MBS Network Plugin, Plugin Version: 15.0.

Function: One of the auth mode constants.
Notes: Only for Windows.

113.1.39 kAuthNegotiate = & h4FF

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the auth mode constants.
Notes: Only for Windows.

113.1.40 kAuthNegotiateWin = & h0486

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the auth mode constants.
Notes: Only for Windows.

113.1.41 kAuthNone = 0

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the auth mode constants.
Notes: No auth.

113.1.42 kAuthNTLM = & h1086

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the auth mode constants.
Notes: Only for Windows.

113.1.43 kAuthSASL = & hA3

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the auth mode constants.
Notes: Only for Mac OS X and Linux.

113.1.44 kAuthSASLWin = & h83

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the auth mode constants.
Notes: Only for Windows.

113.1.45 kAuthSicily = & h0286

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the auth mode constants.
Notes: Only for Windows.

113.1.46 kAuthSimple = & h80

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the auth mode constants.
Notes: Simple authentication.

113.1.47 kAuthSSPI = & h4FF

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the auth mode constants.
Notes: Only for Windows.

113.1.48 kScopeBase = 0

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the scopes constants.

113.1.49 kScopeDefault = -1

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the scopes constants.

113.1.50 kScopeOneLevel = 1

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the scopes constants.

113.1.51 kScopeSubordinate = 3

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the scopes constants.

113.1.52 kScopeSubtree = 2

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the scopes constants.

113.1.53 kVersion1 = 1

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the version constants.

113.1.54 kVersion2 = 2

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the version constants.

113.1.55 kVersion3 = 3

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the version constants.

113.2 class LDAPModMBS

113.2.1 class LDAPModMBS

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class to hold values being added/modified.
Example:

```
dim m1 as new LDAPModMBS

m1.Operation = m1.kOperationAdd
m1.Type = "sn"
m1.addValue "yyy"
```

113.2.2 Methods

113.2.3 addValue(value as String)

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a value.
Notes: An item may have one value or several, so the plugin manages an array for you.

113.2.4 clearValues

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears all values.

113.2.5 Constructor

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

113.2.6 setValues(values() as String)

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the values array to be the one passed.
Notes: Does not make a copy of the array, but references it.

113.2.7 Values as String()

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the array with values.
Notes: Returns not a copy, but the array used to store values.

113.2.8 Properties

113.2.9 Operation as Integer

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The operation to perform.
Notes:

Can be kOperationAdd, kOperationDelete or kOperationReplace.
(Read and Write property)

113.2.10 Type as String

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: String that specifies the name of the attribute to modify.
Notes: (Read and Write property)

113.2.11 Value as String

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns first value.
Notes:

Some items only have one value, so this is the value.
(Read only property)

113.2.12 Constants

113.2.13 kOperationAdd = 0

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the operation modes.
Notes: Adds a value to the entry. The supplied values are appended to the existing values in the attribute.

113.2.14 kOperationDelete = 1

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the operation modes.
Notes: Deletes a value in the entry. The supplied values are deleted from the current attribute values.

113.2.15 kOperationReplace = 2

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the operation modes.
Notes: Replaces a value in the entry. The supplied values replace the existing attribute values.

Chapter 114

Licenses

114.1 Licenses

114.1.1 bzip2

Platforms: macOS, Linux, Windows, Targets: .

Function: The bzip2 1.0.5 license
Notes:

This program, "bzip2", the associated library "libbzip2", and all documentation, are copyright (C) 1996-2007 Julian R Seward. All rights reserved.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the above copyright
notice, this list of conditions and the following disclaimer.

2. The origin of this software must not be misrepresented; you must not claim that you wrote the original software. If you use this software in a product, an acknowledgment in the product documentation would be appreciated but is not required.

3. Altered source versions must be plainly marked as such, and must not be misrepresented as being the original software.

4. The name of the author may not be used to endorse or promote products derived from this software without specific prior written permission.

THIS SOFTWARE IS PROVIDED BY THE AUTHOR "AS IS" AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN false EVENT SHALL THE AUTHOR BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY,
WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

Julian Seward, jseward@bzip.org bzip2/libbzip2 version 1.0.5 of 10 December 2007

114.1.2 ChartDirector

Platforms: macOS, Linux, Windows, Targets: .

Function: The ChartDirector 5.0 license
Notes:

Please note: The license for the ChartDirector is included when you purchase the plugin as we pay royalties. So you do not need to buy an additional license from Advanced Software Engineering Limited.

The original license for the C library:

ChartDirector Version 5.0
Copyright (C) 2008 Advanced Software Engineering Limited
All Rights Reserved

********** LICENSE AGREEMENT **********

You should carefully read the following terms and conditions before using the ChartDirector software. Your use of the ChartDirector software indicates your acceptance of this license agreement. Do not use the ChartDirector software if you do not agree with the license agreement.

Disclaimer of Warranty

The ChartDirector software and the accompanying files are distributed and licensed "as is". Advanced Software Engineering Limited disclaims all warranties, either express or implied, including, but not limited to implied warranties of merchantability and fitness for a particular purpose. Should the ChartDirector software prove defective, the licensee assumes the risk of paying the entire cost of all necessary servicing, repair, or correction and any incidental or consequential damages. In no event will Advanced Software Engineering

Limited be liable for any damages whatsoever (including without limitation damages for loss of business profits, business interruption, loss of business information and the like) arising out of the use or the inability to use the ChartDirector software even if Advanced Software Engineering Limited has been advised of the possibility of such damages.

Intellectual Property

The ChartDirector software is protected by copyright laws and international copyright treaties, as well as other intellectual property laws and treaties. The ChartDirector software is licensed, not sold. Title to the ChartDirector software shall at all times remain with Advanced Software Engineering Limited.

You agree not to modify, decompile, reverse engineer, disassemble or otherwise attempt to derive source code from the ChartDirector software.

Trial Version

The trial version of the ChartDirector software will produce yellow banner messages at the bottom of the chart images generated by it. You agree to not remove, obscure, or alter this message.

Subjected to the conditions in this license agreement:

- You may use the unmodified trial version of the ChartDirector software without charge.

- You may redistribute the unmodified trial version of the ChartDirector software, provided you do not charge for it.

- You may embed the unmodified trial version of the ChartDirector software (or part of it), in a product and distribute the product, provided you do not charge for the product.

If you do not want the yellow banner messages appearing in the charts, or you want to embed the ChartDirector software (or part of it) in a product that is not free, you must purchase a commercial license to use the ChartDirector software from Advanced Software Engineering Limited. Please refer to Advanced Software Engineering's web site at www.advsofteng.com for details.

Credits

The ASP/COM/VB, PHP, Perl, Python, Ruby and C++ editions of ChartDirector contains code from the Independent JPEG Group and the FreeType team. Any software that is derived from these editions of ChartDirector must include the following text in its documentation. This applies to both the trial version as well as to the commercial licensed version of ChartDirector.

- This software is based in part on the work of the Independent JPEG Group

- This software is based in part of the work of the FreeType Team

114.1.3 CUPS

Platforms: macOS, Linux, Windows, Targets: .

Function: The CUPS 1.4.4 license
Notes:

CUPS License Agreement

Copyright 2007-2009 by Apple Inc.
1 Infinite Loop
Cupertino, CA 95014 USA

WWW: http://www.cups.org/

INTRODUCTION

CUPS(tm) is provided under the GNU General Public License ("GPL")
and GNU Library General Public License ("LGPL"), Version 2, with
exceptions for Apple operating systems and the OpenSSL toolkit. A
copy of the exceptions and licenses follow this introduction.

The GNU LGPL applies to the CUPS and CUPS Imaging libraries
located in the "cups" and "filter" subdirectories of the CUPS
source distribution and in the "cups" include directory and
library files in the binary distributions. The GNU GPL applies to
the remainder of the CUPS distribution, including the "pdftops"
filter which is based upon Xpdf.

For those not familiar with the GNU GPL, the license basically
allows you to:

- Use the CUPS software at no charge.
- Distribute verbatim copies of the software in source or
binary form.
- Sell verbatim copies of the software for a media fee, or
sell support for the software.

What this license *does not* allow you to do is make changes or add features to CUPS and then sell a binary distribution without source code. You must provide source for any changes or additions to the software, and all code must be provided under the GPL or LGPL as appropriate. The only exceptions to this are the portions of the CUPS software covered by the Apple operating system license exceptions outlined later in this license agreement.

The GNU LGPL relaxes the ”link-to” restriction, allowing you to develop applications that use the CUPS and CUPS Imaging libraries under other licenses and/or conditions as appropriate for your application, driver, or filter.

