyFileEx. **Notes:** If the source file is a symbolic link, the destination file is also a symbolic link pointing to the same file that the source symbolic link is pointing to. Windows Server 2003 and Windows XP/2000: This value is not supported.

181.14.44 CopyFileFailIfExists=1

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants used with CopyFileEx. **Notes:** The copy operation fails immediately if the target file already exists.

181.14.45 CopyFileOpenSourceForWrite=4

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants used with CopyFileEx. **Notes:** The file is copied and the original file is opened for write access.

181.14.46 CopyFileRestartable=2

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants used with CopyFileEx. **Notes:** Progress of the copy is tracked in the target file in case the copy fails. The failed copy can be restarted at a later time by specifying the same values for source and dest as those used in the call that failed.

181.14.47 FileOperationAllowUndo=& h40

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:**

Preserve undo information, if possible.
Prior to Windows Vista, operations could be undone only from the same process that performed the original operation.

In Windows Vista and later systems, the scope of the undo is a user session. Any process running in the user session can undo another operation. The undo state is held in the Explorer.exe process, and as long as that process is running, it can coordinate the undo functions.

If the source file parameter does not contain fully qualified path and file names, this flag is ignored.

181.14.48 FileOperationFilesOnly=& h80

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Perform the operation only on files (not on folders) if a wildcard file name (*.*) is specified.

181.14.49 FileOperationMultiDestFiles=1

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** The destination multiple destination files (one for each source file in from) rather than one directory where all source files are to be deposited.

181.14.50 FileOperationNoConfirmation=& h10

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Respond with Yes to All for any dialog box that is displayed.

181.14.51 FileOperationNoConfirmationMkDir=& h200

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Do not ask the user to confirm the creation of a new directory if the operation requires one to be created.

181.14.52 FileOperationNoConnectedElements=& H2000

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Do not move connected files as a group. Only move the specified files.

181.14.53 FileOperationNoCopySecurityAttributes=& h800

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Do not copy the security attributes of the file. The destination file receives the security attributes of its new folder.

181.14.54 FileOperationNoErrorUI=& h400

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Do not display a dialog to the user if an error occurs.

181.14.55 FileOperationNoRecursion=& h1000

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Only perform the operation in the local directory. Don't operate recursively into subdirectories, which is the default behavior.

181.14.56 FileOperationRenameCollision=8

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Give the file being operated on a new name in a move, copy, or rename operation if a file with the target name already exists at the destination.

181.14.57 FileOperationSilent=4

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Do not display a progress dialog box.

181.14.58 FileOperationSimpleProgress=& h100

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods.
Notes:

Display a progress dialog box but do not show individual file names as they are operated on.

The plugin activates this flag if you pass in a window title.

181.14.59 FileOperationWantNukeWarning=& H4000

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods.
Notes: Send a warning if a file is being permanently destroyed during a delete operation rather than recycled. This flag partially overrides FileOperationNoConfirmation.

181.14.60 MoveFileCopyAllowed=2

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the MoveFileWithProgress method.
Notes:

If the file is to be moved to a different volume, the function simulates the move by using the CopyFile and DeleteFile functions.
This value cannot be used with MoveFileDelayUntilReboot.

181.14.61 MoveFileCreateHardLink=16

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the MoveFileWithProgress method.
Notes: Reserved for future use.

181.14.62 MoveFileDelayUntilReboot=4

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the MoveFileWithProgress method.
Notes:

The system does not move the file until the operating system is restarted. The system moves the file immediately after AUTOCHK is executed, but before creating any paging files. Consequently, this parameter enables the function to delete paging files from previous startups.

This value can only be used if the process is in the context of a user who belongs to the administrators group or the LocalSystem account.
This value cannot be used with MoveFileCopyAllowed.

181.14.63 MoveFileReplaceExisting=1

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the MoveFileWithProgress method.
Notes:

If a file named lpNewFileName exists, the function replaces its contents with the contents of the lpExisting-FileName file.
This value cannot be used if NewFileName or ExistingFileName names a directory.

181.14.64 MoveFileWriteThrough=8

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the MoveFileWithProgress method.
Notes:

The function does not return until the file has actually been moved on the disk.
Setting this value guarantees that a move performed as a copy and delete operation is flushed to disk before the function returns. The flush occurs at the end of the copy operation.
This value has no effect if MoveFileDelayUntilReboot is set.

181.14.65 ProgressCancel=1

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the Progress Event return value.
Notes: Cancel the copy operation and delete the destination file.

181.14.66 ProgressContinue=0

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the Progress Event return value.
Notes: Continue the copy operation.

181.14.67 ProgressQuiet=3

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the Progress Event return value.
Notes: Continue the copy operation, but stop invoking the event to report progress.

181.14.68 ProgressStop=2

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the Progress Event return value. **Notes:** Stop the copy operation. It can be restarted at a later time.

181.15 class WindowsFileInfoMBS

181.15.1 class WindowsFileInfoMBS

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The window file information class.
Example:

```
dim f as FolderItem = SelectFolder

if f<>Nil then
dim w as new WindowsFileInfoMBS(f)
MsgBox str(w.FileIndex)
end if
```

Notes:

The identifier that is stored in the FileIndex members is called the file ID. Support for file IDs is file system-specific. File IDs are not guaranteed to be unique over time, because file systems are free to reuse them. In some cases, the file ID for a file can change over time.

In the FAT file system, the file ID is generated from the first cluster of the containing directory and the byte offset within the directory of the entry for the file. Some defragmentation products change this byte offset. (Windows in-box defragmentation does not.) Thus, a FAT file ID can change over time. Renaming a file in the FAT file system can also change the file ID, but only if the new file name is longer than the old one.

In the NTFS file system, a file keeps the same file ID until it is deleted. You can replace one file with another file without changing the file ID by using the ReplaceFile function. However, the file ID of the replacement file, not the replaced file, is retained as the file ID of the resulting file.

Not all file systems can record creation and last access time, and not all file systems record them in the same manner. For example, on a Windows FAT file system, create time has a resolution of 10 milliseconds, write time has a resolution of 2 seconds, and access time has a resolution of 1 day (the access date). On the NTFS file system, access time has a resolution of 1 hour. For more information, see File Times.

- 181.15.8 Constructor(stream as BinaryStream) 22217

181.15.6 Constructor(handle as Integer)

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor using a Windows File Handle.
Notes: On success the valid property is set to true.
See also:

- 181.15.5 Constructor(file as folderitem) 22216
- 181.15.7 Constructor(path as string) 22216
- 181.15.8 Constructor(stream as BinaryStream) 22217

181.15.7 Constructor(path as string)

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor using a file path.
Notes: On success the valid property is set to true.
See also:

- 181.15.5 Constructor(file as folderitem) 22216
- 181.15.6 Constructor(handle as Integer) 22216
- 181.15.8 Constructor(stream as BinaryStream) 22217

181.15.8 Constructor(stream as BinaryStream)

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor using a binarystream.
Notes: On success the valid property is set to true.
See also:

- 181.15.5 Constructor(file as folderitem) 22216
- 181.15.6 Constructor(handle as Integer) 22216
- 181.15.7 Constructor(path as string) 22216

181.15.9 Properties

181.15.10 CreationDate as Date

MBS Win Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A date that specifies when a file or directory is created.
Notes:

If the underlying file system does not support creation time, this member is nil.
(Read only property)

181.15.11 CreationTime as UInt64

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** An UInt64 that specifies when a file or directory is created.
Notes:

If the underlying file system does not support creation time, this member is zero (0).
(Read only property)

181.15.12 FileAttributes as Integer

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The file attributes.
Notes:

For possible values and their descriptions, see kFileAttribute* constants.
(Read only property)

181.15.13 FileIndex as UInt64

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The unique identifier that is associated with a file.
Notes:

The identifier and the volume serial number uniquely identify a file on a single computer. To determine whether two open handles represent the same file, combine the identifier and the volume serial number for each file and compare them.
(Read only property)

181.15.14 FileSize as UInt64

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The file size.
Notes: (Read only property)

181.15.15 LastAccessDate as Date

MBS Win Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** For a file, the structure specifies the last time that a file is read from or written to.
Notes:

For a directory, the structure specifies when the directory is created. For both files and directories, the specified date is correct, but the time of day is always set to midnight. If the underlying file system does not support the last access time, this member is nil.
(Read only property)

181.15.16 LastAccessTime as UInt64

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** For a file, the structure specifies the last time that a file is read from or written to.
Notes:

For a directory, the structure specifies when the directory is created. For both files and directories, the specified date is correct, but the time of day is always set to midnight. If the underlying file system does not support the last access time, this member is zero (0).
(Read only property)

181.15.17 LastWriteDate as Date

MBS Win Plugin, Plugin Version: 18.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** For a file, the structure specifies the last time that a file is written to.
Notes:

For a directory, the structure specifies when the directory is created. If the underlying file system does not support the last write time, this member is nil.
(Read only property)

181.15.18 LastWriteTime as UInt64

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** For a file, the structure specifies the last time that a file is written to.
Notes:

For a directory, the structure specifies when the directory is created. If the underlying file system does not support the last write time, this member is zero (0).
(Read only property)

181.15.19 NumberOfLinks as Integer

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of links to this file.
Notes:

For the FAT file system this member is always 1. For the NTFS file system, it can be more than 1.
(Read only property)

181.15.20 Valid as Boolean

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the constructor got the values.
Notes: (Read only property)

181.15.21 VolumeSerialNumber as Integer

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The serial number of the volume that contains a file.
Notes: (Read only property)

181.15.22 Constants

181.15.23 kFileAttributeArchive = 32

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.
Notes: A file or directory that is an archive file or directory. Applications typically use this attribute to mark files for backup or removal.

181.15.24 kFileAttributeCompressed = 2048

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.
Notes: A file or directory that is compressed. For a file, all of the data in the file is compressed. For a directory, compression is the default for newly created files and subdirectories.

181.15.25 kFileAttributeDevice = 64

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.
Notes: This value is reserved for system use.

181.15.26 kFileAttributeDirectory = 16

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.
Notes: The handle that identifies a directory.

181.15.27 kFileAttributeEncrypted = 16384

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.
Notes: A file or directory that is encrypted. For a file, all data streams in the file are encrypted. For a directory, encryption is the default for newly created files and subdirectories.

181.15.28 kFileAttributeHidden = 2

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.
Notes: The file or directory is hidden. It is not included in an ordinary directory listing.

181.15.29 kFileAttributeNormal = 128

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.
Notes: A file that does not have other attributes set. This attribute is valid only when used alone.

181.15.30 kFileAttributeNotContentIndexed = 8192

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.
Notes: The file or directory is not to be indexed by the content indexing service.

181.15.31 kFileAttributeOffline = 4096

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.
Notes: The data of a file is not available immediately. This attribute indicates that the file data is physically moved to offline storage. This attribute is used by Remote Storage, which is the hierarchical storage management software. Applications should not arbitrarily change this attribute.

181.15.32 kFileAttributeReadonly = 1

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.
Notes: A file that is read-only. Applications can read the file, but cannot write to it or delete it. This attribute is not honored on directories. For more information, see "You cannot view or change the Read-only or the System attributes of folders in Windows Server 2003, in Windows XP, or in Windows Vista".

181.15.33 kFileAttributeReparsePoint = 1024

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.
Notes: A file or directory that has an associated reparse point, or a file that is a symbolic link.

181.15.34 kFileAttributeSparseFile = 512

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.
Notes: A file that is a sparse file.

181.15.35 kFileAttributeSystem = 4

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.
Notes: A file or directory that the operating system uses a part of, or uses exclusively.

181.15.36 kFileAttributeTemporary = 256

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.
Notes: A file that is being used for temporary storage. File systems avoid writing data back to mass storage if sufficient cache memory is available, because typically, an application deletes a temporary file after the handle is closed. In that scenario, the system can entirely avoid writing the data. Otherwise, the data is written after the handle is closed.

181.15.37 kFileAttributeVirtual = 65536

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.
Notes: This value is reserved for system use.

181.16 class WindowsFileStreamMBS

181.16.1 class WindowsFileStreamMBS

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for file streams on Windows.
Notes:

Windows can store more than one data stream in a file.

(on Mac/Linux, please check the ExtendedAttributesMBS module)
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

181.16.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.4pr5

181.16.3 Methods

181.16.4 Constructor

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The private constructor.

181.16.5 List(file as folderitem) as WindowsFileStreamMBS()

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Lists file streams in a file at given folderitem.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim w() as WindowsFileStreamMBS = WindowsFileStreamMBS.List(f)

Break
```

Notes:

Returns nil in case of error.
Else returns an array with stream details.

Requires Windows Vista or newer. Raises exception on Windows XP.
See also:

- 181.16.6 List(Path as String) as WindowsFileStreamMBS() 22224

181.16.6 List(Path as String) as WindowsFileStreamMBS()

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Lists file streams in a file at given path.
Notes:

Returns nil in case of error.
Else returns an array with stream details.

Requires Windows Vista or newer. Raises exception on Windows XP.
See also:

- 181.16.5 List(file as folderitem) as WindowsFileStreamMBS() 22223

181.16.7 Properties

181.16.8 Name as String

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The name of the stream.
Notes: (Read only property)

181.16.9 Size as UInt64

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The size in bytes.
Notes: (Read only property)

181.17 class WindowsFileVersionMBS

181.17.1 class WindowsFileVersionMBS

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to read Windows version information from a file.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetInternalName
end if
```

181.17.2 Blog Entries

- Tipp of the day: WindowsFileVersionMBS

181.17.3 Methods

181.17.4 FileVersion as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The file version in an user readable string.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.FileVersion
end if
```

Notes: format is "1.2.3.4".

181.17.5 GetCompanyName as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns value for key CompanyName.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetCompanyName
end if
```

181.17.6 GetFileDescription as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns value for key FileDescription.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetFileDescription
end if
```

181.17.7 GetFileVersion as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns value for key FileVersion.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetFileVersion
end if
```

181.17.8 GetInternalName as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns value for key InternalName.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetInternalName
```

```
end if
```

181.17.9 GetLegalCopyright as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns value for key LegalCopyright.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetLegalCopyright
end if
```

181.17.10 GetOriginalFilename as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns value for key OriginalFilename.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetOriginalFilename
end if
```

181.17.11 GetProductName as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns value for key ProductName.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetProductName
end if
```

181.17.12 GetProductVersion as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns value for key ProductVersion.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetProductVersion
end if
```

181.17.13 OpenFile(file as folderitem) as boolean

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Loads file information from a given file.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetCompanyName
end if
```

Notes: Returns true on success and false on failure.

181.17.14 ProductVersion as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The product version in an user readable string.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.ProductVersion
end if
```

Notes: format is "1.2.3.4"

181.17.15 QueryBinaryValue(key as string) as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Low level function to read a binary item from the information resource.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
// we define encoding as UTF16 as we know the value for ProductName is an UTF16 string.
MsgBox DefineEncoding(w.QueryBinaryValue("ProductName"), encodings.UTF16)
end if
```

Notes: Returns "" on any error.

181.17.16 QueryUnicodeValue(key as string) as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Low level function to read an unicode string item from the information resource.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.QueryUnicodeValue("ProductName"))
end if
```

Notes: Returns "" on any error.

181.17.17 Properties

181.17.18 FileDateLS as Integer

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** File date number. Lower part.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileDateLS)
```

```
end if
```

Notes:

Filedate is a 64 bit integer. This is the lower 32 bit part.

Specifies the least significant 32 bits of the file's 64-bit binary creation date and time stamp.
(Read and Write property)

181.17.19 FileDateMS as Integer

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** File date number. Higher part.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileDateMS)
end if
```

Notes:

Filedate is a 64 bit integer. This is the higher 32 bit part.

Specifies the most significant 32 bits of the file's 64-bit binary creation date and time stamp.
(Read and Write property)

181.17.20 FileFlags as Integer

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The file flags.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileFlags)
end if
```

Notes:

Contains a bitmask that specifies the Boolean attributes of the file. This member can include one or more of the following values.

VS_FF_DEBUG	= 1	The file contains debugging information or is compiled with debugging features enabled.
VS_FF_INFOINFERRED	= 16	The file's version structure was created dynamically; therefore, some of the members in this structure may be empty or incorrect. This flag should never be set in a file's VS_VERSIONINFO data.
VS_FF_PATCHED	= 4	The file has been modified and is not identical to the original shipping file of the same version number.
VS_FF_PRERELEASE	= 2	The file is a development version, not a commercially released product.
VS_FF_PRIVATEBUILD	= 8	The file was not built using standard release procedures. If this flag is set, the StringFileInfo structure should contain a PrivateBuild entry.
VS_FF_SPECIALBUILD	= 32	The file was built by the original company using standard release procedures but is a variation of the normal file of the same version number. If this flag is set, the StringFileInfo structure should contain a SpecialBuild entry.

(Read and Write property)

181.17.21 FileOS as Integer

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The file os settings.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileOS)
end if
```

Notes:

Specifies the operating system for which this file was designed. This member can be one of the following values.

An application can combine these values to indicate that the file was designed for one operating system running on another. The following FileOS values are examples of this, but are not a complete list.

(Read and Write property)

VOS_DOS	= & h00010000	The file was designed for MS-DOS.
VOS_NT	= & h00040000	The file was designed for Windows NT.
VOS___WINDOWS16	= & h00000001	The file was designed for 16-bit Windows.
VOS___WINDOWS32	= & h00000004	The file was designed for 32-bit Windows.
VOS_OS216	= & h00020000	The file was designed for 16-bit OS/2.
VOS_OS232	= & h00030000	The file was designed for 32-bit OS/2.
VOS___PM16	= & h00000002	The file was designed for 16-bit Presentation Manager.
VOS___PM32	= & h00000003	The file was designed for 32-bit Presentation Manager.
VOS_UNKNOWN	= & h00000000	The operating system for which the file was designed is unknown to the system.

VOS_DOS_WINDOWS16	= & h00010001	The file was designed for 16-bit Windows running on MS-DOS.
VOS_DOS_WINDOWS32	= & h00010004	The file was designed for 32-bit Windows running on MS-DOS.
VOS_NT_WINDOWS16	= ?	The file was designed for Windows NT.
VOS_OS216_PM16	= & h00020002	The file was designed for 16-bit Presentation Manager running on 16-bit OS/2.
VOS_OS232_PM32	= & h00030003	The file was designed for 32-bit Presentation Manager running on 32-bit OS/2.

181.17.22 FileSubtype as Integer

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Windows file subtype code.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileSubType)
end if
```

Notes:

Specifies the function of the file. The possible values depend on the value of FileType. For all values of FileType not described in the following list, FileSubtype is zero.

If FileType is VFT_DRV, FileSubtype can be one of the following values.

VFT2_UNKNOWN	= 0	The driver type is unknown by the system.
VFT2_DRV_COMM	= 10	The file contains a communications driver.
VFT2_DRV_PRINTER	= 1	The file contains a printer driver.
VFT2_DRV_KEYBOARD	= 2	The file contains a keyboard driver.
VFT2_DRV_LANGUAGE	= 3	The file contains a language driver.
VFT2_DRV_DISPLAY	= 4	The file contains a display driver.
VFT2_DRV_MOUSE	= 5	The file contains a mouse driver.
VFT2_DRV_NETWORK	= 6	The file contains a network driver.
VFT2_DRV_SYSTEM	= 7	The file contains a system driver.
VFT2_DRV_INSTALLABLE	= 8	The file contains an installable driver.
VFT2_DRV_SOUND	= 9	The file contains a sound driver.
VFT2_DRV_VERSIONED_PRINTER	= 10	The file contains a versioned printer driver.

If FileType is VFT_FONT, FileSubtype can be one of the following values.

VFT2_UNKNOWN	= 0	The font type is unknown by the system.
VFT2_FONT_RASTER	= 1	The file contains a raster font.
VFT2_FONT_VECTOR	= 2	The file contains a vector font.
VFT2_FONT_TRUETYPE	= 3	The file contains a TrueType font.

If FileType is VFT_VXD, FileSubtype contains the virtual device identifier included in the virtual device control block.
All FileSubtype values not listed here are reserved.
(Read and Write property)

181.17.23 FileType as Integer

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Windows file type code.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileType)
end if
```

Notes:

Specifies the general type of file. This member can be one of the following values. All other values are reserved.

VFT_UNKNOWN	= 0	The file type is unknown to the system.
VFT_APP	= 1	The file contains an application.
VFT_DLL	= 2	The file contains a DLL.
VFT_DRV	= 3	The file contains a device driver. If dwFileType is VFT_DRV, FileSubtype contains a more specific description of the driver.
VFT_FONT	= 4	The file contains a font. If dwFileType is VFT_FONT, FileSubtype contains a more specific description of the font file.
VFT_VXD	= 5	The file contains a virtual device.
VFT_STATIC_LIB	= 7	The file contains a static-link library.

(Read and Write property)

181.17.24 FileVersionLS as Integer

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** File version number. Lower part.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileVersionLS)
end if
```

Notes:

Fileversion is a 64 bit integer. This is the lower 32 bit part.

Specifies the least significant 32 bits of the file's binary version number. This member is used with FileVersionMS to form a 64-bit value used for numeric comparisons.
(Read and Write property)

181.17.25 FileVersionMS as Integer

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** File version number. Higher part.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileVersionMS)
end if
```

Notes:

Fileversion is a 64 bit integer. This is the higher 32 bit part.

Specifies the most significant 32 bits of the file's binary version number. This member is used with FileVersionLS to form a 64-bit value used for numeric comparisons.
(Read and Write property)

181.17.26 LangCharset as Integer

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The language charset to use.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.LangCharset)
end if
```

Notes:

OpenFile sets this to the default value.
You can change it later.
Value is used on each call of GetOriginalFilename, GetFileVersion, GetCompanyName, GetProductName, GetInternalName, GetProductVersion, GetFileDescription, GetLegalCopyright, QueryUnicodeValue and QueryBinaryValue.
(Read and Write property)

181.17.27 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code.
Notes:

Lasterror means no error has happend.
Normally a Windows error code.
(Read and Write property)

181.17.28 ProductVersionLS as Integer

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Product version number. Lower part.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.ProductVersionLS)
end if
```

Notes:

Productversion is a 64 bit integer. This is the lower 32 bit part.

Specifies the least significant 32 bits of the binary version number of the product with which this file was distributed. This member is used with ProductVersionMS to form a 64-bit value used for numeric comparisons.
(Read and Write property)

181.17.29 ProductVersionMS as Integer

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Product version number. Higher part.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.ProductVersionMS)
end if
```

Notes:

Productversion is a 64 bit integer. This is the higher 32 bit part.

Specifies the most significant 32 bits of the binary version number of the product with which this file was distributed. This member is used with ProductVersionLS to form a 64-bit value used for numeric comparisons.
(Read and Write property)

181.17.30 RawData as String

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the data of the file version record as string.
Notes: (Read only property)

181.17.31 Success as Boolean

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether last call to OpenFile was successful.

Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.Success)
end if
```

Notes: (Read and Write property)

181.18 class WindowsGUIResourcesMBS

181.18.1 class WindowsGUIResourcesMBS

MBS Win Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Class to retrieves the count of handles to graphical user interface (GUI) objects in use by the specified process.
Notes:

Allows you to monitor how many handles you use from GDI.
As they are limited, your app will crash if it hits a limit.

181.18.3 Methods

181.18.4 Constructor

MBS Win Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor.
Notes:

Examines current process and sets properties.

If the constructor succeeds, the properties are set to the count of handles to GUI objects in use by the process. If no GUI objects are in use, the return value is zero.

A process without a graphical user interface does not use GUI resources, therefore, GetGuiResources will return zero.

181.18.5 Constructor(ProcessID as integer)

MBS Win Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor.
Notes:

Examines given process and sets properties.

If the constructor succeeds, the properties are set to the count of handles to GUI objects in use by the process. If no GUI objects are in use, the return value is zero.

A process without a graphical user interface does not use GUI resources, therefore, GetGuiResources will return zero.

- 181.18.4 Constructor 22238

181.18.6 Properties

181.18.7 GDIObjectCount as Integer

MBS Win Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The count of GDI objects.
Notes: (Read only property)

181.18.8 GDIObjectPeak as Integer

MBS Win Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The peak count of GDI objects.
Notes: (Read only property)

181.18.9 LastError as Integer

MBS Win Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error from Windows.
Notes:

Should be zero on success.
But could give error code like permissions denied, if you want to examine another process.
(Read only property)

181.18.10 UserObjectCount as Integer

MBS Win Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The count of USER objects.

Notes: (Read only property)

181.18.11 UserObjectPeak as Integer

MBS Win Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The peak count of USER objects.
Notes: (Read only property)

181.19 class WindowsIniMBS

181.19.1 class WindowsIniMBS

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to handle INI files on Windows.
Notes:

Ini files are build by this:

[Sectionname]
key1=value1

[Appname]
key2=value2

An ini file contains one or more sections which are labeled with a name of a section or in the Win.ini file with the application name.
Each section is filled with one or more key = value pairs.

181.19.2 Blog Entries

- MBS Real Studio Plugins, version 13.0pr10

181.19.3 Methods

181.19.4 GetPrivateProfileInt(appname as string, keyname as string, defaultValue as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads an integer value from the ini file.
Notes:

This is the function to work on a private ini file.
Returns the default value on any error.

181.19.5 GetPrivateProfileSection(appname as string) as string

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns a section from an ini file.
Notes:

This is the function to work on a private ini file.
The string is built using CStrings (with ending chr(0)).
Returns "" on any error.

181.19.6 GetPrivateProfileString(appname as string, keyname as string, defaultValue as string = "") as string

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads a string from an ini file.
Notes:

This is the function to work on a private ini file.
Returns the default value on any error.

181.19.7 GetPrivateProfileStruct(section as string, keyname as string, size as Integer) as memoryblock

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads a structure from an ini file.
Notes:

This is the function to work on a private ini file.
Size is the size of the memoryblock returned.
Returns nil on any error.
A checksum is checked to verify that the data is unchanged.

181.19.8 GetProfileInt(appname as string, keyname as string, defaultValue as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns an integer value of the Win.ini file.
Notes: Returns the default value on any error.

181.19.9 GetProfileSection(appname as string) as string

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns a profile section of the Win.ini file.
Notes:

The string is built using CStrings (with ending chr(0)).

Returns "" on any error.

181.19.10 GetProfileString(appname as string, keyname as string, defaultValue as string = "") as string

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns an integer value of the Win.ini file.
Notes:

Searches for a string.
All three parameters are not allowed to be empty. And you must pass trimmed strings (no space on the left and/or right side)
Returns the default string on any error.

181.19.11 WritePrivateProfileSection(appname as string, value as string) as boolean

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Write a section to an ini file.
Notes:

This is the function to work on a private ini file.
Value is an array of strings concated with chr(0) as the delimiter.
Returns true if successfull.

181.19.12 WritePrivateProfileString(appname as string, keyname as string, value as string) as boolean

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Writes a string to an ini file.
Example:

```
dim l as windowsIniMBS

l=new windowsIniMBS
l.filename="c:\test.ini"

if l.writePrivateProfileString("appname","keyname","value") then
msgBox "ok"
end if
```

Notes: This is the function to work on a private ini file.

181.19.13 WritePrivateProfileStruct(section as string, keyname as string, mem as memoryblock, size as Integer) as boolean

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Writes a memoryblock as a structure to a ini file.
Notes:

This is the function to work on a private ini file.
Returns true if successfull.
A checksum is stored to verify later whether the data was changed.

181.19.14 Properties

181.19.15 BufferSize as Integer

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The size of the buffer used for reading strings from the INI files.
Notes:

Should not be bigger than 32767 bytes on Windows 95/98/ME.
Default size is 32000.
(Read and Write property)

181.19.16 Filename as String

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The file path of the private profile file to use.
Notes:

e.g. "C:\Test.ini" or just "myapp.ini".
(Read and Write property)

181.20 class WindowsKeyboardLayoutMBS

181.20.1 class WindowsKeyboardLayoutMBS

MBS Win Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a keyboard layout on Windows.

181.20.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr8

181.20.3 Methods

181.20.4 Constructor

MBS Win Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new keyboard layout object with current layout.
Example:

```
dim w as new WindowsKeyboardLayoutMBS
MsgBox w.name
```

See also:

- 181.20.5 Constructor(SubLanguageID as Integer, PrimaryLanguageID as Integer) 22245

181.20.5 Constructor(SubLanguageID as Integer, PrimaryLanguageID as Integer)

MBS Win Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new keyboard layout object with the given ID.
See also:

- 181.20.4 Constructor 22245

181.20.6 KeyboardLayoutName as string

MBS Win Plugin, Plugin Version: 12.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns the name of the current keyboard layout name.
Example:

msgbox WindowsKeyboardLayoutMBS.KeyboardLayoutName

181.20.7 List as WindowsKeyboardLayoutMBS()

MBS Win Plugin, Plugin Version: 12.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns a list of all keyboard layouts installed.
Example:

```
dim list() as WindowsKeyboardLayoutMBS = WindowsKeyboardLayoutMBS.List
MsgBox str(UBound(list)+1)+" keyboard layouts."
```

181.20.8 Properties

181.20.9 Handle as Integer

MBS Win Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal ID of the keyboard layout.
Notes: (Read only property)

181.20.10 Name as String

MBS Win Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the name of the keyboard layout.
Example:

```
dim w as new WindowsKeyboardLayoutMBS
MsgBox w.name
```

Notes: (Read only property)

181.20.11 PrimaryLanguageID as Integer

MBS Win Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The primary ID for this language.
Notes: (Read and Write property)

181.20.12 SubLanguageID as Integer

MBS Win Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The sub language ID.
Notes:

This is needed as there are for example 16 different English variants.
(Read and Write property)

181.21 class WindowsKeyFilterMBS

181.21.1 class WindowsKeyFilterMBS

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to filter several windows keyboard shortcuts with a low level event filter.
Notes:

There is no need to keep the instance as all internal data is stored in global variables.

Key codes for Windows:

181.21.2 Methods

181.21.3 Install as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Install the event filter.
Notes:

Returns true on success and false on failure.
Second call in an application will return false unless Uninstall was called between.

181.21.4 Uninstall as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Uninstalls the event filter.
Notes: You only call this after Install returned true.

181.21.5 Properties

181.21.6 BlockAlt as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the alt key.
Notes: (Read and Write property)

181.21.7 BlockAltEscape as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the Alt-Escape key combination.
Notes: (Read and Write property)

181.21.8 BlockAltF4 as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the ALT-F4 key combination.
Notes:

By default this one closes the application.
(Read and Write property)

181.21.9 BlockAltTab as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the ALT-Tab key combination.
Notes:

This combination is for task switching.
(Read and Write property)

181.21.10 BlockApplicationWindowsKey as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the application windows key.
Notes: (Read and Write property)

181.21.11 BlockBack as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the back key.
Notes: (Read and Write property)

181.21.12 BlockCancel as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the Cancel key.
Notes: (Read and Write property)

181.21.13 BlockCapital as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the CapsLock key.
Notes: (Read and Write property)

181.21.14 BlockClear as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the Clear key.
Notes: (Read and Write property)

181.21.15 BlockControl as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the control key.
Notes: (Read and Write property)

181.21.16 BlockControlAltDelete as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the Control-Alt-Delete key combination.
Notes:

Sorry, does not have any effect as this key combination is processed earlier in event chain.
(Read and Write property)

181.21.17 BlockControlEscape as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the Control-Escape key combination.

Notes: (Read and Write property)

181.21.18 BlockDelete as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the delete key.
Notes: (Read and Write property)

181.21.19 BlockDown as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the down key.
Notes: (Read and Write property)

181.21.20 BlockEnd as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the end key.
Notes: (Read and Write property)

181.21.21 BlockEscape as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the escape key.
Notes: (Read and Write property)

181.21.22 BlockExecute as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the execute key.
Notes: (Read and Write property)

181.21.23 BlockF1 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F1 key.

Notes: (Read and Write property)

181.21.24 BlockF10 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F10 key.
Notes: (Read and Write property)

181.21.25 BlockF11 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F11 key.
Notes: (Read and Write property)

181.21.26 BlockF12 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F12 key.
Notes: (Read and Write property)

181.21.27 BlockF13 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F13 key.
Notes: (Read and Write property)

181.21.28 BlockF14 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F14 key.
Notes: (Read and Write property)

181.21.29 BlockF15 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F15 key.

Notes: (Read and Write property)

181.21.30 BlockF16 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F16 key.
Notes: (Read and Write property)

181.21.31 BlockF17 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F17 key.
Notes: (Read and Write property)

181.21.32 BlockF18 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F18 key.
Notes: (Read and Write property)

181.21.33 BlockF19 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F19 key.
Notes: (Read and Write property)

181.21.34 BlockF2 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F2 key.
Notes: (Read and Write property)

181.21.35 BlockF20 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F20 key.

Notes: (Read and Write property)

181.21.36 BlockF21 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F21 key.
Notes: (Read and Write property)

181.21.37 BlockF22 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F22 key.
Notes: (Read and Write property)

181.21.38 BlockF23 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F23 key.
Notes: (Read and Write property)

181.21.39 BlockF24 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F24 key.
Notes: (Read and Write property)

181.21.40 BlockF3 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F3 key.
Notes: (Read and Write property)

181.21.41 BlockF4 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F4 key.

Notes: (Read and Write property)

181.21.42 BlockF5 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F5 key.
Notes: (Read and Write property)

181.21.43 BlockF6 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F6 key.
Notes: (Read and Write property)

181.21.44 BlockF7 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F7 key.
Notes: (Read and Write property)

181.21.45 BlockF8 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F8 key.
Notes: (Read and Write property)

181.21.46 BlockF9 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F9 key.
Notes: (Read and Write property)

181.21.47 BlockHelp as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the help key.

Notes: (Read and Write property)

181.21.48 BlockHome as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the home key.
Notes: (Read and Write property)

181.21.49 BlockInsert as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the insert key.
Notes: (Read and Write property)

181.21.50 BlockLeft as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the left key.
Notes: (Read and Write property)

181.21.51 BlockLeftButton as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the left mouse button.
Notes: (Read and Write property)

181.21.52 BlockLeftWindowsKey as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the left windows key.
Notes: (Read and Write property)

181.21.53 BlockMiddleButton as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the middle mouse button.

Notes: (Read and Write property)

181.21.54 BlockPause as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the pause key.
Notes: (Read and Write property)

181.21.55 BlockPrint as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the print key.
Notes:

BlockSnapshot is to block screenshots.
(Read and Write property)

181.21.56 BlockReturn as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the return key.
Notes: (Read and Write property)

181.21.57 BlockRight as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the right key.
Notes: (Read and Write property)

181.21.58 BlockRightButton as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the right mouse button.
Notes: (Read and Write property)

181.21.59 BlockRightWindowsKey as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the right windows key.
Notes: (Read and Write property)

181.21.60 BlockSelect as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the select key.
Notes: (Read and Write property)

181.21.61 BlockShift as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the shift key.
Notes: (Read and Write property)

181.21.62 BlockSleep as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the sleep key.
Notes: (Read and Write property)

181.21.63 BlockSnapshot as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the snapshot key.
Notes:

This is the print key to do screenshots.
(Read and Write property)

181.21.64 BlockSpace as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the space key.

Notes: (Read and Write property)

181.21.65 BlockTab as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the tab key.
Notes: (Read and Write property)

181.21.66 BlockUp as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the up key.
Notes: (Read and Write property)

181.21.67 BlockKey(virtualkeycode as Integer) as boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to block a key with a specific virtual key code.
Notes:

You can set this to true for all keys you want to block.
The virtual key codes are in the windows header files.
For most common keys this class has properties. More can be added.
(Read and Write computed property)

181.21.68 Events

181.21.69 KeyDown(vkCode as Integer, scanCode as Integer, flags as Integer, time as Integer) as Boolean

MBS Win Plugin, Plugin Version: 10.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The key down event.
Notes:

vkCode: Specifies a virtual-key code. The code must be a value in the range 1 to 254.
scanCode: Specifies a hardware scan code for the key.
flags: Specifies the extended-key flag, event-injected flag, context code, and transition-state flag. This member is specified as follows.
time: Specifies the time stamp for this message.

the flag bits are like this:
bit 0: Specifies whether the key is an extended key, such as a function key or a key on the numeric keypad. The value is 1 if the key is an extended key; otherwise, it is 0.
bit 4: Specifies whether the event was injected. The value is 1 if the event was injected; otherwise, it is 0.
bit 5: Specifies the context code. The value is 1 if the ALT key is pressed; otherwise, it is 0.
bit 7: Specifies the transition state. The value is 0 if the key is pressed and 1 if it is being released.
Other bits are reserved.

There can be only one WindowsKeyFilterMBS object in your application which receives this events.

We have currently no idea in what context this event is received. And you should return as soon as possible as this event may be called a lot of times and can block user input.

Return true if you handled the key and false if you did not handle it.
Please have this event being as fast as possible. Do not put msgbox there. Better detect a key shortcut and launch a timer to perform the action a millisecond later, so you don't block the keyboard event system.
Blocks only KeyUp or only KeyDown can lead to trouble if the internal counters for special keys get our of sync.

181.21.70 KeyUp(vkCode as Integer, scanCode as Integer, flags as Integer, time as Integer) as Boolean

MBS Win Plugin, Plugin Version: 10.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The key up event.
Notes:

vkCode: Specifies a virtual-key code. The code must be a value in the range 1 to 254.
scanCode: Specifies a hardware scan code for the key.
flags: Specifies the extended-key flag, event-injected flag, context code, and transition-state flag. This member is specified as follows.
time: Specifies the time stamp for this message.

the flag bits are like this:
bit 0: Specifies whether the key is an extended key, such as a function key or a key on the numeric keypad. The value is 1 if the key is an extended key; otherwise, it is 0.
bit 4: Specifies whether the event was injected. The value is 1 if the event was injected; otherwise, it is 0.
bit 5: Specifies the context code. The value is 1 if the ALT key is pressed; otherwise, it is 0.
bit 7: Specifies the transition state. The value is 0 if the key is pressed and 1 if it is being released.
Other bits are reserved.

There can be only one WindowsKeyFilterMBS object in your application which receives this events.

We have currently no idea in what context this event is received. And you should return as soon as possible as this event may be called a lot of times and can block user input.

Return true if you handled the key and false if you did not handle it.

181.22 class WindowsListMBS

181.22.1 class WindowsListMBS

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to list all the windows on a Windows system.
Notes:

To find all processes on Mac, use the ProcessMBS class.
To find all windows on Mac OS X, use the CGSWindowListMBS class.

181.22.2 Blog Entries

- MBS Xojo Plugins, version 19.2pr1
- SetFrontMost for Windows
- MBS Xojo / Real Studio Plugins, version 16.4pr1

181.22.3 Methods

181.22.4 ActivateWindow(index as integer)

MBS Win Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Activates the window.
Notes:

This function does more than just show. if the window has been minimized, it will restore it. Also the window is moved to front and made the current window for keyboard input.

Sadly windows limits which windows can go to front, so some windows may not come to front unless they are clicked on.

As activation can be asynchronously, the window may activate later, e.g. after current method ends.

181.22.5 Constructor

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor which queries the values.
See also:

- 181.22.6 Constructor(win as window) 22308

- 181.22.7 Constructor(WindowHandle as Integer) 22308

181.22.6 Constructor(win as window)

MBS Win Plugin, Plugin Version: 16.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The constructor which queries the values.
Notes: If win is not nil, we lookup child windows of this window.
See also:

- 181.22.5 Constructor 22307
- 181.22.7 Constructor(WindowHandle as Integer) 22308

181.22.7 Constructor(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor which queries the values.
Notes: If WindowHandle is not zero, we lookup child windows of this window.
See also:

- 181.22.5 Constructor 22307
- 181.22.6 Constructor(win as window) 22308

181.22.8 Focus as Integer

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the handle to the window that has the keyboard focus, if the window is attached to the calling thread's message queue.
Notes: If the calling thread's message queue does not have an associated window with the keyboard focus, the return value is 0.

181.22.9 ForegroundWindow as Integer

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves a handle to the foreground window (the window with which the user is currently working).
Notes:

The system assigns a slightly higher priority to the thread that creates the foreground window than it does to other threads.
The return value is a handle to the foreground window. The foreground window can be 0 in certain circumstances, such as when a window is losing activation.

181.22.10 Update

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the values and returns true on success.

181.22.11 WindowClassName(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the window class name of the window with the given index.
Notes: For example "SciCalc" for the calc.exe main window.

181.22.12 WindowClassNameFromHandle(Handle as Integer) as String

MBS Win Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the window class name of the window with the given handle.
Notes: For example "SciCalc" for the calc.exe main window.

181.22.13 WindowHandle(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

181.22.14 WindowHeight(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The height of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

181.22.15 WindowIconic(index as Integer) as boolean

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the window with the given index is minimized.

181.22.16 WindowImageFileName(index as Integer) as string

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the path to the execuable file of the process which owns the window with the given index.
Notes:

Requires Windows XP or newer.
Returns an empty string on any error.

181.22.17 WindowLeft(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The x position of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

181.22.18 WindowProcessID(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The process ID of the process which ows the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

181.22.19 WindowText(index as Integer) as string

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the title of the window with the given index.

181.22.20 WindowTextFromHandle(Handle as Integer) as String

MBS Win Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the title of the window with the given handle.

181.22.21 WindowThreadHandle(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The thread handle of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

181.22.22 WindowTop(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Y position of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

181.22.23 WindowVisible(index as Integer) as boolean

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the window with the given index is visible.

181.22.24 WindowWidth(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The width of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

181.22.25 WindowZoomed(index as Integer) as boolean

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the window with the given index is zoomed.

181.22.26 Properties

181.22.27 CurrentProcessID as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current process ID.
Notes:

This value is updated by the Constructor and the Update method.
(Read and Write property)

181.22.28 CurrentThreadID as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current thread ID.
Notes:

This value is updated by the Constructor and the Update method.
(Read and Write property)

181.22.29 DesktopWindowHandle as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle of the desktop window.
Notes:

This value is updated by the Constructor and the Update method.
(Read and Write property)

181.22.30 ForegroundWindowHandle as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle of the foreground window.
Notes:

This value is updated by the Constructor and the Update method.
(Read and Write property)

181.22.31 ParentWindowHandle as Integer

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle of the parent window.
Notes:

This value is set by the Constructor.
(Read and Write property)

181.22.32 WindowCount as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of windows.
Notes:

This value is updated by the Constructor and the Update method.
(Read and Write property)

181.23 class WindowsMonitorMBS

181.23.1 class WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class to query monitor details on Windows.
Example:

```
for each m as WindowsMonitorMBS in WindowsMonitorMBS.AllMonitors
MsgBox m.DeviceName+": "+str(m.Left)+"x"+str(m.top)+" "+str(m.Width)+"x"+str(m.Height)
next
```

181.23.2 Blog Entries

- MBS Real Studio Plugins, version 11.3pr2

181.23.3 Methods

181.23.4 AllMonitors as WindowsMonitorMBS()

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries all monitors.
Example:

```
for each m as WindowsMonitorMBS in WindowsMonitorMBS.AllMonitors
MsgBox m.DeviceName+": "+str(m.Left)+"x"+str(m.top)+" "+str(m.Width)+"x"+str(m.Height)
next
```

Notes: Returns an array with an entry for each monitor connected to this computer.
See also:

- 181.23.5 AllMonitors(monitors() as WindowsMonitorMBS) as Integer 22313

181.23.5 AllMonitors(monitors() as WindowsMonitorMBS) as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries all monitors.
Notes:

Returns the number of monitors found and sets the monitor objects in the array.
if the array is too short, you get the first ubound(monitors)+1 fonts set there.
See also:

• 181.23.4 AllMonitors as WindowsMonitorMBS() 22313

181.23.6 MonitorFromPoint(x as Integer, y as Integer, flags as Integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The MonitorFromPoint function retrieves a handle to the display monitor that contains a specified point.
Example:

```
dim m as WindowsMonitorMBS = WindowsMonitorMBS.MonitorFromPoint(1900, 1000)

if m = nil then
MsgBox "Your display is smaller than 1900 x 1000"
else
MsgBox m.DeviceName
end if
```

Notes:

x and y: The point of interest in virtual-screen coordinates.
Flags: Determines the function's return value if the point is not contained within any display monitor.

This parameter can be one of the following values.

Value	Meaning
kDefaultToNearest	Returns a handle to the display monitor that is nearest to the point.
kDefaultToNull	Returns nil.
kDefaultToPrimary	Returns a handle to the primary display monitor.

If the point is contained by a display monitor, the return value is that display monitor.
If the point is not contained by a display monitor, the return value depends on the value of flags.

181.23.7 MonitorFromRect(left as Integer, top as Integer, width as Integer, height as Integer, flags as Integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The MonitorFromRect function retrieves the display monitor that has the largest area of intersection with a specified rectangle.
Example:

```
dim m as WindowsMonitorMBS = WindowsMonitorMBS.MonitorFromRect(0,0,100,100)
MsgBox m.DeviceName
```

Notes:

left, top, width, height: The rectangle of interest in virtual-screen coordinates.
Flags: Determines the function's return value if the rectangle does not intersect any display monitor.

This parameter can be one of the following values.

Value	Meaning
kDefaultToNearest	Returns a handle to the display monitor that is nearest to the rectangle.
kDefaultToNull	Returns nil.
kDefaultToPrimary	Returns a handle to the primary display monitor.

If the rectangle intersects one or more display monitor rectangles, the return value is the display monitor that has the largest area of intersection with the rectangle.
If the rectangle does not intersect a display monitor, the return value depends on the value of Flags.

181.23.8 MonitorFromWindow(win as window, flags as Integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The MonitorFromWindow function retrieves the display monitor that has the largest area of intersection with the bounding rectangle of a specified window.
Example:

```
dim m as WindowsMonitorMBS = WindowsMonitorMBS.MonitorFromWindow(window1)
MsgBox m.DeviceName
```

Notes:

win: The window of interest.
Flags: Determines the function's return value if the window does not intersect any display monitor.

This parameter can be one of the following values:

If the window intersects one or more display monitor rectangles, the return value is the display monitor that has the largest area of intersection with the window.

If the window does not intersect a display monitor, the return value depends on the value of Flags.

Value	Meaning
kDefaultToNearest	Returns the display monitor that is nearest to the window.
kDefaultToNull	Returns nil.
kDefaultToPrimary	Returns the primary display monitor.

If the window is currently minimized, MonitorFromWindow uses the rectangle of the window before it was minimized.
See also:

- 181.23.9 MonitorFromWindow(WindowHandle as Integer, flags as Integer = 0) as WindowsMonitorMBS 22316

181.23.9 MonitorFromWindow(WindowHandle as Integer, flags as Integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The MonitorFromWindow function retrieves the display monitor that has the largest area of intersection with the bounding rectangle of a specified window.
Example:

```
dim m as WindowsMonitorMBS = WindowsMonitorMBS.MonitorFromWindow(window1.handle)
MsgBox m.DeviceName
```

Notes:

WindowHandle: A handle to the window of interest.
Flags: Determines the function's return value if the window does not intersect any display monitor.

This parameter can be one of the following values:

Value	Meaning
kDefaultToNearest	Returns the display monitor that is nearest to the window.
kDefaultToNull	Returns nil.
kDefaultToPrimary	Returns the primary display monitor.

If the window intersects one or more display monitor rectangles, the return value is the display monitor that has the largest area of intersection with the window.

If the window does not intersect a display monitor, the return value depends on the value of Flags.
If the window is currently minimized, MonitorFromWindow uses the rectangle of the window before it was

minimized.
See also:

- 181.23.8 MonitorFromWindow(win as window, flags as Integer = 0) as WindowsMonitorMBS 22315

181.23.10 Properties

181.23.11 Bottom as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The bottom value of the display monitor.
Notes:

Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

181.23.12 DeviceName as String

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string that specifies the device name of the monitor being used.
Notes: (Read and Write property)

181.23.13 Height as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The height of the display monitor.
Notes:

Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

181.23.14 HMonitor as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal window handle for this monitor.
Notes: (Read and Write property)

181.23.15 IsPrimary as Boolean

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this is the primary display monitor.
Notes: (Read and Write property)

181.23.16 Left as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The left position of the display monitor.
Notes:

Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

181.23.17 Right as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The right value of the display monitor.
Notes:

Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

181.23.18 Top as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The top position of the display monitor.
Notes:

Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

181.23.19 Width as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The width of the display monitor.
Notes:

Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

181.23.20 WorkBottom as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The bottom value from useable screen area.
Notes:

Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

181.23.21 WorkHeight as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The height value from useable screen area.
Notes:

Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

181.23.22 WorkLeft as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The left value from useable screen area.
Notes:

Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

181.23.23 WorkRight as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The right value from useable screen area.
Notes:

Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

181.23.24 WorkTop as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The top value from useable screen area.
Notes:

Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

181.23.25 WorkWidth as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The width value from useable screen area.
Notes:

Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

181.23.26 Constants

181.23.27 kDefaultToNearest = 2

MBS Win Plugin, Plugin Version: 11.3. **Function:** One of the flag constants.
Notes: Return the display monitor that is nearest to the window, point or rectangle.

181.23.28 kDefaultToNull = 0

MBS Win Plugin, Plugin Version: 11.3. **Function:** One of the flag constants.
Notes: Returns nil if no monitor matches is located at point, window or rectangle.

181.23.29 kDefaultToPrimary = 1

MBS Win Plugin, Plugin Version: 11.3. **Function:** One of the flag constants.
Notes: Returns the primary display monitor if point, rect or window does not point to a monitor.

181.24 class WindowsPipeMBS

181.24.1 class WindowsPipeMBS

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a Windos Pipe.
Notes:

A replacement for IPCSocket on Windows.
Can be used in two applications to exchange data.

181.24.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 19.5
- MBS Xojo Plugins, version 19.5pr1
- New Windows Pipe class for Xojo

181.24.3 Methods

181.24.4 Close

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Closes the pipe.
Notes: Called by destructor automatically.

181.24.5 Constructor

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor.

181.24.6 CreatePipe(Name as string, MessageMode as Boolean = false, BufferSize as Integer = & h100000, AllowAllUsers as Boolean = false) as Boolean

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a named pipe.
Notes:

Buffersize defines the size for input/output buffers.
Returns true on success or false on failure.
Lasterror is set.

Normally the pipe allows only same user.
But if AllowAllUsers is true, you can talk to other users or from service to user.

If name does not start with \then we prefix it with "\\.\Pipe\".

181.24.7 OpenPipe(Name as string) as Boolean

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Opens an existing named pipe from client side.
Notes:

Returns true on success or false on failure.
Lasterror is set.

If name does not start with \then we prefix it with "\\.\Pipe\".

181.24.8 Peek(ByteCount as Integer) as String

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads data without removing it from the buffer.
Notes:

Reads up to the given number of bytes.
BytesRead property is set and data is returned.
LastError property is set.

181.24.9 PeekAll as String

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads all data without removing it from the buffer.
Notes:

Reads whole message or in byte mode
BytesRead property is set and data is returned.
LastError property is set.

181.24.10 Read(ByteCount as Integer) as String

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads data.
Notes:

Reads up to the given number of bytes.
BytesRead property is set and data is returned.
LastError property is set.

181.24.11 ReadAll as String

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads all data.
Example:

```
dim Pipe as WindowsPipeMBS // your pipe

Dim r As String = pipe.ReadAll
Dim d As String = DefineEncoding(r, Encodings.UTF8)

List.AddRow d
```

Notes:

Reads whole message or in byte mode what is available.
BytesRead property is set and data is returned.
LastError property is set.

181.24.12 Write(data as MemoryBlock)

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Writes data.
Notes:

Lasterror is set.
BytesWritten is set to number of bytes sent.
See also:

- 181.24.13 Write(data as string)

181.24.13 Write(data as string)

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Writes data.
Example:

```
dim Pipe as WindowsPipeMBS // your pipe

Dim d As String = ConvertEncoding(MessageField.Text, encodings.UTF8)
If d.Len >0 Then
pipe.Write d
MessageField.Text = ""
End If
```

Notes:

Lasterror is set.
BytesWritten is set to number of bytes sent.
See also:

- 181.24.12 Write(data as MemoryBlock) 22324

181.24.14 Properties

181.24.15 BytesAvailable as Integer

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries number of bytes available in buffer.
Notes: (Read only property)

181.24.16 BytesRead as Integer

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Number of bytes read.
Notes: (Read and Write property)

181.24.17 BytesWritten as Integer

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Number of bytes written.
Notes: (Read and Write property)

181.24.18 Handle as Integer

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle for the pipe.
Notes: (Read only property)

181.24.19 InputBufferSize as Integer

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The input buffer size.
Notes: (Read only property)

181.24.20 IsClient as Boolean

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this is client or server side.
Notes:

True if this is client side.
(Read only property)

181.24.21 IsMessageMode as Boolean

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this pipe is in message mode.
Notes: (Read only property)

181.24.22 IsOpen as Boolean

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries whether pipe is open.
Notes: (Read only property)

181.24.23 IsServer as Boolean

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this is client or server side.
Notes:

True if this is server side.
(Read only property)

181.24.24 LastError as Integer

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code.
Notes:

A Windows error code.
(Read and Write property)

181.24.25 MessageBytesAvailable as Integer

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries number of bytes available for current message.
Notes: (Read only property)

181.24.26 Name as String

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The name of the pipe.
Notes:

This is name as used in CreatePipe or OpenPipe method.
(Read and Write property)

181.24.27 NamedPipeClientComputerName as String

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the client computer name for the specified named pipe.
Example:

```
dim Pipe as WindowsPipeMBS // your pipe

Msgbox "NamedPipeClientComputerName: "+pipe.NamedPipeClientComputerName
```

Notes: (Read only property)

181.24.28 NamedPipeClientProcessId as Integer

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the client process identifier for the specified named pipe.
Example:

```
dim Pipe as WindowsPipeMBS // your pipe

Msgbox "NamedPipeClientProcessId: "+str(pipe.NamedPipeClientProcessId)
```

Notes: (Read only property)

181.24.29 NamedPipeClientSessionId as Integer

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the client session identifier for the specified named pipe.
Example:

```
dim Pipe as WindowsPipeMBS // your pipe

Msgbox "NamedPipeClientSessionId: "+str(pipe.NamedPipeClientSessionId)
```

Notes: (Read only property)

181.24.30 NamedPipeServerProcessId as Integer

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the server process identifier for the specified named pipe.
Example:

```
dim Pipe as WindowsPipeMBS // your pipe

Msgbox "NamedPipeServerProcessId: "+str(pipe.NamedPipeServerProcessId)
```

Notes: (Read only property)

181.24.31 NamedPipeServerSessionId as Integer

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the server session identifier for the specified named pipe.
Example:

```
dim Pipe as WindowsPipeMBS // your pipe

Msgbox "NamedPipeServerSessionId: "+str(pipe.NamedPipeServerSessionId)
```

Notes: (Read only property)

181.24.32 OutputBufferSize as Integer

MBS Win Plugin, Plugin Version: 19.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The output buffer size.
Notes: (Read only property)

181.24.33 Events

181.24.34 Connected

MBS Win Plugin, Plugin Version: 19.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The connected event.
Notes: Called when pipe is connected on either client or server side.

181.24.35 DataAvailable(BytesAvailable as Integer, MessageBytesAvailable as Integer)

MBS Win Plugin, Plugin Version: 19.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The event called when new data is available.

181.24.36 PipeBroken

MBS Win Plugin, Plugin Version: 19.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The event called when pipe breaks.
Notes:

The plugin will stop calling DataAvailable handler.
You can call Close and CreatePipe method to open pipe again.

181.25 class WindowsPreviewHandlerMBS

181.25.1 class WindowsPreviewHandlerMBS

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for showing previews on windows.
Notes: This is linke a control which you can put into a window to show a preview for a file.

181.25.2 Blog Entries

- MonkeyBread Software Releases the MBS Real Studio plug-ins in version 12.3
- MBS Real Studio Plugins, version 12.3pr11
- File Previews on Windows

181.25.3 Xojo Developer Magazine

- 10.6, page 10: News

181.25.4 Methods

181.25.5 Constructor(ClassID as string)

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Initializes the object with loading the class with the given classid.
Notes: You find those ClassIDs in the registry (See example project).

181.25.6 DoPreview

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Directs the preview handler to load data from the source specified in an earlier Initialize method call, and to begin rendering to the previewer window.
Notes:

Lasterror is set.

If the previewer window has not yet been created, then it must be created after this method has been called. The preview handler is responsible for painting the area specified in SetWindow or SetRect. If these methods are called while the preview handler is rendering, the window must be reparented/resized without stopping or restarting the rendering of the item.
This method should be called only after SetWindow has been called.

Aditionally, this method should be called only after Constructor has been called.

181.25.7 InitWithData(data as MemoryBlock)

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Loads the given data.
Notes: Lasterror is set.
See also:

- 181.25.8 InitWithData(data as string) 22332

181.25.8 InitWithData(data as string)

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Loads the given data.
Notes: Lasterror is set.
See also:

- 181.25.7 InitWithData(data as MemoryBlock) 22332

181.25.9 InitWithFile(file as folderitem)

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Loads the given file.
Notes:

Lasterror is set.
If the preview handler does not support reading file, the plugin reads the file and passes as data.

181.25.10 SetBackgroundColor(red as Integer, green as Integer, blue as Integer)

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the background color of the preview handler.
Notes:

Lasterror is set.
Not all preview handlers implement this method.

181.25.11 SetFocus

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Directs the preview handler to set focus to itself.
Notes: Lasterror is set.

181.25.12 SetFont(size as Integer, font as string)

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the font attributes to be used for text within the preview handler.
Notes:

Lasterror is set.
Not all preview handlers implement this method.

181.25.13 SetRect(left as Integer, top as Integer, width as Integer, height as Integer)

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Directs the preview handler to change the area within the parent hwnd that it draws into.
Notes:

Lasterror is set.

If called before the preview handler window has been created, the new rectangle replaces the rectangle previously received in the SetWindow call.
If called after the preview handler window has been created, the preview handler window must be resized.
If the preview handler is already rendering, then the preview must be resized without interrupting the render process.

181.25.14 SetTextColor(red as Integer, green as Integer, blue as Integer)

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the color of the text within the preview handler.
Notes:

Lasterror is set.
Not all preview handlers implement this method.

181.25.15 SetWindow(win as window, left as Integer, top as Integer, width as Integer, height as Integer)

MBS Win Plugin, Plugin Version: 12.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sets the parent window of the previewer window, as well as the area within the parent to be used for the previewer window.
Notes:

Pass the window and the area for the previewer.
Lasterror is set.

The preview handler is responsible for painting the entire area. If the previewer window has been created, the preview handler must associate the previewer window to the new parent hwnd and resize the previewer window to the area defined by the rectangle. If the previewer window has not yet been created, the preview handler must remember this information for when the previewer window is created in DoPreview.
It is preferred that this information be stored prior to calling DoPreview. Doing so increases performance at setup time for any cases where the preview does not start.

181.25.16 Unload

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Directs the preview handler to cease rendering a preview and to release all resources that have been allocated based on the item passed in during the initialization.
Notes:

Lasterror is set.
When called, the preview window will be destroyed.

This method should be called only after Constructor has been called. All resources associated with this initialization will be released. Prior to calling DoPreview, this preview handler will be re-initialized with a call to one of the initialization interfaces and a call to SetWindow.

181.25.17 Properties

181.25.18 Handle as Integer

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal object reference.
Notes: (Read only property)

181.25.19 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code.
Notes: (Read and Write property)

181.25.20 LasterrorString as String

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The error message for the error number in the lasterror property.
Notes: (Read only property)

181.25.21 SupportsDataLoading as Boolean

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the preview handler supports loading data from a string or memoryblock.
Notes: (Read only property)

181.25.22 SupportsFileLoading as Boolean

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the preview handler supports loading files.
Notes:

As the plugin can also load file and pass as data if needed, this function also returns true if SupportsDataLoading is also true.
(Read only property)

181.25.23 Window as Window

MBS Win Plugin, Plugin Version: 12.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The parent window.
Notes: (Read only property)

181.26 class WindowsPropertiesMBS

181.26.1 class WindowsPropertiesMBS

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The class for window properties.
Example:

```
dim w as new WindowsPropertiesMBS(self)

dim key as string = w.EdgeGestureDisableTouchWhenFullscreen

w.Value(key) = true

dim c as integer = w.count
for i as integer = 0 to c-1
dim k as string = w.key(i)
MsgBox k+" "+w.Value(k)
next
```

181.26.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 17.5
- MBS Xojo Plugins, version 17.5pr7
- MBS Xojo Plugins, version 17.5pr6
- Disable edge touch gestures in full screen windows

181.26.3 Methods

181.26.4 Close

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Closes properties.
Notes: Same as destructor.

181.26.5 Commit

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Commits values.
Notes:

Optional as window properties are set directly.
LastError and LastErrorMessage are set.

181.26.6 Constructor(Win as Window)

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves an object that represents a specific window's collection of properties, which allows those properties to be queried or set.
Notes:

Requires Windows 7 or Windows Server 2008 R2 or newer.

An application can use this function to obtain access to a window's property store so that it can set an explicit Application User Model ID (AppUserModelID) in the System.AppUserModel.ID property.

Raises FunctionNotFoundException if function is not available, PlatformNotSupportedException if not running on Windows, NilObjectException if window is nil or invalid and UnsupportedOperationException if Window properties can't be queried.

181.26.7 Count as Integer

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Queries number of values.
Example:

```
dim w as new WindowsPropertiesMBS(self)

// show all keys with values
dim c as integer = w.count
for i as integer = 0 to c-1
dim k as string = w.key(i)
MsgBox k+" "+w.Value(k)
next
```

Notes: LastError and LastErrorMessage are set.

181.26.8 EdgeGestureDisableTouchWhenFullscreen as String

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The property name used to disable touch gesture with full screen window.

Example:

```
dim w as new WindowsPropertiesMBS(self)
dim key as string = w.EdgeGestureDisableTouchWhenFullscreen

w.Value(key) = true
```

181.26.9 Key(Index as Integer) as String

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The key with given index.
Notes:

Index from 0 to Count-1.
Keys are passed as UUID followed by property ID.
LastError and LastErrorMessage are set.

181.26.10 Values as Dictionary

MBS Win Plugin, Plugin Version: 20.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Queries all values as dictionary.
Notes: The dictionary is a copy, so changes to the dictionary are not going back to the window.

181.26.11 Properties

181.26.12 Handle as Integer

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The internal object reference.
Notes: (Read and Write property)

181.26.13 LastError as Integer

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The last error code.
Notes: (Read and Write property)

181.26.14 LastErrorMessage as String

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The last error message.
Notes: (Read and Write property)

181.26.15 Value(Key as String) as Variant

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Set or query property value.
Example:

```
dim w as new WindowsPropertiesMBS(self)

// show all keys with values
dim c as integer = w.count
for i as integer = 0 to c-1
dim k as string = w.key(i)
MsgBox k+" "+w.Value(k)
next
```

Notes:

Keys are passed as UUID followed by property ID.
LastError and LastErrorMessage are set.
(Read and Write computed property)

181.27 class WindowsScriptErrorExceptionMBS

181.27.1 class WindowsScriptErrorExceptionMBS

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The exception class raised when an error happens while executing a script.
Example:

```
dim w as new WindowsScriptMBS

w.Language = "VBScript"

w.AddCode "a = 1"
w.AddCode "b = 2"

w.AllowUI = false
w.ExecuteStatement "msgbox a+b" // shows exception with access denied

Exception e as WindowsScriptErrorExceptionMBS
MsgBox e.message
```

Notes: Subclass of the RuntimeException class.

181.27.2 Blog Entries

- Windows Scripts in REALbasic

181.28 class WindowsScriptErrorMBS

181.28.1 class WindowsScriptErrorMBS

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for error details.
Example:

```
dim w as new WindowsScriptMBS

w.Language = "JScript"

try
w.AddCode "function Test(a,b) { 1 return a+b; } " // 1 is there to make error

dim p(-1) as string = array("Hello ", "World from JavaScript")
dim x as string = w.Run("Test", p)
catch e as WindowsScriptErrorExceptionMBS
dim error as WindowsScriptErrorMBS = w.Error
MsgBox error.Description+EndOfLine+"in "+str(error.Line)+":"+str(error.Column)
end try
```

181.28.2 Properties

181.28.3 Column as Integer

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Source code column position where the error occurred.
Notes: (Read and Write property)

181.28.4 Description as String

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Friendly description of error.
Notes: (Read and Write property)

181.28.5 Line as Integer

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Source code line number where the error occurred.

Notes: (Read and Write property)

181.28.6 Number as Integer

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Error number.
Notes: (Read and Write property)

181.28.7 Source as String

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Source of the error.
Notes: (Read and Write property)

181.28.8 Text as String

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Line of source code on which the error occurred.
Notes: (Read and Write property)

181.29 class WindowsScriptMBS

181.29.1 class WindowsScriptMBS

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class to run Windows Scripts.
Example:

```
dim w as new WindowsScriptMBS

w.Language = "JScript"
w.AddCode "function Test(a,b) { return a+b; } "

dim p(-1) as string = array("Hello ", "World from JavaScript")
dim x as string = w.Run("Test", p)

MsgBox x
```

181.29.3 Methods

181.29.4 AddCode(code as string)

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Add code to the global module.
Example:

```
dim w as new WindowsScriptMBS

w.Language = "VBScript"

w.AddCode "a = 1" // define some global variables
w.AddCode "b = 2"
```

Notes: If you use VBScript, you don't need "dim" keyword for defining variables.

181.29.5 ClearError

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Clears the current error.

181.29.6 Eval(code as string) as string

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Evaluate an expression within the context of the global module.

181.29.7 ExecuteStatement(statement as string)

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Execute a statement within the context of the global module.
Example:

```
dim w as new WindowsScriptMBS

w.Language = "VBScript"

w.AddCode "a = 1"
w.AddCode "b = 2"

w.AllowUI = true
w.ExecuteStatement "msgbox a+b" // shows 3

w.AllowUI = false
w.ExecuteStatement "msgbox a+b" // shows exception with access denied

Exception e as WindowsScriptErrorExceptionMBS
MsgBox e.message
```

181.29.8 Reset

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reset the scripting engine to a newly created state.

181.29.9 Run(functionName as string, parameters() as string) as string

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Call a procedure defined in the global module.
Example:

```
dim w as new WindowsScriptMBS

// First try VBScript
w.Language = "VBScript"

dim lines(-1) as string

lines.append "Function Test(a,b)"
lines.append "Test = a+b"
lines.append "End Function"

w.AddCode Join(lines, EndOfLine.Windows)

dim p(-1) as string = array("Hello ", "World from VBScript")
dim x as string = w.Run("Test", p)

'MsgBox x

// Second try JScript
w.Language = "JScript"

redim lines(-1)
lines.append "function Test(a,b)"
lines.Append " { "
lines.append "return a+b;"
lines.append " } "

w.AddCode Join(lines, EndOfLine.Windows)

p = array("Hello ", "World from JavaScript")
x = w.Run("Test", p)
```

```
MsgBox x

Exception e as WindowsScriptErrorExceptionMBS
MsgBox "Exception: "+e.message
```

181.29.10 Properties

181.29.11 AllowUI as Boolean

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Enable or disable display of the UI.
Example:

```
dim w as new WindowsScriptMBS

w.Language = "VBScript"

w.AddCode "a = 1"
w.AddCode "b = 2"

w.AllowUI = true
w.ExecuteStatement "msgbox a+b" // shows 3

w.AllowUI = false
w.ExecuteStatement "msgbox a+b" // shows exception with access denied

Exception e as WindowsScriptErrorExceptionMBS
MsgBox e.message
```

Notes: (Read and Write property)

181.29.12 Error as WindowsScriptErrorMBS

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current error status.
Notes: (Read only property)

181.29.13 Language as String

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Language engine to use.
Example:

```
dim w as new WindowsScriptMBS

w.Language = w.kLanguageJScript

MsgBox w.Language // shows "JScript"

w.Language = w.kLanguageVBScript

MsgBox w.Language // shows "VBScript"
```

Notes:

Use kLanguageVBScript or kLanguageJScript constants.
Setting this property calls reset internally.
(Read and Write property)

181.29.14 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code.
Notes:

0 is no error. -1 is a parameter error on the plugin side. All other codes are from Windows.
(Read and Write property)

181.29.15 SitehWnd as Integer

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The window handle for the window being parent to any window the scripts create.
Example:

```
dim w as new WindowsScriptMBS
w.SitehWnd = window1.handle
```

Notes:

The window is used as the parent window for message boxes, alerts, etc.
(Read and Write property)

181.29.16 Timeout as Integer

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Length of time in milliseconds that a script can execute before being considered hung.
Notes: (Read and Write property)

181.29.17 UseSafeSubset as Boolean

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Force script to execute in safe mode and disallow potentially harmful actions.
Notes: (Read and Write property)

181.29.18 Constants

181.29.19 kLanguageJScript = "JScript"

MBS Win Plugin, Plugin Version: 10.0. **Function:** One of the language constants.
Notes: Using this constant you can switch to JavaScript.

181.29.20 kLanguageVBScript = "VBScript"

MBS Win Plugin, Plugin Version: 10.0. **Function:** One of the language constants.
Notes: Using this constant you can switch to VBScript.

181.30 class WindowsSerialPortsMBS

181.30.1 class WindowsSerialPortsMBS

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This is a class to query the serial ports on a Windows system.
Notes: This class was created in response to feedback report 8212: Serial Port Hangup on Windows.

181.30.2 Blog Entries

181.30.3 Methods

181.30.4 Constructor(OnlyPresent as boolean = true)

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor which builds the list of devices.

181.30.5 Description(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The description of this serial port.

181.30.6 DevicePath(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device path of this serial port.

181.30.7 FriendlyName(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The display name of this serial port.

181.30.8 Location(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The location of this serial port.

181.30.9 QueryComDevices as String()

MBS Win Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries list of DOS COM Port names.
Notes:

While Constructor builds a list based on registry information (setup database), this function will use QueryDosDevice to ask Windows about device names for DOS starting with COM in their name and return the list.

Returns nil in case of failure.

181.30.10 Properties

181.30.11 Count as Integer

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of serial ports found.
Notes: (Read and Write property)

181.31 class WindowsTaskbarListMBS

181.31.1 class WindowsTaskbarListMBS

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class for windows with methods that control the taskbar.
Notes: It allows you to dynamically add, remove, and activate items on the taskbar.

181.31.2 Blog Entries

- Show progress in task bar on Windows
- SetProgressState on Windows
- MBS REALbasic plug-ins version 10.2

181.31.3 Methods

181.31.4 ActivateTab(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Activates an item on the taskbar.
Notes:

The window is not actually activated; the window's item on the taskbar is merely displayed as active.
Lasterror is set.

181.31.5 AddTab(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Adds an item to the taskbar.
Notes:

Any type of window can be added to the taskbar, but it is recommended that the window at least have the WS_CAPTION style.

Any window added with this method must be removed with the DeleteTab method when the added window is destroyed.

Lasterror is set.

181.31.6 DeleteTab(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Deletes an item from the taskbar.

181.31.7 MarkFullscreenWindow(WindowHandle as Integer, Fullscreen as Boolean)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Marks a window as full-screen.
Notes:

Fullscreen: A Boolean value marking the desired full-screen status of the window.

Setting the value of fFullscreen to TRUE, the Shell treats this window as a full-screen window, and the taskbar is moved to the bottom of the z-order when this window is active. Setting the value of fFullscreen to FALSE removes the full-screen marking, but does not cause the Shell to treat the window as though it were definitely not full-screen. With a FALSEfFullscreen value, the Shell depends on its automatic detection facility to specify how the window should be treated, possibly still flagging the window as full-screen.

Requires Windows XP or Windows Server 2003 or newer.
Lasterror is set.

181.31.8 RegisterTab(TabWindowHandle as Integer, MDIWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Informs the taskbar that a new tab or document thumbnail has been provided for display in an application's taskbar group flyout.
Notes:

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.
By itself, registering a tab thumbnail alone will not result in its being displayed. You must also call SetTabOrder to instruct the group where to display it.

181.31.9 SetActiveAlt(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Marks a taskbar item as active but does not visually activate it.
Notes: SetActiveAlt marks the item associated with hwnd as the currently active item for the window's process without changing the pressed state of any item. Any user action that would activate a different tab

in that process will activate the tab associated with hwnd instead. The active state of the window's item is not guaranteed to be preserved when the process associated with this window is not active. To ensure that a given tab is always active, call SetActiveAlt whenever any of your windows are activated. Calling SetActiveAlt with a nil window handle clears this state.

181.31.10 SetOverlayIcon(TabWindowHandle as Integer, IconHandle as Integer, Description as string)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Applies an overlay to a taskbar button to indicate application status or a notification to the user.
Notes:

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

TabWindowHandle:
The handle of the window whose associated taskbar button receives the overlay. This handle must belong to a calling process associated with the button's application and must be a valid HWND or the call is ignored.

IconHandle:
The handle of an icon to use as the overlay. This should be a small icon, measuring 16x16 pixels at 96 dpi. If an overlay icon is already applied to the taskbar button, that existing overlay is replaced.

This value can be 0. How a 0 value is handled depends on whether the taskbar button represents a single window or a group of windows.

- If the taskbar button represents a single window, the overlay icon is removed from the display.
- If the taskbar button represents a group of windows and a previous overlay is still available (received earlier than the current overlay, but not yet freed by a 0 value), then that previous overlay is displayed in place of the current overlay.

It is the responsibility of the calling application to free hIcon when it is no longer needed. This can generally be done after you've called SetOverlayIcon because the taskbar makes and uses its own copy of the icon.

Description:
A string that provides an alt text version of the information conveyed by the overlay, for accessibility purposes.

In versions of Windows earlier than Windows 7, applications often used icons in the notification area of the taskbar to display application status and notifications to the user. The Windows 7 taskbar allows an application to provide that same sort of user feedback through its taskbar button, centralizing more of the application information in one place. These overlays are similar to existing overlays used for shortcut icons

or security notifications, displayed at the lower-right corner of the button.

The following illustration shows an overlay (the small, green square that indicates the user status as "Available") applied to the far-right taskbar button.

Windows Messenger taskbar button with an overlay to indicate an Available status.

Icon overlays serve as a contextual notification of status, and are intended to negate the need for a separate notification area status icon to communicate that information to the user. The application designer must decide during the development cycle which method—icon overlay or notification area status icon—best serves that application. Overlay icons are intended to supply important, long-standing status or notifications such as network status, messenger status, or new mail. They should not be frequently changed, nor should they be animated.

To display an overlay icon, the taskbar must be in the default large icon mode. If the taskbar is configured through Taskbar and Start Menu Properties to show small icons, overlays cannot be applied and calls to this method are ignored.

Because a single overlay is applied to the taskbar button instead of to the individual window thumbnails, this is a per-group feature rather than per-window. Requests for overlay icons can be received from individual windows in a taskbar group, but they do not queue. The last overlay received is the overlay shown. If the last overlay received is removed, the overlay that it replaced is restored so long as it is still active. As an example, windows 1, 2, and 3 set, in order, overlays A, B, and C. Because overlay C was received last, it is shown on the taskbar button. Window 2 calls SetOverlayIcon with a 0 value to remove overlay B. Window 3 then does the same to remove overlay C. Because window 1's overlay A is still active, that overlay is then displayed on the taskbar button.

If Windows Explorer shuts down unexpectedly, overlays are not restored when Windows Explorer is restored. The application should wait to receive the TaskbarButtonCreated message that indicates that Windows Explorer has restarted and the taskbar button has been re-created, and then call SetOverlayIcon again to reapply the overlay.

181.31.11 SetProgressState(WindowHandle as Integer, Flags as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the type and state of the progress indicator displayed on a taskbar button.
Notes:

Use the ProgressStateFlag* constants. Flags that control the current state of the progress button. Specify only one of the following flags; all states are mutually exclusive of all others.

Requires Windows 7 or Windows Server 2008 R2 or newer.

Lasterror is set.

Progress bar information is not shown in high contrast color schemes to guarantee that no accessibility needs are compromised.

Developers accustomed to the existing progress bar control should find the taskbar button progress indicator to be a similar experience both in concept and visuals. Here, the taskbar button itself becomes a progress bar. A taskbar button's progress indicator should be a reflection of a more detailed progress bar in the associated window. This allows the user to see specifics, such as the percentage number and the amount of time remaining, that cannot be shown in a taskbar button. Also, because a taskbar button can show the progress of only a single window in a group, it allows the user to check the progress of individual windows. It also provides progress information to the user when the taskbar button cannot, such as in a high-contrast color scheme.

Note that a taskbar button progress bar is not intended for use with normally peripheral actions such as the loading of a Web page or the printing of a document. That type of progress should continue to be shown in a window's status bar.

The progress indicator is displayed between the taskbar button's icon or text and the background. If progress is shown for both the active taskbar button and an inactive button, shading in the respective progress bars is such that the active button is still obvious to the user. Also, button functionality such as the display of thumbnails continues to work normally when the button is being used to display progress.

When exiting an error or paused state, call this method again with the ProgressStateFlagNormal or ProgressStateFlagIndeterminate flag to continue in the original state or TBPF_NOPROGRESS if the operation is cancelled.

How the Taskbar Button Chooses the Progress Indicator for a Group

The taskbar button can show a progress indicator for only one window at a time. This includes the situation where the taskbar button represents a group and more than one window in that group is broadcasting progress information. In that case, the taskbar button chooses its progress display based on state priority. State priority is shown in the following table with priority 1 being the highest.

Priority	State
1	ProgressStateFlagError
2	ProgressStateFlagPaused
3	ProgressStateFlagNormal
4	ProgressStateFlagIndeterminate

Changing a window's state changes its priority in relation to other windows in the group which in turn might

change which window in a group is used for the progress indicator in the taskbar button.

In the case of a priority collision between two windows that are broadcasting determinate progress, the window with the least progress is used.

Based on this priority, the indeterminate progress indicator can be displayed in the taskbar button only in these cases:

- The taskbar button does not represent a group and the single window that it represents has set ProgressStateFlagIndeterminate.
- The taskbar button represents a group, only one window in that group is broadcasting progress information, and that window has set ProgressStateFlagIndeterminate.
- The taskbar button represents a group, multiple windows in that group are broadcasting progress information, and all of those windows have set ProgressStateFlagIndeterminate.

A determinate progress indicator can be displayed in these cases:

- The taskbar button does not represent a group and the single window that it represents is broadcasting determinate progress information.
- The taskbar button represents a group, only one window in that group is broadcasting progress information, and that window is broadcasting determinate progress information.
- The taskbar button represents a group, multiple windows in that group are broadcasting progress information, at least one of those windows is broadcasting determinate progress information, and no window has set ProgressStateFlagError or ProgressStateFlagPaused.

Note that a call to SetProgressValue will switch a progress indicator currently in an indeterminate mode (ProgressStateFlagIndeterminate) to a normal (determinate) display and clear the ProgressStateFlagIndeterminate flag.

181.31.12 SetProgressValue(WindowHandle as Integer, Completed as UInt64, Total as UInt64)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Displays or updates a progress bar hosted in a taskbar button to show the specific percentage completed of the full operation.
Notes:

Completed: An application-defined value that indicates the proportion of the operation that has been completed at the time the method is called.

Total: An application-defined value that specifies the value ullCompleted will have when the operation is complete.

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

Determinate Progress Bar Lifecycle

An application first calls SetProgressValue to begin the display of a determinate progress bar, and then calls it again as needed to update the bar as the progress changes. When progress is complete, the application must call SetProgressState with the TBPF_NOPROGRESS flag to dismiss the progress bar.

How the Taskbar Button Chooses the Progress Indicator for a Group

The taskbar button can show a progress indicator for only one window at a time. When the taskbar button represents a group and more than one of the windows in that group are broadcasting progress information, the taskbar button chooses its progress display based on the following state priority.

Priority	State
1	ProgressStateFlagError
2	ProgressStateFlagPaused
3	ProgressStateFlagNormal
4	ProgressStateFlagIndeterminate

Unless SetProgressState has set a blocking state (ProgressStateFlagError or ProgressStateFlagPaused) for the window, a call to SetProgressValue assumes the ProgressStateFlagNormal state even if it is not explicitly set. A call to SetProgressValue overrides and clears the ProgressStateFlagIndeterminate state.

In the case of a priority collision where two windows are broadcasting determinate progress, the window with the least progress is used.

Based on that priority, this determinate (specific percentage) progress indicator can be displayed in these cases:

- The taskbar button does not represent a group and the single window that it represents is broadcasting determinate progress information through this method.
- The taskbar button represents a group, only one window in that group is broadcasting progress information, and that window is broadcasting determinate progress information through this method.

- The taskbar button represents a group, multiple windows in that group are broadcasting progress information, at least one of those windows is broadcasting progress information through this method, and none of those windows has set the ProgressStateFlagError or ProgressStateFlagPaused state.

If a window in the group has set ProgressStateFlagError or ProgressStateFlagPaused, that state will be used for the button display. However, you can still make calls to SetProgressValue on other, unblocked windows in the group to update their progress in the background.

181.31.13 SetTabActive(TabWindowHandle as Integer, MDIWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Informs the taskbar that a tab or document window has been made the active window.
Notes:

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

TabWindowHandle: Handle of the active tab window. This handle must already be registered through RegisterTab. This value can be 0 if no tab is active.

MDIWindowHandle: Handle of the application's main window. This value tells the taskbar which group the thumbnail is a member of. This value is required and cannot be 0.

181.31.14 SetTabOrder(TabWindowHandle as Integer, InsertBeforeWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Inserts a new thumbnail into a tabbed-document interface (TDI) or multiple-document interface (MDI) application's group flyout or moves an existing thumbnail to a new position in the application's group.
Notes:

TabWindowHandle: The handle of the tab window whose thumbnail is being placed. This value is required, must already be registered through RegisterTab, and cannot be 0.
InsertBeforeWindowHandle: The handle of the tab window whose thumbnail that hwndTab is inserted to the left of. This handle must already be registered through RegisterTab. If this value is 0, the new thumbnail is added to the end of the list.

181.31.15 SetTabProperties(TabWindowHandle as Integer, flags as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Allows a tab to specify whether the main application frame window or the tab window should be used as a thumbnail or in the peek feature under certain circumstances.
Notes:

An application might want to use the thumbnail or peek representation of its associated parent window if the application cannot generate its own thumbnail for a tab or for its active tab content (such as an animation) to appear live.

flags: One of the TabPropertyFlag* constants.
Available on Windows 7 or Windows Server 2008 R2 or newer.

181.31.16 SetThumbnailClip(TabWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Selects a portion of a window's client area to display as that window's thumbnail in the taskbar.
Notes:

This variant of the method clears the clip that is already in place and return to the default display of the thumbnail.

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.
See also:

- 181.31.17 SetThumbnailClip(TabWindowHandle as Integer, x as Integer, y as Integer, w as Integer, h as Integer) 22359

181.31.17 SetThumbnailClip(TabWindowHandle as Integer, x as Integer, y as Integer, w as Integer, h as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Selects a portion of a window's client area to display as that window's thumbnail in the taskbar.
Notes:

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.
See also:

- 181.31.16 SetThumbnailClip(TabWindowHandle as Integer) 22359

181.31.18 SetThumbnailTooltip(TabWindowHandle as Integer, tip as string)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies or updates the text of the tooltip that is displayed when the mouse pointer rests on an individual preview thumbnail in a taskbar button flyout.
Notes:

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

TabWindowHandle: The handle to the window whose thumbnail displays the tooltip. This handle must belong to the calling process.

tip: The text to be displayed in the tooltip. This value can be empty, in which case the title of the window specified by WindowHandle is used as the tooltip.

181.31.19 UnregisterTab(TabWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Removes a thumbnail from an application's preview group when that tab or document is closed in the application.
Notes:

It is the responsibility of the calling application to free hwndTab through DestroyWindow. UnregisterTab must be called before the handle is freed.
Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

181.31.20 Properties

181.31.21 Handle1 as Integer

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference for the ITaskbarList interface.
Notes:

The ITaskbarList interface is available on Windows 2000 Professional, Windows XP or Windows 2000 Server or newer.
(Read and Write property)

181.31.22 Handle2 as Integer

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference for the ITaskbarList2 interface.
Notes:

The ITaskbarList4 interface is available on Windows XP or Windows Server 2003 or newer.
(Read and Write property)

181.31.23 Handle3 as Integer

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference for the ITaskbarList3 interface.
Notes:

The ITaskbarList3 interface is available on Windows 7 or Windows Server 2008 R2 or newer.
none
(Read and Write property)

181.31.24 Handle4 as Integer

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference for the ITaskbarList4 interface.
Notes:

The ITaskbarList4 interface is available on Windows 7 or Windows Server 2008 R2 or newer.
(Read and Write property)

181.31.25 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code from one of the methods.
Notes: (Read and Write property)

181.31.26 Constants

181.31.27 ProgressStateFlagError = 4

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the progress state flag constants.
Notes: The progress indicator turns red to show that an error has occurred in one of the windows that is

broadcasting progress. This is a determinate state. If the progress indicator is in the indeterminate state, it switches to a red determinate display of a generic percentage not indicative of actual progress.

181.31.28 ProgressStateFlagIndeterminate = 1

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the progress state flag constants.
Notes: The progress indicator does not grow in size, but cycles repeatedly along the length of the taskbar button. This indicates activity without specifying what proportion of the progress is complete. Progress is taking place, but there is no prediction as to how long the operation will take.

181.31.29 ProgressStateFlagNoProgress = 0

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the progress state flag constants.
Notes: Stops displaying progress and returns the button to its normal state. Call this method with this flag to dismiss the progress bar when the operation is complete or cancelled.

181.31.30 ProgressStateFlagNormal = 2

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the progress state flag constants.
Notes: The progress indicator grows in size from left to right in proportion to the estimated amount of the operation completed. This is a determinate progress indicator; a prediction is being made as to the duration of the operation.

181.31.31 ProgressStateFlagPaused = 8

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the progress state flag constants.
Notes: he progress indicator turns yellow to show that progress is currently stopped in one of the windows but can be resumed by the user. No error condition exists and nothing is preventing the progress from continuing. This is a determinate state. If the progress indicator is in the indeterminate state, it switches to a yellow determinate display of a generic percentage not indicative of actual progress.

181.31.32 TabPropertyFlagNone = 0

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the flag values you can use with SetTabProperties.
Notes: No specific property values are specified. The default behavior is used: the tab window provides a thumbnail and peek image, either live or static as appropriate.

181.31.33 TabPropertyFlagUseAppPeekAlways = 4

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the flag values you can use with SetTabProperties.
Notes: Always use the peek image provided by the main application frame window rather than a peek image provided by the individual tab window. Do not combine this value with TabPropertyFlagUseAppPeekWhenActive; doing so will result in an error.

181.31.34 TabPropertyFlagUseAppPeekWhenActive = 8

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the flag values you can use with SetTabProperties.
Notes: When the application tab is active and a live representation of its window is available, show the main application frame in the peek feature. At other times, use the tab window. Do not combine this value with TabPropertyFlagUseAppPeekAlways; doing so will result in an error.

181.31.35 TabPropertyFlagUseAppThumbnailAlways = 1

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the flag values you can use with SetTabProperties.
Notes: Always use the thumbnail provided by the main application frame window rather than a thumbnail provided by the individual tab window. Do not combine this value with TabPropertyFlagUseAppThumbnailWhenActive; doing so will result in an error.

181.31.36 TabPropertyFlagUseAppThumbnailWhenActive = 2

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the flag values you can use with SetTabProperties.
Notes: When the application tab is active and a live representation of its window is available, use the main application frame window thumbnail. At other times, use the tab window thumbnail. Do not combine this value with TabPropertyFlagUseAppThumbnailAlways; doing so will result in an error.

181.32 class WindowsVerticalBlankMBS

181.32.1 class WindowsVerticalBlankMBS

MBS ComputerControl Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.
Function: A class for checking on Windows with the retrace of the display.
Notes: Sometimes you may want to draw only if the device is currently not touching the video memory.

181.32.2 Blog Entries

- MBS Real Studio Plugins, version 12.3pr10

181.32.3 Methods

181.32.4 Constructor

MBS ComputerControl Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.
Function: Initializes the class.

181.32.5 GetMonitorFrequency as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.
Function: Retrieves the frequency of the monitor that the DirectDraw object controls.
Notes:

Returns the monitor frequency, in Hz.
Lasterror is set.

181.32.6 GetScanLine as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.
Function: This method retrieves the scan line that is currently being drawn on the monitor.
Notes:

To synchronize with the vertical blank, use the WaitForVerticalBlank method.
Lasterror is set.

Scan lines are reported as zero-based integers.
The returned scan line value is between 0 and n, where scan line 0 is the first visible scan line on the screen and n is the last visible scan line, plus scan lines that occur during the vertical blank period.

So, in a case where an application is running at 640x480, and there are 12 scan lines during the vertical blank period, the values returned by this method will range from 0 to 491.

181.32.7 GetVerticalBlankStatus as boolean

MBS ComputerControl Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.
Function: Retrieves the status of the vertical blank.
Notes:

Returns the status of the vertical blank. True if a vertical blank is occurring, and false otherwise.
Lasterror is set.

181.32.8 WaitForVerticalBlankBegin

MBS ComputerControl Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.
Function: Helps the application synchronize itself with the vertical-blank interval.
Notes:

WaitForVerticalBlank returns when the vertical-blank interval begins.
Lasterror is set.

181.32.9 WaitForVerticalBlankEnd

MBS ComputerControl Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.
Function: Helps the application synchronize itself with the vertical-blank interval.
Notes:

WaitForVerticalBlank returns when the vertical-blank interval ends and the display begins.
Lasterror is set.

181.32.10 Properties

181.32.11 Available as Boolean

MBS ComputerControl Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.
Function: Whether this class will work.
Notes: (Read and Write property)

181.32.12 Lasterror as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.
Function: The last windows error string.
Notes: (Read and Write property)

181.32.13 LasterrorString as String

MBS ComputerControl Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.
Function: The last windows error string.
Notes: (Read only property)

181.33 class WindowsWMIMBS

181.33.1 class WindowsWMIMBS

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to run queries in the Windows Management Interface.
Example:

```
dim w as WindowsWMIMBS

w=new WindowsWMIMBS

if w.ConnectServer("root\cimv2") then
MsgBox "ConnectServer: ok"

if w.query("WQL","SELECT * FROM Win32_Processor") then
MsgBox "query: ok"

if w.NextItem then
MsgBox "NextItem: ok"

MsgBox w.GetPropertyString("Name") // string
MsgBox str(w.GetPropertyInteger("MaxClockSpeed")) // uint32
MsgBox str(w.GetPropertyInteger("ProcessorType")) // uint16

else
MsgBox "NextItem: fail"
end if
else
MsgBox "query: fail"
end if

else
MsgBox "ConnectServer: fail"
end if
```

Notes:

In Windows 8.1 it looks like WindowsWMIMBS.InitSecurity(false) must be called at app.open time as Xojo will do some things in background when opening first window which block our queries.
Subclass of the WMIObjectMBS class.

181.33.2 Blog Entries

- Windows Task Monitor written in Xojo

- MBS Real Studio Plugins, version 12.2pr6
- Detecting drive letter for an USB Stick
- MBS Releases the MBS Real Studio plug-ins in version 12.0
- MBS Real Studio Plugins, version 11.4pr1
- MBS REALbasic Plugins, version 10.4pr13

181.33.3 Methods

181.33.4 CancelAsyncCall as boolean

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Stops events being delivered to this WindowsWMIMBS object.
Notes: Lasterror is set.

181.33.5 ConnectServer(NetworkResource as string, Username as string="", Password as string="", Locale as string="", Authority as string="") as boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Connect to WMI server.
Example:

```
dim w as WindowsWMIMBS // your WMI object
call w.ConnectServer("root\cimv2")
```

Notes:

Returns true on success and false on failure.
Authority parameter added in plugin version 12.2.

181.33.6 Constructor

MBS Win Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor.

181.33.7 ExecNotificationQueryAsync(QueryLanguage as string, QueryText as string) as boolean

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The ExecNotificationQueryAsync method executes a query to receive events.
Notes:

The plugin receives events and enqueues them in a queue. You read objects from this queue in a timer and process them.
NextItem returns nil if the queue is empty.

Returns true on success and false on failure.
Lasterror is set. e.g. & h80041018 if you have syntax error in the query or & h80041058 if the query can't be parsed.

181.33.8 InitAuthentication(User as string, Domain as string, Password as string) as boolean

MBS Win Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Initializes authentication data.
Notes:

Call before ConnectServer.
This settings are passed to objects for authentication.

181.33.9 InitSecurity(AuthnLevel as Integer, ImpLevel as Integer) as boolean

MBS Win Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Registers security and sets the default security values for the process.
Notes:

You can call this method before creating WindowsWMIMBS object, you can prepare security settings for remote connections.

AuthnLevel:
The default authentication level for the process. Both servers and clients use this parameter when they call CoInitializeSecurity. COM will fail calls that arrive with a lower authentication level. By default, all proxies will use at least this authentication level. This value should contain one of the authentication level constants. By default, all calls to IUnknown are made at this level.

ImpLevel:
The default impersonation level for proxies. The value of this parameter is used only when the process is a client. It should be a value from the impersonation level constants, except for kImpersonationLevelDefault,

which is not for use with CoInitializeSecurity.
Outgoing calls from the client always use the impersonation level as specified. (It is not negotiated.) Incoming calls to the client can be at any impersonation level. By default, all IUnknown calls are made with this impersonation level, so even security-aware applications should set this level carefully. To determine which impersonation levels each authentication service supports, see the description of the authentication services in COM and Security Packages. For more information about impersonation levels, see Impersonation.
See also:

- 181.33.10 InitSecurity(remote as boolean) as boolean 22370

181.33.10 InitSecurity(remote as boolean) as boolean

MBS Win Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Initializes security.
Notes:

You can call this method before creating WindowsWMIMBS object, you can prepare security settings for remote connections.

Calling InitSecurity with remote=true will initialize security with kImpersonationLevelImpersonate. If remote=false, we use kImpersonationLevelIdentity which is the default.
See also:

- 181.33.9 InitSecurity(AuthnLevel as Integer, ImpLevel as Integer) as boolean 22369

181.33.11 NextItem as boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Moves to next item in the list.
Notes:

You need to call this at least once to move to the first item.
Returns false if no more items are there.

181.33.12 Query(QueryLanguage as string, QueryText as string) as boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Runs a query.
Example:

```
dim w as WindowsWMIMBS
call w.query("WQL","SELECT * FROM Win32_Processor")
```

Notes: Returns true on success and false on failure.

181.33.13 Properties

181.33.14 EnumeratorHandle as Integer

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle to the used IEnumWbemClassObject object.
Notes: (Read only property)

181.33.15 LocatorHandle as Integer

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle to the used IWbemLocator object.
Notes: (Read only property)

181.33.16 ServiceHandle as Integer

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle to the used IWbemServices object.
Notes: (Read only property)

181.33.17 Constants

181.33.18 kAuthenticationLevelCall = 3

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the authentication level constants.
Notes: Authenticates only at the beginning of each remote procedure call when the server receives the request. Datagram transports use kAuthenticationLevelPaket instead.

181.33.19 kAuthenticationLevelConnect = 2

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the authentication level constants.
Notes: Authenticates the credentials of the client only when the client establishes a relationship with the server. Datagram transports always use kAuthenticationLevelPacket instead.

181.33.20 kAuthenticationLevelDefault = 0

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the authentication level constants.
Notes: Tells DCOM to choose the authentication level using its normal security blanket negotiation algorithm. For more information, see Security Blanket Negotiation.

181.33.21 kAuthenticationLevelNone = 1

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the authentication level constants.
Notes: Performs no authentication.

181.33.22 kAuthenticationLevelPacket = 4

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the authentication level constants.
Notes: Authenticates that all data received is from the expected client.

181.33.23 kAuthenticationLevelPacketIntegrity = 5

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the authentication level constants.
Notes: Authenticates and verifies that none of the data transferred between client and server has been modified.

181.33.24 kAuthenticationLevelPacketPrivacy = 6

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the authentication level constants.
Notes: Authenticates all previous levels and encrypts the argument value of each remote procedure call.

181.33.25 kImpersonationLevelAnonymous = 1

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the impersonation level constants.
Notes: The client is anonymous to the server. The server process can impersonate the client, but the impersonation token will not contain any information and cannot be used.

181.33.26 kImpersonationLevelDefault = 0

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the impersonation level constants.
Notes: DCOM can choose the impersonation level using its normal security blanket negotiation algorithm. For more information, see Security Blanket Negotiation.

181.33.27 kImpersonationLevelDelegate = 4

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the impersonation level constants.
Notes: The server process can impersonate the client's security context while acting on behalf of the client. The server process can also make outgoing calls to other servers while acting on behalf of the client, using cloaking. The server may use the client's security context on other machines to access local and remote resources as the client. When impersonating at this level, the impersonation token can be passed across any number of computer boundaries.

181.33.28 kImpersonationLevelIdentity = 2

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the impersonation level constants.
Notes: The server can obtain the client's identity. The server can impersonate the client for ACL checking, but it cannot access system objects as the client.

181.33.29 kImpersonationLevelImpersonate = 3

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the impersonation level constants.
Notes: The server process can impersonate the client's security context while acting on behalf of the client. This level of impersonation can be used to access local resources such as files. When impersonating at this level, the impersonation token can only be passed across one machine boundary. The Schannel authentication service only supports this level of impersonation.

181.34 class WinExceptionMBS

181.34.1 class WinExceptionMBS

MBS Win Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class to catch windows system exceptions.
Notes:

This class was made to intercept crashes in a Xojo application.
Whenever the application crashes, this class will fire its event so you have a chance to report that crash to your user and maybe save a crash report.

Do not try to save data as this could overwrite good data with bad data. Remember your application already crashed. Maybe because of data corruption!

Only one instance can exist in your application.

181.34.2 Methods

181.34.3 Close

MBS Win Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Removes the exception handler from the system.

181.34.4 Properties

181.34.5 ExceptionAddress as Integer

MBS Win Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The address in memory where the exception was raised.
Notes: (Read only property)

181.34.6 ExceptionCode as Integer

MBS Win Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The code of this exception.
Notes:

Normally one of the kException* constants.
(Read only property)

181.34.7 ExceptionFlags as Integer

MBS Win Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The exception flags.
Notes: (Read only property)

181.34.8 ExceptionIsNonContinuable as Boolean

MBS Win Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this exception allows to continue in code.
Notes:

For example a division by zero can be continued.
(Read only property)

181.34.9 ExceptionName as String

MBS Win Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The name of the exception.
Notes:

If ExceptionCode=kExceptionAccessViolation then returns "ExceptionAccessViolation".

This is a convenience function which you can use to show the exception to the user.
(Read only property)

181.34.10 Events

181.34.11 GotException() as Integer

MBS Win Plugin, Plugin Version: 8.7, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The event called when an exception was received.
Notes:

Your application has crashed on this point, but instead of seeing the Microsoft dialog to tell you that the application crashed, your application has the chance to report that problem.

Return one of the following constants: kExecuteHandler, kContinueCode, kNextHandler, kExecuteHandlerNoDialog.

The plugin already removed the crash callback from the system so if the code in this event crashes again, the system dialog shows.

181.34.12 Constants

181.34.13 kContinueCode = 2

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants you can use for the GotException event return value.
Notes: This one is not recommented as it can raise the same exception again or crash your application.

181.34.14 kExceptionAccessViolation = & hC0000005

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: The thread attempts to read from or write to a virtual address for which it does not have access.

181.34.15 kExceptionArrayBoundsExceeded = & hC000008C

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: The thread attempts to access an array element that is out of bounds, and the underlying hardware supports bounds checking.

181.34.16 kExceptionBreakPoint = & h80000003

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: A breakpoint is encountered.

181.34.17 kExceptionDataTypeMisalignment = & h80000002

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: The thread attempts to read or write data that is misaligned on hardware that does not provide alignment. For example, 16-bit values must be aligned on 2-byte boundaries, 32-bit values on 4-byte boundaries, and so on.

181.34.18 kExceptionFloatDenormalOperand = & hC000008D

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: One of the operands in a floating point operation is denormal. A denormal value is one that is too small to represent as a standard floating point value.

181.34.19 kExceptionFloatDivideByZero = & hC000008E

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: The thread attempts to divide a floating point value by a floating point divisor of 0 (zero).

181.34.20 kExceptionFloatInexactResult = & hC000008F

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: The result of a floating point operation cannot be represented exactly as a decimal fraction.

181.34.21 kExceptionFloatInvalidOperation = & hC0000090

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: A floating point exception that is not included in this list.

181.34.22 kExceptionFloatOverflow = & hC0000091

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: The exponent of a floating point operation is greater than the magnitude allowed by the corresponding type.

181.34.23 kExceptionFloatStackCheck = & hC0000092

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: The stack has overflowed or underflowed, because of a floating point operation.

181.34.24 kExceptionFloatUnderflow = & hC0000093

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: The exponent of a floating point operation is less than the magnitude allowed by the corresponding

type.

181.34.25 kExceptionIllegalInstruction = & hC000001D

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: The thread tries to execute an invalid instruction.

181.34.26 kExceptionInPageError = & hC0000006

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: The thread tries to access a page that is not present, and the system is unable to load the page. For example, this exception might occur if a network connection is lost while running a program over a network.

181.34.27 kExceptionIntegerDivideByZero = & hC0000094

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: The thread attempts to divide an integer value by an integer divisor of 0 (zero).

181.34.28 kExceptionIntegerOverflow = & hC0000095

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: The result of an integer operation causes a carry out of the most significant bit of the result.

181.34.29 kExceptionInvalidDisposition = & hC0000026

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: An exception handler returns an invalid disposition to the exception dispatcher. Programmers using a high-level language such as C should never encounter this exception.

181.34.30 kExceptionNonContinueableException = & hC0000025

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: The thread attempts to continue execution after a non-continuable exception occurs.

181.34.31 kExceptionPrivilegedInstruction = & hC0000096

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: The thread attempts to execute an instruction with an operation that is not allowed in the current computer mode.

181.34.32 kExceptionSingleStep = & h80000004

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: A trace trap or other single instruction mechanism signals that one instruction is executed.

181.34.33 kExceptionStackOverflow = & hC00000FD

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.
Notes: The thread uses up its stack.

181.34.34 kExecuteHandler = 1

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants you can use for the GotException event return value.
Notes:

Windows will execute the default handler for this exception.
This can show a Windows error dialog.

181.34.35 kExecuteHandlerNoDialog = 4

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants you can use for the GotException event return value.
Notes: Windows will execute the default handler for this exception, but not show a dialog.

181.34.36 kNextHandler = 3

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants you can use for the GotException event return value.
Notes: Windows will call the next exception handler.

181.35 class WinGestureConfigMBS

181.35.1 class WinGestureConfigMBS

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** ets and sets the configuration for enabling gesture messages and the type of this configuration.
Example:

```
// make a config for accepting pan/rotate gestures
dim c1 as new WinGestureConfigMBS

c1.ID = c1.kGestureIDPan
c1.Want = c1.kPan
c1.Block = 0

dim c2 as new WinGestureConfigMBS
c2.ID = c2.kGestureIDRotate
c2.Want = c2.kRotate
c2.Block = 0

dim configs() as WinGestureConfigMBS
configs.Append c1
configs.Append c2

// and add to window
if WinPointerEventsMBS.SetGestureConfig(window1, configs) then
MsgBox "OK"
end if
```

Notes:

It is impossible to disable two-finger panning and keep single finger panning. You must set the want bits for GC_PAN before you can set them for GC_PAN_WITH_SINGLE_FINGER_HORIZONTALLY or GC_PAN_WITH_SINGLE_FINGER_VERTICALLY.
An inertia vector is included in the GID_PAN message with the GF_END flag if inertia was disabled by a call to SetGestureConfig.
When you pass this structure, the dwID member contains information for a set of gestures. This determines what the other flags will mean. If you set flags for pan messages, they will be different from those flags that are set for rotation messages.
The following table indicates the various identifiers for gestures that are supported by the dwID member of the GESTURECONFIG structure. Note that setting dwID to 0 indicates that global gesture configuration flags are set.

The following flags are used when dwID is set to 0.

Name	Value	Description
GID_ZOOM	3	Indicates configuration settings for the zoom gesture.
GID_PAN	4	Indicates the pan gesture.
GID_ROTATE	5	Indicates the rotation gesture.
GID_TWOFINGERTAP	6	Indicates the two-finger tap gesture.
GID_PRESSANDTAP	7	Indicates the press and tap gesture.

Name	Value	Description
GC_ALLGESTURES	0x00000001	Indicates all of the gestures.

The following flags are used when dwID is set to GID_ZOOM.

Name	Value	Description
GC_ZOOM	0x00000001	Indicates the zoom gesture.

The following flags are used when dwID is set to GID_PAN.

Note Setting the GID_PAN flags in SetGestureConfig will affect the default gesture handler for panning. You should not have both dwWant and dwBlock set for the same flags; this will result in unexpected behavior. See Windows Touch Gestures for more information on panning and legacy panning support; see SetGestureConfig for examples of enabling and blocking gestures.

The following flags are used when dwID is set to GID_ROTATE.

The following flags are used when dwID is set to GID_TWOFINGERTAP.

The following flags are used when dwID is set to GID_PRESSANDTAP.

181.35.2 Blog Entries

- Windows Touch Events

181.35.3 Properties

181.35.4 Block as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The messages to disable.
Example:

Name	Value	Description
GC_PAN	0x00000001	Indicates all pan gestures.
GC_PAN_WITH_SINGLE_FINGER_VERTICALLY	0x00000002	Indicates vertical pans with one finger.
GC_PAN_WITH_SINGLE_FINGER_HORIZONTALLY	0x00000004	Indicates horizontal pans with one finger.
GC_PAN_WITH_GUTTER	0x00000008	Limits perpendicular movement to primary direction until a threshold is reached to break out of the gutter.
GC_PAN_WITH_INERTIA	0x00000010	Indicates panning with inertia to smoothly slow when pan gestures stop.

Name	Value	Description
GC_ROTATE	0x00000001	Indicates the rotation gesture.

```
// make a config for accepting some pan gestures
dim c as new WinGestureConfigMBS

c.ID = kGestureIDPan
c.Want = c.kPanWithSingleFingerVertically + c.kPanWithGutter + c.kPanWithInteria
c.Block = c.kPanWithSingleFingerHorizontally
```

Notes: (Read and Write property)

181.35.5 ID as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The identifier for the type of configuration that will have messages enabled or disabled.
Example:

```
// make a config for accepting some pan/rotate gestures
dim c1 as new WinGestureConfigMBS

c1.ID = 0
c1.Want = c1.kAllGestures
c1.Block = 0

dim configs() as WinGestureConfigMBS
configs.Append c1

// and add to window
if WinPointerEventsMBS.SetGestureConfig(window1, configs) then
MsgBox "OK"
end if
```

Notes: (Read and Write property)

Name	Value	Description
GC_TWOFINGERTAP	0x00000001	Indicates the two-finger tap gesture.

Name	Value	Description
GC_PRESSANDTAP	0x00000001	Indicates the press and tap gesture.

181.35.6 Want as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The messages to enable.
Example:

```
// make a config for accepting all gestures
dim c as new WinGestureConfigMBS

c.ID = 0 // catch all IDs
c.Want = c.kAllGestures
```

Notes: (Read and Write property)

181.35.7 Constants

181.35.8 kAllGestures = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags.
Notes: Indicates all of the gestures. (for ID = 0)

181.35.9 kGestureIDBegin = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
Notes: Begin of gesture.

181.35.10 kGestureIDEnd = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
Notes: End of a gesture

181.35.11 kGestureIDPan = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
Notes: Pan gesture

181.35.12 kGestureIDPressAndTap = 7

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
Notes: Press and Tap gesture

181.35.13 kGestureIDRotate = 5

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
Notes: Rotate gesture

181.35.14 kGestureIDTwoFingerTap = 6

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
Notes: Two-Finger Tap

181.35.15 kGestureIDZoom = 3

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
Notes: Zoom gesture

181.35.16 kPan = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags.
Notes: Indicates all pan gestures.

181.35.17 kPanWithGutter = 8

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags.
Notes: Limits perpendicular movement to primary direction until a threshold is reached to break out of the gutter.

181.35.18 kPanWithInteria = 16

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags.
Notes: Indicates panning with inertia to smoothly slow when pan gestures stop.

181.35.19 kPanWithSingleFingerHorizontally = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags.
Notes: Indicates horizontal pans with one finger.

181.35.20 kPanWithSingleFingerVertically = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags.
Notes: Indicates vertical pans with one finger.

181.35.21 kPressAndTap = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags.
Notes: Indicates the press and tap gesture.

181.35.22 kRotate = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags.
Notes: Indicates the rotation gesture.

181.35.23 kTwoFingerTap = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags.
Notes: Indicates the two-finger tap gesture.

181.35.24 kZoom = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags.
Notes: Indicates the zoom gesture. (for ID = kGestureIDZoom)

181.36 class WinGestureInfoMBS

181.36.1 class WinGestureInfoMBS

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Stores information about a gesture.
Notes:

Parameters for touches:
If kFlagBegin flag is set, save Location so you have first point. And save argument to check later.

For Zoom, get second point from this class. Than you can calculate center point and zoom factor is OldArgumentsLower/NewArgumentsLower.

For Pan, check difference between last point and new point to know how much moved.

For Rotate, please check difference between old RotateAngle and new RotateAngle.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Windows Touch Events

181.36.3 Methods

181.36.4 Constructor

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The private constructor.

181.36.5 Properties

181.36.6 Arguments as Int64

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A 64-bit unsigned integer that contains the arguments for gestures that fit into 8 bytes.
Notes: (Read only property)

181.36.7 ArgumentsHigher as UInt32

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The higher 32bits from Arguments.
Notes: (Read only property)

181.36.8 ArgumentsLower as UInt32

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The lower 32bits from Arguments.
Notes:

Most events just use lower bits.
(Read only property)

181.36.9 Flags as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The state of the gesture.
Notes:

See kFlagBegin/kFlagInertia/kFlagEnd constants.
(Read only property)

181.36.10 ID as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The identifier of the gesture command.
Notes:

see kGestureID* constants.
(Read only property)

181.36.11 InstanceID as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** An internally used identifier for the structure.
Notes: (Read only property)

181.36.12 LocationInWindowX as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A x coordinate associated with the gesture.
Notes:

This is LocationX relative to target window.
(Read only property)

181.36.13 LocationInWindowY as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A x coordinate associated with the gesture.
Notes:

This is LocationY relative to target window.
(Read only property)

181.36.14 LocationX as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A x coordinate associated with the gesture.
Notes:

These coordinates are always relative to the origin of the screen.
(Read only property)

181.36.15 LocationY as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A x coordinate associated with the gesture.
Notes:

These coordinates are always relative to the origin of the screen.
(Read only property)

181.36.16 RotateAngle as Double

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The argument as angle for rotate gesture.

Notes: (Read only property)

181.36.17 SequenceID as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** An internally used identifier for the sequence.
Notes: (Read only property)

181.36.18 TargetWindow as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A handle to the window that is targeted by this gesture.
Notes: (Read only property)

181.36.19 Constants

181.36.20 kFlagBegin = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag values.
Notes: A gesture is starting.

181.36.21 kFlagEnd = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag values.
Notes: A gesture has finished.

181.36.22 kFlagInertia = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag values.
Notes: A gesture has triggered inertia.

181.36.23 kGestureIDBegin = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
Notes: Begin of a gesture

181.36.24 kGestureIDEnd = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
Notes: End of a gesture

181.36.25 kGestureIDPan = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
Notes: Pan gesture

181.36.26 kGestureIDPressAndTap = 7

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
Notes: Press and Tap gesture

181.36.27 kGestureIDRotate = 5

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
Notes: Rotate gesture

181.36.28 kGestureIDTwoFingerTap = 6

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
Notes: Two-Finger Tap

181.36.29 kGestureIDZoom = 3

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
Notes: Zoom gesture

181.37 class WinPointerEventsMBS

181.37.1 class WinPointerEventsMBS

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class to capture touch events on Windows.
Notes: The plugin can only deliver events the Xojo runtime doesn't consume.

181.37.2 Blog Entries

- Windows Touch Events
- MBS Xojo / Real Studio Plugins, version 17.0pr4

181.37.3 Methods

181.37.4 Close

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Cleans up.
Notes:

Optional and does same as destructor, but now.
You can call this in a window's close event to shutdown the event handler class.

181.37.5 Constructor(control as RectControl)

MBS Win Plugin, Plugin Version: 17.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The constructor events to a control.
Notes: Call in a control's open event to attach event listener to the control.
See also:

- 181.37.6 Constructor(win as window) 22391
- 181.37.7 Constructor(WindowHandle as Integer) 22392

181.37.6 Constructor(win as window)

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The constructor events to a window.
Notes: Call in a window's open event to attach event listener to the window.
See also:

- 181.37.5 Constructor(control as RectControl) 22391
- 181.37.7 Constructor(WindowHandle as Integer) 22392

181.37.7 Constructor(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor.
Notes:

This method allows you to attach to any window.
So this works in console projects, too.
With any window, not just xojo windows.
See also:

- 181.37.5 Constructor(control as RectControl) 22391
- 181.37.6 Constructor(win as window) 22391

181.37.8 EnableMouseInPointer(enable as boolean) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Enables the mouse to act as a pointer input device and send pointer events.
Notes:

Requires Windows 8 or newer.

If the function succeeds, the return value is true.
If the function fails, the return value is false.
To get extended error information, call GetLastError.

This function can be called only once in the context of a process lifetime. Prior to the first call, Windows Store apps run with mouse-in-pointer enabled, as do any desktop applications that consume mshtml.dll. All other desktop applications run with mouse-in-pointer disabled.

On the first call in the process lifetime, the state is changed as specified and the call succeeds.
On subsequent calls, the state will not change. If the current state is not equal to the specified state, the call fails.

Call IsMouseInPointerEnabled to verify the mouse-in-pointer state.

181.37.9 GetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 17.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the configuration for which Windows Touch gesture messages are sent from a window.
Notes: Same as other GetGestureConfig, but for a control, not a window.
See also:

- 181.37.10 GetGestureConfig(win as window, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 22393

181.37.10 GetGestureConfig(win as window, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the configuration for which Windows Touch gesture messages are sent from a window.
Notes:

win: The window to get the gesture configuration from.
Flags: A gesture command flag value indicating options for retrieving the gesture configuration. Can be 1 to return consolidated configuration for the specified window and its parent window chain.
Config: an array of gesture configuration structures that specify the gesture configuration.

Please pass an empty array and the plugin appends config objects.

Return function returns number of configs found.
Returns -1 in case of error.
See also:

- 181.37.9 GetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 22393

181.37.11 IsMouseInPointerEnabled as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates whether EnableMouseInPointer is set for the mouse to act as a pointer input device and send pointer events.
Notes:

Requires Windows 8 or newer.

If EnableMouseInPointer is set, the return value is true.
If EnableMouseInPointer is not set, the return value is false.

EnableMouseInPointer can be called only once in the context of a process lifetime. Prior to the first call, Windows Store apps run with mouse-in-pointer enabled, as do any desktop applications that consume mshtml.dll. All other desktop applications run with mouse-in-pointer disabled.
On the first call to EnableMouseInPointer in the process lifetime, the state is changed as specified and the call succeeds.
On subsequent calls to EnableMouseInPointer, the state will not change. If the current state is not equal to the specified state, the call fails.
Call IsMouseInPointerEnabled to verify the mouse-in-pointer state.

181.37.12 SetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS = nil) as boolean

MBS Win Plugin, Plugin Version: 17.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Configures the messages that are sent from a window for Windows Touch gestures.
Notes: Same as other SetGestureConfig, but for a control, not a window.
See also:

- 181.37.13 SetGestureConfig(win as window, config() as WinGestureConfigMBS = nil) as boolean 22394

181.37.13 SetGestureConfig(win as window, config() as WinGestureConfigMBS = nil) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Configures the messages that are sent from a window for Windows Touch gestures.
Notes:

Win: The window to set the gesture configuration on.
config: An array of gesture configuration structures that specify the gesture configuration.

If the function succeeds, the return value is true, else false.

If you don't expect to change the gesture configuration, call SetGestureConfig at window creation time. If you want to dynamically change the gesture configuration, call SetGestureConfig in response to GestureNotify event.
See also:

- 181.37.12 SetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS = nil) as boolean 22394

181.37.14 Properties

181.37.15 WindowHandle as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The window handle.
Notes: (Read only property)

181.37.16 Events

181.37.17 Gesture(info as WinGestureInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Passes information about a gesture.
Notes: Return true, if you processed the message, else false.

181.37.18 GestureNotify

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Gives you a chance to set the gesture configuration.
Notes: When the GestureNotify event is received, the application can use SetGestureConfig to specify the gestures to receive.

181.37.19 PointerDeviceChange(Change as Integer, Param as Integer) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sent to a window when there is a change in the settings of a monitor that has a digitizer attached to it.
Notes:

This message contains information regarding the scaling of the display mode.
See kDeviceChange* constants.

181.37.20 PointerDeviceInRange(Param1 as Integer, Param2 as Integer) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sent to a window when a pointer device is detected within range of an input digitizer.
Notes:

This message contains information regarding the device and its proximity.

If the application processes this message, it should return true, else false.

181.37.21 PointerDeviceOutOfRange(Param1 as Integer, Param2 as Integer) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sent to a window when a pointer device has departed the range of an input digitizer.
Notes:

This message contains information regarding the device and its proximity.

If the application processes this message, it should return true, else false.

181.37.22 PointerDown(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Posted when a pointer makes contact over the client area of a window.
Notes:

This input message targets the window over which the pointer makes contact, and the pointer is implicitly captured to the window so that the window continues to receive input for the pointer until it breaks contact.

We provide pointer ID, flags, X and Y.

Note:
A hovering pointer has none of the button flags set. This is analogous to a mouse move with no mouse buttons down. An application can determine the buttons states of a hovering pen, for example, by calling GetPointerPenInfo and examining the flags that specify button states.

Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

Important When a window loses capture of a pointer and it receives the PointerCaptureChanged notification, it typically will not receive any further notifications. For this reason, it is important that you not make any assumptions based on evenly paired PointerDown/PointerUp or PointerEnter/PointerLeave notifications.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagNew) <>0	A flag that indicates whether this message represents the first input generated by a new pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	A flag that indicates whether this message was generated by a pointer during its lifetime. This flag is not set on messages that indicate that the pointer has left detection range
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <>0	A flag that indicates whether this message was generated by a pointer that is in contact with the window surface. This flag is not set on messages that indicate a hovering pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagPrimary) <>0	Indicates that this pointer has been designated as primary.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFirstButton) <>0	A flag that indicates whether there is a primary action. This is analogous to a mouse left button down. A touch pointer will have this set when it is in contact with the digitizer surface. A pen pointer will have this set when it is in contact with the digitizer surface with no buttons pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagSecondButton) <>0	A flag that indicates whether there is a secondary action. This is analogous to a mouse right button down. A pen pointer will have this set when it is in contact with the digitizer surface with the pen barrel button pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagThirdButton) <>0	A flag that indicates whether there are one or more tertiary actions based on the pointer type; applications that wish to respond to tertiary actions must retrieve information specific to the pointer type to determine which tertiary buttons are pressed. For example, an application can determine the buttons states of a pen by calling GetPointerPenInfo and examining the flags that specify button states.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFourthButton) <>0	A flag that indicates whether the specified pointer took fourth action. Applications that wish to respond to fourth actions must retrieve information specific to the pointer type to determine if the first extended mouse (XButton1) button is pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFifthButton) <>0	A flag that indicates whether the specified pointer took fifth action. Applications that wish to respond to fifth actions must retrieve information specific to the pointer type to determine if the second extended mouse (XButton2) button is pressed.

Each pointer has a unique pointer identifier during its lifetime. The lifetime of a pointer begins when it is first detected.
A PointerEnter event is generated if a hovering pointer is detected. A PointerDown event followed by a PointerEnter event is generated if a non-hovering pointer is detected.
During its lifetime, a pointer may generate a series of PointerUpdate events while it is hovering or in contact.
The lifetime of a pointer ends when it is no longer detected. This generates a PointerLeave event.
When a pointer is aborted, kFlagCanceled is set.
A WM_POINTERLEAVE message may also be generated when a non-captured pointer moves outside the bounds of a window.

To convert the lParam parameter to a POINTS structure, use the MAKEPOINTS macro.
To retrieve further information associated with the message, use the GetPointerInfo function.
To determine the keyboard modifier key states associated with this message, use the GetKeyState function.
For example, to detect that the ALT key was pressed, check whether GetKeyState(VK_MENU) <0.
Note that if the application does not process this message, DefWindowProc may generate one or more WM_GESTURE messages if the sequence of input from this and, possibly, other pointers is recognized as a gesture. If a gesture is not recognized, DefWindowProc may generate mouse input.
If an application selectively consumes some pointer input and passes the rest to DefWindowProc, the resulting behavior is undefined.
When a window loses capture of a pointer and receives the WM_POINTERCAPTURECHANGED notification, it will typically not receive any further notifications. Therefore, it is important that a window does not make any assumptions of its pointer status, regardless of whether it receives evenly paired DOWN / UP or ENTER / LEAVE notifications.

181.37.23 PointerEnter(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sent to a window when a new pointer enters detection range over the window (hover) or when an existing pointer moves within the boundaries of the window.
Notes:

We provide Pointer ID, Flags, X and Y.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagNew) <>0	Indicates whether this message is the first message generated by a new pointer entering detection range (hover).
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	Indicates whether this message was generated by a pointer that has not left detection range. This flag is always set for PointerEnter messages.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <>0	A flag that indicates whether this message was generated by a pointer that is in contact. This flag is not set for a pointer in detection range (hover).

Contains the point location of the pointer.
Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

The PointerEnter notification can be used by a window to provide feedback to the user while the pointer is over its surface or to otherwise react to the presence of a pointer over its surface.
This notification is only sent to the window that is receiving input for the pointer. The following table lists some of the situations in which this notification is sent.

Action	Flags Set	Notifications Sent To
A new pointer enters detection range (hover).	kFlagNew and kFlagInRange	Window over which the pointer enters detection range.
A hovering pointer crosses within the window boundaries.	kFlagInRange	Window within which the pointer has crossed.

Important:
When a window loses capture of a pointer and it receives the PointerCaptureChange notification, it typically will not receive any further notifications. For this reason, it is important that you not make any assumptions based on evenly paired PointerDown/PointerUp or PointerEnter/PointerLeave notifications.

When inputs come from the mouse, as a result of mouse and pointer message integration, PointerEnter is not sent.

181.37.24 PointerHWheel(PointerID as Integer, Delta as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Posted to the window with foreground keyboard focus when a horizontal scroll wheel is rotated.
Notes:

We provide, the pointer ID, the delta and x/y coordinate.
Info object provides pointer details.

To retrieve the wheel scroll units, use the inputData filed of the WinPointerInfoMBS object. This field contains a signed value and is expressed in a multiple of WHEEL_DELTA (120). A positive value indicates a rotation forward and a negative value indicates a rotation backward.
Note that the wheel inputs may be delivered even if the mouse cursor is located outside of application's window. The wheel messages are delivered in a way very similar to the keyboard inputs. The focus window of the foregournd message queue receives the wheel messages.

181.37.25 PointerLeave(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sent to a window when a pointer leaves detection range over the window (hover) or when a pointer moves outside the boundaries of the window.
Notes:

We provide the pointer ID, Flags, X and Y values.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	Indicates whether this message was generated by a pointer that has not left detection range. This flag is not set when the pointer leaves the detection range of the window.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <>0	A flag that indicates whether this message was generated by a pointer that is in contact. This flag is not set for a pointer in detection range (hover).

Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

The PointerLeave notification can be used by a window to change mode or stop any feedback to the user while the pointer is over the window surface.
This notification is only sent to the window that is receiving input for the pointer. The following table lists some of the situations in which this notification is sent.

Action	Flags Set	Notifications Sent To
A hovering pointer crosses window boundaries.	BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	Window outside of whose boundary the pointer moved.
A pointer goes out of detection range.	N/A	Window for which the pointer leaves detection range.

Important:
When a window loses capture of a pointer and it receives the PointerCaptureChange notification, it typically will not receive any further notifications. For this reason, it is important that you not make any assumptions based on evenly paired PointerDown/PointerUp or PointerEnter/PointerLeave notifications.

If contact is maintained with the input digitizer and the pointer moves outside the window, PointerLeave is not generated. PointerLeave is generated only when a hovering pointer crosses window boundaries or contact is terminated.
PointerLeave is posted to the posted message queue if the input is originated from a mouse device.

181.37.26 PointerUp(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Posted when a pointer that made contact over the client area of a window breaks contact.
Notes:

This input message targets the window over which the pointer makes contact and the pointer is, at that point, implicitly captured to the window so that the window continues to receive input messages including the WM_POINTERUP notification for the pointer until it breaks contact.

We provide pointer ID, flags, X and Y.

See Pointer Flags for more details.

Note:
A hovering pointer has none of the button flags set. This is analogous to a mouse move with no mouse buttons down. An application can determine the buttons states of a hovering pen, for example, by calling GetPointerPenInfo and examining the flags that specify button states.

Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagNew) <>0	A flag that indicates whether this message represents the first input generated by a new pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	A flag that indicates whether this message was generated by a pointer during its lifetime. This flag is not set on messages that indicate that the pointer has left detection range
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <>0	A flag that indicates whether this message was generated by a pointer that is in contact with the window surface. This flag is not set on messages that indicate a hovering pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagPrimary) <>0	Indicates that this pointer has been designated as primary.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFirstButton) <>0	A flag that indicates whether there is a primary action. This is analogous to a mouse left button down. A touch pointer will have this set when it is in contact with the digitizer surface. A pen pointer will have this set when it is in contact with the digitizer surface with no buttons pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagSecondButton) <>0	A flag that indicates whether there is a secondary action. This is analogous to a mouse right button down. A pen pointer will have this set when it is in contact with the digitizer surface with the pen barrel button pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagThirdButton) <>0	A flag that indicates whether there are one or more tertiary actions based on the pointer type; applications that wish to respond to tertiary actions must retrieve information specific to the pointer type to determine which tertiary buttons are pressed. For example, an application can determine the buttons states of a pen by calling GetPointerPenInfo and examining the flags that specify button states.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFourthButton) <>0	A flag that indicates whether the specified pointer took fourth action. Applications that wish to respond to fourth actions must retrieve information specific to the pointer type to determine if the first extended mouse (XButton1) button is pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFifthButton) <>0	A flag that indicates whether the specified pointer took fifth action. Applications that wish to respond to fifth actions must retrieve information specific to the pointer type to determine if the second extended mouse (XButton2) button is pressed.

Each pointer has a unique pointer identifier during its lifetime. The lifetime of a pointer begins when it is first detected.
A PointerEnter event is generated if a hovering pointer is detected. A PointerDown event followed by a PointerEnter event is generated if a non-hovering pointer is detected.
During its lifetime, a pointer may generate a series of PointerUpdate event while it is hovering or in contact.
The lifetime of a pointer ends when it is no longer detected. This generates a WM_POINTERLEAVE message.
When a pointer is aborted, kFlagCanceled is set.
A PointerLeave event may also be generated when a non-captured pointer moves outside the bounds of a window.
To obtain the horizontal and vertical position of a pointer, use the following:

If the application does not process this message, Windows may generate one or more Gesture event if the sequence of input from this and, possibly, other pointers is recognized as a gesture. If a gesture is not recognized, DefWindowProc may generate mouse input.
If an application selectively consumes some pointer input and passes the rest back to Windows, the resulting behavior is undefined.

181.37.27 PointerUpdate(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Posted to provide an update on a pointer that made contact over the client area of a window or on a hovering uncaptured pointer over the client area of a window.
Notes:

While the pointer is hovering, the message targets whichever window the pointer happens to be over. While the pointer is in contact with the surface, the pointer is implicitly captured to the window over which the pointer made contact and that window continues to receive input for the pointer until it breaks contact.

We provide pointer ID, flags, X and Y.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagNew) <>0	A flag that indicates whether this message represents the first input generated by a new pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	A flag that indicates whether this message was generated by a pointer during its lifetime. This flag is not set on messages that indicate that the pointer has left detection range
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <>0	A flag that indicates whether this message was generated by a pointer that is in contact with the window surface. This flag is not set on messages that indicate a hovering pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagPrimary) <>0	Indicates that this pointer has been designated as primary.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFirstButton) <>0	A flag that indicates whether there is a primary action. This is analogous to a mouse left button down. A touch pointer will have this set when it is in contact with the digitizer surface. A pen pointer will have this set when it is in contact with the digitizer surface with no buttons pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagSecondButton) <>0	A flag that indicates whether there is a secondary action. This is analogous to a mouse right button down.

A pen pointer will have this set when it is in contact with the digitizer surface with the pen barrel button pressed.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagThirdButton) <>0	A flag that indicates whether there are one or more tertiary actions based on the pointer type; applications that wish to respond to tertiary actions must retrieve information specific to the pointer type to determine which tertiary buttons are pressed. For example, an application can determine the buttons states of a pen by calling GetPointerPenInfo and examining the flags that specify button states.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFourthButton) <>0	A flag that indicates whether the specified pointer took fourth action. Applications that wish to respond to fourth actions must retrieve information specific to the pointer type to determine if the first extended mouse (XButton1) button is pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFifthButton) <>0	A flag that indicates whether the specified pointer took fifth action. Applications that wish to respond to fifth actions must retrieve information specific to the pointer type to determine if the second extended mouse (XButton2) button is pressed.

See Pointer Flags for more details.

Note:
A hovering pointer has none of the button flags set. This is analogous to a mouse move with no mouse

buttons down. An application can determine the buttons states of a hovering pen, for example, by calling GetPointerPenInfo and examining the flags that specify button states.

Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

Each pointer has a unique pointer identifier during its lifetime. The lifetime of a pointer begins when it is first detected.
A PointerEnterevent is generated if a hovering pointer is detected. A PointerDown event followed by a PointerEnter event is generated if a non-hovering pointer is detected.
During its lifetime, a pointer may generate a series of PointerUpdate events while it is hovering or in contact.
The lifetime of a pointer ends when it is no longer detected. This generates a PointerLeave event.
When a pointer is aborted, kFlagCanceled is set.
A PointerLeave event may also be generated when a non-captured pointer moves outside the bounds of a window.

If the application does not process this message, Windows may generate one or more Gesture event if the sequence of input from this and, possibly, other pointers is recognized as a gesture. If a gesture is not recognized, Windows may generate mouse input.
If an application selectively consumes some pointer input and passes the rest back to Windows, the resulting behavior is undefined.
If the application does not process these messages as fast as they are generated, some moves may be coalesced. The history of inputs that were coalesced into this message can be retrieved using the GetPointerInfoHistory function.

181.37.28 PointerWheel(PointerID as Integer, Delta as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Posted to the window with foreground keyboard focus when a vertical scroll wheel is rotated.
Notes:

We provide, the pointer ID, the delta and x/y coordinate.
Info object provides pointer details.

To retrieve the wheel scroll units, use the inputData filed of the WinPointerInfoMBS object. This field contains a signed value and is expressed in a multiple of WHEEL_DELTA (120). A positive value indicates a rotation forward and a negative value indicates a rotation backward.
Note that the wheel inputs may be delivered even if the mouse cursor is located outside of application's

window. The wheel messages are delivered in a way very similar to the keyboard inputs. The focus window of the foregournd message queue receives the wheel messages.

181.37.29 Constants

181.37.30 kDeviceChangeArrival = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags.
Notes: A new device is attached.

181.37.31 kDeviceChangeAspectRatioPreserved = 2048

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags.
Notes: The display aspect ratio.

181.37.32 kDeviceChangeMapping = 256

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags.
Notes: The change in display to digitizer mapping.

181.37.33 kDeviceChangeModeCentered = 128

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags.
Notes: Centered display mode.

181.37.34 kDeviceChangeModeDefault = 64

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags.
Notes: The default display mode.

181.37.35 kDeviceChangeOrientation0 = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags.
Notes: Orientation of the device: 0°

181.37.36 kDeviceChangeOrientation180 = 16

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags.
Notes: Orientation of the device: 180°

181.37.37 kDeviceChangeOrientation270 = 32

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags.
Notes: Orientation of the device: 270°

181.37.38 kDeviceChangeOrientation90 = 8

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags.
Notes: Orientation of the device: 90°

181.37.39 kDeviceChangeOrigin = 1024

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags.
Notes: The display origin.

181.37.40 kDeviceChangeRemoval = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags.
Notes: A device has been detached.

181.37.41 kDeviceChangeResolution = 512

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags.
Notes: Display resolution.

181.38 class WinPointerInfoMBS

181.38.1 class WinPointerInfoMBS

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for pointer input details.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

181.38.2 Blog Entries

- Windows Touch Events

181.38.3 Methods

181.38.4 Constructor

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The private constructor.

181.38.5 Properties

181.38.6 ButtonChangeType as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies the change in button state between this input and the previous input.
Notes:

See kPointerChange* constants.
(Read only property)

181.38.7 frameId as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** An identifier common to multiple pointers for which the source device reported an update in a single input frame.
Notes:

For example, a parallel-mode multi-touch digitizer may report the positions of multiple touch contacts in a single update to the system.

Note that frame identifier is assigned as input is reported to the system for all pointers across all devices. Therefore, this field may not contain strictly sequential values in a single series of messages that a window receives. However, this field will contain the same numerical value for all input updates that were reported in the same input frame by a single device.
(Read only property)

181.38.8 HimetricLocationRawX as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The screen coordinates of the pointer, in HIMETRIC units.
Notes:

For adjusted screen coordinates, see HimetricLocation.
(Read only property)

181.38.9 HimetricLocationRawY as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The screen coordinates of the pointer, in HIMETRIC units.
Notes:

For adjusted screen coordinates, see HimetricLocation.
(Read only property)

181.38.10 HimetricLocationX as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The predicted screen coordinates of the pointer, in HIMETRIC units.
Notes:

The predicted value is based on the pointer position reported by the digitizer and the motion of the pointer. This correction can compensate for visual lag due to inherent delays in sensing and processing the pointer location on the digitizer. This is applicable to pointers of type touch. For other pointer types, the predicted value will be the same as the non-predicted value (see ptHimetricLocationRaw).
(Read only property)

181.38.11 HimetricLocationY as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The predicted screen coordinates of the pointer, in HIMETRIC units.
Notes:

The predicted value is based on the pointer position reported by the digitizer and the motion of the pointer. This correction can compensate for visual lag due to inherent delays in sensing and processing the pointer location on the digitizer. This is applicable to pointers of type touch. For other pointer types, the predicted value will be the same as the non-predicted value (see ptHimetricLocationRaw).
(Read only property)

181.38.12 historyCount as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Count of inputs that were coalesced into this message.
Notes:

This count matches the total count of entries that can be returned by a call to GetPointerInfoHistory. If no coalescing occurred, this count is 1 for the single input represented by the message.
(Read only property)

181.38.13 hwndTarget as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Window to which this message was targeted.
Notes:

If the pointer is captured, either implicitly by virtue of having made contact over this window or explicitly using the pointer capture API, this is the capture window. If the pointer is uncaptured, this is the window over which the pointer was when this message was generated.
(Read only property)

181.38.14 InputData as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A value whose meaning depends on the nature of input.
Notes:

When flags indicate kFlagWheel, this value indicates the distance the wheel is rotated, expressed in multiples or factors of WHEEL_DELTA. A positive value indicates that the wheel was rotated forward and a negative value indicates that the wheel was rotated backward.
When flags indicate kFlagWheel, this value indicates the distance the wheel is rotated, expressed in multiples or factors of WHEEL_DELTA. A positive value indicates that the wheel was rotated to the right and a negative value indicates that the wheel was rotated to the left.
(Read only property)

181.38.15 KeyStates as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates which keyboard modifier keys were pressed at the time the input was generated.
Notes:

May be zero or a combination of the following values:

8 A SHIFT key was pressed.
4 A CTRL key was pressed.

(Read only property)

181.38.16 PerformanceCount as Int64

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The value of the high-resolution performance counter when the pointer message was received (high-precision, 64 bit alternative to Time).
Notes:

The value can be calibrated when the touch digitizer hardware supports the scan timestamp information in its input report.
(Read only property)

181.38.17 PixelLocationRawX as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The screen coordinates of the pointer, in pixels.
Notes:

For adjusted screen coordinates, see PixelLocation.
(Read only property)

181.38.18 PixelLocationRawY as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The screen coordinates of the pointer, in pixels.
Notes:

For adjusted screen coordinates, see PixelLocation.
(Read only property)

181.38.19 PixelLocationX as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The predicted screen coordinates of the pointer, in pixels.
Notes:

The predicted value is based on the pointer position reported by the digitizer and the motion of the pointer. This correction can compensate for visual lag due to inherent delays in sensing and processing the pointer location on the digitizer. This is applicable to pointers of type touch. For other pointer types, the predicted value will be the same as the non-predicted value (see ptPixelLocationRaw).
(Read only property)

181.38.20 PixelLocationY as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The predicted screen coordinates of the pointer, in pixels.
Notes:

The predicted value is based on the pointer position reported by the digitizer and the motion of the pointer. This correction can compensate for visual lag due to inherent delays in sensing and processing the pointer location on the digitizer. This is applicable to pointers of type touch. For other pointer types, the predicted value will be the same as the non-predicted value (see ptPixelLocationRaw).
(Read only property)

181.38.21 pointerFlags as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** May be any reasonable combination of flags from the flags constants.
Notes:

See kFlag* constants.
(Read only property)

181.38.22 pointerId as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** An identifier that uniquely identifies a pointer during its lifetime.
Notes:

A pointer comes into existence when it is first detected and ends its existence when it goes out of detection

range. Note that if a physical entity (finger or pen) goes out of detection range and then returns to be detected again, it is treated as a new pointer and may be assigned a new pointer identifier.
(Read only property)

181.38.23 pointerType as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The pointer type.
Notes:

See kType* constants.
(Read only property)

181.38.24 sourceDevice as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Handle to the source device that can be used in calls to the raw input device API and the digitizer device API.
Notes: (Read only property)

181.38.25 Time as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The time of the event.
Notes:

Value is 0 or the time stamp of the message, based on the system tick count when the message was received. The application can specify the input time stamp in either Time or PerformanceCount. The value cannot be more recent than the current tick count or QueryPerformanceCount (QPC) value of the injection thread. Once a frame is injected with a time stamp, all subsequent frames must include a timestamp until all contacts in the frame go to an UP state. The custom timestamp value must also be provided for the first element in the contacts array. The time stamp values after the first element are ignored. The custom timestamp value must increment in every injection frame.
When PerformanceCount is specified, the time stamp will be converted to the current time in .1 millisecond resolution upon actual injection. If a custom PerformanceCount resulted in the same .1 millisecond window from the previous injection, ERROR_NOT_READY is returned and injection will not occur. While injection will not be invalidated immediately by the error, the next successful injection must have a PerformanceCount value that is at least 0.1 millisecond from the previously successful injection. This is also true if Time is used.
If both Time and PerformanceCount are specified in InjectTouchInput, ERROR_INVALID_PARAMETER is returned.
InjectTouchInput cannot switch between Time and PerformanceCount once injection has started.
If neither Time and PerformanceCount are specified, InjectTouchInput allocates the timestamp based on the

timing of the call. If InjectTouchInput calls are repeatedly less than 0.1 millisecond apart, ERROR_NOT_READY might be returned. The error will not invalidate the input immediately, but the injection application needs to retry the same frame again for injection to succeed.
(Read only property)

181.38.26 Constants

181.38.27 kFlagCanceled = & h8000

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes: Indicates that the pointer is departing in an abnormal manner, such as when the system receives invalid input for the pointer or when a device with active pointers departs abruptly. If the application receiving the input is in a position to do so, it should treat the interaction as not completed and reverse any effects of the concerned pointer.

181.38.28 kFlagCaptureChanged = & h200000

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes: Indicates that this pointer was captured by (associated with) another element and the original element has lost capture.

181.38.29 kFlagConfidence = & h4000

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes: Confidence is a suggestion from the source device about whether the pointer represents an intended or accidental interaction, which is especially relevant for touch pointers where an accidental interaction (such as with the palm of the hand) can trigger input. The presence of this flag indicates that the source device has high confidence that this input is part of an intended interaction.

181.38.30 kFlagDown = & h10000

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes: Indicates that this pointer transitioned to a down state; that is, it made contact with the digitizer surface.

181.38.31 kFlagFifthButton = & h100

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes:

Analogous to a second extended mouse (XButton2) button down.
A touch pointer does not use this flag.
A pen pointer does not use this flag.
A mouse pointer has this flag set when the second extended mouse (XBUTTON2) button is down.

181.38.32 kFlagFirstButton = & h10

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes:

Indicates a primary action, analogous to a left mouse button down.
A touch pointer has this flag set when it is in contact with the digitizer surface.
A pen pointer has this flag set when it is in contact with the digitizer surface with no buttons pressed.
A mouse pointer has this flag set when the left mouse button is down.

181.38.33 kFlagFourthButton = & h80

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes:

Analogous to a first extended mouse (XButton1) button down.
A touch pointer does not use this flag.
A pen pointer does not use this flag.
A mouse pointer has this flag set when the first extended mouse (XBUTTON1) button is down.

181.38.34 kFlagHasTransform = & h400000

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes: Indicates that this pointer has an associated transform.

181.38.35 kFlagHWheel = & h100000

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes: Indicates input associated with a pointer h-wheel. For mouse pointers, this is equivalent to the action of the mouse horizontal scroll wheel.

181.38.36 kFlagInContact = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes:

Indicates that this pointer is in contact with the digitizer surface.
When this flag is not set, it indicates a hovering pointer.

181.38.37 kFlagInRange = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes:

Indicates that this pointer continues to exist. When this flag is not set, it indicates the pointer has left detection range.
This flag is typically not set only when a hovering pointer leaves detection range (kFlagUpdate is set) or when a pointer in contact with a window surface leaves detection range (kFlagUp is set).

181.38.38 kFlagNew = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes: Indicates the arrival of a new pointer.

181.38.39 kFlagNone = 0

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes: Default

181.38.40 kFlagPrimary = & h2000

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes:

Indicates that this pointer has been designated as the primary pointer. A primary pointer is a single pointer that can perform actions beyond those available to non-primary pointers. For example, when a primary pointer makes contact with a window's surface, it may provide the window an opportunity to activate by sending it a PointerActivate event.
The primary pointer is identified from all current user interactions on the system (mouse, touch, pen, and so on). As such, the primary pointer might not be associated with your app. The first contact in a multi-touch interaction is set as the primary pointer. Once a primary pointer is identified, all contacts must be lifted before a new contact can be identified as a primary pointer. For apps that don't process pointer input, only

the primary pointer's events are promoted to mouse events.

181.38.41 kFlagSecondButton = & h20

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes:

Indicates a secondary action, analogous to a right mouse button down.
A touch pointer does not use this flag.
A pen pointer has this flag set when it is in contact with the digitizer surface with the pen barrel button pressed.
A mouse pointer has this flag set when the right mouse button is down.

181.38.42 kFlagThirdButton = & h40

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes:

Analogous to a mouse wheel button down.
A touch pointer does not use this flag.
A pen pointer does not use this flag.
A mouse pointer has this flag set when the mouse wheel button is down.

181.38.43 kFlagUp = & h40000

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes: Indicates that this pointer transitioned to an up state; that is, contact with the digitizer surface ended.

181.38.44 kFlagUpdate = & h20000

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes: Indicates that this is a simple update that does not include pointer state changes.

181.38.45 kFlagWheel = & h80000

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
Notes: Indicates input associated with a pointer wheel. For mouse pointers, this is equivalent to the action

of the mouse scroll wheel.

181.38.46 kPointerChangeFifthButtonDown = 9

MBS Win Plugin, Plugin Version: 16.2. **Function:** The fifth button transitioned to a pressed state.

181.38.47 kPointerChangeFifthButtonUp = 10

MBS Win Plugin, Plugin Version: 16.2. **Function:** The fifth button transitioned to a released state.

181.38.48 kPointerChangeFirstButtonDown = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** The first button transitioned to a pressed state.

181.38.49 kPointerChangeFirstButtonUp = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** The first button transitioned to a released state.

181.38.50 kPointerChangeFourthButtonDown = 7

MBS Win Plugin, Plugin Version: 16.2. **Function:** The fourth button transitioned to a pressed state.

181.38.51 kPointerChangeFourthButtonUp = 8

MBS Win Plugin, Plugin Version: 16.2. **Function:** The fourth button transitioned to a released state.

181.38.52 kPointerChangeNone = 0

MBS Win Plugin, Plugin Version: 16.2. **Function:** No change in button state.

181.38.53 kPointerChangeSecondButtonDown = 3

MBS Win Plugin, Plugin Version: 16.2. **Function:** The second button transitioned to a pressed state.

181.38.54 kPointerChangeSecondButtonUp = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** The second button transitioned to a released state.

181.38.55 kPointerChangeThirdButtonDown = 5

MBS Win Plugin, Plugin Version: 16.2. **Function:** The third button transitioned to a pressed state.

181.38.56 kPointerChangeThirdButtonUp = 6

MBS Win Plugin, Plugin Version: 16.2. **Function:** The third button transitioned to a released state.

181.38.57 kTypeMouse = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the pointer types.
Notes: Mouse pointer type.

181.38.58 kTypePen = 3

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the pointer types.
Notes: Pen pointer type.

181.38.59 kTypePointer = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the pointer types.
Notes:

Generic pointer type.
This type never appears in pointer messages or pointer data. Some data query functions allow the caller to restrict the query to specific pointer type. The kTypePointer type can be used in these functions to specify that the query is to include pointers of all types

181.38.60 kTypeTouch = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the pointer types.
Notes: Touch pointer type.

181.38.61 kTypeTouchpad = 5

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the pointer types.
Notes: Touchpad pointer type (Windows 8.1 and later).

181.39 class WMIObjectMBS

181.39.1 class WMIObjectMBS

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a WMI object.

181.39.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.5pr6
- MBS Xojo / Real Studio Plugins, version 13.4pr2
- MBS Xojo / Real Studio Plugins, version 13.4pr1

- MBS Real Studio Plugins, version 13.1pr15
- MBS Releases the MBS Real Studio plug-ins in version 12.0
- MBS Real Studio Plugins, version 11.4pr1

181.39.3 Methods

181.39.4 GetNames as string()

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the names of all properties in this object.

181.39.5 GetProperty(Name as string) as Variant

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets a property as a variant.
Notes:

Objects, booleans, strings and numbers are supported directly. Also string arrays in version 13.1.
Other values are casted to string first.

181.39.6 GetPropertyBoolean(Name as string) as Boolean

MBS Win Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets a value as an integer.

Notes: Value must be of a numeric type.

181.39.7 GetPropertyDouble(Name as string) as Double

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets a value as a double.
Notes: Value must be of a numeric type.

181.39.8 GetPropertyInt64(Name as string) as Int64

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets a property as an integer value.

181.39.9 GetPropertyInteger(Name as string) as Integer

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets a value as an integer.
Example:

```
dim w as WindowsWMIMBS // your WMI object

MsgBox str(w.GetPropertyInteger("MaxClockSpeed")) // uint32
```

Notes: Value must be of a numeric type.

181.39.10 GetPropertyObject(Name as string) as WMIObjectMBS

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets a value as an object.
Notes: Value must be of an IUnknown type.

181.39.11 GetPropertyString(Name as string) as string

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets a property as a string.
Example:

```
dim w as WindowsWMIMBS
MsgBox w.GetPropertyString("Name") // string
```

181.39.12 GetPropertyStringArray(Name as string) as string()

MBS Win Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets a property as a string array.
Example:

```
dim w as WindowsWMIMBS
MsgBox join(w.GetPropertyStringArray("Name"), ", ")
```

181.39.13 GetPropertyType(Name as string) as Integer

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets the type of a property.
Notes: You can send in the value you get here and the plugin can be changed to handle this type, too. Currently only numbers and strings are handled.

181.39.14 GetPropertyTypeString(Name as string) as string

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets the type of a property as a string.
Notes: For example type 8 is returned as "string".

181.39.15 Properties

181.39.16 Handle as Integer

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Internal object reference.
Notes: (Read and Write property)

181.39.17 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code reported from one of the functions.
Notes:

-1 is the value used by the plugin if the function is not available.
(Read and Write property)

181.39.18 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The error message for the last error.
Notes:

This may help to debug the errors.
(Read only property)

Chapter 182

Windows Console

182.1 class ConsoleStateMBS

182.1.1 class ConsoleStateMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class for handling a console window state.

182.1.2 Properties

182.1.3 BackColor as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The colorcode of the background.
Notes:

Color codes can be build up from red, blue, green and highlight.
red=1, blue=2, green=4 and highlight=8.
(Read and Write property)

182.1.4 CursorX as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The horizontal cursor position in characters.
Notes: (Read and Write property)

182.1.5 CursorY as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The vertical cursor position in characters.
Notes: (Read and Write property)

182.1.6 Height as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The height of the window in characters.
Notes: (Read and Write property)

182.1.7 MaxHeight as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The maximum height of the window in characters.
Notes: (Read and Write property)

182.1.8 MaxWidth as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The maximum width of the window in characters.
Notes: (Read and Write property)

182.1.9 TextColor as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The colorcode of the text.
Notes:

Color codes can be build up from red, blue, green and highlight.
red=1, blue=2, green=4 and highlight=8.
(Read and Write property)

182.1.10 Width as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The width of the window in characters.

Notes: (Read and Write property)

182.1.11 WindowHeight as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The height of the console window.
Notes: (Read and Write property)

182.1.12 WindowLeft as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The left position of the console window.
Notes: (Read and Write property)

182.1.13 WindowTop as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The top position of the console window.
Notes: (Read and Write property)

182.1.14 WindowWidth as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The width of the console window.
Notes: (Read and Write property)

182.2 class WindowsConsoleMBS

182.2.1 class WindowsConsoleMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class for handling a console window in Windows.

182.2.2 Methods

182.2.3 Close

MBS Win Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

182.2.4 FlushConsole

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The FlushConsole function flushes the console input buffer.
Notes: All input records currently in the input buffer are discarded.

182.2.5 ReadConsole(maxcount as Integer) as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads maximum of maxcount characters from the input stream.

182.2.6 SetCursorPosition(x as Integer,y as Integer)

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the cursor position inside the console window.

182.2.7 SetWindowPosition(absolute as boolean, left as Integer,top as Integer, right as Integer, bottom as Integer)

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the window position and size.

Notes: If absolute=false, the coordinates are relative to the current one.

182.2.8 State as ConsoleStateMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current state of the console window.

182.2.9 WriteConsole(message as string) as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Writes the message to the console.
Notes: Returns true if successfull.

182.2.10 Properties

182.2.11 AutoScrollAtEOL as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Automatical scrolling at end of line?
Notes:

When writing with WriteConsole or echoing with ReadFile, the cursor moves to the beginning of the next row when it reaches the end of the current row. This causes the rows displayed in the console window to scroll up automatically when the cursor advances beyond the last row in the window. It also causes the contents of the screen buffer to scroll up (discarding the top row of the screen buffer) when the cursor advances beyond the last row in the screen buffer. If this mode is disabled, the last character in the row is overwritten with any subsequent characters.
(Read and Write property)

182.2.12 BackColor as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The text background color used.
Notes: (Read and Write property)

182.2.13 CursorSize as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The size of the cursor in percent (from 0 to 100).
Notes: (Read and Write property)

182.2.14 CursorVisible as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Is the cursor visible?
Notes: (Read and Write property)

182.2.15 EchoInput as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Echo the input on the screen?
Notes:

Characters read by the ReadFile function are written to the active screen buffer as they are read. This mode can be used only if the WaitForReturn mode is also enabled.
(Read and Write property)

182.2.16 GotConsole as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** whether the console was created inside the constructor.
Notes: (Read only property)

182.2.17 InputCodepage as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Codepage of the input stream.
Notes: (Read and Write property)

182.2.18 OutputCodepage as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Codepage of the output stream.

Notes: (Read and Write property)

182.2.19 ProcessInput as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Process input before reading?
Notes:

Ctrl+c is processed by the system and is not placed in the input buffer. If the input buffer is being read by ReadConsole, other control keys are processed by the system and are not returned in the ReadConsole buffer. If the WaitForReturn mode is also enabled, backspace, carriage return, and linefeed characters are handled by the system.
(Read and Write property)

182.2.20 ProcessOutput as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Process output before reading?
Notes:

Characters written by the WriteConsole function or echoed by the ReadFile or ReadConsole function are parsed for ASCII control sequences, and the correct action is performed. Backspace, tab, bell, carriage return, and linefeed characters are processed.
(Read and Write property)

182.2.21 TextColor as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The text color used.
Notes: (Read and Write property)

182.2.22 Title as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The title bar of the console window.
Notes: (Read and Write property)

182.2.23 WaitForReturn as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Wait for return key on reading?
Notes:

The ReadConsole function returns only when a carriage return character is read. If this mode is disabled, the functions return when one or more characters are available.
(Read and Write property)

182.2.24 Events

182.2.25 ConsoleClosed

MBS Win Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Console was closed.

182.2.26 ConsoleOpened

MBS Win Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Console was opened.

182.2.27 ControlBreak as boolean

MBS Win Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Control-Break was pressed.
Notes:

Return true if you handled it yourself.
Return false for the default handler.

182.2.28 ControlC as boolean

MBS Win Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Control-C was pressed.
Notes:

Return true if you handled it yourself.
Return false for the default handler.

182.2.29 Logoff as boolean

MBS Win Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The user is logging off.
Notes:

Return true if you handled it yourself.
Return false for the default handler.

182.2.30 Shutdown as boolean

MBS Win Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The user is shutting down the computer.
Notes:

Return true if you handled it yourself.
Return false for the default handler.

182.2.31 UserClose as boolean

MBS Win Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The user pressed the close button.
Notes:

Return true if you handled it yourself.
Return false for the default handler.

182.2.32 Constants

182.2.33 Black = 0

MBS Win Plugin. **Function:** The color code for Black.
Notes: Read only property with value 0.

182.2.34 Blue = 1

MBS Win Plugin. **Function:** The color code for Blue.
Notes: Read only property with value 2.

182.2.35 Green = 2

MBS Win Plugin. **Function:** The color code for Green.
Notes: Read only property with value 4.

182.2.36 Highlight = 8

MBS Win Plugin. **Function:** The color code for Highlight.
Notes: Read only property with value 8.

182.2.37 Red = 4

MBS Win Plugin. **Function:** The color code for Red.
Notes: Read only property with value 1.

Chapter 183

Windows ICM

183.1 class WindowsICMColorMBS

183.1.1 class WindowsICMColorMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a color value.
Notes:

A variable of type color may be accessed as any of the supported color space colors by accessing the appropriate member of the union.

see also:
http://msdn.microsoft.com/en-us/library/dd371932(v=VS.85).aspx

183.1.2 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

183.1.3 Properties

183.1.4 a as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The a color value of a Lab color.
Notes: (Read and Write property)

183.1.5 b as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The b color value of a Lab color.
Notes: (Read and Write property)

183.1.6 black as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The black color value of a CMYK color.
Notes: (Read and Write property)

183.1.7 blue as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The blue value.
Notes:

Range from 0 to 255.
(Read and Write property)

183.1.8 ch1 as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The first channel color value of a three channel color.
Notes: (Read and Write property)

183.1.9 ch2 as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The second channel color value of a three channel color.
Notes: (Read and Write property)

183.1.10 ch3 as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The third channel color value of a three channel color.

Notes: (Read and Write property)

183.1.11 cyan as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The cyan color value of a CMYK color.
Notes: (Read and Write property)

183.1.12 gray as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The gray color value.
Notes:

For grayscale color space.
(Read and Write property)

183.1.13 green as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The green value.
Notes:

Range from 0 to 255.
(Read and Write property)

183.1.14 Index as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The index value for an indexed color space.
Notes: (Read and Write property)

183.1.15 L as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The L color value of a Lab color.
Notes: (Read and Write property)

183.1.16 magenta as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The magenta color value of a CMYK color.
Notes: (Read and Write property)

183.1.17 red as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The red value.
Notes:

Range from 0 to 255.
(Read and Write property)

183.1.18 XYZ_X as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The X value of a XYZ color.
Notes: (Read and Write property)

183.1.19 XYZ_Y as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Y value of a XYZ color.
Notes: (Read and Write property)

183.1.20 XYZ_Z as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Z value of a XYZ color.
Notes: (Read and Write property)

183.1.21 yellow as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The yellow color value of a CMYK color.

Notes: (Read and Write property)

183.1.22 Yxy_x as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The x value of a Yxy color.
Notes: (Read and Write property)

183.1.23 Yxy_y as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The y value of a Yxy color.
Notes:

Yxy_YY is the first Y and Yxy_Y the second one in a Yxy color.
(Read and Write property)

183.1.24 Yxy_YY as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The y value of a Yxy color.
Notes:

Yxy_YY is the first Y and Yxy_Y the second one in a Yxy color.
(Read and Write property)

183.1.25 Channel(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The channel value of a colorspaces with 3 to 8 channels.
Notes:

Index from 0 to 7.
(Read and Write computed property)

183.1.26 Constants

183.1.27 COLOR_3_CHANNEL = 6

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.
Notes: The COLOR is in the GENERIC3CHANNEL color space.

183.1.28 COLOR_5_CHANNEL = 8

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.
Notes: The COLOR is in a five channel color space.

183.1.29 COLOR_6_CHANNEL = 9

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.
Notes: The COLOR is in a six channel color space.

183.1.30 COLOR_7_CHANNEL = 10

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.
Notes: The COLOR is in a seven channel color space.

183.1.31 COLOR_8_CHANNEL = 11

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.
Notes: The COLOR is in an eight channel color space.

183.1.32 COLOR_CMYK = 7

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.
Notes: The COLOR is in the CMYKCOLOR color space.

183.1.33 COLOR_GRAY = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.
Notes: The COLOR is in the GRAYCOLOR color space.

183.1.34 COLOR_Lab = 5

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.
Notes: The COLOR is in the LabCOLOR color space.

183.1.35 COLOR_NAMED = 12

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.
Notes: The COLOR is in a named color space.

183.1.36 COLOR_RGB = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.
Notes: The COLOR is in the RGBCOLOR color space.

183.1.37 COLOR_XYZ = 3

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.
Notes: The COLOR is in the XYZCOLOR color space.

183.1.38 COLOR_Yxy = 4

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.
Notes: The COLOR is in the YxyCOLOR color space.

183.1.39 MAX_COLOR_CHANNELS = 8

MBS Win Plugin, Plugin Version: 11.1. **Function:** The maximum number of supported color channels.

183.2 class WindowsICMEnumMBS

183.2.1 class WindowsICMEnumMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The WindowsICMEnumMBS class contains information that defines the profile enumeration constraints.
Example:

```
dim c as new WindowsICMEnumMBS // no options set

dim a(-1) as string = WindowsICMModuleMBS.EnumColorProfiles(c)

for each s as string in a
MsgBox s
next
```

183.2.2 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

183.2.3 Properties

183.2.4 Attributes0 as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Attributes of profile that can be any of the following values.
Notes:

Constant	Meaning
ATTRIB_TRANSPARENCY	Turns transparency on. If this flag is not used, the attribute is reflective by default.
ATTRIB_MATTE	Turns matte display on. If this flag is not used, the attribute is glossy by default.

(Read and Write property)

183.2.5 Attributes1 as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Attributes of profile that can be any of the following values.
Notes:

Constant	Meaning
ATTRIB_TRANSPARENCY	Turns transparency on. If this flag is not used, the attribute is reflective by default.
ATTRIB_MATTE	Turns matte display on. If this flag is not used, the attribute is glossy by default.

(Read and Write property)

183.2.6 Classs as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates the profile class.
Notes:

For a description of profile classes, see Using Device Profiles with WCS.
http://msdn.microsoft.com/en-us/library/dd372213(v=VS.85).aspx

A profile class may have any of the following values.

Profile Class	Signature
Input Device Profile	CLASS_SCANNER
Display Device Profile	CLASS_MONITOR
Output Device Profile	CLASS_PRINTER
Device Link Profile	CLASS_LINK
Color Space Conversion Profile	CLASS_COLORSPACE
Abstract Profile	CLASS_ABSTRACT
Named Color Profile	CLASS_NAMED
Color Appearance Model Profile	CLASS_CAMP
Color Gamut Map Model Profile	CLASS_GMMP

(Read and Write property)

183.2.7 CMMType as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The identification number of the CMM that is used in the profile.

Notes:

Identification numbers are registered with the ICC.
(Read and Write property)

183.2.8 ConnectionSpace as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A signature value that indicates the color space in which the profile connection space (PCS) is defined.
Notes:

Can be any of the following values: SPACE_XYZ or SPACE_Lab

When the Classs member is set to CLASS_LINK, the PCS is taken from the DataColorSpace member.
(Read and Write property)

183.2.9 Creator as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Signature of the software that created the profile.
Notes:

Signatures are registered with the ICC.
(Read and Write property)

183.2.10 DataColorSpace as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A signature value that indicates the color space in which the profile data is defined.
Notes:

Can be any value from the SPACE_* Constants.
(Read and Write property)

183.2.11 DeviceClass as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates the device class.
Notes:

A device class may have one of the following values.

Profile Class	Signature
Input Device Profile	CLASS_SCANNER
Display Device Profile	CLASS_MONITOR
Output Device Profile	CLASS_PRINTER

(Read and Write property)

183.2.12 DeviceName as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** User friendly name of the device.
Notes: (Read and Write property)

183.2.13 DitheringMode as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates the style of dithering that will be used when an image is displayed.
Notes: (Read and Write property)

183.2.14 Fields as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates which fields in this class are being used.
Notes:

Can be set to any combination of the following constant values:

ET_DEVICENAME
ET_MEDIATYPE
ET_DITHERMODE
ET_RESOLUTION
ET_CMMTYPE
ET_CLASS
ET_DATACOLORSPACE
ET_CONNECTIONSPACE
ET_SIGNATURE
ET_PLATFORM
ET_PROFILEFLAGS

ET_MANUFACTURER
ET_MODEL
ET_ATTRIBUTES
ET_RENDERINGINTENT
ET_CREATOR
ET_DEVICECLASS
(Read and Write property)

183.2.15 Manufacturer as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The identification number of the device profile manufacturer.
Notes:

All manufacturer identification numbers are registered with the ICC.
(Read and Write property)

183.2.16 MediaType as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates which type of media is associated with the profile, such as a printer or screen.
Notes: (Read and Write property)

183.2.17 Model as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device manufacturer's device model number.
Notes:

All model identification numbers are registered with the ICC.
(Read and Write property)

183.2.18 Platform as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The primary platform for which the profile was created.
Notes:

The member can be set to any of the following values.

Platform	Value
Apple Computer, Inc.	'APPL'
Microsoft Corp.	'MSFT'
Silicon Graphics, Inc.	'SGI'
Sun Microsystems, Inc.	'SUNW'
Taligent	'TGNT'

(Read and Write property)

183.2.19 ProfileFlags as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Bit flags containing hints that the CMM uses to interpret the profile data and can be set to one of the following values.
Notes:

Constant	Meaning
FLAG_EMBEDDEDPROFILE	The profile is embedded in a bitmap file.
FLAG_DEPENDENTONDATA	The profile can't be used independently of the embedded color data. Used for profiles that are embedded in bitmap files.

(Read and Write property)

183.2.20 RenderingIntent as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The profile rendering intent.
Notes:

The member can be set to one of the following values:

INTENT_PERCEPTUALINTENT_SATURATIONINTENT_RELATIVE_COLORIMETRICINTENT_ABSOLUTE_COLORIMETRIC

For more information, see Rendering Intents.
http://msdn.microsoft.com/en-us/library/dd372183(v=VS.85).aspx
(Read and Write property)

183.2.21 ResolutionX as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The horizontal resolution in pixels of the device on which the image will be displayed.
Notes: (Read and Write property)

183.2.22 ResolutionY as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The vertical resolution in pixels of the device on which the image will be displayed.
Notes: (Read and Write property)

183.2.23 Signature as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reserved for internal use.
Notes: (Read and Write property)

183.2.24 Constants

183.2.25 ATTRIB_MATTE = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the attribute constants.
Notes: Turns matte display on. If this flag is not used, the attribute is glossy by default.

183.2.26 ATTRIB_TRANSPARENCY = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the attribute constants.
Notes: Turns transparency on. If this flag is not used, the attribute is reflective by default.

183.2.27 CLASS_ABSTRACT = & h61627374

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.

183.2.28 CLASS_CAMP = & h6C616D70

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.

183.2.29 CLASS_COLORSPACE = & h73706163

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.

183.2.30 CLASS_GMMP = & h676D6D70

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.

183.2.31 CLASS_LINK = & h6C696E6B

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the constants to specify which property in this class is used.

183.2.50 ET_RENDERINGINTENT = & h04000

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the constants to specify which property in this class is used.

183.2.51 ET_RESOLUTION = & h00008

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the constants to specify which property in this class is used.

183.2.52 ET_SIGNATURE = & h00100

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the constants to specify which property in this class is used.

183.2.53 FLAG_DEPENDENTONDATA = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile flag constants.
Notes: The profile can't be used independently of the embedded color data. Used for profiles that are embedded in bitmap files.

183.2.54 FLAG_EMBEDDEDPROFILE = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile flag constants.
Notes: The profile is embedded in a bitmap file.

183.2.55 FLAG_ENABLE_CHROMATIC_ADAPTATION = & h02000000

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile flag constants.

183.2.56 SigMacintosh = & h4150504C

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the platform signatures.
Notes: APPL = Apple Computer, Inc.

183.2.57 SigMicrosoft = & h4D534654

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the platform signatures.
Notes: MSFT = Microsoft Corp.

183.2.58 SigSGI = & h53474920

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the platform signatures.
Notes: SGI = Silicon Graphics, Inc.

183.2.59 SigSolaris = & h53554E57

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the platform signatures.
Notes: SUNW = Sun Microsystems, Inc.

183.2.60 SigTaligent = & h54474E54

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the platform signatures.
Notes: TGNT = Taligent

183.2.61 SPACE_Lab = & h4C616220

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space constants.
Notes: Lab

183.2.62 SPACE_XYZ = & h58595A20

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space constants.
Notes: XYZ

183.3 class WindowsICMLogColorSpaceMBS

183.3.1 class WindowsICMLogColorSpaceMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This class contains information that defines a logical color space.
Notes:

If the CSType member is set to LCS_sRGB or LCS_WINDOWS_COLOR_SPACE, the other members of this structure are ignored, and WCS uses the sRGB color space. The Endpoints, GammaRed, GammaGreen, and GammaBlue members are used to describe the logical color space. The Endpoints member is a CIEXYZTRIPLE that contains the x, y, and z values of the color space's RGB endpoint.

The required DWORD bit format for the GammaRed, GammaGreen, and GammaBlue is an 8.8 fixed point interger left-shifted by 8 bits. The plugin takes care about that detail.

Whenever the Filename member contains a file name and the CSType member is set to LCS_CALIBRATED_RGB, WCS ignores the other members of this class. It uses the color space in the file as the color space to which this LOGCOLORSPACE structure refers.

The relation between tri-stimulus values X,Y,Z and chromaticity values x,y,z is as follows:

x = X/(X+Y+Z)
y = Y/(X+Y+Z)
z = Z/(X+Y+Z)

If the CSType member is set to LCS_sRGB or LCS_WINDOWS_COLOR_SPACE, the other members of this structure are ignored, and ICM uses the sRGB color space. Appliations should still initialize the rest of the structure since CreateProfileFromLogColorSpace ignores CSType member and uses Endpoints, GammaRed, GammaGreen, GammaBlue members to create a profile, which may not be initialized in case of LCS_sRGB or LCS_WINDOWS_COLOR_SPACE color spaces.

183.3.2 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

183.3.3 Properties

183.3.4 CSType as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Color space type.

Notes:

The member can be one of the following values.

Value	Meaning
LCS_CALIBRATED_RGB	Color values are calibrated RGB values. The values are translated using the endpoints specified by the lcsEndpoints member before being passed to the device.
LCS_sRGB	Color values are values are sRGB values.
LCS_WINDOWS_COLOR_SPACE	Color values are Windows default color space color values.

(Read and Write property)

183.3.5 EndpointsBX as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The X value of the Blue Endpoint.
Notes: (Read and Write property)

183.3.6 EndpointsBY as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Y value of the Blue Endpoint.
Notes: (Read and Write property)

183.3.7 EndpointsBZ as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Z value of the Blue Endpoint.
Notes: (Read and Write property)

183.3.8 EndpointsGX as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The X value of the Green Endpoint.
Notes: (Read and Write property)

183.3.9 EndpointsGY as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Y value of the Green Endpoint.
Notes: (Read and Write property)

183.3.10 EndpointsGZ as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Z value of the Green Endpoint.
Notes: (Read and Write property)

183.3.11 EndpointsRX as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The X value of the Red Endpoint.
Notes: (Read and Write property)

183.3.12 EndpointsRY as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Y value of the Red Endpoint.
Notes: (Read and Write property)

183.3.13 EndpointsRZ as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Z value of the Red Endpoint.
Notes: (Read and Write property)

183.3.14 Filename as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string that names a color profile file.
Notes:

This member is typically set to "", but may be used to set the color space to be exactly as specified by the color profile. This is useful for devices that input color values for a specific printer, or when using an

installable image color matcher. If a color profile is specified, all other members of this class should be set to reasonable values, even if the values are not completely accurate.
(Read and Write property)

183.3.15 GammaBlue as Double

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Scale of the blue coordinate.
Notes: (Read and Write property)

183.3.16 GammaGreen as Double

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Scale of the green coordinate.
Notes: (Read and Write property)

183.3.17 GammaRed as Double

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Scale of the red coordinate.
Notes: (Read and Write property)

183.3.18 Intent as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The gamut mapping method.
Notes:

This member can be one of the following values.

Value	Value	Intent	ICC Name	Meaning
LCS_GM_BUSINESS	1	Graphic	Saturation	Maintain saturation. Used for business charts and other situations in which undithered colors are required.
LCS_GM_GRAPHICS	2	Proof	Relative Colorimetric	Maintain colorimetric match. Used for graphic designs and named colors.
LCS_GM_IMAGES	4	Picture	Perceptual	Maintain contrast. Used for photographs and natural images.
LCS_GM_ABS_COLORIMETRIC	8	Match	Absolute Colorimetric	Maintain the white point. Match the colors to their nearest color in the destination gamut.

(Read and Write property)

183.3.19 Constants

183.3.20 INTENT_ABSOLUTE_COLORIMETRIC = 3

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants.
Notes: Maintain the white point. Match the colors to their nearest color in the destination gamut.

183.3.21 INTENT_PERCEPTUAL = 0

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants.
Notes: Maintain contrast. Used for photographs and natural images.

183.3.22 INTENT_RELATIVE_COLORIMETRIC = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants.
Notes: Maintain colorimetric match. Used for graphic designs and named colors.

183.3.23 INTENT_SATURATION = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants.
Notes: Maintain saturation. Used for business charts and other situations in which undithered colors are required.

183.3.24 LCS_CALIBRATED_RGB = 0

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space type constants.
Notes: Color values are calibrated RGB values. The values are translated using the endpoints specified by the Endpoints member before being passed to the device.

183.3.25 LCS_sRGB = & h73524742

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space type constants.
Notes: Color values are values are sRGB values.

183.3.26 LCS_WINDOWS_COLOR_SPACE = & h57696E20

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space type constants.
Notes: Color values are Windows default color space color values.

183.4 module WindowsICMModuleMBS

183.4.1 module WindowsICMModuleMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The main module for Windows Image Color Matching functions.

183.4.2 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

183.4.3 Methods

183.4.4 AssociateColorProfileWithDevice(ProfileName as string, DeviceName as string) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The AssociateColorProfileWithDevice function associates a specified color profile with a specified device.
Notes:

ProfileName: The file name of the profile to associate.
DeviceName: The name of the device to associate.

Returns true on success and false on failure.

The AssociateColorProfileWithDevice function will fail if the profile has not been installed on the computer using the InstallColorProfile function.

Note that under Windows (Windows 95 or later), the PostScript device driver for printers assumes a CMYK color model. Therefore, all PostScript printers must use a CMYK color profile. Windows 2000 does not have this limitation.

If the specified device is a monitor, this function updates the default profile.

Several profiles are typically associated with printers, based on paper and ink types. There is no default. The GDI selects the best one from the associated profiles when your application creates a device context (DC).

Scanners also have no default profile. However, it is atypical to associate more than one profile with a scanner.

AssociateColorProfileWithDevice always adds the specified profile to the current user's per-user profile as-

sociation list for the specified device. Before adding the profile to the list, AssociateColorProfileWithDevice determines whether the user has previously expressed the desire to use a per-user profile association list for the device. If so, then AssociateColorProfileWithDevice simply adds the specified profile to the existing per-user profile association list for the device. If not, then AssociateColorProfileWithDevice creates a new per-user profile association list for the device by copying the system-wide association list for that device. It then appends the specified profile to the per-user list. From that point on, the current user will be using a per-user profile association list for the specified device, as if SetUsePerUserProfiles had been called for Device with the usePerUserProfiles parameter set to TRUE.

183.4.5 DisassociateColorProfileFromDevice(ProfileName as string, DeviceName as string) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The DisassociateColorProfileFromDevice function disassociates a specified color profile with a specified device on a specified computer.
Notes:

Returns true on success and false on failure.

ProfileName: The file name of the profile to disassociate.
DeviceName: The name of the device to disassociate.

If more than one profile is associated with a device, WCS uses the last one associated as the default. That is, if your application sequentially associates three profiles with a device, WCS will use the last one associated as the default. If your application then calls the DisassociateColorProfileFromDevice function to disassociate the third profile (which is the default in this example), the WCS will use the second profile as the default.

If your application disassociates all profiles from a device, WCS uses the sRGB profile as the default.

DisassociateColorProfileFromDevice always removes the specified profile from the current user's per-user profile association list for the specified device. Before removing the profile from the list, DisassociateColorProfileFromDevice determines whether the user has previously expressed the desire to use a per-user profile association list for the device. If so, then DisassociateColorProfileFromDevice simply removes the specified profile from the existing per-user profile association list for the device. If not, then DisassociateColorProfileFromDevice creates a new per-user profile association list for the device by copying the system-wide association list for that device. It then removes the specified profile from the per-user list. From that point on, the current user will be using a per-user profile association list for the specified device, as if SetUsePerUserProfiles had been called for Device with the usePerUserProfiles parameter set to TRUE.

183.4.6 EnumColorProfiles(criterias as WindowsICMEnumMBS) as string()

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The EnumColorProfiles function enumerates all the profiles satisfying the given enumeration criteria.
Example:

```
dim c as new WindowsICMEnumMBS // no options set

dim a(-1) as string = WindowsICMModuleMBS.EnumColorProfiles(c)

for each s as string in a
MsgBox s
next
```

Notes:

On success the function returns an array of profile names.

Several profiles are typically associated with printers, based on the paper and ink types. There is a default profile for each device. For International Color Consortium (ICC) profiles, GDI selects the best one from the ICC-associated profiles when your application creates a device context (DC).

Do not attempt to use EnumColorProfiles to determine the default profile for a device. Instead, create a device context for the device and then invoke the GetICMProfile function. On Windows Vista and Windows 7, the WcsGetDefaultColorProfile function can also be used to determine a device's default color profile.

If the Fields member of WindowsICMEnumMBS that is pointed to by the criterias parameter is set to ET_DEVICENAME, this function will enumerate all of the color profiles associated with all types of devices attached to the user's computer, regardless of the device class. If the Fields member is set to ET_DEVICENAME or ET_DEVICECLASS and a device class is specified in the DeviceClass member, this function will only enumerate the profiles associated with the specified device class. If the Fields member is set only to ET_DEVICECLASS, the EnumColorProfiles function will enumerate all profiles that can be associated with that type of device.

Whenever EnumColorProfiles is examining the profiles associated with a specific device, the results depend on whether the user has chosen to use the system-wide list of profiles associated with that device, or his or her own ("per-user") list. Calling SetUsePerUserProfiles with its usePerUserProfiles parameter set to TRUE causes future calls to EnumColorProfiles to look at only the current user's per-user list of profile associations for the specified device. Calling WcsSetUsePerUserProfiles with its usePerUserProfiles parameter set to FALSE causes future calls to EnumColorProfiles to look at the system-wide list of profile associations for the specified device. If SetUsePerUserProfiles has never been called for the current user, EnumColorProfiles examines the system-wide list.

This function will provide the information for converting WCS-specific DMP information to the legacy

EnumType record in enable consistent profile enumeration. The defaults will be the same as ICC if this information is not present.

Per-user/LUA support

The enumeration is specific to current user. Both system wide and current user device associations are considered. For default profile configuration, current user settings override system wide ones.

183.4.7 GetColorDirectory as folderitem

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GetColorDirectory function retrieves the path of the Windows COLOR directory on a specified machine.
Example:

```
dim f as FolderItem = WindowsICMModuleMBS.GetColorDirectory

if f=nil then
MsgBox "No path?"
else
MsgBox f.NativePath
end if
```

Notes: On success returns folderitem for color directory. Returns nil on any error.

183.4.8 GetStandardColorSpaceProfile(ProfileID as Integer) as string

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GetStandardColorSpaceProfile function retrieves the color profile registered for the specified standard color space.
Example:

```
MsgBox WindowsICMModuleMBS.GetStandardColorSpaceProfile(WindowsICMModuleMBS.LCS_WINDOWS_COLOR_S
```

Notes:

ProfileID: Specifies the ID value of the standard color space for which to retrieve the profile. The only valid values for this parameter are LCS_sRGB and LCS_WINDOWS_COLOR_SPACE.

This function supports Windows Color System (WCS) device model profiles (DMPs) in addition to International Color Consortium (ICC) profiles. It does not support WCS CAMP or GMMP profiles and will return

an error if such profiles are used.

Overview of Windows Vista Specific Functionality

This will support WCS DMPs in addition to ICC profiles. It will not support WCS CAMP or GMMP profiles and will return an error if such profiles are used with this API.

Per-user/LUA support

This will retrieve the color profile registered for the given standard color space for current user. If there is no such setting for the current user, it retrieves the system wide setting.

This uses WcsGetDefaultColorProfile with WCS_PROFILE_MANAGEMENT_SCOPE_CURRENT_USER.

This is executable in LUA context.

183.4.9 InstallColorProfile(file as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The InstallColorProfile function installs a given profile for use on a specified machine.
Notes:

The profile is also copied to the COLOR directory.
Returns true on success and false on failure.

183.4.10 RegisterCMM(cmmID as Integer, file as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** RegisterCMM associates a specified identification value with the specified color management module dynamic link library (CMM DLL).
Notes:

When this ID appears in a color profile, Windows can then locate the corresponding CMM so as to create a transform.

cmmID: Specifies the ID signature of the CMM registered with the International Color Consortium (ICC).

file: Points to the CMM DLL.

Returns true on success and false on failure.

183.4.11 SelectCMM(cmmID as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** SelectCMM allows an application to select the preferred color management module (CMM) to use.
Notes:

cmmID: Specifies the signature of the desired CMM as registered with the International Color Consortium (ICC).

Windows 2000 only: Setting this parameter to 0 causes the WCS system to select the default CMM.

Returns true on success and false on failure.

183.4.12 SetStandardColorSpaceProfile(ProfileID as Integer, ProfileName as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The SetStandardColorSpaceProfile function registers a specified profile for a given standard color space.
Notes:

The profile can be queried using GetStandardColorSpaceProfile.

ProfileID: Specifies the ID value of the standard color space that the given profile represents.
Profilename: path to the profile file.

Returns true on success and false on failure.

The profile must already be installed on the system before it can be registered for a standard color space.

This function supports Windows Color System (WCS) device model profiles (DMPs) in addition to International Color Consortium (ICC) profiles. It does not support WCS CAMP or GMMP profiles and will return an error if such profiles are used.

Per-user/LUA support

This will register a specified profile for a given standard color space only for current user.

This uses SetDefaultColorProfile with WCS_PROFILE_MANAGEMENT_SCOPE_CURRENT_USER.

This is executable in LUA context if the profile is already installed, fails otherwise with access denied since install is system-wide and requires administrator privileges.

183.4.13 UninstallColorProfile(ProfileName as string, DeleteFile as boolean = true) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** UninstallColorProfile removes a specified color profile from a specified computer. Associated files are optionally deleted from the system.
Notes:

ProfileName: Points to the file name of the profile to uninstall.

DeleteFile: If set to true, the function deletes the profile from the COLOR directory. If set to false, this function has no effect.

Returns true on success and false on failure.

183.4.14 UnregisterCMM(cmmID as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The UnregisterCMM function dissociates a specified ID value from a given color management module dynamic-link library (CMM DLL).
Notes:

cmmID: Specifies the ID value identifying the CMM whose registration is to be removed. This is the signature of the CMM registered with the International Color Consortium (ICC).

Returns true on success and false on failure.

183.4.15 Constants

183.4.16 CMM_DESCRIPTION = 5

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.
Notes: A text string that describes the color management module.

183.4.17 CMM_DLL_VERSION = 3

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.
Notes: Version number of the CMM DLL.

183.4.18 CMM_DRIVER_VERSION = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.

183.4.19 CMM_IDENT = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.
Notes: The CMM identification signature registered with the International Color Consortium (ICC).

183.4.20 CMM_LOGOICON = 6

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.
Notes: The logo icon for this CMM.

183.4.21 CMM_VERSION = 4

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.
Notes: Version of Windows supported.

183.4.22 CMM_WIN_VERSION = 0

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.
Notes: Backward compatibility with Windows 95.

183.4.23 LCS_sRGB = & h73524742

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile IDs for GetStandardColorSpaceProfile.
Example:

MsgBox WindowsICMModuleMBS.GetStandardColorSpaceProfile(WindowsICMModuleMBS.LCS_sRGB)

183.4.24 LCS_WINDOWS_COLOR_SPACE = & h57696E20

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile IDs for GetStandardColorSpaceProfile.
Example:

MsgBox WindowsICMModuleMBS.GetStandardColorSpaceProfile(WindowsICMModuleMBS.LCS_WINDOWS_COLOR_S

183.5 class WindowsICMNamedProfileInfoMBS

183.5.1 class WindowsICMNamedProfileInfoMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This class is used to store information about a named color profile.

183.5.2 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

183.5.3 Properties

183.5.4 Count as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Total number of named colors in the profile.
Notes: (Read and Write property)

183.5.5 CountDevCoordinates as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Total number of device coordinates for each named color.
Notes: (Read and Write property)

183.5.6 Flags as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Flags for this information record.
Notes:

Not currently used by the default CMM.
(Read and Write property)

183.5.7 Prefix as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string containing the prefix for each color name.

Notes: (Read and Write property)

183.5.8 Suffix as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string containing the suffix for each color name.
Notes: (Read and Write property)

183.6 class WindowsICMProfileHeaderMBS

183.6.1 class WindowsICMProfileHeaderMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This class contains information that describes the contents of a device profile file.
Notes: This header occurs at the beginning of a device profile file.

183.6.2 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

183.6.3 Properties

183.6.4 Attributes0 as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Attributes of profile.
Notes: (Read and Write property)

183.6.5 Attributes1 as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Attributes of profile.
Notes: (Read and Write property)

183.6.6 Classs as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates the profile class.
Example:

```
// some profile file
dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")

// open profile read only
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PRO-
FILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXIST-
ING)
```

```
// get headers
dim h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader

// show color space name
Select case h.Classs
case WindowsICMProfileHeaderMBS.CLASS_MONITOR
msgbox "Monitor"
case WindowsICMProfileHeaderMBS.CLASS_PRINTER
msgbox "Printer"
case WindowsICMProfileHeaderMBS.CLASS_SCANNER
msgbox "Scanner"
case WindowsICMProfileHeaderMBS.CLASS_LINK
msgbox "Link"
case WindowsICMProfileHeaderMBS.CLASS_ABSTRACT
msgbox "Abstract"
case WindowsICMProfileHeaderMBS.CLASS_COLORSPACE
msgbox "Colorspace"
case WindowsICMProfileHeaderMBS.CLASS_NAMED
msgbox "Named"
case WindowsICMProfileHeaderMBS.CLASS_CAMP
msgbox "Camp"
case WindowsICMProfileHeaderMBS.CLASS_GMMP
msgbox "GNMP"
else
msgbox "Unknown: "+hex(h.Classs)
end Select
```

Notes:

For a description of profile classes, see Using Device Profiles with WCS:
http://msdn.microsoft.com/en-us/library/dd372213(v=VS.85).aspx

A profile class may have any of the values from the CLASS_* constants.

Class is written with three s here as Class is a reserved word in Xojo.
(Read and Write property)

183.6.7 CMMType as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The identification number of the CMM that is used in the profile.
Notes:

Identification numbers are registered with the ICC.

(Read and Write property)

183.6.8 ConnectionSpace as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A signature value that indicates the color space in which the profile connection space (PCS) is defined.
Notes:

The member can be any of the following values: SPACE_XYZ or SPACE_Lab.
(Read and Write property)

183.6.9 Creator as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Signature of the software that created the profile.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PRO-
FILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXIST-
ING)
dim h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader

MsgBox hex(h.Creator)
```

Notes:

Signatures are registered with the ICC.
(Read and Write property)

183.6.10 DataColorSpace as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A signature value that indicates the color space in which the profile data is defined.
Example:

```
function Name() as string
dim w as WindowsICMProfileMBS // your profile
dim h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader

if h=nil then Return "?"
```

```
Select case h.DataColorSpace
case WindowsICMProfileHeaderMBS.SPACE_XYZ
Return "XYZ"
case WindowsICMProfileHeaderMBS.SPACE_Lab
Return "Lab"
case WindowsICMProfileHeaderMBS.SPACE_Luv
Return "Luv"
case WindowsICMProfileHeaderMBS.SPACE_YCbCr
Return "YCbCr"
case WindowsICMProfileHeaderMBS.SPACE_Yxy
Return "Yxy"
case WindowsICMProfileHeaderMBS.SPACE_RGB
Return "RGB"
case WindowsICMProfileHeaderMBS.SPACE_GRAY
Return "GRAY"
case WindowsICMProfileHeaderMBS.SPACE_HSV
Return "HSV"
case WindowsICMProfileHeaderMBS.SPACE_HLS
Return "HLS"
case WindowsICMProfileHeaderMBS.SPACE_CMYK
Return "CMYK"
case WindowsICMProfileHeaderMBS.SPACE_CMY
Return "CMY"
case WindowsICMProfileHeaderMBS.SPACE_2_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_3_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_4_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_5_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_6_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_7_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_8_CHANNEL
Return "2 Channel"
else
Return "Unknown: "+hex(h.DataColorSpace)
end Select
end function
```

Notes:

The member can be any of value from the SPACE_* Constants.
(Read and Write property)

183.6.11 DateTime0 as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The data and time that the profile was created.
Notes: (Read and Write property)

183.6.12 DateTime1 as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The data and time that the profile was created.
Notes: (Read and Write property)

183.6.13 DateTime2 as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The data and time that the profile was created.
Notes: (Read and Write property)

183.6.14 IlluminantX as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** X value of the Profile illuminant.
Notes: (Read and Write property)

183.6.15 IlluminantY as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Y value of the Profile illuminant.
Notes: (Read and Write property)

183.6.16 IlluminantZ as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Z value of the Profile illuminant.
Notes: (Read and Write property)

183.6.17 Manufacturer as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The identification number of the device profile manufacturer.
Notes:

All manufacturer identification numbers are registered with the ICC.
(Read and Write property)

183.6.18 Model as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device manufacturer's device model number.
Notes:

All model identification numbers are registered with the ICC.
(Read and Write property)

183.6.19 Platform as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The primary platform for which the profile was created.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PRO-
FILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXIST-
ING)
dim h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader

MsgBox DecodingFromHexMBS(hex(h.Platform)) // shows platform, e.g. "APPL"
```

Notes:

The primary platform can be set to any of the following values.

Platform	Value
Apple Computer, Inc.	'APPL'
Microsoft Corp.	'MSFT'
Silicon Graphics, Inc.	'SGI'
Sun Microsystems, Inc.	'SUNW'
Taligent	'TGNT'

(Read and Write property)

183.6.20 ProfileFlags as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Bit flags containing hints that the CMM uses to interpret the profile data.
Notes:

The member can be set to the following values.

Constant	Meaning
FLAG_EMBEDDEDPROFILE	The profile is embedded in a bitmap file.
FLAG_DEPENDENTONDATA	The profile can't be used independently of the embedded color data. Used for profiles that are embedded in bitmap files.

(Read and Write property)

183.6.21 RenderingIntent as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The profile rendering intent.
Notes:

The member can be set to one of the following values:

INTENT_PERCEPTUALINTENT_SATURATIONINTENT_RELATIVE_COLORIMETRICINTENT_ABSOLUTE_COLORIMETRIC

For more information, see Rendering Intents.
http://msdn.microsoft.com/en-us/library/dd372183(v=VS.85).aspx
(Read and Write property)

183.6.22 Signature as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reserved for internal use.
Notes: (Read and Write property)

183.6.23 Version as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The version number of the profile.
Notes:

The version number is determined by the ICC. The current major version number is & h02. The current minor version number is & h10. The major and minor version numbers are in binary coded decimal (BCD). They must be stored in the following format.

Byte Number	Contents
0	Major version number in BCD.
1	Minor version number in the most significant nibble of this byte. Bug fix version number in the least significant nibble.
2	Reserved. Must be set to 0.
3	Reserved. Must be set to 0.

(Read and Write property)

183.6.24 Constants

183.6.25 ATTRIB_MATTE = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the attribute constants.
Notes: Turns matte display on. If this flag is not used, the attribute is glossy by default.

183.6.26 ATTRIB_TRANSPARENCY = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the attribute constants.
Notes: Turns transparency on. If this flag is not used, the attribute is reflective by default.

183.6.27 CLASS_ABSTRACT = & h61627374

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.
Notes: Abstract Profile

183.6.28 CLASS_CAMP = & h6C616D70

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.
Notes: Color Appearance Model Profile

183.6.29 CLASS_COLORSPACE = & h73706163

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.
Notes: Color Space Conversion Profile

183.6.30 CLASS_GMMP = & h676D6D70

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.
Notes: Color Gamut Map Model Profile

183.6.31 CLASS_LINK = & h6C696E6B

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.
Notes: Device Link Profile

183.6.32 CLASS_MONITOR = & h6D6E7472

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.
Notes: Display Device Profile

183.6.33 CLASS_NAMED = & h6E6D636C

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.
Notes: Named Color Profile

183.6.34 CLASS_PRINTER = & h70727472

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.
Notes: Output Device Profile

183.6.35 CLASS_SCANNER = & h73636E72

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.
Notes: Input Device Profile

183.6.36 FLAG_DEPENDENTONDATA = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile flags.
Notes: The profile can't be used independently of the embedded color data. Used for profiles that are embedded in bitmap files.

183.6.37 FLAG_EMBEDDEDPROFILE = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile flags.
Notes: The profile is embedded in a bitmap file.

183.6.38 FLAG_ENABLE_CHROMATIC_ADAPTATION = & h02000000

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile flags.

183.6.39 SPACE_2_CHANNEL = & h32434C52

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space constants.
Notes: Generic 2 channel

183.6.40 SPACE_3_CHANNEL = & h33434C52

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space constants.
Notes: Generic 3 channel

183.6.41 SPACE_4_CHANNEL = & h34434C52

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space constants.
Notes: Yxy

183.7 class WindowsICMProfileMBS

183.7.1 class WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a color profile.

183.7.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.1pr4
- MBS Xojo / Real Studio Plugins, version 14.1pr3
- MBS Real Studio Plugins, version 11.1pr11

183.7.3 Methods

183.7.4 ConvertColorNameToIndex(name as string) as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The CMConvertColorNameToIndex function converts color names in a named color space to index numbers in a color profile.
Notes:

name: The name of the color.

Returns the color index.

This function is required in the default CMM. It is optional for all other CMMs.

183.7.5 ConvertIndexToColorName(index as Integer) as string

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The ConvertIndexToColorName transforms indices in a color space to an array of names in a named color space.
Notes: This function is required in the default CMM. It is optional for all other CMMs.

183.7.6 CountColorProfileElements as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GetCountColorProfileElements function retrieves the number of tagged elements in a given color profile.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)

MsgBox "CountColorProfileElements: "+str(w.CountColorProfileElements)
```

Notes:

Returns number of tagged elements in the profile or 0 on any error.
This function will fail if hProfile is not a valid ICC profile.
This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP.

183.7.7 CreateIccProfile(options as Integer = 0) as WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Converts a WCS profile into an International Color Consortium (ICC) profile.
Notes:

Options: A flag value that specifies the profile conversion options.By default, the original WCS profiles used for the conversion are embedded in the output ICC profile in a Microsoft private tag, ProfilesTag (with signature "MS000". This produces an ICC profile that is compatible with ICC software, yet retains the original WCS profile data available to code designed to parse it.The possible values of this parameter are as follows. Any bits not defined in this list are reserved and should be set to zero:

WCS_DEFAULT	Specifies that the new ICC profile contains the original WCS profile in a private ProfilesTag.
WCS_ICCONLY	Specifies that the new ICC profile does not contain either the ProfilesTag or the original WCS profile.

Returns new profile object.

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/dd372239(v=vs.85).aspx

183.7.8 GetColorProfileElement(tag as Integer) as string

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GetColorProfileElement function copies data from a specified tagged profile element of a specified color profile into a buffer.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("sRGB Profile.icc")
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)

MsgBox w.GetColorProfileElement(& h64657363) // that's the code for desc, the description
```

Notes:

tag: Identifies the tagged element from which to copy.

This function will fail if Profile is not a valid International Color Consortium (ICC) profile.

This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because profile elements are implicitly associated with, and hard coded to, ICC tag types and there exist many robust XML parsing libraries.

183.7.9 GetColorProfileElementTag(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GetColorProfileElementTag function retrieves the tag name specified by dwIndex in the tag table of a given International Color Consortium (ICC) color profile, where Index is a one-based index into that table.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)
dim list(-1) as string
dim c as Integer = w.CountColorProfileElements-1

for i as Integer = 0 to c
list.Append DecodingFromHexMBS(hex(w.GetColorProfileElementTag(i)))
next

MsgBox "Tags: "+Join(list, ", ")
```

Notes:

Index: Specifies the one-based index of the tag to retrieve.

This function will fail if Profile is not a valid ICC profile.

GetColorProfileElementTag can be used to enumerate all tags in a profile after getting the number of tags in the profile using GetCountColorProfileElements.

This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because profile elements are implicitly associated with, and hard coded to, ICC tag types and there exist many robust XML parsing libraries.

183.7.10 GetNamedProfileInfo as WindowsICMNamedProfileInfoMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GetNamedProfileInfo function retrieves information about the International Color Consortium (ICC) named color profile that is specified in the first parameter.
Notes:

This function will fail if hProfile is not a valid ICC profile.
This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because named profiles are explicit ICC profile types.
Returns nil on any error.

183.7.11 GetProfileData as string

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Given valid color profile, the GetProfileData function will return the contents of the profile.
Notes:

If the object is a Windows Color System (WCS) handle, then the DMP is returned and the CAMP and GMMP associated with the HPROFILE are ignored.

Returns the data or an empty string on any error.
See GetColorProfileFromHandle in MSDN documentation.

183.7.12 IsColorProfileTagPresent(tag as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The IsColorProfileTagPresent function reports whether a specified International Color Consortium (ICC) tag is present in the specified color profile.
Notes:

tag: Specifies the ICC tag to check.

Returns true if the tag is valid and false if not.

This function will fail if Profile is not a valid ICC profile.

This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because profile elements are implicitly associated with and hard coded to ICC tag types and there exist many robust XML parsing libraries.

183.7.13 IsValid as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The IsValid function reports whether the given profile is a valid ICC profile that can be used for color management.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)

MsgBox "Valid: "+str(w.IsValid)
```

Notes:

Returns true if the profile is valid.

Only the Windows default CMM is required to export this function; it is optional for all other CMMs.

If a CMM does not support this function, Windows uses the default CMM to validate the profile.

183.7.14 OpenProfileData(data as string, DesiredAccess as Integer) as WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The OpenColorProfile function opens or create a color profile.
Notes:

file: The file where to load profile from.
DesiredAccess: Specifies how to access the given profile. This parameter must take one the following constant values.

Value	Meaning
PROFILE_READ	Opens the profile for read access.
PROFILE_READWRITE	Opens the profile for both read and write access. Has no effect for WCS XML profiles.

Returns the profile on success and nil on error.

For ICC and WCS profiles, a CAMP and GMMP are provided by the function based on the current default CAMP and GMMP in the registry.

When OpenColorProfile encounters an ICC profile with an embedded WCS profile, and if the dwType member within the Profile structure does not take the value DONT_USE_EMBEDDED_WCS_PROFILES, it should extract and use the WCS profile(s) contained in this WcsProfilesTag. The HPROFILE returned would be a WCS HPROFILE.

When the function opens the ICC profile, it will look for a WcsProfilesTag and, if there is one, it will extract and use the original WCS profiles contained therein. (See WcsCreateIccProfile.)

An profile with WCS profile information is derived from a DMP by acquiring the default CAMP and default GMMP from the registry. An HPROFILE is a composition of a DMP, CAMP and GMMP.

183.7.15 OpenProfileFile(file as folderitem, DesiredAccess as Integer, ShareMode as Integer, CreationMode as Integer) as WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The OpenColorProfile function opens or create a color profile.
Notes:

file: The file where to load profile from.
DesiredAccess: Specifies how to access the given profile. This parameter must take one the following constant values.

Value	Meaning
PROFILE_READ	Opens the profile for read access.
PROFILE_READWRITE	Opens the profile for both read and write access. Has no effect for WCS XML profiles.

ShareMode: Specifies how the profile should be shared, if the profile is contained in a file. A value of zero prevents the profile from being shared at all. The parameter can contain one or both of the following constants (combined by addition or logical OR).

Value	Meaning
FILE_SHARE_READ	Other open operations can be performed on the profile for read access.
FILE_SHARE_WRITE	Other open operations can be performed on the profile for write access. Has no effect for WCS XML profiles.

CreationMode: Specifies which actions to take on the profile while opening it, if it is contained in a file. This parameter must take one of the following constant values.

Value	Meaning
CREATE_NEW	Creates a new profile. Fails if the profile already exists.
CREATE_ALWAYS	Creates a new profile. Overwrites the profile if it exists.
OPEN_EXISTING	Opens the profile. Fails if it does not exist
OPEN_ALWAYS	Opens the profile if it exists. For ICC profiles, if the profile does not exist, creates the profile. For WCS XML profiles, if the profile does not exist, returns an error.
TRUNCATE_EXISTING	Opens the profile, and truncates it to zero bytes, returning a blank ICC profile. Fails if the profile doesn't exist.

Returns the profile on success and nil on error.

For ICC and WCS profiles, a CAMP and GMMP are provided by the function based on the current default CAMP and GMMP in the registry.

When OpenColorProfile encounters an ICC profile with an embedded WCS profile, and if the dwType member within the Profile structure does not take the value DONT_USE_EMBEDDED_WCS_PROFILES, it should extract and use the WCS profile(s) contained in this WcsProfilesTag. The HPROFILE returned would be a WCS HPROFILE.

CreationMode flags CREATE_NEW, CREATE_ALWAYS, and TRUNCATE_EXISTING, will always return blank ICC HPROFILEs. If other CreationMode flags are present, InternalOpenColorProfile is called (using the flags as provided by the API) to determine whether the profile is ICC or WCS XML.

Within the ICC code path, an ICC Profile is returned using the requested sharing, access and creation flags as specified in the tables above.

Within the WCS path, the CreationMode flag OPEN_ALWAYS will fail if the profile doesn't exist, since WCS profiles cannot be created or edited within the WCS architecture (they must be edited outside of it, using MSXML6). For the same reason, dwShareMode flag FILE_SHARE_WRITE, and dwDesiredAccess flag PROFILE_READWRITE are ignored within the WCS path.

When the function opens the ICC profile, it will look for a WcsProfilesTag and, if there is one, it will extract and use the original WCS profiles contained therein. (See WcsCreateIccProfile.)

An profile with WCS profile information is derived from a DMP by acquiring the default CAMP and default GMMP from the registry. An HPROFILE is a composition of a DMP, CAMP and GMMP.

183.7.16 OpenProfilePath(path as string, DesiredAccess as Integer, ShareMode as Integer, CreationMode as Integer) as WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The OpenColorProfile function opens or create a color profile.
Notes:

file: The file where to load profile from.
DesiredAccess: Specifies how to access the given profile. This parameter must take one the following constant values.

Value	Meaning
PROFILE_READ	Opens the profile for read access.
PROFILE_READWRITE	Opens the profile for both read and write access. Has no effect for WCS XML profiles.

ShareMode: Specifies how the profile should be shared, if the profile is contained in a file. A value of zero prevents the profile from being shared at all. The parameter can contain one or both of the following constants (combined by addition or logical OR).

Value	Meaning
FILE_SHARE_READ	Other open operations can be performed on the profile for read access.
FILE_SHARE_WRITE	Other open operations can be performed on the profile for write access. Has no effect for WCS XML profiles.

CreationMode: Specifies which actions to take on the profile while opening it, if it is contained in a file. This parameter must take one of the following constant values.

Value	Meaning
CREATE_NEW	Creates a new profile. Fails if the profile already exists.
CREATE_ALWAYS	Creates a new profile. Overwrites the profile if it exists.
OPEN_EXISTING	Opens the profile. Fails if it does not exist
OPEN_ALWAYS	Opens the profile if it exists. For ICC profiles, if the profile does not exist, creates the profile. For WCS XML profiles, if the profile does not exist, returns an error.
TRUNCATE_EXISTING	Opens the profile, and truncates it to zero bytes, returning a blank ICC profile. Fails if the profile doesn't exist.

Returns the profile on success and nil on error.

For ICC and WCS profiles, a CAMP and GMMP are provided by the function based on the current default CAMP and GMMP in the registry.

When OpenColorProfile encounters an ICC profile with an embedded WCS profile, and if the dwType member within the Profile structure does not take the value DONT_USE_EMBEDDED_WCS_PROFILES, it should extract and use the WCS profile(s) contained in this WcsProfilesTag. The HPROFILE returned would be a WCS HPROFILE.

CreationMode flags CREATE_NEW, CREATE_ALWAYS, and TRUNCATE_EXISTING, will always return blank ICC HPROFILEs. If other CreationMode flags are present, InternalOpenColorProfile is called (using the flags as provided by the API) to determine whether the profile is ICC or WCS XML.

Within the ICC code path, an ICC Profile is returned using the requested sharing, access and creation flags as specified in the tables above.

Within the WCS path, the CreationMode flag OPEN_ALWAYS will fail if the profile doesn't exist, since WCS profiles cannot be created or edited within the WCS architecture (they must be edited outside of it, using MSXML6). For the same reason, dwShareMode flag FILE_SHARE_WRITE, and dwDesiredAccess flag PROFILE_READWRITE are ignored within the WCS path.

When the function opens the ICC profile, it will look for a WcsProfilesTag and, if there is one, it will extract and use the original WCS profiles contained therein. (See WcsCreateIccProfile.)

An profile with WCS profile information is derived from a DMP by acquiring the default CAMP and default GMMP from the registry. An HPROFILE is a composition of a DMP, CAMP and GMMP.

183.7.17 SetColorProfileHeader(header as WindowsICMProfileHeaderMBS) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The SetColorProfileHeader function sets the header data in a specified ICC color profile.
Notes:

Header: the profile header data to write to the specified profile.

Returns true on success.

This function will fail if Profile is not a valid ICC profile.

If the color profile was not opened with read/write permission, SetColorProfileHeader fails.

SetColorProfileHeader overwrites the current header in the ICC profile.

This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because profile elements are implicitly associated with and hard coded to ICC tag types and there exist many robust XML parsing libraries.

183.7.18 Properties

183.7.19 ColorProfileHeader as WindowsICMProfileHeaderMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GetColorProfileHeader function retrieves or derives ICC header structure from either ICC color profile or WCS XML profile.
Notes:

Drivers and applications should assume returning TRUE only indicates that a properly structured header is returned. Each tag will still need to be validated independently using either legacy ICM2 APIs or XML schema APIs.

To determine whether the header is derived from an ICC or DMP profile handle, check the header signature (header bytes 36-39). If the signature is "acsp" (big endian) then an ICC profile was used. If the signature is "cdmp" (big-endian) then a DMP was used.

The distinguishing features that identify a header as having been "synthesized" for a WCS DMP are:

WindowsICMProfileHeaderMBS.Signature = 'pmdc' (little endian = big endian 'cdmp')

WindowsICMProfileHeaderMBS.CMMType = '1scw' (little endian = big endian 'wcs1').
(Read only property)

183.7.20 Handle as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference to the object.
Notes:

Value is a HPROFILE.
(Read and Write property)

183.7.21 Constants

183.7.22 CREATE_ALWAYS = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the creation mode constants.
Notes: Creates a new profile. Overwrites the profile if it exists.

183.7.23 CREATE_NEW = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the creation mode constants.
Notes: Creates a new profile. Fails if the profile already exists.

183.7.24 FILE_SHARE_READ = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile sharing flags.
Notes: Other open operations can be performed on the profile for read access.

183.7.25 FILE_SHARE_WRITE = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile sharing flags.
Notes: Other open operations can be performed on the profile for write access. Has no effect for WCS XML profiles.

183.7.26 OPEN_ALWAYS = 4

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the creation mode constants.
Notes: Opens the profile if it exists. For ICC profiles, if the profile does not exist, creates the profile. For WCS XML profiles, if the profile does not exist, returns an error.

183.7.27 OPEN_EXISTING = 3

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the creation mode constants.
Notes: Opens the profile. Fails if it does not exist

183.7.28 PROFILE_READ = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile access flags.
Notes: Opens the profile for read access.

183.7.29 PROFILE_READWRITE = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile access flags.
Notes: Opens the profile for both read and write access. Has no effect for WCS XML profiles.

183.7.30 TRUNCATE_EXISTING = 5

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the creation mode constants.
Notes: Opens the profile, and truncates it to zero bytes, returning a blank ICC profile. Fails if the profile doesn't exist.

183.7.31 WCS_DEFAULT = 0

MBS Win Plugin, Plugin Version: 14.1. **Function:** One of the flags for the CreateICCProfile.
Notes: Specifies that the new ICC profile contains the original WCS profile in a private WcsProfilesTag.

183.7.32 WCS_ICCONLY = & h00010000

MBS Win Plugin, Plugin Version: 14.1. **Function:** One of the flags for the CreateICCProfile.
Notes: Specifies that the new ICC profile does not contain either the WcsProfilesTag or the original WCS

profile.

183.8 class WindowsICMSetupMBS

183.8.1 class WindowsICMSetupMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This class is made to query color matching setup information from the user.
Notes: This class contains information that the Setup function uses to initialize the ColorManagement dialog box. After the user closes the dialog box, Setup returns information about the user's selection in this class.

183.8.2 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

183.8.3 Methods

183.8.4 Setup as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Setup function creates a Color Management dialog box that lets the user choose whether to enable color management, and if so, provides control over the color profiles used and over the rendering intent.
Notes: Returns true if the user clicked OK and false on any error or when dialog was cancelled.

183.8.5 Properties

183.8.6 DisplayName as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string naming the monitor to be used for color management.
Notes:

If this is not the name of a valid monitor, the first enumerated monitor is used.
(Read and Write property)

183.8.7 Flags as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A set of bit flags used to initialize the dialog box.
Notes:

If set to 0 on entry, all controls assume their default states.

When the dialog box returns, these flags are set to indicate the user's input.

See CMS_* flag constants.
(Read and Write property)

183.8.8 MonitorProfile as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string in which to place the name of the user-selected monitor profile.
Notes:

If the CMS_SETMONITORPROFILE flag is used, this flag can also be used to select a profile other than the monitor default when the dialog is first displayed.
(Read and Write property)

183.8.9 Parent as Window

MBS Win Plugin, Plugin Version: 11.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The parent window.
Notes: (Read and Write property)

183.8.10 PrinterName as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string naming the printer on which the image is to be rendered.
Notes:

If this is not a valid printer name, the default printer is used and named in the dialog.
(Read and Write property)

183.8.11 PrinterProfile as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string in which to place the name of the user-selected printer profile.
Notes:

If the CMS_SETPRINTERPROFILE flag is used, this flag can also be used to select a profile other than the printer default when the dialog is first displayed.
(Read and Write property)

183.8.12 ProofingIntent as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The type of color management desired for the proofed image.
Notes:

Valid values are:

INTENT_PERCEPTUAL
INTENT_SATURATION
INTENT_RELATIVE_COLORIMETRIC
INTENT_ABSOLUTE_COLORIMETRIC

For more information, see Rendering Intents.
http://msdn.microsoft.com/en-us/library/dd372183(v=vs.85).aspx
(Read and Write property)

183.8.13 RenderIntent as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The type of color management desired.
Notes:

Valid values are:

INTENT_PERCEPTUAL
INTENT_SATURATION
INTENT_RELATIVE_COLORIMETRIC
INTENT_ABSOLUTE_COLORIMETRIC

For more information, see Rendering Intents.
http://msdn.microsoft.com/en-us/library/dd372183(v=vs.85).aspx
(Read and Write property)

183.8.14 SourceName as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** An application-specified string which describes the source profile of the item for which color management is to be performed.
Notes:

If this is "", the Image Source control displays the name of the Windows default color profile.

(Read and Write property)

183.8.15 TargetProfile as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string in which to place the name of the user-selected target profile for proofing.
Notes:

If the CMS_SETTARGETPROFILE flag is used, this flag can also be used to select a profile other than the printer default when the dialog is first displayed.
(Read and Write property)

183.8.16 Events

183.8.17 Apply

MBS Win Plugin, Plugin Version: 11.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** This event is invoked when the Apply button of the Color Management dialog box is selected.

183.8.18 Idle

MBS Win Plugin, Plugin Version: 11.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** This event is called regularly if the CMS_USEHOOK flag is used.

183.8.19 Constants

183.8.20 CMS_DISABLEICM = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.
Notes: If set on entry, this flag indicates that the "Enable Color Management" check box is cleared, disabling all other controls. If set on exit, it means that the user does not wish color management performed.

183.8.21 CMS_DISABLEINTENT = 1024

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.

183.8.22 CMS_DISABLERENDERINTENT = 2048

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.

183.8.23 CMS_ENABLEPROOFING = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.
Notes: If set on entry, this flag indicates that the Proofing controls are to be enabled, and the Proofing check box is checked. If set on exit, it means that the user wishes to perform color management for a different target device than the selected printer.

183.8.24 CMS_SETMONITORPROFILE = 16

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.
Notes: If set on entry, this flag indicates that the color management profile named in the MonitorProfile member is to be the initial selection in the monitor profile control. If the specified profile is not associated with the monitor, this flag is ignored, and the default profile for the monitor is used.

183.8.25 CMS_SETPRINTERPROFILE = 32

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.
Notes: If set on entry, this flag indicates that the color management profile named in the PrinterProfile member is to be the initial selection in the printer profile control. If the specified profile is not associated with the printer, this flag is ignored, and the default profile for the printer is used.

183.8.26 CMS_SETPROOFINTENT = 5

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.
Notes: Ignored unless CMS_ENABLEPROOFING is also set. If set on entry, and CMS_ENABLEPROOFING is also set, this flag indicates that the ProofingIntent member is to be used to initialize the Target Rendering Intent control. Otherwise, the control defaults to Picture rendering. This flag is set on exit if proofing is enabled.

183.8.27 CMS_SETRENDERINTENT = 4

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.
Notes: If set on entry, this flag indicates that the RenderIntent member contains the value to use to initialize

the Rendering Intent control. Otherwise, the control defaults to Picture rendering. This flag is set on exit if WCS is enabled.

183.8.28 CMS_SETTARGETPROFILE = 64

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.
Notes: If set on entry, this flag indicates that the color profile named in the TargetProfile member is to be the initial selection in the target profile control. If the specified profile is not installed, this flag is ignored, and the default profile for the printer is used. If the printer has no default profile, then the first profile in alphabetical order will be displayed.

183.8.29 CMS_USEAPPLYCALLBACK = 256

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.
Notes: If set on entry, this flag indicates that the SetupColorMatching function should call the Apply event.

183.8.30 CMS_USEDESCRIPTION = 512

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.
Notes: If set on entry, this flag instructs the Setup function to retrieve the profile description contained in the profile description tags (See ICC Profile Format Specification v3.4). It will insert them into the Monitor Profile, Printer Profile, Emulated Device Profile edit boxes in the Color Management common dialog box.

183.8.31 CMS_USEHOOK = 128

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.
Notes: The idle event is called regularly if this flag is set.

183.8.32 INTENT_ABSOLUTE_COLORIMETRIC = 3

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants.
Notes: Maintain the white point. Match the colors to their nearest color in the destination gamut.

183.8.33 INTENT_PERCEPTUAL = 0

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants.
Notes: Maintain contrast. Used for photographs and natural images.

183.8.34 INTENT_RELATIVE_COLORIMETRIC = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants.
Notes: Maintain colorimetric match. Used for graphic designs and named colors.

183.8.35 INTENT_SATURATION = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants.
Notes: Maintain saturation. Used for business charts and other situations in which undithered colors are required.

183.9 class WindowsICMTransformMBS

183.9.1 class WindowsICMTransformMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a color transformation.

183.9.2 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

183.9.3 Methods

183.9.4 CheckColors(InputColors() as WindowsICMColorMBS, ctInput as Integer, Results() as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The CheckColors function determines whether the colors in an array lie within the output gamut of a specified transform.
Notes:

InputColors: an array of colors.
ctInput: Specifies the input color type.
Results: An array of nColors bytes that receives the results of the test.

If this function succeeds, the return value is TRUE.

If this function fails, the return value is FALSE. For extended error information, call GetLastError.

Remarks

If the input color type is not compatible with the color transform, CheckColors fails.

The function places results of the tests in the array pointed to by paResult. Each byte in the array corresponds to a COLOR element in the array pointed to by paInputColors and has an unsigned value between 0 and 255. The value 0 denotes that the color is in gamut, while a nonzero value denotes that it is out of gamut. For any integer n such that 0 <n <255, a result value of n+1 indicates that the corresponding color is at least as far out of gamut as would be indicated by a result value of n.

The out-of-gamut information in the gamut tags created in WCS use the perceptual color distance in CIECAM02, which is the mean square root in CIECAM02 Jab space. The distance in the legacy ICC

profile gamut tags is the mean square root in CIELAB space. We recommend that you use the CIECAM02 space when it is available because it provides more perceptually accurate distance metrics.

183.9.5 Constructor(LogColorSpace as WindowsICMLogColorSpaceMBS, DestProfile as WindowsICMProfileMBS, TargetProfile as WindowsICMProfileMBS, Flags as Integer)

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The CreateColorTransform function creates a color transform that applications can use to perform color management.
Notes:

LogColorSpace: The input colorspace.

DestProfile: The profile of the destination device. The function determines whether the profile contains International Color Consortium (ICC) or Windows Color System (WCS) profile information.

TargetProfile: The profile of the target device. The function determines whether the profile contains ICC or WCS profile information.

Flags: Specifies flags to used control creation of the transform. See Remarks.

On success the handle property is not zero.

If the target profile is nil, the transform goes from the source logical color space to the destination profile. If the target profile is given, the transform goes from the source logical color space to the target profile and then to the destination profile. This allows previewing output meant for the target device on the destination device.

The values in Flags are intended as hints only. The color management module must determine the best way to use them.

Windows Vista: Three new flags have been added that can be used with dwFlags:

PRESERVEBLACK	If this bit is set, the transform engine inserts the appropriate black generation GMMP as the last GMMP in the transform sequence. This flag only works in a pure WCS transform.
SEQUENTIAL_TRANSFORM	If this bit is set, each step in the WCS processing pipeline is performed for every pixel in the image and no optimized color transform is built. This flag only works in a pure WCS transform.

Restrictions: A transform created with the SEQUENTIAL_TRANSFORM flag set may only be used in the thread on which it was created and only for one color translation call at a time. COM must be initialized prior to creating the sequential transform and must remain initialized for the lifetime of the transform object.

WCS_ALWAYS If this bit is set, even all-ICC transforms will use the WCS code path.

For details, see CMM Transform Creation Flags. All of the flags mentioned there are supported for all types of transforms, except for FAST_TRANSLATE, which only works in a pure ICC-to-ICC transform.

The CreateColorTransform function is used outside of a device context. Colors may shift when transforming from a color profile to the same color profile. This is due to precision errors. Therefore, a color transform should not be performed under these circumstances.

The B2Ax tags are required for any profile that is the target of a transform.

WCS transform support for ICC ColorSpace profiles is limited to RGB colorspace profiles. The following ICC profile types cannot be used in a CITE-processed transform, either a mixed WCS/ICC transform or an all-ICC transform with WCS_ALWAYS set:

Non-RGB ColorSpace profiles
NamedColor profiles
n-channel profiles (where n >8)
DeviceLink profiles
Abstract profiles
See also:

- 183.9.6 Constructor(Profiles() as WindowsICMProfileMBS, Intents() as Integer, Flags as Integer, indexPreferredCMM as Integer) 22504

183.9.6 Constructor(Profiles() as WindowsICMProfileMBS, Intents() as Integer, Flags as Integer, indexPreferredCMM as Integer)

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The CreateMultiProfileTransform function accepts an array of profiles or a single device link profile and creates a color transform that applications can use to perform color mapping.
Notes:

Profiles: An array of profiles to be used. The function determines whether the HPROFILEs contain International Color Consortium (ICC) or Windows Color System (WCS) profile information and processes them appropriately. When valid WCS profiles are returned by OpenColorProfile, these profiles contain the combination of DMP, CAMP, and GMMP profiles.
Intent: An array of intents to use. Each intent is one of the following values:

INTENT_PERCEPTUAL
INTENT_SATURATION
INTENT_RELATIVE_COLORIMETRIC
INTENT_ABSOLUTE_COLORIMETRIC

GMMPs are a generalization of intents. There are two possible sources of intents: the "destination" profile and the intent list parameter to CreateMultiProfileTransform. The term "destination" is not used since all but two of the profiles in the profile list parameter will serve as first destination and then source.

For more information, see Rendering Intents.

nIntents
Specifies the number of elements in the intents array: can either be 1 or the same value as nProfiles. For profile arrays that contain any WCS profiles, the first rendering intent is ignored and only nProfiles -1 elements are used for these profile arrays. The maximum number of nIntents is 10.

Flags: Specifies flags used to control creation of the transform.

indexPreferredCMM: Specifies the one-based index of the color profile that indicates what color management module (CMM) to use. The application developer may allow Windows to choose the CMM by setting this parameter to INDEX_DONT_CARE. See Using Color Management Modules (CMM) Third party CMMs are only available for ICC workflows. Profile arrays containing WCS profiles will ignore this flag. It is also ignored when only ICC profiles are used and when the WCS_ALWAYS flag is used.

On success the handle property is not zero.

If a device link profile is being used, the function will fail if Profiles contains more than one value.

The array of intents specifies how profiles should be combined. The nth intent is used for combining the nth profile in the array. If only one intent is specified, it is used for the first profile, and all other profiles are combined using Match intent.

The values in Flags are intended as hints only. The color management module must determine the best way to use them.

Windows Vista: Three new flags have been added that can be used with dwFlags:

Restrictions: A transform created with the SEQUENTIAL_TRANSFORM flag set may only be used in the thread on which it was created and only for one color translation call at a time. COM must be initialized prior to creating the sequential transform and must remain initialized for the lifetime of the transform object.

PRESERVEBLACK	If this bit is set, the transform engine inserts the appropriate black generation GMMP as the last GMMP in the transform sequence. This flag only works in a pure WCS transform.
SEQUENTIAL_TRANSFORM	If this bit is set, each step in the WCS processing pipeline is performed for every pixel in the image and no optimized color transform is built. This flag only works in a pure WCS transform.

WCS_ALWAYS If this bit is set, even all-ICC transforms will use the WCS code path.

For details, see CMM Transform Creation Flags. All of the flags mentioned there are supported for all types of transforms, except for FAST_TRANSLATE and USE_RELATIVE_COLORIMETRIC, which only work in a pure ICC-to-ICC transform.

The CreateMultiProfileTransform function is used outside of a device context. Colors may shift when transforming from a color profile to the same color profile. This is due to precision errors. Therefore, a color transform should not be performed under these circumstances.

We recommend that there be only one GMMP between a source and destination DMP. Gamut boundary descriptions (GBDs) are created from the DMP/CAMP combinations. The subsequent GMMPs use the GDBs prior to them in the processing chain until there exists a DMP/CAMP GBD next in the sequence to be used. For example, assume a sequence DMP1, CAMP1, GMMP1, GMMP2, GMMP3, DMP2, CAMP2, GMMP4, GMMP5, CAMP3, DMP3. Then GMMP1, GMMP2 use GBD1 as their source and destination. Then GMMP3 uses GBD1 as source and GBD2 as destination. Then GMMP4 uses GBD2 as source and destination. Finally GMMP5 uses GBD2 as source and GBD3 as destination. This assumes no GMMP is identical to one next to it.

For WCS profiles, we recommend that the rendering intents be set to DWORD_MAX in order to use the GMMP within the WCS profile handle. This is because the array of rendering intents takes precedence over the rendering intents or gamut mapping models specified or contained in the profiles specified by the PROFILEs. The array of rendering intents references the default GMMP for those rendering intents. Ideally, only one gamut mapping is performed between a source and destination device by setting one or the other GMMP to NULL when creating the HPROFILE with WCS profile information. Any legacy application that uses a WCS DMP will invoke a sequence of GMMPs. GDBs are chosen based on DMPs and CAMPs. For intermediate GMMP gamut boundaries, the source and destination GBDs are used.

In summary, if ubound(Intents)=0, then the first GMM is set based on the GMMP that is set as default* for the padwIntent value, unless that value is DWORD_MAX, in which case the embedded GMM information from the second profile is used (The embedded GMM information is either a GMMP or, in the case of an ICC profile, the baseline GMM corresponding to** the intent from the profile header). The remainder of the GMMs are set based on the GMMP that is set as default* for RelativeColorimetric.

If ubound(Intents) = ubound(Profiles) - 1, then each GMM is set based on the GMMP that is set as default* for the value in the padwIntent array at the corresponding index, except where padwIntent values are

DWORD_MAX. For values in the padwIntent array that are DWORD_MAX, the GMMs at corresponding positions are set based on the embedded GMM information from the second of the two profiles whose gamuts are mapped by the GMM. (Again, the embedded GMM information is either a GMMP or, in the case of an ICC profile, the baseline GMM corresponding to** the intent from the profile header).

If ubound(Intents) = ubound(Profiles), then first intent is ignored and funtion behaves as it does in the case when ubound(Intents) = ubound(Profiles) - 1.

Any other combination of padwIntents and nIntents will return an error.

- "set as default" means that the default GMMP is queried using WcsGetDefaultColorProfile with its profileManagementScope parameter set to WCS_PROFILE_MANAGEMENT_SCOPE_CURRENT_USER. This may return either current-user or system-wide defaults as described in the documentation for WcsGetDefaultColorProfile.

- "GMM corresponding to" does not mean "GMM from the GMMP set as default for". Instead it means "a constant association between ICC profile intents and baseline GMM algorithms."

WCS transform support for ICC ColorSpace profiles is limited to RGB colorspace profiles. The following ICC profile types cannot be used in a CITE-processed transform, either a mixed WCS/ICC transform or an all-ICC transform with WCS_ALWAYS set:

- Non-RGB ColorSpace profiles
- NamedColor profiles
- n-channel profiles (where n >8)
- DeviceLink profiles
- Abstract profiles

See also:

- 183.9.5 Constructor(LogColorSpace as WindowsICMLogColorSpaceMBS, DestProfile as WindowsICMProfileMBS, TargetProfile as WindowsICMProfileMBS, Flags as Integer) 22503

183.9.7 GetCMMInfo(what as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GetCMMInfo function retrieves various information about the color management module (CMM) that created the specified color transform.
Notes:

Value	Meaning
CMM_WIN_VERSION	Retrieves the version of Windows targeted by the color management module (CMM).
CMM_DLL_VERSION	Retrieves the version number of the CMM.
CMM_IDENT	Retrieves the CMM signature registered with the International Color Consortium (ICC).

what: Specifies the information to be retrieved. This parameter can take one of the following constant values.

If this function succeeds, the return value is the information specified in What.
If this function fails, the return value is zero.

183.9.8 TranslateBitmapBits(SrcBits as memoryblock, InputType as Integer, Width as Integer, Height as Integer, InputRowBytes as Integer, DestBits as memoryblock, DestType as Integer, DestRowBytes as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The TranslateBitmapBits function translates the colors of a bitmap having a defined format so as to produce another bitmap in a requested format.
Notes:

SrcBits: Pointer to the bitmap to translate.
InputType: Specifies the format of the input bitmap. Use one of the BM_* constants.
Width: Specifies the number of pixels per scan line in the input bitmap.
Height: Specifies the number of scan lines in the input bitmap.
InputRowBytes: Specifies the number of bytes from the beginning of one scan line to the beginning of the next in the input bitmap; if set to zero, the function assumes that scan lines are padded so as to be DWORD-aligned.
DestBits: Pointer to the buffer in which to place the translated bitmap.
DestType: Specifies the format of the output bitmap. Use one of the BM_* constants.
DestRowBytes: Specifies the number of bytes from the beginning of one scan line to the beginning of the next in the output bitmap; if set to zero, the function assumes that scan lines should be padded to be DWORD-aligned.

If this function succeeds, the return value is TRUE.
If this function fails, the return value is FALSE.

Remarks

If the input and output formats are not compatible with the color transform, this function fails.

When either of the floating point BMFORMATs, BM_32b_scARGB or BM_32b_scRGB are used, the color data being translated should not contain NaN or infinity. NaN and infinity are not considered to represent legitimate color component values, and the result of translating pixels containing NaN or infinity is meaningless in color terms. NaN or infinity values in the color data being processed will be handled silently, and an error will not be returned.

183.9.9 TranslateColors(InputColors() as WindowsICMColorMBS, ctInput as Integer, OutputColors() as WindowsICMColorMBS, ctOutput as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The TranslateColors function translates an array of colors from the source color space to the destination color space as defined by a color transform.
Notes:

InputColors: The input color.
ctInput: Specifies the input color type.
OutputColors: The output color.
ctOutput: Specifies the output color type.

Returns true on success and false on failure.

183.9.10 TranslatePictures(InputPicture as picture, OutputPicture as picture) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The TranslateBitmapBits function translates the colors of a bitmap having a defined format so as to produce another bitmap in a requested format.
Notes:

InputPicture: input picture
OutputPicture: output picture

If this function succeeds, the return value is TRUE.
If this function fails, the return value is FALSE.

Make sure the pictures have the same size.

If the input and output formats are not compatible with the color transform, this function fails.

183.9.11 Properties

183.9.12 Handle as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal handle for the transformation.
Notes: (Read and Write property)

183.9.13 Events

183.9.14 Progress(Maximum as Integer, Current as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The progress event for long operations.

183.9.15 Constants

183.9.16 BEST_MODE = 3

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flags passed when creating a transformation.
Notes: Transform will be used for the display of the highest-quality image possible on the target device.

183.9.17 BM_10b_G3CH = & h0404

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 32 bits per pixel. 10 bits are used for each color channel. The 2 most significant bits are ignored.

183.9.18 BM_10b_Lab = & h0403

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 32 bits per pixel. 10 bits are used for each color channel. The 2 most significant bits are ignored.

183.9.19 BM_10b_RGB = 9

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 32 bits per pixel. 10 bits are used for each color channel. The 2 most significant bits are ignored.

183.9.20 BM_10b_XYZ = & h0401

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 32 bits per pixel. 10 bits are used for each color channel. The 2 most significant bits are ignored.

183.9.21 BM_10b_Yxy = & h0402

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 32 bits per pixel. 10 bits are used for each color channel. The 2 most significant bits are ignored.

183.9.22 BM_16b_G3CH = & h0504

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 64 bits per pixel. 16 bits are used for the gray-scale value. Each of the three color channels uses 16 bits.

183.9.23 BM_16b_GRAY = & h0505

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 64 bits per pixel. 16 bits are used for the gray-scale value. All other bits are ignored.

183.9.24 BM_16b_Lab = & h0503

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 64 bits per pixel. 16 bits are used for the gray-scale value. Each of the three color channels uses 16 bits.

183.9.25 BM_16b_RGB = 10

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 64 bits per pixel. 16 bits are used for the gray-scale value. Each of the three color channels uses 16 bits.

183.9.26 BM_16b_XYZ = & h0501

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 64 bits per pixel. 16 bits are used for the gray-scale value. Each of the three color channels uses 16 bits.

183.9.27 BM_16b_Yxy = & h0502

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 64 bits per pixel. 16 bits are used for the gray-scale value. Each of the three color channels uses 16 bits.

183.9.28 BM_32b_scARGB = & h0602

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 128 bits per pixel. 32 bits are used for each color channel, as defined by the IEEE 32-bit floating point standard.

183.9.29 BM_32b_scRGB = & h0601

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 96 bits per pixel. 32 bits are used for each color channel, as defined by the IEEE 32-bit floating point standard.

183.9.30 BM_565RGB = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 16 bits per pixel. 5 bits are used for red, 6 for green, and 5 for blue.

183.9.31 BM_5CHANNEL = & h0205

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 40 bits per pixel. 8 bits apiece are used for each channel.

183.9.32 BM_6CHANNEL = & h0206

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 48 bits per pixel. 8 bits apiece are used for each channel.

183.9.33 BM_7CHANNEL = & h0207

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 56 bits per pixel. 8 bits apiece are used for each channel.

183.9.34 BM_8CHANNEL = & h0208

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 64 bits per pixel. 8 bits apiece are used for each channel.

183.9.35 BM_BGRTRIPLETS = 4

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 24 bits per pixel maximum. For three channel colors, such as red, green, and blue, the total size is 24 bits per pixel. For single channel colors, such as gray, the total size is 8 bits per pixel.

183.9.36 BM_CMYKQUADS = & h0020

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 32 bits per pixel. 8 bits are used for each color channel.

183.9.37 BM_G3CHTRIPLETS = & h0204

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 24 bits per pixel maximum. For three channel values, the total size is 24 bits per pixel. For single channel gray scale, the total size is 8 bits per pixel.

183.9.38 BM_GRAY = & h0209

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 32 bits per pixel. Only the 8 bit gray-scale value is used.

183.9.39 BM_KYMCQUADS = & h0305

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 32 bits per pixel. 8 bits are used for each color channel.

183.9.40 BM_LabTRIPLETS = & h0203

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 24 bits per pixel maximum. For three channel, L, a, and b values, the total size is 24 bits per pixel. For single channel gray scale, the total size is 8 bits per pixel.

183.9.41 BM_NAMED_INDEX = & h0405

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 32 bits per pixel. Named color indices. Index numbering begins at one.

183.9.42 BM_R10G10B10A2 = & h0701

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: Only in Windows Vista.

183.9.43 BM_R10G10B10A2_XR = & h0702

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: Only in Windows Vista.

183.9.44 BM_R16G16B16A16_FLOAT = & h0703

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: Only in Windows Vista.

183.9.45 BM_RGBTRIPLETS = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 24 bits per pixel maximum. For three channel colors, such as red, green, and blue, the total size is 24 bits per pixel. For single channel colors, such as gray, the total size is 8 bits per pixel.

183.9.46 BM_S2DOT13FIXED_scARGB = & h0604

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 64 bits per pixel. Color data is stored as one 16-bit word per channel, with a fixed range of -4 to +4, inclusive. A signed format is used, with 1 bit for the sign, 2 bits for the integer portion, and 13 bits for the fractional portion.

183.9.47 BM_S2DOT13FIXED_scRGB = & h0603

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 48 bits per pixel. Color data is stored as one 16-bit word per channel, with a fixed range of -4 to +4, inclusive. A signed format is used, with 1 bit for the sign, 2 bits for the integer portion, and 13 bits for the fractional portion.

183.9.48 BM_x555G3CH = & h0104

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 16 bits per pixel. G3CH color space. 5 bits per channel. The most significant bit is ignored.

183.9.49 BM_x555Lab = & h0103

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 16 bits per pixel. Lab color space. 5 bits per channel. The most significant bit is ignored.

183.9.50 BM_x555RGB = 0

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 16 bits per pixel. RGB color space. 5 bits per channel. The most significant bit is ignored.

183.9.51 BM_x555XYZ = & h0101

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 16 bits per pixel. Yxy color space. 5 bits per channel. The most significant bit is ignored.

183.9.52 BM_x555Yxy = & h0102

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 16 bits per pixel. Yxy color space. 5 bits per channel. The most significant bit is ignored.

183.9.53 BM_xBGRQUADS = & h0010

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 32 bits per pixel. 8 bits are used for each color channel. The most significant byte is ignored.

183.9.54 BM_xG3CHQUADS = & h0304

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 32 bits per pixel. 8 bits are used for each color channel. The most significant byte is ignored.

183.9.55 BM_xRGBQUADS = & h0008

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 32 bits per pixel. 8 bits are used for each color channel. The most significant byte is ignored.

183.9.56 BM_XYZTRIPLETS = & h0201

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 24 bits per pixel maximum. For three channel colors, such as red, green, and blue, the total size is 24 bits per pixel. For single channel colors, such as gray, the total size is 8 bits per pixel.

183.9.57 BM_YxyTRIPLETS = & h0202

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
Notes: 24 bits per pixel maximum. For three channel, Y, x, and y values, the total size is 24 bits per pixel.

For single channel gray scale, the total size is 8 bits per pixel.

183.9.58 CMM_DESCRIPTION = 5

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.
Notes: A text string that describes the color management module.

183.9.59 CMM_DLL_VERSION = 3

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the values for the GetCMMInfo function.
Notes: Retrieves the version number of the CMM.

183.9.60 CMM_DRIVER_VERSION = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.

183.9.61 CMM_FROM_PROFILE = 0

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.

183.9.62 CMM_IDENT = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the values for the GetCMMInfo function.
Notes: Retrieves the CMM signature registered with the International Color Consortium (ICC).

183.9.63 CMM_LOGOICON = 6

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.
Notes: The logo icon for this CMM.

183.9.64 CMM_VERSION = 4

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.
Notes: Version of Windows supported.

183.9.65 CMM_WINDOWS_DEFAULT = & h57696E20

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.

183.9.66 CMM_WIN_VERSION = 0

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the values for the GetCMMInfo function.
Notes: Retrieves the version of Windows targeted by the color management module (CMM).

183.9.67 ENABLE_GAMUT_CHECKING = & h10000

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flags passed when creating a transformation.
Notes: Use this transform for gamut checking.

183.9.68 FAST_TRANSLATE = & h40000

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flags passed when creating a transformation.
Notes: Look up color only. Do not interpolate the color.

183.9.69 INDEX_DONT_CARE = 0

MBS Win Plugin, Plugin Version: 11.1. **Function:** A special value for index in constructor.
Notes: The application developer may allow Windows to choose the CMM by setting the indexPreferredCMM parameter to INDEX_DONT_CARE for the constructor.

183.9.70 INTENT_ABSOLUTE_COLORIMETRIC = 3

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants.
Notes: Maintain the white point. Match the colors to their nearest color in the destination gamut.

183.9.71 INTENT_PERCEPTUAL = 0

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants.
Notes: Maintain contrast. Used for photographs and natural images.

183.9.72 INTENT_RELATIVE_COLORIMETRIC = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants.
Notes: Maintain colorimetric match. Used for graphic designs and named colors.

183.9.73 INTENT_SATURATION = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants.
Notes: Maintain saturation. Used for business charts and other situations in which undithered colors are required.

183.9.74 NORMAL_MODE = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flags passed when creating a transformation.
Notes: Transform will be used for normal image display. Average image quality.

183.9.75 PRESERVEBLACK = & h100000

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flags passed when creating a transformation.
Notes: If this bit is set, the transform engine inserts the appropriate black generation GMMP as the last GMMP in the transform sequence. This flag only works in a pure WCS transform.

183.9.76 PROOF_MODE = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flags passed when creating a transformation.
Notes: Transform will be used to preview the image. Low image quality.

183.9.77 SEQUENTIAL_TRANSFORM = & h80800000

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flags passed when creating a transformation.
Notes:

If this bit is set, each step in the WCS processing pipeline is performed for every pixel in the image and no optimized color transform is built. This flag only works in a pure WCS transform.
Restrictions: A transform created with the SEQUENTIAL_TRANSFORM flag set may only be used in the thread on which it was created and only for one color translation call at a time. COM must be initialized prior to creating the sequential transform and must remain initialized for the lifetime of the transform object.

183.9.78 USE_RELATIVE_COLORIMETRIC = & h20000

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flags passed when creating a transformation.

183.9.79 WCS_ALWAYS = & h200000

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flags passed when creating a transformation. **Notes:** If this bit is set, even all-ICC transforms will use the WCS code path.

Chapter 184

Windows Media Foundation

184.1 class MFPMediaItemMBS

184.1.1 class MFPMediaItemMBS

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** An item to playback.
Notes:

Can be loaded asynchronously before playing, so you can preload the next file while another is playing.
For Windows 7, Windows Server 2008 R2 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

184.1.2 Blog Entries

- MBS Xojo Plugins, version 19.6pr4

184.1.3 Methods

184.1.4 Constructor

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The private constructor.

184.1.5 PresentationAttribute(UUID as String) as Variant

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the media item for a presentation attribute.
Notes:

see
https://docs.microsoft.com/windows/win32/medfound/presentation-descriptor-attributes

If needed a future MBS Plugin version could include explicit properties for some of those values.

184.1.6 StreamAttribute(index as Integer, UUID as String) as Variant

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the media item for a stream attribute.
Notes:

see
https://docs.microsoft.com/windows/win32/medfound/stream-descriptor-attributes

184.1.7 Properties

184.1.8 CanPause as Boolean

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The media item can pause.
Notes:

If this flag is absent, the Pause method will likely fail.
(Read only property)

184.1.9 CanSeek as Boolean

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The media item supports seeking.
Notes:

If this flag is absent, setting the Position property will fail.
(Read only property)

184.1.10 Duration as Double

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets the duration of the media item.
Notes: (Read only property)

184.1.11 Handle as Integer

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal object reference.
Notes: (Read only property)

184.1.12 HasAudio as Boolean

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries whether the media item contains an audio stream.
Notes:

Returns the value true if the media item contains at least one audio stream, or false otherwise.
(Read only property)

184.1.13 HasAudioSelected as Boolean

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries whether the media item contains an audio stream.
Notes:

Returns the value true if at least one audio stream is selected, or false otherwise.

To select or deselect streams before playback starts, set StreamSelection(index).
(Read only property)

184.1.14 HasSlowSeek as Boolean

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Seeking can take a long time.
Notes:

For example, the source might download content through HTTP.
(Read only property)

184.1.15 HasVideo as Boolean

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries whether the media item contains a video stream.
Notes:

Returns the value true if the media item contains at least one video stream, or false otherwise.
(Read only property)

184.1.16 HasVideoSelected as Boolean

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries whether the media item contains a video stream.
Notes:

Returns the value true if at least one video stream is selected, or false otherwise.

To select or deselect streams before playback starts, set StreamSelection(index).
(Read only property)

184.1.17 IsLive as Boolean

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The media item represents a live data source, such as video camera.
Notes:

If playback is stopped and then restarted, there will be a gap in the content.
(Read only property)

184.1.18 IsProtected as Boolean

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries whether the media item contains protected content.
Notes:

If true then the media item contains protected content. Attempting to play this media item will cause a playback error.
(Read only property)

184.1.19 Metadata as Dictionary

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets a dictionary that contains metadata for the source, such as author or title.
Notes: (Read only property)

184.1.20 NumberOfStreams as Integer

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets the number of streams (audio, video, and other) in the media item.
Notes: (Read only property)

184.1.21 StartPosition as Double

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The start time for the media item.
Notes:

The adjusted start and stop times are used the next time that SetMediaItem is called with this media item. If the media item is already set on the player, the change does not happen unless you call SetMediaItem again.
(Read and Write property)

184.1.22 StopPosition as Double

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The stop time for the media item.
Notes:

The adjusted start and stop times are used the next time that SetMediaItem is called with this media item. If the media item is already set on the player, the change does not happen unless you call SetMediaItem again.
(Read and Write property)

184.1.23 Tag as Variant

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The tag value associated with this plugin object.
Notes:

Can be used freely by you.
(Read and Write property)

184.1.24 URL as String

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets the URL that was used to create the media item.
Notes: (Read only property)

184.1.25 StreamSelection(index as Integer) as Boolean

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Selects or deselects a stream.
Notes:

Zero-based index of the stream. To get the number of streams, call NumberOfStreams.

Set to true: The stream is selected. During playback, this stream will play.
Set to false: The stream is not selected. During playback, this stream will not play.
(Read and Write computed property)

184.2 class MFPMediaPlayerExceptionMBS

184.2.1 class MFPMediaPlayerExceptionMBS

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for an error with MFPMediaPlayerMBS class.
Notes:

See ErrorCode and Message properties.
Subclass of the RuntimeException class.

184.2.2 Blog Entries

- MBS Xojo Plugins, version 19.6pr4

184.3 class MFPMediaPlayerMBS

184.3.1 class MFPMediaPlayerMBS

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Windows Media Foundation Media Player class.
Notes:

An alternative movie and audio player for Xojo.
For Windows 7, Windows Server 2008 R2 or newer.

184.3.2 Blog Entries

- MBS Xojo Plugins, version 20.1pr5
- MonkeyBread Software Releases the MBS Xojo Plugins in version 20.0
- MBS Xojo Plugins, version 19.6pr4

184.3.3 Methods

184.3.4 ClearMediaItem

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Clears the current media item.
Notes:

This method stops playback and releases the player object's references to the current media item.
This method completes asynchronously. When the operation completes, the MediaItemCleared event is invoked. The event type is

184.3.5 Constructor(URL as String = """, StartPlayback as Boolean = false)

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new instance of the MFPlay player object for audio only.
Notes:

URL: The string that contains the URL of a media file to open. This parameter can be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Please call this in main thread of application only.
See also:

- 184.3.6 Constructor(URL as String, StartPlayback as Boolean, control as RectControl) 22529
- 184.3.7 Constructor(URL as String, StartPlayback as Boolean, Handle as Integer) 22529
- 184.3.8 Constructor(URL as String, StartPlayback as Boolean, win as Window) 22530

184.3.6 Constructor(URL as String, StartPlayback as Boolean, control as RectControl)

MBS Win Plugin, Plugin Version: 20.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new instance of the MFPlay player object.
Notes:

URL: The string that contains the URL of a media file to open. This parameter can be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Control: A reference to a control where the video will appear. For audio-only playback, this parameter can be nil.

The control specified is used for the first selected video stream in the source.
If control is nil, MFPlay will not display any video.

Please call this in main thread of application only.
See also:

- 184.3.5 Constructor(URL as String = """, StartPlayback as Boolean = false) 22528
- 184.3.7 Constructor(URL as String, StartPlayback as Boolean, Handle as Integer) 22529
- 184.3.8 Constructor(URL as String, StartPlayback as Boolean, win as Window) 22530

184.3.7 Constructor(URL as String, StartPlayback as Boolean, Handle as Integer)

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new instance of the MFPlay player object.
Notes:

URL: The string that contains the URL of a media file to open. This parameter can be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Handle: A handle to a window or control where the video will appear. For audio-only playback, this parameter can be nil.

The window specified is used for the first selected video stream in the source.

If windows is nil, MFPlay will not display any video.

Please call this in main thread of application only.
See also:

- 184.3.5 Constructor(URL as String = """, StartPlayback as Boolean = false) 22528
- 184.3.6 Constructor(URL as String, StartPlayback as Boolean, control as RectControl) 22529
- 184.3.8 Constructor(URL as String, StartPlayback as Boolean, win as Window) 22530

184.3.8 Constructor(URL as String, StartPlayback as Boolean, win as Window)

MBS Win Plugin, Plugin Version: 20.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new instance of the MFPlay player object.
Notes:

URL: The string that contains the URL of a media file to open. This parameter can be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Win: A reference to a window where the video will appear. For audio-only playback, this parameter can be nil.

The window specified is used for the first selected video stream in the source.

If windows is nil, MFPlay will not display any video.

Please call this in main thread of application only.
See also:

- 184.3.5 Constructor(URL as String = """, StartPlayback as Boolean = false) 22528
- 184.3.6 Constructor(URL as String, StartPlayback as Boolean, control as RectControl) 22529
- 184.3.7 Constructor(URL as String, StartPlayback as Boolean, Handle as Integer) 22529

184.3.9 CreateMediaItemFromURL(URL as String, Sync as Boolean = true, tag as Variant = nil) as MFPMediaItemMBS

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a media item from a URL.
Notes:

URL: String that contains the URL of a media file.
Sync: If true, the method blocks until it completes. If false, the method does not block and completes asynchronously.

If fSync is true, we return the item on success.

This method does not queue the media item for playback. To queue the item for playback, set MediaItem property.

The CreateMediaItemFromURL method can be called either synchronously or asynchronously:

If Sync is true, the method completes synchronously and returns the new item.
If Sync is false, the method completes asynchronously. When the operation completes, the MediaItemCreated event is invoked. The event call passes the new media item.

If you make multiple asynchronous calls to CreateMediaItemFromURL, they are not guaranteed to complete in the same order. Use the tag to pass data to the event.

Currently, this method raises an error if the URL specifies any of the following protocols: rtsp*, mms*, or mcast.

184.3.10 FrameStep

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Steps forward one video frame.
Notes:

This method completes asynchronously. When the operation completes, the FrameStepped event is raised.

The player object does not support frame stepping during reverse playback (that is, while the playback rate is negative).

184.3.11 GetVideoSourceRect(byref Left as Single, byref Top as Single, byref Right as Single, byref Bottom as Single)

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets the video source rectangle.
Notes:

This rectangle defines which portion of the video is displayed. It is specified in normalized coordinates, which are defined as follows:
The upper-left corner of the video image is (0, 0).
The lower-right corner of the video image is (1, 1).
If the source rectangle is { 0, 0, 1, 1 } , the entire image is displayed. This is the default value.

184.3.12 InsertEffect(CLSID as String, isOptional as boolean = false) as Integer

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Applies an audio or video effect to playback.
Notes:

Please pass class id of a Media Foundation transform (MFT) that implements the effect. MFTs expose the IMFTransform interface.

isOptional specifies whether the effect is optional.

Value	Meaning
True	The effect is optional. If the MFPlay player object cannot add the effect, it ignores the effect and continues playback.
False	If the MFPlay player object cannot add the effect, a playback error occurs.

Returns index of the effect, which you pass for RemoveEffect later if needed.

The effect is applied to any media items set after the method is called. It is not applied to the current media item.

For each media item, the effect is applied to the first selected stream of the matching type (audio or video). If a media item has two selected streams of the same type, the second stream does not receive the effect. The effect is ignored if the media item does not contain a stream that matches the effect type. For example, if you set a video effect and play a file that contains just audio, the video effect is ignored, although no error is raised.

The effect is applied to all subsequent media items, until the application removes the effect. To remove an effect, call RemoveEffect or RemoveAllEffects.

If you set multiple effects of the same type (audio or video), they are applied in the same order in which you call InsertEffect.

Remote Playback Optimizations

Audio and video effects might be incompatible with optimizations that are used for remote playback. The following remarks apply only to audio or video effects that are actually used during playback:
If you mark an audio or video effect as required, by setting fOptional to false, MFPlay disables remote playback optimizations.
Otherwise, if all audio/video effects are marked as optional, MFPlay might drop the effects, in order to enable remote playback optimizations.
In other words, required effects have priority over remote optimizations, but optional effects do not.

Non-audio, non-video effects do not affect remote optimizations. Also, if you insert a required effect but the source does not contain any streams of that type, remote optimizations are not disabled.

184.3.13 Pause

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Pauses playback.
Notes:

While playback is paused, the most recent video frame is displayed, and audio is silent.

This method completes asynchronously. When the operation completes, the application's Paused event is invoked.

184.3.14 Play

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Starts playback.
Notes: This method completes asynchronously. When the operation completes, the Started event is raised.

184.3.15 RemoveAllEffects

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Removes all effects that were added with the InsertEffect method.
Notes: The change applies to the next media item that is set on the player. The effects are not removed from the current media item.

184.3.16 RemoveEffect(Handle as Integer)

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Removes an effect that was added with the InsertEffect method.
Notes:

Please pass the number returned by InsertEffect.

The change applies to the next media item that is set on the player. The effect is not removed from the current media item.

184.3.17 SetVideoSourceRect(Left as Single, Top as Single, Right as Single, Bottom as Single)

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the video source rectangle.
Notes:

MFPlay clips the video to this rectangle and stretches the rectangle to fill the video window.

This rectangle defines which portion of the video is displayed. It is specified in normalized coordinates, which are defined as follows:
The upper-left corner of the video image is (0, 0).
The lower-right corner of the video image is (1, 1).

To display the entire image, set the source rectangle to { 0, 0, 1, 1 } . This is the default value.

MFPlay stretches the source rectangle to fill the entire video window. By default, MFPlay maintains the source's correct aspect ratio, letterboxing if needed. The letterbox color is controlled by the BorderColor property.

This method fails if no media item is currently set, or if the current media item does not contain video.
To set the video position before playback starts, call this method inside your MediaItemSet event.

184.3.18 Shutdown

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Shuts down the MFPlay player object and releases any resources the object is using.
Notes:

After this method is called, most IMFPMediaPlayer methods raise exception about shutdown. Also, any media items created from this instance of the player object are invalidated and most IMFPMediaItem methods also raise exceptions.

The player object automatically shuts itself down when its reference count reaches zero. You can use the Shutdown method to shut down the player before all of the references have been released.

184.3.19 Stop

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Stops playback.
Notes: This method completes asynchronously. When the operation completes, the Stopped event is raised.

184.3.20 UpdateVideo

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Updates the video frame.
Notes: This method makes sure the video is updated now, not later.

184.3.21 Properties

184.3.22 AspectRatioMode as Integer

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current aspect-ratio correction mode.
Notes:

This mode controls whether the aspect ratio of the video is preserved during playback.
See VideoARMode* constants.
(Read and Write property)

184.3.23 Balance as Single

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current audio balance.
Notes:

The value can be any number in the following range (inclusive).

Value	Meaning
-1.0	The left channel is at full volume; the right channel is silent.
+1.0	The right channel is at full volume; the left channel is silent.

If the value is zero, the left and right channels are at equal volumes. The default value is zero.
(Read and Write property)

184.3.24 BorderColor as Color

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current color of the video border.
Notes:

The border color is used to letterbox the video.
(Read and Write property)

184.3.25 Duration as Double

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets the playback duration of the current media item.
Notes:

This method calculates the playback duration, taking into account the start and stop times for the media item. To set the start and stop times, use StartPosition and StopPosition properties on the media item. To get the actual duration of the underlying media file, regardless of start and stop times, use Duration property on the item.

For example, suppose that you load a 30-second audio file and set the start time equal to 2 seconds and stop time equal to 10 seconds. The MFPMediaItemMBS.Duration method will return 30 seconds, but the MFPMediaPlayerMBS.Duration method will return 8 seconds.
(Read only property)

184.3.26 FastestSupportedRateForward as Single

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the fastest supported forward playback rates.
Notes:

Playback rates are expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback speed, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read only property)

184.3.27 FastestSupportedRateReverse as Single

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the fastest supported reverse playback rates.
Notes:

Playback rates are expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback speed, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read only property)

184.3.28 Handle as Integer

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal object reference.
Notes: (Read only property)

184.3.29 IdealVideoMaxHeight as Integer

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets the maximum height of video size that can be displayed without significantly degrading performance or image quality.
Notes: (Read only property)

184.3.30 IdealVideoMaxWidth as Integer

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets the maximum width of video sizes that can be displayed without significantly degrading performance or image quality.

Notes: (Read only property)

184.3.31 IdealVideoMinHeight as Integer

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets the minimum height of video sizes that can be displayed without significantly degrading performance or image quality.
Notes: (Read only property)

184.3.32 IdealVideoMinWidth as Integer

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets the minimum width of video sizes that can be displayed without significantly degrading performance or image quality.
Notes: (Read only property)

184.3.33 Looping as Boolean

MBS Win Plugin, Plugin Version: 20.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to loop video.
Notes:

If set to true, the plugin will call Play automatically when playback ended.
(Read and Write property)

184.3.34 MediaItem as MFPMediaItemMBS

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Current media item.
Notes:

Setting the MediaItem property is asynchronous. Therefore, while set is pending, get will not return the media item that was just set. Instead, the application should implement MediaItemSet event to know when it is done.
(Read and Write property)

184.3.35 Mute as Boolean

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the audio is muted.
Notes: (Read and Write property)

184.3.36 NativeVideoAspectRateHeight as Integer

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The picture aspect ratio of the video.
Notes: (Read only property)

184.3.37 NativeVideoAspectRateWidth as Integer

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The picture aspect ratio of the video.
Notes: (Read only property)

184.3.38 NativeVideoHeight as Integer

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The height of the video, in pixels.
Notes: (Read only property)

184.3.39 NativeVideoWidth as Integer

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The width of the video, in pixels.
Notes: (Read only property)

184.3.40 Position as Double

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The playback position.
Notes:

If you call this method while playback is stopped, the new position takes effect after playback resumes.

This method completes asynchronously. When the operation completes, the PositionSet event is raised.
If playback was started before SetPosition is called, playback resumes at the new position. If playback was paused, the video is refreshed to display the current frame at the new position.

If you make two consecutive calls to SetPosition, and the second call is made before the first call has completed, the second call supersedes the first. The status code for the superseded call is set to false in the event data for that call. This behavior prevents excessive latency from repeated calls to SetPosition, as each call may force the media source to perform a relatively lengthy seek operation.
(Read and Write property)

184.3.41 Rate as Single

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current playback rate.
Notes:

The playback rate is expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read and Write property)

184.3.42 SlowestSupportedRateForward as Single

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the slowest supported forward playback rates.
Notes:

Playback rates are expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback speed, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read only property)

184.3.43 SlowestSupportedRateReverse as Single

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the slowest supported reverse playback rates.
Notes:

Playback rates are expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback speed, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read only property)

184.3.44 State as Integer

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current playback state of the MFPlay player object.
Notes:

See State* constants.

This property can be read after the player object has been shut down.

Many of the player methods complete asynchronously. While an asynchronous operation is pending, the current state is not updated until the operation completes. When the operation completes, the application receives an event.
(Read only property)

184.3.45 VideoWindow as Integer

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets the window where the video is displayed.
Notes:

Returns HWND as integer.
(Read only property)

184.3.46 Volume as Single

MBS Win Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The audio volume.
Notes:

Volume is expressed as an attenuation level, where 0.0 indicates silence and 1.0 indicates full volume (no attenuation).

If you call this method before playback starts, the setting is applied after playback starts.
This method does not change the master volume level for the player's audio session. Instead, it adjusts the per-channel volume levels for audio stream(s) that belong to the current media item. Other streams in the audio session are not affected.
(Read and Write property)

184.3.47 Events

184.3.48 Ended

MBS Win Plugin, Plugin Version: 20.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Playback has ended.
Notes: The player object sends this event when playback reaches the end of the media file.

184.3.49 Error

MBS Win Plugin, Plugin Version: 20.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** A playback error has occurred.

184.3.50 FrameStepped

MBS Win Plugin, Plugin Version: 20.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** A frame-step operation has completed.
Notes: This event is sent when the FrameStep method completes.

184.3.51 MediaItemCleared

MBS Win Plugin, Plugin Version: 20.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The current media item was cleared.
Notes: This event is sent when the ClearMediaItem method completes.

184.3.52 MediaItemCreated(MediaItem as MFPMediaItemMBS, Tag as variant)

MBS Win Plugin, Plugin Version: 20.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** A new media item was created.
Notes: This event is sent when the CreateMediaItemFromURL method completes.

184.3.53 MediaItemSet

MBS Win Plugin, Plugin Version: 20.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** A media item is ready for playback.

Notes: This event is sent when the SetMediaItem method completes.

184.3.54 Paused

MBS Win Plugin, Plugin Version: 20.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Playback has paused.
Notes: This event is sent when the Pause method completes.

184.3.55 PositionSet

MBS Win Plugin, Plugin Version: 20.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The MFPlay player object has seeked to a new playback position.
Notes: This event is sent when the Position setter completes.

184.3.56 RateSet(rate as Single)

MBS Win Plugin, Plugin Version: 20.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The playback rate has changed.
Notes: This event is sent when the rate setter completes.

184.3.57 Started

MBS Win Plugin, Plugin Version: 20.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Playback has started.
Notes: This event is sent when the Play method completes.

184.3.58 Stopped

MBS Win Plugin, Plugin Version: 20.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Playback has stopped.
Notes: This event is sent when the Stop method completes.

184.3.59 Constants

184.3.60 StateEmpty = 0

MBS Win Plugin, Plugin Version: 20.0. **Function:** One of the player states.
Notes: Initial state. No media items have been set on the player object.

184.3.61 StatePaused = 3

MBS Win Plugin, Plugin Version: 20.0. **Function:** One of the player states.
Notes: Playback is paused.

184.3.62 StatePlaying = 2

MBS Win Plugin, Plugin Version: 20.0. **Function:** One of the player states.
Notes: Playback is in progress.

184.3.63 StateShutdown = 4

MBS Win Plugin, Plugin Version: 20.0. **Function:** One of the player states.
Notes: The player object was shut down. This state is returned after the application calls Shutdown method.

184.3.64 StateStopped = 1

MBS Win Plugin, Plugin Version: 20.0. **Function:** One of the player states.
Notes: Playback is stopped.

184.3.65 VideoARModeMask = 7

MBS Win Plugin, Plugin Version: 20.0. **Function:** One of the aspect ratio modes.
Notes: Bitmask to validate flag values. This value is not a valid flag.

184.3.66 VideoARModeNone = 0

MBS Win Plugin, Plugin Version: 20.0. **Function:** One of the aspect ratio modes.
Notes: Do not maintain the aspect ratio of the video. Stretch the video to fit the output rectangle.

184.3.67 VideoARModeNonLinearStretch = 4

MBS Win Plugin, Plugin Version: 20.0. **Function:** One of the aspect ratio modes.
Notes:

Apply a non-linear horizontal stretch if the aspect ratio of the destination rectangle does not match the aspect ratio of the source rectangle.

The non-linear stretch algorithm preserves the aspect ratio in the middle of the picture and stretches (or shrinks) the image progressively more toward the left and right. This mode is useful when viewing 4:3 content full-screen on a 16:9 display, instead of pillar-boxing. Non-linear vertical stretch is not supported, because the visual results are generally poor.

This mode may cause performance degradation.

If this flag is set, you must also set the VideoARModePreservePixel and VideoARModePreservePicture flags.

184.3.68 VideoARModePreservePicture = 1

MBS Win Plugin, Plugin Version: 20.0. **Function:** One of the aspect ratio modes.
Notes: Preserve the aspect ratio of the video by letterboxing or within the output rectangle.

184.3.69 VideoARModePreservePixel = 2

MBS Win Plugin, Plugin Version: 20.0. **Function:** One of the aspect ratio modes.
Notes:

Correct the aspect ratio if the physical size of the display device does not match the display resolution. For example, if the native resolution of the monitor is 1600 by 1200 (4:3) but the display resolution is 1280 by 1024 (5:4), the monitor will display non-square pixels.

If this flag is set, you must also set the VideoARModePreservePicture flag.

Chapter 185

Windows Mutex

185.1 class WindowsMutexMBS

185.1.1 class WindowsMutexMBS

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class for a mutex.
Notes:

As a mutex must have a unique name you can use this class to find out if an application is allready running. Try to create a mutex with an unique name and if it allready exists your application was launched twice.

185.1.2 Methods

185.1.3 close

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

185.1.4 Create(name as string)

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new mutex.
Notes:

The name must be unique and should not contain a backslash.

Use only ASCII strings for this.
Lasterror is set.

185.1.5 Open(name as string)

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Trys to open a mutex with the given name.
Notes:

Fails if the mutex does not exist.
Lasterror is set.

185.1.6 Properties

185.1.7 Handle as Integer

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle of the Mutex for use with Declares.
Notes: (Read and Write property)

185.1.8 Lasterror as Integer

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code reported.
Notes:

A windows error code.
Or 0 for okay and -1 for "Function not available or parameters wrong."
(Read and Write property)

185.1.9 Name as String

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The name used to create or open the mutex.
Notes: (Read only property)

Chapter 186

Windows Registry

186.1 class RegistryFileTypeMBS

186.1.1 class RegistryFileTypeMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** An easy way to register an document icon for Windows.
Notes:

You set up the properties of this class and than you call create.
I suggest that you do it like QuickTime or Winzip. Ask the user on first run if he want's your application to register its file types.
And also provide two buttons in the Preferencesdialog to register or unregister the types.

This class works on Windows 7 only if you run the app as administrator.

This function may fail to run if permissions are denied.
Or it may only affect the shadow registry used by Windows to protect itself from having unauthorized apps editing the real registry.

186.1.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr5

- Plugin notes

186.1.3 Methods

186.1.4 Create as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates this file type.
Example:

```
dim r as RegistryFileTypeMBS
' set properties for r
dim errorcode as Integer
errorcode=r.create
```

Notes:

Returns:

-1 - Run on Mac OS
0 - OK
1 - Failed to create main extension key.
2 - Failed to create the description key for file type.
3 - Failed to create the key for the icon.
4 - Failed to create the key for the open description.
5 - Required parameters not provided.

This function may fail to run if permissions are denied.
Or it may only affect the shadow registry used by Windows to protect itself from having unauthorized apps editing the real registry.

186.1.5 Remove as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Removes this file type.
Example:

```
dim r as RegistryFileTypeMBS
dim errorcode as Integer

errorcode=r.remove
```

Notes:

Returns:

-1 - Run on Mac OS or parameters bad.
0 - OK
x - A Windows error code like 5 for permissions denied.

Note: The return values changed in MBS Plugin 3.2 to now return Windows error codes!

This function may fail to run if permissions are denied.
Or it may only affect the shadow registry used by Windows to protect itself from having unauthorized apps editing the real registry.

186.1.6 Properties

186.1.7 AppFile as Folderitem

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The application to launch to open the file.
Example:

```
dim r as new RegistryFileTypeMBS
r.Appfile=app.applicationfilembs // it is my file ;-)
```

Notes: (Read and Write property)

186.1.8 Description as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The description for this file type.
Example:

```
dim r as new RegistryFileTypeMBS
r.description="Monkeybread File"
```

Notes:

The text to show in the explorer in column view.
(Read and Write property)

186.1.9 Extension as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The extension for this file type.
Example:

```
dim r as new RegistryFileTypeMBS

r.extension=".MBS"
```

Notes:

The extension should start with a dot follow by 3 uppercase letters and it should be unique. But as there are more file types than combinations of 3 letters this may be difficult...
(Read and Write property)

186.1.10 FileType as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A internal unique signature for this file type.
Example:

```
dim r as new RegistryFileTypeMBS

r.FileType="MBSFile"
```

Notes:

May contain any character except chr(0) and should be ANSI encoded.
(Read and Write property)

186.1.11 Iconfile as Folderitem

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The file with the icon.
Example:

```
dim r as new RegistryFileTypeMBS

r.iconfile=app.applicationfileMBS // it is my file ;-)
```

Notes:

You can get the icon out of your application (ID 0 is the default icon).
But you can also use DLL files like "Shell32.dll" for some nice icons.
Last but not least you can use an ICO file which Iconographer can create for you from your Mac Icons.
(Read and Write property)

186.1.12 IconID as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The ID of the Icon to use.
Example:

```
dim r as new RegistryFileTypeMBS

r.iconid=3
```

Notes:

Your icon file may contain more than one icon. Here you can specify which one to use. First is ID 0.
(Read and Write property)

186.1.13 OpenDescription as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The text to show in the context menu for Open.
Example:

```
dim r as new RegistryFileTypeMBS

r.OpenDescription="Open MBS file"
```

Notes:

If you don't provide an OpenDescription you'll get "Open".
Here you can describe the default action.
e.g. Stuffit Expander could say "Expand file".
(Read and Write property)

186.2 class RegistryKeyMBS

186.2.1 class RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you access to a Windows Registry Key.

186.2.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 17.4
- MBS Xojo Plugins, version 17.4pr6
- MBS REALbasic Plugins, version 10.4pr11

186.2.3 Methods

186.2.4 CopyTree(keyname as string, Dest as RegistryKeyMBS) as boolean

MBS Win Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Copies the specified registry key, along with its values and subkeys, to the specified destination key.
Notes: Returns true on success and false on failure.

186.2.5 CreateKey(name as string, Use64bitRegistry as boolean = false) as RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new subkey.
Notes:

If the key is allready present it is just opened.
Returns a registry key or nil on any error.

Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

186.2.6 Delete(keyname as string) as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Deletes the specified subkey key.
Notes:

Windows 95: The Delete function deletes a subkey and all its descendants.
Windows NT: The Delete function deletes the specified subkey. The subkey to be deleted must not have subkeys.

With plugin version 3.2 the NT behavior is worked around to match the Windows 95 behavior. So all sub keys are deleted!

186.2.7 DeleteTree(keyname as string) as boolean

MBS Win Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Deletes the subkeys and values of the specified key recursively.
Example:

```
dim t as RegistryKeyMBS = RegistryMBS.CurrentUser

// create some keys
dim n as RegistryKeyMBS = t.CreateKey("Hello")
dim w as RegistryKeyMBS = n.CreateKey("World")

w.Value("Test").asString = "Hello"

break // see in regedit

// delete it
if t.DeleteTree("Hello") then
MsgBox "deleted. ok"
else
MsgBox "delete failed"
end if
```

Notes: Returns true on success and false on failure.

186.2.8 Flush

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Writes all the attributes of the specified open key into the RegistryMBS.

186.2.9 Item(index as Integer) as RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the key at the specified index.
Notes:

May return nil on any error like missing access rights.
Some keys can't be opened, but ItemName() may return the name of the key.
See also:

- 186.2.10 Item(name as string) as RegistryKeyMBS 22556

186.2.10 Item(name as string) as RegistryKeyMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the key with the specified name.
Notes:

May return nil on any error like missing access rights.
Some keys can't be opened, but ItemName() may return the name of the key.
See also:

- 186.2.9 Item(index as Integer) as RegistryKeyMBS 22556

186.2.11 ItemName(index as Integer) as string

MBS Win Plugin, Plugin Version: 6.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the name of the key at the specified index.
Notes: May return "" on any error.

186.2.12 Value(index as Integer) as RegistryValueMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the value at the specified index.
See also:

- 186.2.13 Value(name as string) as RegistryValueMBS 22556

186.2.13 Value(name as string) as RegistryValueMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the value item with the specified name.
Notes:

The value must not exists. So use this function to make a new key.
Use an empty name (e.g. "") for the default key value.

This method was named ValueItem in plugin version before 10.4.
See also:

- 186.2.12 Value(index as Integer) as RegistryValueMBS 22556

186.2.14 ValueName(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the name of the value with the given index.
Notes: May return "" on any error.

186.2.15 Properties

186.2.16 ItemCount as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the count of subkeys.
Example:

```
dim i,c as Integer
dim key as RegistryKeyMBS // the registry item

c=key.ItemCount-1
for i=0 to c
// do something
next
```

Notes:

This property calls a System function to get the value. So save it in a local variable instead of calling it in a for loop. See the example.
(Read only property)

186.2.17 name as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the name of the Key.

Notes: (Read only property)

186.2.18 ValueCount as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the count of values.
Example:

```
dim i,c as Integer
dim key as RegistryKeyMBS

c=key.ValueCount
for i=1 to c
// do something
next
```

Notes:

This property calls a System function to get the value. So save it in a local variable instead of calling it in a for loop. See the example.
(Read only property)

186.3 class RegistryMBS

186.3.1 class RegistryMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you access to the Windows Registry.
Notes: Please send me an email if you need some functions which are now not included.

186.3.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr10
- MBS REALbasic Plugins, version 10.4pr11

186.3.3 Methods

186.3.4 classesRoot as RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you an RegistryKeyMBS object for the ClassesRoot Tree.

186.3.5 CurrentConfig as RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you an RegistryKeyMBS object for the CurrentConfig Tree.

186.3.6 CurrentUser as RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you an RegistryKeyMBS object for the CurrentUser Tree.

186.3.7 getBinaryValue(keypath as string,valuename as string, Use64bitRegistry as boolean = false) as Memoryblock

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you a Memoryblock of the value called valuename in the key found at keypath.
Example:

```
const path="HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion"
dim r as new RegistryMBS
msgBox "This OS is: "+r.getBinaryValue(path, "ProductName").cstring(0)
```

Notes:

Returns nil on any error.
Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

186.3.8 getStringValue(keypath as string,valuename as string, Use64bitRegistry as boolean = false) as String

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you a String of the value called valuename in the key found at keypath.
Example:

```
const path="HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion"
dim r as new RegistryMBS
msgBox "This OS is: "+r.getStringValue(path, "ProductName")
```

Notes:

Returns "" on any error.
Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

186.3.9 Key(keypath as string, Use64bitRegistry as boolean = false) as RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you an RegistryKeyMBS object for the given path of a key.
Example:

```
const path="HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion"
dim r as new RegistryMBS
msgBox r.Key(path).Name
```

Notes:

If you need you can recreate this function in Xojo code to have some error checking. This function here will return nil on any error.

Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

186.3.10 LocalMachine as RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you an RegistryKeyMBS object for the LocalMachine Tree.

186.3.11 PerformanceData as RegistryKeyMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you an RegistryKeyMBS object for the PerformanceData Tree.

186.3.12 Users as RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you an RegistryKeyMBS object for the Users Tree.

186.4 class RegistryValueMBS

186.4.1 class RegistryValueMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you access to a value of a RegistryMBS Key.

186.4.2 Blog Entries

- MBS Xojo Plugins, version 18.3pr6
- MBS REALbasic Plugins, version 10.4pr11

186.4.3 Methods

186.4.4 Delete as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Deletes this value.
Notes: The RegistryValueMBS object should be destroyed after deleting.

186.4.5 SetBinaryMem(typ as Integer,data as Memoryblock)

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the value to the content of the memoryblock.
Notes:

Type may be one of this values:

186.4.6 SetBinaryStr(typ as Integer,data as String)

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the value to the content of the string.
Notes:

Type may be one of this values:

0	No value type
1	Nul terminated string
2	Nul terminated string (with environment variable references)
3	Free form binary
4	32-bit number (LittleEndian)
5	32-bit number (BigEndian)
6	Symbolic Link (unicode)
7	Multiple Unicode strings
8	Resource list in the resource map
9	Resource list in the hardware description
10	Resource requirements list
11	64-bit number

186.4.7 Properties

186.4.8 asBinary as Memoryblock

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the value as a memoryblock.
Notes:

Can also be used to set the value.
(Read and Write property)

186.4.9 asBinaryString as String

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the value as a string with binary content.
Notes:

This string may include chr(0).
Can also be used to set the value.
(Read and Write property)

186.4.10 asLong32 as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the value as a 32bit integer.
Notes:

0	No value type
1	Nul terminated string
2	Nul terminated string (with environment variable references)
3	Free form binary
4	32-bit number (LittleEndian)
5	32-bit number (BigEndian)
6	Symbolic Link (unicode)
7	Multiple Unicode strings
8	Resource list in the resource map
9	Resource list in the hardware description
10	Resource requirements list
11	64-bit number

Can also be used to set the value.
(Read and Write property)

186.4.11 asLong64 as Int64

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the value as a 64bit integer.
Example:

```
dim v as RegistryValueMBS
v.aslong64=v.aslong64+1 // add one
```

Notes:

Can also be used to set the value.
(Read and Write property)

186.4.12 asString as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the value as a string.
Notes:

Can also be used to set the value.
(Read and Write property)

186.4.13 isBinary as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if the value is binary data.
Notes: (Read only property)

186.4.14 isLong32 as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if the value is a 32 bit integer.
Notes: (Read only property)

186.4.15 isLong64 as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if the value is a 64 bit Integer.
Notes: (Read only property)

186.4.16 isString as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if the value is a string.
Notes: (Read only property)

186.4.17 name as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the name of the Value.
Notes: (Read only property)

186.4.18 size as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the size of this value.
Notes: (Read only property)

186.4.19 type as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the type of the value.
Notes:

Type may be one of this values:

0	No value type
1	Nul terminated string
2	Nul terminated string (with environment variable references)
3	Free form binary
4	32-bit number (LittleEndian)
5	32-bit number (BigEndian)
6	Symbolic Link (unicode)
7	Multiple Unicode strings
8	Resource list in the resource map
9	Resource list in the hardware description
10	Resource requirements list
11	64-bit number

(Read only property)

Chapter 187

Windows Shortcuts

187.1 class WindowsInternetShortcutMBS

187.1.1 class WindowsInternetShortcutMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to create internet shortcuts on Windows.
Example:

```
# if targetwin32
dim w as WindowsInternetShortcutMBS

w=new WindowsInternetShortcutMBS

w.URL="http://www.monkeybreadsoftware.de"
w.Command=3
w.Icon=windowsSystemFolder.child("shell32.dll")
w.iconID=41
w.Location=SpecialFolder.Desktop.child("A new link to explorer.lnk")
w.Working=volume(0)

if w.CreateInternetShortCut then
if w.AddInternetShortCutIcon then
msgBox "Shortcut created."
else
msgBox "Failed to add icon."
end if
else
msgBox "Failed to create shortcut."
end if
# endif
```

187.1.2 Methods

187.1.3 CreateInternetShortCut as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a shortcut on the specified location.
Notes: Version 10.1: Now adds the icon, too.

187.1.4 Properties

187.1.5 Command as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The code for the showing of the application.
Notes:

Use e.g. 3 for full screen.
(Read and Write property)

187.1.6 Icon as String

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The location of the icon file.
Notes:

(Changed from Folderitem to String in plugin version 3.4)
(Read and Write property)

187.1.7 IconID as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The ID of the icon inside the icon file.
Notes: (Read and Write property)

187.1.8 Location as String

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The location where the shortcut is created or modified.
Notes:

(Changed from Folderitem to String in plugin version 3.4)
(Read and Write property)

187.1.9 url as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The URL where the shortcut will point to.
Notes: (Read and Write property)

187.1.10 WorkingDirectory as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The working directory for the browser.
Notes:

(Changed from Folderitem to String in plugin version 3.4)
(Read and Write property)

187.2 class WindowsShortCutMBS

187.2.1 class WindowsShortCutMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to create shortcuts on Windows.
Example:

```
dim w as WindowsShortCutMBS

w = new WindowsShortCutMBS

w.Arguments = ""
w.Command = 3
w.Icon = specialfolder.system.child("shell32.dll").NativePath
w.iconID = 41
w.Location = SpecialFolder.Desktop.child("A new link to explorer.lnk").NativePath
w.Target = SpecialFolder.Windows.child("explorer.exe").NativePath
w.WorkingDirectory = volume(0).NativePath

if w.CreateShortCut then
msgBox "Shortcut created."
else
msgBox "Failed to create shortcut."
end if
```

187.2.2 Methods

187.2.3 CreateShortCut as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a shortcut on the specified location.
Notes:

Returns true on success and false on any error.
Version 10.1: Now adds the icon, too.

187.2.4 ResolveShortCut(DisableGUI as boolean=false, DisableSearch as boolean=false) as boolean

MBS Win Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Resolves the shortcut.

Notes:

Fills the properties target, description, Argument, WorkingDirectory, Icon and IconID.
Returns false on any error.

Parameters added in plugin version 7.4:

DisableGUI:
Do not display a dialog box if the link cannot be resolved. The time-out duration will be set to the default value of 3,000 milliseconds (3 seconds).

DisableSearch:
Do not execute the search heuristics.

For more details check this page in Microsoft's documentation:
http://msdn.microsoft.com/en-us/library/bb774952(v=vs.85).aspx

187.2.5 Properties

187.2.6 Arguments as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Arguments to the application which is linked to the shortcut.
Notes: (Read and Write property)

187.2.7 Command as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The code for the showing of the application.
Notes:

Constants which may be useful:

(Read and Write property)

187.2.8 Description as String

MBS Win Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The description of the shortcut.

SW_HIDE	= 0
SW_NORMAL	= 1
SW_SHOWMINIMIZED	= 2
SW_SHOWMAXIMIZED	= 3
SW_MAXIMIZE	= 3
SW_SHOWNOACTIVATE	= 4
SW_SHOW	= 5
SW_MINIMIZE	= 6
SW_SHOWMINNOACTIVE	= 7
SW_SHOWNA	= 8
SW_RESTORE	= 9
SW_SHOWDEFAULT	= 10
SW_FORCEMINIMIZE	= 11

Notes: (Read and Write property)

187.2.9 Icon as String

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The location of the icon file.
Notes:

(Changed from Folderitem to String in plugin version 3.4)
(Read and Write property)

187.2.10 IconID as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The ID of the icon inside the icon file.
Notes: (Read and Write property)

187.2.11 Location as String

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The location where the shortcut is created or modified.
Notes:

(Changed from Folderitem to String in plugin version 3.4)
(Read and Write property)

187.2.12 ParentWindow as Window

MBS Win Plugin, Plugin Version: 3.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The parent window used when a dialog must be opened.
Notes: (Read and Write property)

187.2.13 Target as String

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The target where the shortcut will point to.
Notes:

(Changed from Folderitem to String in plugin version 3.4)
(Read and Write property)

187.2.14 WorkingDirectory as String

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The working directory of this shortcut.
Notes:

(Changed from Folderitem to String in plugin version 3.4)
(Read and Write property)

Chapter 188

Windows System Tray

188.1 Globals

188.1.1 HIconFromFileMBS(IconFile as Folderitem, IconID as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a Windows Icon Handle for an icon loaded fromt he given icon file.
Notes:

What image depths are used and supported depends on the Windows version.
IconID = 0 points to the first icon in the file.
Returns 0 on failure.

The icon file can be .ico, .exe, .dll or similar files with windows icon resource.
This function is useful for declares where you have to pass a HICON parameter.

188.1.2 HIconFromPicturesMBS(Icon as picture, Mask as picture) as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a Windows Icon Handle with the given pictures.
Notes:

What image depths are used and supported depends on the Windows version.
Returns 0 on failure.
This function is useful for declares where you have to pass a HICON parameter.

188.2 class WindowsSystemTrayMBS

188.2.1 class WindowsSystemTrayMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to create an item in the system tray.

188.2.2 Blog Entries

- MBS Real Studio Plugins, version 11.3pr10
- MBS REALbasic Plugins, version 10.4pr8

188.2.3 Methods

188.2.4 Add as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Adds the item to the system tray.
Example:

```
dim e as WindowsSystemTrayMBS // your system tray object

if e.add then
list.addrow "Added icon."
else
list.addrow "Failed to add icon."
end if
```

Notes:

Returns true if successfull.
You can change the Icon& Mask or the Tooltip string.

188.2.5 Available as boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the system tray functions are available.
Notes:

Returns true on Windows 95 and newer.
Returns false on Mac OS and Linux.

188.2.6 Modify as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Modifies the item to the system tray.
Notes:

Returns true if successfull.
You can change the Icon& Mask or the Tooltip string.

188.2.7 Remove as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Removes the item from the system tray.
Notes: Returns true if successfull.

188.2.8 SetFocus as boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This method resets focus back to the system try area.
Notes: May be useful to call as cleanup after some context menu was shown.

188.2.9 SetIconFile(IconFile as Folderitem, IconID as Integer) as boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Loads an icon from the given file.
Example:

```
dim wst as WindowsSystemTrayMBS // your system tray

call wst.SetIconFile(file,1)
```

Notes:

Returns true on success and false on failure.
What image depths are used and supported depends on the Windows version.
IconID = 0 points to the first icon in the file.

The icon file can be .ico, .exe, .dll or similar files with windows icon resource.

188.2.10 SetIconPicture(Icon as picture, Mask as picture) as boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Loads the icon from the given picture with mask.
Example:

```
dim myicon as picture // your picture
dim mymask as picture // the mask for the picture
dim wst as WindowsSystemTrayMBS // your system tray

call wst.SetIconPicture(myicon, mymask)
```

Notes:

Returns true on success and false on failure.
What image depths are used and supported depends on the Windows version.

Type is 0 for a small icon and 1 for a big icon.

188.2.11 Properties

188.2.12 BalloonMode as Integer

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The balloon mode.
Example:

```
dim s as WindowsSystemTrayMBS

s.BalloonText = "The text for the balloon."
s.BalloonTitle = "The title for the balloon"
s.BalloonMode = 0 // Error mode
```

Notes:

0 is Error, 1 is Info and 2 is warning.
(Read and Write property)

188.2.13 BalloonText as string

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The balloon text to show.
Example:

```
dim wst as WindowsSystemTrayMBS // your system tray object

wst.BalloonTitle="Warning"
wst.BalloonText="You have not clicked on me the last 10 minutes."
call wst.modify
```

Notes:

If BalloonTitle or BalloonText are not empty the balloon is shown when you call modify.
(Read and Write property)

188.2.14 BalloonTimeout as Integer

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The balloon timeout in milliseconds.
Example:

```
dim s as WindowsSystemTrayMBS

s.BalloonText = "The text for the balloon."
s.BalloonTitle = "The title for the balloon"
s.BalloonMode = 0 // Error mode
s.BalloonTimeout = 30000
```

Notes:

A value between 10000 and 30000.
Note that Timeout is valid only in Windows 2000 and Windows XP.
(Read and Write property)
See also:

- 188.2.23 BalloonTimeout(id as Integer, MouseX as Integer, MouseY as Integer) 22582

188.2.15 BalloonTitle as string

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The title of the balloon tooltip.

Example:

```
dim s as WindowsSystemTrayMBS

s.BalloonText = "The text for the balloon."
s.BalloonTitle = "The title for the balloon"
s.BalloonMode = 0 // Error mode
```

Notes:

If BalloonTitle or BalloonText are not empty the balloon is shown when you call modify.
(Read and Write property)

188.2.16 IconHandle as Integer

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The icon handle currently used for the tray object.
Notes:

zero if no handle is there.
(Read and Write property)

188.2.17 ID as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** If you have more than one icon in the system tray, use this ID to see which one is referred to inside an event.
Notes: (Read and Write property)

188.2.18 Tooltip as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The help string for the tooltip.
Example:

```
dim e as WindowsSystemTrayMBS // global

e=new WindowsSystemTrayMBS
e.ID=12345678
e.Tooltip="some text"
e.BalloonText="some text"
e.BalloonTitle="some text"
e.BalloonMode=0
```

Notes:

Limited to 63 characters.
(Read and Write property)

188.2.19 UsingNewEvents as Boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the new events are enabled.
Notes:

The plugin tries to enable new events if possible. That will only work on Windows 2000 or newer.

New events are:
BalloonTimeout
PopupOpen
ContextMenu
BalloonHide
KeySelected
BalloonUserClick
BalloonShow
Selected
(Read only property)

188.2.20 Events

188.2.21 BalloonHide(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The balloon has been hidden.

188.2.22 BalloonShow(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The balloon was shown.
Notes: You will get one balloon event when it disappears: BalloonHide, BalloonUserClick or BalloonTimeout.

188.2.23 BalloonTimeout(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The balloon was removed because of a timeout.
See also:

- 188.2.14 BalloonTimeout as Integer 22579

188.2.24 BalloonUserClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The user clicked on the balloon to make it away.

188.2.25 ContextMenu(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** You should show a context menu.

188.2.26 KeySelected(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The system tray item was selected by the keyboard.

188.2.27 MouseLeftButtonDoubleClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Called if the left mouse button is pressed for a double click on the system tray icon.

188.2.28 MouseLeftButtonDown(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Called if the left mouse button is pressed on the system tray icon.

188.2.29 MouseLeftButtonUp(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Called if the left mouse button is released on the system tray icon.

188.2.30 MouseMiddleButtonDoubleClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Called if the middle mouse button is pressed for a double click on the system tray icon.

188.2.31 MouseMiddleButtonDown(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Called if the middle mouse button is pressed on the system tray icon.

188.2.32 MouseMiddleButtonUp(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Called if the middle mouse button is released on the system tray icon.

188.2.33 MouseMove(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Called if the mouse is moved over the system tray icon.

188.2.34 MouseRightButtonDoubleClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Called if the right mouse button is pressed for a double click on the system tray icon.

188.2.35 MouseRightButtonDown(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Called if the right mouse button is pressed on the system tray icon.

188.2.36 MouseRightButtonUp(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Called if the right mouse button is pressed on the system tray icon.

188.2.37 PopupOpen(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** You should show a popup menu on the mouse position.

188.2.38 Selected(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The system tray item was selected.

Chapter 189

Windows Taskbar State

189.1 class WindowsTaskbarStateMBS

189.1.1 class WindowsTaskbarStateMBS

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class for information about the settings for the Windows taskbar.

189.1.2 Blog Entries

- MBS Real Studio Plugins, version 12.2pr6

189.1.3 Properties

189.1.4 AlwaysOnTop as Boolean

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** True if the taskbar should be always on the top.
Notes:

Value is false on any error.
Settable in plugin version 12.2 and newer.
(Read and Write property)

189.1.5 AutoHide as Boolean

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** True if the taskbar automatically hides itself.
Notes:

Value is false on any error.
Settable in plugin version 12.2 and newer.
(Read and Write property)

189.1.6 Bottom as Integer

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The bottom value of the taskbar dimensions.
Notes:

Value is 0 on any error.
(Read and Write property)

189.1.7 Height as Integer

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The height value of the taskbar dimensions.
Notes:

Value is 0 on any error.
(Read and Write property)

189.1.8 Left as Integer

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The left value of the taskbar dimensions.
Notes:

Value is 0 on any error.
(Read and Write property)

189.1.9 Right as Integer

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The right value of the taskbar dimensions.

Notes:

Value is 0 on any error.
(Read and Write property)

189.1.10 Top as Integer

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The top value of the taskbar dimensions.
Notes:

Value is 0 on any error.
(Read and Write property)

189.1.11 Width as Integer

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The width value of the taskbar dimensions.
Notes:

Value is 0 on any error.
(Read and Write property)

Chapter 190

WiringPi

190.1 module WiringPiMBS

190.1.1 module WiringPiMBS

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The module to work with wiring pi library.
Deprecated: This item is deprecated and should no longer be used. **Notes:** Deprecated as underlaying C library is deprecated.

190.1.2 Blog Entries

- MBS Xojo Plugins, version 19.2pr1
- MBS Xojo / Real Studio Plugins, version 15.3pr2

190.1.3 Methods

190.1.4 analogRead(pin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This returns the value read on the supplied analog input pin.
Notes: You will need to register additional analog modules to enable this function for devices such as the Gertboard, quick2Wire analog board, etc.

190.1.5 analogWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This writes the given value to the supplied analog pin.
Notes: You will need to register additional analog modules to enable this function for devices such as the Gertboard.

190.1.6 delay(HowLong as UInt32)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This causes program execution to pause for at least howLong milliseconds.
Notes: Due to the multi-tasking nature of Linux it could be longer. Note that the maximum delay is an unsigned 32-bit integer or approximately 49 days.

190.1.7 delayMicroseconds(HowLong as UInt32)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This causes program execution to pause for at least howLong microseconds.
Notes:

Due to the multi-tasking nature of Linux it could be longer. Note that the maximum delay is an unsigned 32-bit integer microseconds or approximately 71 minutes.

Delays under 100 microseconds are timed using a hard-coded loop continually polling the system time, Delays over 100 microseconds are done using the system nanosleep() function – You may need to consider the implications of very short delays on the overall performance of the system, especially if using threads.

190.1.8 digitalRead(pin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This function returns the value read at the given pin.
Notes: It will be kHIGH or kLOW (1 or 0) depending on the logic level at the pin.

190.1.9 digitalWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Writes the value kHIGH or kLOW (1 or 0) to the given pin which must have been previously set as an output.

Notes: WiringPi treats any non-zero number as kHIGH, however 0 is the only representation of kLOW.

190.1.10 digitalWriteByte(value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This writes the 8-bit byte supplied to the first 8 GPIO pins.
Notes: It's the fastest way to set all 8 bits at once to a particular value, although it still takes two write operations to the Pi's GPIO hardware.

190.1.11 gpioClockSet(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Sets the clock.

190.1.12 I2CRead(fd as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Simple device read.
Notes:

Some devices present data when you read them without having to do any register transactions.
If the return value is negative then an error has happened and you should consult errno.

190.1.13 I2CReadReg16(fd as Integer, reg as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Simple device read.
Notes:

Some devices present data when you read them without having to do any register transactions.
Read a 16-bit value from the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

190.1.14 I2CReadReg8(fd as Integer, reg as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Simple device read.

Notes:

Some devices present data when you read them without having to do any register transactions.
Read an 8-bit value from the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

190.1.15 I2CSetup(devId as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This initialises the I2C system with your given device identifier.
Notes:

The ID is the I2C number of the device and you can use the i2cdetect program to find this out. I2CSetup() will work out which revision Raspberry Pi you have and open the appropriate device in /dev.

The return value is the standard Linux filehandle, or -1 if any error – in which case, you can consult errno as usual.

E.g. the popular MCP23017 GPIO expander is usually device Id 0x20, so this is the number you would pass into wiringPiI2CSetup().

190.1.16 I2CSetupInterface(device as string, devId as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This initialises the I2C system with your given device identifier and name.

190.1.17 I2CWrite(fd as Integer, Data as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Simple device write.
Notes:

Some devices accept data this way without needing to access any internal registers.
If the return value is negative then an error has happened and you should consult errno.

190.1.18 I2CWriteReg16(fd as Integer, reg as Integer, Data as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Simple device write.
Notes:

Some devices accept data this way without needing to access any internal registers.
Write a 16-bit data value into the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

190.1.19 I2CWriteReg8(fd as Integer, reg as Integer, Data as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Simple device write.
Notes:

Some devices accept data this way without needing to access any internal registers.
Write a 8-bit data value into the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

190.1.20 LoadLibrary(File as FolderItem) as boolean

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Loads the library.
Notes:

Returns true on success or false on failure.
LoadError is set in case of failure.
See also:

- 190.1.21 LoadLibrary(Path as string) as boolean 22593

190.1.21 LoadLibrary(Path as string) as boolean

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Loads the library.
Notes:

Returns true on success or false on failure.
LoadError is set in case of failure.

See also:

- 190.1.20 LoadLibrary(File as FolderItem) as boolean 22593

190.1.22 micros as UInt32

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This returns a number representing the number of microseconds since your program called one of the wiringPiSetup functions.
Notes: It returns an unsigned 32-bit number which wraps after approximately 71 minutes.

190.1.23 millis as UInt32

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This returns a number representing the number of milliseconds since your program called one of the wiringPiSetup functions.
Notes: It returns an unsigned 32-bit number which wraps after 49 days.

190.1.24 physPinToGpio(physPin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This returns the BCM_GPIO pin number of the supplied physical pin on the P1 connector.

190.1.25 piBoardId(byref model as Integer, byref Rev as Integer, byref Mem as Integer, byref Maker as Integer, byref OverVolted as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Queries board identifiers.
Notes:

Mem is memory in Megabytes.
Maker, Model and Rev are value which match the constants in this module.

190.1.26 piBoardRev as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This returns the board revision of the Raspberry Pi.
Notes: It will be either 1 or 2. Some of the BCM_GPIO pins changed number and function when moving from board revision 1 to 2, so if you are using BCM_GPIO pin numbers, then you need to be aware of the

differences.

190.1.27 piHiPri(pri as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This attempts to shift your program (or thread in a multi-threaded program) to a higher priority and enables a real-time scheduling.
Notes:

The priority parameter should be from 0 (the default) to 99 (the maximum). This won't make your program go any faster, but it will give it a bigger slice of time when other programs are running. The priority parameter works relative to others – so you can make one program priority 1 and another priority 2 and it will have the same effect as setting one to 10 and the other to 90 (as long as no other programs are running with elevated priorities)

The return value is 0 for success and -1 for error. If an error is returned, the program should then consult the errno global variable, as per the usual conventions.

Note: Only programs running as root can change their priority. If called from a non-root program then nothing happens.

190.1.28 piLock(Key as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Locks a synchronization lock.
Notes:

These allow you to synchronise variable updates from your main program to any threads running in your program. keyNum is a number from 0 to 3 and represents a "key". When another process tries to lock the same key, it will be stalled until the first process has unlocked the same key.

You may need to use these functions to ensure that you get valid data when exchanging data between your main program and a thread – otherwise it's possible that the thread could wake-up halfway during your data copy and change the data – so the data you end up copying is incomplete, or invalid.

190.1.29 piMakerNames(index as Integer) as string

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Maps maker numbers to names.

190.1.30 piModelNames(index as Integer) as string

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Maps model numbers to names.

190.1.31 pinMode(pin as Integer, mode as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This sets the mode of a pin to either INPUT, OUTPUT, PWM_OUTPUT or GPIO_CLOCK.
Notes:

Note that only wiringPi pin 1 (BCM_GPIO 18) supports PWM output and only wiringPi pin 7 (BCM_GPIO 4) supports CLOCK output modes.

This function has no effect when in Sys mode. If you need to change the pin mode, then you can do it with the gpio program in a script before you start your program.

190.1.32 piRevisionNames(index as Integer) as string

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Maps revision numbers to names.

190.1.33 piUnlock(Key as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Unlocks a synchronization lock.
Notes:

These allow you to synchronise variable updates from your main program to any threads running in your program. keyNum is a number from 0 to 3 and represents a "key". When another process tries to lock the same key, it will be stalled until the first process has unlocked the same key.

You may need to use these functions to ensure that you get valid data when exchanging data between your main program and a thread – otherwise it's possible that the thread could wake-up halfway during your data copy and change the data – so the data you end up copying is incomplete, or invalid.

190.1.34 pullUpDnControl(pin as Integer, pud as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This sets the pull-up or pull-down resistor mode on the given pin, which should be set as an input.
Notes:

Unlike the Arduino, the BCM2835 has both pull-up an down internal resistors. The parameter pud should be; kPUD_OFF, (no pull up/down), kPUD_DOWN (pull to ground) or kPUD_UP (pull to 3.3v) The internal pull up/down resistors have a value of approximately 50KΩ on the Raspberry Pi.

This function has no effect on the Raspberry Pi's GPIO pins when in Sys mode. If you need to activate a pull-up/pull-down, then you can do it with the gpio program in a script before you start your program.

190.1.35 pwmSetClock(divisor as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This sets the divisor for the PWM clock.

190.1.36 pwmSetMode(mode as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The PWM generator can run in 2 modes – "balanced" and "mark:space".
Notes: The mark:space mode is traditional, however the default mode in the Pi is "balanced". You can switch modes by supplying the parameter: kPWM_MODE_BAL or kPWM_MODE_MS.

190.1.37 pwmSetRange(range as UInt32)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This sets the range register in the PWM generator.
Notes: The default is 1024.

190.1.38 pwmToneWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Writes a tone.

190.1.39 pwmWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Writes the value to the PWM register for the given pin.
Notes:

The Raspberry Pi has one on-board PWM pin, pin 1 (BMC_GPIO 18, Phys 12) and the range is 0-1024. Other PWM devices may have other PWM ranges.

This function is not able to control the Pi's on-board PWM when in Sys mode.

190.1.40 Read(fd as Integer, count as UInt64) as Memoryblock

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Read attempts to read count bytes of data from the object referenced by the descriptor fildes into a buffer.
Notes:

Returns the memoryblock on success (if we got more than zero bytes).
Errno is set in case of error.

190.1.41 serialClose(fd as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Closes the device identified by the file descriptor given.

190.1.42 serialDataAvail(fd as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Returns the number of characters available for reading, or -1 for any error condition, in which case errno will be set appropriately.

190.1.43 serialFlush(fd as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This discards all data received, or waiting to be send down the given device.

190.1.44 serialGetchar(fd as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Returns the next character available on the serial device.
Notes: This call will block for up to 10 seconds if no data is available (when it will return -1)

190.1.45 serialOpen(device as String, Baud as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This opens and initialises the serial device and sets the baud rate.
Notes: It sets the port into "raw" mode (character at a time and no translations), and sets the read timeout to 10 seconds. The return value is the file descriptor or -1 for any error, in which case errno will be set as appropriate.

190.1.46 serialPutchar(fd as Integer, c as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Sends the single byte to the serial device identified by the given file descriptor.

190.1.47 serialPutData(fd as Integer, data as Memoryblock)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Sends the nul-terminated string to the serial device identified by the given file descriptor.
Notes: This sends text with any encoding.

190.1.48 serialPuts(fd as Integer, text as string)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Sends the nul-terminated string to the serial device identified by the given file descriptor.
Notes: This sends text with UTF-8 encoding.

190.1.49 setPadDrive(group as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This sets the "strength" of the pad drivers for a particular group of pins.
Notes: There are 3 groups of pins and the drive strength is from 0 to 7. Do not use this unless you know what you are doing.

190.1.50 SPIDataRW(channel as Integer, data as Memoryblock) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This performs a simultaneous write/read transaction over the selected SPI bus.
Notes:

Data that was in your buffer is overwritten by data returned from the SPI bus.

That's all there is in the helper library. It is possible to do simple read and writes over the SPI bus using the standard read() and write() system calls though – write() may be better to use for sending data to chains of shift registers, or those LED strings where you send RGB triplets of data. Devices such as A/D and D/A converters usually need to perform a concurrent write/read transaction to work.

190.1.51 SPIGetFd(channel as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Queries the file descriptor for a channel.

190.1.52 SPISetup(channel as Integer, speed as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This is the way to initialise a channel (The Pi has 2 channels; 0 and 1).
Notes:

The speed parameter is an integer in the range 500,000 through 32,000,000 and represents the SPI clock speed in Hz.

The returned value is the Linux file-descriptor for the device, or -1 on error. If an error has happened, you may use the standard errno global variable to see why.

190.1.53 SPISetupMode(channel as Integer, speed as Integer, mode as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This is the way to initialise a channel (The Pi has 2 channels; 0 and 1).
Notes:

The speed parameter is an integer in the range 500,000 through 32,000,000 and represents the SPI clock speed in Hz.

The returned value is the Linux file-descriptor for the device, or -1 on error. If an error has happened, you

may use the standard errno global variable to see why.

190.1.54 wiringPiSetup as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Initializes the library.
Notes:

This initialises wiringPi and assumes that the calling program is going to be using the wiringPi pin numbering scheme. This is a simplified numbering scheme which provides a mapping from virtual pin numbers 0 through 16 to the real underlying Broadcom GPIO pin numbers. See the pins page for a table which maps the wiringPi pin number to the Broadcom GPIO pin number to the physical location on the edge connector.

This function needs to be called with root privileges.

One of the setup functions must be called at the start of your program or your program will fail to work correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

190.1.55 wiringPiSetupGpio as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Initializes the library.
Notes:

This is identical to wiringPiSetup, however it allows the calling programs to use the Broadcom GPIO pin numbers directly with no re-mapping.

As above, this function needs to be called with root privileges, and note that some pins are different from revision 1 to revision 2 boards.

One of the setup functions must be called at the start of your program or your program will fail to work correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

190.1.56 wiringPiSetupPhys as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Initializes the library.
Notes:

Identical to wiringPiSetup, however it allows the calling programs to use the physical pin numbers on the P1 connector only.

As above, this function needs to be called with root priviliges.

One of the setup functions must be called at the start of your program or your program will fail to work correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

190.1.57 wiringPiSetupSys as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Initializes the library.
Notes:

This initialises wiringPi but uses the /sys/class/gpio interface rather than accessing the hardware directly. This can be called as a non-root user provided the GPIO pins have been exported before-hand using the gpio program. Pin numbering in this mode is the native Broadcom GPIO numbers – the same as wiringPiSetupGpio() above, so be aware of the differences between Rev 1 and Rev 2 boards.

Note: In this mode you can only use the pins which have been exported via the /sys/class/gpio interface before you run your program. You can do this in a separate shell-script, or by using the system() function from inside your program to call the gpio program.

Also note that some functions have no effect when using this mode as they're not currently possible to action unless called with root privileges. (although you can use system() to call gpio to set/change modes if needed)

One of the setup functions must be called at the start of your program or your program will fail to work correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

190.1.58 wpiPinToGpio(wpiPin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This returns the BCM_GPIO pin number of the supplied wiringPi pin.
Notes: It takes the board revision into account.

190.1.59 Write(fd as Integer, data as Memoryblock) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Write to a file descriptor.
Notes:

Write attempts to write bytes to the object referenced by the descriptor fildes from the memoryblock pointed to by data.
Upon successful completion the number of bytes which were written is returned. Otherwise, a -1 is returned and the global variable errno is set to indicate the error.

190.1.60 Properties

190.1.61 ErrNo as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The last error code from the underlaying linux functions.
Notes:

must be called directly after a function to have the result from that function.
Calling any other function including writing a debug log, may cause this value to be reset.
(Read only property)

190.1.62 LoadError as String

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Returns the last load error.
Notes: (Read only property)

190.1.63 Constants

190.1.64 kGPIO_CLOCK = 3

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the pin mode constants.
Notes: GPIO Clock

190.1.65 kHIGH = 1

MBS Linux Plugin, Plugin Version: 15.3. **Function:** The constant for high value.

190.1.66 kINPUT = 0

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the pin mode constants.
Notes: Input

190.1.67 kINT_EDGE_BOTH = 3

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the interrupt level constants.
Notes: Both

190.1.68 kINT_EDGE_FALLING = 1

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the interrupt level constants.
Notes: Failing

190.1.69 kINT_EDGE_RISING = 2

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the interrupt level constants.
Notes: Rising

190.1.70 kINT_EDGE_SETUP = 0

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the interrupt level constants.
Notes: Setup

190.1.71 kLOW = 0

MBS Linux Plugin, Plugin Version: 15.3. **Function:** The constant for low value.

190.1.72 kOUTPUT = 1

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the pin mode constants.
Notes: Output

190.1.73 kPI_MAKER_EGOMAN = 1

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the maker values.
Notes: Egoman

190.1.74 kPI_MAKER_MBEST = 4

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the maker values.
Notes: MBest

190.1.75 kPI_MAKER_QISDA = 3

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the maker values.
Notes: QISDA

190.1.76 kPI_MAKER_SONY = 2

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the maker values.
Notes: Sony

190.1.77 kPI_MAKER_UNKNOWN = 0

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the maker values.
Notes: Unknown

190.1.78 kPI_MODEL_2 = 6

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the model constants.
Notes: Model 2

190.1.79 kPI_MODEL_A = 1

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the model constants.
Notes: Model A

190.1.80 kPI_MODEL_AP = 5

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the model constants.
Notes: Model AP

190.1.81 kPI_MODEL_B = 2

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the model constants.
Notes: Model B

190.1.82 kPI_MODEL_BP = 3

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the model constants.
Notes: Model BP

190.1.83 kPI_MODEL_CM = 4

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the model constants.
Notes: Model CM

190.1.84 kPI_MODEL_UNKNOWN = 0

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the model constants.
Notes: unknown

190.1.85 kPI_VERSION_1 = 1

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the version constants.
Notes: Version 1

190.1.86 kPI_VERSION_1_1 = 2

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the version constants.
Notes: Version 1.1

190.1.87 kPI_VERSION_1_2 = 3

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the version constants.
Notes: Version 1.2

190.1.88 kPI_VERSION_2 = 4

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the version constants.
Notes: Version 2

190.1.89 kPI_VERSION_UNKNOWN = 0

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the version constants.
Notes: Unknown version

190.1.90 kPUD_DOWN = 1

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the pull up/down constants.
Notes: pull to ground

190.1.91 kPUD_OFF = 0

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the pull up/down constants.
Notes: no pull up/down

190.1.92 kPUD_UP = 2

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the pull up/down constants.
Notes: pull to 3.3v

190.1.93 kPWM_MODE_BAL = 1

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the PWM generator modes.
Notes: Balanced

190.1.94 kPWM_MODE_MS = 0

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the PWM generator modes.
Notes: Mark:Space

190.1.95 kPWM_OUTPUT = 2

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the pin mode constants.
Notes: PWM Output

190.1.96 kPWM_TONE_OUTPUT = 6

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the pin mode constants.
Notes: Tone Output

190.1.97 kSOFT_PWM_OUTPUT = 4

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the pin mode constants.
Notes: PWM Output

190.1.98 kSOFT_TONE_OUTPUT = 5

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the pin mode constants.
Notes: Tone Output

Chapter 191

Wordfile

191.1 class WordFileMBS

191.1.1 class WordFileMBS

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Word file editing.
Example:

```
dim f as FolderItem = GetFolderItem("test.docx")
dim b as BinaryStream = BinaryStream.Open(f)
dim d as string = b.Read(b.Length)
dim w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = GetFolderItem("output.docx")
if w.WriteFile(f) then
MsgBox "OK"
end if
end if
end if
```

Notes:

This is a class for reading word files and replacing text to customize document files.
Works for xml and docx files. Does not support old doc file format.

Please report document files where plugin corrupted file or failed to replace text.

This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

191.1.3 Xojo Developer Magazine

- 15.2, page 10: News

191.1.4 Methods

191.1.5 addMediaFile(name as string, content as string)

MBS XL Plugin, Plugin Version: 19.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a media file image.
Notes:

You can use this function to add a new image.
You need to add the reference in XML yourself to let the image appear somewhere in the document.

191.1.6 Append(other as WordFileMBS, AddPageBreak as boolean = false) as Boolean

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Appends one word file text to other.
Notes:

This function takes document part from other word file and copies it's xml nodes to the current document. Please only copy from one document to other if they both are made from same template, so internal IDs for styles match.
Returns true on success or false on failure.

Added AddPageBreak parameter in version 19.2. If true, we add a page break between the old and new parts.

191.1.7 AppendTableRow(tag as string) as Integer

MBS XL Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Duplicates a table row containing a placeholder.
Notes:

If you have tables in your template word file and you like to duplicate it, this function can do that and add the new row on the end of the table.

Returns Values

0	success
1	Tag not found.
2	Tag found, but not in a table.
3	Missing main document part.

191.1.8 Constructor

MBS XL Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

191.1.9 DuplicateTableRow(tag as string) as Integer

MBS XL Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Duplicates a table row containing a placeholder.
Notes:

If you have tables in your template word file and you like to duplicate it, this function can do that and add the new row on just after the row to copy.

Returns Values

0	success
1	Tag not found.
2	Tag found, but not in a table.
3	Missing main document part.

191.1.10 FieldNames as String()

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries field names in the file.
Notes: This looks for form fields in a word file.

191.1.11 GetFieldText(fieldName as string, byref text as String) as boolean

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries field value.
Notes:

The plugin looks for the field with given name and queries it's text.
Returns true if field was found.

191.1.12 HasTag(tag as string) as boolean

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Checks if a tag exists.
Notes:

The place holder in the document must start with « and end with » characters. The place holder you pass here, should not have those quotes.
Returns true on success or false on failure.

If you change font or style of the text within the marker, it will not be recognized. So please keep all text between and including the « and » markers (or whatever is configured) within the same font style.

191.1.13 MediaFiles as String()

MBS XL Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Lists the media files in the word document.
Notes: e.g. image1.png

191.1.14 OpenData(Data as MemoryBlock) as WordFileMBS

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Opens data as document.
Notes:

You can pass here XML or Docx file content.
Returns nil in case of an error.
See also:

- 191.1.15 OpenData(Data as String) as WordFileMBS 22613

191.1.15 OpenData(Data as String) as WordFileMBS

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Opens data as document.
Example:

```
dim f as FolderItem = GetFolderItem("test.docx")
dim b as BinaryStream = BinaryStream.Open(f)
dim d as string = b.Read(b.Length)
dim w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = GetFolderItem("output.docx")
if w.WriteFile(f) then
MsgBox "OK"
end if
end if
end if
```

Notes:

You can pass here XML or Docx file content.
Returns nil in case of an error.
See also:

• 191.1.14 OpenData(Data as MemoryBlock) as WordFileMBS 22613

191.1.16 OpenXML(XML as String) as WordFileMBS

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Opens XML file from text string.
Notes: Returns nil in case of error.

191.1.17 Parts as String()

MBS XL Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries names of the parts of the document.
Example:

```
dim f as FolderItem = GetFolderItem("test.docx")
dim b as BinaryStream = BinaryStream.Open(f)
dim d as string = b.Read(b.Length)
dim w as WordFileMBS = WordFileMBS.OpenData(d)

MsgBox w.XML("footer1")
```

Notes:

This may tell you how many headers/footers we found in a docx file.
e.g. "footer1", "header1", "document".

191.1.18 RemoveTableRow(tag as string) as Integer

MBS XL Plugin, Plugin Version: 17.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes a table row containing a placeholder.
Notes:

If you have tables in your template word file and you only fill some rows, you can remove superfluous rows using this function.

Returns Values

0 success
1 Tag not found.
2 Tag found, but not in a table.
3 Missing main document part.

191.1.19 ReplaceTag(tag as string, text as string = """, All as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Replaces a placeholder with text.
Example:

```
dim f as FolderItem = GetFolderItem("test.docx")
dim b as BinaryStream = BinaryStream.Open(f)
dim d as string = b.Read(b.Length)
dim w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = GetFolderItem("output.docx")
if w.WriteFile(f) then
MsgBox "OK"
end if
end if
end if
```

Notes:

The place holder in the document must start with « and end with » characters. The place holder you pass here, should not have those quotes.
Returns true on success or false on failure.
If you need to replace multi line text like addresses, please use several placeholders, at least one per line.

Version 17.0 and newer can handle multi line text better for normal paragraphs. It creates for you new paragraphs for each line in the new text.

If you change font or style of the text within the marker, it will not be recognized. So please keep all text between and including the « and » markers (or whatever is configured) within the same font style.

191.1.20 SetFieldText(fieldName as string, text as String) as boolean

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets field value.
Notes:

The plugin looks for the field with given name and sets it's text.
Returns true if field was found.

191.1.21 SetMarkers(openMarker as String, closeMarker as String) as boolean

MBS XL Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the markers to look for before/after a tag.
Notes:

Default are « and ».
Should be different and not empty.
Returns true on success or false on failure.

191.1.22 WriteFile(path as folderItem) as boolean

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a file to disk.
Example:

```
dim f as FolderItem = GetFolderItem("test.docx")
dim b as BinaryStream = BinaryStream.Open(f)
dim d as string = b.Read(b.Length)
dim w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = GetFolderItem("output.docx")
if w.WriteFile(f) then
MsgBox "OK"
end if
end if
end if
```

Notes: File extension should be correct, either docx or xml depending on what you loaded.

191.1.23 Properties

191.1.24 Caseless as Boolean

MBS XL Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to compare tag names case insensitive.
Notes:

Set to true for case insensitive comparison of ASCII characters.
Default is false.
(Read and Write property)

191.1.25 CloseMarker as String

MBS XL Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The close marker text.
Notes:

Default value is "».
(Read only property)

191.1.26 OpenMarker as String

MBS XL Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The open marker text.
Notes:

Default value is "«".
(Read only property)

191.1.27 Text as String

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Extracts text of word file.
Notes:

Plugin inserts a few newline characters for detected line ends.

May not give all text. If you miss something, please send us test files.
(Read only property)

191.1.28 XML as String

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The XML found in the document.
Notes: (Read and Write property)
See also:

- 191.1.30 XML(part as String) as String 22618

191.1.29 MediaFile(name as string) as String

MBS XL Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries or replaces the content of a media file.
Notes:

You can use this to extract images from word file.
Or to replace a placeholder image with the real image.
For replacement please make sure file type and dimensions match.
Raises KeyNotFoundException if media file with given name is not found.
(Read and Write computed property)

191.1.30 XML(part as String) as String

MBS XL Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries/Sets XML for a part.
Notes:

See Parts array for possible parts.
(Read and Write computed property)
See also:

- 191.1.28 XML as String 22618

Chapter 192

X-Face

192.1 Globals

192.1.1 PictureFromXFaceMemoryBlockMBS(xface as memoryblock) as picture

MBS Picture Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new picture from a X-Face string inside a memoryblock.
Notes:

Returns nil on any error.
The returned picture is 32 bit depth.
See also:

- 192.1.2 PictureFromXFaceMemoryBlockMBS(xface as memoryblock, size as Integer) as picture 22619

192.1.2 PictureFromXFaceMemoryBlockMBS(xface as memoryblock, size as Integer) as picture

MBS Picture Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new picture from a X-Face string inside a memoryblock with the given size.
Notes:

Returns nil on any error.
The returned picture is 32 bit depth.
See also:

- 192.1.1 PictureFromXFaceMemoryBlockMBS(xface as memoryblock) as picture 22619

192.1.3 PictureFromXFaceStringMBS(xface as string) as picture

MBS Picture Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new picture from a X-Face string.
Notes:

Returns nil on any error.
The returned picture is 32 bit depth.

192.1.4 XFaceStringFromPictureMBS(pic as picture) as string

MBS Picture Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a X-Face encoded string with the picture as content.
Notes:

The picture is first converted to a 32 bit picture. Than it's encoded. A Pixel like c=rgb(r,g,b) is white if (r+g+b) >= 3*128.

Returns "" on any error.

Chapter 193

XL

193.1 class XLAutoFilterMBS

193.1.1 class XLAutoFilterMBS

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for auto filter.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

193.1.2 Blog Entries

- MBS Xojo Plugins, version 18.4pr9

193.1.3 Methods

193.1.4 Column(colId as Integer) as XLFilterColumnMBS

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the AutoFilter column by zero-based index.
Notes: Creates it if it doesn't exist.

193.1.5 ColumnByIndex(colId as Integer) as XLFilterColumnMBS

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the specified AutoFilter column which have a filter information by index.

193.1.6 Constructor

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

193.1.7 GetRef(byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the cell range of AutoFilter with header.
Notes: Returns false if error. Get error info with XLBookMBS.errorMessage.

193.1.8 GetSort(byref columnIndex as Integer, byref descending as Boolean) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the zero-based index of sorted column in AutoFilter and its sort order.
Notes: Returns false if error. Get error info with XLBookMBS.errorMessage.

193.1.9 GetSortRange(byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the whole range of data to sort.
Notes: Returns false if error. Get error info with XLBookMBS.errorMessage.

193.1.10 SetRef(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the cell range of AutoFilter with header.

193.1.11 SetSort(columnIndex as Integer, descending as Boolean)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the sorted column in AutoFilter by zero-based index and its sort order.
Notes: Returns false if error. Get error info with XLBookMBS.errorMessage.

193.1.12 Properties

193.1.13 ColumnSize as Integer

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the number of specified AutoFilter columns which have a filter information.
Notes: (Read only property)

193.1.14 Handle as Integer

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

193.1.15 Owner as Variant

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The parent object.
Notes:

Usually the XLFilterColumnMBS object.
(Read only property)

193.2 class XLBookMBS

193.2.1 class XLBookMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The central class for a workbook.
Notes:

The MBS Xojo XL Plugin is based on LibXL, a powerful library to handle Excel files.

You'll need your own license for LibXL. For more information go here:
https://www.monkeybreadsoftware.de/xojo/plugin-xls.shtml

When you have obtained license file inside your XOJO project place XLBookMBS.SetKeyGlobal call with LibXL license in app.open.

193.2.3 Xojo Developer Magazine

- 16.1, page 10: News

193.2.4 Methods

193.2.5 AddCustomNumFormat(customNumFormat as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a new custom number format to the workbook.
Notes: The format string customNumFormat indicates how to format and render the numeric value of a cell. See custom format strings guidelines (in FAQ). Returns the custom format identifier. It's used in XLFormatMBS.NumFormat. Returns 0 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.2.6 AddFont(initFont as XLFontMBS = nil) as XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a new font to the workbook, initial parameters can be copied from other font.
Notes: Returns NULL if error occurs.

193.2.7 AddFormat(initFormat as XLFormatMBS = nil) as XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a new format to the workbook, initial parameters can be copied from other format.
Example:

```
// define a format for red fill
Dim redBackgroundFormat As XLFormatMBS = book.AddFormat
Dim c As Color = & cFF0000
// will give back numeric value of color for RGB mode or color index
Dim n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Dim row As Integer = 5 // 6th row
Dim col As Integer = 1 // Column B
Dim value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

Notes: Returns NULL if error occurs.

193.2.8 AddPicture(path as folderitem) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a picture to the workbook.
Notes: Returns a picture identifier. Supports BMP, DIB, PNG, JPG and WMF picture formats. Use picture identifier with XLSheetMBS.setPicture(). Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:

- 193.2.9 AddPicture(path as string) as Integer 22626

193.2.9 AddPicture(path as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a picture to the workbook.
Notes: Returns a picture identifier. Supports BMP, DIB, PNG, JPG and WMF picture formats. Use picture identifier with XLSheetMBS.setPicture(). Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:

- 193.2.8 AddPicture(path as folderitem) as Integer 22626

193.2.10 AddPictureData(data as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a picture to the workbook from memory buffer:
Notes: Returns a picture identifier. Use picture identifier with XLSheetMBS.setPicture(). Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.2.11 AddSheet(name as string = """, initSheet as XLSheetMBS = nil) as XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a new sheet to this book, returns the sheet.
Notes:

Use initSheet parameter if you wish to copy an existing sheet.
Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.2.12 available as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the library is available.
Notes: Returns false on PPC targets.

193.2.13 BookVersion as Integer

MBS XL Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the version number of this book.
Example:

```
dim b as new XLBookMBS
dim v as Integer = b.BookVersion

dim h as Integer = v \256 \256 \256
dim m as Integer = v \256 \256 mod 256
dim l as Integer = v \256 mod 256

MsgBox "libXL "+str(h)+"."+str(m)+"."+str(l)
```

Notes: Version number is encoded as hex number with major version, minor version and bugfix.

193.2.14 Constructor(xml as boolean = false)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new XLBookMBS object.
Notes: xml: If true, creates a book in xlsx format (xml), else one in xls format (binary).

193.2.15 CopyContent(dest as XLBookMBS, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies all content from one book to other book.
Notes:

The plugin loops through all sheets and creates matching sheets on new book.
Formats and fonts are created on the fly.

This allows you to convert from XLS to XLSX or back.

Please report if something is not copied. Of course plugin can only copy what libXL supports, so stuff like movies or diagrams are not copied.

193.2.16 CustomNumFormat(fmt as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a custom format string for specified custom format identifier fmt.
Notes: See custom format string guidelines (in FAQ). Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.2.17 DefaultFont(byref fontSize as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a default font name and size for this workbook.
Notes: Returns "" if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.2.18 DelSheet(index as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Deletes a sheet with specified index.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.2.19 Font(index as Integer) as XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a font with defined index.
Notes: Index must be less than return value of fontCount method.

193.2.20 FontCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a number of fonts in this book.

193.2.21 Fonts as XLFontMBS()

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns array with all defined fonts.

193.2.22 Format(index as Integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a format with defined index.
Notes: Index must be less than return value of formatCount method.

193.2.23 FormatCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a number of formats in this book.

193.2.24 Formats as XLFormatMBS()

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns array with all defined formats.

193.2.25 InsertSheet(index as Integer, name as string = """, initSheet as XLSheetMBS = nil) as XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Inserts a new sheet to this book at position index, returns the sheet.
Notes: Use initSheet parameter if you wish to copy an existing sheet. Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.2.26 LibVersion as string

MBS XL Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns version of library as string.
Example:

```
MsgBox XLBookMBS.LibVersion
```

Notes:

Returns for example "3.8.0".
With plugin version 17.4 or newer, this returns 4 numbers, so you may see another .0 on the end.

193.2.27 LibVersionNumber as Integer

MBS XL Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns version of library as number.
Example:

MsgBox str(XLBookMBS.LibVersionNumber)

Notes: Returns for example 3 * 256*256*256 + 8 * 256*256 + 0 * 256 + 0.

193.2.28 Load(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a xls-file into memory.
Notes:

Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

With the constructor of the XLBookMBS object you decide if you want to load XML format or older binary format. If the format of the book object doesn't match the file, it will fail.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 193.2.29 Load(path as string) as boolean 22630

193.2.29 Load(path as string) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a xls-file into memory.
Notes:

Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

With the constructor of the XLBookMBS object you decide if you want to load XML format or older binary format. If the format of the book object doesn't match the file, it will fail.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 193.2.28 Load(path as folderitem) as boolean 22630

193.2.30 Load2(path as folderitem) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a xls-file from file.
Notes:

Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 193.2.31 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS 22631
- 193.2.32 Load2(path as string) as XLBookMBS 22632
- 193.2.33 Load2(path as string, byref ErrorMessage as String) as XLBookMBS 22633

193.2.31 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a xls-file from file.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("XING contacts.xlsx")
dim e as string
dim b as XLBookMBS = XLBookMBS.Load2(f,e)

if b = nil then
MsgBox e
Return
end if

dim s as XLSheetMBS = b.Sheet(0)
MsgBox s.ReadString(1,1)
```

Notes:

Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 193.2.30 Load2(path as folderitem) as XLBookMBS 22631
- 193.2.32 Load2(path as string) as XLBookMBS 22632
- 193.2.33 Load2(path as string, byref ErrorMessage as String) as XLBookMBS 22633

193.2.32 Load2(path as string) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a xls-file from file.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("XING contacts.xlsx")
dim b as XLBookMBS = XLBookMBS.Load2(f)

if b = nil then
MsgBox e
Return
end if

dim s as XLSheetMBS = b.Sheet(0)
MsgBox s.ReadString(1,1)
```

Notes:

Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 193.2.30 Load2(path as folderitem) as XLBookMBS 22631

- 193.2.31 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS 22631
- 193.2.33 Load2(path as string, byref ErrorMessage as String) as XLBookMBS 22633

193.2.33 Load2(path as string, byref ErrorMessage as String) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a xls-file from file.
Notes:

Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 193.2.30 Load2(path as folderitem) as XLBookMBS 22631
- 193.2.31 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS 22631
- 193.2.32 Load2(path as string) as XLBookMBS 22632

193.2.34 LoadError as String

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The last error message from LoadLibrary call.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.dylib")

if XLBookMBS.LoadLibrary(f) then
MsgBox "OK"
else
MsgBox XLBookMBS.LoadError
end if
```

193.2.35 LoadLibrary(File as FolderItem) as boolean

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads the libXL library file.
Example:

```
MsgBox "Version before: "+XLBookMBS.LibVersion

dim f as FolderItem = SpecialFolder.Desktop.Child("libxl.dylib")

if XLBookMBS.LoadLibrary(f) then
MsgBox "Version after: "+XLBookMBS.LibVersion
else
MsgBox XLBookMBS.LoadError
end if
```

Notes:

Returns true on success or false on failure.

While the plugin comes with an internal libXL library, you can use this method to load a different version of the library.
See also:

- 193.2.36 LoadLibrary(Path as string) as boolean 22634

193.2.36 LoadLibrary(Path as string) as boolean

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads the libXL library file.
Notes:

Returns true on success or false on failure.

While the plugin comes with an internal libXL library, you can use this method to load a different version of the library.
See also:

- 193.2.35 LoadLibrary(File as FolderItem) as boolean 22633

193.2.37 LoadMT(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads from file.
Notes:

Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will

block, but keep other background threads running.
See also:

- 193.2.38 LoadMT(path as string) as boolean 22635

193.2.38 LoadMT(path as string) as boolean

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads from file.
Notes:

Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 193.2.37 LoadMT(path as folderitem) as boolean 22634

193.2.39 LoadPartially(path as folderitem, sheetIndex as Integer, firstRow as Integer, lastRow as Integer) as boolean

MBS XL Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a file only with specified sheet index and row range into memory.
Notes: Returns false if error occurs or true on success.. Get error info with errorMessage function.
See also:

- 193.2.40 LoadPartially(path as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer) as boolean 22635

193.2.40 LoadPartially(path as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer) as boolean

MBS XL Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a file only with specified sheet index and row range into memory.
Notes: Returns false if error occurs or true on success.. Get error info with errorMessage function.
See also:

- 193.2.39 LoadPartially(path as folderitem, sheetIndex as Integer, firstRow as Integer, lastRow as Integer) as boolean 22635

193.2.41 LoadPartiallyUsingTempFile(path as folderitem, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, TempFile as folderitem) as boolean

MBS XL Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a file only with specified sheet index and row range into memory.
Notes:

Specify a temporary file for reducing memory consumption.
Returns false if error occurs or true on success.. Get error info with errorMessage function.
See also:

- 193.2.42 LoadPartiallyUsingTempFile(path as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, TempFile as String) as boolean 22636

193.2.42 LoadPartiallyUsingTempFile(path as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, TempFile as String) as boolean

MBS XL Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a file only with specified sheet index and row range into memory.
Notes:

Specify a temporary file for reducing memory consumption.
Returns false if error occurs or true on success.. Get error info with errorMessage function.
See also:

- 193.2.41 LoadPartiallyUsingTempFile(path as folderitem, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, TempFile as folderitem) as boolean 22636

193.2.43 LoadRaw(data as MemoryBlock) as boolean

MBS XL Plugin, Plugin Version: 14.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a xls-file from user's memory buffer.
Notes:

Returns false if error occurs. Get error info with errorMessage property.

With the constructor of the XLBookMBS object you decide if you want to load XML format or older binary format. If the format of the book object doesn't match the file, it will fail.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 193.2.44 LoadRaw(data as string) as boolean 22637

193.2.44 LoadRaw(data as string) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a xls-file from user's memory buffer.
Notes:

Returns false if error occurs. Get error info with errorMessage property.

With the constructor of the XLBookMBS object you decide if you want to load XML format or older binary format. If the format of the book object doesn't match the file, it will fail.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 193.2.43 LoadRaw(data as MemoryBlock) as boolean 22636

193.2.45 LoadRaw2(data as MemoryBlock) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a xls-file from user's memory buffer.
Notes:

Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.

- 193.2.47 LoadRaw2(data as string) as XLBookMBS 22638

193.2.49 LoadRawMT(data as MemoryBlock) as boolean

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads from memoryblock.
Notes:

Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 193.2.50 LoadRawMT(data as string) as boolean 22639

193.2.50 LoadRawMT(data as string) as boolean

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads from string.
Notes:

Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 193.2.49 LoadRawMT(data as MemoryBlock) as boolean 22639

193.2.51 LoadRawPartially(data as MemoryBlock, sheetIndex as Integer, firstRow as Integer, lastRow as Integer) as boolean

MBS XL Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a file from user's memory buffer.
Notes:

data: Data buffer
sheetIndex: loads a file only with specified sheet index, -1 loads all sheets

firstRow: the first row of loaded range, -1 loads all rows until lastRow
lastRow: the last row of loaded range, -1 loads all rows after firstRow.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 193.2.52 LoadRawPartially(data as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer) as boolean 22640

193.2.52 LoadRawPartially(data as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer) as boolean

MBS XL Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a file from user's memory buffer.
Notes:

data: Data buffer
sheetIndex: loads a file only with specified sheet index, -1 loads all sheets
firstRow: the first row of loaded range, -1 loads all rows until lastRow
lastRow: the last row of loaded range, -1 loads all rows after firstRow.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 193.2.51 LoadRawPartially(data as MemoryBlock, sheetIndex as Integer, firstRow as Integer, lastRow as Integer) as boolean 22639

193.2.53 LoadUsingTempFile(path as folderitem, TempFile as folderitem) as boolean

MBS XL Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads an entire file into memory.
Notes:

Specify a temporary file for reducing memory consumption.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 193.2.54 LoadUsingTempFile(path as string, TempFile as String) as boolean 22640

193.2.54 LoadUsingTempFile(path as string, TempFile as String) as boolean

MBS XL Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads an entire file into memory.
Notes:

Specify a temporary file for reducing memory consumption.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 193.2.53 LoadUsingTempFile(path as folderitem, TempFile as folderitem) as boolean 22640

193.2.55 MoveSheet(SourceIndex as integer, DestIndex as Integer) as boolean

MBS XL Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Takes a sheet with SourceIndex and insert it in front of a sheet with DestIndex.
Notes: Returns false if error occurs and true on success.

193.2.56 PackColor(ColorValue as color) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Packs red, green and blue components in color type.
Example:

```
// define a format for red fill
Dim redBackgroundFormat As XLFormatMBS = book.AddFormat
Dim c As Color = & cFF0000
// will give back numeric value of color for RGB mode or color index
Dim n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Dim row As Integer = 5 // 6th row
Dim col As Integer = 1 // Column B
Dim value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

See also:

- 193.2.57 PackColor(red as Integer, green as Integer, blue as Integer) as Integer 22641

193.2.57 PackColor(red as Integer, green as Integer, blue as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Packs red, green and blue components in color type.
See also:

- 193.2.56 PackColor(ColorValue as color) as Integer 22641

193.2.58 PackDate(d as date) as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Packs date and time information into double type.
See also:

- 193.2.59 PackDate(year as Integer, month as Integer, day as Integer, hour as Integer = 0, min as Integer = 0, sec as Integer = 0, msec as Integer = 0) as Double 22642

193.2.59 PackDate(year as Integer, month as Integer, day as Integer, hour as Integer = 0, min as Integer = 0, sec as Integer = 0, msec as Integer = 0) as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Packs date and time information into double type.
See also:

- 193.2.58 PackDate(d as date) as Double 22642

193.2.60 Picture(index as Integer, byref data as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a picture at position index in memory buffer.
Notes:

Parameters:
index: position in the workbook
data: reference to buffer

Returns type of picture. See PictureType* constants.

193.2.61 PictureCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a number of pictures in this workbook.

193.2.62 Save(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Saves current workbook into xls-file.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:

- 193.2.63 Save(path as folderitem, UseTempFile as Boolean) as boolean 22643
- 193.2.64 Save(path as string) as boolean 22643
- 193.2.65 Save(path as string, UseTempFile as Boolean) as boolean 22643

193.2.63 Save(path as folderitem, UseTempFile as Boolean) as boolean

MBS XL Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Saves current workbook into the file.
Notes:

Use a temporary file for reducing memory consumption.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 193.2.62 Save(path as folderitem) as boolean 22643
- 193.2.64 Save(path as string) as boolean 22643
- 193.2.65 Save(path as string, UseTempFile as Boolean) as boolean 22643

193.2.64 Save(path as string) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Saves current workbook into xls-file.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:

- 193.2.62 Save(path as folderitem) as boolean 22643
- 193.2.63 Save(path as folderitem, UseTempFile as Boolean) as boolean 22643
- 193.2.65 Save(path as string, UseTempFile as Boolean) as boolean 22643

193.2.65 Save(path as string, UseTempFile as Boolean) as boolean

MBS XL Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Saves current workbook into the file.
Notes:

Use a temporary file for reducing memory consumption.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 193.2.62 Save(path as folderitem) as boolean 22643

193.2.66 SaveMT(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Saves document to file on disk.
Notes:

Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 193.2.67 SaveMT(path as string) as boolean 22644

193.2.67 SaveMT(path as string) as boolean

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Saves document to file on disk.
Notes:

Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 193.2.66 SaveMT(path as folderitem) as boolean 22644

193.2.68 SaveRaw(byref data as MemoryBlock) as boolean

MBS XL Plugin, Plugin Version: 14.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Saves a xls-file to internal memory buffer.

Notes: Returns false if error occurs. Get error info with errorMessage property.
See also:

- 193.2.69 SaveRaw(byref data as string) as boolean 22645

193.2.69 SaveRaw(byref data as string) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Saves a xls-file to internal memory buffer.
Notes: Returns false if error occurs. Get error info with errorMessage property.
See also:

- 193.2.68 SaveRaw(byref data as MemoryBlock) as boolean 22644

193.2.70 SaveRawMT(byref data as MemoryBlock) as boolean

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Saves document to memoryblock.
Notes:

Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 193.2.71 SaveRawMT(byref data as string) as boolean 22645

193.2.71 SaveRawMT(byref data as string) as boolean

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Saves document to string.
Notes:

Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 193.2.70 SaveRawMT(byref data as MemoryBlock) as boolean 22645

193.2.72 SetDefaultFont(fontName as string, fontSize as Integer)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets a default font name and size for this workbook.

193.2.73 SetKey(name as string, key as string)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets customer's license key.
Notes:

Call this once for each XLBookMBS object and before you read or write data.

If you have keys for more than one platform, please use # if condition to make sure you pass right key for current platform.

193.2.74 SetKeyGlobal(name as string, key as string)

MBS XL Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets customer's license key.
Example:

```
// add this to app.open

# if TargetMacOS then
// Mac license
XLBookMBS.SetKeyGlobal("Your Name", "Your Key")
# elseif TargetLinux then
// Linux license
XLBookMBS.SetKeyGlobal("Your Name", "Your Key")
# elseif TargetWin32 then
// Win license
XLBookMBS.SetKeyGlobal("Your Name", "Your Key")
# else
// missing
# endif
```

Notes:

You can call this before using the other plugin functions to set key on application startup. Simply call it in app.open event.

If you have keys for more than one platform, please use # if condition to make sure you pass right key for current platform.
See also:

- 193.2.75 SetKeyGlobal(name as string, key as string) 22647

193.2.75 SetKeyGlobal(name as string, key as string)

MBS XL Plugin, Plugin Version: 18.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Private method to avoid you call this on an object.
Notes:

Please call shared method in app.open.
Because if you make a new object and set key, it's too late.
See also:

- 193.2.74 SetKeyGlobal(name as string, key as string) 22646

193.2.76 SetLocale(locale as string)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the locale.
Example:

```
dim book as new XLBookMBS(false)
book.SetLocale "en_US.UTF-8"
```

Notes: Sets the locale for this library. It has no effect for unicode projects.

193.2.77 Sheet(index as Integer) as XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the sheet with specified index.
Notes: Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.2.78 SheetCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a number of sheets in this book.

193.2.79 Sheets as XLSheetMBS()

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns array with all sheets.
Example:

```
Function SheetByName(book as XLBookMBS, name as string) As XLSheetMBS
dim sheets() as XLSheetMBS = book.Sheets
for each s as XLSheetMBS in sheets
if s.Name = name then
Return s
end if
next
End Function
```

193.2.80 SheetType(index as Integer) as Integer

MBS XL Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries type of the sheet.

193.2.81 UnpackColor(ColorValue as Integer) as color

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Unpacks color type to red, green and blue components.
See also:

- 193.2.82 UnpackColor(ColorValue as Integer, byref red as Integer, byref green as Integer, byref blue as Integer) 22648

193.2.82 UnpackColor(ColorValue as Integer, byref red as Integer, byref green as Integer, byref blue as Integer)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Unpacks color type to red, green and blue components.
See also:

- 193.2.81 UnpackColor(ColorValue as Integer) as color 22648

193.2.83 UnpackDate(Value as Double) as date

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Unpacks date and time information from double type.
Notes: Returns nil if error occurs.
See also:

- 193.2.84 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer) as boolean 22649
- 193.2.85 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer) as boolean 22649
- 193.2.86 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer, byref msec as Integer) as boolean 22650

193.2.84 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Unpacks date and time information from double type.
Notes: Returns false if error occurs.
See also:

- 193.2.83 UnpackDate(Value as Double) as date 22649
- 193.2.85 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer) as boolean 22649
- 193.2.86 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer, byref msec as Integer) as boolean 22650

193.2.85 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Unpacks date and time information from double type.
Notes: Returns false if error occurs.
See also:

- 193.2.83 UnpackDate(Value as Double) as date 22649
- 193.2.84 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer) as boolean 22649

- 193.2.86 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer, byref msec as Integer) as boolean 22650

193.2.86 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer, byref msec as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Unpacks date and time information from double type.
Notes: Returns false if error occurs.
See also:

- 193.2.83 UnpackDate(Value as Double) as date 22649
- 193.2.84 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer) as boolean 22649
- 193.2.85 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer) as boolean 22649

193.2.87 Properties

193.2.88 ActiveSheet as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Active sheet index in this workbook.
Notes: (Read and Write property)

193.2.89 BiffVersion as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns BIFF version of binary file.
Notes:

Used for xls format only.
(Read only property)

193.2.90 ErrorMessage as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the last error message.

Notes: (Read only property)

193.2.91 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

193.2.92 IsDate1904 as boolean

MBS XL Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether dates are 1904 based.
Notes:

A boolean value that indicates whether the date systems used in the workbook starts in 1904.
True indicates the date system starts in 1904, where January 1, 1904 is the first day in the system.
False indicates the workbook uses the 1900 date system, where January 1, 1900 is the first day in the system.
(Read and Write property)

193.2.93 IsTemplate as boolean

MBS XL Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the workbook is template.
Notes:

The template flag: true - workbook is template, false - workbook is not template (default).
This flag must have a value "true" for template files (xlt and xltx).
(Read and Write property)

193.2.94 RefR1C1 as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the R1C1 reference mode is active.
Notes: (Read and Write property)

193.2.95 RgbMode as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the RGB mode is active. Used for xlsx format only.

Notes:

true - RGB mode, false - Index mode (default).
In RGB mode use colorPack() and colorUnpack() methods for getting/setting colors. Used for xlsx format only.
(Read and Write property)

193.2.96 Constants

193.2.97 PictureTypeDIB = 4

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the picture format constants.
Notes: DIB format

193.2.98 PictureTypeEMF = 5

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the picture format constants.
Notes: EMF format

193.2.99 PictureTypeError = & hFF

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the picture format constants.
Notes: Error. Check XLBookMBS.ErrorMessage method.

193.2.100 PictureTypeGIF = 2

MBS XL Plugin, Plugin Version: 15.3. **Function:** One of the picture format constants.
Notes: GIF format.

193.2.101 PictureTypeJPEG = 1

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the picture format constants.
Notes: JPEG format

193.2.102 PictureTypePICT = 6

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the picture format constants.
Notes: Mac PICT format.

193.2.103 PictureTypePNG = 0

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the picture format constants.
Notes: PNG format

193.2.104 PictureTypeTIFF = 7

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the picture format constants.
Notes: TIFF format

193.2.105 PictureTypeWMF = 3

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the picture format constants.
Notes: WMF format

193.2.106 SheetTypeChart = 1

MBS XL Plugin, Plugin Version: 13.1. **Function:** One of the sheet type constants.
Notes: Sheet is a chart.

193.2.107 SheetTypeSheet = 0

MBS XL Plugin, Plugin Version: 13.1. **Function:** One of the sheet type constants.
Notes: This is a normal sheet.

193.2.108 SheetTypeUnknown = 2

MBS XL Plugin, Plugin Version: 13.1. **Function:** One of the sheet type constants.
Notes: Type is unknown.

193.3 class XLCopyOptionsMBS

193.3.1 class XLCopyOptionsMBS

MBS XL Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The options for copying.

193.3.2 Blog Entries

- MBS Xojo Plugins in version 19.0

193.3.4 Methods

193.3.5 Constructor

MBS XL Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor.
Notes: Initializes object and sets all properties to true.

193.3.6 Properties

193.3.7 CopyColHidden as Boolean

MBS XL Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to copy column hidden flags.
Notes:

Defaults to true.
(Read and Write property)

193.3.8 CopyComments as Boolean

MBS XL Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to copy comments.
Notes:

Defaults to true.
(Read and Write property)

193.3.9 CopyFormat as Boolean

MBS XL Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to copy formats.
Notes:

Defaults to true.
(Read and Write property)

193.3.10 CopyHorPageBreak as Boolean

MBS XL Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to copy horizontal page breaks.
Notes:

Defaults to true.
(Read and Write property)

193.3.11 CopyMerge as Boolean

MBS XL Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to copy merge cells.
Notes:

Defaults to true.
(Read and Write property)

193.3.12 CopyNamedRanges as Boolean

MBS XL Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to copy named ranges.
Notes:

Defaults to true.
(Read and Write property)

193.3.13 CopyPicture as Boolean

MBS XL Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to copy pictures.
Notes:

Defaults to true.
(Read and Write property)

193.3.14 CopyPrintArea as Boolean

MBS XL Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to copy print area.
Notes:

Defaults to true.
(Read and Write property)

193.3.15 CopyPrintFit as Boolean

MBS XL Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to copy print fit settings.
Notes:

Defaults to true.
(Read and Write property)

193.3.16 CopyPrintRepeat as Boolean

MBS XL Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to copy print repeat settings.
Notes:

Defaults to true.
(Read and Write property)

193.3.17 CopyRowHidden as Boolean

MBS XL Plugin, Plugin Version: 19.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to copy row hidden flags.
Notes:

Defaults to true.
(Read and Write property)

193.4 class XLFilterColumnMBS

193.4.1 class XLFilterColumnMBS

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for filter column.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

193.4.2 Blog Entries

- MBS Xojo Plugins, version 18.4pr9

193.4.3 Methods

193.4.4 AddFilter(Filter as String)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds the filter value.

193.4.5 Clear

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clear the filter criteria.

193.4.6 Constructor

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

193.4.7 Filter(index as Integer) as String

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the filter value by index.

193.4.8 GetCustomFilterEx(byref Op1 as Integer, byref Value1 as String, byref Op2 as Integer, byref Value2 as String, byref andOp as Boolean) as boolean

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the custom filter criteria:
Notes:

op1 - operator used by the filter comparison in the first filter criteria;
Value1 - value used in the first filter criteria;
op2 - operator used by the filter comparison in the second filter criteria;
Value12 - value used in the second filter criteria;
andOp - flag indicating whether the two criterias have an "and" relationship. True indicates "and", false indicates "or".
Returns false if error. Get error info with XLBookMBS.errorMessage.

193.4.9 GetTop10(byref value as Double, byref top as boolean, byref percent as boolean) as boolean

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the number of top or bottom items:
Notes:

value - number of items;
top - top items if true otherwise bottom items;
percent - using percent instead of number items.
Returns false if error. Get error info with XLBookMBS.errorMessage.

193.4.10 SetCustomFilter(Op as Integer, Value as String)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the custom filter criteria:
Notes:

op - operator used by the filter comparison in the filter criteria;
Value - value used in the filter criteria;

193.4.11 SetCustomFilterEx(Op1 as Integer, Value1 as String, Op2 as Integer, Value2 as String, andOp as Boolean = false)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the custom filter criteria:

Notes:

op1 - operator used by the filter comparison in the first filter criteria;
Value1 - value used in the first filter criteria;
op2 - operator used by the filter comparison in the second filter criteria;
Value2 - value used in the second filter criteria;
andOp - flag indicating whether the two criterias have an "and" relationship. True indicates "and", false indicates "or".

193.4.12 SetTop10(value as Double, top as boolean = true, percent as boolean = false)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the number of top or bottom items:
Notes:

value - number of items;
top - top items if true otherwise bottom items;
percent - using percent instead of number items.

193.4.13 Properties

193.4.14 FilterSize as Integer

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the number of filter values.
Notes: (Read only property)

193.4.15 FilterType as Integer

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the filter type of this AutoFilter column.
Notes:

can be constants FilterColor, FilterCustom, FilterDynamic, FilterExt, FilterIcon, FilterNotSet, FilterTop10 or FilterValue.
(Read only property)

193.4.16 Handle as Integer

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

193.4.17 Index as Integer

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the zero-based index of this AutoFilter column.
Notes: (Read only property)

193.4.18 Owner as Variant

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The owner object.
Notes: (Read only property)

193.4.19 Constants

193.4.20 FilterColor = 4

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the filter types.
Notes: Specifies the color to filter by.

193.4.21 FilterCustom = 2

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the filter types.
Notes: Custom filter with specified criteria.

193.4.22 FilterDynamic = 3

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the filter types.
Notes: Specifies dynamic filter criteria.

193.4.23 FilterExt = 6

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the filter types.
Notes: Defines flexible storage extensions.

193.4.24 FilterIcon = 5

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the filter types.
Notes: Specifies the icon to filter by.

193.4.25 FilterNotSet = 7

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the filter types.
Notes: No filter.

193.4.26 FilterTop10 = 1

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the filter types.
Notes: The top N (percent or number of items) to filter by.

193.4.27 FilterValue = 0

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the filter types.
Notes: Filter by specified values.

193.4.28 OperatorEqual = 0

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the compare operators.
Notes: Equal

193.4.29 OperatorGreaterThan = 1

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the compare operators.
Notes: Greater than

193.4.30 OperatorGreaterThanOrEqual = 2

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the compare operators.
Notes: Greater than or equal

193.4.31 OperatorLessThan = 3

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the compare operators.
Notes: Less than

193.4.32 OperatorLessThanOrEqual = 4

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the compare operators.
Notes: Less than or equal

193.4.33 OperatorNotEqual = 5

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the compare operators.
Notes: Not equal

193.5 class XLFontMBS

193.5.1 class XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a font definition.
Example:

```
dim book as XLBookMBS // your book
dim textFont as XLFontMBS = book.addFont()
textFont.size = 8
textFont.name = "Century Gothic"
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

193.5.2 Blog Entries

- MBS Xojo Plugins, version 18.4pr9

193.5.3 Methods

193.5.4 Constructor

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

193.5.5 Properties

193.5.6 Bold as Boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the font is bold.
Notes: (Read and Write property)

193.5.7 ColorValue as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The color of the font.

Example:

```
dim book as XLBookMBS // your book
dim textFont as XLFontMBS = book.addFont()
textFont.size = 8
textFont.ColorValue = XLFontMBS.ColorGray25
```

Notes:

If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

193.5.8 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

193.5.9 Italic as Boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the font is italic.
Notes: (Read and Write property)

193.5.10 Name as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The name of the font.
Notes:

Default name is "Arial".
(Read and Write property)

193.5.11 Owner as Variant

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The owner object.
Notes:

As a font is only valid with the owning book, we keep a back reference here.
(Read only property)

193.5.12 Script as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The script style of the font.
Notes: (Read and Write property)

193.5.13 Size as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The size of the font in points.
Notes: (Read and Write property)

193.5.14 StrikeOut as Boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the font is strikeout.
Notes: (Read and Write property)

193.5.15 Underline as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The underline style of the font.
Notes:

See Underline* constants.
(Read and Write property)

193.5.16 Constants

193.5.17 ColorAqua = 49

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.18 ColorAuto = & h7Fff

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.19 ColorBlack = 8

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.20 ColorBlue = 12

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.21 ColorBlueCl = 39

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.22 ColorBluegray = 54

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.23 ColorBrightgreen = 11

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.24 ColorBrown = 60

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.25 ColorCoralCf = 29

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.26 ColorDarkblue = 18

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.27 ColorDarkblueCl = 32

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.28 ColorDarkgreen = 58

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.29 ColorDarkpurpleCf = 28

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.30 ColorDarkred = 16

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.31 ColorDarkredCl = 37

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.32 ColorDarkteal = 56

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.33 ColorDarkyellow = 19

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.34 ColorDefaultBackground = 65

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.
Notes: Auto

193.5.35 ColorDefaultForeground = 64

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.
Notes: Auto

193.5.36 ColorGold = 51

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.37 ColorGray25 = 22

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.38 ColorGray40 = 55

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.39 ColorGray50 = 23

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.40 ColorGray80 = 63

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.41 ColorGreen = 17

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.42 ColorIceblueCf = 31

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.43 ColorIndigo = 62

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.44 ColorIvoryCf = 26

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.45 ColorLavender = 46

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.46 ColorLightblue = 48

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.47 ColorLightgreen = 42

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.48 ColorLightorange = 52

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.49 ColorLightturquoise = 41

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.50 ColorLightturquoiseCf = 27

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.51 ColorLightyellow = 43

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.52 ColorLime = 50

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.53 ColorNone = & H7F

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the color constants.
Notes: No color.

193.5.54 ColorOceanblueCf = 30

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.55 ColorOlivegreen = 59

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.56 ColorOrange = 53

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.57 ColorPaleblue = 44

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.58 ColorPeriwinkleCf = 24

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.59 ColorPink = 14

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.60 ColorPinkCl = 33

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.61 ColorPlum = 61

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.62 ColorPlumCf = 25

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.63 ColorRed = 10

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.64 ColorRose = 45

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.65 ColorSeagreen = 57

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.66 ColorSkyblue = 40

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.67 ColorTan = 47

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.68 ColorTeal = 21

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.69 ColorTealCl = 38

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.70 ColorTooltip = 81

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.71 ColorTurquoise = 15

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.72 ColorTurquoiseCl = 35

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.73 ColorViolet = 20

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.74 ColorVioletCl = 36

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.75 ColorWhite = 9

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.76 ColorYellow = 13

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.77 ColorYellowCl = 34

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

193.5.78 ScriptNormal = 0

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the script style constants.

193.5.79 ScriptSub = 2

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the script style constants.

193.5.80 ScriptSuper = 1

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the script style constants.

193.5.81 UnderlineDouble = 2

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the underline style constants.

193.5.82 UnderlineDoubleacc = & H22

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the underline style constants.

193.5.83 UnderlineNone = 0

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the underline style constants.

193.5.84 UnderlineSingle = 1

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the underline style constants.

193.5.85 UnderlineSingleacc = & H21

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the underline style constants.

193.6 class XLFormatMBS

193.6.1 class XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a format.
Example:

```
dim book as XLBookMBS // your book
// add font
dim boldFont as XLFontMBS = book.addFont()
boldFont.StrikeOut = true

// add format
dim boldFormat as XLFormatMBS = book.addFormat
boldFormat.font = boldFont

// write on a cell in first sheet
sheet = book.Sheet(0)
call sheet.WriteString(1, 1, "Sales Receipt", boldFormat)
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

193.6.2 Blog Entries

- MBS Xojo Plugins, version 18.4pr9

193.6.3 Methods

193.6.4 Constructor

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

193.6.5 SetBorder(border as Integer = 1)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the border style.
Notes: See BorderStyle* constants.

193.6.6 SetBorderColor(ColorValue as Integer)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the border color.
Notes: If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.

193.6.7 SetFont(font as XLFontMBS) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the font for the format.
Notes: To create a new font use XLBookMBS.addFont(). Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.6.8 SetRotation(rotation as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the text rotation.
Notes:

Must be a value from the following table:

Value	Meaning
0 - 90	Text rotated counterclockwise 0 to 90 degrees
91 - 180	Text rotated clockwise 1 to 90 degrees
255	Vertical text

193.6.9 Properties

193.6.10 AlignH as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The horizontal alignment.
Notes:

See AlignH* constants.
(Read and Write property)

193.6.11 AlignV as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The vertical alignment.
Notes:

See AlignV* constants.
(Read and Write property)

193.6.12 BorderBottom as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The bottom border style.
Notes:

See BorderStyle* constants.
(Read and Write property)

193.6.13 BorderBottomColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The color of the bottom border.
Notes:

If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

193.6.14 BorderDiagonal as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The diagonal border.
Notes:

see BorderDiagonal* constants.
(Read and Write property)

193.6.15 BorderDiagonalColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The color of the diagonal border.
Notes:

If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

193.6.16 BorderDiagonalStyle as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The diagonal border style.
Notes:

See BorderDiagonal* constants.
(Read and Write property)

193.6.17 BorderLeft as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The left border style.
Notes:

See BorderStyle* constants.
(Read and Write property)

193.6.18 BorderLeftColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The color of the left border.
Notes:

If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.

(Read and Write property)

193.6.19 BorderRight as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The right border style.
Notes:

See BorderStyle* constants.
(Read and Write property)

193.6.20 BorderRightColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The color of the right border.
Notes:

If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

193.6.21 BorderTop as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The top border style.
Notes:

See BorderStyle* constants.
(Read and Write property)

193.6.22 BorderTopColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The color of the top border.
Notes:

If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS

color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

193.6.23 FillPattern as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The fill pattern.
Notes:

See fill pattern constants.
(Read and Write property)

193.6.24 Font as XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The font for the format.
Example:

```
// your book
dim book as XLBookMBS

// add font
dim StrikeOutFont as XLFontMBS = book.addFont()
StrikeOutFont.StrikeOut = true

// add format
dim StrikeOutFormat as XLFormatMBS = book.addFormat
StrikeOutFormat.font = StrikeOutFont

// write on a cell in first sheet
sheet = book.Sheet(0)
call sheet.WriteString(1, 1, "Sales Receipt", StrikeOutFormat)
```

Notes:

To create a new font use XLBookMBS.addFont(). Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
(Read and Write property)

193.6.25 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

193.6.26 Hidden as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the hidden protection property is set to true.
Notes: (Read and Write property)

193.6.27 Indent as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The text indentation level.
Notes:

Must be less than or equal to 15.
(Read and Write property)

193.6.28 Locked as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the locked protection property is set to true.
Notes:

Needs to be used together with XLSheetMBS.Protect property and XLSheetMBS.SetProtectEx method to prevent editing in locked cells.
(Read and Write property)

193.6.29 NumFormat as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The number format identifier.
Notes:

The identifier must be a valid built-in number format identifier or the identifier of a custom number format. To create a custom format use XLBookMBS.addCustomNumFormat(). Or use one of the NumFormat* constants.

(Read and Write property)

193.6.30 Owner as Variant

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The object owning this format object.
Notes:

As a format is only valid with the owning book, we keep a back reference here.
(Read only property)

193.6.31 PatternBackgroundColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The background color of the fill pattern.
Example:

```
// define a format for red fill
Dim redBackgroundFormat As XLFormatMBS = book.AddFormat
Dim c As Color = & cFF0000
// will give back numeric value of color for RGB mode or color index
Dim n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Dim row As Integer = 5 // 6th row
Dim col As Integer = 1 // Column B
Dim value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

Notes:

If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

193.6.32 PatternForegroundColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The foreground color of the fill pattern.
Example:

```
// define a format for red fill
Dim redBackgroundFormat As XLFormatMBS = book.AddFormat
Dim c As Color = & cFF0000
// will give back numeric value of color for RGB mode or color index
Dim n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Dim row As Integer = 5 // 6th row
Dim col As Integer = 1 // Column B
Dim value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

Notes:

If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

193.6.33 Rotation as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the text rotation.
Notes:

Must be a value from the following table:

(Read only property)

Value	Meaning
0 - 90	Text rotated counterclockwise 0 to 90 degrees
91 - 180	Text rotated clockwise 1 to 90 degrees
255	Vertical text

193.6.34 ShrinkToFit as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the cell is shrink-to-fit.
Notes: (Read and Write property)

193.6.35 Wrap as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the cell text is wrapped.
Notes: (Read and Write property)

193.6.36 Constants

193.6.37 AlignHCenter = 2

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the horizontal alignment constants.
Notes: Center

193.6.38 AlignHDistributed = 7

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the horizontal alignment constants.
Notes: Distributed

193.6.39 AlignHFill = 4

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the horizontal alignment constants.
Notes: Fill

193.6.40 AlignHGeneral = 0

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the horizontal alignment constants.
Notes: Default

193.6.41 AlignHJustify = 5

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the horizontal alignment constants.
Notes: Justify

193.6.42 AlignHLeft = 1

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the horizontal alignment constants.
Notes: Left

193.6.43 AlignHMerge = 6

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the horizontal alignment constants.
Notes: Center over several cells.

193.6.44 AlignHRight = 3

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the horizontal alignment constants.
Notes: Right

193.6.45 AlignVBottom = 2

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the vertical alignment constants.
Notes: Bottom

193.6.46 AlignVCenter = 1

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the vertical alignment constants.
Notes: Center

193.6.47 AlignVDistributed = 4

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the vertical alignment constants.
Notes: Distributed

193.6.48 AlignVJustify = 3

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the vertical alignment constants.
Notes: Justify

193.6.49 AlignVTop = 0

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the vertical alignment constants.
Notes: Top

193.6.50 BorderDiagonalBoth = 3

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the diagonal border style constants.

193.6.51 BorderDiagonalDown = 1

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the diagonal border style constants.

193.6.52 BorderDiagonalNone = 0

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the diagonal border style constants.

193.6.53 BorderDiagonalUp = 2

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the diagonal border style constants.