LICENSE EXCEPTIONS

In addition, as the copyright holder of CUPS, Apple Inc. grants the following special exceptions:

1. Apple Operating System Development License Exception;

a. Software that is developed by any person or entity for an Apple Operating System (”Apple OS-Developed Software”), including but not limited to Apple and third party printer drivers, filters, and backends for an Apple Operating System, that is linked to the CUPS imaging library or based on any sample filters or backends provided with CUPS shall not be considered to be a derivative work or collective work based on the CUPS program and is exempt from the mandatory source code release clauses of the GNU GPL. You may therefore distribute linked combinations of the CUPS imaging library with Apple OS-Developed Software without releasing the source code of the Apple OS-Developed Software. You may also use sample filters and backends provided with CUPS to develop Apple OS-Developed Software without releasing the source code of the Apple OS-Developed Software.

b. An Apple Operating System means any operating system software developed and/or marketed by Apple Computer, Inc., including but not limited to all existing releases and versions of Apple’s Darwin, Mac OS X, and Mac OS X Server products and all follow-on releases and future versions thereof.

c. This exception is only available for Apple
OS-Developed Software and does not apply to software
that is distributed for use on other operating
systems.

d. All CUPS software that falls under this license
exception have the following text at the top of each
source file:

This file is subject to the Apple OS-Developed
Software exception.

2. OpenSSL Toolkit License Exception;

a. Apple Inc. explicitly allows the compilation and
distribution of the CUPS software with the OpenSSL
Toolkit.

No developer is required to provide these exceptions in a
derived work.

KERBEROS SUPPORT CODE

The Kerberos support code ("KSC") is copyright 2006 by Jelmer
Vernooij and is provided 'as-is', without any express or implied
warranty. In no event will the author or Apple Inc. be held
liable for any damages arising from the use of the KSC.

Sources files containing KSC have the following text at the top
of each source file:

This file contains Kerberos support code, copyright 2006 by
Jelmer Vernooij.

The KSC copyright and license apply only to Kerberos-related
feature code in CUPS. Such code is typically conditionally
compiled based on the present of the HAVE_GSSAPI preprocessor
definition.

Permission is granted to anyone to use the KSC for any purpose,

including commercial applications, and to alter it and
redistribute it freely, subject to the following restrictions:

1. The origin of the KSC must not be misrepresented; you
must not claim that you wrote the original software. If
you use the KSC in a product, an acknowledgment in the
product documentation would be appreciated but is not
required.

2. Altered source versions must be plainly marked as such,
and must not be misrepresented as being the original
software.

3. This notice may not be removed or altered from any source
distribution.

TRADEMARKS

CUPS and the CUPS logo (the "CUPS Marks") are trademarks of Apple
Inc. Apple grants you a non-exclusive and non-transferable right
to use the CUPS Marks in any direct port or binary distribution
incorporating CUPS software and in any promotional material
therefor. You agree that your products will meet the highest
levels of quality and integrity for similar goods, not be unlawful,
and be developed, manufactured, and distributed in compliance with
this license. You will not interfere with Apple's rights in the
CUPS Marks, and all use of the CUPS Marks shall inure to the
benefit of Apple. This license does not apply to use of the CUPS
Marks in a derivative products, which requires prior written
permission from Apple Inc.

GNU GENERAL PUBLIC LICENSE
Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.
59 Temple Place, Suite 330, Boston, MA 02111-1307 USA
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your

freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software–to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.

b) You must cause any work that you distribute or publish, that in

whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.

c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

b) Accompany it with a written offer, valid for at least three

years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License

may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

false WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS false WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN false EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY

YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

Appendix: How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>
Copyright (C) 19yy <name of author>

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 675 Mass Ave, Cambridge, MA 02139, USA.

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

Gnomovision version 69, Copyright (C) 19yy name of author
Gnomovision comes with ABSOLUTELY false WARRANTY; for details type 'show w'.

This is free software, and you are welcome to redistribute it
under certain conditions; type 'show c' for details.

The hypothetical commands 'show w' and 'show c' should show the appropriate
parts of the General Public License. Of course, the commands you use may
be called something other than 'show w' and 'show c'; they could even be
mouse-clicks or menu items–whatever suits your program.

You should also get your employer (if you work as a programmer) or your
school, if any, to sign a "copyright disclaimer" for the program, if
necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the program
'Gnomovision' (which makes passes at compilers) written by James Hacker.

<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice

This General Public License does not permit incorporating your program into
proprietary programs. If your program is a subroutine library, you may
consider it more useful to permit linking proprietary applications with the
library. If this is what you want to do, use the GNU Library General
Public License instead of this License.

Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

[This is the first released version of the library GPL. It is
numbered 2 because it goes with version 2 of the ordinary GPL.]

Preamble

The licenses for most software are designed to take away your
freedom to share and change it. By contrast, the GNU General Public
Licenses are intended to guarantee your freedom to share and change

free software–to make sure the software is free for all its users.

This license, the Library General Public License, applies to some specially designated Free Software Foundation software, and to any other libraries whose authors decide to use it. You can use it for your libraries, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library, or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link a program with the library, you must provide complete object files to the recipients so that they can relink them with the library, after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

Our method of protecting your rights has two steps: (1) copyright the library, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the library.

Also, for each distributor's protection, we want to make certain that everyone understands that there is no warranty for this free library. If the library is modified by someone else and passed on, we want its recipients to know that what they have is not the original version, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that companies distributing free software will individually obtain patent licenses, thus in effect transforming the program into proprietary software. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License, which was designed for utility programs. This license, the GNU Library General Public License, applies to certain designated libraries. This license is quite different from the ordinary one; be sure to read it in full, and don't assume that anything in it is the same as in the ordinary license.

The reason we have a separate public license for some libraries is that they blur the distinction we usually make between modifying or adding to a program and simply using it. Linking a program with a library, without changing the library, is in some sense simply using the library, and is analogous to running a utility program or application program. However, in a textual and legal sense, the linked executable is a combined work, a derivative of the original library, and the ordinary General Public License treats it as such.

Because of this blurred distinction, using the ordinary General Public License for libraries did not effectively promote software sharing, because most developers did not use the libraries. We concluded that weaker conditions might promote sharing better.

However, unrestricted linking of non-free programs would deprive the users of those programs of all benefit from the free status of the libraries themselves. This Library General Public License is intended to permit developers of non-free programs to use free libraries, while preserving your freedom as a user of such programs to change the free libraries that are incorporated in them. (We have not seen how to achieve this as regards changes in header files, but we have achieved it as regards changes in the actual functions of the Library.) The hope is that this will lead to faster development of free libraries.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, while the latter only works together with the library.

Note that it is possible for a library to be covered by the ordinary General Public License rather than by this special one.

GNU LIBRARY GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Library General Public License (also called ”this License”). Each licensee is addressed as ”you”.

A ”library” means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The ”Library”, below, refers to any such software library or work which has been distributed under these terms. A ”work based on the Library” means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term ”modification”.)

”Source code” for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library’s complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) The modified work must itself be a software library.

b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License.

Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also compile or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood

that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

c) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

d) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Library General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

false WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS false WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN false EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

Appendix: How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the library's name and a brief idea of what it does.>
Copyright (C) <year><name of author>

This library is free software; you can redistribute it and/or
modify it under the terms of the GNU Library General Public
License as published by the Free Software Foundation; either
version 2 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU
Library General Public License for more details.

You should have received a copy of the GNU Library General Public
License along with this library; if not, write to the Free
Software Foundation, Inc., 675 Mass Ave, Cambridge, MA 02139, USA.

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your
school, if any, to sign a "copyright disclaimer" for the library, if
necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the
library 'Frob' (a library for tweaking knobs) written by James Random Hacker.

<signature of Ty Coon>, 1 April 1990
Ty Coon, President of Vice

That's all there is to it!

114.1.4 CURL

Platforms: macOS, Linux, Windows, Targets: .

Function: The CURL 7.20.0 license
Notes:

CURL links to libssl, libcrypto, libssh2 and other libraries.

COPYRIGHT AND PERMISSION NOTICE

Copyright (c) 1996 - 2009, Daniel Stenberg, <daniel@haxx.se>.

All rights reserved.

Permission to use, copy, modify, and distribute this software for any purpose with or without fee is hereby granted, provided that the above copyright notice and this permission notice appear in all copies.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OF THIRD PARTY RIGHTS. IN false EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

Except as contained in this notice, the name of a copyright holder shall not be used in advertising or otherwise to promote the sale, use or other dealings in this Software without prior written authorization of the copyright holder.

114.1.5 expat

Platforms: macOS, Linux, Windows, Targets: .

Function: The expat 2.0.1 license
Notes:

Copyright (c) 1998, 1999, 2000 Thai Open Source Software Center Ltd and Clark Cooper Copyright (c) 2001, 2002, 2003, 2004, 2005, 2006 Expat maintainers.

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. 114.1.6 FreeType

Platforms: macOS, Linux, Windows, Targets: .

Function: The FreeType 2.3.9 license
Notes:

The FreeType 2 font engine is copyrighted work and cannot be used legally without a software license. In order to make this project usable to a vast majority of developers, we distribute it under two mutually exclusive open-source licenses.

This means that *you* must choose *one* of the two licenses described below, then obey all its terms and conditions when using FreeType 2 in any of your projects or products.

- The FreeType License, found in the file 'FTL.TXT', which is similar to the original BSD license *with* an advertising clause that forces you to explicitly cite the FreeType project in your product's documentation. All details are in the license file. This license is suited to products which don't use the GNU General Public License.

- The GNU General Public License version 2, found in 'GPL.TXT' (any later version can be used also), for programs which already use the GPL. Note that the FTL is incompatible with the GPL due to its advertisement clause.

The contributed PCF driver comes with a license similar to that of the X Window System. It is compatible to the above two licenses (see file src/pcf/readme).

— end of LICENSE.TXT —

The FreeType Project LICENSE
————————————-

2006-Jan-27

Copyright 1996-2002, 2006 by
David Turner, Robert Wilhelm, and Werner Lemberg

Introduction

==========

The FreeType Project is distributed in several archive packages;
some of them may contain, in addition to the FreeType font engine,
various tools and contributions which rely on, or relate to, the
FreeType Project.

This license applies to all files found in such packages, and
which do not fall under their own explicit license. The license
affects thus the FreeType font engine, the test programs,
documentation and makefiles, at the very least.

This license was inspired by the BSD, Artistic, and IJG
(Independent JPEG Group) licenses, which all encourage inclusion
and use of free software in commercial and freeware products
alike. As a consequence, its main points are that:

o We don't promise that this software works. However, we will be
interested in any kind of bug reports. ('as is' distribution)

o You can use this software for whatever you want, in parts or
full form, without having to pay us. ('royalty-free' usage)

o You may not pretend that you wrote this software. If you use
it, or only parts of it, in a program, you must acknowledge
somewhere in your documentation that you have used the
FreeType code. ('credits')

We specifically permit and encourage the inclusion of this
software, with or without modifications, in commercial products.
We disclaim all warranties covering The FreeType Project and
assume no liability related to The FreeType Project.

Finally, many people asked us for a preferred form for a
credit/disclaimer to use in compliance with this license. We thus
encourage you to use the following text:

"""
Portions of this software are copyright © <year>The FreeType
Project (www.freetype.org). All rights reserved.
"""

Please replace <year>with the value from the FreeType version you actually use.

Legal Terms
==========

0. Definitions

Throughout this license, the terms 'package', 'FreeType Project', and 'FreeType archive' refer to the set of files originally distributed by the authors (David Turner, Robert Wilhelm, and Werner Lemberg) as the 'FreeType Project', be they named as alpha, beta or final release.

'You' refers to the licensee, or person using the project, where 'using' is a generic term including compiling the project's source code as well as linking it to form a 'program' or 'executable'. This program is referred to as 'a program using the FreeType engine'.

This license applies to all files distributed in the original FreeType Project, including all source code, binaries and documentation, unless otherwise stated in the file in its original, unmodified form as distributed in the original archive. If you are unsure whether or not a particular file is covered by this license, you must contact us to verify this.

The FreeType Project is copyright (C) 1996-2000 by David Turner, Robert Wilhelm, and Werner Lemberg. All rights reserved except as specified below.

1. No Warranty

THE FREETYPE PROJECT IS PROVIDED 'AS IS' WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. IN false EVENT WILL ANY OF THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY DAMAGES CAUSED BY THE USE OR THE INABILITY TO USE, OF THE FREETYPE PROJECT.

2. Redistribution

This license grants a worldwide, royalty-free, perpetual and irrevocable right and license to use, execute, perform, compile, display, copy, create derivative works of, distribute and sublicense the FreeType Project (in both source and object code forms) and derivative works thereof for any purpose; and to authorize others to exercise some or all of the rights granted herein, subject to the following conditions:

o Redistribution of source code must retain this license file ('FTL.TXT') unaltered; any additions, deletions or changes to the original files must be clearly indicated in accompanying documentation. The copyright notices of the unaltered, original files must be preserved in all copies of source files.

o Redistribution in binary form must provide a disclaimer that states that the software is based in part of the work of the FreeType Team, in the distribution documentation. We also encourage you to put an URL to the FreeType web page in your documentation, though this isn't mandatory.

These conditions apply to any software derived from or based on the FreeType Project, not just the unmodified files. If you use our work, you must acknowledge us. However, no fee need be paid to us.

3. Advertising

Neither the FreeType authors and contributors nor you shall use the name of the other for commercial, advertising, or promotional purposes without specific prior written permission.

We suggest, but do not require, that you use one or more of the following phrases to refer to this software in your documentation or advertising materials: 'FreeType Project', 'FreeType Engine', 'FreeType library', or 'FreeType Distribution'.

As you have not signed this license, you are not required to accept it. However, as the FreeType Project is copyrighted

material, only this license, or another one contracted with the authors, grants you the right to use, distribute, and modify it. Therefore, by using, distributing, or modifying the FreeType Project, you indicate that you understand and accept all the terms of this license.

4. Contacts

There are two mailing lists related to FreeType:

o freetype@nongnu.org

Discusses general use and applications of FreeType, as well as future and wanted additions to the library and distribution. If you are looking for support, start in this list if you haven't found anything to help you in the documentation.

o freetype-devel@nongnu.org

Discusses bugs, as well as engine internals, design issues, specific licenses, porting, etc.

Our home page can be found at

http://www.freetype.org

GNU GENERAL PUBLIC LICENSE
Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.
51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA
Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your

freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software–to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.

b) You must cause any work that you distribute or publish, that in

whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.

c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

b) Accompany it with a written offer, valid for at least three

years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License

may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

false WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS false WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN false EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY

YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>
Copyright (C) <year><name of author>

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

Gnomovision version 69, Copyright (C) year name of author
Gnomovision comes with ABSOLUTELY false WARRANTY; for details type 'show w'.

This is free software, and you are welcome to redistribute it
under certain conditions; type 'show c' for details.

The hypothetical commands 'show w' and 'show c' should show the appropriate
parts of the General Public License. Of course, the commands you use may
be called something other than 'show w' and 'show c'; they could even be
mouse-clicks or menu items–whatever suits your program.

You should also get your employer (if you work as a programmer) or your
school, if any, to sign a "copyright disclaimer" for the program, if
necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the program
'Gnomovision' (which makes passes at compilers) written by James Hacker.

<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice

This General Public License does not permit incorporating your program into
proprietary programs. If your program is a subroutine library, you may
consider it more useful to permit linking proprietary applications with the
library. If this is what you want to do, use the GNU Library General
Public License instead of this License.

114.1.7 GraphicsMagick

Platforms: macOS, Linux, Windows, Targets: .

Function: The GraphicsMagick license
Notes:

GraphicsMagick links to Tiff, zlib, LCMS, JPEG, FreeType, XML, iconv and PNG.

.. This text is in reStucturedText format, so it may look a bit odd.
.. See http://docutils.sourceforge.net/rst.html for details.

==========
GraphicsMagick Copyrights and Licenses
==========

This file is part of the GraphicsMagick software distributed by the
GraphicsMagick Group.

[*Please note that the legal community considers 15 or more
total lines of code or text (not necessarily contiguous) to
be significant for the purposes of copyright. Repeated
changes such as renaming a symbol has similar significance
to changing one line of code.*]

The licenses which components of this software fall under are as follows.

1)
In November 2002, the GraphicsMagick Group created GraphicsMagick
from ImageMagick Studio's ImageMagick and applied the "MIT" style
license:

Copyright (C) 2002 - 2010 GraphicsMagick Group

Permission is hereby granted, free of charge, to any person
obtaining a copy of this software and associated documentation files
(the "Software"), to deal in the Software without restriction,
including without limitation the rights to use, copy, modify, merge,
publish, distribute, sublicense, and/or sell copies of the Software,
and to permit persons to whom the Software is furnished to do so,
subject to the following conditions:

The above copyright notice and this permission notice shall be
included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND,
EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF
MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND
NONINFRINGEMENT. IN false EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS
BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN
ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN
CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE
SOFTWARE.