193.6.54 BorderStyleDashdot = 9

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.
Notes: dash and dot

193.6.55 BorderStyleDashdotdot = 11

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.
Notes: dash and dots

193.6.56 BorderStyleDashed = 3

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.
Notes: dashed

193.6.57 BorderStyleDotted = 4

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.
Notes: dotted

193.6.58 BorderStyleDouble = 6

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.
Notes: double

193.6.59 BorderStyleHair = 7

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.
Notes: hair style

193.6.60 BorderStyleMedium = 2

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.
Notes: medium

193.6.61 BorderStyleMediumdashdot = 10

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.
Notes: medium dash and dot

193.6.62 BorderStyleMediumdashdotdot = 12

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.
Notes: medium dash and dots

193.6.63 BorderStyleMediumdashed = 8

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.
Notes: medium dashed

193.6.64 BorderStyleNone = 0

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.
Notes: no border

193.6.65 BorderStyleSlantdashdot = 13

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.
Notes: dash and dot

193.6.66 BorderStyleThick = 5

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.
Notes: thick

193.6.67 BorderStyleThin = 1

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.
Notes: thin

193.6.68 FillPatternDiagcrosshatch = 9

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.69 FillPatternDiagstripe = 8

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.70 FillPatternGray12P5 = 17

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.71 FillPatternGray25 = 4

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.72 FillPatternGray50 = 2

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.73 FillPatternGray6P25 = 18

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.74 FillPatternGray75 = 3

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.75 FillPatternHorstripe = 5

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.76 FillPatternNone = 0

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.77 FillPatternRevdiagstripe = 7

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.78 FillPatternSolid = 1

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.
Example:

```
// define a format for red fill
Dim redBackgroundFormat As XLFormatMBS = book.AddFormat
Dim c As Color = & cFF0000
// will give back numeric value of color for RGB mode or color index
Dim n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Dim row As Integer = 5 // 6th row
Dim col As Integer = 1 // Column B
Dim value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

193.6.79 FillPatternThickdiagcrosshatch = 10

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.80 FillPatternThindiagcrosshatch = 16

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.81 FillPatternThindiagstripe = 14

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.82 FillPatternThinhorcrosshatch = 15

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.83 FillPatternThinhorstripe = 11

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.84 FillPatternThinrevdiagstripe = 13

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.85 FillPatternThinverstripe = 12

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.86 FillPatternVerstripe = 6

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the fill pattern style constants.

193.6.87 NumformatAccount = 41

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: account value: 5,000

193.6.88 NumformatAccountcur = 42

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: account value with currency symbol: $ 5,000

193.6.89 NumformatAccountD2 = 43

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: account value with decimal point: 5,000.00

193.6.90 NumformatAccountD2Cur = 44

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes:

account value with currency symbol and decimal point: $ 5,000.00

193.6.91 NumformatCurrencyD2Negbra = 7

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: monetary value with decimal point, negative in brackets: ($ 1000.00)

193.6.92 NumformatCurrencyD2NegbraRed = 8

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: monetary value with decimal point, negative is red in brackets: ($ 1000.00)

193.6.93 NumformatCurrencyNegbra = 5

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: monetary value, negative in brackets: (1000$)

193.6.94 NumformatCurrencyNegbraRed = 6

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: monetary value, negative is red in brackets: (1000$)

193.6.95 NumformatCustom000P0EPlus0 = 48

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: custom value: 15.2E+3

193.6.96 NumformatCustomDMon = 16

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: custom date value: 11-Mar

193.6.97 NumformatCustomDMonYY = 15

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: custom date value: 11-Mar-09

193.6.98 NumformatCustomH0MMSS = 46

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: custom time value: 20:30:55

193.6.99 NumformatCustomHMM = 20

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: custom date value: 8:30

193.6.100 NumformatCustomHMMAM = 18

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: custom date value: 8:30 AM

193.6.101 NumformatCustomHMMSS = 21

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: custom date value: 8:30:00

193.6.102 NumformatCustomHMMSSAM = 19

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: custom date value: 8:30:00 AM

193.6.103 NumformatCustomMDYYYYHMM = 22

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: custom datetime value: 3/11/2009 8:30

193.6.104 NumformatCustomMMSS = 45

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: custom time value: 30:55

193.6.105 NumformatCustomMMSS0 = 47

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: custom time value: 30:55.0

193.6.106 NumformatCustomMonYY = 17

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: custom date value: Mar-09

193.6.107 NumformatDate = 14

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: date value, depends on OS settings: 3/11/2009

193.6.108 NumformatFractionOneDig = 12

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: fraction value, one digit: 10 1/2

193.6.109 NumformatFractionTwoDig = 13

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: fraction value, two digits: 10 23/95

193.6.110 NumformatGeneral = 0

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: general format

193.6.111 NumformatNumber = 1

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: general number: 1000

193.6.112 NumformatNumberD2 = 2

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: number with decimal point: 1000.00

193.6.113 NumformatNumberD2SepNegbra = 39

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: number with thousands separator and decimal point, negative in brackets: (4,000.00)

193.6.114 NumformatNumberD2SepNegbraRed = 40

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: number with thousands separator and decimal point, negative is red in brackets: (4,000.00)

193.6.115 NumformatNumberSep = 3

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: number with thousands separator: 100,000

193.6.116 NumformatNumberSepD2 = 4

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: number with decimal point and thousands separator: 100,000.00

193.6.117 NumformatNumberSepNegbra = 37

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: number with thousands separator, negative in brackets: (4,000)

193.6.118 NumformatNumberSepNegbraRed = 38

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: number with thousands separator, negative is red in brackets: (4,000)

193.6.119 NumformatPercent = 9

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: percent value, multiply the cell value by 100: 75%

193.6.120 NumformatPercentD2 = 10

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: percent value with decimal point, multiply the cell value by 100: 75.00%

193.6.121 NumformatScientificD2 = 11

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: scientific value with E character and decimal point: 10.00E+1

193.6.122 NumformatText = 49

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.
Notes: text value

193.7 class XLSheetMBS

193.7.1 class XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for an Excel worksheet.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

193.7.3 Methods

193.7.4 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String)

MBS XL Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a data validation for the specified range (only for xlsx files).
Notes:

type: the type of data validation.
op: the relational operator of data validation.
rowFirst: the first row of range;
rowLast: the last row of range;
colFirst: the first column of range;
colLast: the last column of range;

value1: the first value for relational operator;
value2: the second value for ValidationOpBetween or ValidationOpNotBetween operator;
See also:

- 193.7.5 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = "", prompt as String = "", errorTitle as string = "", error as string = "", errorStyle as integer = 0) 22701

193.7.5 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = "", prompt as String = "", errorTitle as string = "", error as string = "", errorStyle as integer = 0)

MBS XL Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a data validation for the specified range (only for xlsx files).
Notes:

type: the type of data validation.
op: the relational operator of data validation.
rowFirst: the first row of range;
rowLast: the last row of range;
colFirst: the first column of range;
colLast: the last column of range;
value1: the first value for relational operator;
value2: the second value for ValidationOpBetween or ValidationOpNotBetween operator;
allowBlank: a boolean value indicating whether the data validation treats empty or blank entries as valid, 'true' means empty entries are OK and do not violate the validation constraints;
hideDropDown: a boolean value indicating whether to display the dropdown combo box for a list type data validation (ValidationTypeList);
showInputMessage: a boolean value indicating whether to display the input prompt message;
showErrorMessage: a boolean value indicating whether to display the error alert message when an invalid value has been entered, according to the criteria specified;
promptTitle: title bar text of input prompt;
prompt: message text of input prompt;
errorTitle: title bar text of error alert;
error: message text of error alert;
errorStyle: the style of error alert used for this data validation:

- 193.7.4 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String) 22700

193.7.6 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double)

MBS XL Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a data validation for the specified range with double or date values for the relational operator (only for xlsx files).
Notes: See parameters in the addDataValidation() method.
See also:

- 193.7.7 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = ””, prompt as String = ””, errorTitle as string = ””, error as string = ””, errorStyle as integer = 0) 22702

193.7.7 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = ””, prompt as String = ””, errorTitle as string = ””, error as string = ””, errorStyle as integer = 0)

MBS XL Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a data validation for the specified range with double or date values for the relational operator (only for xlsx files).
Notes: See parameters in the addDataValidation() method.

- 193.7.6 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double) 22702

193.7.8 AddHyperlink(hyperlink as string, rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds the new hyperlink.

193.7.9 AddIgnoredError(rowFirst as Integer, colFirst as Integer, rowLast as Integer, colLast as Integer, iError as Integer)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds the ignored error for specified range.
Notes: It allows to hide green triangles on left sides of cells. For example, if a cell is formatted as text but contains a numeric value, this is considered to be a potential error because the number won't be treated as a number, for example, in calculations. It is possible to combine a few IgnoredError values with operator | . Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

193.7.10 AddrToRowCol(addr as string, byref row as Integer, byref col as Integer, byref rowRelative as boolean, byref colRelative as boolean)

MBS XL Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Converts a cell reference to row and column.
Example:

```
// create new xls file
dim book as new XLBookMBS(false)

// create sheet
dim sheet as XLSheetMBS = book.AddSheet("Sheet1")

dim row, col as Integer
dim rowRelative, colRelative as boolean

sheet.AddrToRowCol("F7", row, col, rowRelative, colRelative)
MsgBox str(row)+" "+str(col) // shows 6 5
```

193.7.11 ApplyFilter

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Applies the AutoFilter to the sheet.

193.7.12 CellType(row as Integer, col as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns cell's type.
Notes: See CellType constants.

193.7.13 Clear(rowFirst as Integer = 0, rowLast as Integer = 1048575, colFirst as Integer = 0, colLast as Integer = 16383)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clears cells in specified area.

193.7.14 ClearPrintArea

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clears the print area.

193.7.15 ClearPrintRepeats

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clears repeated rows and columns on each page.

193.7.16 ColWidth(col as Integer) as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns column width.

193.7.17 ColWidthPx(col as integer) as Integer

MBS XL Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns column width in pixels.

193.7.18 Constructor

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

193.7.19 CopyCell(rowSrc as Integer, colSrc as Integer, rowDst as Integer, colDst as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies cell with format from (rowSrc, colSrc) to (rowDst, colDst).
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.7.20 CopyRow(dest as XLSheetMBS, SourceRow as Integer, DestRow as Integer, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies a row from one sheet to another.
Notes:

Sheets can be in different books.
This copies most properties and all cells.
If something is missing, please let us know.

193.7.21 CopySheet(dest as XLBookMBS, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies a sheet to the other book.
Notes:

This copies most properties and all cells.
If something is missing, please let us know.
See also:

- 193.7.22 CopySheet(dest as XLSheetMBS, Options as XLCopyOptionsMBS = nil) 22705

193.7.22 CopySheet(dest as XLSheetMBS, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies the sheet content to the other sheet.
Notes:

This copies most properties and all cells.
If something is missing, please let us know.
See also:

- 193.7.21 CopySheet(dest as XLBookMBS, Options as XLCopyOptionsMBS = nil) 22705

193.7.23 DelHyperlink(index as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes hyperlink by index.
Notes: Index: The index from 0 to HyperlinkSize.

193.7.24 DelMerge(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes merged cells.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.7.25 DelMergeByIndex(index as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes merged cells by index.
Notes: Index: From 0 to MergeSize-1.

193.7.26 DelNamedRange(name as string, scopeId as Integer = -2) as boolean

MBS XL Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Deletes the named range by name.
Notes:

Returns false if error occurs. Get error info with XLBookMBS.errorMessage().
scopeId - index of sheet for local named range or ScopeWorkbook for global named range.

193.7.27 GetHorPageBreak(index as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns row with horizontal page break at position index.

193.7.28 GetMerge(row as Integer, col as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets merged cells for cell at row, col.

Notes:

Result is written in rowFirst, rowLast, colFirst, colLast.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.7.29 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the named range coordianates by name.
Notes: Returns false if specified named range isn't found or error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:

- 193.7.30 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer, ScopeID as Integer, byref Hidden as Integer) as boolean 22707

193.7.30 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer, ScopeID as Integer, byref Hidden as Integer) as boolean

MBS XL Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the named range coordianates by name.
Notes:

scopeId - index of sheet for local named range or SCOPE_WORKBOOK for global named range.
hidden - true if named range is hidden and false if isn't.
Returns false if specified named range isn't found or error occurs. Get error info with XLBookMBS.errorMessage.
See also:

- 193.7.29 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as boolean 22707

193.7.31 GetPicture(index as Integer, byref rowTop as Integer, byref colLeft as Integer, byref rowBottom as Integer, byref colRight as Integer, byref width as Integer, byref height as Integer, byref offsetX as Integer, byref offsetY as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a workbook picture index at position index in worksheet.
Notes:

Output parameters:
(rowTop, colLeft) - top left position of picture;
(rowBottom, colRight) - bottom right position of picture;
width - width of picture in pixels;
height - height of picture in pixels;
offset_x - horizontal offset of picture in pixels;
offset_y - vertical offset of picture in pixels.

Use XLBookMBS.getPicture() for extracting binary data of picture by workbook picture index.
Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.7.32 GetPrintArea(byref rowFirst as Integer, byref colFirst as Integer, byref rowLast as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the print area.
Notes: Returns false if print area isn't found.

193.7.33 GetPrintFit(byref wPages as Integer, byref hPages as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns whether fit to page option is enabled.
Notes:

Output parameters:
wPages - number of pages the sheet width is fit to;
hPages - number of pages the sheet height is fit to.

193.7.34 GetPrintRepeatCols(byref colFirst as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets repeated columns on each page from colFirst to colLast.
Notes: Returns false if repeated columns aren't found.

193.7.35 GetPrintRepeatRows(byref rowFirst as Integer, byref rowLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets repeated rows on each page from rowFirst to rowLast.
Notes: Returns false if repeated rows aren't found.

193.7.36 GetTopLeftView(byref row as Integer, byref col as Integer)

MBS XL Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Extracts the first visible row and the leftmost visible column of the sheet.
Example:

```
// create new xls file
dim book as new XLBookMBS(false)

// create sheet
dim sheet as XLSheetMBS = book.AddSheet("Sheet1")

// set top left view
sheet.SetTopLeftView(2,3)

// read values
dim col, row as Integer
sheet.GetTopLeftView(row, col)

MsgBox str(Row)+", "+str(col) // shows 2, 3
```

193.7.37 GetVerPageBreak(index as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns column with vertical page break at position index.

193.7.38 GroupCols(colFirst as Integer, colLast as Integer, collapsed as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Groups columns from colFirst to colLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.7.39 GroupRows(rowFirst as Integer, rowLast as Integer, collapsed as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Groups rows from rowFirst to rowLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.7.40 Hyperlink(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as String

MBS XL Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the hyperlink and its coordianates by index.

193.7.41 InsertCol(colFirst as Integer, colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Inserts columns from colFirst to colLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.7.42 InsertRow(rowFirst as Integer, rowLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Inserts rows from rowFirst to rowLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.7.43 IsDate(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Checks that cell contains a date or time value.

193.7.44 IsFormula(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Checks that cell contains a formula.

193.7.45 Merge(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the merged cells by index.

193.7.46 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the named range coordianates by index.
See also:

- 193.7.47 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref scopeId as Integer, byref Hidden as Boolean) as string 22711

193.7.47 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref scopeId as Integer, byref Hidden as Boolean) as string

MBS XL Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the named range coordianates by index.
Notes:

scopeId - index of sheet for local named range or ScopeWorkbook for global named range.
hidden - true if named range is hidden and false if isn't.
See also:

- 193.7.46 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer) as string 22711

193.7.48 ReadBlank(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads format from blank cell.
Notes:

Returns false if specified cell isn't blank or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 193.7.49 ReadBlank(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean 22712

193.7.49 ReadBlank(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads format from blank cell.
Notes:

Returns false if specified cell isn't blank or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 193.7.48 ReadBlank(row as Integer, col as Integer) as boolean 22711

193.7.50 ReadBoolean(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a boolean value and its format from cell.
Notes:

If nil format is returned then an error occured. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 193.7.51 ReadBoolean(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean 22712

193.7.51 ReadBoolean(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a boolean value and its format from cell.
Notes:

If nil format is returned then an error occured. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 193.7.50 ReadBoolean(row as Integer, col as Integer) as boolean 22712

193.7.52 ReadComment(row as Integer, col as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a comment from specified cell.
Notes:

Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

193.7.53 ReadDate(row as Integer, col as Integer) as date

MBS XL Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a date/time and its format from cell.
Notes:

Internally uses XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 193.7.54 ReadDate(row as Integer, col as Integer, byref format as XLFormatMBS) as date 22713

193.7.54 ReadDate(row as Integer, col as Integer, byref format as XLFormatMBS) as date

MBS XL Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a date/time and its format from cell.
Notes:

Internally uses XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 193.7.53 ReadDate(row as Integer, col as Integer) as date 22713

193.7.55 ReadError(row as Integer, col as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads error from cell.
Notes:

See ErrorType* constants.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

193.7.56 ReadFormula(row as Integer, col as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a formula string and its format from cell.
Notes:

Returns nil if specified cell doesn't contain formula or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 193.7.57 ReadFormula(row as Integer, col as Integer, byref format as XLFormatMBS) as string 22714

193.7.57 ReadFormula(row as Integer, col as Integer, byref format as XLFormatMBS) as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a formula string and its format from cell.
Notes:

Returns nil if specified cell doesn't contain formula or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 193.7.56 ReadFormula(row as Integer, col as Integer) as string 22714

193.7.58 ReadNumber(row as Integer, col as Integer) as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a number or date/time and its format from cell.
Notes:

Use XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 193.7.59 ReadNumber(row as Integer, col as Integer, byref format as XLFormatMBS) as Double 22715

193.7.59 ReadNumber(row as Integer, col as Integer, byref format as XLFormatMBS) as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a number or date/time and its format from cell.
Notes:

Use XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 193.7.58 ReadNumber(row as Integer, col as Integer) as Double 22714

193.7.60 ReadString(row as Integer, col as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a string and its format from cell.
Notes:

Returns "" if specified cell doesn't contain string or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 193.7.61 ReadString(row as Integer, col as Integer, byref format as XLFormatMBS) as string 22715

193.7.61 ReadString(row as Integer, col as Integer, byref format as XLFormatMBS) as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a string and its format from cell.
Notes:

Returns "" if specified cell doesn't contain string or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 193.7.60 ReadString(row as Integer, col as Integer) as string 22715

193.7.62 RemoveCol(colFirst as Integer, colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes columns from colFirst to colLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.7.63 RemoveComment(row as Integer, col as Integer)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes a comment from the cell (only for xls format).

193.7.64 RemoveDataValidations

MBS XL Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes all data validations for the sheet (only for xlsx files).

193.7.65 RemoveFilter

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes the AutoFilter from the sheet.

193.7.66 RemoveRow(rowFirst as Integer, rowLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes rows from rowFirst to rowLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.7.67 RowColToAddr(row as Integer, col as Integer, rowRelative as boolean = true, colRelative as boolean = true) as string

MBS XL Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Converts row and column to a cell reference.
Example:

```
// create new xls file
dim book as new XLBookMBS(false)

// create sheet
```

```
dim sheet as XLSheetMBS = book.AddSheet("Sheet1")

MsgBox sheet.RowColToAddr(5,5) // shows F6
MsgBox sheet.RowColToAddr(5,5,false,false) // shows $ F$ 6
```

193.7.68 RowHeight(row as Integer) as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns row height.

193.7.69 RowHeightPx(row as integer) as Integer

MBS XL Plugin, Plugin Version: 20.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns row height in pixels.

193.7.70 SetAutoFitArea(rowFirst as Integer = 0, colFirst as Integer = 0, rowLast as Integer = -1, colLast as Integer = -1)

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the borders for autofit column widths feature.
Notes: The method setCol with -1 width value will affect only to the specified limited area.

193.7.71 SetCol(colFirst as Integer, colLast as Integer, width as Double, format as XLFormatMBS = nil, hidden as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets column width and format for all columns from colFirst to colLast.
Notes:

If format is nil then format is ignored. Columns may be hidden. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Column width measured as the number of characters of the maximum digit width of the numbers 0, 1, 2, ..., 9 as rendered in the normal style's font. Value -1 is used for autofit column widths. If format equals 0 then format is ignored. Columns may be hidden.

193.7.72 SetFooter(footer as string, margin as Double) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the footer text for the sheet when printed.
Notes:

The footer text appears at the bottom of every page when printed. The length of the text must be less than or equal to 255. The footer text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. See setHeader for details. Margin is specified in inches.

Code	Description
& L	specifies the beginning of the left section
& P	specifies the current page number
& N	specifies the total number of pages
& \d { 1,3 }	specifies the text font size, where font size is measured in points, for example: & 9 or & 36
& S	specifies whether the strikethrough text style is on or off
& X	specifies whether the superscript text style is on or off
& Y	specifies whether the subscript text style is on or off
& C	specifies the beginning of the center section
& D	specifies a date
& T	specifies a time
& G	specifies a picture
& U	specifies whether the single underline text style is on or off
& E	specifies whether the double underline text style is on or off
& R	specifies the beginning of the right section
& Z	specifies a workbook file path
& F	specifies a workbook file name
& A	specifies a sheet name
& "fontname"	specifies the text font, for example: & "Comic Sans MS"
& B	specifies whether the bold text style is on or off
& I	specifies whether the italic text style is on or off
& &	specifies an ampersand character (&)

193.7.73 SetHeader(header as string, margin as Double) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the header text of the sheet when printed.
Notes:

The text appears at the top of every page when printed. The length of the text must be less than or equal to 255. The header text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Special commands are represented by single letter with a leading

ampersand ("& "). Margin is specified in inches.

Code	Description
& L	specifies the beginning of the left section
& P	specifies the current page number
& N	specifies the total number of pages
& \d { 1,3 }	specifies the text font size, where font size is measured in points, for example: & 9 or & 36
& S	specifies whether the strikethrough text style is on or off
& X	specifies whether the superscript text style is on or off
& Y	specifies whether the subscript text style is on or off
& C	specifies the beginning of the center section
& D	specifies a date
& T	specifies a time
& G	specifies a picture
& U	specifies whether the single underline text style is on or off
& E	specifies whether the double underline text style is on or off
& R	specifies the beginning of the right section
& Z	specifies a workbook file path
& F	specifies a workbook file name
& A	specifies a sheet name
& "fontname"	specifies the text font, for example: & "Comic Sans MS"
& B	specifies whether the bold text style is on or off
& I	specifies whether the italic text style is on or off
& &	specifies an ampersand character (&)

193.7.74 SetHorPageBreak(row as Integer, pageBreak as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets/removes a horizontal page break.
Example:

```
// new document
dim x as new XLBookMBS

// add a sheet
dim s as XLSheetMBS = x.AddSheet

// write a cell
call s.WriteString(5,5, "Hello")

// now put a page break there
```

```
if s.SetHorPageBreak(5, true) then
// and now we have one at row 5
MsgBox str(s.GetHorPageBreakCount)+" "+str(s.GetHorPageBreak(0))
end if
```

Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.7.75 SetMerge(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets merged cells for range: rowFirst - rowLast, colFirst - colLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.7.76 SetNamedRange(name as string, rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer, scopeId as Integer = -2) as boolean

MBS XL Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the named range.
Notes:

scopeId - index of sheet for local named range or ScopeWorkbook for global named range.
Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

193.7.77 SetPicture(row as Integer, col as Integer, PictureID as Integer, scale as Double = 1.0, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets a picture with pictureId identifier at position row and col with scale factor.
Notes: Use XLBookMBS.addPicture() for getting picture identifier.
See also:

- 193.7.78 SetPicture(row as Integer, col as Integer, PictureID as Integer, width as Integer, height as Integer, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0)

193.7.78 SetPicture(row as Integer, col as Integer, PictureID as Integer, width as Integer, height as Integer, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets a picture with pictureId identifier at position row and col with custom size.
Notes:

Use XLBookMBS.addPicture() for getting a picture identifier.

Width and height can be -1 for default size of picture.
See also:

- 193.7.77 SetPicture(row as Integer, col as Integer, PictureID as Integer, scale as Double = 1.0, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0) 22720

193.7.79 SetPrintArea(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the print area.

193.7.80 SetPrintFit(wPages as Integer, hPages as Integer)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Fits sheet width and sheet height to wPages and hPages respectively.

193.7.81 SetPrintRepeatCols(colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets repeated columns on each page from colFirst to colLast.

193.7.82 SetPrintRepeatRows(rowFirst as Integer, rowLast as Integer)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets repeated rows on each page from rowFirst to rowLast.

193.7.83 SetProtectEx(protect as boolean = true, password as string = "", enhancedProtection as Integer = -1)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Protects/unprotects the sheet with password and enchanced parameters below.
Notes: It is possible to combine a few EnhancedProtection values with operator BitwiseOr.

193.7.84 SetRow(row as Integer, height as Double, format as XLFormatMBS = nil, hidden as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets row height and format.
Notes:

If format is nil then format is ignored. Row may be hidden. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Height is in points. If you want to convert from pixels to points you can use this calculation: points = pixels * 72 / 96. So for a height of 72 pixel, you pass 54 points.

193.7.85 SetTabColor(colorValue as Integer)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the color for the sheet's tab.

193.7.86 SetTabRgbColor(red as Integer, green as Integer, blue as Integer)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the color for the sheet's tab.

193.7.87 SetTopLeftView(row as Integer, col as Integer)

MBS XL Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the first visible row and the leftmost visible column of the sheet.
Example:

```
// create new xls file
dim book as new XLBookMBS(false)
```

```
// create sheet
dim sheet as XLSheetMBS = book.AddSheet("Sheet1")

// set top left view
sheet.SetTopLeftView(2,3)

// read values
dim col, row as Integer
sheet.GetTopLeftView(row, col)

MsgBox str(Row)+", "+str(col) // shows 2, 3
```

193.7.88 SetVerPageBreak(row as Integer, pageBreak as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets/removes a vertical page break.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

193.7.89 Split(row as Integer, col as Integer)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Splits a sheet at position (row, col).
Notes: Splits a sheet at position (row, col) or specifies the position of frozen pane. This function allows to freeze a header at top position or freeze some columns on the right.

193.7.90 SplitInfo(byref row as Integer, byref col as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the split information (position of frozen pane) in the sheet.
Notes:

row: vertical position of the split;
col: horizontal position of the split.
Returns true on success.

193.7.91 Table(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref headerRowCount as Integer, byref totalsRowCount as Integer) as string

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the table parameters by index.
Notes:

headerRowCount - the number of header rows showing at the top of the table. 0 means that the header row is not shown.
totalsRowCount - the number of totals rows that shall be shown at the bottom of the table. 0 means that the totals row is not shown.
Returns a string representing the name of the table.

193.7.92 WriteBlank(row as Integer, col as Integer, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes blank cell with specified format.
Notes:

Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

193.7.93 WriteBoolean(row as Integer, col as Integer, value as boolean, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a bool value into cell with specified format.
Notes:

If format is nil then format is ignored.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

193.7.94 WriteComment(row as Integer, col as Integer, value as string, author as string, width as Integer, height as Integer)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a comment to the cell.

Notes:

row and col: cell's position
value: comment string
author: author string
width: width of text box in pixels
height: height of text box in pixels

Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

193.7.95 WriteDate(row as Integer, col as Integer, value as date, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a date/time into cell with specified format.
Notes:

If format is nil then format is ignored. Internally uses XLBookMBS.datePack() for packing date/time parts to double.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

193.7.96 WriteError(row as Integer, col as Integer, Error as Integer, format as XLFormatMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes error into the cell with specified format.
Notes: If format equals nil then format is ignored.

193.7.97 WriteFormula(row as Integer, col as Integer, value as string, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a formula into cell with specified format.
Notes:

If format is nil then format is ignored. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

As LibXL does not calculate the result of the formula, it will not encode the result in the Excel file. It does only store the formula, so an app opening the file will have to do the calculation. But QuickLook on Mac OS X does not calculate, so results do not show there.
Examples for formulas are: "TODAY()", "IF(C1>0;ABS(C1*D1);"""")", "SUM(E16:E38)" or "E39+E39*E40".

193.7.98 WriteFormulaBool(row as Integer, col as Integer, Expression as string, value as Boolean, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a formula expression with precalculated bool value into cell with specified format.
Notes:

If format equals nil then format is ignored.
Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

193.7.99 WriteFormulaNum(row as Integer, col as Integer, Expression as string, value as Double, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a formula expression with precalculated double value into cell with specified format.
Notes: If format equals nil then format is ignored. Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

193.7.100 WriteFormulaString(row as Integer, col as Integer, Expression as string, value as String, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a formula expression with precalculated string value into cell with specified format.
Notes: If format equals nil then format is ignored. Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

193.7.101 WriteNumber(row as Integer, col as Integer, value as Double, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a number or date/time into cell with specified format.
Notes:

If format is nil then format is ignored. Use XLBookMBS.datePack() for packing date/time parts to double.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

193.7.102 WriteString(row as Integer, col as Integer, value as string, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a string into cell with specified format.
Notes:

If format is nil then format is ignored.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

193.7.103 Properties

193.7.104 AutoFilter as XLAutoFilterMBS

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the AutoFilter.
Notes:

Creates it if it doesn't exist.
Only for xml based files.
(Read only property)

193.7.105 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The parent book.
Notes:

As a sheet is only valid with the owning book, we keep a back reference here.
(Read only property)

193.7.106 DisplayGridlines as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the gridlines are displayed.
Notes:

True if gridlines are displayed and false if aren't.
(Assigning a value to this property calls setDisplayGridlines internally)
(Read and Write property)

193.7.107 FirstCol as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the first column in the sheet that contains a used cell.
Notes: (Read only property)

193.7.108 FirstRow as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the first row in the sheet that contains a used cell.
Notes: (Read only property)

193.7.109 Footer as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The footer text of the sheet when printed.
Notes:

The footer text appears at the bottom of every page when printed. The length of the text must be less than or equal to 255. The footer text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Margin is specified in inches.

Code	Description
& L	specifies the beginning of the left section
& P	specifies the current page number
& N	specifies the total number of pages
& \d { 1,3 }	specifies the text font size, where font size is measured in points, for example: & 9 or & 36
& S	specifies whether the strikethrough text style is on or off
& X	specifies whether the superscript text style is on or off
& Y	specifies whether the subscript text style is on or off
& C	specifies the beginning of the center section
& D	specifies a date
& T	specifies a time
& G	specifies a picture
& U	specifies whether the single underline text style is on or off
& E	specifies whether the double underline text style is on or off
& R	specifies the beginning of the right section
& Z	specifies a workbook file path
& F	specifies a workbook file name
& A	specifies a sheet name
& "fontname"	specifies the text font, for example: & "Comic Sans MS"
& B	specifies whether the bold text style is on or off
& I	specifies whether the italic text style is on or off
& &	specifies an ampersand character (&)

(Read only property)

193.7.110 FooterMargin as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The footer margin in inches.
Notes: (Read only property)

193.7.111 GetHorPageBreakCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a number of horizontal page breaks in the sheet.
Example:

```
// new document
dim x as new XLBookMBS
```

```
// add a sheet
dim s as XLSheetMBS = x.AddSheet

// write a cell
call s.WriteString(5,5, "Hello")

// now put a page break there
if s.SetHorPageBreak(5, true) then
// and now we have one at row 5
MsgBox str(s.GetHorPageBreakCount)+" "+str(s.GetHorPageBreak(0))
end if
```

Notes: (Read only property)

193.7.112 GetVerPageBreakCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a number of vertical page breaks in the sheet.
Notes: (Read only property)

193.7.113 GroupSummaryBelow as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether grouping rows summary is below.
Notes:

True if summary is below and false if isn't.
(Read and Write property)

193.7.114 GroupSummaryRight as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether grouping columns summary is right.
Notes:

Returns true if summary is right and false if isn't.
(Read and Write property)

193.7.115 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
Notes: (Read and Write property)

193.7.116 HCenter as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the sheet is centered horizontally when printed.
Notes: (Read and Write property)

193.7.117 Header as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The header text of the sheet when printed.
Notes:

The text appears at the top of every page when printed. The length of the text must be less than or equal to 255. The header text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Special commands are represented by single letter with a leading ampersand ("& "). Margin is specified in inches.

(Read only property)

193.7.118 HeaderMargin as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The header margin in inches.
Notes: (Read only property)

193.7.119 Hidden as Integer

MBS XL Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Specifies the visible state of this sheet.
Notes:

See constants: SheetStateHidden, SheetStateVeryHidden, SheetStateVisible.
(Read and Write property)

Code	Description
& L	specifies the beginning of the left section
& P	specifies the current page number
& N	specifies the total number of pages
& \d { 1,3 }	specifies the text font size, where font size is measured in points, for example: & 9 or & 36
& S	specifies whether the strikethrough text style is on or off
& X	specifies whether the superscript text style is on or off
& Y	specifies whether the subscript text style is on or off
& C	specifies the beginning of the center section
& D	specifies a date
& T	specifies a time
& G	specifies a picture
& U	specifies whether the single underline text style is on or off
& E	specifies whether the double underline text style is on or off
& R	specifies the beginning of the right section
& Z	specifies a workbook file path
& F	specifies a workbook file name
& A	specifies a sheet name
& "fontname"	specifies the text font, for example: & "Comic Sans MS"
& B	specifies whether the bold text style is on or off
& I	specifies whether the italic text style is on or off
& &	specifies an ampersand character (&)

193.7.120 HyperlinkSize as Integer

MBS XL Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the number of hyperlinks in the sheet.
Notes: (Read only property)

193.7.121 Landscape as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to use landscape or portrait mode for printing.
Notes:

true - pages are printed using landscape mode, false - pages are printed using portrait mode.
(Read and Write property)

193.7.122 LastCol as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the zero-based index of the column after the last column in the sheet that contains a used cell.
Example:

```
dim book as XLBookMBS // your book instance

// get first sheet
dim sheet as XLSheetMBS = book.Sheet(0)

// show index of last column
dim LastCol as Integer = sheet.LastCol

MsgBox "LastCol: " + str(LastCol)
```

Notes: (Read only property)

193.7.123 LastRow as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the zero-based index of the row after the last row in the sheet that contains a used cell.
Example:

```
dim book as XLBookMBS // your book instance

// get first sheet
dim sheet as XLSheetMBS = book.Sheet(0)

// show index of last row
dim LastRow as Integer = sheet.LastRow

MsgBox "LastRow: " + str(LastRow)
```

Notes: (Read only property)

193.7.124 MarginBottom as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The bottom margin of the sheet in inches.
Notes: (Read and Write property)

193.7.125 MarginLeft as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The left margin of the sheet in inches.
Notes: (Read and Write property)

193.7.126 MarginRight as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The right margin of the sheet in inches.
Notes: (Read and Write property)

193.7.127 MarginTop as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The top margin of the sheet in inches.
Notes: (Read and Write property)

193.7.128 MergeSize as Integer

MBS XL Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a number of merged cells in this worksheet.
Notes: (Read only property)

193.7.129 Name as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The name of the sheet.
Notes: (Read and Write property)

193.7.130 NamedRangeCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the number of named ranges in the sheet.

Notes: (Read only property)

193.7.131 Paper as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The paper size.
Notes:

See Paper* constants.
(Read and Write property)

193.7.132 PictureCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a number of pictures in this worksheet.
Notes: (Read only property)

193.7.133 PrintGridlines as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the gridlines are printed.
Notes:

True if gridlines are printed and false if aren't.
(Read and Write property)

193.7.134 PrintRowCol as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the row and column headers are printed.
Notes: (Read and Write property)

193.7.135 PrintZoom as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Scaling factor for printing as a percentage.
Notes: (Read and Write property)

193.7.136 Protect as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether sheet is protected.
Notes: (Read and Write property)

193.7.137 RightToLeft as boolean

MBS XL Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the text is displayed in right-to-left mode.
Notes:

true - the text is displayed in right-to-left mode,
false - the text is displayed in left-to-right mode.
(Read and Write property)

193.7.138 TableSize as Integer

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the number of tables in the sheet.
Notes: (Read only property)

193.7.139 VCenter as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the sheet is centered vertically when printed.
Notes: (Read and Write property)

193.7.140 Zoom as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The zoom level of the current view.
Notes:

100 is a usual view.
(Read and Write property)

193.7.141 CellFormat(row as Integer, col as Integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The cell's format.
Notes: (Read and Write computed property)

193.7.142 ColHidden(col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether column is hidden.
Notes: (Read and Write computed property)

193.7.143 RowHidden(row as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether row is hidden.
Notes: (Read and Write computed property)

193.7.144 Constants

193.7.145 CellTypeBlank = 4

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the cell type constants.
Notes: blank

193.7.146 CellTypeBoolean = 3

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the cell type constants.
Notes: boolean value

193.7.147 CellTypeEmpty = 0

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the cell type constants.
Notes: empty

193.7.148 CellTypeError = 5

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the cell type constants.
Notes: error

Notes: Default protection.

193.7.288 ProtectDeleteColumns = 256

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the protection levels.
Notes: Deleting columns is allowed when the sheet is protected.

193.7.289 ProtectDeleteRows = 512

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the protection levels. **Notes:** Deleting rows is allowed when the sheet is protected.

193.7.290 ProtectFormatCells = 4

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the protection levels. **Notes:** Formatting cells is allowed when the sheet is protected.

193.7.291 ProtectFormatColumns = 8

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the protection levels. **Notes:** Formatting columns is allowed when the sheet is protected.

193.7.292 ProtectFormatRows = 16

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the protection levels. **Notes:** Formatting rows is allowed when the sheet is protected.

193.7.293 ProtectInsertColumns = 32

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the protection levels. **Notes:** Inserting columns is allowed when the sheet is protected.

193.7.294 ProtectInsertHyperlinks = 128

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the protection levels. **Notes:** Inserting hyperlinks is allowed when the sheet is protected.

193.7.295 ProtectInsertRows = 64

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the protection levels. **Notes:** Inserting rows is allowed when the sheet is protected.

193.7.296 ProtectObjects = 1

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the protection levels.
Notes: Objects are locked when the sheet is protected.

193.7.297 ProtectPivottables = 8192

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the protection levels.
Notes: Pivot tables are allowed when the sheet is protected.

193.7.298 ProtectScenarios = 2

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the protection levels.
Notes: Scenarios are locked when the sheet is protected.

193.7.299 ProtectSelLockedCells = 1024

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the protection levels.
Notes: Selection of locked cells is locked when the sheet is protected.

193.7.300 ProtectSelUnlockedCells = 16384

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the protection levels.
Notes: Selection of unlocked cells is locked when the sheet is protected.

193.7.301 ProtectSort = 2048

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the protection levels.
Notes: Sorting is allowed when the sheet is protected.

193.7.302 ScopeUndefined = -2

MBS XL Plugin, Plugin Version: 14.0. **Function:** One of the scope constants.
Notes: Undefined scope

193.7.303 ScopeWorkbook = -1

MBS XL Plugin, Plugin Version: 14.0. **Function:** One of the scope constants.
Notes: Workbook scope.

193.7.304 SheetStateHidden = 1

MBS XL Plugin, Plugin Version: 12.1. **Function:** One of the constants for the visible state of a sheet.
Notes: Sheet is hidden, but can be shown via the user interface.

193.7.305 SheetStateVeryHidden = 2

MBS XL Plugin, Plugin Version: 12.1. **Function:** One of the constants for the visible state of a sheet.
Notes: Sheet is hidden and cannot be shown in the user interface.

193.7.306 SheetStateVisible = 0

MBS XL Plugin, Plugin Version: 12.1. **Function:** One of the constants for the visible state of a sheet.
Notes: Sheet is visible

193.7.307 ValidationErrstyleInformation = 2

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the error styles.
Notes: This data validation error style uses an information icon in the error alert.

193.7.308 ValidationErrstyleStop = 0

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the error styles.
Notes: This data validation error style uses a stop icon in the error alert.

193.7.309 ValidationErrstyleWarning = 1

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the error styles.
Notes: This data validation error style uses a warning icon in the error alert.

193.7.310 ValidationOpBetween = 0

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the validation operations.
Notes: Data validation which checks if a value is between two other values.

193.7.311 ValidationOpEqual = 2

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the validation operations.
Notes: Data validation which checks if a value is equal to a specified value.

193.7.312 ValidationOpGreaterthan = 6

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the validation operations.
Notes: Data validation which checks if a value is greater than a specified value.

193.7.313 ValidationOpGreaterthanorequal = 7

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the validation operations.
Notes: Data validation which checks if a value is greater than or equal to a specified value.

193.7.314 ValidationOpLessthan = 4

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the validation operations.
Notes: Data validation which checks if a value is less than a specified value.

193.7.315 ValidationOpLessthanorequal = 5

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the validation operations.
Notes: Data validation which checks if a value is less than or equal to a specified value.

193.7.316 ValidationOpNotbetween = 1

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the validation operations.
Notes: Data validation which checks if a value is not between two other values.

193.7.317 ValidationOpNotequal = 3

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the validation operations.
Notes: Data validation which checks if a value is not equal to a specified value.

193.7.318 ValidationTypeCustom = 7

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the constants for the types of data validation.
Notes: Data validation which uses a custom formula to check the cell value.

193.7.319 ValidationTypeDate = 4

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the constants for the types of data validation.
Notes: Data validation which checks for date values satisfying the given condition.

193.7.320 ValidationTypeDecimal = 2

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the constants for the types of data validation.
Notes: Data validation which checks for decimal values satisfying the given condition.

193.7.321 ValidationTypeList = 3

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the constants for the types of data validation.
Notes: Data validation which checks for a value matching one of list of values.

193.7.322 ValidationTypeNone = 0

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the constants for the types of data validation.
Notes: No data validation.

193.7.323 ValidationTypeTextLength = 6

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the constants for the types of data validation.
Notes: Data validation which checks for text values, whose length satisfies the given condition.

193.7.324 ValidationTypeTime = 5

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the constants for the types of data validation. **Notes:** Data validation which checks for time values satisfying the given condition.

193.7.325 ValidationTypeWhole = 1

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the constants for the types of data validation. **Notes:** Data validation which checks for whole number values satisfying the given condition.

Chapter 194

XML

194.1 class XMLValidatorMBS

194.1.1 class XMLValidatorMBS

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for the XML validator.
Notes: Using the validator in LibXML.

194.1.2 Blog Entries

- MBS Xojo Plugins in version 19.2
- MBS Xojo Plugins, version 19.2pr8
- New XML Validator class for Xojo

194.1.3 Xojo Developer Magazine

- 17.4, page 10: News

194.1.4 Methods

194.1.5 Constructor(XMLSchema as String)

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor.

Notes: May raise an XMLException if the XML can't be parsed or the validator can't be initialized.

194.1.6 Destructor

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

194.1.7 Message(index as Integer) as XMLValidatorMessageMBS

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries a message by index.
Notes: Index from 0 to MessageCount-1.

194.1.8 Messages as XMLValidatorMessageMBS()

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries array of messages recorded while validating.

194.1.9 SetCurrentWorkingDirectory(path as folderitem) as boolean

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets current working directory for the application.
Notes:

The library looks in current directory to find related files.
So if your schema or the XML file to check references other files, please set the diretory.

Returns true on success or false on failure.
See also:

- 194.1.10 SetCurrentWorkingDirectory(path as String) as boolean 22764

194.1.10 SetCurrentWorkingDirectory(path as String) as boolean

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets current working directory for the application.
Notes:

The library looks in current directory to find related files.
So if your schema or the XML file to check references other files, please set the diretory.

Returns true on success or false on failure.
See also:

- 194.1.9 SetCurrentWorkingDirectory(path as folderitem) as boolean 22764

194.1.11 ValidateFile(file as FolderItem) as Integer

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Validates XML file against a XML schema.
Notes:

Validate a document tree in memory.
Returns 0 if the document is schemas valid, a positive error code number otherwise and -1 in case of internal or API error.

See messages array for the logged error and warning messages.
Please pass in XML file path and a valid XSD schema.

Use SetCurrentWorkingDirectory with file.parent to set working directory if needed.
See also:

- 194.1.12 ValidateFile(path as string) as Integer 22765

194.1.12 ValidateFile(path as string) as Integer

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Validates XML file against a XML schema.
Notes:

Validate a document tree in memory.
Returns 0 if the document is schemas valid, a positive error code number otherwise and -1 in case of internal or API error.

See messages array for the logged error and warning messages.
Please pass in XML file path and a valid XSD schema.

Use SetCurrentWorkingDirectory with file.parent to set working directory if needed.
See also:

- 194.1.11 ValidateFile(file as FolderItem) as Integer 22765

194.1.13 ValidateString(text as string) as Integer

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Validates XML text against a XML schema.
Notes:

Validate a document tree in memory.
Returns 0 if the document is schemas valid, a positive error code number otherwise and -1 in case of internal or API error.

See messages array for the logged error and warning messages.

194.1.14 Properties

194.1.15 MessageCount as Integer

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries number of messages we recorded in validation.
Notes: (Read only property)

194.1.16 Events

194.1.17 Error(message as XMLValidatorMessageMBS)

MBS Util Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The error event called for validation errors.

194.1.18 Warning(message as XMLValidatorMessageMBS)

MBS Util Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The warning event called for validation warnings.

194.2 class XMLValidatorMessageMBS

194.2.1 class XMLValidatorMessageMBS

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for an error or warning message in XML validator.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

194.2.2 Blog Entries

- New XML Validator class for Xojo

194.2.3 Methods

194.2.4 Constructor

MBS Util Plugin, Plugin Version: 19.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

194.2.5 Destructor

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

194.2.6 Properties

194.2.7 Code as Integer

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The error code.
Notes: (Read only property)

194.2.8 FileName as String

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The filename if available.

Notes: (Read only property)

194.2.9 IsError as Boolean

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether this was reported as error and not as warning.
Notes: (Read only property)

194.2.10 IsWarning as Boolean

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether this was reported as warning and not as error.
Notes: (Read only property)

194.2.11 Line as Integer

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The line number in the XML file if available.
Notes: (Read only property)

194.2.12 Message as String

MBS Util Plugin, Plugin Version: 19.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The message text.
Notes: (Read only property)

Chapter 195

XMP

195.1 class XMPAssertNotifyMBS

195.1.1 class XMPAssertNotifyMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This class provides a way to get notified for Assertion.
Notes: Only one instance can be registered at a given time.

195.1.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr2

195.1.3 Events

195.1.4 Assert(text as string)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** An assertion was reported.
Example:

```
Sub Assert(text as string)
MsgBox text
End Sub
```

Notes: Display it to the user or just log it for debugging.

195.2 class XMPDateTimeMBS

195.2.1 class XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The expanded type for a date and time.
Notes:

Dates and time in the serialized XMP are ISO 8601 strings. The XMPDateTimeMBS class allows easy conversion with other formats.

DateTime values are occasionally used in cases with only a date or only a time component. A date without a time has zeros in the XMPDateTimeMBS class for all time fields. A time without a date has zeros for all date fields (year, month, and day).

195.2.2 Methods

195.2.3 ClearTimeZone

MBS XMP Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Resets the timezone by setting all time zone properties to zero.

195.2.4 Clone as XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a copy of this date.
Notes: Not just a new reference to the same object, but a real copy.

195.2.5 Compare(other as XMPDateTimeMBS) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compare the order of two date/time values.
Notes:

Returns:
-1 if self is before other or other=nil
0 if self matches other
+1 if self is after other

195.2.6 Constructor

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Obtain the current date and time.
Notes: The returned time is UTC, properly adjusted for the local time zone. The resolution of the time is not guaranteed to be finer than seconds.
See also:

- 195.2.7 Constructor(text as string) 22771

195.2.7 Constructor(text as string)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from string to date/time.
See also:

- 195.2.6 Constructor 22771

195.2.8 ConvertToLocalTime

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Make sure a time is local.
Notes: If the time zone is not the local zone, the time is adjusted and the time zone set to be local.

195.2.9 ConvertToUTCTime

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Make sure a time is UTC.
Notes: If the time zone is not UTC, the time is adjusted and the time zone set to be UTC.

195.2.10 IsDateOnly as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether only the date is defined for this datetime object.

195.2.11 IsTimeOnly as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether only the time is defined for this datetime object.

195.2.12 Operator_Convert as string

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from date/time to string.
See also:

- 195.2.13 Operator_Convert(text as string) 22772

195.2.13 Operator_Convert(text as string)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from string to date/time.
See also:

- 195.2.12 Operator_Convert as string 22772

195.2.14 SetTimeZone

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set the local time zone.
Notes: Any existing time zone value is replaced, the other date/time fields are not adjusted in any way.

195.2.15 Str as string

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from date/time to string.

195.2.16 Properties

195.2.17 Day as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The day of the month in the range 1..31.
Notes: (Read and Write property)

195.2.18 hasDate as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A property to tell if the date is defined in this object.

Notes: (Read and Write property)

195.2.19 hasTime as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A property to tell if the time is defined in this object.
Notes: (Read and Write property)

195.2.20 hasTimeZone as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether there is a time zone set.
Notes: (Read and Write property)

195.2.21 Hour as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The hour in the range 0..23.
Notes: (Read and Write property)

195.2.22 Minute as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The minute in the range 0..59.
Notes: (Read and Write property)

195.2.23 Month as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The month in the range 1..12.
Notes: (Read and Write property)

195.2.24 NanoSecond as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Nanoseconds within a second, often left as zero.

Notes: (Read and Write property)

195.2.25 Second as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The second in the range 0..59.
Notes: (Read and Write property)

195.2.26 TimezoneHour as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The time zone hour in the range 0..23.
Notes: (Read and Write property)

195.2.27 TimezoneMinute as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The time zone minute in the range 0..59.
Notes: (Read and Write property)

195.2.28 TimezoneSign as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The "sign" of the time zone, 0 means UTC, -1 is west, +1 is east.
Notes:

The "sign" of the time zone, kTimeIsUTC (0) means UTC, kTimeWestOfUTC (-1) is west, kTimeEastOfUTC (+1) is east.
(Read and Write property)

195.2.29 Year as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The year, can be negative.
Notes: (Read and Write property)

195.2.30 Constants

195.2.31 kXMP_TimeEastOfUTC = 1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the TimezoneSign property. **Notes:** UTC time.

195.2.32 kXMP_TimeIsUTC = 0

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the TimezoneSign property. **Notes:** Time zone is east of UTC.

195.2.33 kXMP_TimeWestOfUTC = -1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the TimezoneSign property. **Notes:** Time zone is west of UTC.

195.3 class XMPExceptionMBS

195.3.1 class XMPExceptionMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The exception class for the other XMP classes.
Notes:

For current plugins (6.4): Windows and MachO works, Carbon/Classic PEF crashes on an exception. Linux not tested.

Nearly every method or function may raise this exception, so catch it!
Subclass of the RuntimeException class.

195.4 class XMPFilesMBS

195.4.1 class XMPFilesMBS

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for access to the main (document-level) metadata in a file.
Notes:

The Adobe XMP Toolkit's file handling component, XMPFiles, is a front end to a set of format-specific file handlers that support file I/O for XMP. The file handlers implement smart, efficient support for those file formats for which the means to embed XMP is defined in the XMP Specification. Where possible, this support allows:

* Injection of XMP where none currently exists

- Expansion of XMP without regard to existing padding
- Reconciliation of the XMP and other legacy forms of metadata.

TXMPFiles is designed for use by clients interested in the metadata and not in the primary file content; the Adobe Bridge application is a typical example. TXMPFiles is not intended to be appropriate for files authored by an application; that is, those files for which the application has explicit knowledge of the file format.

Supported file formats:
PDF, PostScript, EPS, JPEG, JPEG2K, TIFF, GIF, PNG, SWF, FLA, FLV, MOV, AVI, CIN, WAV, MP3, SES, CEL, MPEG, MPEG2, MPEG4, WMAV, AIFF, P2, XDCAM_FAM, XDCAM_SAM, XDCAM_EX, AVCHD, SonyHDV, HTML, XML, Text, Photoshop, Illustrator, InDesign, AEProject, AEProjTemplate, AEFilterPreset, EncoreProject, PremiereProject, PremiereTitle and UCF.

Based on the XMP-Toolkit-SDK from Adobe.

This constructor crashes on Linux with 14.0 plugins and Xojo 2011r1 and 2011r3. Some change in 2011r4 makes it work, so up to Xojo 2014 we don't see the crash.

195.4.2 Blog Entries

- Tip of the day: Change EXIF metadata
- MBS Real Studio Plugins, version 11.2pr9
- MBS Real Studio Plugins, version 11.2pr3
- MBS REALbasic Plugins, version 10.5pr5

195.4.3 Methods

195.4.4 CanPutXMP(xmpPacket as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** CanPutXMP() reports whether this file can be updated with a specific XMP packet.
Notes: Use to determine if the file can probably be updated with a given set of XMP metadata. This depends on the size of the packet, the options with which the file was opened, and the capabilities of the handler for the file format. The function obtains the length of the serialized packet for the provided XMP, but does not keep it or modify it, and does not cause the file to be written when closed.
See also:

- 195.4.5 CanPutXMP(xmpPacket as XMPMetaMBS) as boolean 22778

195.4.5 CanPutXMP(xmpPacket as XMPMetaMBS) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

CanPutXMP() reports whether this file can be updated with a specific XMP packet,
passed in a string object.
See also:

- 195.4.4 CanPutXMP(xmpPacket as string) as boolean 22778

195.4.6 CheckFileFormat(path as string) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** CheckFileFormat() tries to determine the format of a file.
Notes:

CheckFileFormat tries to determine the format of a file, returning an format value. It uses the same logic as OpenFile will use to select a smart handler.

path: The path for the file, appropriate for the local operating system. Passed as a UTF-8 string. The path is the same as would be passed to OpenFile.

Returns the file's format if a smart handler would be selected, otherwise kUnknownFile.

195.4.7 CheckPackageFormat(path as string) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** CheckPackageFormat() tries to determine the format of a "package" folder.
Notes:

CheckPackageFormat tries to determine the format of a "package" given the name of the top level folder, returning an XMP_FileFormat value. Examples of recognized packages include the video formats P2, XDCAM, or Sony HDV. These packages contain collections of "clips", stored as multiple files in specific subfolders.

Path: The path for the top level folder, appropriate for the local operating
system. Passed as an UTF-8 string. The path is not the same as would be passed to OpenFile. For example the path passed to CheckPackageFormat might be "../MyMovie", while the path passed to OpenFile would be "../MyMovie/SomeClip".

Returns the package's format if a smart handler would be selected, otherwise kUnknownFile.

195.4.8 CloseFile(closeFlags as Integer)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** CloseFile() explicitly closes an opened file.
Notes:

Performs any necessary output to the file and closes it. Files that are opened for update are written to only when closing.

If the file is opened for read-only access (passing kOpenForRead), the disk
file is closed immediately after reading the data from it; the XMPFiles object, however, remains in the open state. You must call CloseFile() when finished using it. Other methods, such as GetXMP(), can only be used between the OpenFile() and CloseFile() calls. The XMPFiles destructor does not call CloseFile(); if you call it without closing, any pending updates are lost.

If the file is opened for update (passing kOpenForUpdate), the disk file remains
open until CloseFile() is called. The disk file is only updated once, when CloseFile() is called, regardless of how many calls are made to PutXMP().

closeFlags: Option flags for optional closing actions. This bit-flag constant is
defined:

- kUpdateSafely - Write into a temporary file then swap for crash safety.

195.4.9 Constructor

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Default constructor initializes an object that is associated with no file.

Notes: The destructor does not call CloseFile(); pending updates are lost when the destructor is run.
See also:

- 195.4.10 Constructor(path as folderitem, format as Integer=& h20202020, OpenFlags as Integer=0) 22780
- 195.4.11 Constructor(path as string, format as Integer=& h20202020, OpenFlags as Integer=0) 22781

195.4.10 Constructor(path as folderitem, format as Integer=& h20202020, OpenFlags as Integer=0)

MBS XMP Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Opens a file for metadata access.
Notes:

Opens a file for the requested forms of metadata access. Opening the file at a minimum causes the raw XMP packet to be read from the file. If the file handler supports legacy metadata reconciliation then legacy metadata is also read, unless kOpenOnlyXMP is passed. If the file handler supports native thumbnails and kOpenCacheTNail is passed, the native thumbnail is cached.
If the file is opened for read-only access (passing kOpenForRead), the disk file is closed immediately after reading the data from it; the XMPFiles object, however, remains in the open state. You must call CloseFile() when finished using it. Other methods, such as GetXMP(), can only be used between the OpenFile() and CloseFile() calls. The XMPFiles destructor does not call CloseFile(); if you call it without closing, any pending updates are lost.
If the file is opened for update (passing kOpenForUpdate), the disk file remains open until CloseFile() is called. The disk file is only updated once, when CloseFile() is called, regardless of how many calls are made to PutXMP().
Typically, the XMP is not parsed and legacy reconciliation is not performed until GetXMP() is called, but this is not guaranteed. Specific file handlers might do earlier parsing of the XMP. Delayed parsing and early disk file close for read-only access are optimizations to help clients implementing file browsers, so that they can access the file briefly and possibly display a thumbnail, then postpone more expensive XMP processing until later.

path: The path for the file, appropriate for the local operating system.
format: The format of the file. If the format is unknown (kUnknownFile) the format is determined from the file content. The first handler to check is guessed from the file's extension. Passing a specific format value is generally just a hint about what file handler to try first (instead of the one based on the extension). If kOpenStrictly is set, then any format other than kUnknownFile requires that the file actually be that format; otherwise an exception is thrown.
openFlags: A set of option flags that describe the desired access. By default (zero) the file is opened for read-only access and the format handler decides on the level of reconciliation that will be performed. A logical OR of these bit-flag constants:

- kOpenForRead - Open for read-only access.
- kOpenForUpdate - Open for reading and writing.

- kOpenOnlyXMP - Only the XMP is wanted, no reconciliation.
- kOpenCacheTNail - Cache thumbnail if possible, GetThumbnail will be called.
- kOpenStrictly - Be strict about locating XMP and reconciling with other forms. By default, a best effort is made to locate the correct XMP and to reconcile XMP with other forms (if reconciliation is done). This option forces stricter rules, resulting in exceptions for errors. The definition of strictness is specific to each handler, there might be no difference.
- kOpenUseSmartHandler - Require the use of a smart handler.
- kOpenUsePacketScanning - Force packet scanning, do not use a smart handler.

Throws an exception for serious problems.

- 195.4.9 Constructor 22779
- 195.4.11 Constructor(path as string, format as Integer=& h20202020, OpenFlags as Integer=0) 22781

195.4.11 Constructor(path as string, format as Integer=& h20202020, OpenFlags as Integer=0)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Alternate constructor associates the new XMPFiles object with a specific file.
Notes:

Calls OpenFile() to open the specified file after performing a default construct.

path: The path for the file, specified as an UTF-8 string. (On MacOSX use UnixpathMBS)
format: A format hint for the file, if known.
openFlags: Options for how the file is to be opened (for read or read/write, for example). Use a logical OR of these bit-flag constants:

- kOpenForRead
- kOpenForUpdate
- kOpenOnlyXMP
- kOpenCacheTNail
- kOpenStrictly
- kOpenUseSmartHandler
- kOpenUsePacketScanning
- kOpenLimitedScanning

- kOpenInBackground

The destructor does not call CloseFile(); pending updates are lost when the destructor is run.
See also:

- 195.4.9 Constructor 22779
- 195.4.10 Constructor(path as folderitem, format as Integer=& h20202020, OpenFlags as Integer=0) 22780

195.4.12 GetFileInfo(byref path as string, byref openFlags as UInt32, byref format as UInt32, byref handlerFlags as UInt32) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetFileInfo() retrieves basic information about an opened file.
Notes:

path: A buffer in which to return the path passed to OpenFile(). Can be
null if value is not wanted.

openFlags: A variable in which to return the option flags passed to
OpenFile.
format: A variable in which to return the file format.
handlerFlags: [out] A variable in which to return the handler's capability flags.

Returns true if the file object is in the open state; that is, OpenFile() has been called but CloseFile() has not. False otherwise. Even if the file object is open, the actual disk file might be closed in the host file-system sense; see OpenFile().

195.4.13 GetFormatInfo(format as Integer, byref handlerFlags as UInt32) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetFormatInfo() reports what features are supported for a specific file format.
Example:

```
dim flags as UInt32
if XMPFilesMBS.GetFormatInfo(XMPFilesMBS.kJPEGFile, flags) then

if BitwiseAnd(flags, XMPFilesMBS.kCanInjectXMP) <>0 then
MsgBox "Can inject first-time XMP into an existing file."
end if

if BitwiseAnd(flags, XMPFilesMBS.kCanExpand) <>0 then
```

```
MsgBox "Can expand XMP or other metadata in an existing file."
end if

if BitwiseAnd(flags, XMPFilesMBS.kCanRewrite) <>0 then
MsgBox "Can copy one file to another, writing new metadata (as in SaveAs)."
end if

if BitwiseAnd(flags, XMPFilesMBS.kCanReconcile) <>0 then
MsgBox "Supports reconciliation between XMP and other forms."
end if

if BitwiseAnd(flags, XMPFilesMBS.kAllowsOnlyXMP) <>0 then
MsgBox "Allows access to just the XMP, ignoring other forms."
end if

if BitwiseAnd(flags, XMPFilesMBS.kReturnsTNail) <>0 then
MsgBox "File handler returns native thumbnail information."
end if

if BitwiseAnd(flags, XMPFilesMBS.kReturnsRawPacket) <>0 then
MsgBox "File handler returns raw XMP packet information and string."
end if

end if
```

Notes:

The file handlers for different file formats vary considerably in what features they support. Support depends on both the general capabilities of the format and the implementation of the handler for that format.

format: The file format whose support flags are desired.
handlerFlags: A variable in which to return a logical OR of option bit flags.
The following constants are defined:

- kCanInjectXMP - Can inject first-time XMP into an existing file.
- kCanExpand - Can expand XMP or other metadata in an existing file.
- kCanRewrite - Can copy one file to another, writing new metadata (as in SaveAs)
- kCanReconcile - Supports reconciliation between XMP and other forms.
- kAllowsOnlyXMP - Allows access to just the XMP, ignoring other forms.

This is only meaningful if kCanReconcile is set.

- kReturnsTNail - File handler returns native thumbnail information.
- kReturnsRawPacket - File handler returns raw XMP packet information and string.

Even if kReturnsRawPacket is set, the returned packet information might have an
offset of -1 to indicate an unknown offset. While all file handlers should be able to return the raw packet, some might not know the offset of the packet within the file. This is typical in cases where external libraries are used. These cases might not even allow return of the raw packet.

Returns true if the format has explicit "smart" support, false if the format is handled by the default packet scanning plus heuristics.

195.4.14 GetVersionInfo as XMPVersionInfoMBS

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetVersionInfo() retrieves version information for the XMPFiles component.

195.4.15 GetXMP(byref xmp as XMPMetaMBS, byref xmppacket as string, byref PacketInfo as XMPPacketInfoMBS) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetXMP() retrieves the XMP metadata from an open file.
Notes:

The function reports whether XMP is present in the file; you can choose to retrieve any or all of the parsed XMP, the raw XMP packet, or information about the raw XMP packet. The options provided when the file was opened determine if reconciliation is done with other forms of metadata.

xmp: An XMP object in which to return the parsed XMP metadata.
xmppacket: An string in which to return the raw XMP packet as stored in
the file. The encoding of the packet is given in the packetInfo. Returns an
empty string if the low level file handler does not provide the raw packet.
packetInfo: A packetinfo object in which to return the location and form of the raw XMP in the file. PacketInfo.charForm and PacketInfo.writeable reflect the
raw XMP in the file. The parsed XMP property values are always UTF-8. The writeable flag is taken from the packet trailer; it applies only to "format ignorant" writing. The PacketInfo object always reflects the state of the XMP in the file. The offset, length, and character form do not change as a result of calling PutXMP() unless the file is also written. Some file handlers might not return location or contents of the raw packet string. To determine whether one does, check the kReturnsRawPacket bit returned by GetFormatInfo(). If the low-level file handler does not provide the raw packet location, PacketInfo.offset and PacketInfo.length are both 0, PacketInfo.charForm is UTF-8, and PacketInfo.writeable is false.

195.4.16 OpenFile(path as folderitem, format as Integer=& h20202020, OpenFlags as Integer=0) as boolean

MBS XMP Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Alternate constructor associates the new XMPFiles object with a specific file.
Notes:

Calls OpenFile() to open the specified file after performing a default construct.

path: The path for the file, specified as folderitem.
format: A format hint for the file, if known.
openFlags: Options for how the file is to be opened (for read or read/write, for example). Use a logical OR of these bit-flag constants:

- kOpenForRead
- kOpenForUpdate
- kOpenOnlyXMP
- kOpenCacheTNail
- kOpenStrictly
- kOpenUseSmartHandler
- kOpenUsePacketScanning
- kOpenLimitedScanning
- kOpenInBackground

The destructor does not call CloseFile(); pending updates are lost when the destructor is run.
See also:

- 195.4.17 OpenFile(path as string, format as Integer=& h20202020, OpenFlags as Integer=0) as boolean 22785

195.4.17 OpenFile(path as string, format as Integer=& h20202020, OpenFlags as Integer=0) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Opens a file for metadata access.
Notes:

Opens a file for the requested forms of metadata access. Opening the file at a minimum causes the raw XMP packet to be read from the file. If the file handler supports legacy metadata reconciliation then legacy

metadata is also read, unless kOpenOnlyXMP is passed. If the file handler supports native thumbnails and kOpenCacheTNail is passed, the native thumbnail is cached.
If the file is opened for read-only access (passing kOpenForRead), the disk file is closed immediately after reading the data from it; the XMPFiles object, however, remains in the open state. You must call CloseFile() when finished using it. Other methods, such as GetXMP(), can only be used between the OpenFile() and CloseFile() calls. The XMPFiles destructor does not call CloseFile(); if you call it without closing, any pending updates are lost.
If the file is opened for update (passing kOpenForUpdate), the disk file remains open until CloseFile() is called. The disk file is only updated once, when CloseFile() is called, regardless of how many calls are made to PutXMP().
Typically, the XMP is not parsed and legacy reconciliation is not performed until GetXMP() is called, but this is not guaranteed. Specific file handlers might do earlier parsing of the XMP. Delayed parsing and early disk file close for read-only access are optimizations to help clients implementing file browsers, so that they can access the file briefly and possibly display a thumbnail, then postpone more expensive XMP processing until later.

path: The path for the file, specified as an UTF-8 string. (On MacOSX use UnixpathMBS)
format: The format of the file. If the format is unknown (kUnknownFile) the format is determined from the file content. The first handler to check is guessed from the file's extension. Passing a specific format value is generally just a hint about what file handler to try first (instead of the one based on the extension). If kOpenStrictly is set, then any format other than kUnknownFile requires that the file actually be that format; otherwise an exception is thrown.
openFlags: A set of option flags that describe the desired access. By default (zero) the file is opened for read-only access and the format handler decides on the level of reconciliation that will be performed. A logical OR of these bit-flag constants:

- kOpenForRead - Open for read-only access.
- kOpenForUpdate - Open for reading and writing.
- kOpenOnlyXMP - Only the XMP is wanted, no reconciliation.
- kOpenCacheTNail - Cache thumbnail if possible, GetThumbnail will be called.
- kOpenStrictly - Be strict about locating XMP and reconciling with other forms. By default, a best effort is made to locate the correct XMP and to reconcile XMP with other forms (if reconciliation is done). This option forces stricter rules, resulting in exceptions for errors. The definition of strictness is specific to each handler, there might be no difference.
- kOpenUseSmartHandler - Require the use of a smart handler.
- kOpenUsePacketScanning - Force packet scanning, do not use a smart handler.

Returns true if the file is succesfully opened and attached to a file handler. False for anticipated problems, such as passing kOpenUseSmartHandler but not having an appropriate smart handler. Throws an exception for serious problems.

195.4.18 PutXMP(xmpPacket as string)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** PutXMP() updates the XMP metadata in this object without writing out the file,
Notes: Overloads the basic form of the function, allowing you to pass the metadata as a string object instead of an XMP object. It is otherwise identical; see details in the canonical form.
See also:

- 195.4.19 PutXMP(xmpPacket as XMPMetaMBS) 22787

195.4.19 PutXMP(xmpPacket as XMPMetaMBS)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** PutXMP() updates the XMP metadata in this object without writing out the file.
Notes: This function supplies new XMP for the file. However, the disk file is not written until the object is closed with CloseFile(). The options provided when the file was opened determine if reconciliation is done with other forms of metadata.
See also:

- 195.4.18 PutXMP(xmpPacket as string) 22787

195.4.20 Events

195.4.21 Abort as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This event is called periodically to allow a user to cancel time-consuming operations.
Notes:

The event should return true to signal an abort, which results in an
exception being thrown.

195.4.22 Constants

195.4.23 kAEFilterPresetFile = & h46465820

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

195.4.24 kAEProjectFile = & h41455020

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

195.4.63 kMPEGFile = & h4D504547

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

195.4.64 kNeedsReadOnlyPacket = & h00000400

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for GetFormatInfo
Notes: The file format needs the XMP packet to be read-only.

195.4.65 kNoOptions = 0

MBS XMP Plugin, Plugin Version: 9.4. **Function:** The constant to specify to use no options.

195.4.66 kOpenCacheTNail = 8

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for OpenFile().
Notes: Cache thumbnail if possible, TXMPFiles::GetThumbnail() will be called.

195.4.67 kOpenForRead = 1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for OpenFile().
Notes: Open for read-only access.

195.4.68 kOpenForUpdate = 2

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for OpenFile().
Notes: Open for reading and writing.

195.4.69 kOpenInBackground = & h10000000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for OpenFile().
Notes: Set if calling from background thread.

195.4.70 kOpenLimitedScanning = & h00000080

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for OpenFile().
Notes: Only packet scan files "known" to need scanning.

195.4.71 kOpenOnlyXMP = 4

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for OpenFile().
Notes: Only the XMP is wanted, allows space/time optimizations.

195.4.72 kOpenRepairFile = & h00000100

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for OpenFile().
Notes: Attempt to repair a file opened for update, default is to not open (throw an exception).

195.4.73 kOpenStrictly = & h00000010

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for OpenFile().
Notes: Be strict about locating XMP and reconciling with other forms.

195.4.74 kOpenUsePacketScanning = & h00000040

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for OpenFile().
Notes: Force packet scanning, do not use a smart handler.

195.4.75 kOpenUseSmartHandler = & h00000020

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for OpenFile().
Notes: Require the use of a smart handler.

195.4.76 kP2File = & h50322020

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
Notes: a collection not really a single file

195.4.77 kPDFFile = & h50444620

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

195.4.78 kPhotoshopFile = & h50534420

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

195.4.79 kPNGFile = & h504E4720

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

195.4.80 kPostScriptFile = & h50532020

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
Notes: general PostScript following DSC conventions

195.4.81 kPrefersInPlace = 8

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for GetFormatInfo
Notes: Can expand, but prefers in-place update.

195.4.82 kPremiereProjectFile = & h5052504A

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

195.4.83 kPremiereTitleFile = & h5052544C

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

195.4.84 kReturnsRawPacket = & h00000040

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for GetFormatInfo
Notes: File handler returns raw XMP packet information.

195.4.85 kReturnsTNail = & h00000080

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for GetFormatInfo
Notes: File handler returns native thumbnail.

195.4.86 kSESFile = & h53455320

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
Notes: Audition session

195.4.87 kSonyHDVFile = & h53484456

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
Notes: a collection not really a single file

195.4.88 kSWFFile = & h53574620

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

195.4.89 kTextFile = & h74657874

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

195.4.90 kTIFFFile = & h54494646

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

195.4.91 kUCFFile = & h55434620

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
Notes: Universal Container Format

195.4.92 kUnknownFile = & h20202020

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
Notes: Unknown file format constant

195.4.93 kUnknownLength = -1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** Constant for an unknown packet length within a file.

195.4.94 kUnknownOffset = -1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** Constant for an unknown packet offset within a file.

195.4.95 kUpdateSafely = 1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for CloseFile().

Notes: Write into a temporary file and swap for crash safety.

195.4.96 kUseNullTermination = 0

MBS XMP Plugin, Plugin Version: 9.4. **Function:** The length constants for a string to determinate the length automatically.

195.4.97 kUsesSidecarXMP = & h00000800

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for GetFormatInfo
Notes: The file handler uses a "sidecar" file for the XMP.

195.4.98 kWAVFile = & h57415620

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

195.4.99 kWMAVFile = & h574D4156

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
Notes: Windows Media Audio and Video

195.4.100 kXDCAM_EXFile = & h58444358

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
Notes: a collection not really a single file

195.4.101 kXDCAM_FAMFile = & h58444346

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
Notes: a collection not really a single file

195.4.102 kXDCAM_SAMFile = & h58444353

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
Notes: a collection not really a single file

195.4.103 kXMLFile = & h584D4C20

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

195.5 class XMPIteratorMBS

195.5.1 class XMPIteratorMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The XMPIteratorMBS class provides a uniform means to iterate over several XMP data structures, including the schema and properties within an XMP object plus global tables such as registered namespaces.
Notes:

Note: Only XMP object iteration is implemented at this time. There are no table iterators yet.

Iteration over the schema and properties within an XMP object is the most important and complex use of XMPIteratorMBS. It is helpful to have a thorough understanding of the XMP data tree. One way to learn this is to create some complex XMP and examine the output of XMPMetaMBS.DumpObject. This is also described in the XMP Specification, in the XMP Data Model chapter.
The top of the XMP data tree is a single root node. This does not explicitly appear in the dump and is never visited by an iterator (that is, it is never returned from XMPIteratorMBS.Next). Beneath the root are schema nodes. These are just collectors for top level properties in the same namespace. They are created and destroyed implicitly. Beneath the schema nodes are the property nodes. The nodes below a property node depend on its type (simple, struct, or array) and whether it has qualifiers.

A XMPIteratorMBS constructor defines a starting point for the iteration and options that control how it proceeds. By default the iteration starts at the root and visits all nodes beneath it in a depth first manner. The root node is not visited, the first visited node is a schema node. You can provide a schema name or property path to select a different starting node. By default this visits the named root node first then all nodes beneath it in a depth first manner.

The XMPIteratorMBS.Next method delivers the schema URI, path, and option flags for the node being visited. If the node is simple it also delivers the value. Qualifiers for this node are visited next. The fields of a struct or items of an array are visited after the qualifiers of the parent.

The options to control the iteration are:

kXMP_IterJustChildren	Visit just the immediate children of the root. Skip the root itself and all nodes below the immediate children. This omits the qualifiers of the immediate children, the qualifier nodes being below what they qualify.
kXMP_IterJustLeafNodes	Visit just the leaf property nodes and their qualifiers.
kXMP_IterJustLeafName	Return just the leaf component of the node names. The default is to return the full path name.
kXMP_IterIncludeAliases	Include aliases as part of the iteration. Since aliases are not actual nodes the default iteration does not visit them.
kXMP_IterOmitQualifiers	Do not visit the qualifiers of a node.

195.5.2 Methods

195.5.3 Constructor

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Empty constructor which does nothing.
See also:

- 195.5.4 Constructor(meta as XMPMetaMBS, options as Integer=0) 22801
- 195.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0) 22802
- 195.5.6 Constructor(meta as XMPMetaMBS, schemaNS as string, propName as string, options as Integer=0) 22802
- 195.5.7 Constructor(schemaNS as string, propName as string, options as Integer) 22803

195.5.4 Constructor(meta as XMPMetaMBS, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Construct an iterator for the global tables of the XMP toolkit.
Notes:

options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= & h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= & h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= & h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= & h1000	Omit all qualifiers.

Note: Not yet implemented in the XMP SDK.
See also:

- 195.5.3 Constructor 22801
- 195.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0) 22802

- 195.5.7 Constructor(schemaNS as string, propName as string, options as Integer) 22803

195.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Construct an iterator for the global tables of the XMP toolkit.
Notes:

schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= & h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= & h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= & h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= & h1000	Omit all qualifiers.

Note: Not yet implemented in the XMP SDK.
See also:

- 195.5.7 Constructor(schemaNS as string, propName as string, options as Integer) 22803

195.5.6 Constructor(meta as XMPMetaMBS, schemaNS as string, propName as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Construct an iterator for the global tables of the XMP toolkit.
Notes:

schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
propName: Optional property name to restrict the iteration. May be an arbitrary path expression. Omitted (visit all properties) by passing "". If not empty a schema URI must also be provided.
options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= & h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= & h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= & h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= & h1000	Omit all qualifiers.

Note: Not yet implemented in the XMP SDK.
See also:

- 195.5.3 Constructor 22801
- 195.5.4 Constructor(meta as XMPMetaMBS, options as Integer=0) 22801
- 195.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0) 22802
- 195.5.7 Constructor(schemaNS as string, propName as string, options as Integer) 22803

195.5.7 Constructor(schemaNS as string, propName as string, options as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Construct an iterator for the properties within an XMP object.
Notes:

On success handle is not 0.

schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
propName: Optional property name to restrict the iteration. May be an arbitrary path expression. Omitted (visit all properties) by passing "". If not empty a schema URI must also be provided.
options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= & h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= & h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= & h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= & h1000	Omit all qualifiers.

- 195.5.6 Constructor(meta as XMPMetaMBS, schemaNS as string, propName as string, options as Integer=0) 22802

195.5.8 NextItem() as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Visit the next node in the iteration.
See also:

- 195.5.9 NextItem(byref schemaNS as string) as boolean 22804
- 195.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 22805
- 195.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean 22805
- 195.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 22806

195.5.9 NextItem(byref schemaNS as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Visit the next node in the iteration.
Notes:

Parameters:

schemaNS	A string that is assigned the schema namespace URI of the current property.
propPath	A string that is assigned the XPath name of the current property.
propValue	A string that is assigned the value of the current property.
options	An integer that is assigned the flags describing the current property.

See also:

- 195.5.8 NextItem() as boolean 22804
- 195.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 22805
- 195.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean 22805
- 195.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 22806

195.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Visit the next node in the iteration.
Notes:

Parameters:

schemaNS	A string that is assigned the schema namespace URI of the current property.
propPath	A string that is assigned the XPath name of the current property.

See also:

- 195.5.8 NextItem() as boolean 22804
- 195.5.9 NextItem(byref schemaNS as string) as boolean 22804
- 195.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean 22805
- 195.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 22806

195.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Visit the next node in the iteration.
Notes:

Parameters:

schemaNS	A string that is assigned the schema namespace URI of the current property.
propPath	A string that is assigned the XPath name of the current property.
propValue	A string that is assigned the value of the current property.

See also:

- 195.5.8 NextItem() as boolean 22804
- 195.5.9 NextItem(byref schemaNS as string) as boolean 22804
- 195.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 22805

- 195.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 22806

195.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Visit the next node in the iteration.
Notes:

Parameters:

schemaNS	A string that is assigned the schema namespace URI of the current property.
propPath	A string that is assigned the XPath name of the current property.
propValue	A string that is assigned the value of the current property.
options	An integer that is assigned the flags describing the current property.

See also:

- 195.5.8 NextItem() as boolean 22804
- 195.5.9 NextItem(byref schemaNS as string) as boolean 22804
- 195.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 22805
- 195.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean 22805

195.5.13 Skip(options as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Skip some portion of the remaining iterations.
Notes:

The available option flags are:

kXMP_IterSkipSubtree	= 1	Skip the subtree below the current node.
kXMP_IterSkipSiblings	= 2	Skip the subtree below and remaining siblings of the current node.

195.6 class XMPMetaMBS

195.6.1 class XMPMetaMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The main class for the Adobe XMP SDK.

195.6.2 Blog Entries

- Tip of the day: Change EXIF metadata
- MBS Real Studio Plugins, version 12.5pr2

195.6.3 Methods

195.6.4 AppendArrayItem(schemaNS as string, arrayName as string, arrayOptions as Integer, itemValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Appends an item to an array.
Notes:

AppendArrayItem simplifies construction of an array by not requiring that you pre-create an empty array. The array that is assigned is created automatically if it does not yet exist. Each call to AppendArrayItem appends an item to the array. The corresponding parameters have the same use as SetArrayItem. The arrayOptions parameter is used to specify what kind of array. If the array exists, it must have the specified form.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not be null or the empty string. Has the same namespace prefix usage as propPath in GetProperty.
arrayOptions	Option flags describing the array form. The only valid bits are those that are part of kXMP_PropArrayFormMask: kXMP_PropValueIsArray (& h200), kXMP_PropArrayIsOrdered (& h400), kXMP_PropArrayIsAlternate (& h800), or kXMP_PropArrayIsAltText (& h1000).
itemValue	An UTF-8 string that is the value of the array item, if the array item has a value. Has the same usage as propValue in GetProperty.
itemOptions	Option flags describing the item.

195.6.5 ApplyTemplate(WorkingXMP as XMPMetaMBS, template as XMPMetaMBS, actions as Integer)

MBS XMP Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Applies an xmp template.

195.6.6 CatenateArrayItems(schemaNS as string, arrayName as string, separator as string, quotes as string, options as Integer) as string

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create a single edit string from an array of strings.
Notes:

xmpObj	The XMP object containing the array to be catenated.
schemaNS	The schema namespace URI for the array. Must not be an empty string.
arrayName	The name of the array. May be a general path expression, must not be an empty string. Each item in the array must be a simple string value.
separator	The string to be used to separate the items in the catenated string. Defaults to "; ", ASCII semicolon and space (U+003B, U+0020).
quotes	The characters to be used as quotes around array items that contain a separator. Defaults to '"', ASCII quote (U+0022).
options	Option flags to control the catenation.

returns the string with the catenated array items.

195.6.7 Clone as XMPMetaMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a copy of the XMPMeta Object.
Notes:

Deep copy, not just a new reference.
Returns nil on any error.

195.6.8 ComposeArrayItemPath(schemaNS as string, arrayName as string, itemIndex as Integer) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compose the path expression for an item in an array.
Notes:

schemaNS	The namespace URI for the array. Must not be null or the empty string.
arrayName	The name of the array. May be a general path expression, must not be an empty string.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem always refers to the last existing array item.

Returns the composed path. This will be of the form <tt>ns:arrayName [i] </tt>, where "ns" is the prefix for schemaNS and "i" is the decimal representation of itemIndex. If the value of itemIndex is kXMP_ArrayLastItem, the path is <tt>ns:arrayName [last()] </tt>.

195.6.9 ComposeFieldSelector(schemaNS as string, arrayName as string, fieldNS as string, fieldName as string, fieldValue as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compose the path expression to select an alternate item by a field's value.
Notes:

The path syntax allows two forms of "content addressing" that may be used to select an item in an array of alternatives. The form used in ComposeFieldSelector lets you select an item in an array of structs based on the value of one of the fields in the structs. The other form of content addressing is shown in ComposeLangSelector.

For example, consider a simple struct that has two fields, the name of a city and the URI of an FTP site in that city. Use this to create an array of download alternatives. You can show the user a popup built from the values of the city fields. You can then get the corresponding URI as follows:

path=ComposeFieldSelector (schemaNS, "Downloads", fieldNS, "City", chosenCity)
exists = GetStructField (schemaNS, path, fieldNS, "URI", uri)

schemaNS	The namespace URI for the array. Must not be null or the empty string.
arrayName	The name of the array. May be a general path expression, must not be an empty string.
fieldNS	The namespace URI for the field used as the selector. Must not be an empty string.
fieldName	The name of the field used as the selector. Must be a simple XML name, must not be an empty string. It must be the name of a field that is itself simple.
fieldValue	The desired value of the field.

Returns the string with the composed path. This will be of the form <tt>ns:arrayName [fNS:fieldName='fieldValue'] </tt>, where "ns" is the prefix for schemaNS and "fNS" is the prefix for fieldNS.

195.6.10 ComposeLangSelector(schemaNS as string, arrayName as string, langName as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compose the path expression to select an alternate item by language.
Notes:

The path syntax allows two forms of "content addressing" that may be used to select an item in an array of alternatives. The form used in ComposeLangSelector lets you select an item in an alt-text array based on the value of its <tt>xml:lang</tt>qualifier. The other form of content addressing is shown in ComposeFieldSelector.

ComposeLangSelector does not supplant SetLocalizedText or GetLocalizedText.
They should generally be used, as they provide extra logic to choose the appropriate language and maintain consistency with the 'x-default' value. ComposeLangSelector gives you an path expression that is explicitly and only for the language given in the langName parameter.

schemaNS	The namespace URI for the array. Must not be null or the empty string.
arrayName	The name of the array. May be a general path expression, must not be an empty string.
langName	The RFC 3066 code for the desired language.

Returns the composed path. This will be of the form <tt>ns:arrayName [\@xml:lang='langName'] </tt>, where "ns" is the prefix for schemaNS.

195.6.11 ComposeQualifierPath(schemaNS as string, structName as string, qualNS as string, qualName as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compose the path expression for a qualifier.
Notes:

schemaNS The namespace URI for the property to which the qualifier is attached. Must not be an empty string.
propName The name of the property to which the qualifier is attached. May be a general path expression, must not be an empty string.
qualNS The namespace URI for the qualifier. May be an empty string if the qualifier is in the XML empty namespace.
qualName The name of the qualifier. Must be a simple XML name, must not be an empty string.
Returns the composed path. This will be of the form <tt>ns:propName/?qNS:qualName</tt>, where "ns"

is the prefix for schemaNS and "qNS" is the prefix for qualNS.

195.6.12 ComposeStructFieldPath(schemaNS as string, structName as string, fieldNS as string, fieldName as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compose the path expression for a field in a struct.
Notes:

schemaNS	The namespace URI for the struct. Must not be null or the empty string.
structName	The name of the struct. May be a general path expression, must not be an empty string.
fieldNS	The namespace URI for the field. Must not be an empty string.
fieldName	The name of the field. Must be a simple XML name, must not be an empty string.

Returns the composed path. This will be of the form <tt>ns:structName/fNS:fieldName</tt>, where "ns" is the prefix for schemaNS and "fNS" is the prefix for fieldNS.

195.6.13 Constructor

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Default constructor, creates an empty object.
See also:

- 195.6.14 Constructor(data as memoryblock, Offset as Integer, Size as Integer) 22811
- 195.6.15 Constructor(data as string) 22812

195.6.14 Constructor(data as memoryblock, Offset as Integer, Size as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Construct an object and parse one buffer of RDF into it.
Notes: This constructor creates a new TXMPMeta object and populates it with metadata from a buffer containing serialized RDF. This buffer must be a complete RDF parse stream. Pass "" to construct an empty XMPMetaMBS object. The result of an actual parse is identical to creating an empty object then calling XMPMetaMBS.ParseFromBuffer. The RDF must be complete. If you need to parse with multiple buffers, create an empty object and use XMPMetaMBS.ParseFromBuffer.
See also:

- 195.6.13 Constructor 22811

- 195.6.15 Constructor(data as string) 22812

195.6.15 Constructor(data as string)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Construct an object and parse one buffer of RDF into it.
Notes: This constructor creates a new TXMPMeta object and populates it with metadata from a buffer containing serialized RDF. This buffer must be a complete RDF parse stream. Pass "" to construct an empty XMPMetaMBS object. The result of an actual parse is identical to creating an empty object then calling XMPMetaMBS.ParseFromBuffer. The RDF must be complete. If you need to parse with multiple buffers, create an empty object and use XMPMetaMBS.ParseFromBuffer.

- 195.6.13 Constructor 22811
- 195.6.14 Constructor(data as memoryblock, Offset as Integer, Size as Integer) 22811

195.6.16 ConvertFromBool(value as boolean) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from Boolean to string.

195.6.17 ConvertFromDate(value as XMPDateTimeMBS) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from date/time to string.

195.6.18 ConvertFromFloat(value as Double, format as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from floating point to string.
Notes: format: Optional C sprintf format for the conversion. Defaults to "% f".

195.6.19 ConvertFromInt(value as Integer, format as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from integer to string.
Notes: format: Optional C sprintf format for the conversion. Defaults to "% d".

195.6.20 ConvertFromInt64(value as Int64, format as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from integer to string.
Notes: format: Optional C sprintf format for the conversion. Defaults to "% d".

195.6.21 ConvertToBool(value as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from string to Boolean.

195.6.22 ConvertToDate(value as string) as XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from string to date/time.

195.6.23 ConvertToFloat(value as string) as Double

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from string to floating point.

195.6.24 ConvertToInt(value as string) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from string to integer.

195.6.25 ConvertToInt64(value as string) as Int64

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from string to 64 bit integer.

195.6.26 CountArrayItems(schemaNS as string, arrayName as string) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Counts array items of given array.

Notes: Returns 0 on any error.

195.6.27 CurrentDateTime as XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Current date and time as a XMPDateTimeMBS object.
Notes: Returns nil on any error.

195.6.28 DecodeFromBase64(text as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Decode from Base64 encoded string to raw data.
Example:

```
dim x as XMPMetaMBS
x=new XMPMetaMBS
MsgBox x.DecodeFromBase64("dGVzdA==") // test
```

Notes: This is a global method which does not need a valid handle.

195.6.29 DeleteArrayItem(schemaNS as string, arrayName as string, itemIndex as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** DeleteArrayItem deletes the given XMP subtree rooted at the given array item.
Notes:

It is not an error if the array item does not exist.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not "". Has the same namespace prefix usage as propName in GetProperty.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem (-1) always refers to the last existing array item.

195.6.30 DeleteLocalizedText(schemaNS as string="", altTextName as string="", genericLang as string="", specificLang as string="")

MBS XMP Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Deletes localized text.

195.6.31 DeleteNamespace(namespaceURI as string)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Deletes a namespace from the registry.
Notes:

Not implemented?

Does nothing if the URI is not registered, or if the parameter is null or the empty string.

namespaceURI: The URI for the namespace.

195.6.32 DeleteProperty(schemaNS as string, propName as string)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** DeleteProperty deletes the given XMP subtree rooted at the given property.
Notes:

It is not an error if the property does not exist.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.

195.6.33 DeleteQualifier(schemaNS as string, structName as string, qualNS as string, qualName as string)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** DeleteQualifier deletes the given XMP subtree rooted at the given qualifier.
Notes:

It is not an error if the qualifier does not exist.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
propName	The name of the property to which the qualifier is attached. Has the same usage as in GetProperty.
qualNS	The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName	The name of the qualifier. Must be a single XML name, must not be "" Has the same namespace prefix usage as the propName parameter.

195.6.34 DeleteStructField(schemaNS as string, structName as string, fieldNS as string, fieldName as string)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** DeleteStructField deletes the given XMP subtree rooted at the given struct field.
Notes:

It is not an error if the field does not exist.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
structName	The name of the struct. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
fieldNS	The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName	The name of the field. Must be a single XML name, must not be "". Has the same namespace prefix usage as the structName parameter.

195.6.35 DoesArrayItemExist(schemaNS as string, arrayName as string, itemIndex as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** DoesArrayItemExist tells if the array item exists.
Notes:

Returns true if the array item exists.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem (-1) always refers to the last existing array item.

195.6.36 DoesPropertyExist(schemaNS as string, propName as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** DoesPropertyExist tells if the property exists.
Notes:

Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.

195.6.37 DoesQualifierExist(schemaNS as string, structName as string, qualNS as string, qualName as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** DoesQualifierExist tells if the qualifier exists.
Notes:

Returns true if the qualifier exists.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
propName	The name of the property to which the qualifier is attached. Has the same usage as in GetProperty.
qualNS	The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName	The name of the qualifier. Must be a single XML name, must not be "". Has the same namespace prefix usage as the propName parameter.

195.6.38 DoesStructFieldExist(schemaNS as string, structName as string, fieldNS as string, fieldName as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** DoesStructFieldExist tells if the struct field exists.
Notes:

Returns true if the field exists.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
structName	The name of the struct. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
fieldNS	The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName	The name of the field. Must be a single XML name, must not be "". Has the same namespace prefix usage as the structName parameter.

195.6.39 DumpNamespaces(output as XMPTextOutputMBS) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** DumpNamespaces dumps the list of registered namespace URIs and prefixes.
Notes:

This is a global method which does not need a valid handle.
Returns status code. (0=success and -1=error)

195.6.40 DumpObject(output as XMPTextOutputMBS) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** DumpObject dumps the content of an XMP object.
Notes: Returns status code. (0=success and -1=error)

195.6.41 DuplicateSubtree(dest as XMPMetaMBS, sourceNS as string, sourceRoot as string, destNS as string="", destRoot as string="", options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Replicate a subtree from one XMP object into another, possibly at a different location.
Notes:

Parameters:

self	The source XMP object.
dest	The destination XMP object.
sourceNS	The schema namespace URI for the source subtree.
sourceRoot	The root location for the source subtree. May be a general path expression, must not be null or the empty string.
destNS	The schema namespace URI for the destination. Defaults to the source namespace.
destRoot	The root location for the destination. May be a general path expression. Defaults to the source location.
options	Option flags to control the separation.

195.6.42 EncodeToBase64(text as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from raw data to Base64 encoded string.
Example:

```
dim x as XMPMetaMBS
x=new XMPMetaMBS
MsgBox x.EncodeToBase64("test") // dGVzdA==
```

Notes: This is a global method which does not need a valid handle.

195.6.43 Erase

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Restores the object to a "just constructed" state.

195.6.44 GetArrayItem(schemaNS as string, arrayName as string, itemIndex as Integer, byref itemValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetArrayItem provides access to items within an array.
Notes:

The index is passed as an integer, you need not worry about the path string syntax for array items, convert a loop index to a string, etc.

Returns true if the array item exists.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem (-1) always refers to the last existing array item.
itemValue	A string that is assigned the value of the array item, if the array item has a value. Arrays and non-leaf levels of structs do not have values.
options	An integer variable that is assigned option flags describing the array item.

195.6.45 GetLocalizedText(schemaNS as string, altTextName as string, genericLang as string, specificLang as string, byref actualLang as string, byref itemValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetLocalizedText returns information about a selected item in an alt-text array.
Notes:

The array item is selected according to the rules given above.

Returns true if an appropriate array item exists.

Parameters:

schemaNS	The namespace URI for the alt-text array. Has the same usage as in GetProperty.
altTextName	The name of the alt-text array. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
genericLang	The name of the generic language as an RFC 3066 primary subtag. May be "" if no generic language is wanted.
specificLang	The name of the specific language as an RFC 3066 tag. Must not be null or the empty string.
actualLang	A string that is assigned the language of the selected array item, if an appropriate array item is found.
itemValue	A string that is assigned the value of the array item, if an appropriate array item is found.
options	An integer variable that is assigned option flags describing the array item.

195.6.46 GetNamespacePrefix(namespaceURI as string, byref namespacePrefix as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Obtain the prefix for a registered namespace URI.
Notes:

It is not an error if the namespace URI is not registered. The output namespacePrefix string is "" if the namespace URI is not registered.

Parameters:

namespaceURI	The URI for the namespace. Must not be null or the empty string.
namespacePrefix	Returns the prefix registered for this URI, with a terminating ':'.

Returns true if the namespace URI is registered.

This is a global method which does not need a valid handle.

195.6.47 GetNamespaceURI(namespacePrefix as string, byref namespaceURI as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Obtain the URI for a registered namespace prefix.
Notes:

It is not an error if the namespace prefix is not registered. The output namespaceURI string is "" if the namespace prefix is not registered.

Parameters:

namespacePrefix	The prefix for the namespace. Must not be "".
namespaceURI	Returns the URI registered for this prefix.

Returns true if the namespace prefix is registered.

This is a global method which does not need a valid handle.

195.6.48 GetProperty(schemaNS as string, propName as string, byref propValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetProperty is the simplest property getter, mainly for top level simple properties or after using the path composition functions.
Notes:

Returns true if the property exists.

Parameters:

195.6.49 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean) as boolean

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetPropertyBoolean returns the value of a Boolean property as a boolean.
Notes:

Returns true if the property exists.

schemaNS	The namespace URI for the property. May be an empty string if the first component of the propName path contains a namespace prefix. The URI must be for a registered namespace.
propName	The name of the property. May be a general path expression, must not be an empty string. Using a namespace prefix on the first component is optional. If present without a schemaNS value then the prefix specifies the namespace. The prefix must be for a registered namespace. If both a schemaNS URI and propName prefix are present, they must be corresponding parts of a registered namespace.
propValue	A string that is assigned the value of the property, if the property has a value. Arrays and non-leaf levels of structs do not have values.
options	An integer variable that is assigned option flags describing the property.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A boolean variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 195.6.50 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean, byref options as Integer) as boolean 22823

195.6.50 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetPropertyBoolean returns the value of a Boolean property as a boolean.
Notes:

Returns true if the property exists.

Parameters:

See also:

- 195.6.49 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean)

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A boolean variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

as boolean 22822

195.6.51 GetPropertyDate(schemaNS as string, propName as string, byref propValue as XMPDateTimeMBS, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetProperty_Date returns the value of a date/time property as an XMPDateTimeMBS object.
Notes:

Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A XMPDateTimeMBS variable that is assigned the value of the property.
options	An integer variable that is assigned option flags describing the property.

195.6.52 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double) as boolean

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetPropertyFloat returns the value of a flaoting point property as a double value.
Notes:

Returns true if the property exists.

Parameters:

See also:

- 195.6.53 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double, byref options as Integer) as boolean 22825

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A double variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

195.6.53 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetPropertyFloat returns the value of a flaoting point property as a double value.
Notes:

Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A double variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 195.6.52 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double) as boolean 22824

195.6.54 GetPropertyInt64Double(schemaNS as string, propName as string, byref propValue as Double, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetPropertyInt64Double returns the value of a 64 bit integer property as a double value.
Notes:

Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A double variable that is assigned the value of the property.
options	An integer variable that is assigned option flags describing the property.

195.6.55 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer) as boolean

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetPropertyInteger returns the value of an integer property as an integer.
Notes:

Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	An integer variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 195.6.56 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer, byref options as Integer) as boolean 22826

195.6.56 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetPropertyInteger returns the value of an integer property as an integer.
Notes:

Returns true if the property exists.

Parameters:

See also:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	An integer variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

- 195.6.55 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer) as boolean 22826

195.6.57 GetPropertyInteger64(schemaNS as string, propName as string, byref propValue as Int64, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieves the value of an integer property as an Int64.
Notes:

Reports whether a property exists, and retrieves its binary value and property type information.

schemaNS: The namespace URI; see GetProperty().
propName: The name of the property. Can be a general path expression, must not be empty string; see GetProperty() for namespace prefix usage.

propValue: A variable in which to return the binary value.

options: A variable in which to return the option flags describing the property, a logical OR of allowed bit-flag constants; see kPropValueIsStruct and following.

Returns true if the property exists.

195.6.58 GetQualifier(schemaNS as string, propName as string, qualNS as string, qualName as string, byref qualValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetQualifier provides access to a qualifier attached to a property.
Notes:

The namespace for the qualifier is passed as a URI, you need not worry about the path string syntax. In many regards qualifiers are like struct fields.

The names of qualifiers should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix. This is unreliable since the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Note: Qualifiers are only supported for simple leaf properties at this time. (in the XMP SDK)

Returns true if the qualifier exists.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
propName	The name of the property to which the qualifier is attached. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as in GetProperty.
qualNS	The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName	The name of the qualifier. Must be a single XML name, must not be an empty string. Has the same namespace prefix usage as the propName parameter.
qualValue	A string variable that is assigned the value of the qualifier, if the qualifier has a value. Arrays and non-leaf levels of structs do not have values.
options	An integer variable that is assigned option flags describing the qualifier.

195.6.59 GetStructField(schemaNS as string, structName as string, fieldNS as string, fieldName as string, byref itemValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetStructField provides access to fields within a nested structure.
Notes:

The namespace for the field is passed as a URI, you need not worry about the path string syntax.

The names of fields should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix. This is unreliable since the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Returns true if the field exists.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
structName	The name of the struct. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
fieldNS	The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName	The name of the field. Must be a single XML name, must not be an empty string. Has the same namespace prefix usage as the structName parameter.
fieldValue	An string variable that is assigned the value of the field, if the field has a value. Arrays and non-leaf levels of structs do not have values.
options	An integer variable that is assigned option flags describing the field. May be null if the flags are not wanted.

195.6.60 GetVersionInfo as XMPVersionInfoMBS

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieves runtime version information.

195.6.61 Iterator(schemaNS as string, propName as string, options as Integer) as XMPIteratorMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates an iterator for the properties within an XMP object.
Notes:

Returns nil on failure.

schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
propName: Optional property name to restrict the iteration. May be an arbitrary path expression. Omitted (visit all properties) by passing "". If not empty a schema URI must also be provided.
options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= & h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= & h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= & h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= & h1000	Omit all qualifiers.

195.6.62 MergeFromJPEG(extendedXMP as XMPMetaMBS)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** merges standard and extended XMP retrieved from a JPEG file.
Notes:

When an extended partition stores properties that do not fit into the JPEG file limitationof 64K bytes, this function integrates those properties back into the same XMP object with those from the standard XMP packet.

self: An XMP object which the caller has initialized from the standard XMP packet in a JPEG file. The extended XMP is added to this object.

extendedXMP: An XMP object which the caller has initialized from the extended XMP packet in a JPEG file.

195.6.63 PackageForJPEG(byref standardXMP as string, byref extendedXMP as string, byref extendedDigest as string)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** creates XMP serializations appropriate for a JPEG file.
Notes:

The standard XMP in a JPEG file is limited to 64K bytes. This function serializes the XMP metadata in an XMP object into a string of RDF (see \c SerializeToBuffer) the data does not fit into the 64K byte limit, it creates a second packet string with the extended data.

self: The XMP object containing the metadata.
standardXMP: A string object in which to return the full standard XMP packet.

extendedXMP: A string object in which to return the serialized extended XMP, empty if not needed.

extendedDigest: A string object in which to return an MD5 digest of the serialized extended XMP, empty if not needed.

195.6.64 ParseFromBuffer(buffer as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** ParseFromBuffer parses RDF from a series of input buffers.
Notes:

The buffers may be any length. The buffer boundaries need not respect XML tokens or even Unicode characters.

Parameters:

buffer	Input data buffer. Termination of an input loop is convenient by passing kXMP_ParseMoreBuffers (2) for all real input, then having a final call with a zero length and kXMP_NoOptions.
options	Options controlling the parsing.

The available options are:

kXMP_ParseMoreBuffers	= 2	This is not the last buffer of input, more calls follow.
kXMP_RequireXMPMeta	= 1	The x:xmpmeta XML element is required around rdf:RDF.
kXMP_StrictAliasing	= 4	Do not reconcile alias differences, throw an exception.

Note: The kXMP_StrictAliasing option is not yet implemented.

195.6.65 RegisterNamespace(namespaceURI as string, suggestedPrefix as string, byref registeredPrefix as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Register a namespace URI with a suggested prefix.
Example:

```
dim x as new XMPMetaMBS
dim registeredPrefix as string

call x.RegisterNamespace ("xwnv", "xwnv", registeredPrefix)

x.SetProperty "xwnv","MZSTID","test"

MsgBox x.SerializeToBuffer
```

Notes:

It is not an error if the URI is already registered, no matter what the prefix is. If the URI is not registered but the suggested prefix is in use, a unique prefix is created from the suggested one. The actual registeed prefix is always returned. The function result tells if the registered prefix is the suggested one.

Parameters:

namespaceURI	The URI for the namespace. Must be a valid XML URI.
suggestedPrefix	The suggested prefix to be used if the URI is not yet registered. Must be a valid XML name.
registeredPrefix	Returns the prefix actually registered for this URI.

Returns true if the registered prefix matches the suggested prefix.

Note: No checking is presently done on either the URI or the prefix.

This is a global method which does not need a valid handle.

195.6.66 RemoveProperties(schemaNS as string="", propName as string="", options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Remove multiple properties from an XMP object.
Notes:

RemoveProperties was created to support the File Info dialog's Delete button, and has been been generalized somewhat from those specific needs. It operates in one of three main modes depending on the schemaNS and propName parameters:
Non-empty schemaNS and propName - The named property is removed if it is an external property, or if the kXMPUI_DoAllProperties option is passed. It does not matter whether the named property is an actual property or an alias.
Non-empty schemaNS and empty propName - The all external properties in the named schema are removed. Internal properties are also removed if the kXMPUI_DoAllProperties option is passed. In addition, aliases from the named schema will be removed if the kXMPUI_IncludeAliases option is passed.
Empty schemaNS and empty propName - All external properties in all schema are removed. Internal properties are also removed if the kXMPUI_DoAllProperties option is passed. Aliases are implicitly handled because the associated actuals are.
It is an error to pass and empty schemaNS and non-empty propName.

xmpObj	The XMP object containing the properties to be removed.
schemaNS	Optional schema namespace URI for the properties to be removed.
propName	Optional path expression for the property to be removed.
options	Option flags to control the deletion. The defined flags are: kXMPUI_DoAllProperties - Do internal properties in addition to external properties. kXMPUI_IncludeAliases - Include aliases in the "named schema" case above.

195.6.67 SeparateArrayItems(schemaNS as string, arrayName as string, options as Integer, catedStr as string)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Separate a single edit string into an array of strings.
Notes:

Parameters:

xmpObj	The XMP object containing the array to be updated.
schemaNS	The schema namespace URI for the array. Must not be null or the empty string.
arrayName	The name of the array. May be a general path expression, must not an empty string. Each item in the array must be a simple string value.
options	Option flags to control the separation.
catedStr	The string to be separated into the array items.

195.6.68 SerializeToBuffer(options as Integer, padding as Integer, newline as string, indent as string=""", baseIndent as Integer=0) as string

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SerializeToBuffer serializes an XMP object into a string as RDF.
Notes:

Returns the serialized RDF.

Parameters:

options	Option flags to control the serialization.
padding	The amount of padding to be added if a writeable XML packet is created. If zero is passed (the default) an appropriate amount of padding is computed.
newline	The string to be used as a line terminator. If empty it defaults to linefeed, U+000A, the standard XML newline.
indent	The string to be used for each level of indentation in the serialized RDF. If empty it defaults to two ASCII spaces, U+0020.
baseIndent	The number of levels of indentation to be used for the outermost XML element in the serialized RDF. This is convenient when embedding the RDF in other text.

The available option flags are:

kXMP_OmitPacketWrapper	= & h10	Do not include an XML packet wrapper.
kXMP_ReadOnlyPacket	= & h20	Create a read-only XML packet wapper.
kXMP_UseCompactFormat	= & h40	Use a highly compact RDF syntax and layout.
kXMP_WriteAliasComments	= & h400	Include XML comments for aliases.
kXMP_IncludeThumbnailPad	= & h100	Include typical space for a JPEG thumbnail in the padding if no xmp:Thumbnails property is present.
kXMP_ExactPacketLength	= & h200	The padding parameter provides the overall packet length. The actual amount of padding is computed. An exception is thrown if the packet exceeds this length with no padding.

The specified options must be logically consistent, an exception is thrown if not. You cannot specify both kXMP_OmitPacketWrapper along with kXMP_ReadOnlyPacket, kXMP_IncludeThumbnailPad, or kXMP_ExactPacketLength.
In addition, one of the following encoding options may be included:

kXMP_EncodeUTF8	= 0	Encode as UTF-8, the default.
kXMP_EncodeUTF16Big	= 2	Encode as big-endian UTF-16.
kXMP_EncodeUTF16Little	= 3	Encode as little-endian UTF-16.
kXMP_EncodeUTF32Big	= 4	Encode as big-endian UTF-32.
kXMP_EncodeUTF32Little	= 5	Encode as little-endian UTF-32.

See also:

- 195.6.69 SerializeToBuffer(options as Integer=0, padding as Integer=0) as string 22834

195.6.69 SerializeToBuffer(options as Integer=0, padding as Integer=0) as string

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SerializeToBuffer serializes an XMP object into a string as RDF.
Example:

```
dim x as new XMPMetaMBS
dim registeredPrefix as string

call x.RegisterNamespace ("xwnv", "xwnv", registeredPrefix)

x.SetProperty "xwnv","MZSTID","test"

MsgBox x.SerializeToBuffer
```

Notes: Same as other SerializeToBuffer method, but with newline="", indent=0 and baseIndent=0.
See also:

- 195.6.68 SerializeToBuffer(options as Integer, padding as Integer, newline as string, indent as string=""", baseIndent as Integer=0) as string 22833

195.6.70 SetArrayItem(schemaNS as string, arrayName as string, itemIndex as Integer, itemValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetArrayItem provides access to items within an array.
Notes:

The index is passed as an integer, you need not worry about the path string syntax for array items, convert a loop index to a string, etc. The array passed to SetArrayItem must already exist. See also AppendArrayItem.

In normal usage the selected array item is modified. A new item is automatically appended if the index is the array size plus 1. A new item may be inserted before or after any item by using one of the following option flags:

kXMP_InsertBeforeItem	= & h4000	Insert a new array item before the selected one.
kXMP_InsertAfterItem	= & h8000	Insert a new array item after the selected one.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem always refers to the last existing array item.
itemValue	An UTF-8 string that is the value of the array item, if the array item has a value. Has the same usage as propValue in GetProperty.
options	Option flags describing the item. See the earlier description.

195.6.71 SetLocalizedText(schemaNS as string, altTextName as string, genericLang as string, specificLang as string, itemValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetLocalizedText modifies the value of a selected item in an alt-text array.
Notes:

Creates an appropriate array item if necessary, and handles special cases for the x-default item.

If the selected item is from a match with the specific language, the value of that item is modified. If the existing value of that item matches the existing value of the x-default item, the x-default item is also modified. If the array only has 1 existing item (which is not x-default), an x-default item is added with the given value.
If the selected item is from a match with the generic language and there are no other generic matches, the value of that item is modified. If the existing value of that item matches the existing value of the x-default item, the x-default item is also modified. If the array only has 1 existing item (which is not x-default), an x-default item is added with the given value.
If the selected item is from a partial match with the generic language and there are other partial matches, a new item is created for the specific language. The x-default item is not modified.
If the selected item is from the last 2 rules then a new item is created for the specific language. If the array only had an x-default item, the x-default item is also modified. If the array was empty, items are created for the specific language and x-default.

Parameters:

schemaNS	The namespace URI for the alt-text array. Has the same usage as in GetProperty.
altTextName	The name of the alt-text array. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
genericLang	The name of the generic language as an RFC 3066 primary subtag.
specificLang	The name of the specific language as an RFC 3066 tag. Must not be an empty string.
itemValue	An UTF-8 string that is the new value for the appropriate array item.
options	Option flags, none are defined at present.

195.6.72 SetProperty(schemaNS as string, propName as string, propValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetProperty is the simplest property setter, mainly for top level simple properties or after using the path composition functions.
Notes:

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	An UTF-8 string that is the value of the property, if the property has a value. Arrays and non-leaf levels of structs do not have values.
options	Option flags describing the property.

195.6.73 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean)

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetPropertyBoolean sets the value of a Boolean property from a boolean.
Notes:

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The bool value to be assigned to the property.
options	An integer variable that is assigned option flags describing the property.

See also:

- 195.6.74 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean, options as Integer) 22837

195.6.74 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean, options as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetPropertyBoolean sets the value of a Boolean property from a boolean.
Notes:

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The bool value to be assigned to the property.
options	An integer variable that is assigned option flags describing the property.

See also:

- 195.6.73 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean) 22837

195.6.75 SetPropertyDate(schemaNS as string, propName as string, propValue as XMPDateTimeMBS, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetPropertyDate sets the value of a date/time property from an XMPDateTimeMBS object.
Notes:

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The XMPDateTimeMBS object to be assigned to the property.
options	Option flags describing the property.

195.6.76 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double)

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetPropertyFloat sets the value of a floating point property from a double.
Notes:

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The double float value to be assigned to the property.
options	Option flags describing the property.

See also:

- 195.6.77 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double, options as Integer) 22838

195.6.77 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double, options as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetPropertyFloat sets the value of a floating point property from a double.

Notes:

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The double float value to be assigned to the property.
options	Option flags describing the property.

See also:

- 195.6.76 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double) 22838

195.6.78 SetPropertyInt64Double(schemaNS as string, propName as string, propValue as Double, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetPropertyInt64Double sets the value of a 64 bit integer property from a double.
Notes:

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The double value to be assigned to the property.
options	Option flags describing the property.

195.6.79 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetPropertyInteger sets the value of an integer property from an integer.
Notes:

Parameters:

See also:

- 195.6.80 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer, options as Integer) 22840

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The long integer value to be assigned to the property.
options	Option flags describing the property.

195.6.80 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer, options as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetPropertyInteger sets the value of an integer property from an integer.
Notes:

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The long integer value to be assigned to the property.
options	Option flags describing the property.

See also:

- 195.6.79 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer) 22839

195.6.81 SetPropertyInteger64(schemaNS as string, propName as string, propValue as Int64, options as Integer=0)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the value of an integer property using an Int64.
Notes:

Sets a property with a binary value, creating it if necessary.

schemaNS: The namespace URI; see GetProperty().
propName: The name of the property. Can be a general path expression, must not be "" or the empty string; see GetProperty() for namespace prefix usage.
propValue: The new binary value.
options: Option flags describing the property; a logical OR of allowed bit-flag constants; see kPropValueIsStruct and following. Must match the type of a property that already exists.

195.6.82 SetQualifier(schemaNS as string, propName as string, qualNS as string, qualName as string, qualValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetQualifier provides access to a qualifier attached to a property.
Notes:

The namespace for the qualifier is passed as a URI, you need not worry about the path string syntax. In many regards qualifiers are like struct fields. See the introductory discussion of qualified properties for more information.

The names of qualifiers should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix, which is unreliable because the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
propName	The name of the property to which the qualifier is attached. Has the same usage as in GetProperty.
qualNS	The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName	The name of the qualifier. Must be a single XML name, must not be an empty string. Has the same namespace prefix usage as the propName parameter.
qualValue	An UTF-8 string that is the value of the qualifier, if the qualifier has a value. Has the same usage as propValue in GetProperty.
options	Option flags describing the qualifier.

195.6.83 SetStructField(schemaNS as string, structName as string, fieldNS as string, fieldName as string, fieldValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetStructField provides access to fields within a nested structure.
Notes:

The namespace for the field is passed as a URI, you need not worry about the path string syntax.

The names of fields should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix, which is unreliable because the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
structName	The name of the struct. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
fieldNS	The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName	The name of the field. Must be a single XML name, must not be null or the empty string. Has the same namespace prefix usage as the structName parameter.
fieldValue	An UTF-8 string that is the value of the field, if the field has a value. Has the same usage as propValue in GetProperty.
options	Option flags describing the field.

195.6.84 Sort

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sorts the data model tree of an XMP object.
Notes:

Use this function to sort the data model of an XMP object into a canonical order. This can be convenient when comparing data models, (e.g. by text comparison of DumpObject output).

At the top level the namespaces are sorted by their prefixes. Within a namespace, the top level properties are sorted by name. Within a struct, the fields are sorted by their qualified name, i.e. their XML prefix:local form. Unordered arrays of simple items are sorted by value. Language Alternative arrays are sorted by the xml:lang qualifiers, with the "x-default" item placed first.

195.6.85 Properties

195.6.86 GlobalOptions as Integer

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets or retrieves the set of global option flags.
Notes: (Read and Write computed property)

195.6.87 Name as string

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The object name.
Notes: (Read and Write computed property)

195.6.88 Constants

195.6.89 kAllowCommas = & h10000000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: Used by CatenateArrayItems and SeparateArrayItems.

195.6.90 kArrayLastItem = -1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** The index constant for the last item.

195.6.91 kDeleteEmptyValues = 4

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for RemoveProperties() and AppendProperties().
Notes: Delete properties if the new value is empty.

195.6.92 kDeleteExisting = & h20000000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants.
Notes: Used by SetXyz functions to delete any pre-existing property.

195.6.93 kDoAllProperties = 1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for RemoveProperties() and AppendProperties().
Notes: Do all properties, default is just external properties.

195.6.94 kEncodeUTF16Big = 2

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
Notes: Use UTF16 big-endian encoding

195.6.95 kEncodeUTF16Little = 3

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
Notes: Use UTF16 little-endian encoding

195.6.96 kEncodeUTF32Big = 4

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
Notes: Use UTF32 big-endian encoding

195.6.97 kEncodeUTF32Little = 5

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
Notes: Use UTF32 little-endian encoding

195.6.98 kEncodeUTF8 = 0

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
Notes: Use UTF8 encoding

195.6.99 kEncodingMask = & h7

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
Notes: Bit-flag mask for encoding-type bits

195.6.100 kExactPacketLength = & h200

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
Notes: The padding parameter is the overall packet length.

195.6.101 kImplReservedMask = & h70000000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants.

195.6.102 kIncludeAliases = & h800

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for RemoveProperties() and AppendProperties().
Notes: Include aliases, default is just actual properties.

195.6.103 kIncludeThumbnailPad = & h100

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
Notes: Include a padding allowance for a thumbnail image.

195.6.104 kInsertAfterItem = & h8000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option for array item location.
Notes: Insert a new item after the given index.

195.6.105 kInsertBeforeItem = & h4000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option for array item location.
Notes: Insert a new item before the given index.

195.6.106 kIterAliases = 1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: Iterate the global alias table.

195.6.107 kIterClassMask = & hFF

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: The low 8 bits are an enum of what data structure to iterate.

195.6.108 kIterIncludeAliases = & h800

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: Include aliases, default is just actual properties.

195.6.109 kIterJustChildren = & h100

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: Just do the immediate children of the root, default is subtree.

195.6.110 kIterJustLeafName = & h400

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: Return just the leaf part of the path, default is the full path.

195.6.111 kIterJustLeafNodes = & h200

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: Just do the leaf nodes, default is all nodes in the subtree.

195.6.112 kIterNamespaces = 2

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: Iterate the global namespace table.

195.6.113 kIterOmitQualifiers = & h1000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: Omit all qualifiers.

195.6.114 kIterProperties = 0

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: Iterate the property tree of a TXMPMeta object.

195.6.115 kIterSkipSiblings = 2

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for Skip.
Notes: Skip the subtree below and remaining siblings of the current node.

195.6.116 kIterSkipSubtree = 1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for Skip.
Notes: Skip the subtree below the current node.

195.6.117 kLittleEndianBit = 1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().

195.6.118 kNoOptions = 0

MBS XMP Plugin, Plugin Version: 9.4. **Function:** The constant to specify to use no options.

195.6.119 kNS_AdobeStockPhoto = "http://ns.adobe.com/StockPhoto/1.0/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.

195.6.120 kNS_ASF = "http://ns.adobe.com/asf/1.0/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.

195.6.121 kNS_CameraRaw = "http://ns.adobe.com/camera-raw-settings/1.0/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.

195.6.122 kNS_CreatorAtom = "http://ns.adobe.com/creatorAtom/1.0/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.

195.6.123 kNS_DC = "http://purl.org/dc/elements/1.1/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants from outside Adobe.
Notes: The XML namespace for the Dublin Core schema.

195.6.124 kNS_DICOM = "http://ns.adobe.com/DICOM/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants from outside Adobe.

195.6.125 kNS_DM = "http://ns.adobe.com/xmp/1.0/DynamicMedia/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.

195.6.126 kNS_EXIF = "http://ns.adobe.com/exif/1.0/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.
Notes: The XML namespace for Adobe's EXIF schema.

195.6.127 kNS_EXIF_Aux = "http://ns.adobe.com/exif/1.0/aux/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.

195.6.128 kNS_IPTCCore = "http://iptc.org/std/Iptc4xmpCore/1.0/xmlns/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants from outside Adobe.
Notes: The XML namespace for the IPTC Core schema.

195.6.129 kNS_JP2K = "http://ns.adobe.com/jp2k/1.0/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.

195.6.130 kNS_JPEG = "http://ns.adobe.com/jpeg/1.0/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.

195.6.131 kNS_PDF = "http://ns.adobe.com/pdf/1.3/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.
Notes: The XML namespace for the PDF schema.

195.6.132 kNS_PDFA_Extension = "http://www.aiim.org/pdfa/ns/extension/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants from outside Adobe.

195.6.133 kNS_PDFA_Field = "http://www.aiim.org/pdfa/ns/field# "

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants from outside Adobe.

195.6.134 kNS_PDFA_ID = "http://www.aiim.org/pdfa/ns/id/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants from outside Adobe.

195.6.135 kNS_PDFA_Property = "http://www.aiim.org/pdfa/ns/property# "

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants from outside Adobe.

195.6.136 kNS_PDFA_Schema = "http://www.aiim.org/pdfa/ns/schema# "

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants from outside Adobe.

195.6.137 kNS_PDFA_Type = "http://www.aiim.org/pdfa/ns/type# "

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants from outside Adobe.

195.6.138 kNS_PDFX = "http://ns.adobe.com/pdfx/1.3/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants from outside Adobe.

195.6.139 kNS_PDFX_ID = "http://www.npes.org/pdfx/ns/id/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants from outside Adobe.

195.6.140 kNS_Photoshop = "http://ns.adobe.com/photoshop/1.0/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.
Notes: The XML namespace for the Photoshop custom schema.

195.6.141 kNS_PNG = "http://ns.adobe.com/png/1.0/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.

195.6.142 kNS_PSAlbum = "http://ns.adobe.com/album/1.0/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.

195.6.143 kNS_RDF = "http://www.w3.org/1999/02/22-rdf-syntax-ns# "

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants from outside Adobe.
Notes: The XML namespace for RDF.

195.6.144 kNS_SWF = "http://ns.adobe.com/swf/1.0/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.

195.6.145 kNS_TIFF = "http://ns.adobe.com/tiff/1.0/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.

Notes: The XML namespace for Adobe's TIFF schema.

195.6.146 kNS_WAV = "http://ns.adobe.com/xmp/wav/1.0/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.

195.6.147 kNS_XML = "http://www.w3.org/XML/1998/namespace"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants from outside Adobe.
Notes: The XML namespace for XML.

195.6.148 kNS_XMP = "http://ns.adobe.com/xap/1.0/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.
Notes: The XML namespace for the XMP "basic" schema.

195.6.149 kNS_XMP_BJ = "http://ns.adobe.com/xap/1.0/bj/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.
Notes: The XML namespace for the job management schema.

195.6.150 kNS_XMP_Dimensions = "http://ns.adobe.com/xap/1.0/sType/Dimensions# "

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for qualifiers and structured property fields.
Notes: The XML namespace for fields of the Dimensions type.

195.6.151 kNS_XMP_Font = "http://ns.adobe.com/xap/1.0/sType/Font# "

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for qualifiers and structured property fields.

195.6.152 kNS_XMP_Graphics = "http://ns.adobe.com/xap/1.0/g/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for qualifiers and structured property fields.

195.6.153 kNS_XMP_G_IMG = "http://ns.adobe.com/xap/1.0/g/img/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.
Notes: Deprecated XML namespace constant.

195.6.154 kNS_XMP_IdentifierQual = "http://ns.adobe.com/xmp/Identifier/qual/1.0/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for qualifiers and structured property fields.
Notes: The XML namespace for qualifiers of the xmp:Identifier property.

195.6.155 kNS_XMP_Image = "http://ns.adobe.com/xap/1.0/g/img/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for qualifiers and structured property fields.
Notes: The XML namespace for fields of a graphical image. Used for the Thumbnail type.

195.6.156 kNS_XMP_ManifestItem = "http://ns.adobe.com/xap/1.0/sType/ManifestItem# "

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for qualifiers and structured property fields.

195.6.157 kNS_XMP_MM = "http://ns.adobe.com/xap/1.0/mm/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.
Notes: The XML namespace for the XMP digital asset management schema.

195.6.158 kNS_XMP_Note = "http://ns.adobe.com/xmp/note/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.

195.6.159 kNS_XMP_PagedFile = "http://ns.adobe.com/xap/1.0/t/pg/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for qualifiers and structured property fields.

195.6.160 kNS_XMP_ResourceEvent = "http://ns.adobe.com/xap/1.0/sType/ResourceEvent# "

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for qualifiers and structured property fields.
Notes: The XML namespace for fields of the ResourceEvent type.

195.6.161 kNS_XMP_ResourceRef = "http://ns.adobe.com/xap/1.0/sType/ResourceRef# "

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for qualifiers and structured property fields.
Notes: The XML namespace for fields of the ResourceRef type.

195.6.162 kNS_XMP_Rights = "http://ns.adobe.com/xap/1.0/rights/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.
Notes: The XML namespace for the XMP copyright schema.

195.6.163 kNS_XMP_ST_Job = "http://ns.adobe.com/xap/1.0/sType/Job# "

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for qualifiers and structured property fields.
Notes: The XML namespace for fields of the JobRef type.

195.6.164 kNS_XMP_ST_Version = "http://ns.adobe.com/xap/1.0/sType/Version# "

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for qualifiers and structured property fields.
Notes: The XML namespace for fields of the Version type.

195.6.165 kNS_XMP_T = "http://ns.adobe.com/xap/1.0/t/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.
Notes:

The XML namespace for the XMP text document schema.
Deprecated XML namespace constant.

195.6.166 kNS_XMP_Text = "http://ns.adobe.com/xap/1.0/t/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for qualifiers and structured property fields.

195.6.167 kNS_XMP_T_PG = "http://ns.adobe.com/xap/1.0/t/pg/"

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the XML namespace constants for standard XMP schema.
Notes:

The XML namespace for the XMP paged document schema.
Deprecated XML namespace constant.

195.6.168 kOmitAllFormatting = & h800

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
Notes: Omit all formatting whitespace.

195.6.169 kOmitPacketWrapper = & h10

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
Notes: Omit the XML packet wrapper.

195.6.170 kOmitXMPMetaElement = & h1000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
Notes: Omit the x:xmpmeta element surrounding the rdf:RDF element.

195.6.171 kParseMoreBuffers = 2

MBS XMP Plugin, Plugin Version: 9.4. **Function:** This is the not last input buffer for this parse stream.

195.6.172 kPropArrayFormMask = & h1E00

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: Property type bit-flag mask for all array types

195.6.173 kPropArrayIsAlternate = & h800

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: Implies kPropArrayIsOrdered, items are alternates. It is serialized using an rdf:Alt container.

195.6.174 kPropArrayIsAltText = & h1000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: Implies kPropArrayIsAlternate, items are localized text. Each array element is a simple property with an xml:lang attribute.

195.6.175 kPropArrayIsOrdered = & h400

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: Implies kPropValueIsArray, item order matters. It is serialized using an rdf:Seq container.

195.6.176 kPropArrayIsUnordered = & h200

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: The item order does not matter.

195.6.177 kPropArrayLocationMask = & hC000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for the property setting functions.
Notes: Bit-flag mask for array-item location bits

195.6.178 kPropCompositeMask = & h1F00

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: Property type bit-flag mask for composite types (array and struct)

195.6.179 kPropHasAliases = & h20000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: This property is the base value (actual) for a set of aliases.This is only returned by GetProperty() and then only if the property name is simple, not an path expression.

195.6.180 kPropHasLang = & h40

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: Implies kPropHasQualifiers, property has xml:lang.

195.6.181 kPropHasQualifiers = & h10

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: The property has qualifiers, includes rdf:type and xml:lang.

195.6.182 kPropHasType = & h80

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: Implies kPropHasQualifiers, property has rdf:type.

195.6.183 kPropIsAlias = & h10000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: This property is an alias name for another property. This is only returned by GetProperty() and then only if the property name is simple, not an path expression.

195.6.184 kPropIsDerived = & h200000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: The value of this property is derived from the document content.

195.6.185 kPropIsInternal = & h40000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: The value of this property is ”owned” by the application, and should not generally be editable in a UI.

195.6.186 kPropIsQualifier = & h20

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes:

This is a qualifier for some other property, includes rdf:type and xml:lang.
Qualifiers can have arbitrary structure, and can themselves have qualifiers. If the qualifier itself has a structured value, this flag is only set for the top node of the qualifier's subtree.

195.6.187 kPropIsStable = & h100000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: The value of this property is not derived from the document content.

195.6.188 kPropValueIsArray = & h200

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: The value is an array (RDF alt/bag/seq). The "ArrayIs..." flags identify specific types of array; default is a general unordered array, serialized using an rdf:Bag container.

195.6.189 kPropValueIsStruct = & h100

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: The value is a structure with nested fields.

195.6.190 kPropValueIsURI = 2

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
Notes: The XML string form of the property value is a URI, use rdf:resource attribute. DISCOURAGED

195.6.191 kPropValueOptionsMask = 2

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants of the option bit flags for the property setting functions.
Notes: Bit-flag mask for property-value option bits

195.6.192 kReadOnlyPacket = & h20

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
Notes: Default is a writeable packet.

195.6.193 kReplaceOldValues = 2

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for RemoveProperties() and AppendProperties().
Notes: Replace existing values, default is to leave them.

195.6.194 kRequireXMPMeta = 1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** Require a surrounding x:xmpmeta element.

195.6.195 kStrictAliasing = 4

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for ParseFromBuffer().
Notes: Do not reconcile alias differences, throw an exception.

195.6.196 kUseCompactFormat = & h40

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
Notes: Use a compact form of RDF.

195.6.197 kUseNullTermination = 0

MBS XMP Plugin, Plugin Version: 9.4. **Function:** The length constants for a string to determinate the length automatically.

195.6.198 kUTF16Bit = 2

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().

195.6.199 kUTF32Bit = 4

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().

195.6.200 kWriteAliasComments = & h400

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
Notes: Show aliases as XML comments.

195.6.201 kXMPFiles_IgnoreLocalText = 2

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the flags for XMPFiles initialize.
Notes: Ignore non-XMP text that uses an undefined "local" encoding.

195.6.202 kXMPFiles_ServerMode = 2

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the flags for XMPFiles initialize.
Notes: Combination of flags necessary for server products using XMPFiles.

195.6.203 kXMPTemplate_AddNewProperties = 8

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the option constants for ApplyTemplate function.
Notes: Perform an Add operation, add properties if they don't already exist.

195.6.204 kXMPTemplate_ClearUnnamedProperties = & h10

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the option constants for ApplyTemplate function.
Notes: Perform a Clear operation, keep named properties and delete everything else.

195.6.205 kXMPTemplate_IncludeInternalProperties = 1

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the option constants for ApplyTemplate function.

Notes: Do all properties, default is just external properties.

195.6.206 kXMPTemplate_ReplaceExistingProperties = 2

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the option constants for ApplyTemplate function.
Notes: Perform a Replace operation, add new properties and modify existing ones.

195.6.207 kXMPTemplate_ReplaceWithDeleteEmpty = 4

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the option constants for ApplyTemplate function.
Notes: Similar to Replace, also delete if the template has an empty value.

195.6.208 kXMP_NS_BWF = "http://ns.adobe.com/bwf/bext/1.0/"

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the XML namespace constants for standard XMP schema.

195.6.209 kXMP_NS_Script = "http://ns.adobe.com/xmp/1.0/Script/"

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the XML namespace constants for standard XMP schema.

195.6.210 kXMP_WriteAliasComments = & h400

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the option flags for SerializeToBuffer.
Notes: Show aliases as XML comments.

195.6.211 Version = "5.5.0"

MBS XMP Plugin, Plugin Version: 11.0. **Function:** The version string of the XMP library.

195.7 class XMPPacketInfoMBS

195.7.1 class XMPPacketInfoMBS

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for information about a xmp packet.

195.7.2 Blog Entries

- Tip of the day: Change EXIF metadata

195.7.3 Properties

195.7.4 CharForm as Integer

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Character format using the values kChar8Bit, kChar16BitBig, etc.
Notes: (Read and Write property)

195.7.5 HasWrapper as Boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** True if there is a packet wrapper, the "<?xpacket...>" XML processing instructions.
Notes: (Read and Write property)

195.7.6 Length as Integer

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Packet length in the file in bytes, -1 if unknown.
Notes: (Read and Write property)

195.7.7 Offset as Int64

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Packet offset in the file in bytes, -1 if unknown.
Notes: (Read and Write property)

195.7.8 PadSize as Integer

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Packet padding size in bytes, zero if unknown.
Notes: (Read and Write property)

195.7.9 Writeable as Boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** True if there is a packet wrapper and the trailer says writeable by dumb packet scanners.
Notes: (Read and Write property)

195.8 class XMPScannerMBS

195.8.1 class XMPScannerMBS

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class to scan any file stream for XMP data.
Example:

```
dim c,n,i,l as Integer
dim xs as XMPScannerMBS
dim xn as XMPSnipMBS
dim s as string
dim x as XMPMetaMBS
dim b as BinaryStream
dim source as FolderItem

// get file
source=GetOpenFolderItem("any")
if source=nil then Return

b=source.OpenAsBinaryFile(false)

if b=nil then Return

// read file to memory
l=b.Length
s=b.Read(l)

// scan for xmp blocks

195.8.2 Methods

195.8.3 Constructor

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Default constructor doing nothing.
See also:

- 195.8.4 Constructor(StreamLength as Integer) 22866

195.8.4 Constructor(StreamLength as Integer)

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Constructor to create a XMPScanner which reads the given number of bytes.
See also:

- 195.8.3 Constructor 22866

195.8.5 Report as Integer

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Produces a report of what is known about the input stream.
Notes: The snipps found are saved in an array which you can access using the snip() function. Returns the number of entries in this array.

195.8.6 Scan(Buffer as string, Offset as Int64)

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Scans the given part of the input, incorporating it in to the known snips.
Notes: The Offset is the offset of this block of input relative to the entire stream.

195.8.7 Snip(index as UInt32) as XMPSnipMBS

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the snip with the given index.
Notes:

index is zero based.
Returns nil on any error.
You must call Report before this method.

195.8.8 SnipCount as UInt32

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Number of snips found so far.

195.8.9 StreamAllScanned as boolean

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true if all of the stream has been seen.

195.9 class XMPSnipMBS

195.9.1 class XMPSnipMBS

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for the XMP Snips found by the XMPScannerMBS class.

195.9.2 Properties

195.9.3 Access as Integer

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The read-only/read-write access from the end attribute.
Notes: (Read and Write property)

195.9.4 BytesAttr as Int64

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The value of the bytes attribute, -1 if not present.
Notes: (Read only property)

195.9.5 CharForm as Integer

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** How the packet is divided into characters.
Notes:

The values allow easy testing for 16/32 bit and big/little endian.

eChar8Bit	= 0
eChar16BitBig	= 2
eChar16BitLittle	= 3
eChar32BitBig	= 4
eChar32BitLittle	= 5

(Read and Write property)

195.9.6 EncodingAttr as String

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The value of the encoding attribute, if any, with nulls removed.
Notes: (Read and Write property)

195.9.7 Length as Int64

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The length in bytes of this snip.
Notes: (Read only property)

195.9.8 Offset as Int64

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The byte offset of this snip within the input stream.
Notes: (Read only property)

195.9.9 OutOfOrder as Integer

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** If true, this snip was seen before the one in front of it.
Notes: (Read and Write property)

195.9.10 State as Integer

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The state of this snip.
Notes:

constants:

eNotSeenSnip	0	This snip has not been seen yet.
ePendingSnip	1	This snip is an input buffer being processed.
eRawInputSnip	2	This snip is raw input, it doesn't contain any part of an XMP packet.
eValidPacketSnip	3	This snip is a complete, valid XMP packet.
ePartialPacketSnip	4	This snip contains the start of a possible XMP packet.
eBadPacketSnip	5	This snip contains a complete, but semantically incorrect XMP packet.

(Read and Write property)

195.10 class XMPTextOutputMBS

195.10.1 class XMPTextOutputMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** An event class for text output.
Notes: You may want to make a subclass which collects all the strings into one string or write them to a file.

195.10.2 Events

195.10.3 Output(text as string) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** New text arrived.
Notes:

You may get more than one event per line.
Return 0 for success or something else for failure.

195.11 class XMPVersionInfoMBS

195.11.1 class XMPVersionInfoMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The XMP Version class.
Example:

```
dim v as XMPVersionInfoMBS
v=XMPMetaMBS.GetVersionInfo
MsgBox v.Message
```

Notes: Constructor sets values.

195.11.2 Properties

195.11.3 Build as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A rolling build number, monotonically increasing in a release.
Notes: (Read and Write property)

195.11.4 Flags as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Individual feature implementation flags.
Notes: (Read and Write property)

195.11.5 IsDebug as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** True if this is a debug build.
Notes: (Read and Write property)

195.11.6 Major as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The primary release number, the "1" in version "1.2.3".

Notes: (Read and Write property)

195.11.7 Message as String

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A comprehensive version information string.
Example:

```
dim v as XMPVersionInfoMBS
v=XMPMetaMBS.GetVersionInfo
MsgBox v.Message
```

Notes: (Read and Write property)

195.11.8 Micro as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The tertiary release number, the "3" in version "1.2.3".
Notes: (Read and Write property)

195.11.9 Minor as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The secondary release number, the "2" in version "1.2.3".
Notes: (Read and Write property)

Chapter 196

List of Questions in the FAQ

- 197.0.1 Can anyone help me convert seconds to time in this format hh:mm:ss? 22885
- 197.0.2 How do I get the proper highlight color on Mac OS X for active/inactive selection? 22886
- 197.0.3 How to catch delete key? 22887
- 197.0.4 How to convert cmyk to rgb? 22887
- 197.0.5 How to delete a folder? 22889
- 197.0.6 How to detect if CPU if 64bit processor? 22890
- 197.0.7 How to refresh a htmlviewer on Windows? 22890
- 197.0.8 Is there an example for vector graphics in Xojo? 22891
- 197.0.9 Picture functions do not preserve resolution values? 22891
- 197.0.10 A toolbox call needs a rect - how do I give it one? 22892
- 197.0.11 API client not supported? 22892
- 197.0.12 Can I access Access Database with Java classes? 22893
- 197.0.13 Can I create PDF from Xojo Report using DynaPDF? 22894
- 197.0.14 Can I use AppleScripts in a web application? 22894
- 197.0.15 Can I use graphics class with DynaPDF? 22894
- 197.0.16 Can I use sockets on a web application? 22895
- 197.0.17 Can I use your ChartDirector plugin on a web application? 22895
- 197.0.18 Can I use your DynaPDF plugin on a web application? 22897
- 197.0.19 Can I use your plugin controls on a web application? 22897

- 197.0.20 Can you get an unique machine ID? 22897
- 197.0.21 ChartDirector: Alignment Specification 22898
- 197.0.22 ChartDirector: Color Specification 22899
- 197.0.23 ChartDirector: Font Specification 22902
- 197.0.24 ChartDirector: Mark Up Language 22905
- 197.0.25 ChartDirector: Parameter Substitution and Formatting 22909
- 197.0.26 ChartDirector: Shape Specification 22914
- 197.0.27 Copy styled text? 22915
- 197.0.28 Do you have code to validate a credit card number? 22915
- 197.0.29 Do you have plugins for X-Rite EyeOne, eXact or i1Pro? 22916
- 197.0.30 Does SQL Plugin handle stored procedures with multiple result sets? 22916
- 197.0.31 Does the plugin home home? 22916
- 197.0.32 folderitem.absolutepath is limited to 255 chars. How can I get longer ones? 22917
- 197.0.33 Has anyone played round with using CoreImage to do things like add dissolve transitions say when changing from one tab to another within a window? 22918
- 197.0.34 How about Plugin support for older OS X? 22919
- 197.0.35 How can I detect whether an Intel CPU is a 64bit CPU? 22919
- 197.0.36 How can I disable the close box of a window on Windows? 22920
- 197.0.37 How can I get all the environment variables from Windows? 22921
- 197.0.38 How can i get similar behavior to Roxio Toast or iTunes where clicking a 'burn' button allows the next inserted blank CD-R to bypass the Finder and be accepted by my application? 22921
- 197.0.39 How can I get text from a PDF? 22922
- 197.0.40 How can I get text from a Word Document? 22922
- 197.0.41 How can I get the item string for a given file creator? 22922
- 197.0.42 How can I launch an app using it's creator code? 22923
- 197.0.43 How can I learn what shared libraries are required by a plugin on Linux? 22924
- 197.0.44 How can I validate an email address? 22925
- 197.0.45 How do I decode correctly an email subject? 22926
- 197.0.46 How do I enable/disable a single tab in a tabpanel? 22927
- 197.0.47 How do I find the root volume for a file? 22927

22877

- 197.0.48 How do I get the current languages list? 22928
- 197.0.49 How do I get the Mac OS Version? 22929
- 197.0.50 How do I get the printer name? 22929
- 197.0.51 How do I make a metal window if RB does not allow me this? 22930
- 197.0.52 How do I make a smooth color transition? 22930
- 197.0.53 How do I read the applications in the dock app? 22931
- 197.0.54 How do I truncate a file? 22932
- 197.0.55 How do update a Finder's windows after changing some files? 22933
- 197.0.56 How to access a USB device directly? 22933
- 197.0.57 How to add icon to file on Mac? 22933
- 197.0.58 How to ask the Mac for the Name of the Machine? 22934
- 197.0.59 How to automatically enable retina in my apps? 22934
- 197.0.60 How to avoid leaks with Cocoa functions? 22935
- 197.0.61 How to avoid trouble connecting to oracle database with SQL Plugin? 22935
- 197.0.62 How to avoid ___NSAutoreleaseNoPool console messages in threads? 22936
- 197.0.63 How to bring app to front? 22936
- 197.0.64 How to bring my application to front? 22937
- 197.0.65 How to catch Control-C on Mac or Linux in a console app? 22937
- 197.0.66 How to change name of application menu? 22938
- 197.0.67 How to change the name in the menubar of my app on Mac OS X? 22938
- 197.0.68 How to check if a folder/directory has subfolders? 22939
- 197.0.69 How to check if Macbook runs on battery or AC power? 22939
- 197.0.70 How to check if Microsoft Outlook is installed? 22940
- 197.0.71 How to check on Mac OS which country or language is currently selected? 22941
- 197.0.72 How to code sign my app with plugins? 22941
- 197.0.73 How to collapse a window? 22942
- 197.0.74 How to compare two pictures? 22942
- 197.0.75 How to compile PHP library? 22944
- 197.0.76 How to convert a BrowserType to a String with WebSession.Browser? 22945

- 197.0.77 How to convert a EngineType to a String with WebSession.Engine? 22946
- 197.0.78 How to convert a PlatformType to a String with WebSession.Platform? 22946
- 197.0.79 How to convert a text to iso-8859-1 using the TextEncoder? 22947
- 197.0.80 How to convert ChartTime back to Xojo date? 22948
- 197.0.81 How to convert line endings in text files? 22948
- 197.0.82 How to convert picture to string and back? 22949
- 197.0.83 How to copy an array? 22950
- 197.0.84 How to copy an dictionary? 22950
- 197.0.85 How to copy parts of a movie to another one? 22951
- 197.0.86 How to create a birthday like calendar event? 22951
- 197.0.87 How to create a GUID? 22952
- 197.0.88 How to create a Mac picture clip file? 22952
- 197.0.89 How to create a PDF file in Xojo? 22953
- 197.0.90 How to create EmailAttachment for PDF Data in memory? 22954
- 197.0.91 How to create PDF for image files? 22954
- 197.0.92 How to CURL Options translate to Plugin Calls? 22955
- 197.0.93 How to delete file with ftp and curl plugin? 22956
- 197.0.94 How to detect display resolution changed? 22957
- 197.0.95 How to detect retina? 22957
- 197.0.96 How to disable force quit? 22957
- 197.0.97 How to disable the error dialogs from Internet Explorer on javascript errors? 22957
- 197.0.98 How to display a PDF file in Xojo? 22958
- 197.0.99 How to do a lottery in RB? 22958
- 197.0.100 How to do an asycron DNS lookup? 22959
- 197.0.101 How to draw a dushed pattern line? 22959
- 197.0.102 How to draw a nice antialiased line? 22960
- 197.0.103 How to dump java class interface? 22961
- 197.0.104 How to duplicate a picture with mask or alpha channel? 22962
- 197.0.105 How to enable assistive devices? 22963

22879

- 197.0.106 How to encrypt a file with Blowfish? 22963
- 197.0.107 How to extract text from HTML? 22964
- 197.0.108 How to find empty folders in a folder? 22964
- 197.0.109 How to find iTunes on a Mac OS X machine fast? 22965
- 197.0.110 How to find network interface for a socket by it's name? 22965
- 197.0.111 How to find version of Microsoft Word? 22966
- 197.0.112 How to fix CURL error 60/53 on connecting to server? 22967
- 197.0.113 How to format double with n digits? 22967
- 197.0.114 How to get a time converted to user time zone in a web app? 22968
- 197.0.115 How to get an handle to the frontmost window on Windows? 22968
- 197.0.116 How to get CFAbsoluteTime from date? 22969
- 197.0.117 How to get client IP address on web app? 22969
- 197.0.118 How to get fonts to load in charts on Linux? 22970
- 197.0.119 How to get fonts to load in DynaPDF on Linux? 22970
- 197.0.120 How to get GMT time and back? 22971
- 197.0.121 How to get good crash reports? 22971
- 197.0.122 How to get list of all threads? 22971
- 197.0.123 How to get parameters from webpage URL in Xojo Web Edition? 22972
- 197.0.124 How to get the color for disabled textcolor? 22972
- 197.0.125 How to get the current free stack space? 22973
- 197.0.126 How to get the current timezone? 22974
- 197.0.127 How to get the current window title? 22975
- 197.0.128 How to get the cursor blink interval time? 22976
- 197.0.129 How to get the list of the current selected files in the Finder? 22976
- 197.0.130 How to get the Mac OS system version? 22978
- 197.0.131 How to get the Mac OS Version using System.Gestalt? 22978
- 197.0.132 How to get the screensize excluding the task bar? 22979
- 197.0.133 How to get the size of the frontmost window on Windows? 22979
- 197.0.134 How to get the source code of a HTMLViewer? 22980

- 197.0.135 How to get Xojo apps running Linux? 22980
- 197.0.136 How to handle really huge images with GraphicsMagick or ImageMagick? 22980
- 197.0.137 How to handle tab key for editable cells in listbox? 22981
- 197.0.138 How to hard link MapKit framework? 22982
- 197.0.139 How to have a PDF downloaded to the user in a web application? 22983
- 197.0.140 How to hide all applications except mine? 22983
- 197.0.141 How to hide script errors in HTMLViewer on Windows? 22983
- 197.0.142 How to hide the grid/background/border in ChartDirector? 22984
- 197.0.143 How to hide the mouse cursor on Mac? 22984
- 197.0.144 How to insert image to NSTextView or TextArea? 22984
- 197.0.145 How to jump to an anchor in a htmlviewer? 22985
- 197.0.146 How to keep a movieplayer unclickable? 22985
- 197.0.147 How to keep my web app from using 100% CPU time? 22986
- 197.0.148 How to kill a process by name? 22986
- 197.0.149 How to know how many CPUs are present? 22986
- 197.0.150 How to know the calling function? 22987
- 197.0.151 How to launch an app using it's creator code? 22988
- 197.0.152 How to launch disc utility? 22988
- 197.0.153 How to make a lot of changes to a REAL SQL Database faster? 22988
- 197.0.154 How to make a NSImage object for my retina enabled app? 22989
- 197.0.155 How to make a window borderless on Windows? 22989
- 197.0.156 How to make an alias using AppleEvents? 22990
- 197.0.157 How to make AppleScripts much faster? 22991
- 197.0.158 How to make double clicks on a canvas? 22991
- 197.0.159 How to make my Mac not sleeping? 22993
- 197.0.160 How to make my own registration code scheme? 22994
- 197.0.161 How to make small controls on Mac OS X? 22994
- 197.0.162 How to mark my Mac app as background only? 22995
- 197.0.163 How to move a file or folder to trash? 22995

22881

- 197.0.164 How to move an application to the front using the creator code? 22996
- 197.0.165 How to move file with ftp and curl plugin? 22996
- 197.0.166 How to normalize string on Mac? 22997
- 197.0.167 How to obscure the mouse cursor on Mac? 22997
- 197.0.168 How to open icon file on Mac? 22998
- 197.0.169 How to open PDF in acrobat reader? 22998
- 197.0.170 How to open printer preferences on Mac? 22999
- 197.0.171 How to open special characters panel on Mac? 22999
- 197.0.172 How to optimize picture loading in Web Edition? 23000
- 197.0.173 How to parse XML? 23000
- 197.0.174 How to play audio in a web app? 23000
- 197.0.175 How to pretty print xml? 23002
- 197.0.176 How to print to PDF? 23002
- 197.0.177 How to query Spotlight's Last Open Date for a file? 23003
- 197.0.178 How to quit windows? 23003
- 197.0.179 How to read a CSV file correctly? 23004
- 197.0.180 How to read the command line on windows? 23004
- 197.0.181 How to render PDF pages with PDF Kit? 23005
- 197.0.182 How to restart a Mac? 23006
- 197.0.183 How to resume ftp upload with curl plugin? 23006
- 197.0.184 How to rotate a PDF page with CoreGraphics? 23006
- 197.0.185 How to rotate image with CoreImage? 23007
- 197.0.186 How to run a 32 bit application on a 64 bit Linux? 23008
- 197.0.187 How to save HTMLViewer to PDF with landscape orientation? 23008
- 197.0.188 How to save RTFD? 23009
- 197.0.189 How to save RTFD? 23009
- 197.0.190 How to scale a picture proportionally with mask? 23010
- 197.0.191 How to scale a picture proportionally? 23011
- 197.0.192 How to scale/resize a picture? 23012

- 197.0.193 How to search with regex and use unicode codepoints? 23012

Chapter 197

The FAQ

197.0.1 Can anyone help me convert seconds to time in this format hh:mm:ss?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Sure, here's a routine I use (which has an advantage over the previously-posted Date-based solution in that you don't have to rely on the creation of an object – all that happens is some division and string concatenation):
Example:

```
Function SecsToTimeString(timeInSecs as Integer, padHours as boolean, padMinutes as boolean) as string
// Given an amount time (in seconds), generates a string representing that amount
// of time. The padHours and padMinutes parameters determine whether to display
// hours and minutes if their values are zero.

// Examples:
// timeInSecs = 90, padHours = true; returns "00:01:30"
// timeInSecs = 1, padHours = false, padMinutes = true; returns "00:01"
// timeInSecs = 3601, padMinutes = false; returns "01:00:01"

dim hours, minutes, seconds as Integer
dim hoursString, minutesString as string

hours = timeInSecs / 3600
minutes = (timeInSecs mod 3600) / 60
seconds = timeInSecs mod 60

if hours = 0 then
if padHours then
hoursString = "00:"
else
hoursString = ""
end if
else
```

```
hoursString = Format(hours, "# # \:")
end if
if minutes = 0 then
if hours <>0 or padMinutes then
minutesString = "00:"
else
minutesString = ""
end if
else
minutesString = Format(minutes, "00\:")
end if

return hoursString + minutesString + Format(seconds, "00")
End Function
```

Notes: (from the rb mailinglist)

197.0.2 How do I get the proper highlight color on Mac OS X for active/inactive selection?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use functions from NSColor to get proper highlight color in RGB:
Example:

```
Function ProperHighlightColor(active as Boolean) As Color
# if TargetCocoa
Dim theColor As NSColorMBS
If active Then
theColor = NSColorMBS.alternateSelectedControlColor
Else
theColor = NSColorMBS.secondarySelectedControlColor
End If

Dim rgbColor As NSColorMBS = theColor.colorUsingColorSpaceName(NSColorSpaceMBS.NSCalibrate-
dRGBColorSpace)
If rgbColor <>Nil Then
Dim red as Integer = rgbColor.redComponent * 255.0
Dim green as Integer = rgbColor.greenComponent * 255.0
Dim blue as Integer = rgbColor.blueComponent * 255.0
Return RGB(red, green, blue)
Else
Return HighlightColor
End If
# else
```

```
return HighlightColor
# endif
End Function
```

Notes: As you see we convert color to Calibrated RGB for best results.

197.0.3 How to catch delete key?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** The following is the code in keydown event catches delete or backspace keys.
Example:

```
Function KeyDown(Key As String) As Boolean
if asc(key) = 8 or asc(key) = 127 then
MsgBox "Delete"
Return true
end if
End Function
```

- 197.0.7 How to refresh a htmlviewer on Windows? 22890

197.0.4 How to convert cmyk to rgb?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:**

The following is the code to convert cmyk values to an RGB color datatype.
It's just a basic estimate of the color values. If you are looking for completely color accurate solution, this is not it. It should work for most people. :)
Example:

```
Function CMYKToRGB(c as Integer, m as Integer, y as Integer, k as Integer) As color
// converts c,m,y,k values (0-100) to color data type RGB
// place this in a method. Supply C,M,Y,K values-
// it returns color datatype

dim color_RGB as color
dim r, g, b as Integer

r=255-round(2.55*(c+k))
if r<0 then
r=0
end if
g=255-round(2.55*(m+k))
if g<0 then
g=0
end if
b=255-round(2.55*(y+k))
if b<0 then
b=0
end if

color_RGB=RGB(r,g,b)

return color_RGB

End Function
```

Notes: (from the rb mailinglist)

- 197.0.7 How to refresh a htmlviewer on Windows? 22890

197.0.5 How to delete a folder?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** The following is the code deletes a folder recursively.
Example:

```
Sub deletefolder(f as folderitem)
dim files(-1) as FolderItem

if f=nil then Return

// delete single file
if f.Directory=false then
f.Delete
Return
end if

// get a list of all items in that folder
dim i,c as Integer
c=F.Count
for i=1 to c
files.Append f.TrueItem(i)
next

// delete each item
for each fo as FolderItem in files
if fo=nil then
' ignore
elseif fo.Directory then
deletefolder fo
else ' file
fo.Delete
end if
next

f.Delete
End Sub
```

- 197.0.7 How to refresh a htmlviewer on Windows? 22890

197.0.6 How to detect if CPU if 64bit processor?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Via CPUID you can ask CPU:
Example:

```
dim c as new CPUIDMBS

if c.Flags(CPUIDMBS.kFeatureLM) then
MsgBox "64-bit CPU"
else
MsgBox "32-bit CPU"
end if
```

Notes: Should work on all intel compatible CPUs.

- 197.0.7 How to refresh a htmlviewer on Windows? 22890

197.0.7 How to refresh a htmlviewer on Windows?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can ask the browser to reload the website with this code line:
Example:

```
call htmlViewer1.IERunJavaScriptMBS("javascript:document.location.reload()")
```

See also:

- 197.0.2 How do I get the proper highlight color on Mac OS X for active/inactive selection? 22886
- 197.0.3 How to catch delete key? 22887

197.0.8 Is there an example for vector graphics in Xojo?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Try this example inside the paint event of a window:
Example:

```
dim v as Group2D
dim r as RectShape
dim s as StringShape

const pi=3.14

s=new StringShape
s.Text="Hello World!"
s.TextFont="Geneva"
s.TextSize=24
s.FillColor=rgb(0,0,255)
s.Italic=true
s.y=5
s.x=0

r=new RectShape

r.X=0
r.y=0
r.Height=100
r.Width=180
r.BorderColor=rgb(255,0,0)
r.FillColor=rgb(0,255,0)
r.BorderWidth=5
r.Border=50

v=new Group2d
v.Append r
v.Append s
v.Rotation=pi*-20.0/180.0
v.x=150
v.y=150

g.DrawObject v
```

197.0.9 Picture functions do not preserve resolution values?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Yes, the picture functions return pictures with no/default resolution values.

Example:

```
dim l as Picture = LogoMBS(500)

l.HorizontalResolution = 300
l.VerticalResolution = 300

dim r as Picture = l.Rotate90MBS

MsgBox str(r.HorizontalResolution)+" x "+str(r.VerticalResolution)

r.HorizontalResolution = l.HorizontalResolution
r.VerticalResolution = l.VerticalResolution

MsgBox str(r.HorizontalResolution)+" x "+str(r.VerticalResolution)
```

Notes:

So please fix them yourself after calling a function.

Maybe in the future this changes, but currently you can't really set this easily from plugin code.

197.0.10 A toolbox call needs a rect - how do I give it one?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** Fill a memoryblock like this:
Example:

```
Dim MB As Memoryblock
MB = NewMemoryBlock(8)
MB.Short(0) = window1.Top
MB.Short(2) = window1.Left
MB.Short(4) = window1.Height+window1.Top // bottom
MB.Short(6) = window1.Width+window1.Left // right
```

197.0.11 API client not supported?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** If you get this exception message on SQLConnectionMBS.Connect, we may have a problem.
Notes:

First case is that the given thing is not supported (e.g. MS SQL directly on Mac).

Second case is that the plugin compilation went wrong and the support for the database was not linked into the plugin. Like MySQL missing or MS SQL on Windows missing. In that case please contact us to fix the plugin.

197.0.12 Can I access Access Database with Java classes?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** You can use ucanaccess to access databases created with Microsoft
Example:

```
dim options(-1) as string

// load all the jar files we have in a folder called java:

dim appFolder as FolderItem = GetFolderItem("")

Dim count as Integer = appFolder.Parent.Child("java").Count
dim libjs() as string
For i as Integer = 1 to count
Dim f As FolderItem = appFolder.Parent.Child("java").item(i)
If f <>Nil and f.Exists Then
libjs.append f.NativePath+";"
End If
Next

// now init virtual machine
dim librery as string = Join(libjs, "")
dim vm as new JavaVMMBS(librery)

if vm.Handle = 0 then
MsgBox "Failed to initialize virtual machine"
else
// now make a new database connection with ucanaccess
dim d as new JavaDatabaseMBS(vm,"net.ucanaccess.jdbc.UcanaccessDriver")
Dim DbFile as FolderItem = appFolder.Parent.Child("Database11.accdb")
dim j as JavaConnectionMBS = d.getConnection("jdbc:ucanaccess://"+DbFile.NativePath)

// select and show values
dim r as JavaResultSetMBS = j.MySelectSQL("Select * From test")
while r.NextRecord
MsgBox r.getString("FirstName") +" "+ r.getString("LastName")
wend

end if

Exception e as JavaExceptionMBS
```

```
MsgBox e.message+" errorcode: "+str(e.ErrorNumber)
```

Notes:

see website:
http://ucanaccess.sourceforge.net/site.html

197.0.13 Can I create PDF from Xojo Report using DynaPDF?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Yes, we have a graphics class integration for DynaPDF.
Notes: Since MBS Plugin in version 19.2, we can integrate reports with Xojo.

197.0.14 Can I use AppleScripts in a web application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Yes, but they run on the server, not on the client.
Example:

```
dim a as new AppleScriptMBS

// query my application name
a.Compile "tell application ""System Events"" to return name of current application"

// run
a.Execute

// show result
label1.text = a.Result

// shows something like "My Application.fcgi.debug"
```

Notes: This can be useful to control the server from remote, if and only if the your sever is running Mac OS X.

197.0.15 Can I use graphics class with DynaPDF?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Sorry, no. We can't provide a graphics subclass from plugin.

Notes:

The is a feature request to allow graphics subclasses:
Feedback case 11391: feedback://showreport?report_id=11391

197.0.16 Can I use sockets on a web application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Yes, but they run on the server, not on the client.
Notes:

You can use HTTPSocket, SMTPSocket, POP3Socket, SMTPSecureSocket, SecurePOP3Socket, EasyTCPSocket, EasyUDPSocket, AutoDiscovery, our Bonjour classes or our CURL* classes. But all of them work on the server, not on the client.

This means if you search for a printer with Bonjour, you can find the printers in the local network on your server hosting site. Using SMTPSocket may be a good idea for sending emails from the server like notifications.

197.0.17 Can I use your ChartDirector plugin on a web application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Yes, our ChartDirector plugin works just fine on the Xojo Web Edition.
Example:

```
// The data for the pie chart
dim data(-1) as Double=array(55.0, 18.0, 25.0, 22.0, 18.0, 30.0, 35.0)

// The labels for the pie chart, Words are choosen random to check font!
dim labels(-1) as string=array("Germany","Italy","France","Spain","UK","Poland","Russia")

// The colors to use for the sectors
dim colors(-1) as Integer

colors.Append & h66aaee
colors.Append & heebb22
colors.Append & hbbbbbb
colors.Append & h8844ff

if TargetLinux then
CDBaseChartMBS.SetFontSearchPath "/usr/share/fonts/truetype/msttcorefonts"
end if

// Create a PieChart object of size 360 x 300 pixels
```

```
dim c as new CDPieChartMBS(700, 600)

c.setBackground(c.linearGradientColor(0, 0, 0, c.getHeight(), & h0000cc, & h000044))
c.setRoundedFrame(& hffffff, 16)
dim tt as CDTextBoxMBS = c.addTitle("ChartDirector Demonstration", "timesbi.ttf", 18)
tt.setMargin(0, 0, 16, 0)
tt.setFontColor(& hFFFFFF)

// Set the center of the pie at (180, 140) and the radius to 100 pixels
c.setPieSize 350,300,150
// Set the sector colors
c.setColors(c.kDataColor, colors)

// Draw the pie in 3D with a pie thickness of 20 pixels
c.set3D(20)

dim t as CDTextBoxMBS = c.setLabelStyle("arialbd.ttf", 10, & h000000)
t.setBackground(CDPieChartMBS.kSameAsMainColor, CDPieChartMBS.kTransparent, CDPieChartMBS.soft-
Lighting(CDPieChartMBS.kRight, 0))
t.setRoundedCorners(8)

// Use local gradient shading for the sectors, with 5 pixels wide
// semi-transparent white (bbffffff) borders
c.setSectorStyle(CDPieChartMBS.kLocalGradientShading, & hbbffffff, 0)

// Set the pie data and the pie labels
c.setData data,labels
call c.setLabelStyle "arialbd.ttf",18

dim pic as picture = c.makeChartPicture
dim wp as new WebPicture(pic, Picture.FormatJPEG) // JPEG makes it smaller and faster

ImageView1.Picture=wp
```

Notes:

Be aware that our plugin produces pictures for you, which you assign to ImageViews. Tranfserring those pictures takes time, so you can optimize that with using WebPicture class. There you can decide between different compressions to improve speed (use JPEG instead of PNG).

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.

197.0.18 Can I use your DynaPDF plugin on a web application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Yes, our DynaPDF plugin works just fine on the Xojo Web Edition.
Notes:

PDF files are created on the server. You may want to offer a preview to the user which uses reduced resolution images to reduce the time to download the PDF.

See our Create PDF example for the Xojo Web Edition.

197.0.19 Can I use your plugin controls on a web application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** No.

197.0.20 Can you get an unique machine ID?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** There is nothing like an unique machine ID.
Notes:

1:
You can use the MAC IDs of the network interfaces.
This can be changed by the user with software tools.
And the list of network interfaces changes if user reorder the interfaces.

2:
You can use the system folder creation date/time.
This may stay equal after cloning machines or after migration to new PC.

3:
You can use the Mac Serialnumber.
Mac only and it can happen that a Mac does not have a serial number.

4:
You can use the x86 CPU ID.
This is x86 CPU only and does not avoid running on the same CPU in different PCs.

197.0.21 ChartDirector: Alignment Specification

Plugin Version: 8.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** ChartDirector: Alignment Specification
Notes:

In many ChartDirector objects, you may specify the alignment of the object's content relative to its boundary. For example, for a TextBox object, you may specify the text's alignment relative to the box boundary by using TextBox.setAlignment.

The ChartDirector API defines several constants for the alignment options.

Constant	Value	Description
BottomLeft	1	The leftmost point on the bottom line.
BottomCenter	2	The center point on the bottom line.
BottomRight	3	The rightmost point on the bottom line.
Left	4	The leftmost point on the middle horizontal line.
Center	5	The center point on the middle horizontal line.
Right	6	The rightmost point on the middle horizontal line.
TopLeft	7	The leftmost point on the top line.
TopCenter	8	The center point on the top line.
TopRight	9	The rightmost point on the top line.
Bottom	2	The center point on the bottom line. Same as BottomCenter.
Top	8	The center point on the top line. Same as TopCenter.
TopLeft2	10	An alternative top-left position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, TopLeft2 refers to refers to the left of the top side, while TopLeft refers to the top of the left side. The reverse applies for a horizontal axis.
TopRight2	11	An alternative top-right position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, TopRight2 refers to refers to the right of the top side, while TopRight refers to the top of the right side. The reverse applies for a horizontal axis.
BottomLeft2	12	An alternative bottom-left position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, BottomLeft2 refers to refers to the left of the bottom side, while BottomLeft refers to the bottom of the left side. The reverse applies for a horizontal axis.
BottomRight2	13	An alternative bottom-right position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, BottomRight2 refers to refers to the right of the bottom side, while BottomRight refers to the bottom of the right side. The reverse applies for a horizontal axis.

197.0.22 ChartDirector: Color Specification

Plugin Version: 8.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** ChartDirector: Color Specification
Notes:

Many functions in the ChartDirector API accept colors as parameters. ChartDirector supports colors specified in web and HTML compatible ARGB format, in which ARGB refers to the Alpha transparency, Red, Green and Blue components of the color.

In addition to ARGB colors, ChartDirector supports "dynamic" colors. A dynamic color is a color that changes depending on the position of the pixels. The "dynamic" colors that ChartDirector supports include "pattern colors", "metal colors", "gradient colors", "zone colors" and "dash line colors".

ChartDirector supports specifying colors indirectly using "palette colors". When a "palette color" is used, the color is specified as an index to a palette. The actual color is looked up from the palette.ARGB Color
ARGB color consists of 4 components - alpha transparency, red, green and blue. The four components are encoded as a 32-bit number, with each component occupying 8 bits. In hexadecimal notation, it is AARRGGBB, where AA, RR, GG and BB are the alpha transparency, red, green and blue components.

Each component ranges from 00 - FF (0 - 255), representing its intensity. For example, pure red color is 00FF0000, pure green color is 0000FF00, and pure blue color is 000000FF. White color is 00FFFFFF, and black color is 00000000.

Most programming language requires you to put special prefix in front of hexadecimal characters. For C++, the prefix is "0x". For example, the syntax for the hexadecimal number 00FFFFFF is 0x00FFFFFF, or simply 0xFFFFFF.
For the alpha transparency component, a zero value means the color is not transparent all at. This is equivalent to traditional RGB colors. A non-zero alpha transparency means the the color is partially transparent. The larger the alpha transparency, the more transparent the color will be. If a partially transparent color is used to draw something, the underlying background can still be seen.

For example, 80FF0000 is a partially transparent red color, while 00FF0000 is a non-transparent red color.

Note that ChartDirector's ARGB color is web and HTML compatible. For example, red is FF0000, the same as in HTML. There are many resources on the web that provide tables in which you can click a color and it will show its HTML color code. These color codes can be used in ChartDirector.

If alpha transparency is FF (255), the color is totally transparent. That means the color is invisible. It does not matter what the RGB components are. So in ChartDirector, only one totally transparent color is used - FF000000. All other colors of the form FFnnnnnn are reserved to represent palette colors and dynamic colors, and should not be interpreted as the normal ARGB colors.

The totally transparent color FF000000 is often used in ChartDirector to disable drawing something. For example, if you want to disable drawing the border of a rectangle, you can set the border color to totally transparent.

For convenience, ChartDirector defines a constant called Transparent, which is equivalent to FF000000.Pattern Color
A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used to fill an area, the area will look like being tiled with a wallpaper pattern.

Pattern colors are created using BaseChart.patternColor, BaseChart.patternColor2, DrawArea.patternColor and DrawArea.patternColor2. The patternColor method creates pattern colors using an array of colors as a bitmap. The patternColor2 method creates pattern colors by loading the patterns from image files.

These methods return a 32-bit integer acting as a handle to the pattern color. The handle can be used in any ChartDirector API that expects a color as its input.Metal Color
A metal color is a color of which the brightness varies smoothly across the chart surface as to make the surface looks shiny and metallic. ChartDirector supports using any color as the base color of the metal color. In particular, using yellow and grey as the base colors will result in metal colors that look gold and silver.

Metal colors are most often used as background colors of charts. They are created using CDBaseChartMBS.metalColor, CDBaseChartMBS.goldColor and CDBaseChartMBS.silverColor. The first method allows you to specify an arbitrary base color. The second and third methods use yellow and grey as the base colors, resulting in gold and silver metal colors.

These methods return a 32-bit integer acting as a handle to the gradient color. The handle can be used in any ChartDirector API that expects a color as its input.Gradient Color
A gradient color is a color that changes progressively across a direction.

Gradient colors are created using BaseChart.gradientColor, BaseChart.gradientColor2, DrawArea.gradientColor and DrawArea.gradientColor2. The gradientColor method creates a 2-point gradient color that changes from color A to color B. The gradientColor2 method creates a multi-point gradient colors that changes from color A to B to C ....

These methods return a 32-bit integer acting as a handle to the gradient color. The handle can be used in any ChartDirector API that expects a color as its input.

One common use of multi-point gradient colors is to define colors that have metallic look and feel. Please refer to DrawArea.gradientColor2 for details.Dash Line Colors
A dash line color is a color that switches on and off periodically. When used to draw a line, the line will appear as a dash line.

Dash line colors are created using BaseChart.dashLineColor and DrawArea.dashLineColor. They accept a

line color and a dash pattern code as arguments, and return a 32-bit integer acting as a handle to the dash line color. The handle can be used in any ChartDirector API that expects a color as its input.Zone Colors
A zone color is for XY charts only. It is a color that automatically changes upon reaching a data threshold value along the x-axis or y-axis. Zone colors are created using Layer.xZoneColor, Layer.yZoneColor, XYChart.xZoneColor or XYChart.yZoneColor.Palette Colors
Palette colors are colors of the format FFFFnnnn, where the least significant 16 bits (nnnn) are the index to the palette. A palette is simply an array of colors. For a palette color, the actual color is obtained by looking up the palette using the index. For example, the color FFFF0001 is the second color in the palette (first color is index 0).

The colors in the palette can be ARGB colors or "dynamic" colors (pattern, gradient and dash line colors).

The first eight palette colors have special significance. The first three palette colors are the background color, default line color, and default text color of the chart. The 4th to 7th palette colors are reserved for future use. The 8th color is a special dynamic color that is equal to the data color of the "current data set".

The 9th color (index = 8) onwards are used for automatic data colors. For example, in a pie chart, if the sector colors are not specified, ChartDirector will automatically use the 9th color for the first sector, the 10th color for the second sector, and so on. Similarly, for a multi-line chart, if the line colors are not specified, ChartDirector will use the 9th color for the first line, the 10th color for the second line, and so on.

The ChartDirector API defines several constants to facilitate using palette colors.

Constant	Value	Description
Palette	FFFF0000	The starting point of the palette. The first palette color is (Palette + 0). The nth palette color is (Palette + n - 1).
BackgroundColor	FFFF0000	The background color.
LineColor	FFFF0001	The default line color.
TextColor	FFFF0002	The default text color.
[Reserved]	FFFF0003 - FFFF0006	These palette positions are reserved. Future versions of ChartDirector may use these palette positions for colors that have special significance.
SameAsMainColor	FFFF0007	A dynamic color that is equal to the data color of the current data set. This color is useful for objects that are associated with data sets. For example, in a pie chart, if the sector label background color is SameAsMainColor, its color will be the same as the corresponding sector color.
DataColor	FFFF0008	The starting point for the automatic data color allocation.

When a chart is created, it has a default palette. You may modify the palette using BaseChart.setColor, BaseChart.setColors, or BaseChart.setColors2.

The advantages of using palette colors are that you can change the color schemes of the chart in one place. ChartDirector comes with several built-in palettes represented by the following predefined constants.

ConstantDescription

defaultPalette	An array of colors representing the default palette. This palette is designed for drawing charts on white backgrounds (or lightly colored backgrounds).
whiteOnBlackPalette	An array of colors useful for drawing charts on black backgrounds (or darkly colored backgrounds).
transparentPalette	An array of colors useful drawing charts on white backgrounds (or lightly colored backgrounds). The data colors in this palette are all semi-transparent.

197.0.23 ChartDirector: Font Specification

Plugin Version: 8.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** ChartDirector: Font Specification
Notes:

Font Name
In ChartDirector, the font name is simply the file name that contains the font. For example, under the Windows platform, the "Arial" font is "arial.ttf", while the "Arial Bold" font is "arialbd.ttf".

NOTE: Mac OS X Specific Information
In Mac OS X, in addition to ".ttf", ChartDirector also supports Mac OS X font file formats, such as Font Suitcase files and Datafork files (.dfont). These files often contain multiple fonts. For example, the "GillSans.dfont" file contains 6 fonts.

So in addition to the file name, an index is needed to determine the font. The index is specified by appending a " | " character to the font name, followed by the index number. For example, the third font in "GillSans.dfont" is denoted as "GillSans.dfont | 2". (Note: The first font starts at 0.) If no index number is provided, the first font is assumed.

ChartDirector also supports using Mac OS X Font Manager names. For example, one may use "Gill Sans Light Italic" instead of using "GillSans.dfont | 1" as the font name. However, the Mac OS X Font Manager is active only if someone has logged into the Mac GUI console, so this method is only recommended for developing applications that run on the GUI console.

The sample programs that come with ChartDirector are designed to run on all operating systems, so they use generic font file names (eg. "arial.ttf") instead of Mac OS X specific names. To allow them to run on Mac OS X, ChartDirector on Mac OS X has a built-in table to map common font file names to Mac OS X font names:

"arial.ttf", "arialbd.ttf", "ariali.ttf" and "arialbi.ttf" are mapped to "Arial | 0" (Arial), "Arial | 1" (Arial Bold), "Arial | 2" (Arial Italic) and "Arial | 3" (Arial Bold Italic)

”times.ttf”, ”timesbd.ttf”, ”timesi.ttf” and ”timesbi.ttf” are mapped to ”Times New Roman | 0” (Times New Roman), ”Times New Roman | 1” (Times New Roman Bold), ”Times New Roman | 2” (Times New Roman Italic) and ”Times New Roman | 3” (Times New Roman Bold Italic)

”cour.ttf”, ”courbd.ttf”, ”couri.ttf” and ”courbi.ttf” are mapped to ”Courier New | 0” (Courier New), ”Courier New | 1” (Courier New Bold), ”Courier New | 2” (Courier New Italic) and ”Courier New | 3” (Courier New Bold Italic)

Font Location
ChartDirector on Windows does not come with any font files. It relies on the operating system’s font files in the ” [windows] \Fonts” directory. To see what fonts are installed in your operating system and their file names, use the File Explorer to view that directory.

ChartDirector on Windows will also search for the font files in the ”fonts” subdirectory (if it exists) under the directory where the ChartDirector DLL ”chartdir.dll” is installed. This is useful for private fonts. Also, for some especially secure web servers, the web anonymous user may not have access to the ” [windows] \Fonts” directory. In this case, you may copy the font files to the above subdirectory.

ChartDirector on Mac OS X relies on operating system font files in ”/Library/Fonts” and ”/System/Library/Fonts”.

ChartDirector on Linux, FreeBSD and Solaris assume the fonts files are in the ”fonts” subdirectory under the directory where the ChartDirector shared object ”libchartdir.so” is installed. ChartDirector on Linux, FreeBSD and Solaris come with a number of font files in the ”fonts” subdirectory.

To keep the download size small, ChartDirector on Linux, FreeBSD and Solaris only come with some commonly used fonts. You may download additional fonts from the Internet. In particular, the Microsoft fonts at
http://sourceforge.net/project/showfiles.php?group_id=34153& release_id=105355
is highly recommended. Please refer to
http://www.microsoft.com/typography/faq/faq8.htm
on how you could use the fonts legally in your system.

ChartDirector supports True Type fonts (.ttf), Type 1 fonts (.pfa and .pfb) and Windows bitmap fonts (.fon). On Mac OS X, ChartDirector also supports Font Suitcase and Datafork (.dfont) files. On Linux, FreeBSD and Solaris, ChartDirector also supports Portable Compiled Fonts (.pcf fonts).

If you want ChartDirector to search other directories for the font files, you may list the directories in an environment variable called ”FONTPATH”.

If you specify an absolute path name for the font file, ChartDirector will use the absolute path name and will not search other directories.Artificial Boldening and Italicizing

Whereas most popular font comes with different styles for ”normal”, ”bold”, ”italic” and ”bold italic”, some fonts only come with one style (the normal style). For example, the Monotype Corsiva font that comes with MS Office only has the normal style (mtcorsva.ttf). For these cases, you may append the ”Bold” and/or ”Italic” words after the font file name (separated with a space) to ask ChartDirector to artificially bolden and/or italicize the font. For example, you may specify the font name as ”mtcorsva.ttf Bold”.Font List
Instead of specifying a single font file as the font name, you may specify a list of font files as the font name, separated by semi-colons. This is useful when using international characters that are only available in some fonts.

For example, if you would like to use the Arial font (”arial.ttf”) for western characters, and the MingLiu font ”mingliu.ttc” for Chinese characters (since the Arial font does not have Chinese characters), you may specify the font name as ”arial.ttf;mingliu.ttc”. In this case, ChartDirector will try the Arial font first. If it cannot find a certain character there, it will try the MingLiu font.Indirect Font Names
ChartDirector supports several special keywords for specifying the font name indirectly. When these keywords are used as font names, ChartDirector will look up the actual font names from a font table. The keywords are as follows:

KeywordsDescription	
”normal”	This default normal font, which is the first font in the font table. This is initially mapped to ”arial.ttf” (Arial).
”bold”	The default bold font, which is the second font in the font table. This is initially mapped to ”arialbd.ttf” (Arial Bold).
”italic”	The default italic font, which is the third font in the font table. This is initially mapped to ”ariali.ttf” (Arial Italic).
”boldItalic”	The default bold-italic font, which is the fourth font in the font table. This is initially mapped to ”arialbi.ttf” (Arial Bold Italic).
”fontN”	The (N + 1)th font in the font table (the first font is ”font0”).

The font table can be modified using BaseChart.setFontTable or DrawArea.setFontTable.

The advantage of using indirect font names is that you can change the fonts fonts in your charts in one place.Font Index
Most font files contain one font. However, it is possible a font file contains multiple fonts (that is, a font collection). For example, in True Type fonts, font files with extension ”.ttc” may represent a font collection.

If a font file contains multiple font, the font index can be used to specify which font to use. By default, the font index is 0, which means the first font in the font file will be used.Font Size
The font size decides how big a font will appear in the image. The font size is expressed in a font unit called points. This is the same unit used in common word processors.

Instead of specifying font size, some ChartDirector API (eg. TextBox.setFontSize) allow you to specify font

height and font width separately. You may use different point sizes for font height and font width to create special effects.Font Color
This is the color to draw the font. (See Color Specification on how colors are represented in ChartDirector.)Font Angle
This is the angle in degrees by which the font should be rotated anti-clockwise.Vertical Layout
By default, text are laid out horizontally, with characters being drawn from left to right.

ChartDirector also supports vertical layout, with characters being drawn from top to bottom. For example, you may use BaseChart.addText to add text that are laid out vertically. Vertical layout is common for oriental languages such as Chinese, Japanese and Korean.