2)
In October 1999, ImageMagick Studio assumed the responsibility for
the development of ImageMagick (forking from the distribution by
E. I. du Pont de Nemours and Company) and applied a new license:

Copyright (C) 2002 ImageMagick Studio, a non-profit organization dedicated

to making software imaging solutions freely available.

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (”ImageMagick”), to deal in ImageMagick without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of ImageMagick, and to permit persons to whom the ImageMagick is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of ImageMagick.

The software is provided ”as is”, without warranty of any kind, express or implied, including but not limited to the warranties of merchantability, fitness for a particular purpose and noninfringement. In no event shall ImageMagick Studio be liable for any claim, damages or other liability, whether in an action of contract, tort or otherwise, arising from, out of or in connection with ImageMagick or the use or other dealings in ImageMagick.

Except as contained in this notice, the name of the ImageMagick Studio shall not be used in advertising or otherwise to promote the sale, use or other dealings in ImageMagick without prior written authorization from the ImageMagick Studio.

3)
From 1991 to October 1999 (through ImageMagick 4.2.9), ImageMagick was developed and distributed by E. I. du Pont de Nemours and Company:

Copyright 1999 E. I. du Pont de Nemours and Company

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (”ImageMagick”), to deal in ImageMagick without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of ImageMagick, and to permit persons to whom the ImageMagick is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of ImageMagick.

The software is provided "as is", without warranty of any kind, express or implied, including but not limited to the warranties of merchantability, fitness for a particular purpose and noninfringement. In no event shall E. I. du Pont de Nemours and Company be liable for any claim, damages or other liability, whether in an action of contract, tort or otherwise, arising from, out of or in connection with ImageMagick or the use or other dealings in ImageMagick.

Except as contained in this notice, the name of the E. I. du Pont de Nemours and Company shall not be used in advertising or otherwise to promote the sale, use or other dealings in ImageMagick without prior written authorization from the E. I. du Pont de Nemours and Company.

4)
The GraphicsMagick Base64Decode() and Base64Encode() functions are based on source code obtained from OpenSSH. This source code is distributed under the following license:

Copyright (c) 2000 Markus Friedl. All rights reserved.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.

2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

THIS SOFTWARE IS PROVIDED BY THE AUTHOR \'\'AS IS\'\' AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN false EVENT SHALL THE AUTHOR BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

5)

Many of the pattern images in coders/logo.c are derived from XFig, which is distributed under the following license:

| FIG : Facility for Interactive Generation of figures
| Copyright (c) 1985-1988 by Supoj Sutanthavibul
| Parts Copyright (c) 1989-2000 by Brian V. Smith
| Parts Copyright (c) 1991 by Paul King

Any party obtaining a copy of these files is granted, free of charge, a full and unrestricted irrevocable, world-wide, paid up, royalty-free, nonexclusive right and license to deal in this software and documentation files (the "Software"), including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons who receive copies from any such party to do so, with the only requirement being that this copyright notice remain intact.

6)
The documentation for the composition operators is copied from the rlecomp manual page, which is authored by Rod Bogart and John W. Peterson. Rlecomp is part of the Utah Raster Toolkit distributed by the University of Michigan and the University of Utah. The copyright for this manual page is as follows:

Copyright (c) 1986, University of Utah

This software is copyrighted as noted below. It may be freely copied, modified, and redistributed, provided that the copyright notice is preserved on all copies.

There is no warranty or other guarantee of fitness for this software, it is provided solely "as is". Bug reports or fixes may be sent to the author, who may or may not act on them as he desires.

You may not include this software in a program or other software product without supplying the source, or without informing the end-user that the source is available for no extra charge.

If you modify this software, you should include a notice giving the name of the person performing the modification, the date of modification, and the reason for such modification.

7)
The source code comprising swab.c is originally derived from libtiff which has the following license:

| Copyright (c) 1988-1997 Sam Leffler
| Copyright (c) 1991-1997 Silicon Graphics, Inc.

Permission to use, copy, modify, distribute, and sell this software and its documentation for any purpose is hereby granted without fee, provided that (i) the above copyright notices and this permission notice appear in all copies of the software and related documentation, and (ii) the names of Sam Leffler and Silicon Graphics may not be used in any advertising or publicity relating to the software without the specific, prior written permission of Sam Leffler and Silicon Graphics.

THE SOFTWARE IS PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EXPRESS, IMPLIED OR OTHERWISE, INCLUDING WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

IN false EVENT SHALL SAM LEFFLER OR SILICON GRAPHICS BE LIABLE FOR ANY SPECIAL, INCIDENTAL, INDIRECT OR CONSEQUENTIAL DAMAGES OF ANY KIND, OR ANY DAMAGES WHATSOEVER RESULTING FROM LOSS OF USE, DATA OR PROFITS, WHETHER OR NOT ADVISED OF THE POSSIBILITY OF DAMAGE, AND ON ANY THEORY OF LIABILITY, ARISING OUT OF OR IN CONNECTION WITH THE USE OR PERFORMANCE OF THIS SOFTWARE.

8)
The C++ API known as "Magick++", and which resides in the Magick++ directory, is distributed under the following license:

Copyright 1999 - 2003 Bob Friesenhahn <bfriesen@simple.dallas.tx.us>

Permission is hereby granted, free of charge, to any person obtaining a copy of the source files and associated documentation files ("Magick++"), to deal in Magick++ without restriction, including without limitation of the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of Magick++, and to permit persons to whom the Magick++ is furnished to do so, subject to the following conditions:

This copyright notice shall be included in all copies or substantial portions of Magick++. The copyright to Magick++ is retained by its author and shall not be subsumed or replaced by any other copyright.

The software is provided "as is", without warranty of any kind,

express or implied, including but not limited to the warranties of merchantability, fitness for a particular purpose and noninfringement. In no event shall Bob Friesenhahn be liable for any claim, damages or other liability, whether in an action of contract, tort or otherwise, arising from, out of or in connection with Magick++ or the use or other dealings in Magick++.

9)
The GraphicsMagick HaldClutImagePixels() function in magick/hclut.c is based on source code from the HaldCLUT package by Eskil Steenberg (http://www.quelsolaar.com/technology/clut.html) which is distributed under the following license:

Copyright (c) 2005 Eskil Steenberg. All rights reserved.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the above copyright notice, this list of conditions and the following disclaimer.

2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

THIS SOFTWARE IS PROVIDED BY THE AUTHOR \'\'AS IS\'\' AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN false EVENT SHALL THE AUTHOR BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

10)
GraphicsMagick makes use of third-party "delegate" libraries to support certain optional features. These libraries bear their own copyrights and licenses, which may be more or less restrictive than the GraphicsMagick license. For convenience, when GraphicsMagick is bundled with (or compiled with) "delegate" libraries, a copy of the licenses for these libraries is provided in a "licenses" directory.

| Copyright (C) 2002 - 2010 GraphicsMagick Group

114.1.8 HASP

Platforms: macOS, Linux, Windows, Targets: .

Function: The HASP license
Notes:

Aladdin Knowledge Systems Ltd. (c) 1985 - 2005. All rights reserved.

Exact license details are available with the HASP SDKs.

114.1.9 ImageMagick

Platforms: macOS, Linux, Windows, Targets: .

Function: The ImageMagick license
Notes:

The authoratitive ImageMagick license can be found at
http://www.imagemagick.org/script/license.php and ImageMagick notices at
http://www.imagemagick.org/script/notice.php.

Before we get to the text of the license lets just review what the license says in simple terms:

It allows you to:

* freely download and use ImageMagick software, in whole or in part, for personal, company internal, or commercial purposes;
* use ImageMagick software in packages or distributions that you create.

It forbids you to:

* redistribute any piece of ImageMagick-originated software without proper attribution;
* use any marks owned by ImageMagick Studio LLC in any way that might state or imply that ImageMagick Studio LLC endorses your distribution;
* use any marks owned by ImageMagick Studio LLC in any way that might state or imply that you created

the ImageMagick software in question.

It requires you to:

* include a copy of the license in any redistribution you may make that includes ImageMagick software;
* provide clear attribution to ImageMagick Studio LLC for any distributions that include ImageMagick software.

It does not require you to:

* include the source of the ImageMagick software itself, or of any modifications you may have made to it, in any redistribution you may assemble that includes it;
* submit changes that you make to the software back to the ImageMagick Studio LLC (though such feedback is encouraged).

A few other clarifications include:
* ImageMagick is freely available without charge;
* you may include ImageMagick on a CD-ROM as long as you comply with the terms of the license;
* you can give modified code away for free or sell it under the terms of the ImageMagick license or distribute the result under a different license, but you need to acknowledge the use of the ImageMagick software;
* the license is compatible with the GPL.

The legally binding and authoritative terms and conditions for use, reproduction, and distribution of ImageMagick follow:

Copyright 1999-2007 ImageMagick Studio LLC, a non-profit organization dedicated to making software imaging solutions freely available.

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.
"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.
"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.
"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.
"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

”Object” form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

”Work” shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

”Derivative Works” shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

”Contribution” shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, ”submitted” means any form of electronic, verbal, or written communication intentionally sent to the Licensor by its copyright holder or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as ”Not a Contribution.”

”Contributor” shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

a. You must give any other recipients of the Work or Derivative Works a copy of this License; and

b. You must cause any modified files to carry prominent notices stating that You changed the files; and

c. You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

d. If the Work includes a ”NOTICE” text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from

the Work, provided that such additional attribution notices cannot be construed as modifying the License. You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.
5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License.

114.1.10 iMedia Browser

Platforms: macOS, Linux, Windows, Targets: .

Function: The iMedia Browser license
Notes:

iMedia Browser <http://karelia.com/imedia/>
Copyright (c) 2005-2007 by Karelia Software et al.
iMedia Browser is based on code originally developed by Jason Terhorst, further developed for Sandvox by Greg Hulands, Dan Wood, and Terrence Talbot. Contributions have also been made by Matt Gough, Martin Wennerberg and others as indicated in source files.
iMedia Browser is licensed under the following terms:
Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in all or substantial portions of the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the

following conditions:
Redistributions of source code must retain the original terms stated here, including this list of conditions, the disclaimer noted below, and the following copyright notice: Copyright (c) 2005-2007 by Karelia Software et al.
Redistributions in binary form must include, in an end-user-visible manner, e.g., About window, Acknowledgments window, or similar, either a) the original terms stated here, including this list of conditions, the disclaimer noted below, and the aforementioned copyright notice, or b) the aforementioned copyright notice and a link to karelia.com/imedia.
Neither the name of Karelia Software, nor Sandvox, nor the names of contributors to iMedia Browser may be used to endorse or promote products derived from the Software without prior and express written permission from Karelia Software or individual contributors, as appropriate.
Disclaimer: THE SOFTWARE IS PROVIDED BY THE COPYRIGHT OWNER AND CONTRIBUTORS "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NONINFRINGEMENT. IN false EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES, OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT, OR OTHERWISE, ARISING FROM, OUT OF, OR IN CONNECTION WITH, THE SOFTWARE OR THE USE OF, OR OTHER DEALINGS IN, THE SOFTWARE.

114.1.11 lcms

Platforms: macOS, Linux, Windows, Targets: .

Function: The lcms 1.19 license
Notes:

Little CMS
Copyright (c) 1998-2007 Marti Maria Saguer

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

114.1.12 libjpeg

Platforms: macOS, Linux, Windows, Targets: .

Function: The libjpeg license
Notes:

In plain English:

1. We don't promise that this software works. (But if you find any bugs, please let us know!)
2. You can use this software for whatever you want. You don't have to pay us.
3. You may not pretend that you wrote this software. If you use it in a program, you must acknowledge somewhere in your documentation that you've used the IJG code.

In legalese:

The authors make false WARRANTY or representation, either express or implied, with respect to this software, its quality, accuracy, merchantability, or fitness for a particular purpose. This software is provided "AS IS", and you, its user, assume the entire risk as to its quality and accuracy.

This software is copyright (C) 1991-2010, Thomas G. Lane, Guido Vollbeding. All Rights Reserved except as specified below.

Permission is hereby granted to use, copy, modify, and distribute this software (or portions thereof) for any purpose, without fee, subject to these conditions:
(1) If any part of the source code for this software is distributed, then this README file must be included, with this copyright and no-warranty notice unaltered; and any additions, deletions, or changes to the original files must be clearly indicated in accompanying documentation.
(2) If only executable code is distributed, then the accompanying documentation must state that "this software is based in part on the work of the Independent JPEG Group".
(3) Permission for use of this software is granted only if the user accepts full responsibility for any undesirable consequences; the authors accept false LIABILITY for damages of any kind.

These conditions apply to any software derived from or based on the IJG code, not just to the unmodified library. If you use our work, you ought to acknowledge us.

Permission is NOT granted for the use of any IJG author's name or company name in advertising or publicity relating to this software or products derived from it. This software may be referred to only as "the Independent JPEG Group's software".

We specifically permit and encourage the use of this software as the basis of commercial products, provided that all warranty or liability claims are assumed by the product vendor.

ansi2knr.c is included in this distribution by permission of L. Peter Deutsch, sole proprietor of its copyright holder, Aladdin Enterprises of Menlo Park, CA. ansi2knr.c is NOT covered by the above copyright and conditions, but instead by the usual distribution terms of the Free Software Foundation; principally, that you must include source code if you redistribute it. (See the file ansi2knr.c for full details.) However, since ansi2knr.c is not needed as part of any program generated from the IJG code, this does not limit you more than the foregoing paragraphs do.

The Unix configuration script "configure" was produced with GNU Autoconf. It is copyright by the Free Software Foundation but is freely distributable. The same holds for its supporting scripts (config.guess, config.sub, ltmain.sh). Another support script, install-sh, is copyright by X Consortium but is also freely distributable.

The IJG distribution formerly included code to read and write GIF files. To avoid entanglement with the Unisys LZW patent, GIF reading support has been removed altogether, and the GIF writer has been simplified to produce "uncompressed GIFs". This technique does not use the LZW algorithm; the resulting GIF files are larger than usual, but are readable by all standard GIF decoders.

We are required to state that
"The Graphics Interchange Format(c) is the Copyright property of CompuServe Incorporated. GIF(sm) is a Service Mark property of CompuServe Incorporated."

114.1.13 libpng

Platforms: macOS, Linux, Windows, Targets: .

Function: The libpng 1.4.3 license.
Notes:

This copy of the libpng notices is provided for your convenience. In case of any discrepancy between this

copy and the notices in the file png.h that is included in the libpng distribution, the latter shall prevail.

COPYRIGHT NOTICE, DISCLAIMER, and LICENSE:

If you modify libpng you may insert additional notices immediately following this sentence.

This code is released under the libpng license.

libpng versions 1.2.6, August 15, 2004, through 1.4.3, June 26, 2010, are Copyright (c) 2004, 2006-2007 Glenn Randers-Pehrson, and are distributed according to the same disclaimer and license as libpng-1.2.5 with the following individual added to the list of Contributing Authors

Cosmin Truta

libpng versions 1.0.7, July 1, 2000, through 1.2.5 - October 3, 2002, are Copyright (c) 2000-2002 Glenn Randers-Pehrson, and are distributed according to the same disclaimer and license as libpng-1.0.6 with the following individuals added to the list of Contributing Authors

Simon-Pierre Cadieux
Eric S. Raymond
Gilles Vollant

and with the following additions to the disclaimer:

There is no warranty against interference with your enjoyment of the
library or against infringement. There is no warranty that our
efforts or the library will fulfill any of your particular purposes
or needs. This library is provided with all faults, and the entire
risk of satisfactory quality, performance, accuracy, and effort is with
the user.

libpng versions 0.97, January 1998, through 1.0.6, March 20, 2000, are Copyright (c) 1998, 1999 Glenn Randers-Pehrson, and are distributed according to the same disclaimer and license as libpng-0.96, with the following individuals added to the list of Contributing Authors:

Tom Lane
Glenn Randers-Pehrson
Willem van Schaik

libpng versions 0.89, June 1996, through 0.96, May 1997, are Copyright (c) 1996, 1997 Andreas Dilger Distributed according to the same disclaimer and license as libpng-0.88,

with the following individuals added to the list of Contributing Authors:

John Bowler
Kevin Bracey
Sam Bushell
Magnus Holmgren
Greg Roelofs
Tom Tanner

libpng versions 0.5, May 1995, through 0.88, January 1996, are Copyright (c) 1995, 1996 Guy Eric Schalnat, Group 42, Inc.

For the purposes of this copyright and license, "Contributing Authors"
is defined as the following set of individuals:

Andreas Dilger
Dave Martindale
Guy Eric Schalnat
Paul Schmidt
Tim Wegner

The PNG Reference Library is supplied "AS IS". The Contributing Authors and Group 42, Inc. disclaim all warranties, expressed or implied,
including, without limitation, the warranties of merchantability and of fitness for any purpose. The Contributing Authors and Group 42, Inc.
assume no liability for direct, indirect, incidental, special, exemplary,
or consequential damages, which may result from the use of the PNG Reference Library, even if advised of the possibility of such damage.