197.0.24 ChartDirector: Mark Up Language

Plugin Version: 8.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** ChartDirector: Mark Up Language
Notes:

ChartDirector Mark Up Language (CDML) is a language for including formatting information in text strings by marking up the text with tags.

CDML allows a single text string to be rendered using multiple fonts, with different colors, and even embed images in the text.Font Styles
You can change the style of the text by using CDML tags. For example, the line:

<*font=timesi.ttf,size=16,color=FF0000>Hello <*font=arial.ttf,size=12,color=8000*>world!
will result in the following text rendered:

In general, all tags in CDML are enclosed by <* and *>. Attributes within the tags determine the styles of the text following the tags within the same block.

If you want to include <* in text without being interpreted as CDML tags, use «* as the escape sequence.

The following table describes the supported font style attributes in CDML. See Font Specification for details on various font attributes.

AttributeDescription

Set the following text to be in superscript style. This attribute does not need to have a value. (You may use ”super” as the attribute instead of ”super=1”.)

Note that unlike HTML tags, no double or single quotes are used in the tags. It is because CDML tags are

font	Starts a new style section, and sets the font name. You may use this attribute without a value (that is, use ”font” instead of ”font=arial.ttf”) to create a new style section without modifying the font name.
size	The font size.
width	The font width. This attribute is used to set the font width and height to different values. If the width and height are the same, use the size attribute.
height	The font height. This attribute is used to set the font width and height to different values. If the width and height are the same, use the size attribute.
color	The text color in hex format.
bgColor	The background color of the text in hex format.
underline	The line width of the line used to underline the following characters. Set to 0 to disable underline.
sub	Set the following text to be in subscript style. This attribute does not need to have a value. (You may use ”sub” as the attribute instead of ”sub=1”.)
super	Set the following text to be in superscript style.

xoffset	Draw the following the text by shifting the text horizontally from the original position by the specified offset in pixels.
yoffset	Draw the following the text by shifting the text vertically from the original position by the specified offset in pixels.
advance	Move the cursor forward (to the right) by the number of pixels as specified by the value this attribute.
advanceTo	Move the cursor forward (to the right) to the position as specified by the value this attribute. The position is specified as the number of pixels to the right of the left border of the block. If the cursor has already passed through the specified position, the cursor is not moved.

often embedded as string literals in source code. The double or single quotes, if used, will conflict with the string literal quotes in the source code. Therefore in CDML, no quotes are necessary and they must not be used.

Also, unlike HTML tags, CDML uses the comma character as the delimiter between attributes. It is because certain attributes may contain embed spaces (such as the font file name). So space is not used as the delimiter and the comma character is used instead.

Note the font attribute above starts a new style section, while other attributes just modify the current style section. You may use <*/font*>to terminate a style section, which will restore the font styles to the state before the style section.Blocks and Lines
In CDML, a text string may contain multiple blocks. A block may contain multiple lines of text by separating them with new line characters (”\n”) or with <*br*>. The latter is useful for programming languages

that cannot represent new line characters easily.

For example, the line:

<*size=15*><*block*><*color=FF*>BLOCK<*br*>ONE<*/*>and <*block*><*color=FF00*>BLOCK<*br*>TWO
will result in the following text rendered:

The above example contains a line of text. The line contains two blocks with the characters ” and ” in between. Each block in turn contains two lines. The blocks are defined using <*block*>as the start tag and <*/*>as the end tag.

When a block ends, font styles will be restored to the state before entering the block.Embedding Images
CDML supports embedding images in text using the following syntax:

<*img=my_image_file.png*>
where my_image_file.png is the path name of the image file.

For example, the line:

<*size=20*>A <*img=sun.png*>day
will result in the following text rendered:

ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath or DrawArea.setSearchPath on the directory that ChartDirector will search for the file.

The <*img*>tag may optionally contain width and height attributes to specify its pixel width and height. In this case, ChartDirector will stretch or compress the image if necessary to the required width and height.Blocks Attributes
CDML supports nesting blocks, that is, a block can contain other sub-blocks. Attributes are supported in the <*block*>tag to control the alignment and orientation of the sub-blocks. The <*img=my_image_file.png*>is treated as a block for layout purposes.

For example, the line:

<*block,valign=absmiddle*><*img=molecule.png*><*block*>Hydrazino\nMolecule<*/*><*/*>
will result in the following text rendered:

The the above starts <*block,valign=absmiddle*>which specifies its content should align with each others in the vertical direction using the absolute middle alignment. The block contains an image, followed by a space characters, and then another block which has two lines of text.

The following table describes the supported attributes inside <*block*>tag:

AttributeDescription

width	The width of the block in pixels. By default, the width is automatically determined to be the width necessary for the contents of the block. If the width attribute is specified, it will be used as the width of the block. If the width is insufficient for the contents, the contents will be wrapped into multiple lines.
height	The height of the block in pixels. By default, the height is automatically determined to be the height necessary for the contents of the block. If the height attribute is specified, it will be used as the height of the block.
maxwidth	The maximum width of the block in pixels. If the content is wider than maximum width, it will be wrapped into multiple lines.
truncate	The maximum number of lines of the block. If the content requires more than the maximum number of lines, it will be truncated. In particular, if truncate is 1, the content will be truncated if it exceeds the maximum width (as specified by maxwidth or width) without wrapping. The last few characters at the truncation point will be replaced with "...".
linespacing	The spacing between lines as a ratio to the default line spacing. For example, a line spacing of 2 means the line spacing is two times the default line spacing. The default line spacing is the line spacing as specified in the font used.
bgColor	The background color of the block in hex format.
valign	The vertical alignment of sub-blocks. This is for blocks that contain sub-blocks. Supported values are baseline, top, bottom, middle and absmiddle.

The value baseline means the baseline of sub-blocks should align with the baseline of the block. The baseline is the underline position of text. This is normal method of aligning text, and is the default in CDML. For images or blocks that are rotated, the baseline is the same as the bottom.

The value top means the top line of sub-blocks should align with the top line of the block.

The value bottom means the bottom line of sub-blocks should align with the bottom line of the block.

The value middle means the middle line of sub-blocks should align with the the middle line of the block. The middle line is the middle position between the top line and the baseline.

The value absmiddle means the absolute middle line of sub-blocks should align with the absolute middle line of the block. The absolute middle line is the middle position between the top line and the bottom line.

halign The horizontal alignment of lines. This is for blocks that contain multiple lines. Supported values are left, center and right.

The value left means the left border of each line should align with the left border of the block. This is the default.

The value center means the horizontal center of each line should align with the horizontal center of the block.

The value right means the right border of each line should align with the right border of the block.

angle Rotate the content of the block by an angle. The angle is specified in degrees in counter-clockwise direction.

197.0.25 ChartDirector: Parameter Substitution and Formatting

Plugin Version: 8.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** ChartDirector: Parameter Substitution and Formatting
Notes:

ChartDirector charts often contain a lot of text strings. For example, sector labels in pie charts, axis labels for x and y axes, data labels for the data points, HTML image maps, etc, are all text strings.

ChartDirector uses parameter substitution to allow you to configure precisely the information contained in the text and their format.
Format Strings
In parameter substitution, format strings are used to specify the entities to be include into labels and how to format numbers and dates.

For example, when drawing a pie chart with side label layout, the default sector label format string is:

" { label } ({ percent } %)"

When the sector label is actually drawn, ChartDirector will replace " { label } " with the sector name, and " { percent } " with the sector percentage. So the above label format will result is a sector label similar to "ABC (34.56%)".

You may change the sector label format by changing the format string. For example, you may change it to:

" { label } : US$ { value | 2 } K ({ percent } %)"

The sector label will then become something like "ABC: US$ 123.00 (34.56%)".

In general, in ChartDirector parameter substitution, parameters enclosed by curly brackets will be substituted with their actual values when creating the texts.

For parameters that are numbers or dates/times, ChartDirector supports a special syntax in parameter substitution to allow formatting for these values. Please refer to the Number Formatting and Date/Time Formatting sections below for details.

Parameter Expressions

ChartDirector supports numeric expressions in format strings. They are denoted by enclosing the expression with curly brackets and using "=" as the first character. For example:

"USD { value } (Euro { = { value } *0.9 })"

In the above, " { value } " will be substituted with the actual value of the sector. The expression " { = { value } *0.9 } " will be substituted with the actual value of the sector multiplied by 0.9.

ChartDirector parameter expressions support operators "+", "-", "*", "/", "% " (modulo) and "^" (exponentiation). Operators "*", "/", "% ", "^" is computed first, followed by "+" and "-". Operators of the same precedence are computed from left to right). Parenthesis "(" and ")" can be used to change the computation order.

Parameters for Pie Charts

The following table describes the parameters available for pie charts.

Parameter	Description
sector	The sector number. The first sector is 0, while the nth sector is (n-1).
dataSet	Same as { sector } . See above.
label	The text label of the sector.
dataSetName	Same as { label } . See above.
value	The data value of the sector.
percent	The percentage value of the sector.
fieldN	The (N + 1)th extra field. For example, { field0 } means the first extra field. An extra field is an array of custom elements added using BaseChart.addExtraField or BaseChart.addExtraField2.

Parameters for All XY Chart Layers

The followings are parameters that are apply to all XY Chart layers in general. Some layer types may have

additional parameters (see below).

Note that certain parameters are inapplicable in some context. For example, when specifying the aggregate label of a stacked bar chart, the { dataSetName } parameter is inapplicable. It is because a stacked bar is composed of multiple data sets. It does not belong to any particular data set and hence does not have a data set name.

{ fieldN } means the extra field is indexed by the data point number. The Pth data point corresponds to the Pth element of the extra field.

Additional Parameters for Line Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for Trend Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for Box-Whisker Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for HLOC and CandleStick Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for Vector Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Parameters for All Polar Layers
The followings are parameters that are apply to all Polar Chart layers in general. Some layer types may have additional parameters (see below).

{ fieldN } means the extra field is indexed by the data point number. The Pth data point corresponds to the Pth element of the extra field.

Additional Parameters for PolarVector Layers
The followings are parameters that are in additional to the parameters for all Polar Chart layers.

Parameters for Axis
The following table describes the parameters available for pie charts.

Number Formatting
For parameters that are numbers, ChartDirector supports a number of formatting options in parameter substitution.

For example, if you want a numeric field { value } to have a precision of two digits to the right of the decimal point, use ',' (comma) as the thousand separator, and use '.' (dot) as the decimal point, and you may use { value | 2,. } . The number 123456.789 will then be displayed as 123,456.79.

For numbers, the formatting options are specified using the following syntax:

{ [param] | [a] [b] [c] [d] }

where:

If this field starts with "E" or "e", followed by a number, it means formatting the value using scientific notation with the specified number of decimal places. If the "E" or "e" is not followed by a number, 3 is assumed.

For example, { value | E4 } will format the value 10.3 to 1.0300E+1, and { value | e4 } will format the same value to 1.0300e+1.

If this field starts with "G" or "g", followed by a number, it means formatting the value using the scientific notation only if the value is large and requires more than the specified number of digits, or the value is less than 0.001. If scientific notation is used, the number following "G" or "g" also specifies the number of significant digits to use. If the "G" or "g" is not followed by a number, 4 is assumed.

For example, consider the format string { value | G4 } . The value 10 will be formatted to 10. The value 100000 will be formatted to 1.000E+5. Similarly, for { value | g4 } , the value 10 will be formatted to 10, while the value 100000 will be formatted to 1.000e+5.

If you skip this argument, ChartDirector will display the exact value using at most 6 decimal places.

You may skip [b] [c] [d] . In this case, the default will be used.

Date/Time Formatting
For parameters that are dates/times, the formatting options can be specified using the following syntax:

{ [param] | [datetime_format_string] }

where [datetime_format_string] must start with an english character (A-Z or a-z) that is not "G", "g", "E" or "e", and may contain any characters except ' } '. (If it starts with "G", "g", "E" or "e", it will be considered as a number format string.)

Certain characters are substituted according to the following table. Characters that are not substituted will be copied to the output.

For example, a parameter substitution format of { value | mm-dd-yyyy } will display a date as something similar to 09-15-2002. A format of { value | dd/mm/yy hh:nn:ss a } will display a date as something similar to 15/09/02 03:04:05 pm.

If you want to include characters in the format string without substitution, you may enclose the characters in single or double quotes.

For example, the format { value | mmm '<*color=dd0000*>'yyyy } will display a date as something like Jan <*color=dd0000*>2005 (the <*color=dd0000*>is a CDML tag to specify red text color). Note that the <*color=dd0000*>tag is copied directly without substitution, even it contains "dd" which normally will be substituted with the day of month.
Escaping URL/HTML/CDML characters
Parameter substitution is often used to create HTML image maps. In HTML, some characters has special meanings and cannot be used reliably. For example, the '>' is used to represent the end of an HTML tag.

Furthermore, if the field happens to be used as an URL, characters such as '?', '& ' and '+' also have special meanings.

By default, ChartDirector will escape template fields used in URL and query parameters when generating image maps. It will modify URL special characters to the URL escape format "% XX" (eg. "?" will become "% 3F"). After that, it will modify HTML special characters to the HTML escape format "& amps;# nn;" (eg. ">" will become "& amps;# 62;".). Similarly, it will escape other attributes in the image map using HTML escape format (but not URL escape format).

In addition to escaping HTML and URL special characters, ChartDirector will also remove CDML fields in creating image maps. It is because CDML is only interpreted in ChartDirector, should not be useful outside of ChartDirector (such as in browser tool tips).

In some cases, you may not want ChartDirector to escape the special characters. For example, if the parameters have already been escaped before passing to ChartDirector, you may want to disable ChartDirector from escaping them again.

ChartDirector supports the following special fields to control the escape methods - " { escape_url } ", " { noescape_url } ", " { escape_html } ", " { noescape_html } ", " { escape_cdml } " and { noescape_cdml } ". These fields enable/disable the escape methods used in the template fields that follow them.

197.0.26 ChartDirector: Shape Specification

Plugin Version: 8.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** ChartDirector: Shape Specification
Notes:

Several ChartDirector API accept shape specification as arguments. For example, BarLayer.setBarShape and BarLayer.setBarShape2 can be used to specify shapes of bars in bar charts, while DataSet.setDataSymbol, DataSet.setDataSymbol4, PolarLayer.setDataSymbol and PolarLayer.setDataSymbol4 can be used to specify shapes for data symbols.

Note that in addition to shapes, in many cases ChartDirector also accepts images or custom draw objects for data representation. For example, see DataSet.setDataSymbol2, DataSet.setDataSymbol3, PolarLayer.setDataSymbol2 and PolarLayer.setDataSymbol3.

Built-In Shapes

Built-in shapes are specified as integers. The integers can be explicit constants, or can be generated by a ChartDirector method for parameterized shapes. For example, a circle is represented by an explicit constant CircleShape (=7). On the other hand, the number representing a polygon depends on the number of sides the polygon has, so it is generated by using the PolygonShape method, passing in the number of sides as argument.

The following table illustrates the various ChartDirector shapes:

Custom Shapes

In ChartDirector, custom shapes are specified as an array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of 1000 x 1000 units, in which the x-axis is from -500 to 500 going from left to right, and the y-axis is from 0 to 1000 going from bottom to top.

ChartDirector will automatically scale the polygon so that 1000 units will become to the pixel size as requested by the various ChartDirector API.

As an example, the shape of the standard diamond shape in ChartDirector is represented as an array with 8 numbers:

0, 0, 500, 500, 0, 1000, -500, 500

197.0.27 Copy styled text?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** How to quickly copy styled text from one textarea to another?
Example:

```
# if TargetWin32 then
TextArea1.WinRTFDataMBS = TextArea2.WinRTFDataMBS
# elseif TargetMacOS then
TextArea1.NSTextViewMBS.textStorage.setAttributedString TextArea2.NSTextViewMBS.textStorage
# else
TextArea1.StyledText = TextArea2.StyledText
# endif
```

Notes: The code above uses special plugin functions on Mac and Windows and falls back to framework for Linux.

197.0.28 Do you have code to validate a credit card number?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can check the checksum to tell if a credit card number is not valid.
Example:

```
Dim strNumber As String
Dim nLength as Integer
Dim nValue as Integer
Dim nChecksum as Integer
Dim nIndex as Integer

strNumber = EditField1.Text
nLength = Len(strNumber)
nChecksum = 0

For nIndex = 0 To nLength - 2
nValue = Val(Mid(strNumber, nLength - (nIndex + 1), 1)) * (2 - (nIndex Mod 2))
If nValue <10 Then
nChecksum = nChecksum + nValue
Else
nChecksum = nChecksum + (nValue - 9)
End If
Next

If Val(Mid(strNumber, Len(strNumber), 1)) = (10 - (nChecksum Mod 10)) Mod 10 Then
MsgBox("The credit card number looks valid")
Else
```

```
MsgBox("The credit card number is invalid")
End IF
```

Notes:

Here's some code that will validate the checksum for a credit card. It works for Visa, MasterCard, American Express and Discover. Not sure about others, but I imagine they use the same basic algorithm. Of course, this doesn't actually mean that the credit card is valid, it's only useful for helping the user catch typos.

The above code doesn't have any error checking and it expects that the credit card number will be entered without spaces, dashes or any other non-numeric characters. Addressing those issues will be an exercise left to the reader. :)

(From Mike Stefanik)

197.0.29 Do you have plugins for X-Rite EyeOne, eXact or i1Pro?

Plugin Version: all, Console & Web: No. **Answer:** Our EyeOne plugin is available on request for licensees of the X-Rite SDKs.
Notes:

Please first go to X-Rite and get a SDK license.
Than we can talk about the plugin.

197.0.30 Does SQL Plugin handle stored procedures with multiple result sets?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Yes, the plugin can work with multiple recordsets.
Notes:

You need to use SQLCommandMBS class. When you get back results, you use FetchNext to walk over all records in the first result set. Than you simply start again with FetchNext to get the second record set.
Even the RecordSet functions should work, just use them twice to get all records from both record sets.

197.0.31 Does the plugin home home?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Yes, we like to know who is using the plugin, so the plugin may contact our server.
Example:

none.

Notes:

Please note that this does not affect your users as the plugin will only do this in the IDE and the relevant plugin part is never included in your applications.

The plugin if used for some hours, does contact our server to provide statistical data about Xojo version and OS versions. This way we know what versions are used. We can return the version number of the current plugin which may be visible in future versions somehow. And we transmit partial licenses data so we can track use of illegal license keys.

If you do not like to have this, you can block Xojo IDE from contacting our website via your Firewall.
Blocking the transfer will not disable the plugin or change the features.
Or contact us for a plugin version which explicitly does not contain this feature.

197.0.32 folderitem.absolutepath is limited to 255 chars. How can I get longer ones?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Paths on a Mac are not unique, so use them only to display them to the user.
Example:

```
Function AbsolutePath(f as FolderItem) As String
Dim s as string
Dim nf as FolderItem
nf = f
s = ""
while nf<>nil
s = nf.name + ":" + s
nf = nf.parent
wend
Return s
End Function
```

197.0.33 Has anyone played round with using CoreImage to do things like add dissolve transitions say when changing from one tab to another within a window?

Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** This code implements animations for a tabpanel change:
Example:

```
// in a tabpanel.change event:

dim r as CGSTransitionRequestMBS
dim co as new CGSConnectionMBS
dim cw as CGSWindowMBS
dim ct as CGSTransitionMBS
static OldTab as Integer

cw=co.CGSWindow(window1)
If cw = Nil Then
return // 10.3...
End If
r=new CGSTransitionRequestMBS
r.TransitionType=r.CGSFlip
r.HasBackGround=false
r.HasBackColor=false
r.Win=cw
// watch the value of the clicked tab versus the last tab
if tabpanel1.Value=0 or tabpanel1.Value <OldTab then
r.TransitionOption=r.CGSLeft
ct=co.NewTransition(r)
if ct<>Nil then
Refresh
ct.Invoke(1)
ct.Wait(1)
ct.Release
else
MsgBox "Error creating the transition."
end if
else
r.TransitionOption=r.CGSRight
ct=co.NewTransition(r)
if ct<>Nil then
Refresh
ct.Invoke(1)
ct.Wait(1)
ct.Release
else
MsgBox "Error creating the transition."
end if
```

```
end if
// Keep track of the last tab clicked
OldTab = tabpanel1.Value
```

Notes: See CGS* classes for more details.

197.0.34 How about Plugin support for older OS X?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** We support in general Mac OS X 10.5 and newer.
Notes:

All the 64-bit plugins on Mac require OS X 10.7.
Intel 32-bit plugins on Mac require OS X 10.5 or newer.

Currently the ChartDirector 6, GraphicsMagick and GameKit plugins requires Mac OS X 10.6.
Also for SQL Plugin the built in SQLite library requires 10.6.

197.0.35 How can I detect whether an Intel CPU is a 64bit CPU?

Plugin Version: all, Console & Web: No. **Answer:** Look on the CPU family returned by sysctl:
Example:

```
Function is64bit() As Boolean

# if TargetLittleEndian

dim m as MemoryBlock = NewMemoryBlock(8)
dim family as Integer
dim s as string

m=SystemControlNameToMIBMBS("hw.cpufamily")
m=SystemControlMBS(m)

if m<>nil then
m.LittleEndian=True
family=m.Long(0)

const CPUFAMILY_INTEL_6_14 = & h73d67300 //* "Intel Core Solo" and "Intel Core Duo" (32-bit Pentium-M with SSE3) */
const CPUFAMILY_INTEL_6_15 = & h426f69ef //* "Intel Core 2 Duo" */
const CPUFAMILY_INTEL_6_23 = & h78ea4fbc //* Penryn */
```

```
const CPUFAMILY_INTEL_6_26 = & h6b5a4cd2 //* Nehalem */

Select case family
case CPUFAMILY_INTEL_6_14
Return false
case CPUFAMILY_INTEL_6_15
Return true
case CPUFAMILY_INTEL_6_23
Return true
case CPUFAMILY_INTEL_6_26
Return true
// newer CPUs may be missing here
end Select

end if

# endif

Return false

Exception
Return false
End Function
```

Notes: This code is written for Mac OS X where you only have a limited number of possible CPUs.

197.0.36 How can I disable the close box of a window on Windows?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** The following code will remove the close item from the system menu of the window.
Example:

```
# if TargetWin32 then
Declare Function GetSystemMenu Lib "user32" (hwnd as Integer, bRevert as Integer) as Integer
Declare Function RemoveMenu Lib "user32" (hMenu as Integer, nPosition as Integer, wFlags as Integer) as
Integer
Dim hSysMenu as Integer
hSysMenu = GetSystemMenu(me.WinHWND, 0)
RemoveMenu hSysMenu, & HF060, & H0
# endif
```

Notes: The window may not be updated directly.

197.0.37 How can I get all the environment variables from Windows?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Try this code:
Example:

```
# if targetWin32
declare function GetEnvironmentStrings Lib "kernel32" () as ptr
dim m as memoryBlock
dim n as Integer

m=GetEnvironmentStrings()

n=0
do
msgBox m.cstring(n)
while m.byte(n)<>0
n=n+1
wend
n=n+1
loop until m.byte(n)=0
# endif
```

Notes: The MBS Plugin has an EnvironmentMBS class for this.

197.0.38 How can i get similar behavior to Roxio Toast or iTunes where clicking a 'burn' button allows the next inserted blank CD-R to bypass the Finder and be accepted by my application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You need to get a media reservation.
Example:

```
dim d as DRDeviceMBS // get a device
d.AcquireMediaReservation
```

Notes:

Use the plugin function AcquireMediaReservation and later release it using ReleaseMediaReservation.
See plugin examples on how to use it and check Apples DiscRecording framework documentation for more details.

197.0.39 How can I get text from a PDF?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Crossplatform you can use DynaPDF Pro.
Notes:

On Mac OS X you can also use PDFKit for the same job.
While DynaPDF Pro gives you each bit of text with rotation, font information and encoding details, PDFKit gives you only the text string for a PDF page.

197.0.40 How can I get text from a Word Document?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** to get the text string from a doc file, use the NSAttributedStringMBS class.
Notes:

The NSAttributedStringMBS class is Mac OS X only and we have currently no solution for Windows or Linux.

Use the NSAttributedStringMBS.initWithDocFormat(data as string) as boolean method.

197.0.41 How can I get the item string for a given file creator?

Plugin Version: all, Console & Web: No. **Answer:** Try this function:
Example:

```
Sub pullNativeDocs(aCREA As string)
Dim result as Integer
Dim m, k as memoryBlock
Dim f as folderItem
Dim newType as string
Dim anIcon As picture
Dim ofs as Integer

Declare Function GetFileTypesThatAppCanNativelyOpen Lib "Carbon" (appVRefNumHint as Short, appSignature as OSType, nativeTypes as Ptr) as Short Inline68K("701CABFC")
Declare Function GetDocumentKindString Lib "Carbon" (docVRefNum as Short, docType as OSType, docCreator as OSType, kindString as ptr) as Short Inline68K("7016ABFC")

listBox1.deleteAllRows

m = newMemoryBlock(1024)
result = GetFileTypesThatAppCanNativelyOpen(Volume(0).MacVRefNum, aCREA, m)
if result <>0 then
listBox1.addRow "<Not found.>"
```

```
return
end if

do
if m.byte(ofs*4) = 0 then
exit
else
newType = m.OSTypeMBS(ofs*4)
listBox1.addRow newType
k = newMemoryBlock(64)
result = GetDocumentKindString(Volume(0).MacVRefNum, newType, aCREA, k)
if result = 0 then
listBox1.cell(ofs,1) = k.pString(0)
ofs = ofs + 1
else
listBox1.cell(ofs,1) = "(unknown)"
end if

end if
loop

End Sub
```

Notes: Change "Translation" to "CarbonLib" for Mac OS X.

197.0.42 How can I launch an app using it's creator code?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Send an AppleEvent "odoc" with the creator code to the Finder ("MACS"):
Example:

```
Function LaunchByCreator(C As String) As Boolean
Dim A As AppleEvent
A = NewAppleEvent("aevt","odoc","MACS")
A.ObjectSpecifierParam("—-") = GetUniqueIDObjectDescriptor("appf",nil,C)
return A.Send
End Function
```

197.0.43 How can I learn what shared libraries are required by a plugin on Linux?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Please use the ldd command in the terminal.
Notes:

You build an app on any platform, but for Linux.
For the resulting .so files in the libs folder, you can run the ldd command with the library path as parameter. It shows you references lib files and you can make sure you have those installed.

This is a sample run of our graphicsmagick plugin:

cs@Ubuntu32:
textasciitilde /MeinProgramm/MeinProgramm Libs$ ldd libMBSGraphicsMagickPlugin17744.so

cs@Ubuntu32:
textasciitilde /MeinProgramm/MeinProgramm Libs$

As you see all library have been found and their load address is printed behind the na,e.
If a library is missing, you usually see the address missing there or being zero.

197.0.44 How can I validate an email address?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can try this code: **Example:**

```
Dim re As RegEx
re = New RegEx
Dim rm As RegExMatch

re.SearchPattern = " [ a-z0-9!# $ % & '*+/=?^_' { | }
textasciitilde - ] +(?:\. [ a-z0-9!# $ % & '*+/=?^_' { | }
textasciitilde - ] +)*@(?: [ a-z0-9 ] (?: [ a-z0-9- ] * [ a-z0-9 ] )?\.)+ [ a-z0-9 ] (?: [ a-z0-9- ] * [ a-z0-9 ] )?"
rm = re.Search(editField1.Text)

if rm = Nil Then
StaticText2.text = editField1.Text + " not valid email"
Else
StaticText2.Text = editField1.Text + " is valid"
End if
```

Notes:

Adapted from:

http://www.regular-expressions.info/email.html

197.0.45 How do I decode correctly an email subject?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** The following code can be used to decode an email subject including several encodings including Base 64.
Example:

```
dim src as string // input

dim theRegex as Regex
dim theRegexMatch as RegexMatch
dim result, infoCharset, encodedPart as string
dim theStart as Integer

if instr(src, "=?") >0 then
theRegex = new Regex
theRegex.Options.Greedy = false
theRegex.searchPattern = "(.*)=\?(.+)\?(Q | B)\?(.+)\?="
theRegexMatch = theRegex.search(src)
while theRegexMatch <>nil
theStart = theRegexMatch.subExpressionStartB(0) + len(theRegexMatch.subExpressionString(0))

result = result + theRegexMatch.subExpressionString(1)
infoCharset = theRegexMatch.subExpressionString(2)
encodedPart = theRegexMatch.subExpressionString(4)
if theRegexMatch.subExpressionString(3) = "B" then
encodedPart = DecodeBase64(encodedPart)
elseif theRegexMatch.subExpressionString(3) = "Q" then
encodedPart = DecodeQuotedPrintable(encodedPart)
end if
if right(result, 1) = " " then
result = mid(result, 1, len(result)-1)
end if
encodedPart = encodedPart.DefineEncoding(GetInternetTextEncoding(infoCharset))
result = result + encodedPart

theRegex.SearchStartPosition = theStart
theRegexMatch = theRegex.search()
wend

result = result + mid(src, theStart+1)

else
result = src
end if
```

```
// theRegexMatch = theRegex.search

msgbox result
```

Notes:

May not look nice depending on the controls used.
This is no longer needed when using MimeEmailMBS class which decodes for you.

197.0.46 How do I enable/disable a single tab in a tabpanel?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Use the TabpanelEnabledMBS method.
Example:

```
TabpanelEnabledMBS(tabpanel1, 1, false)
```

Notes:

Use Carbon for MachO and CarbonLib for Mac Carbon and AppearanceLib for Mac OS Classic as library.
For Cocoa, please use enabled property of NSTabViewItemMBS class.

197.0.47 How do I find the root volume for a file?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Try this function:
Example:

```
Function GetRootVolume(f as FolderItem) as FolderItem
dim root, dum as folderItem
if f <>nil then
root = f // f might be the volume
do
dum = root.parent
if dum <>nil then
root = dum
end if
loop until dum = nil
return root
end if
End Function
```

197.0.48 How do I get the current languages list?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this code:
Example:

```
dim p as new CFPreferencesMBS
dim a as CFArrayMBS
dim s as CFStringMBS
dim o as CFObjectMBS
dim sa(-1) as string

o=p.CopyAppValue("AppleLanguages",".GlobalPreferences")

if o<>Nil then
a=CFArrayMBS(o)

dim i,c as Integer

c=a.Count-1
for i=0 to c
o=a.Item(i)

if o isa CFStringMBS then
s=CFStringMBS(o)
sa.Append s.str
end if
next
end if

MsgBox Join(sa,EndOfLine)
```

Notes:

On Mac OS X you can get the list of current languages like this list:

```
de
en
ja
fr
es
it
pt
pt-PT
nl
sv
nb
```

da
fi
ru
pl
zh-Hans
zh-Hant
ko

Which has German (de) on the top for a German user.
This code has been tested on Mac OS X 10.5 only.

197.0.49 How do I get the Mac OS Version?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this code:
Example:

```
dim i as Integer
if system.gestalt("sysv", i) then
//do this in an 'If' in case you don't get any value back at all and system.gestalt returns boolean
if i = & h750 then //If OS is 7.5
//do stuff
elseif i = & h761 then //If OS is 7.6.1
//do stuff
end if
end if
```

Notes: The MBS Plugin has a function SystemInformationMBS.OSVersionString for this.

197.0.50 How do I get the printer name?

Plugin Version: all, Console & Web: No. **Answer:** For Mac OS Classic see the code below and for Mac OS X use the Carbon Print Manager Classes from the MBS Plugin.
Example:

```
dim s as String
dim i as Integer

s=app.ResourceFork.GetResource("STR ",-8192)
if s<>"" then
i=ascb(leftb(s,1))
s=mid(s,2,i)
```

```
MsgBox s
end if
```

Notes:

A note from Craig Hoyt:

After looking at your example I had a little deja-vu experience. Several years ago I played around with this same code if FutureBasic. I discovered that it did not and still doesn't provide the 'Printer Name', it does return the print driver name. If it returns 'LaserWriter 8' as the print driver you can look into this file and get the 'PAPA' resource # -8192 to get the actual Printer Name. Unfortunately this does not hold true for other printers. My Epson and HP Printers (the Epson has an Ethernet Card and the HP is USB) do not provide this info in their drivers. As far as I can tell it only returns the name by polling the printer itself.

197.0.51 How do I make a metal window if RB does not allow me this?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** The following declare turns any window on Mac OS X 10.2 or newer into a metal one.
Example:

```
declare sub ChangeWindowAttributes lib "Carbon" (win as windowptr, a as Integer, b as Integer)

ChangeWindowAttributes window1,256,0
```

Notes: May not look nice depending on the controls used.

197.0.52 How do I make a smooth color transition?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:**

I'd like to show in a report some bars, which start with color A and end with color B.

The color change should be very smooth.

My problem: If I would start from 255,0,0 and end by 0,0,0, I would have 255 different colors. If the bars are longer than 255 pixels, would

this look nice?
Example:

```
// Window.Paint:
Sub Paint(g As Graphics)
dim w,w1,x,p as Integer
dim c1,c2,c as color
dim p1,p2 as Double

c1=rgb(255,0,0) // start color
c2=rgb(0,255,0) // end color

w=g.Width
w1=w-1

for x=0 to w1
p1=x/w1
p2=1.0-p1

c=rgb(c1.red*p1+c2.red*p2, c1.green*p1+c2.green*p2, c1.blue*p1+c2.blue*p2)

g.ForeColor=c
g.DrawLine x,0,x,g.Height

next
End Sub
```

Notes: Try the code above in a window paint event handler.

197.0.53 How do I read the applications in the dock app?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Use CFPreferencesMBS class like in this example:
Example:

```
// Reads file names from persistent dock applications and puts them into the list

dim pref as new CFPreferencesMBS

dim persistentapps as CFStringMBS = NewCFStringMBS("persistent-apps")
dim ApplicationID as CFStringMBS = NewCFStringMBS("com.apple.dock")
dim tiledata as CFStringMBS = NewCFStringMBS("tile-data")
dim filelabel as CFStringMBS = NewCFStringMBS("file-label")

// get the array of persistent applications from dock preferences
```

```
dim o as CFObjectMBS = pref.CopyValue(persistentapps, ApplicationID, pref.kCFPreferencesCurrentUser,
pref.kCFPreferencesAnyHost)

if o isa CFArrayMBS then
dim a as CFArrayMBS = CFArrayMBS(o)

// walk over all items in array
dim c as Integer = a.Count-1
for i as Integer = 0 to c

// get dictionary describing item
o = a.Item(i)

if o isa CFDictionaryMBS then
dim d as CFDictionaryMBS = CFDictionaryMBS(o)

// and pick tile data dictionary
o = d.Value(tiledata)
if o isa CFDictionaryMBS then
d = CFDictionaryMBS(o)

// and pick there the file label
o = d.Value(filelabel)
if o isa CFStringMBS then
// and display it
dim name as string = CFStringMBS(o).str
List.AddRow name
end if
end if
end if

next

else
MsgBox "Failed to read dock preferences."
end if
```

Notes: You can use the CFPreferencesMBS.SetValue to change a value and CFPreferencesMBS.Synchronize to write the values to disc. You may need to restart the Dock.app if you modified things.

197.0.54 How do I truncate a file?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** In a binarystream you can set the length property to truncate.

197.0.55 How do update a Finder's windows after changing some files?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this code:
Example:

```
dim f as folderitem // some file
dim ae as appleevent
ae=newappleevent("fndr","fupd","MACS")
ae.folderitemparam("—-")=f
if not ae.send then
//something went wrong
end if
```

Notes: The folderitem.finderupdate from the MBS Plugin does something like this.

197.0.56 How to access a USB device directly?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** First, it depends on the device.
Notes:

Some devices can be talked directly from user mode code, but some require a kernel driver.

For some devices you can use plugins to access them like:

- Audio and Video sources using the QTGrabberClassMBS
- Mass storage devices using the folderitem class.
- Serial devices using the System.SerialPort function.
- HID USB devices can be used with MacHIDMBS, WinHIDMBS or LinuxHIDInterface class.
- Any USB device may be used with MacUSBMBS or WinUSBMBS classes.

In general it is always the best to take the most high level access to have others do the work for the details.

197.0.57 How to add icon to file on Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use Folderitem.AddCustomIcon or NSWorkspaceMBS.setIcon functions.

Notes: Please close any open stream for the file you want to add an icon.

197.0.58 How to ask the Mac for the Name of the Machine?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Using Apple Events you can use this code:
Example:

```
Function Computername() As string

dim theEvent as AppleEvent
dim err as boolean

theEvent = newAppleEvent("mchn","getd","MACS")

err = theEvent.send

return theevent.ReplyString

End Function
```

Notes:

Code above is for Mac OS 9!
Also the MBS Plugin has a function for this which may be faster and work also on Macs without Filesharing (which handles this event).

197.0.59 How to automatically enable retina in my apps?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can run a build script on each build with this code:
Example:

```
Dim App As String = CurrentBuildLocation + "/" + CurrentBuildAppName + ".app"
Call DoShellCommand("/usr/bin/defaults write " + App + "/Contents/Info ""NSHighResolutionCapable""
YES")
```

Notes: This will set the NSHighResolutionCapable flag to YES.

197.0.60 How to avoid leaks with Cocoa functions?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can try this code on Mac OS X:
Example:

```
// in a Timer Action event:
Sub Action()
static LastPool as NSAutoreleasePoolMBS = nil
static CurrentPool as NSAutoreleasePoolMBS = nil

LastPool = CurrentPool
CurrentPool = new NSAutoreleasePoolMBS
End Sub
```

Notes:

With Xojo 2009r4 the code above should not be needed as Xojo runtime does automatically handle the NSAutoreleasePools for you. For older Xojo versions you need to use code with a timer with the action event above to avoid memory leaks.

Please do not use Xojo 2009r4 and newer with plugins before version 9.5. You can get crashes there which typically show a line with a objc_msgSend call.

197.0.61 How to avoid trouble connecting to oracle database with SQL Plugin?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** For oracle the most important thing is to point the plugin to the libraries from oracle.
Notes:

In environment variables, the paths like ORACLE_HOME must be defined.
On Mac OS X you also need to define DYLD_LIBRARY_PATH to point to the dylib files from oracle.

For that you need to modify /etc/launchd.conf for Mac OS X 10.8 and newer.
In older versions those variables in .MacOSX/environment.plist file in user's home.

Another way for the case you bundle things inside your app is to use the LSEnvironment key in info.plist.
In info.plist it looks like this:

```
<key>LSEnvironment</key>
<dict>
<key>test</key>
<string>Hello World</string>
```

</dict>

197.0.62 How to avoid ___NSAutoreleaseNoPool console messages in threads?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You need to use your own NSAutoreleasePool on a thread like this:
Example:

```
sub MyThread.run
dim pool as new NSAutoreleasePoolMBS
// do work here

pool=nil
end sub
```

Notes:

For more details read here:
http://developer.apple.com/mac/library/documentation/Cocoa/Reference/Foundation/Classes/NSAutoreleasePool_Class/Reference/Reference.html

197.0.63 How to bring app to front?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** On Mac you can use this code:
Example:

```
// First way:
app.FrontMostMBS = true

// second way:
dim p as new ProcessMBS
p.GetCurrentProcess
p.FrontProcess = true

// third way:
NSApplicationMBS.sharedApplication.activateIgnoringOtherApps(true)

// for Windows:
RemoteControlMBS.WinBringWindowToTop
```

Notes: This will bring a Mac app to the front layer.

197.0.64 How to bring my application to front?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** This makes SimpleText (Code ttxt) to the frontmost application:
Example:

```
Dim A As AppleEvent
A = NewAppleEvent("misc","actv","")
If Not A.Send then
Beep
end if
```

Notes: (Code is Mac only)

197.0.65 How to catch Control-C on Mac or Linux in a console app?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use SignalHandlerMBS class for this.
Example:

```
// watch for Control-C on Mac
call SignalHandlerMBS.SetFlagHandler(2)

dim ende as boolean = false
do
if SignalHandlerMBS.IsFlagSet(2) then
Print "Flag 2 set. Existing..."
ende = true
end if

DoEvents 1
loop until ende
```

Notes: The signal is catched, a flag is set and you can ask later in your normal application flow for the result.

197.0.66 How to change name of application menu?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** Use this code to change the application menu name on Mac OS X:
Example:

```
dim mb as new MenubarMBS
dim m as MenuMBS = mb.item(1) // 1 is in my tests the app menu
if m<>Nil then
m.MenuTitle = "Hello World"
end if
```

Notes: This code is for Carbon only.

197.0.67 How to change the name in the menubar of my app on Mac OS X?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:**

You mean it screws up if the file name of the bundle itself is different than the name of the executable file in the MacOS folder within the bundle? If so, you should find something like this within your Info.plist file (or the 'plst' resource that the RB IDE builds for you):

```
<key>CFBundleExecutable</key>
<string>Executable file name here</string>
```

Just make sure that file name matches.

However, if your question involves how you can change the name of the app that appears in the menu and the dock, that's different. You can make this name different from the file name by changing the CFBundleName key:

```
<key>CFBundleName</key>
<string>Name for menu here</string>
```

Note that if you use my free AppBundler program, this second part is taken care of for you – just fill in a custom name in the right field. You can find AppBundler (from Thomas Reed) at http://www.bitjuggler.com/products/appbundler/ .

197.0.68 How to check if a folder/directory has subfolders?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use code like this to check all items in a folder:
Example:

```
Function HasSubFolder(folder as FolderItem) As Boolean
dim c as Integer = folder.Count

for i as Integer = 1 to c
dim item as FolderItem = folder.TrueItem(i)

if item<>Nil and item.Directory then
Return true
end if
next

End Function
```

Notes:

We use trueitem() here to avoid resolving alias/link files.
Also we check for nil as we may not have permission to see all items.
And if one is a directory, we return without checking the rest.

197.0.69 How to check if Macbook runs on battery or AC power?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Please use our IOPowerSourcesMBS class like this:
Example:

```
Function PowerSourceState() as Integer
dim p as new IOPowerSourcesMBS

// check all power sources
dim u as Integer = p.Count-1
for i as Integer = 0 to u
dim d as CFDictionaryMBS = p.Item(i)
if d<>nil then
// check if they have a power source state key:
dim o as CFObjectMBS = d.Value(NewCFStringMBS("Power Source State"))
if o isa CFStringMBS then
dim s as string = CFStringMBS(o).str

'MsgBox s
```

```
if s = "AC Power" then
Return 1
elseif s = "Battery Power" then
Return 2
end if
end if
end if
next
Return 0 // unknown
End Function
```

Notes: If you want to check the CFDictionaryMBS content, simply use a line like "dim x as dictionary = d.dictionary" and check the contents in the debugger.

197.0.70 How to check if Microsoft Outlook is installed?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** If you need Outlook for Scripting, you should simply check registry for the required Outlook.Application class:
Example:

```
Function OutlookInstalled() As Boolean
# if TargetWin32 then

try
dim r as new RegistryItem("HKEY_CLASSES_ROOT\Outlook.Application\CLSID", false)

Return true

catch r as RegistryAccessErrorException
// not installed
Return false

end try

# else

// Windows only, so false on other platforms
Return false

# endif

End Function
```

197.0.71 How to check on Mac OS which country or language is currently selected?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** The code below returns a country value.
Example:

```
dim result as Integer

IF TargetMacOS THEN

CONST smScriptLang = 28
CONST smSystemScript = -1

DECLARE FUNCTION GetScriptManagerVariable LIB "Carbon" ( selector as Integer) as Integer
DECLARE FUNCTION GetScriptVariable LIB "Carbon" ( script as Integer, selector as Integer) as Integer

result=GetScriptVariable(smSystemScript, smScriptLang)

END IF
```

Notes:

Returns values like:

For more values, check "Script.h" in the frameworks.

197.0.72 How to code sign my app with plugins?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** When you try to code sign the application with plugin dylibs on Mac OS X, you may see error message that there is actually a signature included.
Notes:

Please use the -f command line parameter with codesign utility to overwrite our MBS signature.
We sign our plugins for Mac and Windows to make sure they have not been modified.

In terminal, you do like this:

```
cd <Path to folder of app>

xattr -cr <Appname>.app
codesign -f -s "Developer ID Application: <Your Name>" <Appname>.app/Contents/Frameworks/*.dylib
```

codesign -f -s "Developer ID Application: <Your Name>" <Appname>.app/Contents/Frameworks/*.framework
codesign -f -s "Developer ID Application: <Your Name>" <Appname>.app

Please use the name of your certificate (See keychain), the name of your app and the path to the app folder.
If you have helper apps you need to sign them first.
You can use a build step to automatically sign your app on build.

197.0.73 How to collapse a window?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Use this function (Mac only):
Example:

```
Sub CollapseRBwindow(w as window, CollapseStatus as boolean)
dim state, err as Integer
dim wh as MemoryBlock

Declare Function CollapseWindow Lib "Carbon" (window as Integer,collapse as Integer) as Integer

IF CollapseStatus THEN
state = 1
ELSE
state = 0
END IF

err = CollapseWindow(w.MacWindowPtr, state)

End Sub
```

Notes:

Also the MBS Plugin has a window.collapsedmbs property you can set.
For Windows the MBS Plugin has a window.isiconicmbs property.

197.0.74 How to compare two pictures?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can try this code:
Example:

```
Function ComparePictures(p as picture,q as picture) as Integer
dim r,u as RGBSurface
dim x,y,n,m,h,w as Integer
```

```
dim w1,w2,h1,h2,d1,d2 as Integer
dim c1,c2 as color

h1=p.Height
h2=q.Height
w1=p.Width
w2=q.Width
d1=p.Depth
d2=q.Depth

if d1<>d2 then
Return 1
elseif w1<>w2 then
return 2
elseif h1<>h2 then
Return 3
else
r=p.RGBSurface
u=q.RGBSurface

if r=nil or u=nil then
Return -1
else
h=h1-1
w=w1-1
m=min(w,h)

for n=0 to m
c1=r.Pixel(n,n)
c2=u.Pixel(n,n)
if c1<>c2 then
Return 4
end if
next

for y=0 to h
for x=0 to w
c1=r.Pixel(x,y)
c2=u.Pixel(x,y)
if c1<>c2 then
Return 5
end if
next
next

// 0 for equal
// -1 for error (no RGBsurface)
// 1 for different depth
```

```
// 2 for different width
// 3 for different height
// 4 for different pixels (fast test)
// 5 for different pixels (slow test)
end if
end if

Exception
Return -1
End Function
```

Notes: Remember that this only works on bitmap pictures, so the picture.BitmapMBS function may be useful.

197.0.75 How to compile PHP library?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You have to download the source code and compile a static version of the library.
Notes:

This instructions were written based on PHP 5.2.6 on Mac OS X:

- Best take a new Mac with current Xcode version installed.
- Download the source code archive. e.g. "php-5.2.6.tar.bz2"
- Expand that archive on your harddisc.
- Open terminal window
- change directory to the php directory. e.g. "cd /php-5.2.6"
- execute this two lines to define the supported CPU types and the minimum Mac OS X version:
- export CFLAGS="-arch ppc -arch i386 -mmacosx-version-min=10.3"
- export CXXFLAGS="-arch ppc -arch i386 -mmacosx-version-min=10.3"
- the command "./configure help" does show the configure options.
- use configure with a line like this:
- ./configure –enable-embed –with-curl -enable-ftp –enable-zip –enable-sockets –enable-static –enable-soap –with-zlib –with-bz2 –enable-exif –enable-bcmath –enable-calendar
- start the compilation with "make all"

- other option is to use "make install" which first does the same as "make all" and than does some installation scripts.
- you may get an error about a duplicate symbole __yytext. Search the file "zend_ini_scanner.c", search a line with "char *yytext;" and change it to "extern char *yytext;".
- On the end you get a lot of error messages, but you have a working library (named libphp5.so) file in the invisible ".libs" folder inside your php source folder.

Possible problems and solutions:

- If the path to your files has spaces, you can get into trouble. e.g. "/RB Plugins/PHP" is bad as files will be searched sometimes in "/RB".
- If you have in /usr/local/lib libraries which conflict with the default libraries, you can get into trouble.
- If you installed some open source tools which compiled their own libraries, you can get into conflicts.
- if you have to reconfigure or after a problem, you may need to use "make clean" before you start "make all" again.

Feel free to install additional libraries and add more packages to the configure line.

197.0.76 How to convert a BrowserType to a String with WebSession.Browser?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use code like this:
Example:

```
Function GetBrowserName(s as WebSession.BrowserType) As string
Select case s
case WebSession.BrowserType.Android
Return "Andriod"
case WebSession.BrowserType.Blackberry
Return "Blackberry"
case WebSession.BrowserType.Chrome
Return "Chrome"
case WebSession.BrowserType.ChromeOS
Return "ChromeOS"
case WebSession.BrowserType.Firefox
Return "Firefox"
case WebSession.BrowserType.InternetExplorer
Return "InternetExplorer"
case WebSession.BrowserType.Opera
Return "Opera"
case WebSession.BrowserType.Safari
Return "Safari"
```

```
case WebSession.BrowserType.SafariMobile
Return "SafariMobile"
case WebSession.BrowserType.Unknown
Return "Unknown"
else
Return "Unkown: "+str(integer(s))
end Select

End Function
```

197.0.77 How to convert a EngineType to a String with WebSession.Engine?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use code like this: **Example:**

```
Function GetRenderingEngineName(s as WebSession.EngineType) As string
Select case s
case WebSession.EngineType.Gecko
Return "Gecko"
case WebSession.EngineType.Presto
Return "Presto"
case WebSession.EngineType.Trident
Return "Trident"
case WebSession.EngineType.Unknown
Return "Unknown"
case WebSession.EngineType.WebKit
Return "WebKit"
else
Return "Unkown: "+str(integer(s))
end Select

End Function
```

197.0.78 How to convert a PlatformType to a String with WebSession.Platform?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use code like this: **Example:**

```
Function GetPlatformName(s as WebSession.PlatformType) As string
Select case s
case WebSession.PlatformType.Blackberry
```

```
Return "Blackberry"
case WebSession.PlatformType.iPad
Return "iPad"
case WebSession.PlatformType.iPhone
Return "iPhone"
case WebSession.PlatformType.iPodTouch
Return "iPodTouch"
case WebSession.PlatformType.Linux
Return "Linux"
case WebSession.PlatformType.Macintosh
Return "Macintosh"
case WebSession.PlatformType.PS3
Return "PS3"
case WebSession.PlatformType.Unknown
Return "Unknown"
case WebSession.PlatformType.WebOS
Return "WebOS"
case WebSession.PlatformType.Wii
Return "Wii"
case WebSession.PlatformType.Windows
Return "Windows"
else
Return "Unkown: "+str(integer(s))
end Select

End Function
```

197.0.79 How to convert a text to iso-8859-1 using the TextEncoder?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:**

This code can help you althrough it's not perfect.
You need to set lc to the current color you use.
Example:

```
dim outstring as string
dim theMac, thePC as textencoding
dim Mac2PC as textconverter

theMac = getTextEncoding(0) // MacRoman
thePC = getTextEncoding(& h0201) // ISOLatin1

Mac2PC = getTextConverter(theMac, thePC)
// if you wanted to do the opposite just create a converter
// PC2Mac = getTextConverter(thePC, theMac)
```

```
outstring = Mac2PC.convert("Björn, this text should be converted")
Mac2PC.clear
```

Notes:

You have to call Mac2PC.clear after every conversion to reset the encoding engine.
See also newer TextConverterMBS class.

197.0.80 How to convert ChartTime back to Xojo date?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** We have this example code:
Example:

```
Function ChartTimeToDate(ChartTime as Double) As date
static diff as Double = 0.0

if diff = 0.0 then
dim d2 as Double = CDBaseChartMBS.chartTime(2015, 1, 1)
dim da as new date(2015, 1, 1)
dim ts as Double = da.TotalSeconds

diff = ts - d2
end if

dim d as new date
d.TotalSeconds = diff + ChartTime

Return d
End Function
```

Notes: As you see we calculate the difference in base date from Date and ChartTime and later use difference to convert.

197.0.81 How to convert line endings in text files?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can simply read file with TextInputStream and write with new line endings using TextOutputStream class.
Example:

```
dim inputfile as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim outputfile as FolderItem = SpecialFolder.Desktop.Child("output.txt")
```

```
dim it as TextInputStream = TextInputStream.Open(inputfile)
dim ot as TextOutputStream = TextOutputStream.Create(outputfile)

ot.Delimiter = EndOfLine.Windows // new line ending
while not it.EOF
ot.WriteLine it.ReadLine
wend
```

Notes: TextInputStream will read any input line endings and with delimiter property in TextOutputStream you can easily define your new delimiter.

197.0.82 How to convert picture to string and back?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use this plugin functions:
Notes:

JPEG:

JPEGStringToPictureMBS(buf as string) as picture
JPEGStringToPictureMBS(buf as string,allowdamaged as Boolean) as picture
PictureToJPEGStringMBS(pic as picture,quality as Integer) as string

PNG:

PictureToPNGStringMBS(pic as picture, gamma as single) as string
PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single) as string
PictureToPNGStringMBS(pic as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string
PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string
PNGStringToPictureMBS(data as string, gamma as single) as picture
PNGStringToPNGPictureMBS(data as string, gamma as single) as PNGpictureMBS

Tiff:

TIFFStringToPictureMBS(data as string) as picture
TIFFStringToTiffPictureMBS(data as string) as TiffPictureMBS

BMP:

BMPStringtoPictureMBS(data as string) as picture
Picture.BMPDataMBS(ResolutionValueDPI as Integer=72) as string

GIF:

GifStringToGifMBS(data as string) as GIFMBS
GifStringToPictureMBS(data as string) as Picture

197.0.83 How to copy an array?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use a function like this to copy an array:
Example:

```
Function CopyArray(a() as Double) as Double()
dim r() as Double
for each v as Double in a
r.Append v
next
Return r
End Function
```

Notes:

If needed make several copies of this method with different data types, not just double.
For a deep copy of an array of objects, you need to change code to also make a copy of those objects.

197.0.84 How to copy an dictionary?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use a function like this to copy a dictionary:
Example:

```
Function CopyDictionary(d as Dictionary) As Dictionary
dim r as new Dictionary
for each key as Variant in d.keys
r.Value(key) = d.Value(key)
next
Return r
End Function
```

Notes:

If needed make several copies of this method with different data types, not just double.
For a deep copy of an dictionary of objects, you need to change code to also make a copy of those objects.

197.0.85 How to copy parts of a movie to another one?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** The code below copies ten seconds of the snowman movie to the dummy movie starting at the 5th second.
Example:

```
dim f as FolderItem
dim md as EditableMovie
dim ms as EditableMovie

f=SpecialFolder.Desktop.Child("Our First Snowman.mov")
ms=f.OpenEditableMovie

ms.SelectionStartMBS=5
ms.SelectionLengthMBS=10

f=SpecialFolder.Desktop.Child("dummy.mov")
md=f.CreateMovie

msgbox str(md.AddMovieSelectionMBS(ms))
```

Notes: If result is not 0, the method fails.

197.0.86 How to create a birthday like calendar event?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this code:
Example:

```
// start a connection to the calendar database
dim s as new CalCalendarStoreMBS

// needed for the error details
dim e as NSErrorMBS

dim r as CalRecurrenceRuleMBS = CalRecurrenceRuleMBS.initYearlyRecurrence(1, nil) // repeat every year without end

dim a as new CalAlarmMBS // add alarm
```

```
a.action = a.CalAlarmActionDisplay
a.relativeTrigger = -3600*24 // 24 Hours before

// create a new calendar
dim c as new CalEventMBS

dim d as new date(2011, 04, 20) // the date

dim calendars() as CalCalendarMBS = s.calendars

// set properties
c.Title="Test Birthday"
c.startDate=d
c.recurrenceRule = r
c.calendar=calendars(0) // add to first calendar
c.addAlarm(a)
c.endDate = d
c.isAllDay = true

// save event
call s.saveEvent(c,s.CalSpanAllEvents, e)
if e<>nil then
MsgBox e.localizedDescription
else
MsgBox "New event was created."
end if
```

Notes: This adds an event to iCal for the given date with alarm to remember you and repeats it every year.

197.0.87 How to create a GUID?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use the UUIDMBS class for this.

197.0.88 How to create a Mac picture clip file?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** You can use code like this one.
Example:

```
dim f As FolderItem
dim p As Picture
```

```
f=SpecialFolder.Desktop.Child("Test.pictClipping")
if f=nil then Return

p=new Picture(300,200,32) 'Make a sample picture
p.Graphics.ForeColor=RGB(0,255,255)
p.Graphics.FillOval 0,0,99,99
p.Graphics.ForeColor=RGB(255,0,0)
p.Graphics.DrawOval 0,0,99,99

dim r As ResourceFork 'ResourceFork is needed for a clip file

// Please define a file type Any
r=f.CreateResourceFork("Any")

// get PICT data using plugin function
dim pictdata as string = p.PicHandleDataMBS
r.AddResource(pictdata,"PICT",256,"Picture")

dim m as new MemoryBlock(8)

m.LittleEndian = false
m.Int16Value(0) = 0
m.Int16Value(2) = 0
m.Int16Value(4) = p.Width
m.Int16Value(6) = p.Height

r.AddResource(m,"RECT",256,"")

'Values taken from a sample file and irrelevant to the problem
dim data as string = DecodeBase64("AQAAAAAAAAAAAAAAAAACAFRDRVIAAAABAAAAAAAAAABUQ0lQAAAAA
r.AddResource(data,"drag",128,"") 'ditto
r.Close
```

Notes: In general Apple has deprecated this, but a few application still support clippings.

197.0.89 How to create a PDF file in Xojo?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Check our DynaPDF plugin and the examples.
Notes:

An alternative can be to use the CoreGraphics and Cocoa functions on Mac OS X.
For Windows, we can only suggest our DynaPDF plugin.

197.0.90 How to create EmailAttachment for PDF Data in memory?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use code like the one below:
Example:

```
Function EmailAttachmentFromPDFData(PDFData as string, filename as string) As EmailAttachment
dim a as new EmailAttachment

a.data = EncodeBase64(PDFData, 76)
a.ContentEncoding = "base64"
a.MIMEType = "application/pdf"
a.MacType = "PDF "
a.MacCreator = "prvw"
a.Name = filename

Return a
End Function
```

Notes:

Compared to sample code from Xojo documentation, we set the mime type correct for PDF.
The MacType/MacCreator codes are deprecated, but you can still include them for older Mac email clients. "prvw" is the creator code for Apple's preview app.

197.0.91 How to create PDF for image files?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use DynaPDF like this:
Example:

```
Function CreatePrintPDF(jpgFiles() as folderitem, pdfFile as FolderItem, PageWidth as Integer, PageHeight as Integer) As Boolean
// have files?
If pdfFile = Nil Then Return False
If jpgFiles = Nil Then Return False

If jpgFiles.Ubound <0 Then Return False

// new DynaPDF
Dim pdf As New MyDynapdfMBS

// page width/height in MilliMeter
Dim pdfWidth as Integer = PageWidth * 72 / 25.4
Dim pdfHeight as Integer = PageHeight * 72 / 25.4
```

```
// put your license here
Call pdf.SetLicenseKey "Starter"

// create pdf
Call pdf.CreateNewPDF pdfFile

// set a couple of options
Call pdf.SetPageCoords(MyDynaPDFMBS.kpcTopDown)
Call pdf.SetResolution(300)
Call pdf.SetUseTransparency(False)
Call pdf.SetSaveNewImageFormat(False)
Call pdf.SetGStateFlags(MyDynaPDFMBS.kgfUseImageColorSpace, False)
Call pdf.SetJPEGQuality(100)

// set page size
Call pdf.SetBBox(MyDynaPDFMBS.kpbMediaBox, 0, 0, pdfWidth, pdfHeight)
Call pdf.SetPageWidth(pdfWidth)
Call pdf.SetPageHeight(pdfHeight)

// append pages with one image per page
For i as Integer = 0 To jpgFiles.Ubound
Call pdf.Append
Call pdf.InsertImageEx(0, 0, pdfWidth, pdfHeight, jpgFiles(i), 1)
Call pdf.EndPage
Next

// close
Call pdf.CloseFile

Return True
End Function
```

Notes:

This is to join image files in paper size to a new PDF.
e.g. scans in A4 into an A4 PDF.

197.0.92 How to CURL Options translate to Plugin Calls?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Below a few tips on how to translate command line CURL calls to plugin calls.
Notes:

curl -vX PUT http://localhost:5984/appserials/78569238475/DocumentRegister.docx?rev=3-25634563456

–data-binary @DocumentRegister.docx -H ”Content-Type: application/msword”

- The option -v means verbose. You can use OptionVerbose and listen for messages in the DebugMessage event.
- The option -X PUT means we want to do a HTTP PUT Request. So set OptionPut to true. Also you will want to set OptionUpload to true as you upload data.
- We have the URL which you put into OptionURL property.
- The –data-binary option tells CURL to pass the given data. With the @ before the data, it is intrepreted as a file name, so the data is read from the given file. You'll need to open this file and pass data with the Read event as needed. (See CURLS ftp file upload example project)
- The last option -H specifies an additional header for the upload. Pas this additional header with the SetOptionHTTPHeader method.

curl -X PUT http://127.0.0.1:5984/appserials/f2f4e540bf8bb60f61cfcd4328001c59 -d ' { ”type”:”Product”,”description”:”Application Serial”,”acronym”:”AppSerial”,”dateAdded”:”2011-03-21 14:57:36” } '

- Option -X PUT like above.
- Pass the URL again in OptionURL
- This time data is passed in command line for CURL. You'd put this data in the quotes into a string and make it available in the Read event. (See CURLS ftp upload example project)

197.0.93 How to delete file with ftp and curl plugin?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can set post/pre quotes to have ftp commands executed before or after the download/upload.
Example:

```
dim d as CURLMBS // your curl object

// delete file
dim ws() As String
ws.Append "DELE Temp.txt"

d.SetOptionPostQuote(ws)
```

Notes:

Use SetOptionPostQuote, SetOptionPreQuote or SetOptionQuote.
The ftp commands you pass here are native ftp commands and not the commands you use with ftp applications. To delete use DELE and the file path.

197.0.94 How to detect display resolution changed?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** On Mac OS X simply listen for display changed notifications.
Notes: Use the "Distribution Notification Center.rbp" example project as a base and use it to listen to notifications with the name "O3DeviceChanged".

197.0.95 How to detect retina?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Please use Window.BackingScaleFactorMBS to query the factor.
Example:

```
msgbox str(window1.BackingScaleFactorMBS)
```

197.0.96 How to disable force quit?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:**

Please visit this website and get the control panel for Mac OS 9 there:
http://www3.sk.sympatico.ca/tinyjohn/DFQ.html

For Mac OS X use the MBS Plugin with the SetSystemUIModeMBS method.
Notes: Please use presentationOptions in NSApplicationMBS for Cocoa applications.

197.0.97 How to disable the error dialogs from Internet Explorer on javascript errors?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** You can use this code in the htmlviewer open event:
Example:

```
if targetwin32 then
htmlviewer1._ole.Content.value("Silent") = True
end if
```

Notes: This disables the error dialogs from Internet Explorer.

197.0.98 How to display a PDF file in Xojo?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** On Mac OS X you can use CoreGraphics or PDFKit to display a PDF.
Notes:

An alternative can be to load the PDF into a htmlviewer so the PDF plugin can display it.
On Windows you may need to use the Acrobat ActiveX control from Adobe or launch Acrobat Reader.

197.0.99 How to do a lottery in RB?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Try this function:
Example:

```
Sub Lotto(max as Integer,count as Integer,z() as Integer)
// Lotto count numbers of max put into the array z beginning at index 0
dim n(0) as Integer ' all the numbers
dim m as Integer ' the highest field in the current array
dim i,a,b,d as Integer ' working variables

'fill the array with the numbers
m=max-1
redim n(m)

for i=0 to m
n(i)=i+1
next

' unsort them by exchanging random ones
m=max*10
for i=1 to m
a=rnd*max
b=rnd*max

d=n(a)
n(a)=n(b)
n(b)=d
next

' get the first count to the dest array
m=count-1
redim z(m)
for i=0 to m
z(i)=n(i)
next
```

```
'sort the result
z.sort
End Sub

Sub Open()
// Test it

dim za(0) as Integer ' the array of the numbers

lotto 49,6,za ' 6 of 49 in Germany

' and display them
staticText1.text=str(za(0))+chr(13)+str(za(1))+chr(13)+str(za(2))+chr(13)+str(za(3))+chr(13)+str(za(4))+chr(13)+str(za
End Sub
```

197.0.100 How to do an asycron DNS lookup?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** use CFHostMBS class (Mac OS X only).
Notes:

Xojo internal functions and plugin DNS functions are sycronized.
You can use DNSLookupThreadMBS class for doing them asyncron.

197.0.101 How to draw a dushed pattern line?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can try this code:
Example:

```
// call like this: DrawDushedPatternLine g,0,0,width,height,10

Sub DrawDushedPatternLine(g as graphics,x1 as Integer,y1 as Integer,x2 as Integer,y2 as Integer, partlen
as Integer)
dim x,y,ox,oy as Double
dim dx,dy as Double
dim w,h,d as Double
dim b as Boolean

w=x2-x1
h=y2-y1

d=sqrt(w*w+h*h)
```

```
dx=w/d*partlen
dy=h/d*partlen

b=true
x=x1
while (x<x2) and (y<y2)
ox=x
oy=y

x=x+dx
y=y+dy

if b then
g.DrawLine ox,oy,x,y
end if

b=not b
wend

End Sub
```

Notes: It would be possible to add this to the plugin, but I think it's better if you do it in plain Xojo code, so it even works on Windows.

197.0.102 How to draw a nice antialiased line?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:**

This code can help you althrough it's not perfect.
You need to set lc to the current color you use.
Example:

```
Sub drawLine(xs as Integer, ys as Integer, xe as Integer, ye as Integer, face as RGBSurface, lineColor as color)
dim intX, intY, count, n, xDiff, yDiff as Integer
dim v, v1, floatX, floatY, xx, yy, xStep, yStep as Double
dim c as color

const st=1.0

xDiff=xe-xs
yDiff=ye-ys
count=max(abs(xDiff), abs(yDiff))
xStep=xDiff/count
```

```
yStep=yDiff/count
xx=xs
yy=ys
for n=1 to count
intX=xx
intY=yy
floatX=xx-intX
floatY=yy-intY

v=(1-floatX)*(1-floatY)*st
v1=1-v
c=face.pixel(intX, intY)
face.pixel(intX, intY)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)
v=floatX*(1-floatY)*st
v1=1-v
c=face.pixel(intX+1, intY)
face.pixel(intX+1, intY)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)
v=(1-floatX)*floatY*st
v1=1-v
c=face.pixel(intX, intY+1)
face.pixel(intX, intY+1)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)
v=floatX*floatY*st
v1=1-v
c=face.pixel(intX+1, intY+1)
face.pixel(intX+1, intY+1)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)

xx=xx+xStep
yy=yy+yStep
next

End Sub
```

Notes: PS: st should be 1 and face should be a RGBSurface or a Graphics object.

197.0.103 How to dump java class interface?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** In terminal you can use "javap -s <classname>" to display the class with the method names and parameters.
Notes: For example show ResultSet class: javap -s java.sql.ResultSet

197.0.104 How to duplicate a picture with mask or alpha channel?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use code like this function:
Example:

```
Function Duplicate(extends p as Picture) As Picture
# if RBVersion >= 2011.04 then
if p.HasAlphaChannel then

// create nw picture and copy content:
dim q as new Picture(p.Width, p.Height)
q.Graphics.DrawPicture p,0,0

Return q

end if
# endif

// create new picture
dim q as new Picture(p.Width, p.Height, 32)

// get mask
dim oldMask as Picture = p.mask(false)
if oldMask = nil then
// no mask, so simple copy
q.Graphics.DrawPicture p,0,0
Return q
end if

// remove mask
p.mask = nil

// copy picture and mask
q.Graphics.DrawPicture p, 0, 0
q.mask.Graphics.DrawPicture oldMask,0,0

// restore mask
p.mask = oldmask

Return q
End Function
```

Notes:

Simply copy it to a module and call it like this: q = p.duplicate.
The code above works with old Xojo versions because of the # if even if your RS version does not support

alpha channel pictures. This way it's future proof.

197.0.105 How to enable assistive devices?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use AppleScript code like below:
Notes:

```
tell application "System Events"
activate

set UI elements enabled to true

return UI elements enabled
end tell
```

You can run this with AppleScriptMBS class.

197.0.106 How to encrypt a file with Blowfish?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use code like this:
Example:

```
dim fi as FolderItem = SpecialFolder.Desktop.Child("test.xojo_binary_project")
dim fo as FolderItem = SpecialFolder.Desktop.Child("test.encrypted")

// read input
dim bi as BinaryStream = BinaryStream.Open(fi)
dim si as string = bi.Read(bi.Length)
bi.Close

// encrypt
dim so as string = BlowfishMBS.Encrypt("MyKey",si)

// write output
dim bo as BinaryStream = BinaryStream.Create(fo)
bo.Write so
bo.Close
```

Notes: Of course you can decrypt same way, just use Decrypt function and of course swap files.

197.0.107 How to extract text from HTML?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use both RemoveHTMLTagsMBS and DecodingFromHTMLMBS like this:
Example:

```
dim html as string = "<p><B>Gr& uuml;& szlig;e</B></P>"
dim htmltext as string = RemoveHTMLTagsMBS(html)
dim text as string = DecodingFromHTMLMBS(htmltext)

MsgBox text // shows: Grüße
```

Notes:

You can use it together with RemoveHTMLTagsMBS to remove html tags. What you get will be the text without tags.
DecodingFromHTMLMBS turns HTML escapes back to unicode characters. Like & auml; to ä.

197.0.108 How to find empty folders in a folder?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Try this code:
Example:

```
dim folder as folderitem // your folder

dim c as Integer = folder.count
for i as Integer = 1 to c
dim item as folderitem = folder.trueitem(i)
if item = nil then
// ignore
elseif item.directory then
// folder
if item.count = 0 then
// found empty folder
end if
end if
next
```

197.0.109 How to find iTunes on a Mac OS X machine fast?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can try Launch Services.
Example:

```
dim f as FolderItem

f=LaunchServicesFindApplicationForInfoMBS("hook","com.apple.iTunes","iTunes.app")

MsgBox f.NativePath
```

197.0.110 How to find network interface for a socket by it's name?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use our plugin to build a lookup table.
Example:

```
Function FindNetworkInterface(name as string) As NetworkInterface
name = name.trim

if name.len = 0 then Return nil

// search by IP/MAC
dim u as Integer = System.NetworkInterfaceCount-1
for i as Integer = 0 to u
dim n as NetworkInterface = System.GetNetworkInterface(i)
if n.IPAddress = name or n.MACAddress = name then
Return n
end if
next

// use MBS Plugin to build a mapping
dim interfaces() as NetworkInterfaceMBS = NetworkInterfaceMBS.AllInterfaces
dim map as new Dictionary

for each n as NetworkInterfaceMBS in interfaces
dim IPv4s() as string = n.IPv4s
dim IPv6s() as string = n.IPv6s

for each IPv4 as string in IPv4s
map.Value(IPv4) = n.Name
next
for each IPv6 as string in IPv6s
map.Value(IPv6) = n.Name
```

```
next
if n.MAC<>"" then
map.Value(n.MAC) = n.Name
end if
next

// now search interfaces by name, IPv4 or IPv6
for i as Integer = 0 to u
dim n as NetworkInterface = System.GetNetworkInterface(i)
if map.Lookup(n.IPAddress, "") = name then
Return n
end if

if map.Lookup(n.MACAddress, "") = name then
Return n
end if
next

End Function
```

Notes: The code above uses a lookup table build using NetworkInterfaceMBS class to find the network interface by name.

197.0.111 How to find version of Microsoft Word?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use code like this:
Example:

```
// find Word
dim f as FolderItem = LaunchServicesFindApplicationForInfoMBS("","com.microsoft.Word","")

// open bundle
dim c as new NSBundleMBS(f)

// read info
dim d as Dictionary = c.infoDictionary

// show version
MsgBox d.Lookup("CFBundleVersion","")
```

Notes: Older versions of Word can be found with creator code "MSWD".

197.0.112 How to fix CURL error 60/53 on connecting to server?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You probably connect with SSL and you have no valid certificate.
Example:

```
dim d as new CURLSMBS

// Disable SSL verification
d.OptionSSLVerifyHost = 0 // don't verify server
d.OptionSSLVerifyPeer = 0 // don't proofs certificate is authentic

// With SSL Verification:
dim cacert as FolderItem = Getfolderitem("cacert.pem")
d.OptionCAInfo = cacert.UnixpathMBS
d.OptionSSLVerifyHost = 2 // verify server
d.OptionSSLVerifyPeer = 1 // proofs certificate is authentic
```

Notes:

You can either use the code above to disable the SSL verification and have no security.
Or you use the cacert file and enable the verification. Than you only get a connection if the server has a valid certificate.

see also:
http://curl.haxx.se/ca/

197.0.113 How to format double with n digits?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use the FormatMBS function for this.
Example:

```
dim d as Double = 123.4567890
listbox1.AddRow FormatMBS("% f", d)
listbox1.AddRow FormatMBS("% e", d)
listbox1.AddRow FormatMBS("% g", d)

listbox1.AddRow FormatMBS("% 5.5f", d)
listbox1.AddRow FormatMBS("% 5.5e", d)
listbox1.AddRow FormatMBS("% 5.5g", d)

d = 0.000000123456
listbox1.AddRow FormatMBS("% f", d)
listbox1.AddRow FormatMBS("% e", d)
```

```
listbox1.AddRow FormatMBS("% g", d)

listbox1.AddRow FormatMBS("% 5.5f", d)
listbox1.AddRow FormatMBS("% 5.5e", d)
listbox1.AddRow FormatMBS("% 5.5g", d)
```

Notes:

see FormatMBS for details.
In general % f is normal style, % e is scientific and % g is whichever gives best result for given space.

197.0.114 How to get a time converted to user time zone in a web app?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use the WebSession.GMTOffset property.
Example:

```
Sub Open()
// current date on server
dim d as new date
dim s as string = d.LongTime

// adjust to client GMT offset
d.GMTOffset = d.GMTOffset + Session.GMTOffset

dim t as string = D.LongTime

MsgBox s+EndOfLine+t
End Sub
```

197.0.115 How to get an handle to the frontmost window on Windows?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** This function returns a handle for the frontmost window:
Example:

```
Function GetForegroundWindowHandle() as Integer
# if targetwin32 then
declare function GetForegroundWindow Lib "user32.dll" as Integer
Return GetForegroundWindow()
# endif
End Function
```

197.0.116 How to get CFAbsoluteTime from date?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** Use code like this:
Example:

```
dim d as new date
dim t as CFTimeZoneMBS = SystemCFTimeZoneMBS
dim g as new CFGregorianDateMBS
g.Day = d.Day
g.Month = d.Month
g.Year = d.Year
g.Minute = d.Minute
g.Hour = d.Hour
g.Second = d.Second

dim at as CFAbsoluteTimeMBS = g.AbsoluteTime(t)
dim x as Double = at.Value

MsgBox str(x)
```

Notes:

As you see we need a timezone and put the date values in a gregorian date record.
Now we can query absolute time for the given timezone.

197.0.117 How to get client IP address on web app?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use the WebSession.RemoteAddress property.
Example:

```
Sub Open()
Title = Session.RemoteAddress
End Sub
```

197.0.118 How to get fonts to load in charts on Linux?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Please use the SetFontSearchPath method in the CDBaseChartMBS class to specify where your fonts are.
Example:

```
if TargetLinux then
CDBaseChartMBS.SetFontSearchPath "/usr/share/fonts/truetype"
else
// on Mac and Windows we use system fonts.
end if
```

Notes:

On Mac OS X and Windows, the fonts are loaded from the system's font folder.

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.

197.0.119 How to get fonts to load in DynaPDF on Linux?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Please use the AddFontSearchPath method in the DynaPDFMBS class to specify where your fonts are.
Example:

```
dim d as new DynaPDFMBS
if TargetLinux then
call d.AddFontSearchPath "/usr/share/fonts/truetype", true
else
// on Mac and Windows we use system fonts.
end if
```

Notes:

On Mac OS X and Windows, the fonts are loaded from the system's font folder.

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.

197.0.120 How to get GMT time and back?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use the date class and the GMTOffset property.
Example:

```
// now
dim d as new date

// now in GMT
dim e as new date
e.GMTOffset = 0

// show
MsgBox str(d.TotalSeconds,"0.0")+" "+str(e.TotalSeconds, "0.0")

dim GMTTimeStamp as Double = e.TotalSeconds

// restore
dim f as new date

// add GMT offset here
f.TotalSeconds = GMTTimeStamp + f.GMTOffset*3600
// because here it's removed
f.GMTOffset = f.GMTOffset

MsgBox d.ShortTime+" ("+str(d.GMTOffset)+") "+str(d.TotalSeconds,"0.0")+EndOfLine+_
e.ShortTime+" ("+str(e.GMTOffset)+") "+str(e.TotalSeconds,"0.0")+EndOfLine+_
f.ShortTime+" ("+str(f.GMTOffset)+") "+str(f.TotalSeconds,"0.0")
```

Notes: It's sometimes a bit tricky with the date class as setting one property often changes the others.

197.0.121 How to get good crash reports?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Check this website from the webkit website:
Notes: http://webkit.org/quality/crashlogs.html

197.0.122 How to get list of all threads?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use the runtime module like in this function:

Example:

```
Function Threads() As Thread()
# pragma DisableBackgroundTasks
dim t() as Thread

Dim o as Runtime.ObjectIterator=Runtime.IterateObjects
While o.MoveNext
if o.Current isa Thread then
t.Append thread(o.current)
end if
Wend

Return t
End Function
```

Notes:

This returns an array of all thread objects currently in memory.
The pragma is important here as it avoids thread switches which may cause a thread to be created or deleted.

197.0.123 How to get parameters from webpage URL in Xojo Web Edition?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use the Webpage.ParametersReceived event.
Example:

```
Sub ParametersReceived(Variables As Dictionary)
for each key as Variant in Variables.keys
MsgBox key+" ->"+Variables.Value(key)
next
End Sub
```

Notes: The text encodings of this strings is not defined in Xojo 2010r5. Please use DefineEncoding.

197.0.124 How to get the color for disabled textcolor?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Ask the appearance manager:
Example:

```
Function GetThemeTextColor(inColor as Integer, inDepth as Integer, inColorDev as Boolean) As Color
declare function GetThemeTextColor lib "Carbon" (inColor as Integer, inDepth as Integer, inColorDev as Boolean, outColor as Ptr) as Integer

dim i as Integer
dim col as MemoryBlock

col = newMemoryBlock(6)

i = GetThemeTextColor(inColor, inDepth, inColorDev, col)

return RGB(col.UShort(0)\256, col.UShort(2)\256, col.UShort(4)\256)
End Function
```

Notes:

The color for this is:

const kThemeTextColorDialogInactive = 2.

c = GetThemeTextColor(kThemeTextColorDialogInactive, Screen(0).Depth, true)

For Mac OS X you should use "CarbonLib" instead of "AppearanceLib" ...

197.0.125 How to get the current free stack space?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can something like the code below:
Example:

```
Sub ShowStackSize()
dim threadid as Integer
dim size as Integer

declare function GetCurrentThread lib "Carbon" (byref threadid as Integer) as short
declare function ThreadCurrentStackSpace lib "Carbon" (threadid as Integer, byref size as Integer) as short

if GetCurrentThread(threadid)=0 then
if 0=ThreadCurrentStackSpace(threadid,size) then
MsgBox str(size)
end if
end if
End Sub
```

Notes: For Mac OS 9, use "ThreadLib" instead of "CarbonLib". You can use # if if you like for that.

197.0.126 How to get the current timezone?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:**

You can use the TimeZoneMBS class or the CFTimeZoneMBS class.
Or code like below:
Example:

```
Function GMTOffsetInMinutes() as Integer
// Returns the offset of the current time to GMT in minutes.
// supports Mac OS and Windows, but not Linux yet (let me know if
// you have code for that, please)
//
// Note that the offset is not always an even multiple of 60, but
// there are also half hour offsets, even one 5:45h offset

// This version by Thomas Tempelmann (rb@tempel.org) on 25 Nov 2005
// with a fix that should also make it work with future Intel Mac targets.
//
// Using code from various authors found on the RB NUG mailing list

dim result, bias, dayLightbias as Integer
dim info as memoryBlock
dim offset as Integer

# if targetMacOS then

Declare Sub ReadLocation lib "Carbon" (location As ptr)

info = NewMemoryBlock(12)
ReadLocation info
if false then
// bad, because it does not work on Intel Macs:
'offset = info.short(9) * 256 + info.byte(11)
else
offset = BitwiseAnd (info.long(8), & hFFFFFF)
end

offset = info.short(9) * 256 + info.byte(11)
offset = offset \60
return offset
```

```
# endif

# if targetWin32 then

Declare Function GetTimeZoneInformation Lib "Kernel32" ( tzInfoPointer as Ptr ) as Integer
// returns one of
// TIME_ZONE_ID_UNKNOWN 0
// – Note: e.g. New Delhi (GMT+5:30) and Newfoundland (-3:30) return this value 0
// TIME_ZONE_ID_STANDARD 1
// TIME_ZONE_ID_DAYLIGHT 2

info = new MemoryBlock(172)
result = GetTimeZoneInformation(info)

bias = info.Long(0)
// note: the original code I found in the NUG archives used Long(84) and switched to Long(0)
// only for result=1 and result=2, but my tests found that Long(0) is also the right value for result=0

if result = 2 then
daylightBias = info.long(168)
end if
offset = - (bias + dayLightbias)
return offset

# endif

End Function
```

197.0.127 How to get the current window title?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** The code below returns the current window title for the frontmost window on Mac OS X if Accessibilty services are
Example:

```
Function CurrentWindowTitle() As string
dim SystemWideElement,FocusedApplicationElement,FocusedWindowElement as AXUIElementMBS
dim FocusedApplication,FocusedWindow,Title as AXValueMBS
dim s as String
dim cs as CFStringMBS

SystemWideElement=AccessibilityMBS.SystemWideAXUIElement
if SystemWideElement<>nil then
FocusedApplication=SystemWideElement.AttributeValue(AccessibilityMBS.kAXFocusedApplicationAttribute)
if FocusedApplication.Type=AccessibilityMBS.kAXUIElementMBSTypeID then
FocusedApplicationElement=new AXUIElementMBS
```

```
FocusedApplicationElement.Handle=FocusedApplication.Handle
FocusedApplicationElement.RetainObject

FocusedWindow=FocusedApplicationElement.AttributeValue(AccessibilityMBS.kAXFocusedWindowAttribute)

if FocusedWindow<>nil and AccessibilityMBS.kAXUIElementMBSTypeID=FocusedWindow.Type then

FocusedWindowElement=new AXUIElementMBS
FocusedWindowElement.Handle=FocusedWindow.Handle
FocusedWindowElement.RetainObject

Title=FocusedWindowElement.AttributeValue(AccessibilityMBS.kAXTitleAttribute)
if Title<>nil and Title.Type=kCFStringMBSTypeID then
cs=new CFStringMBS
cs.handle=Title.Handle
cs.RetainObject
Return cs.str
end if
end if
end if
end if
End Function
```

197.0.128 How to get the cursor blink interval time?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** On Mac OS you can use GetCaretTime from the toolbox.
Example:

```
declare function GetCaretTime lib "Carbon" () as Integer

MsgBox str(GetCaretTime())+" ticks"
```

Notes: 60 ticks make one second.

197.0.129 How to get the list of the current selected files in the Finder?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:**

Use the AppleScript like this one:

```
tell application "finder"
return selection
end tell
```

Which translates into this AppleEvent:

```
Process("Finder").SendAE "core,getd,'—-':obj { form:prop, want:type(prop), seld:type(sele), from:'null'() }
"
```

and as Xojo code it looks like this:
Example:

```
dim ae as appleevent
dim o1 as appleeventObjectSpecifier
dim f as folderItem
dim aList as appleeventdescList
dim i as Integer
dim dateiname as string

// setup the AppleEvent
o1=getpropertyObjectDescriptor( nil, "sele")
ae= newappleEvent("core", "getd", "MACS")
ae.objectSpecifierParam("—-")=o1

// send it
if ae.send then
// got the list
alist=ae.replyDescList

// now show the list of filename into an editfield:

for i=1 to alist.count
f=alist.folderItemItem(i)

dateiname=f.name
// editfield1 with property "mulitline=true"!
editfield1.text=editfield1.text + dateiname + chr(13)
next
end if
```

197.0.130 How to get the Mac OS system version?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** The following code queries the value and displays the version number:
Example:

```
dim first as Integer
dim second as Integer
dim third as Integer
dim l as Integer

if System.Gestalt("sysv",l) then

Third=Bitwiseand(l,15)
second=Bitwiseand(l\16,15)
first=Bitwiseand(l\256,15)+10*Bitwiseand(l\256\16,15)
end if

if First>=10 then
msgbox "Mac OS X "+str(First)+"."+str(Second)+"."+str(third)
else
msgbox "Mac OS "+str(First)+"."+str(Second)+"."+str(third)
end if
```

197.0.131 How to get the Mac OS Version using System.Gestalt?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this code:
Example:

```
Dim s As String
Dim b As Boolean
Dim i, resp as Integer

// Systemversion
b = System.Gestalt("sysv", resp)
If b then
s = Hex(resp)
For i =Len(s)-1 DownTo 1
s=Left(s,i)+"."+Mid(s,i+1)
Next
MsgBox "Systemversion: Mac OS " + s
end if
```

Notes: The MBS Plugin has a SystemInformationMBS.OSVersionString function for this.

197.0.132 How to get the screensize excluding the task bar?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Try this code:
Notes: Use the Screen class with the available* properties.

197.0.133 How to get the size of the frontmost window on Windows?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Try this code:
Notes:

Make yourself a class for the WindowRect with four properties:

```
Bottom as Integer
Left as Integer
Right as Integer
Top as Integer
```

Add the following method to your class:

```
Sub GetWindowRect(windowhandle as Integer)
dim err as Integer
dim mem as memoryBlock
# if targetwin32 then
Declare Function GetWindowRect Lib "user32.dll" (hwnd as Integer, ipRect As Ptr) as Integer

mem = newmemoryBlock(16)
err = GetWindowRect(windowhandle, mem)
Left = mem.long(0)
Top = mem.Long(4)
Right = mem.Long(8)
Bottom = mem.Long(12)
# endif
End Sub
```

Good to use for the MDI Master Window!

197.0.134 How to get the source code of a HTMLViewer?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this code:
Example:

```
// for Windows:

msgbox HTMLViewer1.IEHTMLTextMBS

// for Mac OS X:

msgbox HTMLViewer1.mainFrameMBS.dataSource.data
```

197.0.135 How to get Xojo apps running Linux?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You need to install some requuire packages.
Notes:

You need CUPS as well as GTK packages. On 64 bit systems also the ia32-libs package.

Please note that you need a x86 compatible Linux. So no PPC, Power, ARM or other CPUs.

197.0.136 How to handle really huge images with GraphicsMagick or ImageMagick?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Sometimes it may be better to use an extra application to process images.
Notes:

A typical 32 bit app made with Xojo can use around 1.8 GB on Windows and 3 GB on Mac OS X. Some images may be huge, so that processing them causes several copies of the image to be in memory. With a 500 MB image in memory, doing a scale or rotation may require a temp image. So with source, temp and dest images with each 500 MB plus your normal app memory usage, you may hit the limit of Windows with 1.8 GB.

In that case it may be worth running a tool like gm in the shell class. gm is the command line version of GraphicsMagick. There you can run the 64 bit version which is not limited in memory like your own application. Also you can monitor progress and keep your app responsive.

197.0.137 How to handle tab key for editable cells in listbox?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use code like this function:
Example:

```
Function HandleTabInList(list as listbox, row as Integer, column as Integer, key as String) As Boolean
// Handle tab character in Listbox.CellKeyDown event

Select case asc(key)
case 9
if Keyboard.AsyncShiftKey then
// back

// look for column left
for i as Integer = column-1 downto 0
if list.ColumnType(i) >= list.TypeEditable then
list.EditCell(row, i)
Return true
end if
next

// not found, so look in row before
row = row - 1
if row >= 0 then
for i as Integer = list.ColumnCount-1 downto 0
if list.ColumnType(i) >= list.TypeEditable then
list.EditCell(row, i)
Return true
end if
next
end if
else
// forward

// look for column right
for i as Integer = column+1 to list.ColumnCount-1
if list.ColumnType(i) >= list.TypeEditable then
list.EditCell(row, i)
Return true
end if
next

// not found, so look in row below
row = row + 1
if row <list.ListCount then
for i as Integer = 0 to list.ColumnCount-1
if list.ColumnType(i) >= list.TypeEditable then
```

```
list.EditCell(row, i)
Return true
end if
next
end if
end if
end Select
End Function
```

Notes:

You call it from CellKeyDown event like this:

```
EventHandler Function CellKeyDown(row as Integer, column as Integer, key as String) As Boolean
if HandleTabInList(me, row, column, key) then Return true
End EventHandler
```

As you see in the code, we handle tab and shift + tab for moving back and forward. Also we wrap to previous/next row if needed. Feel free to extend this to wrap from last to first row or create a new row for editing.