Permission is hereby granted to use, copy, modify, and distribute this source code, or portions hereof, for any purpose, without fee, subject to the following restrictions:

1. The origin of this source code must not be misrepresented.
2. Altered versions must be plainly marked as such and must not be misrepresented as being the original source.
3. This Copyright notice may not be removed or altered from any source or altered source distribution.

The Contributing Authors and Group 42, Inc. specifically permit, without fee, and encourage the use of this source code as a component to supporting the PNG file format in commercial products. If you use this source code in a product, acknowledgment is not required but would be appreciated.

A "png_get_copyright" function is available, for convenient use in "about"

boxes and the like:

printf("% s",png_get_copyright(NULL));

Also, the PNG logo (in PNG format, of course) is supplied in the files "pngbar.png" and "pngbar.jpg (88x31) and "pngnow.png" (98x31).

Libpng is OSI Certified Open Source Software. OSI Certified Open Source is a certification mark of the Open Source Initiative.

114.1.15 LibTesseract

Platforms: macOS, Linux, Windows, Targets: .

Function: The LibTesseract 2.04 license
Notes:

This package contains the Tesseract Open Source OCR Engine.
Orignally developed at Hewlett Packard Laboratories Bristol and
at Hewlett Packard Co, Greeley Colorado, all the code
in this distribution is now licensed under the Apache License:

- Licensed under the Apache License, Version 2.0 (the "License");
- you may not use this file except in compliance with the License.
- You may obtain a copy of the License at
- http://www.apache.org/licenses/LICENSE-2.0
- Unless required by applicable law or agreed to in writing, software
- distributed under the License is distributed on an "AS IS" BASIS,
- WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
- See the License for the specific language governing permissions and
- limitations under the License.

Other Dependencies and Licenses:
==========
The Aspirin/MIGRAINES system is no longer used.

Tesseract can also make use of the libtiff library. (www.libtiff.org)
Without libtiff, Tesseract can only read uncompressed and G3 compressed
TIFF files.

114.1.16 libtiff

Platforms: macOS, Linux, Windows, Targets: .

Function: The libtiff 3.9.4 license
Notes:

Use and Copyright

Silicon Graphics has seen fit to allow us to give this work away. It is free. There is no support or guarantee of any sort as to its operations, correctness, or whatever. If you do anything useful with all or parts of it you need to honor the copyright notices. I would also be interested in knowing about it and, hopefully, be acknowledged.

The legal way of saying that is:

Copyright (c) 1988-1997 Sam Leffler
Copyright (c) 1991-1997 Silicon Graphics, Inc.

Permission to use, copy, modify, distribute, and sell this software and its documentation for any purpose is hereby granted without fee, provided that (i) the above copyright notices and this permission notice appear in all copies of the software and related documentation, and (ii) the names of Sam Leffler and Silicon Graphics may not be used in any advertising or publicity relating to the software without the specific, prior written permission of Sam Leffler and Silicon Graphics.

THE SOFTWARE IS PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EXPRESS, IMPLIED OR OTHERWISE, INCLUDING WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

IN false EVENT SHALL SAM LEFFLER OR SILICON GRAPHICS BE LIABLE FOR ANY SPECIAL, INCIDENTAL, INDIRECT OR CONSEQUENTIAL DAMAGES OF ANY KIND, OR ANY DAMAGES WHATSOEVER RESULTING FROM LOSS OF USE, DATA OR PROFITS, WHETHER OR NOT ADVISED OF THE POSSIBILITY OF DAMAGE, AND ON ANY THEORY OF LIABILITY, ARISING OUT OF OR IN CONNECTION WITH THE USE OR PERFORMANCE OF THIS SOFTWARE.

114.1.17 libunimotion

Platforms: macOS, Linux, Windows, Targets: .

Function: The libunimotion 0.4.1 license
Notes:

The plugin loads the unimotion library. So the library is LGPL and your commercial app can load it.

GNU LESSER GENERAL PUBLIC LICENSE
Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts as the successor of the GNU Library Public License, version 2, hence the version number 2.1.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software–to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages–typically libraries–of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be

allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

GNU LESSER GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

”Source code” for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) The modified work must itself be a software library.

b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or

table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6.

Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

c) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d) If distribution of the work is made by offering access to copy

from a designated place, offer equivalent access to copy the above specified materials from the same place.

e) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

false WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS false WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME

THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN false EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the ”copyright” line and a pointer to where the full notice is found.

<one line to give the library’s name and a brief idea of what it does.>
Copyright (C) <year><name of author>

This library is free software; you can redistribute it and/or modify it under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public

License along with this library; if not, write to the Free Software
Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your
school, if any, to sign a "copyright disclaimer" for the library, if
necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the
library 'Frob' (a library for tweaking knobs) written by James Random Hacker.

<signature of Ty Coon>, 1 April 1990
Ty Coon, President of Vice

That's all there is to it!

114.1.18 libunzip

Platforms: macOS, Linux, Windows, Targets: .

Function: The libunzip 1.01e license
Notes:

unzip.h – IO for uncompress .zip files using zlib
Version 1.01e, February 12th, 2005

Copyright (C) 1998-2005 Gilles Vollant

This unzip package allow extract file from .ZIP file, compatible with PKZip 2.04g
WinZip, InfoZip tools and compatible.

Multi volume ZipFile (span) are not supported.
Encryption compatible with pkzip 2.04g only supported
Old compressions used by old PKZip 1.x are not supported

I WAIT FEEDBACK at mail info@winimage.com
Visit also http://www.winimage.com/zLibDll/unzip.htm for evolution

Condition of use and distribution are the same than zlib :

This software is provided 'as-is', without any express or implied warranty. In no event will the authors be held liable for any damages arising from the use of this software.

Permission is granted to anyone to use this software for any purpose, including commercial applications, and to alter it and redistribute it freely, subject to the following restrictions:

1. The origin of this software must not be misrepresented; you must not claim that you wrote the original software. If you use this software in a product, an acknowledgment in the product documentation would be appreciated but is not required.
2. Altered source versions must be plainly marked as such, and must not be misrepresented as being the original software.
3. This notice may not be removed or altered from any source distribution.

for more info about .ZIP format, see
http://www.info-zip.org/pub/infozip/doc/appnote-981119-iz.zip
http://www.info-zip.org/pub/infozip/doc/
PkWare has also a specification at :
ftp://ftp.pkware.com/probdesc.zip

114.1.19 libxml

Platforms: macOS, Linux, Windows, Targets: .

Function: The libxml license
Notes:

Except where otherwise noted in the source code (e.g. the files hash.c, list.c and the trio files, which are covered by a similar licence but with different Copyright notices) all the files are:

Copyright (C) 1998-2003 Daniel Veillard. All Rights Reserved.

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. 114.1.24 PCRE

Platforms: macOS, Linux, Windows, Targets: .

Function: The PCRE 8.0.1 license (RegEx)
Notes:

PCRE LICENCE

PCRE is a library of functions to support regular expressions whose syntax and semantics are as close as possible to those of the Perl 5 language.

Release 8 of PCRE is distributed under the terms of the "BSD" licence, as specified below. The documentation for PCRE, supplied in the "doc" directory, is distributed under the same terms as the software itself.

The basic library functions are written in C and are freestanding. Also included in the distribution is a set of C++ wrapper functions.

THE BASIC LIBRARY FUNCTIONS

114.1.28 SecureDongle X

Platforms: macOS, Linux, Windows, Targets: .

Function: The SecureDongle X license
Notes:

Software Developer's Agreement

All Products of SecureMetric Technology Sdn. Bhd. (SecureMetric) including, but not limited to, evaluation copies, diskettes, CD-ROMs, hardware and documentation, and all future orders, are subject to the terms of this Agreement. If developers do not agree with the terms herein, please return the evaluation package to us, postage and insurance prepaid, within seven days of their receipt, and we will reimburse developers the cost of the Product, less freight and reasonable handling charges.

1. Allowable Use - Developers may merge and link the Software with other programs for the sole purpose of protecting those programs in accordance with the usage described in the Developer's Guide. Developers may make archival copies of the Software.

2. Prohibited Use - The Software or hardware or any other part of the Product may not be copied, reengineered, disassembled, decompiled, revised, enhanced or otherwise modified, except as specifically allowed in item 1. Developers may not reverse engineer the Software or any part of the product or attempt to discover the Software's source code. Developers may not use the magnetic or optical media included with the Product for the purposes of transferring or storing data that was not either an original part of the Product, or a SecureMetric provided enhancement or upgrade to the Product.

3. Warranty - SecureMetric warrants that the hardware and Software storage media are substantially free from significant defects of workmanship or materials for a time period of twelve (12) months from the date of delivery of the Product to developers.