197.0.138 How to hard link MapKit framework?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Our MapKit classes weak link the framework. If you need hard linking it for the App Store, you can add this method to a class: **Example:**

```
Sub ReferenceMapKit()
// just put this in window or app class

# if TargetMachO and Target64Bit then
Declare sub testing Lib "MapKit" Selector "test" (id as ptr)
testing(nil)
# endif

End Sub
```

Notes:

No need to call the method.
Just having it in a window or app, will cause the compiler to hard link the framework.

197.0.139 How to have a PDF downloaded to the user in a web application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use a WebHTMLViewer control and load the PDF file with the PDF plugin from the browser.
Example:

```
dim CurrentFile as WebFile // a property of the WebPage

// define the PDF file
CurrentFile = new WebFile
CurrentFile.Filename = "test.pdf"
CurrentFile.MIMEType = "application/pdf"
CurrentFile.Data = "some pdf data" // MyDynaPDF.GetBuffer
CurrentFile.ForceDownload = true

// start the download
showurl(CurrentFile.url)
```

Notes: See our Create PDF example for the Xojo Web Edition.

197.0.140 How to hide all applications except mine?

Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** The code below will on Mac OS hide all applications except your one:
Example:

```
dim p as new ProcessMBS

p.GetFirstProcess
do
if not p.FrontProcess then
p.Visible=false
end if
loop until not p.GetNextProcess
```

197.0.141 How to hide script errors in HTMLViewer on Windows?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Set Internet Explorer to silent mode with code like this:
Example:

```
htmlviewer1.__ole.Content.value("Silent") = True
```

Notes: Simply put this code in the open event of your htmlviewer control (using me instead of htmlviewer1).

197.0.142 How to hide the grid/background/border in ChartDirector?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** If you want to hide something in a chart, simply assign the kTransparent constant as color.

197.0.143 How to hide the mouse cursor on Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this declare:
Example:

```
Declare Sub HideCursor Lib "Carbon" () Inline68K("A852")

HideCursor
```

Notes: The MBS Plugin has this function and supports it on Windows, too.

197.0.144 How to insert image to NSTextView or TextArea?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** With NSTextViewMBS you can use this code to insert file:
Example:

```
// insert a file to textview

Public Sub InsertFile(textview as NSTextViewMBS, f as FolderItem)
// read to file
dim b as BinaryStream = BinaryStream.Open(f)
dim s as string = b.Read(b.Length)

// build wrapper
dim fileWrapper as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(s)
fileWrapper.preferredFilename = f.name

// make attachment
dim fileAttachment as new NSTextAttachmentMBS(fileWrapper)
```

```
dim attributedString as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithAttachment(fileAttachment)

// add to a NSTextViewMBS
textview.insertText attributedString

End Sub
```

Notes: For TextArea you can query the underlaying NSTextViewMBS object via TextArea.NSTextViewMBS method.

197.0.145 How to jump to an anchor in a htmlviewer?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** You can use javascript to change the current window's location.
Example:

```
// load website
htmlviewer1.LoadURL "http://www.monkeybreadsoftware.net/addressbook-abpersonmbs.shtml"

// later jump to anchor named "16":

if TargetWin32 then
call HTMLViewer1.IERunJavaScriptMBS "window.location = ""# 16"""
elseif TargetMacOS then
call HTMLViewer1.EvaluateJavaScriptMBS "window.location = ""# 16"""
else
// not supported
end if
```

197.0.146 How to keep a movieplayer unclickable?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** To keep the user away from clicking on a playing Movie you can just drop a Canvas in front of the Movieplayer and take the clicks there.
Example:

```
Function Canvas1.MouseDown(X as Integer, Y as Integer) as boolean
return true // take it and do nothing
End Function
```

197.0.147 How to keep my web app from using 100% CPU time?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** On Linux and Mac OS X you can use renice command in the terminal. On Windows use the task manager to reduce priority.
Notes:

If you launch your app with nohup on Linux or Mac OS X like this from the terminal or a script:

nohup /webapps/MyApp/MyApp &

you can simply have a second line saying this:

renice 20 $!

which tells the system to lower priority to lowest value for the latest background process.

197.0.148 How to kill a process by name?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can kill a process (or application) by name if you loop over all the processes and kill the one you need.
Example:

```
dim p as new ProcessMBS
p.GetfirstProcess ' get first
do
if p.name = "TextEdit" then
call p.KillProcess
Return
end if
loop until not p.GetNextProcess
```

Notes: You may want to check the result of killProcess function. Not every user is allowed to kill every application.

197.0.149 How to know how many CPUs are present?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this function:
Example:

```
Function GetCPUCount() as Integer
Declare Function MPProcessors Lib "Carbon" () as Integer
```

```
Return MPProcessors()
End Function
```

Notes: Your app will than need that library to launch on Classic. To avoid this the MBS plugin checks if this library is available and return 1 if it's not available.

197.0.150 How to know the calling function?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** On Mac you can use a helper function like this this code:
Example:

```
Public Function CallingFunction() as string
// Query name of calling function of a function

# Pragma BreakOnExceptions false

try

// raise a dummy exception
dim r as new NilObjectException
raise r

catch x as NilObjectException

// get stack
dim stack() as string = x.Stack

// pick function name and return
dim name as string = stack(2)
Return name

end try
End Function
```

Notes: You need to include function names in your application.

197.0.151 How to launch an app using it's creator code?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Send an AppleEvent "oapp" with the creator code to the Finder ("MACS"):
Example:

```
Dim a as AppleEvent
dim creator as string

creator = "MSIE" ' here the Internet Explorer

a = NewAppleEvent("aevt", "odoc", "MACS")
a.Timeout = -1

a.ObjectSpecifierParam("—-") = GetUniqueIDObjectDescriptor("appf", nil, creator)

if not a.send then
msgBox "An error has occured"
else

end if
```

197.0.152 How to launch disc utility?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use this code:
Example:

```
dim f as FolderItem = LaunchServicesFindApplicationForInfoMBS("","com.apple.DiskUtility","")

if f<>Nil then
f.Launch
end if
```

Notes: This works even if people renamed the disc utility or moved it to another folder.

197.0.153 How to make a lot of changes to a REAL SQL Database faster?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You may try to embed your changes to the database between two transaction calls.
Example:

```
dim db as Database // some database

db.SQLExecute "BEGIN TRANSACTION"
// Do some Stuff
db.SQLExecute "END TRANSACTION"
```

Notes: This can increase speed by some factors.

197.0.154 How to make a NSImage object for my retina enabled app?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use code like this:
Example:

```
Function NewRetinaImage(pic as Picture, mask as Picture = nil) As NSImageMBS
// first make a NSImageMBS from it
dim n as new NSImageMBS(pic, mask)

// now set to half the size, so we have 2x pixels for the image
n.size = new NSSizeMBS(n.width/2, n.height/2)

// and return
Return n
End Function
```

Notes:

The thing to do is to have 2x the pixels, but assign a size to the image which gives it the right size in points. You can pass the NSImageMBS from here to NSMenuItemMBS. For Retina displays, the full resolution is used. For others it will be reduced.

197.0.155 How to make a window borderless on Windows?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Try this declares:
Example:

```
// Sets window to borderless popup type, and sets its initial dimensions.
// Call this method, then Win32SetBorderlessPos, and then RB's Show
// method. Use RB Frame type 7 (Global Floating Window).

Const SWP_NOMOVE = &H2
Const SWP_FRAMECHANGED = &H20
```

```
Const HWND_TOPMOST = -1
Const GWL_STYLE = -16
Const WS_POPUPWINDOW = & H80880000

Dim styleFlags as Integer

# If TargetWin32 Then

Declare Function SetWindowLong Lib "user32" Alias "SetWindowLongA" (hwnd as Integer, nIndex as Integer, dwNewLong as Integer) as Integer
Declare Function SetWindowPos Lib "user32" (hwnd as Integer, hWndInstertAfter as Integer, x as Integer, y as Integer, cx as Integer, cy as Integer, flags as Integer) as Integer

styleFlags = SetWindowLong( w.WinHWND, GWL_STYLE, WS_POPUPWINDOW )
styleFlags = BitwiseOr( SWP_FRAMECHANGED, SWP_NOMOVE )
styleFlags = SetWindowPos( w.WinHWND, HWND_TOPMOST, 0, 0, wd, ht, styleFlags )

# EndIf
```

197.0.156 How to make an alias using AppleEvents?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this code:
Example:

```
Sub MakeAlias(folder as folderitem, target as folderitem, aliasname as string)
dim ev as AppleEvent
dim myResult as boolean
dim properties as AppleEventRecord

ev = NewAppleEvent("core","crel","MACS")
ev.MacTypeParam("kocl") = "alis"
ev.FolderItemParam("to ") = target
ev.FolderItemParam("insh") = folder

properties=new AppleEventRecord
properties.StringParam("pnam")=aliasname

ev.RecordParam("prdt")=properties

myResult = ev.send
// true on success, false on error
End Sub
```

Notes:

Call it like this:
MakeAlias SpecialFolder.Desktop, SpecialFolder.Desktop.Child("Gif Copy.rb"), "test.rb alias"

Seems to not work on Mac OS X 10.6

197.0.157 How to make AppleScripts much faster?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** use "ignoring application responses" like in this example:
Notes:

on run { fn,fpx,fpy }
ignoring application responses
tell app "Finder" to set the position of folder fn to fpx,fpy
end ignoring
end run

197.0.158 How to make double clicks on a canvas?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:**

Update: Newer Xojo versions support DoubleClick event, so you don't need this code.

Here's my tip from the tips list on how to add a double-click event to the Canvas control. The technique could easily be used for a window or any Rectcontrol:

Because of its built-in drawing methods, the Canvas control is often used to create custom interface controls. But while the Canvas control has event handlers for most mouse events, it doesn't have an event handler for DoubleClick events. Fortunately, you can add a double-click event handler to a Canvas control easily. Basically, you're going to create a new class based on Canvas and add a double-click event to that. You can then use the new class anytime you need a Canvas with a double-click event.

To create a new Canvas class with a DoubleClick event handler, do this:

1. Add a new class to your project.
2. Set the Super property of the new class to "Canvas".
3. Change the name of this new class to "DoubleClickCanvas".

A double-click occurs when two clicks occur within the users double-click time (set in the Mouse control panel on both Macintosh and Windows) and within five pixels of each other. So, you'll need a few properties to store when and where the last click occurred.

4. Add a new property with the following declaration and mark it as private: lastClickTicks as Integer
5. Add a new property with the following declaration and mark it as private: lastClickX as Integer
6. Add a new property with the following declaration and mark it as private: lastClickY as Integer

Since the Canvas control doesn't have a DoubleClick event, you will need to add one.

7. Add a new event to your class by choosing New Event from the Edit menu and enter "DoubleClick" as the event name.

Double-clicks occur on MouseUp. In order for the mouseUp event to fire, you must return True in the MouseDown event.

8. In the MouseDown event, add the following code:
Return True

In the MouseUp event, you will need to determine what the users double-click time is. This value is represented on both the Mac and Windows in ticks. A tick is 1/60th of a second. Since there isn't a built-in function for this, you'll need to make a toolbox call. The mouseUp event code below makes the appropriate toolbox call for both Macintosh and Windows. It then compares the time of the users last click to the time of the current click and compares the location of the users last click to the location of the current click.

9. Add the following code to the MouseUp event:

```
dim doubleClickTime, currentClickTicks as Integer

# if targetMacOS then
Declare Function GetDblTime Lib "Carbon" () as Integer
doubleClickTime = GetDblTime()
# endif

# if targetWin32 then
Declare Function GetDoubleClickTime Lib "User32.DLL" () as Integer
doubleClickTime = GetDoubleClickTime()/60 // convert to ticks from milliseconds
# endif

currentClickTicks = ticks
//if the two clicks happened close enough together in time
if (currentClickTicks - lastClickTicks) <= doubleClickTime then
//if the two clicks occured close enough together in space
if abs(X - lastClickX) <= 5 and abs(Y - LastClickY) <= 5 then
DoubleClick //a double click has occured so call the event
end if
```

end if
lastClickTicks = currentClickTicks
lastClickX = X
lastClickY = Y

10. Now to test out your new DoubleClickCanvas, drag the class from the Project window to a window in your project to create an instance of it.

11. Double-click on the canvas you just added to your window to open the Code Editor. Notice that the canvas has a DoubleClick event handler. In this event handler, add the following code:
BEEP

197.0.159 How to make my Mac not sleeping?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Just inform the Mac OS about some system activity with code like this:
Example:

```
Sub UpdateSystemActivity()

# if TargetCarbon
declare function myUpdateSystemActivity lib "Carbon" alias "UpdateSystemActivity" (activity as Integer)
as short

const OverallAct = 0 // Delays idle sleep by small amount */
const UsrActivity = 1 // Delays idle sleep and dimming by timeout time */
const NetActivity = 2 // Delays idle sleep and power cycling by small amount */
const HDActivity = 3 // Delays hard drive spindown and idle sleep by small amount */
const IdleActivity = 4 // Delays idle sleep by timeout time */

dim e as Integer

e=myUpdateSystemActivity(UsrActivity)

// you may react on an error if e is not 0 after the call.

# endif
End Sub
```

Notes:

You may use another constant if you prefer some different behavior.
Call it maybe every second.

197.0.160 How to make my own registration code scheme?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** There are excellent articles about how to make a registratin code scheme, but you can also simply use our RegistrationEngineMBS class.
Notes: If you need a license text, why not use the one from Xojo as a starting point?

197.0.161 How to make small controls on Mac OS X?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can try this code on Mac OS X:
Example:

```
'/*
'* Use the control's default drawing variant. This does not apply to
'* Scroll Bars, for which Normal is Large.
'*/
const kControlSizeNormal = 0

'/*
'* Use the control's small drawing variant. Currently supported by
'* the Check Box, Combo Box, Radio Button, Scroll Bar, Slider and Tab
'* controls.
'*/
const kControlSizeSmall = 1

'/*
'* Use the control's small drawing variant. Currently supported by
'* the Indeterminate Progress Bar, Progress Bar and Round Button
'* controls.
'*/
const kControlSizeLarge = 2

'/*
'* Control drawing variant determined by the control's bounds. This
'* ControlSize is only available with Scroll Bars to support their
'* legacy behavior of drawing differently within different bounds.
'*/
const kControlSizeAuto = & hFFFF

const kControlSizeTag = "size"

declare function SetControlData lib "Carbon" (controlhandle as Integer, part as short, tagname as OSType, size as Integer, data as ptr) as short

dim m as MemoryBlock
```

```
m=NewMemoryBlock(2)
m.UShort(0)=kControlSizeSmall

Title=str(SetControlData(CheckBox1.Handle, 0, kControlSizeTag, 2, m))
```

197.0.162 How to mark my Mac app as background only?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can run a build script on each build with this code:
Example:

```
Dim App As String = CurrentBuildLocation + "/" + CurrentBuildAppName + ".app"
Call DoShellCommand("/usr/bin/defaults write " + App + "/Contents/Info ""NSUIElement"" YES")
```

Notes: This will set the NSUIElement flag to YES.

197.0.163 How to move a file or folder to trash?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use code like below:
Example:

```
Function MoveToTrash(f as FolderItem) As Boolean
# if TargetMacOS then
dim r as FolderItem
dim e as Integer = MacFileOperationMBS.MoveObjectToTrashSync(f, r, MacFileOperationMBS.kFSFileOperationDefaultOptions)

if e = 0 then
Return true // Ok
end if

# elseif TargetWin32 then
dim w as new WindowsFileCopyMBS

dim flags as Integer = w.FileOperationAllowUndo + w.FileOperationNoErrorUI + w.FileOperationSilent + w.FileOperationNoConfirmation
if w.FileOperationDelete(f, flags) then
Return true // OK
end if

flags = w.FileOperationNoErrorUI + w.FileOperationSilent + w.FileOperationNoConfirmation
```

```
if w.FileOperationDelete(f, flags) then
Return true // OK
end if
# else
// Target not supported
break
Return false
# endif
End Function
```

Notes:

If you want to move a file to trash, you could use f.movefileto f.trashfolder, but that will overwrite existing files in the trash. You can use our MacFileOperationMBS class to move a file on Mac to the trash. And it uses the same code as the Finder, so files are renamed when the same name is already in use in the trash:

On Windows we use WindowsFileCopyMBS class.
Requires Mac OS X 10.5.

197.0.164 How to move an application to the front using the creator code?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** This makes SimpleText (Code ttxt) to the frontmost application:
Example:

```
dim a as appleevent

a=newappleEvent("misc","actv","ttxt")

if a.send then
end if
```

Notes: (Code is Mac only)

197.0.165 How to move file with ftp and curl plugin?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can set post/pre quotes to have ftp commands executed before or after the download/upload.
Example:

```
dim d as CURLMBS // your curl object

// rename/move file
dim ws() As String
ws.Append "RNFR Temp.txt"
ws.append "RNTO MyFile.txt"

d.SetOptionPostQuote(ws)
```

Notes:

Use SetOptionPostQuote, SetOptionPreQuote or SetOptionQuote.
The ftp commands you pass here are native ftp commands and not the commands you use with ftp applications. So rename is two commands. First RNFR to tell where to rename from and second RNTO with the new file name. To delete use DELE and the file path.

197.0.166 How to normalize string on Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use code like below:
Example:

```
Function Normalize(t as string) As string
const kCFStringNormalizationFormD = 0 // Canonical Decomposition
const kCFStringNormalizationFormKD = 1 // Compatibility Decomposition
const kCFStringNormalizationFormC = 2 // Canonical Decomposition followed by Canonical Composition
const kCFStringNormalizationFormKC = 3 // Compatibility Decomposition followed by Canonical Composition

dim s as CFStringMBS = NewCFStringMBS(t)
dim m as CFMutableStringMBS = s.Normalize(kCFStringNormalizationFormD)

Return m.str
End Function
```

Notes: This uses Apple's CFString functions to normalize unicode variants.

197.0.167 How to obscure the mouse cursor on Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this declare:
Example:

```
Declare Sub ObscureCursor Lib "Carbon" ()
```

ObscureCursor

Notes: The MBS Plugin has this function, but it's not supported for Windows.

197.0.168 How to open icon file on Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Use the NSImageMBS class like this:
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.ico")
dim n as new NSImageMBS(f)

window1.Backdrop = n.CopyPictureWithMask
```

197.0.169 How to open PDF in acrobat reader?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this code:
Example:

```
dim pdf as FolderItem = SpecialFolder.Desktop.Child("test.pdf")

// open PDF in Acrobat Reader on Mac:

// find app
dim bundleID as string = "com.adobe.Reader"
dim app as FolderItem = LaunchServicesFindApplicationForInfoMBS("", bundleID, "")

if app<>nil then

// launch app with parameters

dim docs() as FolderItem
docs.Append pdf

dim param as new LaunchServicesLaunchParameterMBS
param.Defaults = true
param.Application = app

dim x as FolderItem = LaunchServicesOpenXMBS(docs, param)
```

```
// on failure, simply launch it
if x = nil then
pdf.Launch(true)
end if

else
pdf.Launch(true)
end if
```

Notes: On Windows, simply use pdf.launch or WindowsShellExecuteMBS.

197.0.170 How to open printer preferences on Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use our OpenMacOSXPreferencesPaneMBS function like this:
Example:

```
dim e as Integer = OpenMacOSXPreferencesPaneMBS("PrintAndFax")
if 0 = e then
MsgBox "OK"
elseif e = -43 then
MsgBox "File not found."
else
MsgBox "Error: "+str(e)
end if
```

197.0.171 How to open special characters panel on Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** We have functions for that in Cocoa and Carbon.
Example:

```
dim a as new NSApplicationMBS
a.orderFrontCharacterPalette
```

Notes:

For Cocoa, you can use orderFrontCharacterPalette method in NSApplicationMBS class.

Or simply for Carbon and Cocoa the ShowCharacterPaletteMBS method.

197.0.172 How to optimize picture loading in Web Edition?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use the WebPicture class.
Notes:

Take your picture and create a WebPicture object. Store this WebPicture in a property of the WebPage, Session or app (as global as possible). On the first time you use this picture on an user session, the browser will load it. Second time you use it, the browser will most likely pick it from the cache.
Having pictures in App or some module reuses the same picture for all sessions which reduces memory footprint.
This does not work well with pictures you change very often or use only for one webpage on one user.

If you like to see an example, check our Map example.

197.0.173 How to parse XML?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use code like this:
Example:

```
dim s as string = "<test><test /></test>"

try
dim x as new XmlDocument(s)
MsgBox "OK"
catch xe as XmlException
MsgBox "invalid XML"
end try
```

Notes: If you got an exception, you have a parse error.

197.0.174 How to play audio in a web app?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use the HTML5 audio tag and control it with javscript.
Notes:

This is just another example app I made today. It plays a christmas song. The audio file is provided by the

application to the server, so no external web server is needed and this application can run stand alone. To compile and run you need Xojo 2010r5.

In the open event we search the audio files and open them as binarystreams. We create the two webfile objects. Those webfiles are part of the app class, so we have them globally. There we set the data with the content of our streams. We also define file names and mime types. They are needed so browser know what we have here:

```
audioFileM4V = new WebFile
audioFileM4V.Data = bM.Read(BM.Length)
audioFileM4V.Filename = "music.m4a"
audioFileM4V.MIMEType = "audio/m4a"

audioFileOGG = new WebFile
audioFileOGG.Data = bO.Read(BO.Length)
audioFileOGG.Filename = "music.ogg"
audioFileOGG.MIMEType = "audio/ogg"
```

Next in the open event of the webpage we have a PageSource control. The location is set to be before content. In the open event we define the html code for this. First we pick the URLs for the audio files. Than we build the html to use the audio tag. As you see, we give it an ID for later use and have it preload automatically. If you add an autoplay tag, you can have the audio play right away. Inside the audio tag we have two sources so we provide audio for both Firefox (OGG) and Safari (MPEG4). Finally we have a text to display if HTML5 audio tag is not supported.

You can set the source in the EditSource event:

```
dim urlo as string = app.audioFileOGG.URL
dim urlm as string = app.audioFileM4V.URL
me.Source = "<audio id=""mymusic"" preload=""auto""><source src=""""+urlo+""""
type=""audio/ogg"" /><source src=""""+urlm+"""" type=""audio/mpeg"" />Your browser does not support the audio element.</audio>"
```

Next in the Play button we execute code to play the audio. This is a short javascript code which searches in the html document for the element with the ID "mymusic" which is the ID of our audio tag above. Once we got the object, we call it's play method to start playback.

```
me.ExecuteJavaScript("document.getElementById('mymusic').play();")
```

same for pause:

```
me.ExecuteJavaScript("document.getElementById('mymusic').pause();")
```

and finally for changing volume:

me.ExecuteJavaScript("document.getElementById('mymusic').volume="+str(me.Value/100.0)+";")

197.0.175 How to pretty print xml?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use the XML Transform method with the right XLS.
Notes:

Learn more here:
http://docs.xojo.com/index.php/XMLDocument.Transform

197.0.176 How to print to PDF?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** This code below shows how to redirect printing to a PDF file on Mac OS X.
Example:

```
// get Xojo printer setup
dim p as new PrinterSetup

// now put it into NSPrintInfo to manipulate
dim n as new NSPrintInfoMBS
n.SetupString = p.SetupString

// change destination to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
n.SetSaveDestination(f)

// move back
p.SetupString = n.SetupString

// and print as usual
dim g as Graphics = OpenPrinter(p)
g.DrawString "Hello World", 20, 20
```

Notes: And you can use normal graphics class for that.

197.0.177 How to query Spotlight's Last Open Date for a file?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use a MDItemMBS objec to query this value:
Example:

```
Function LastOpenedDate(Extends F As FolderItem, DefaultOtherDates As Boolean = True) As Date
# If TargetMacOS Then
Dim xMDItem as New MDItemMBS(F)
Dim xDate as Variant

If xMDItem <>Nil Then
xDate = xMDItem.GetAttribute(xMDItem.kMDItemLastUsedDate).DateValue
If xDate IsA Date Then Return xDate
Else
If xDate <>Nil Then Break
End If
# EndIf

If DefaultOtherDates Then
If F.ModificationDate <>Nil Then Return F.ModificationDate
If F.CreationDate <>Nil Then Return F.CreationDate
End If
End Function
```

Notes: Thanks for Josh Hoggan for this example code.

197.0.178 How to quit windows?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Try this code:
Example:

```
# if targetwin32 then
dim i1,i2,r as Integer
declare function ExitWindowsEx lib "user32" (uFlags as Integer, dwReserved as Integer) as Integer
i1 = 2
i2 = 0
r = ExitWindowsEx(i1,i2)
if r<>0 then
' Error()
end if

# endif
```

Notes:

uFlags parameters:

'4 = EWX_Force
'0 = EWX_Logoff
'2 = EWX_Reboot
'1 = EWX_shutdown, should shut down computer

Also check the ExitWindowsMBS method.

197.0.179 How to read a CSV file correctly?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** With all the rules for quotes and delimiters, you can simply use the SplitCommaSeparatedValuesMBS method in our plugins like this:
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.csv")
dim t as TextInputStream = f.OpenAsTextFile

while not t.EOF
dim s as string = t.ReadLine(encodings.ASCII)

dim items() as string = SplitCommaSeparatedValuesMBS(s, ";", """")

List.AddRow ""
dim u as Integer = UBound(items)
for i as Integer = 0 to u
List.Cell(List.LastIndex,i) = items(i)
next

wend
```

Notes: Please make sure you choose the right text encoding.

197.0.180 How to read the command line on windows?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Try this code:
Example:

```
# if targetwin32 then
dim line as string
Dim mem as MemoryBlock

Declare Function GetCommandLineA Lib "kernel32" () As Ptr

mem=GetCommandLineA()
s=mem.cstring(0)

# endif
```

Notes: Newer Xojo versions have a system.commandline property.

197.0.181 How to render PDF pages with PDF Kit?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Try this code:
Example:

```
// choose a file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")

// open it as PDF Document
dim sourceFile as New PDFDocumentMBS(f)

if sourceFile.handle <>0 then // it is a PDF file

// get upper bound of pages
dim c as Integer = sourceFile.pageCount-1

// from first to last page
for n as Integer = 0 to c

// pick that page
dim page as PDFPageMBS = sourceFile.pageAtIndex(n)

// render to image
dim p as NSImageMBS = page.Render

// and convert to RB picture and display
Backdrop = p.CopyPictureWithMask

next

end if
```

Notes: PDFKit works only on Mac OS X.

197.0.182 How to restart a Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Ask the Finder via Apple Events:
Example:

```
dim ae as appleevent
ae=newappleEvent("FNDR","rest","MACS")
if not ae.send then
msgBox "The computer couldn't be restarted."
end if
```

197.0.183 How to resume ftp upload with curl plugin?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** CURL supports that and you simply need to set the right options.
Notes:

First of course OptionUpload must be true. Second OptionFTPAppend must be true so the OptionResumeFrom is used. Store there (or in OptionResumeFromLarge) your start value.
Don't forget to implement the read event and return data there as requested.

197.0.184 How to rotate a PDF page with CoreGraphics?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** This code opens a PDF and draws the first page into a new PDF with 90° rotation.
Example:

```
// Rotate a PDF page

// our files
dim sourcefile as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim destfile as FolderItem = SpecialFolder.Desktop.Child("rotated.pdf")

// open PDF
dim pdf as CGPDFDocumentMBS = sourcefile.OpenAsCGPDFDocumentMBS

// query media size of first page
```

```
dim r as CGRectMBS = pdf.MediaBox(1)

// create new PDF
dim c as CGContextMBS = destfile.NewCGPDFDocumentMBS(r,"title","Author","Creator")

// create rotated rectangle
dim nr as new CGRectMBS(0,0,r.Height,r.Width)

// create new page
c.BeginPage nr
c.SaveGState

const pi = 3.14159265

// rotate by 90°
c.RotateCTM pi*1.5

// fix origin
c.TranslateCTM -r.width,0

// draw PDF
c.DrawCGPDFDocument pdf,r,1

// cleanup
c.RestoreGState
c.EndPage

c = nil

// show in PDF viewer
destfile.Launch
```

Notes: This code is Mac only as it needs CoreGraphics.

197.0.185 How to rotate image with CoreImage?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Use the code like the one below:
Example:

```
// Rotate image with CoreImage

// load image
dim f as FolderItem = SpecialFolder.Desktop.Child("test.png")
dim image as new CIImageMBS(f)
```

```
// rotate 45 degree
dim n as new NSAffineTransformMBS
n.rotateByDegrees(45)

dim TransformFilter as new CIFilterAffineTransformMBS
TransformFilter.inputImage = image
TransformFilter.inputTransform = n

// get result
dim resultImage as CIImageMBS = TransformFilter.outputImage

// for saving to file
dim outputImage as NSImageMBS = resultImage.RenderNSImage(false)

f = SpecialFolder.Desktop.Child("output.png")
dim b as BinaryStream = BinaryStream.Create(f, true)
b.Write outputImage.PNGRepresentation

// as Xojo picture object for display
dim pic as Picture = outputImage.CopyPictureWithMask

Backdrop = pic
```

197.0.186 How to run a 32 bit application on a 64 bit Linux?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Install 32 bit compatibility libraries.
Notes:

The package is called ia32-libs for ubuntu (and others).
Some applications need to be run on a 32 bit system as they need some hardware related libraries. Like libUSB or libHID for USB devices.

197.0.187 How to save HTMLViewer to PDF with landscape orientation?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use NSPrintInfoMBS to change the options for PrintToPDFFile function.
Example:

```
// make it landscape
dim n as NSPrintInfoMBS = NSPrintInfoMBS.sharedPrintInfo
n.orientation = n.NSLandscapeOrientation
```

```
// save html to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
call HTMLViewer1.PrintToPDFFileMBS(f,10,30,10,30)
```

Notes:

You may want to reset options later.
This code is only for Mac OS X.

197.0.188 How to save RTFD?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** How to load PDF to htmlviewer on desktop?
Example:

```
Public Sub LoadPDFData(viewer as HTMLViewer, PDFData as string)
Dim base64string As String = EncodeBase64(PDFData)

// remove line endings to make it a big line
base64string = ReplaceLineEndings(base64string, "")

// build data URL
// https://en.wikipedia.org/wiki/Data_URI_scheme
Dim dataURL As String = "data:application/pdf; base64," + base64string

// show in webviewer
HTMLViewer1.LoadURL(dataURL)

// may not work everywhere due to URL length limit
// for Web projects, use WebFile instead!
End Sub
```

Notes:

This avoids a temporary file, which may also work.
For Web Apps, please use WebFile.

197.0.189 How to save RTFD?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** With NSTextViewMBS you can use this code to save to RTFD:
Example:

```
// save text as RTFD including image attachments
dim f as FolderItem = GetSaveFolderItem(FileTypes1.ApplicationRtfd, "test.rtfd")

if f = nil then Return

dim a as NSAttributedStringMBS = textView.textStorage
dim w as NSFileWrapperMBS = a.RTFDFileWrapperFromRange(0, a.length, DocumentAttributes)

dim e as NSErrorMBS
if w.writeToFile(f, e) then

else
MsgBox e.LocalizedDescription
end if
```

Notes: For TextArea you can query the underlaying NSTextViewMBS object via TextArea.NSTextViewMBS method.

197.0.190 How to scale a picture proportionally with mask?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** For a proportional scaling, we calculate the new picture size relative to the target maximum size.
Example:

```
Function ProportinalScaledWithMask(extends pic as Picture, Width as Integer, Height as Integer) As Picture
// Calculate scale factor

dim faktor as Double = min( Height / Pic.Height, Width / Pic.Width)

// Calculate new size
dim w as Integer = Pic.Width * faktor
dim h as Integer = Pic.Height * faktor

// create new picture
dim NewPic as new Picture(w,h,32)

// check if we have a mask and clear it
dim m as picture = pic.mask(False)
pic.mask = nil

// draw picture in the new size
NewPic.Graphics.DrawPicture Pic, 0, 0, w, h, 0, 0, Pic.Width, Pic.Height

if m <>nil then
```

```
// restore mask and scale it
pic.mask = m
NewPic.mask.Graphics.DrawPicture m, 0, 0, w, h, 0, 0, Pic.Width, Pic.Height
end if

// return result
Return NewPic
End Function
```

Notes: This version handles mask. As you see we actually have to remove mask in order to copy the picture part correctly.

197.0.191 How to scale a picture proportionally?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** For a proportional scaling, we calculate the new picture size relative to the target maximum size.
Example:

```
Function ProportionalScaled(extends pic as Picture, Width as Integer, Height as Integer) As Picture
// Calculate scale factor

dim faktor as Double = min( Height / Pic.Height, Width / Pic.Width)

// Calculate new size
dim w as Integer = Pic.Width * faktor
dim h as Integer = Pic.Height * faktor

// create new picture
dim NewPic as new Picture(w,h,32)

// draw picture in the new size
NewPic.Graphics.DrawPicture Pic, 0, 0, w, h, 0, 0, Pic.Width, Pic.Height

// return result
Return NewPic
End Function
```

Notes:

This does not handle mask, but you can scale the mask the same way and assign it to the new picture.
(see other FAQ entry with mask)

197.0.192 How to scale/resize a picture?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** There are several ways to scale or resize a picture. The easiest way may be the ScaleMBS function in the Picture class.
Example:

```
dim Original,Scaled as Picture

Original=LogoMBS(500)
Scaled=Original.ScaleMBS(100,100,true)
```

Notes:

The plugin ways:
- GraphicsMagick can scale/resize.
- CoreImage scale filter may result in the fastest and best images on Mac OS X 10.4.
- NSImageMBS can scale, but is Mac OS X only.
- CGImageMBS can scale, but is Mac OS X only.
- CIImageMBS can scale, but is Mac OS X only.
- QuickTime Graphics exporter and importer can be connected to scale. (this was used more often a few years ago)
- ImageMagick can scale very nice and crossplatform. But the ImageMagick libraries are big.
- The picture.ScaleMBS function is self written and results in equal output on Mac, Windows and Linux without any additional libraries installed.
- Picture.ScalingMBS does crossplatform scaling with several modes.

with pure Xojo:
- make a new picture and draw the old one with new size inside.

197.0.193 How to search with regex and use unicode codepoints?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can specify unicode characters in search string with backslash x and digits.
Example:

```
dim r as RegExMbs
dim s as string
dim c as Integer

s="123 äöü ABC 456"

r=new RegExMBS
if r.Compile(".ö.") then
c=r.Execute(s,0)
MsgBox str(c)+" "+str(r.Offset(0))+" "+str(r.Offset(1))
```

```
// shows: 1 4 10
// 1 for ubound of the offset array
// 4 for 4 bytes before the matched pattern
// 10 for the 10 bytes before the end of the matched pattern
end if

r=new RegExMBS
if r.Compile(".\xF6.") then // finds ö using Unicode codepoint
c=r.Execute(s,0)
MsgBox str(c)+" "+str(r.Offset(0))+" "+str(r.Offset(1))
// shows: 1 4 10
// 1 for ubound of the offset array
// 4 for 4 bytes before the matched pattern
// 10 for the 10 bytes before the end of the matched pattern
end if
```

197.0.194 How to see if a file is invisible for Mac OS X?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this function: **Example:**

```
Function Invisible(F As FolderItem) As Boolean
Dim TIS As TextInputStream
Dim S,All As String
Dim I as Integer
dim g as folderitem

If Left(F.Name,1)="." or not f.visible Then
Return True
End If

g=F.Parent.Child(".hidden")
If g.Exists Then
TIS=g.OpenAsTextFile
if tis<>Nil then
All=TIS.ReadAll
For I=1 to CountFields(All,Chr(11))
S=NthField(All, Chr(11), I)
If S=F.name Then
Return True
End If
Next
end if
End if
End Function
```

197.0.195 How to set cache size for SQLite or REALSQLDatabase?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You use the pragma cache_size command on the database.
Example:

```
// set cache size to 20000 pages which is about 20 MB for default page size
dim db as REALSQLDatabase
db.SQLExecute "PRAGMA cache_size = 20000"
```

Notes:

Default cache size is 2000 pages which is not much.
You get best performance if whole database fits in memory.
At least you should try to have a cache big enough so you can do queries in memory.
You only need to call this pragma command once after you opened the database.

197.0.196 How to set the modified dot in the window?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this declares:
Example:

```
window1.ModifiedMBS=true
```

197.0.197 How to show a PDF file to the user in a Web Application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use a WebHTMLViewer control and load the
Example:

```
dim CurrentFile as WebFile // a property of the WebPage

// define the PDF file
CurrentFile = new WebFile
CurrentFile.Filename = "test.pdf"
CurrentFile.MIMEType = "application/pdf"
CurrentFile.Data = "some pdf data" // MyDynaPDF.GetBuffer

// load into html viewer
```

HTMLViewer1.URL = CurrentFile.URL

Notes: See our Create PDF example for the Xojo Web Edition.

197.0.198 How to show Keyboard Viewer programmatically?

Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Use Xojo or AppleScript to launch the KeyboardViewerServer.app.
Example:

```
dim a as new AppleScriptMBS
dim text as string
dim lines(-1) as string

lines.append "set theApplication to ""KeyboardViewerServer"""
lines.append "set thePath to ""/System/Library/Components/KeyboardViewer.component/Contents/Shared-Support/KeyboardViewerServer.app"""
lines.append ""
lines.append "set POSIXPath to ((POSIX file thePath) as string)"
lines.append "tell application ""System Events"" to set isRunning to 0 <(count (application processes whose name is theApplication))"
lines.append "if isRunning then tell application POSIXPath to quit"
lines.append "delay 0.15"
lines.append ""
lines.append "ignoring application responses"
lines.append " tell application POSIXPath to run"
lines.append "end ignoring"

text=join(lines,EndOfLine.macintosh)

a.Compile text
a.Execute
```

Notes:

AppleScript code:

```
set theApplication to "KeyboardViewerServer"
set thePath to "/System/Library/Components/KeyboardViewer.component/Contents/SharedSupport/Key-boardViewerServer.app"
```

```
set POSIXPath to ((POSIX file thePath) as string)
tell application "System Events" to set isRunning to 0 <(count (application processes whose name is theApplication))
if isRunning then tell application POSIXPath to quit
delay 0.15

ignoring application responses
tell application POSIXPath to run
end ignoring
```

197.0.199 How to show the mouse cursor on Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this declare:
Example:

```
Declare Sub ShowCursor Lib "Carbon" ()

ShowCursor
```

Notes: The MBS Plugin has this function and supports it on Windows, too.

197.0.200 How to shutdown a Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Ask the Finder via Apple Events:
Example:

```
dim ae as appleevent
ae=newappleEvent("FNDR","shut","MACS")
if not ae.send then
msgBox "The computer couldn't be shutdown."
end if
```

Notes:

Or toolbox call (Attention: This method will stop the computer immediataly: No document asked to be saved, all applications quitting without knowing).

```
Declare Sub ShutDwnPower Lib "Carbon" ()
ShutDwnPower
```

197.0.201 How to sleep a Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Ask the Finder via Apple Events:
Example:

```
dim ae as appleevent
ae=newappleEvent("FNDR","slep","MACS")
if not ae.send then
msgBox "The computer doesn't want to sleep."
end if
```

197.0.202 How to speed up rasterizer for displaying PDFs with DynaPDF?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Here a few speed tips:
Notes:

- Use the DynaPDFRasterizerMBS function instead of our render functions.
- Reuse DynaPDFRasterizerMBS as long as the target picture size doesn't change.
- Import only the PDF pages you want to display.
- Let DynaPDF do zooming, rotating or other effects instead of you change it.

197.0.203 How to use PDFLib in my RB application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** The PDFlib plugin was discontinued in favor of our DynaPDF plugin.
Notes: If you need help to move, please contact us.

197.0.204 How to use quotes in a string?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Just double them.
Example:

```
msgbox "This String contains ""quotes""."
```

197.0.205 How to use Sybase in Web App?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Please use our MBS Xojo SQL Plugin to connect to a Sybase Database in your web application.
Notes:

If you see db.Connect giving the error message "cs_ctx_alloc ->CS_MEM_ERROR", than some things are not setup right for Sybase.
The Apache process may not have all the SYBASE environment variables being set when the CGI was launched.

Adding these lines to /etc/httpd/conf/httpd.conf stopped the faux memory errors for us:

SetEnv LD_LIBRARY_PATH /opt/sybase/OCS-15_0/lib:/opt/sybase/OCS-15_0/lib3p64:/opt/sybase/OCS-15_0/lib3p:
SetEnv SYBROOT /opt/sybase
SetEnv SYBASE_OCS /opt/sybase
SetEnv SYBASE /opt/sybase

197.0.206 How to use the Application Support folder?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:**

I was saving a registration code for an app to the Preferencefolder.
People on the list have suggested that it would be better in
the ApplicationSupportFolder. How do I save the file called CWWPrefs
into that folder using MBS?

I have checked for examples and the docs but can't see how to apply it

//f = SpecialFolder.Preferences.child("CWWPrefs")
f = ApplicationSupportFolderMBS(-32768)
Example:

```
dim folder,file as FolderItem

folder = createApplicationSupportFolderMBS(-32763)

if folder=nil then
// Some very old Mac OS Versions may not support it
// or the plugin may fail for any reason
folder=SpecialFolder.Preferences
end if
```

```
file=folder.Child("CWWPrefs")

MsgBox file.UnixpathMBS
```

Notes: You may not be able to write there with a normal user account!

197.0.207 How to use the IOPMCopyScheduledPowerEvents function in Xojo?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use the following code which does this using the SoftDeclareMBS class.
Example:

```
Sub Open()
dim c as CFDateMBS
dim t as CFAbsoluteTimeMBS

// get current date
c=NewCFDateMBS

// in absolute time (seconds since x)
t=c.AbsoluteTime

// add 600 seconds (= 10 Minutes)
t.Value=t.Value+600

// Make a Date from it
c=t.Date

// Schedule the event
// 0 on success
// E00002C1 for missing root rights
Title=hex(schedulePowerEvent(c, "wake"))

// Just for information, display the scheduled stuff
CFShowMBS CopyScheduledPowerEvents
End Sub

Function CopyScheduledPowerEvents() As cfarrayMBS
dim s as SoftDeclareMBS
dim m as MemoryBlock

s=new SoftDeclareMBS

if s.LoadLibrary("IOKit.framework") then
if s.LoadFunction("IOPMCopyScheduledPowerEvents") then
```

```
if s.CallFunction(0,nil) then
Return NewCFArrayMBSHandle(s.Result,true)
else
MsgBox "Failed to Call IOPMCopyScheduledPowerEvents."
end if
else
MsgBox "Failed to load IOPMCopyScheduledPowerEvents."
end if
else
MsgBox "Failed to load IOKit."
end if

Return nil
End Function

Function SchedulePowerEvent(time_to_wake as CFDateMBS, Type as CFStringMBS) as Integer
dim s as SoftDeclareMBS
dim m as MemoryBlock

'/*
'* Types of power event
'* These are potential arguments to IOPMSchedulePowerEvent().
'* These are all potential values of the kIOPMPowerEventTypeKey in the CFDictionaries
'* returned by IOPMCopyScheduledPowerEvents().
'*/
'/*!
'@define kIOPMAutoWake
'@abstract Value for scheduled wake from sleep.
'*/
'# define kIOPMAutoWake "wake"
'
'/*!
'@define kIOPMAutoPowerOn
'@abstract Value for scheduled power on from off state.
'*/
'# define kIOPMAutoPowerOn "poweron"
'
'/*!
'@define kIOPMAutoWakeOrPowerOn
'@abstract Value for scheduled wake from sleep, or power on. The system will either wake OR
'power on, whichever is necessary.
'*/
'
'# define kIOPMAutoWakeOrPowerOn "wakepoweron"
'/*!
'@define kIOPMAutoSleep
'@abstract Value for scheduled sleep.
'*/
```

```
'
'# define kIOPMAutoSleep "sleep"
'/*!
'@define kIOPMAutoShutdown
'@abstract Value for scheduled shutdown.
'*/
'
'# define kIOPMAutoShutdown "shutdown"

s=new SoftDeclareMBS

if s.LoadLibrary("IOKit.framework") then
if s.LoadFunction("IOPMSchedulePowerEvent") then

m=NewMemoryBlock(12)
m.Long(0)=time_to_wake.handle
m.Long(4)=0 // nil
m.Long(8)=type.Handle

if s.CallFunction(3,m) then
Return s.Result
end if
end if
end if

End Function
```

Notes: Requires Mac OS X and to execute root rights.

197.0.208 How to validate a GUID?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use this function below which uses a regular expression to verify that the string is a valid UUID/GUID:
Example:

```
Function IsGUID(guid as string) As Boolean
dim r as new RegEx

r.SearchPattern = "^(\{ { 0,1 } ( [ 0-9a-fA-F ] ) { 8 } -( [ 0-9a-fA-F ] ) { 4 } -( [ 0-9a-fA-F ] ) { 4 }
-( [ 0-9a-fA-F ] ) { 4 } -( [ 0-9a-fA-F ] ) { 12 } \} { 0,1 } )$ "

Return r.Search(guid)<>nil
End Function
```

Notes: Simply parsing the GUID with CFUUIDMBS does not give the same result as CFUUIDMBS will also take a string like "DDDD".

197.0.209 How to walk a folder hierarchie non recursively?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use code like this one: **Example:**

```
Sub Walk(folder as FolderItem)
dim folders() as FolderItem

folders.Append folder

while UBound(folders)>=0

dim currentFolder as FolderItem = folders.pop

dim c as Integer = currentFolder.Count
for i as Integer = 1 to c
dim item as FolderItem = currentFolder.TrueItem(i)

if item = Nil then
// no permission
elseif item.Visible then // only visible

if item.Directory then
folders.Append item
else
// work with file here
end if

end if

next

wend
End Sub
```

Notes:

As you see we go with a long loop which runs until we don't have more folders to process.
We ignore items we can't access due to permission limits.
And we only work visible items.
If you like, check folderitem.isBundleMBS on item to handle packages and applications better on Mac OS X.

197.0.210 I got this error: PropVal, QDPictMBS.Name (property value), Type mismatch error. Expected CGDataProviderMBS, but got Variant, Name:QDPictMBS

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** The plugins MacOSX and MacOSXCF belong together. If you use one part, please also install the other part.
Notes: We splitted the plugin because the Xojo IDE on Windows crashed on compilation.

197.0.211 I registered the MBS Plugins in my application, but later the registration dialog is shown.

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** There are two main reasons.
Notes:

1. you may use the plugin before registering them. This is often the case if you register in a window open event and use the plugin in a control open event.
On the console on Mac OS X or Windows, you may see a message like this "MBS Plugins were used by the application before the RegisterMBSPlugin function was called. Please fix this in your code!".

2. you may have mixed different plugin versions which are not compatible.
In this case you can see a message "Internal plugin registration error." on the console on Mac OS X. Newer plugins may show a message dialog reporting this. Older version simply think they are not registered.

If the installer just merges old and new applications, users may have libraries of older and newer plugin versions in the libs folder. If your application loads the wrong version, the registration fails.

If you use remote debugging, make sure you clear the tempory files there, too. Otherwise you may have old DLLs on your hard disc which may disturb your application.

You can run into issues if you use your registration code on different places of your app. Please register only once in app.open (or app Constructor). If you have several codes, simply call them one after the other.

Also check that you only call RegisterMBSPlugin with valid serial number. If you later call RegisterMBSPlugin with Demo like in example code above, you remove the license.

Next check if you can clear the Xojo caches and that helps. This incldues the Xojo Scratch folder and the Plugins & Project caches. Simply locate those folders and delete them. For Windows look in hidden AppData folder in your user folder. For Mac, please check

textasciitilde /Library/Caches and your temp folders.

Finally make sure you use the right serial number. Not an older one or a misspelled one.

197.0.212 I want to accept Drag & Drop from iTunes

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You need to accept AcceptMacDataDrop "itun" and Handle the DropObject.
Example:

```
Sub Open()
window1.AcceptMacDataDrop "itun"
End Sub

Sub DropObject(obj As DragItem)
dim s as string
dim f as folderItem
dim d as CFDictionaryMBS
dim o as CFObjectMBS
dim key as CFStringMBS
dim dl as CFDictionaryListMBS
dim i,c as Integer
dim u as CFURLMBS
dim file as FolderItem

if obj.MacDataAvailable("itun") then
s = obj.MacData("itun")

// Parse XML
o=NewCFObjectMBSFromXML(NewCFBinaryDataMBSStr(s))

// Make dictionary
if o isa CFDictionaryMBS then
d=CFDictionaryMBS(o)

// get Tracks Dictionary
key=NewCFStringMBS("Tracks")
o=d.Value(key)

if o isa CFDictionaryMBS then
d=CFDictionaryMBS(o)
dl=d.List

// Walk over all entries in the Tracks dictionary
c=dl.Count-1
for i=0 to c
```

```
o=dl.Value(i)

if o isa CFDictionaryMBS then
d=CFDictionaryMBS(o)

key=NewCFStringMBS("Location")
o=d.Value(key)
if o isa CFStringMBS then
u=NewCFURLMBSCFStringMBS(CFStringMBS(o),nil)

file=u.file
if file<>nil then
MsgBox file.UnixpathMBS
end if
end if
end if
next
end if
end if
end if
End Sub
```

Notes: The code above inside a window on Xojo 5.5 with MBS Plugin 5.3 will do it nice and show the paths.

197.0.213 I'm drawing into a listbox but don't see something.

Plugin Version: all, Console & Web: No. **Answer:** If you draw this in a listbox cellbackground, you need to draw on the correct position
Example:

```
Function CellBackgroundPaint(g As Graphics, row as Integer, column as Integer) As Boolean
dim f as FolderItem
f=SpecialFolder.Desktop
f.DrawWideIconMBS(g,listbox1.left,listbox1.top+row*20,16)
Return true
End Function
```

Notes: Try this in a listbox. The Graphics object there has a cliping and an offset which the plugin doesn't know about.

197.0.214 I'm searching for a method or so to move a window from position x.y to somewhere else on the screen.

Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:**

The code I produced in RB isn't smooth enough. Is there a call in MBS, if not, can it be done? The speed of it has to be like the show of a DrawerWindow.

Try the declare below for Carbon. With WindowLib it will work on Mac OS 8.5 and newer.
Notes: See Window.Transition functions.

197.0.215 If I use one of your plug-ins under windows, would this then impose the use of dll after compilation or my would my compiled soft still be a stand-alone single file software?

Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Stand alone.
Notes:

Xojo compiles all used plugins into the application binary.
Some plugin parts need external dlls but you will find that in the documentation. (e.g. pdflib for some classes)

197.0.216 Is the fn key on a powerbook keyboard down?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** I am unable to figure out how or if it is possible to detect if the fn key is down on a powerbook keyboard. Is it possible?
Example:

```
' Window.Open Event of a blank project:

dim i as Integer

for i=0 to 127
if keyboard.asynckeydown(i) then
title=str(i) // found
return
end if
next
title="" // not found
```

Notes: This test application shows the keycode (decimal) 63 for the fn key.

197.0.217 Is there a case sensitive Dictionary?

Plugin Version: all, Console & Web: No. **Answer:** The MBS Plugin has several classes which can work as a replacement.
Notes:

First you could use VariantToVariantHashMapMBS or VariantToVariantOrderedMapMBS.
If you know that all keys are Strings or Integers only, you can use the specialized classes which are a little bit faster due to avoiding variants:

IntegerToIntegerHashMapMBS class
IntegerToIntegerOrderedMapMBS class
IntegerToStringHashMapMBS class
IntegerToStringOrderedMapMBS class
IntegerToVariantHashMapMBS class
IntegerToVariantOrderedMapMBS class
StringToStringHashMapMBS class
StringToStringOrderedMapMBS class
StringToVariantHashMapMBS class
StringToVariantOrderedMapMBS class

197.0.218 Is there a way to use the MBS plugin to get only the visible item and folder count on a volume?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use the DirectorySizeMBS class for this as in the example below:
Example:

```
dim d as DirectorySizeMBS

d=new DirectorySizeMBS

// volume(1) as my boot volume is very full
if d.update(volume(1),true,0) then
MsgBox str(d.VisibleItemCount)+" visible items, "+str(d.HiddenItemCount)+" invisible items."
end if
```

Notes:

Complete Question: Is there a way to use the MBS plugin to get only the visible item and folder count on a volume? The FileCount and FolderCount properties of
VolumeInformationMBS seem to provide the total # of items including
invisible items such as .DS_Store and more importantly .Trashes which
is causing me a great amount of difficulty during a recursive scan of a
volume. I've got a progress bar which uses the total of the filecount

and foldercount properties as the maximum value, but my routine needs to filter out all invisible items, as it is creating a catalog of a volume for archiving purposes. Any thoughts how I could get accurate number.

197.0.219 Is there an easy way I can launch the Displays preferences panel?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Use the code below:
Example:

```
dim error as Integer

error=OpenMacOSXPreferencesPaneMBS("Displays")
if error<>0 then
MsgBox "Failed to launch QuickTime System Preferences panel."
end if
```

197.0.220 List of Windows Error codes?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** We have a list of windows error codes on our website.
Notes: http://www.monkeybreadsoftware.de/xojo/winerror.shtml

197.0.221 Midi latency on Windows problem?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** The issue is system related, not a problem with RB or the plugin.
Notes:

Two things will adversely affect the timing:

(1) latency of the software synthesizer output driver. The default Windows wavetable synthesizer has considerable latency. I don't know how many milliseconds, but it is noticeable.

(2) latency of the digital audio output driver. Different systems have different drivers for different audio hardware. My Dell laptop has a minimum 15ms latency in the audio driver.

These two things put together were causing a very sluggish MIDI response. I was able to verify these as the culprits by routing MIDI directly out of RB into a sample player, which only introduces the latency of (2)

and does not include latency of (1).

I don't know how widely known are these facts, if not then you may want to add this information to the documentation, since Windows programmers using the MIDI plugin may not know those problems, and might mistakenly blame your plugin, as I did :) Sorry about that!

(From Aaron Andrew Hunt)

197.0.222 My Xojo Web App does not launch. Why?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Here is a list of checks to do for linux apache installations with Xojo or Xojo Web applications:
Notes:

Just a list of checks to do for linux apache installations:

- You have 64bit linux? Than you need 32 bit compatibility libraries.
- The folder of your app is writable? Set permissions to 777.
- The cgi script is executable? Set permissions to 755.
- The app file itself is executable? Set permissions to 755.
- You uploaded cgi file as text, so it has unix line endings? (this often gives error "Premature end of script headers" in apache log)
- You uploaded config.cfg file and made it writable? Set permissions to 666.
- Your apache allows execution of cgi scripts? You enabled cgi for apache and uncommented addhandler command for CGI on a new apache installation?
- You uploaded the app file and libraries as binary files? Upload as text breaks them.
- You did upload the libs folder?
- You don't have code in app.open, session.open and other events which crashes app right at launch?
- You don"t have a print command in your app.open event? (see feedback case 23817)
- You allowed htaccess file to overwrite permissions?

197.0.223 SQLDatabase not initialized error?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Before you can use SQLDatabaseMBS, it must be initialized.
Example:

```
dim d as new SQLDatabaseMBS
```

Notes:

This happens normally when you use "new SQLDatabaseMBS".
But if you just have a SQLConnectionMBS and get a recordset there, the initialization may not have happend, yet.
So please simply add a line "dim d as new SQLDatabaseMBS" to your app.open code after registration, so the plugin part can initialize and late provide recordsets.

197.0.224 Textconverter returns only the first x characters. Why?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:**

Some older Xojo versions limit the Textconverter to around 1024 characters in input and output.
This should be fixed with RB5.
Notes: Xojo seems not to support Textconverters at all on Windows.

197.0.225 The type translation between CoreFoundation/Foundation and Xojo data types.

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** The plugin does conversion between Cocoa/Carbon data types and native Xojo data types. The following list help you knowing what the current plugins support:
Notes:

Cocoa NSObject to Variant:

nil ->nil
NSDictionary ->Dictionary
NSData ->MemoryBlock
NSString ->String
NSAttributedString ->NSAttributedStringMBS
NSDate ->Date
NSNumber ->double/integer/Int64/UInt64/UInt32/Boolean
NSURL ->String
NSValue with NSRect ->NSRectMBS
NSValue with NSPoint ->NSPointMBS
NSValue with NSSize ->NSSizeMBS
NSValue with NSRange ->NSRangeMBS
NSValue with QTTime ->QTTimeMBS
NSValue with QTTimeRange ->QTTimeRangeMBS
NSArray ->Array of Variant

QuartzFilter ->QuartzFilterMBS

- ->*MBS

Variant to Cocoa NSObject:

nil ->nil
Dictionary ->NSDictionary
Boolean ->NSNumber
Integer ->NSNumber
Color ->NSColor
Int64 ->NSNumber
Single ->NSNumber
Double ->NSNumber
Date ->NSDate
MemoryBlock ->NSData
String ->NSString
NSImageMBS ->NSImage
NSAttributedStringMBS ->NSAttributedString
NSColorMBS ->NSColor
NSRectMBS ->NSValue with NSRect
NSSizeMBS ->NSValue with NSSize
NSPointMBS ->NSValue with NSPoint
NSRangeMBS ->NSValue with NSRange
NSBurnMBS ->NSBurn
NSViewMBS ->NSView
NSFontMBS ->NSFont
NSParagraphStyleMBS ->NSParagraphStyle
NSAttributedStringMBS ->NSAttributedString
WebPolicyDelegateMBS ->WebPolicyDelegate
WebUIDelegateMBS ->WebUIDelegate
WebFrameLoadDelegateMBS ->WebFrameLoadDelegate
WebResourceLoadDelegateMBS ->WebResourceLoadDelegate
NSIndexSetMBS ->NSIndexSet
QTTimeMBS ->QTTime
QTTimeRangeMBS ->QTTimeRange
Array of Variant ->NSArray
Array of String ->NSArray
CFStringMBS ->NSString
CFNumberMBS ->NSNumber
CFDataMBS ->NSData
CFURLMBS ->NSURL
CFArrayMBS ->NSArray
CFDictionaryMBS ->NSDictionary
CFBinaryDataMBS ->NSDate

Carbon CFTypeRef to Variant:

CFDictionaryRef ->Dictionary
CFStringRef ->String
CFDataRef ->String
CFURL ->String
CFNumber ->Integer/Double/Int64
CFArray ->Array
CFDate ->date
nil ->nil
CGColorSpace ->CGColorSpaceMBS
CGColor ->CGColorMBS
CGImage ->CGImageMBS
CF* ->CF*MBS

Variant to Carbon CFTypeRef:

Dictionary ->CFDictionaryRef
Boolean ->CFBooleanRef
Color ->CFNumberRef
Integer ->CFNumberRef
Int64 ->CFNumberRef
Single ->CFNumberRef
Double ->CFNumberRef
String ->CFStringRef
Color ->CGColorRef
Date ->CFDateRef
nil ->nil
Memoryblock ->CFDataRef
Folderitem ->CFURLRef
Dictionary ->CFDictionaryRef
Array of Variant/String/Date/Double/Single/Int64/Integer ->CFArray
CGRectMBS ->CGRect as CFDataRef
CGSizeMBS ->CGSize as CFDataRef
CGPointMBS ->CGPoint as CFDataRef
CGColorMBS ->CGColor
CGColorSpaceMBS ->CGColorSpace
CGImageMBS ->CGImage
CGDataConsumerMBS ->CGDataConsumer
CGDataProviderMBS ->CGDataProvider
CF*MBS ->CF*

Strings without encodings should be put into dictionaries as memoryblocks.

197.0.226 Uploaded my web app with FTP, but it does not run on the server!

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** If you see errors like a simple "Segmentation Fault" on Linux or some other wired errors, you may want to check your FTP upload mode. It must be binary for web apps. ASCII mode corrupts the application.

197.0.227 What classes to use for hotkeys?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Please use CarbonHotKeyMBS class on Mac and WindowsKeyFilterMBS on Windows.
Notes: CarbonHotKeyMBS will also work fine in Cocoa apps.

197.0.228 What do I need for Linux to get picture functions working?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** In order to get our plugins working on Linux systems without GUI, the plugin loads graphics libraries dynamically.
Notes:

To get it working, the plugin tries to load gtk with this paths:

- libgtk-x11-2.0.so"
- libgtk-x11-2.0.so.0"
- /usr/lib/libgtk-x11-2.0.so"
- /usr/lib32/libgtk-x11-2.0.so"
- /usr/lib/libgtk-x11-2.0.so.0"
- /usr/lib32/libgtk-x11-2.0.so.0"

gdk is loaded with this paths:

- libgdk-x11-2.0.so"
- libgdk-x11-2.0.so.0"
- /usr/lib/libgdk-x11-2.0.so"
- /usr/lib32/libgdk-x11-2.0.so"
- /usr/lib/libgdk-x11-2.0.so.0"
- /usr/lib32/libgdk-x11-2.0.so.0"

For the paths without explicit path, the system will search in /lib, /usr/lib and all directories in the LD_LIBRARY_PATH environment variable.

197.0.229 What does the NAN code mean?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:**

197.0.230 What font is used as a 'small font' in typical Mac OS X apps?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:**

Xojo 4.5 has a constant "SmallSystem" to use for a font name.
For older versions try this code:
Example:

```
Sub GetThemeFont(fontType as Integer, ByRef fontName as String, ByRef fontSize as Integer, ByRef fontStyle as Integer)
dim err as Integer
dim theFont, theFontSize, theFontStyle as MemoryBlock

const smSystemScript = -1

Declare Function GetThemeFont Lib "Carbon" (inFontID as Integer, inScript as Integer, outFontName as Ptr, outFontSize as Ptr, outStyle as Ptr) as Integer

theFont = NewMemoryBlock(256) //Str255
theFontSize = NewMemoryBlock(2) //SInt16
theFontStyle = NewMemoryBlock(1) //Style

err = GetThemeFont(fontType, smSystemScript, theFont, theFontSize, theFontStyle)

if err = 0 then
fontName = theFont.PString(0)
fontSize = theFontSize.UShort(0)
fontStyle = theFontStyle.Byte(0)
else
fontName = ""
fontSize = 0
fontStyle = 0
end if
End Sub
```

197.0.231 What is last plugin version to run on Mac OS X 10.4?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Last Version with 10.4 support is version 15.4.
Notes:

With version 15.4 you can build applications for OS X 10.4 and newer.
For Version 16.0 we disabled 10.4 and moved minimum to 10.5. We may be able to enable it again to build a version of 16.x, but may need to charge for this by hour.

197.0.232 What is last plugin version to run on PPC?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Last Version with PPC is 15.4.
Notes:

With version 15.4 you can build PPC applications for OS X 10.4 and newer.
For Version 16.0 we disabled PPC. We may be able to enable it again to build a PPC version of 16.x, but may need to charge for this by hour.

197.0.233 What is the difference between Timer and WebTimer?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Time is server side and WebTimer client side.
Notes: Timer is the normal timer class in Xojo. It runs on the server. On the side the WebTimer runs on the client. It triggers a request to the server to perform the action. So a WebTimer is good to keep the connection running and the website updated regularly. A timer on the server is good to make regular jobs like starting a database backup every 24 hours.

197.0.234 What is the list of Excel functions?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Below a list of function names known by LibXL.
Notes:

LibXL parses the functions and writes tokens to the excel file. So even if Excel can do more functions, we can only accept the ones known by LibXL.

ABS, ABSREF, ACOS, ACOSH, ACTIVE.CELL, ADD.BAR, ADD.COMMAND, ADD.MENU, ADD.TOOLBAR, ADDRESS, AND, APP.TITLE, AREAS, ARGUMENT, ASC, ASIN, ASINH, ATAN, ATAN2, ATANH, AVEDEV, AVERAGE, AVERAGEA, BAHTTEXT, BETADIST, BETAINV, BINOMDIST, BREAK, CALL, CALLER, CANCEL.KEY, CEILING, CELL, CHAR, CHECK.COMMAND, CHIDIST, CHIINV, CHITEST,

CHOOSE, CLEAN, CODE, COLUMN, COLUMNS, COMBIN, CONCATENATE, CONFIDENCE, CORREL, COS, COSH, COUNT, COUNTA, COUNTBLANK, COUNTIF, COVAR, CREATE.OBJECT, CRITBINOM, CUSTOM.REPEAT, CUSTOM.UNDO, DATE, DATEDIF, DATESTRING, DATEVALUE, DAVERAGE, DAY, DAYS360, DB, DBCS, DCOUNT, DCOUNTA, DDB, DEGREES, DELETE.BAR, DELETE.COMMAND, DELETE.MENU, DELETE.TOOLBAR, DEREF, DEVSQ, DGET, DIALOG.BOX, DIRECTORY, DMAX, DMIN, DOCUMENTS, DOLLAR, DPRODUCT, DSTDEV, DSTDEVP, DSUM, DVAR, DVARP, ECHO, ELSE, ELSE.IF, ENABLE.COMMAND, ENABLE.TOOL, END.IF, ERROR, ERROR.TYPE, EVALUATE, EVEN, EXACT, EXEC, EXECUTE, EXP, EXPONDIST, FACT, FALSE, FCLOSE, FDIST, FILES, FIND, FINDB, FINV, FISHER, FISHERINV, FIXED, FLOOR, FOPEN, FOR, FOR.CELL, FORECAST, FORMULA.CONVERT, FPOS, FREAD, FREADLN, FREQUENCY, FSIZE, FTEST, FV, FWRITE, FWRITELN, GAMMADIST, GAMMAINV, GAMMALN, GEOMEAN, GET.BAR, GET.CELL, GET.CHART.ITEM, GET.DEF, GET.DOCUMENT, GET.FORMULA, GET.LINK.INFO, GET.MOVIE, GET.NAME, GET.NOTE, GET.OBJECT, GET.PIVOT.FIELD, GET.PIVOT.ITEM, GET.PIVOT.TABLE, GET.TOOL, GET.TOOLBAR, GET.WINDOW, GET.WORKBOOK, GET.WORKSPACE, GETPIVOTDATA, GOTO, GROUP, GROWTH, HALT, HARMEAN, HELP, HLOOKUP, HOUR, HYPERLINK, HYPGEOMDIST, IF, INDEX, INDIRECT, INFO, INITIATE, INPUT, INT, INTERCEPT, IPMT, IRR, ISBLANK, ISERR, ISERROR, ISLOGICAL, ISNA, ISNONTEXT, ISNUMBER, ISPMT, ISREF, ISTEXT, ISTHAIDIGIT, KURT, LARGE, LAST.ERROR, LEFT, LEFTB, LEN, LENB, LINEST, LINKS, LN, LOG, LOG10, LOGEST, LOGINV, LOGNORMDIST, LOOKUP, LOWER, MATCH, MAX, MAXA, MDETERM, MEDIAN, MID, MIDB, MIN, MINA, MINUTE, MINVERSE, MIRR, MMULT, MOD, MODE, MONTH, MOVIE.COMMAND, N, NA, NAMES, NEGBINOMDIST, NEXT, NORMDIST, NORMINV, NORMSDIST, NORMSINV, NOT, NOTE, NOW, NPER, NPV, NUMBERSTRING, ODD, OFFSET, OPEN.DIALOG, OPTIONS.LISTS.GET, OR, PAUSE, PEARSON, PERCENTILE, PERCENTRANK, PERMUT, PHONETIC, PI, PIVOT.ADD.DATA, PMT, POISSON, POKE, POWER, PPMT, PRESS.TOOL, PROB, PRODUCT, PROPER, PV, QUARTILE, RADIANS, RAND, RANK, RATE, REFTEXT, REGISTER, REGISTER.ID, RELREF, RENAME.COMMAND, REPLACE, REPLACEB, REPT, REQUEST, RESET.TOOLBAR, RESTART, RESULT, RESUME, RETURN, RIGHT, RIGHTB, ROMAN, ROUND, ROUNDBAHTDOWN, ROUNDBAHTUP, ROUNDDOWN, ROUNDUP, ROW, ROWS, RSQ, RTD, SAVE.DIALOG, SAVE.TOOLBAR, SCENARIO.GET, SEARCH, SEARCHB, SECOND, SELECTION, SERIES, SET.NAME, SET.VALUE, SHOW.BAR, SIGN, SIN, SINH, SKEW, SLN, SLOPE, SMALL, SPELLING.CHECK, SQRT, STANDARDIZE, STDEV, STDEVA, STDEVP, STDEVPA, STEP, STEYX, SUBSTITUTE, SUBTOTAL, SUM, SUMIF, SUMPRODUCT, SUMSQ, SUMX2MY2, SUMX2PY2, SUMXMY2, SYD, T, TAN, TANH, TDIST, TERMINATE, TEXT, TEXT.BOX, TEXTREF, THAIDAYOFWEEK, THAIDIGIT, THAIMONTHOFYEAR, THAINUMSOUND, THAINUMSTRING, THAISTRINGLENGTH, THAIYEAR, TIME, TIMEVALUE, TINV, TODAY, TRANSPOSE, TREND, TRIM, TRIMMEAN, TRUE, TRUNC, TTEST, TYPE, UNREGISTER, UPPER, USDOLLAR, USERDEFINED, VALUE, VAR, VARA, VARP, VARPA, VDB, VIEW.GET, VLOOKUP, VOLATILE, WEEKDAY, WEIBULL, WHILE, WINDOW.TITLE, WINDOWS, YEAR and ZTEST.

197.0.235 What is the replacement for PluginMBS?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Use the SoftDeclareMBS class to load libraries dynamically.

197.0.236 What to do on Xojo reporting a conflict?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:**

I get an error like "This item conflicts with another item of the same name" when using one of the plugin functions.

Xojo just wants to tell you that you dropped something in the plugins folder what is not a plugin.
Notes: Some users dropped the examples, the documentation or other files into the plugins folder. Don't do it.

197.0.237 What to do with a NSImageCacheException?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** You need to add exception handlers for NSExceptionMBS in order to catch this exception.
Notes:

You may also add code to write the stack of the exception into a log file for later locating the error source.

A NSImage has several image representations in memory. So basicly you pass in the base image and for whatever size an image is needed, the NSImage class will create a cache image representation of the requested size so on the next query it can use that cache for the same requested size.

197.0.238 What to do with MySQL Error 2014?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can get this error on MySQL if you have a recordset open while you create another one.

197.0.239 What ways do I have to ping?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** You have different ways
Notes:

1. Use the shell class and the ping utility.

2. Use the MBS Network Plugin and there the SuperSocket part:

a) On Windows the ICMPPingMBS works to ping.
b) On Mac OS X it uses OpenTransport and needs root rights. You need to use sudo to run this application.

This does not work on Intel Macs, because the plugin is not endian safe.

3. The DarwinPingMBS.Ping method:

Compiled for Mac OS X Macho target it works as a syncronized ping method.
The Windows version had a bug and was fixed in plugin version 8.2pr4. So it works now.

4. The DarwinPingMBS.SimplePing method:

Works on Mac OS X Macho target.

But this method can be called from a thread to make it working in background.

197.0.240 Where is CGGetActiveDisplayListMBS?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** This is now CGDisplayMBS.GetActiveDisplayList.

197.0.241 Where is CGGetDisplaysWithPointMBS?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** This is now CGDisplayMBS.GetDisplaysWithPoint.

197.0.242 Where is CGGetDisplaysWithRectMBS?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** This is now CGDisplayMBS.GetDisplaysWithRect.

197.0.243 Where is CGGetOnlineDisplayListMBS?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** This is now CGDisplayMBS.GetOnlineDisplayList.

197.0.244 Where is GetObjectClassNameMBS?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Please use this replacement method:
Example:

```
Function GetObjectClassNameMBS(o as Object) As string
dim t as Introspection.TypeInfo = Introspection.GetType(o)
Return t.FullName
End Function
```

Notes: GetObjectClassNameMBS was removed from the plugins.

197.0.245 Where is NetworkAvailableMBS?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** We removed NetworkAvailableMBS some versions ago. It was not working right and basicly it's not useful. If you want to check whether you have a network, than do a DNS resolve:
Example:

```
// two independend domain names
const domain1 = "www.google.com"
const domain2 = "www.macsw.de"

// resolve IPs
dim ip1 as string = DNSNameToAddressMBS(Domain1)
dim ip2 as string = DNSNameToAddressMBS(Domain2)

// if we got IPs and not the same IPs (error/login pages)
if len(ip1)=0 or len(ip2)=0 or ip1=ip2 then
MsgBox "no connection"
else
MsgBox "have connection"
end if
```

Notes: This way you can detect whether you got something from DNS. And you can make sure that a DNS redirection to a login page won't catch you.

197.0.246 Where is StringHeight function in DynaPDF?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Use the function GetFTextHeight or GetFTextHeightEx.
Notes: Be aware that GetFTextHeight works with format commands and you may want to escape your text if you don't use them.

197.0.247 Where is XLSDocumentMBS class?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** This class has been removed in favor of XLBookMBS class.
Notes: This classes have been removed XLSCellMBS, XLSDocumentMBS, XLSFormatRecordMBS, XLSMergedCellsMBS, XLSRowMBS and XLSSheetMBS.

197.0.248 Where to get information about file formats?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:**

Please visit this web page:
http://www.wotsit.org

197.0.249 Where to register creator code for my application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:**

Register at Apple:
http://developer.apple.com/dev/cftype/information.html

197.0.250 Which Mac OS X frameworks are 64bit only?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Some frameworks from Mac OS X do not support 32 bit applications, so we can't provide plugins for Xojo until 64bit target is available.
Notes:

For Mac OS X 10.8:

- Accounts
- EventKit

- GLKit
- Social

and in 10.9:

- Accounts
- AVKit
- EventKit
- GameController
- GLKit
- MapKit
- MediaLibrary
- Social
- SpriteKit

In general Apple makes all new frameworks being 64 bit only.

197.0.251 Which plugins are 64bit only?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Some of our plugins work only in 64 bit modes as operation systems do not provide 32 bit code.
Notes: This effects currently: EventKit, Accounts, Social frameworks from Apple and our matching plugins.

197.0.252 Why application doesn't launch because of a missing ddraw.dll!?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Some RB versions require that you install DirectX from Microsoft on your Windows.

197.0.253 Why application doesn't launch because of a missing shlwapi.dll!?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Some RB versions require that you install the Internet Explorer from Microsoft on your Windows.
Notes: This bug is for several older Windows 95 editions.

197.0.254 Why do I hear a beep on keydown?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** When the user presses a key, RB goes through all keydown event handlers till on returns true.
Notes: If no keydown event handler returns true for the key, a beep is performed.

197.0.255 Why does folderitem.item return nil?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Because Xojo fails to make a folderitem for you. Reason may be an alias file which can't be resolved or simply that you don't have enough access rights to read the folder content.
Notes: A more rarely reason is that the directory changed and the file with the given index or name does no longer exist.

197.0.256 Why doesn't showurl work?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:**

There are three main reasons:

1. showurl is not supported by Xojo in 68k applications.
2. there is now application defined for the protocol (e.g. http) in the Internet Control panel.
3. You don't have Internet Config installed.

You can use the InternetConfigMBS class to check for this stuff.

197.0.257 Why don't the picture functions not work on Linux?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Please make sure libcairo is installed.
Notes:

For accessing pictures on Linux, the MBS Plugin relays on the cairo library.
Please install the package if you don't have it already.
Our plugin looks for library called libcairo.so or libcairo.so.2.

197.0.258 Why have I no values in my chart?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** You have no data points visible, there may be several reasons:
Notes:

For example one of the data values may be infinite or invalid.
Or the scaling may be out of range, so you simply see nothing.

197.0.259 Will application size increase with using plugins?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** All plugins used by your application will be included in the application.
Notes:

If you use no plugins, your application will not change size.
And if you use one class from the plugins, your application size will increase by a few kilobytes.
The documentation of the plugins include a list of all plugin parts and their sizes for the different platforms.

197.0.260 XLS: Custom format string guidelines

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You have to download the source code and compile a static version of the library.
Notes:

Up to four sections of format codes can be specified. The format codes, separated by semicolons, define the formats for positive numbers, negative numbers, zero values, and text, in that order. If only two sections are specified, the first is used for positive numbers and zeros, and the second is used for negative numbers. If only one section is specified, it is used for all numbers. Four sections example:

,# # # .00_); [Red] (# ,# # # .00);0.00;”sales ”@

The following table describes the different symbols that are available for use in custom number formats.

Specify colors

To set the text color for a section of the format, type the name of one of the following eight colors in square brackets in the section. The color code must be the first item in the section.

Instead of using the name of the color, the color index can be used, like this [Color3] for Red. Valid numeric indexes for color range from 1 to 56, which reference by index to the legacy color palette.
Specify conditions

To set number formats that will be applied only if a number meets a specified condition, enclose the condition in square brackets. The condition consists of a comparison operator and a value. Comparison operators include: = Equal to; >Greater than; <Less than; >= Greater than or equal to, <= Less than or equal to, and <>Not equal to. For example, the following format displays numbers that are less than or equal to 100 in a red font and numbers that are greater than 100 in a blue font.
[Red] [<=100] ; [Blue] [>100]
If the cell value does not meet any of the criteria, then pound signs ("# ") are displayed across the width of the cell.
Dates and times

Examples

197.0.261 Xojo doesn't work with your plugins on Windows 98.

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Please upgrade your Windows version.

197.0.262 Xojo or my RB application itself crashes on launch on Mac OS Classic. Why?

Plugin Version: all, Console & Web: No. **Answer:**

You may check if the application has enough memory to be loaded.
RB should have on Mac OS Classic more than 20 MB of RAM.
I prefered to use 50 MB and for an application a 10 MB partition is a good way to start.

Parameter	Description
x	The x value of the data point. For an enumerated x-axis (see Axis.setLabels on what is an enumerated axis), the first data point is 0, and the nth data point is (n-1).
xLabel	The bottom x-axis label of the data point.
x2Label	The top x-axis label of the data point.
value	The value of the data point.
accValue	The sum of values of all data points that are in the same x position and same data group as the current data point, and with data set number less than or equal to the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.
totalValue	The sum of values of all data points that are in the same x position and same data group as the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.
percent	The percentage of the data point based on the total value of all data points that are in the same x position and same data group as the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.
accPercent	The accumulated percentage of the data point based on the total value of all data points that are in the same x position and same data group as the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.
gpercent	The percentage of the data point based on the total value of all data points in a layer.
dataSet	The data set number to which the data point belongs. The first data set is 0. The nth data set is (n-1).
dataSetName	The name of the data set to which the data point belongs.
dataItem	The data point number within the data set. The first data point is 0. The nth data point is (n-1).
dataGroup	The data group number to which the data point belongs. The first data group is 0. The nth data group is (n-1).
dataGroupName	The name of the data group to which the data point belongs.
layerId	The layer number to which the data point belongs. The first layer is 0. The nth layer is (n-1).
fieldN	The (N + 1)th extra field. For example, { field0 } means the first extra field. An extra field is an array of custom elements added using Layer.addExtraField, Layer.addExtraField2, BaseChart.addExtraField or BaseChart.addExtraField2.

diFieldN	Same as fieldN. See above.
dsFieldN	Similar to fieldN, except that dsFieldN means the extra field is indexed by data set number. The Pth data set corresponds to the Pth element of the extra field.
dsdiFieldN	Similar to fieldN, except that dsdiFieldN means the extra fields are indexed by both the data set number and data point number. The Pth data item of the Qth data set corresponds to the Pth element of the (N + Q)th extra field.

Parameter	Description
zx	The symbol scale in the x dimension. Applicable for layers with symbol scales set by LineLayer.setSymbolScale.
zy	The symbol scale in the y dimension. Applicable for layers with symbol scales set by LineLayer.setSymbolScale.
z	The symbol scale without distinguishing the dimension to use. Applicable for layers with symbol scales set by LineLayer.setSymbolScale.

Parameter	Description
slope	The slope of the trend line.
intercept	The y-intercept of the trend line.
corr	The correlation coefficient in linear regression analysis.
stderr	The standard error in linear regression analysis.

Parameter	Description
top	The value of the top edge of the box-whisker symbol.
bottom	The value of the bottom edge of the box-whisker symbol.
max	The value of the maximum mark of the box-whisker symbol.
min	The value of the minimum mark of the box-whisker symbol.
med	The value of the median mark of the box-whisker symbol.

Parameter	Description
high	The high value.
low	The low value.
open	The open value.
close	The close value.

Parameter	Description
dir	The direction of the vector.
len	The length of the vector.

Parameter	Description
radius	The radial value of the data point.
value	Same as { radius } . See above.
angle	The angular value of the data point.
x	Same as { angle } . See above.
label	The angular label of the data point.
xLabel	Same as { label } . See above.
name	The name of the layer to which the data point belongs.
dataSetName	Same as { name } . See above.
i	The data point number. The first data point is 0. The nth data point is (n-1).
dataItem	Same as { i } . See above.
z	The symbol scale. Applicable for layers with symbol scales set by PolarLayer.setSymbolScale.
fieldN	The (N + 1)th extra field. For example, { field0 } means the first extra field. An extra field is an array of custom elements added using Layer.addExtraField, Layer.addExtraField2, BaseChart.addExtraField or BaseChart.addExtraField2.
diFieldN	Same as fieldN. See above.
dsFieldN	Similar to fieldN, except that dsFieldN means the extra field is indexed by layer index. The Pth layer corresponds to the Pth element of the extra field.
dsdiFieldN	Similar to fieldN, except that dsdiFieldN means the extra fields are indexed by both the data set number and data point number. The Pth data item of the Qth layer corresponds to the Pth element of the (N + Q)th extra field.

Parameter	Description
dir	The direction of the vector.
len	The length of the vector.

Parameter	Description
value	The axis value at the tick position.
label	The axis label at the tick position.

Parameter	Description
[param]	The name of the parameter
[a]	If this field a number, it specifies the number of decimal places (digits to the right of the decimal point).

[b]

textasciitilde ' for no thousand separator. The default is '
textasciitilde ', which can be modified using BaseChart.setNumberFormat.

The thousand separator. Should be a non-alphanumeric character (not 0-9, A-Z, a-z). Use '

[c]

The decimal point character. The default is '.', which can be modified using BaseChart.setNumberFormat.

[d]

textasciitilde ' for no negative sign character. The default is '-', which can be modified using BaseChart.setNumberFormat.

The negative sign character. Use '

Parameter	Description
yyyy	The year in 4 digits (e.g. 2002)
yyy	The year showing only the least significant 3 digits (e.g. 002 for the year 2002)
yy	The year showing only the least significant 2 digits (e.g. 02 for the year 2002)
y	The year showing only the least significant 1 digits (e.g. 2 for the year 2002)
mmm	The month formatted as its name. The default is to use the first 3 characters of the english month name (Jan, Feb, Mar ...). The names can be configured using BaseChart.setMonthNames.
mm	The month formatted as 2 digits from 01 - 12, adding leading zero if necessary.
m	The month formatted using the minimum number of digits from 1 - 12.
MMM	The first 3 characters of the month name converted to upper case. The names can be configured using BaseChart.setMonthNames.
MM	The first 2 characters of the month name converted to upper case. The names can be configured using BaseChart.setMonthNames.
M	The first character of the month name converted to upper case. The names can be configured using BaseChart.setMonthNames.
dd	The day of month formatted as 2 digits from 01 - 31, adding leading zero if necessary.
d	The day of month formatted using the minimum number of digits from 1 - 31.
w	The name of the day of week. The default is to use the first 3 characters of the english day of week name (Sun, Mon, Tue ...). The names can be configured using BaseChart.setWeekDayNames.
hh	The hour of day formatted as 2 digits, adding leading zero if necessary. The 2 digits will be 00 - 23 if the 'a' option (see below) is not specified, otherwise it will be 01 - 12.
h	The hour of day formatted using the minimum number of digits. The digits will be 0 - 23 if the 'a' option (see below) is not specified, otherwise it will be 01 - 12.
nn	The minute formatted as 2 digits from 00 - 59, adding leading zero if necessary.
n	The minute formatted using the minimum number of digits from 00 - 59.
ss	The second formatted as 2 digits from 00 - 59, adding leading zero if necessary.
s	The second formatted using the minimum number of digits from 00 - 59.
a	Display either 'am' or 'pm', depending on whether the time is in the morning or afternoon. The text 'am' and 'pm' can be modified using BaseChart.setAMPM.

Shape Id	Value	Description
SquareShape	1	Square shape. See (1, 1) above.
DiamondShape	2	Diamond shape. See (2, 1) above.
TriangleShape	3	Triangle shape pointing upwards. See (3, 1) above.
RightTriangleShape	4	Triangle shape pointing rightwards. See (4, 1) above.
LeftTriangleShape	5	Triangle shape pointing leftwards. See (5, 1) above.
InvertedTriangleShape	6	Triangle shape pointing downwards. See (1, 2) above.
CircleShape	7	Circle shape. See (2, 2) above.
StarShape	[Method]	Star shapes of various points. See (2, 3), (2, 4), (2, 5), (3, 1), (3, 2), (3, 3), (3, 4), (3, 5) above for stars with 3 to 10 points.
PolygonShape	[Method]	Polygon shapes symmetrical about a vertical axis with a vertex at the top center position. See (4, 1), (4, 3), (4, 5), (5, 1) for polygons of 5 to 8 sides.
Polygon2Shape	[Method]	Polygon shapes symmetrical about a vertical axis but without any vertex at the top center position. See (4, 2), (4, 4) for polygons of 5 and 6 sides.
CrossShape	[Method]	'+' shapes. See (5, 2), (5, 3), (5, 4), (5, 5), (6, 1), (6, 2), (6. 3) for '+' shape with arm width of 0.1 - 0.7.
Cross2Shape	[Method]	'X' shapes. See (6, 4), (6, 5), (7, 1), (7, 2), (7, 3), (7, 4), (7, 5) for 'X' shapes with arm width of 0.1 - 0.7.

Nan	Meaning
1	Invalid square root (negative number, usually)
2	Invalid addition (indeterminate such as infinity + (-infinity))
4	Invalid division (indeterminate such as 0/0)
8	Invalid multiplication (indeterminate such as 0*infinity)
9	Invalid modulo such as (a mod 0)
17	Try to convert invalid string to a number like val(”x7”)
33	Invalid argument in a trig function
34	Invalid argument in an inverse trig function
36	Invalid argument in a log function
37	Invalid argument in Pow function
38	Invalid argument in toolbox financial function
40	Invalid argument in hyperbolic function
42	Invalid argument in a gamma function

Symbol	Description and result
0	Digit placeholder. For example, if the value 8.9 is to be displayed as 8.90, use the format # .00
#	Digit placeholder. This symbol follows the same rules as the 0 symbol. However, the application shall not display extra zeros when the number typed has fewer digits on either side of the decimal than there are # symbols in the format. For example, if the custom format is # .# # , and 8.9 is in the cell, the number 8.9 is displayed.
?	Digit placeholder. This symbol follows the same rules as the 0 symbol. However, the application shall put a space for insignificant zeros on either side of the decimal point so that decimal points are aligned in the column. For example, the custom format 0.0? aligns the decimal points for the numbers 8.9 and 88.99 in a column.
. (period)	Decimal point.
%	Percentage. If the cell contains a number between 0 and 1, and the custom format 0% is used, the application shall multiply the number by 100 and adds the percentage symbol in the cell.
, (comma)	Thousands separator. The application shall separate thousands by commas if the format contains a comma that is enclosed by number signs (#) or by zeros. A comma that follows a placeholder scales the number by one thousand. For example, if the format is # .0,, and the cell value is 12,200,000 then the number 12.2 is displayed.
E- E+ e- e+	Scientific format. The application shall display a number to the right of the "E" symbol that corresponds to the number of places that the decimal point was moved. For example, if the format is 0.00E+00, and the value 12,200,000 is in the cell, the number 1.22E+07 is displayed. If the number format is # 0.0E+0, then the number 12.2E+6 is displayed.
$ -+/():space	Displays the symbol. If it is desired to display a character that differs from one of these symbols, precede the character with a backslash (\). Alternatively, enclose the character in quotation marks. For example, if the number format is (000), and the value 12 is in the cell, the number (012) is displayed.
\	Display the next character in the format. The application shall not display the backslash. For example, if the number format is 0\!, and the value 3 is in the cell, the value 3! is displayed.
*	Repeat the next character in the format enough times to fill the column to its current width. There shall not be more than one asterisk in one section of the format. If more than one asterisk appears in one section of the format, all but the last asterisk shall be ignored. For example, if the number format is 0*x, and the value 3 is in the cell, the value 3xxxxxx is displayed. The number of x characters that are displayed in the cell varies based on the width of the column.
_ (underline)	Skip the width of the next character. This is useful for lining up negative and positive values in different cells of the same column. For example, the number format _(0.0_);(0.0) aligns the numbers 2.3 and -4.5 in the column even though the negative number is enclosed by parentheses.
"text"	Display whatever text is inside the quotation marks. For example, the format 0.00 "dollars" displays 1.23 dollars when the value 1.23 is in the cell.
@	Text placeholder. If text is typed in the cell, the text from the cell is placed in the format where the at symbol (@) appears. For example, if the number format is "Bob "@" Smith" (including quotation marks), and the value "John" is in the cell, the value Bob John Smith is displayed.