4. Breach of Warranty - In the event of breach of this warranty, SecureMetric's sole obligation is to replace or repair, at the discretion of SecureMetric, any Product free of charge. Any replaced Product becomes the property of SecureMetric. Warranty claims must be made in writing to SecureMetric during the warranty

period and within fourteen (14) days after the observation of the defect. All warranty claims must be accompanied by evidence of the defect that is deemed satisfactory by SecureMetric. Any Products that developers return to SecureMetric, or a SecureMetric authorized distributor, must be sent with freight and insurance prepaid.
EXCEPT AS STATED ABOVE, THERE IS false OTHER WARRANTY OR REPRESENTATION OF THE PRODUCT, EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

5. Limitation of SecureMetric's Liability - SecureMetric's entire liability to developers or any other party for any cause whatsoever, whether in contract or in tort, including negligence, shall not exceed the price developers paid for the unit of the Product that caused the damages or are the subject of, or indirectly related to the cause of action. In no event shall SecureMetric be liable for any damages caused by developers failure to meet developer's obligations, nor for any loss of data, profit or savings, or any other consequential and incidental damages, even if SecureMetric has been advised of the possibility of damages, or for any claim by developers based on any third-party claim.

6. Termination - This Agreement shall terminate if developers fail to comply with the terms herein. Items 2, 3, 4 and 5 shall survive any termination of this Agreement.

114.1.29 SQLAPI

Platforms: macOS, Linux, Windows, Targets: .

Function: The SQLAPI 3.7.33 license
Notes:

Note: Once you buy a SQL Plugin license, you get automatically a SQLAPI license from use with our plugin. No extra license fee required.

****
SQLAPI++ Library - LICENSE AGREEMENT and WARRANTY
****

You should carefully read the following terms and conditions
before using this software. Your use of this software
indicates your acceptance of this license agreement
and warranty.

LICENSE AGREEMENT:
==========
You have the non-exclusive right to use the Library.
The Company retains all title and ownership of the Library.

EVALUATION:
==========
The SQLAPI++ Library is distributed as shareware. You can use the Library
for evaluation purposes without charge for unlimited period. The evaluation
version has no limits or functional differences from registered version,
but it will display registration messages occasionally.
While in evaluation you MAY NOT distribute your applications written with
trial version of SQLAPI++ library.

REGISTERED VERSIONS:
==========
You have to purchase SQLAPI++ Personal license for every developer,
or one Site license for up to 10 developers in your company
or one Site+ license for unlimited number of developers in your company.
You MAY distribute applications written with SQLAPI++ (including SQLAPI++
run-time) without any additional charge.
You MAY NOT distribute SQLAPI++ source codes (original or modified).

REGISTERED VERSION (Personal license):
One registered copy of SQLAPI++ Library may be used by a single person
who uses it personally on one or more computers.
You may access the registered version of SQLAPI++ Library through a network,
provided that you have obtained individual licenses for the software covering
all developers that will access the software through the network.

REGISTERED VERSION (Site license):
One registered copy of SQLAPI++ may be used by up to 10 developers
WORKING IN ONE COMPANY on one or more computers.

REGISTERED VERSION (Site+ license):
One registered copy of SQLAPI++ may be used by any number of developers
WORKING IN ONE COMPANY on one or more computers.

WARRANTY AND LIMITATION OF LIABILITY
==========
We warrant that you will receive life-time FREE e-mail support, FREE bugs fixing
and FREE new version updates.

114.1.30 TCMPortMapper

Platforms: macOS, Linux, Windows, Targets: .

Function: The TCMPortMapper 1.3.1 license

Notes:

TCMPortMapper
Establishes port mapping via upnp or natpmp

114.1.34 zlib

Platforms: macOS, Linux, Windows, Targets: .

Function: The zlib 1.2.3 license
Notes:

(C) 1995-2004 Jean-loup Gailly and Mark Adler

This software is provided 'as-is', without any express or implied warranty. In no event will the authors be held liable for any damages arising from the use of this software.

Permission is granted to anyone to use this software for any purpose, including commercial applications, and to alter it and redistribute it freely, subject to the following restrictions:

1. The origin of this software must not be misrepresented; you must not claim that you wrote the original software. If you use this software in a product, an acknowledgment in the product documentation would be appreciated but is not required.
2. Altered source versions must be plainly marked as such, and must not be misrepresented as being the original software.

3. This notice may not be removed or altered from any source distribution.

Jean-loup Gailly Mark Adler
jloup@gzip.org madler@alumni.caltech.edu

If you use the zlib library in a product, we would appreciate *not* receiving lengthy legal documents to sign. The sources are provided for free but without warranty of any kind. The library has been entirely written by Jean-loup Gailly and Mark Adler; it does not include third-party code.

If you redistribute modified sources, we would appreciate that you include in the file ChangeLog history information documenting your changes. Please read the FAQ for more information on the distribution of modified source versions.

Chapter 115

Linguistic

115.1 class NSLinguisticTaggerMBS

115.1.1 class NSLinguisticTaggerMBS

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Analyze natural language to tag part of speech and lexical class, identify proper names, perform lemmatization, and determine the language and script (orthography) of text.
Example:

```
dim TagScheme as string = NSLinguisticTaggerMBS.NSLinguisticTagSchemeLanguage
dim TagSchemes() as string = array(TagScheme)
dim t as new NSLinguisticTaggerMBS(TagSchemes)

t.Text = "Hallo Leute"

dim tokenRange as NSRangeMBS
dim sentenceRange as NSRangeMBS
dim tag as string = t.tagAtIndex(0, TagScheme, tokenRange, sentenceRange)

MsgBox "Language: "+tag // should be "de" for German
```

Notes:

The NSLinguisticTaggerMBS class provides a uniform interface to a variety of natural language processing functionality with support for many different languages and scripts. You can use NSLinguisticTaggerMBS to segment natural language text into paragraphs, sentences, or words, and tag information about those tokens, such as part of speech, lexical class, lemma, script, and language.
When you create a linguistic tagger, you specify what kind of information you're interested in by passing one or more

NSLinguisticTagScheme values. Set the string property to the natural language text you want to analyze, and the linguistic tagger processes it according to the specified tag schemes. You can then enumerate over the tags in a specified range, using the methods described in Enumerating Linguistic Tags, to get the information requested for a given scheme and unit.

115.1.2 Blog Entries

- MBS Xojo Plugins, version 21.1pr6
- MBS Xojo Plugins, version 17.3pr3

115.1.3 Blog Entries

- MBS Xojo Plugins, version 21.1pr6
- MBS Xojo Plugins, version 17.3pr3

115.1.4 Methods

115.1.5 availableTagSchemesForLanguage(Language as String) as String()

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns the tag schemes available for a particular language on the current device.
Notes:

language: A BCP-47 tag identifying the language. For example, "en" for English or "zh-Hans" for Chinese written using the Simplified Chinese script.

Returns the available tag schemes. For possible values, see NSLinguisticTagScheme.

This is a convenience method for calling the availableTagSchemesForUnit, passing NSLinguisticTaggerUnitWord as the linguistic unit.

115.1.6 availableTagSchemesForUnit(unit as Integer, Language as String) as String()

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns the tag schemes available for a particular unit and language on the current device.
Notes:

unit: The linguistic unit. For possible values, see NSLinguisticTaggerUnit.
language: A BCP-47 tag identifying the language. For example, "en" for English or "zh-Hans" for Chinese written using the Simplified Chinese script.

Returns the supported tag schemes. For possible values, see NSLinguisticTagScheme.

Available in macOS 10.13 and newer.

115.1.7 Constructor(tagSchemes() as String, options as integer = 0)

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Creates a linguistic tagger instance using the specified tag schemes and options.
Notes:

tagSchemes: An array of tag schemes. See NSLinguisticTagScheme for the possible values.
options: Reserved for future use. Specify 0 for this parameter.

115.1.8 dominantLanguageForString(text as String) as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns the dominant language for the specified string.
Notes:

string: The string for which the dominant language is determined.

Returns the BCP-47 tag identifying the dominant language of the string, or the tag "und" if a specific language cannot be determined.

This is a convenience method for creating a new linguistic tagger, setting the string property, and getting the dominantLanguage property. If you analyze the same string more than once, you should create a linguistic tagger object instead of calling this method.

Available in macOS 10.13 and newer.

115.1.9 NSLinguisticTagAdjective as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.

Notes: This token is an adjective.

115.1.10 NSLinguisticTagAdverb as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is an adverb.

115.1.11 NSLinguisticTagClassifier as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is a classifier.

115.1.12 NSLinguisticTagCloseParenthesis as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is a close parenthesis.

115.1.13 NSLinguisticTagCloseQuote as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is a close quote.

115.1.14 NSLinguisticTagConjunction as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is a conjunction.

115.1.15 NSLinguisticTagDash as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is a dash.

115.1.16 NSLinguisticTagDeterminer as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is a determiner.

115.1.17 NSLinguisticTagIdiom as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is an idiom.

115.1.18 NSLinguisticTagInterjection as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is an interjection.

115.1.19 NSLinguisticTagNoun as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: The token is a noun.

115.1.20 NSLinguisticTagNumber as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is a number.

115.1.21 NSLinguisticTagOpenParenthesis as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is an open parenthesis.

115.1.22 NSLinguisticTagOpenQuote as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is an open quote.

115.1.23 NSLinguisticTagOrganizationName as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the Name Types.
Notes: This token is an organization name.

115.1.24 NSLinguisticTagOther as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the token types.
Notes: The token indicates a non-linguistic item, such as a symbol.

115.1.25 NSLinguisticTagOtherPunctuation as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is punctuation other than a kind described by other lexical classes (sentence terminator, open or close quote, open or close parenthesis, word joiner, and dash).

115.1.26 NSLinguisticTagOtherWhitespace as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is whitespace other than a kind described by other lexical classes (paragraph break).

115.1.27 NSLinguisticTagOtherWord as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is a word other than a kind described by other lexical classes (noun, verb, adjective, adverb, pronoun, determiner, particle, preposition, number, conjunction, interjection, classifier, and idiom).

115.1.28 NSLinguisticTagParagraphBreak as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is a paragraph break.

115.1.29 NSLinguisticTagParticle as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is a particle.

115.1.30 NSLinguisticTagPersonalName as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the Name Types.
Notes: This token is a personal name.

115.1.31 NSLinguisticTagPlaceName as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the Name Types.
Notes: This token is a place name.

115.1.32 NSLinguisticTagPreposition as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is a preposition.

115.1.33 NSLinguisticTagPronoun as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is a pronoun.

115.1.34 NSLinguisticTagPunctuation as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the token types.
Notes: The token indicates punctuation.

115.1.35 NSLinguisticTagSchemeLanguage as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Supplies a BCP-47 language identifier for a token.
Notes:

For example, the language identifier for English is "en" and the identifier for Chinese written using the Simplified Chinese script is "zh-Hans". The identifier "und" is used if a specific language cannot be determined. The tagger generally attempts to determine the language of text at the level of an entire sentence, paragraph, or document, rather than word by word.

115.1.36 NSLinguisticTagSchemeLemma as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Supplies a stem form of a word token, if known.

115.1.37 NSLinguisticTagSchemeLexicalClass as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Classifies tokens according to class: part of speech for words, type of punctuation, or whitespace.

115.1.38 NSLinguisticTagSchemeNameType as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Classifies tokens according to whether they are part of a named entity.

115.1.39 NSLinguisticTagSchemeNameTypeOrLexicalClass as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Classifies tokens corresponding to names according to NSLinguisticTagSchemeNameType and tokens all other tokens according to NSLinguisticTagSchemeLexicalClass.

115.1.40 NSLinguisticTagSchemeScript as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Supplies an ISO 15924 script identifier for a token.
Notes: For example, the identifier for Latin script is "Latn" and the identifier for Simplified Chinese script is "Hans". The identifier "Zyyy" is used if a specific script cannot be determined.

115.1.41 NSLinguisticTagSchemeTokenType as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Classifies tokens according to their broad type: word, punctuation, or whitespace.
Notes:

To classify tokens by a more specific type, for example, distinguishing words between nouns and verbs, use the
NSLinguisticTagSchemeLexicalClass scheme.

115.1.42 NSLinguisticTagSentenceTerminator as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is a sentence terminator.

115.1.43 NSLinguisticTagVerb as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is a verb.

115.1.44 NSLinguisticTagWhitespace as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the token types.
Notes: The token indicates white space of any sort.

115.1.45 NSLinguisticTagWord as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the token types.
Notes: The token indicates a word.

115.1.46 NSLinguisticTagWordJoiner as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the lexical classes.
Notes: This token is a word joiner.

115.1.47 orthographyAtIndex(charIndex as integer, byref effectiveRange as NSRangeMBS) as NSOrthographyMBS

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns the orthography at the index and also returns the effective range.
Example:

```
dim TagScheme as string = NSLinguisticTaggerMBS.NSLinguisticTagSchemeLanguage
dim TagSchemes() as string = array(TagScheme)
dim t as new NSLinguisticTaggerMBS(TagSchemes)

t.Text = "Hallo Leute"

dim tokenRange as NSRangeMBS
dim sentenceRange as NSRangeMBS
dim tag as string = t.tagAtIndex(0, TagScheme, tokenRange, sentenceRange)

dim effectiveRange as NSRangeMBS
dim o as NSOrthographyMBS = t.orthographyAtIndex(0, effectiveRange)

MsgBox o.dominantLanguage+" "+o.dominantScript
```

Notes:

charIndex: The character index to begin examination.
effectiveRange: An NSRangeMBS that, upon completion, contains the range of the orthography containing charIndex.

Returns the orthography for the location.

115.1.48 sentenceRangeForRange(range as NSRangeMBS) as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns the range of a sentence containing the specified range.
Notes:

charRange: The character range.

Returns the range of the sentence.

This is a convenience method for calling tokenRangeAtIndex, passing the NSLinguisticTaggerUnitSentence unit and the first position of the provided range.

115.1.49 setOrthography(orthography as NSOrthographyMBS, range as NSRangeMBS)

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Sets the orthography for the specified range.
Notes:

orthography: The orthography.
charRange: The range.

If the orthography of the linguistic tagger is not set, it will determine it automatically from the contents of the text. You should call this method only if you know the orthography of the text by some other means.

115.1.50 tagAtIndex(charIndex as Integer, Scheme as String, byref tokenRange as NSRangeMBS, byref sentenceRange as NSRangeMBS) as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns a tag for a single scheme at the specified character position.
Notes:

charIndex: The position of the initial character.
tagScheme: The tag scheme. See NSLinguisticTagScheme for the possible values.
tokenRange: The token range for output.
sentenceRange: The range of the sentence for output.

Returns the tag for the requested tag scheme, or nil. If a tag is returned, this function returns by reference the range of the token to tokenRange, and the range of the enclosing sentence to sentenceRange, if applicable.

This is a convenience method for calling tagAtIndex and passing NSLinguisticTaggerUnitWord as the linguistic unit.

Available in macOS 10.7 and newer.
See also:

- 115.1.51 tagAtIndex(charIndex as Integer, unit as Integer, Scheme as String, byref tokenRange as NSRangeMBS) as String 19724

115.1.51 tagAtIndex(charIndex as Integer, unit as Integer, Scheme as String, byref tokenRange as NSRangeMBS) as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns a tag for a single scheme for a given linguistic unit at the specified character position.

Notes:

charIndex: The position of the initial character.
unit: The linguistic unit. See NSLinguisticTaggerUnit for possible values.
tagScheme: The tag scheme. See NSLinguisticTagScheme for possible values.
tokenRange: The token range for output.

Returns the tag for the requested tag scheme and linguistic unit, or nil. If a tag is returned, this function returns by reference the range of the token to tokenRange.

Available in macOS 10.13 and newer.
See also:

- 115.1.50 tagAtIndex(charIndex as Integer, Scheme as String, byref tokenRange as NSRangeMBS, byref sentenceRange as NSRangeMBS) as String 19724

115.1.52 tagForString(text as string, charIndex as Integer, unit as Integer, Scheme as String, orthography as NSOrthographyMBS, byref tokenRange as NSRangeMBS) as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns a tag for a single scheme for a given linguistic unit at the specified character position in a string.
Notes:

charIndex: The position of the initial character.
unit: The linguistic unit. See NSLinguisticTaggerUnit for possible values.
tagScheme: The tag scheme. See NSLinguisticTagScheme for possible values.
tokenRange: The token range for output.

Returns the tag for the requested tag scheme and linguistic unit, or nil. If a tag is returned, this function returns by reference the range of the token to tokenRange.

This is a convenience method for initializing a linguistic tagger, setting the string property, and calling the tagForString method. If you analyze the same string more than once, you should create a linguistic tagger object instead of calling this method.

115.1.53 tagSchemes as String()

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns the tag schemes configured for this linguistic tagger.
Notes: For possible values, see NSLinguisticTagScheme.

115.1.54 TagsForString(text as string, range as NSRangeMBS, unit as Integer, Scheme as String, options as Integer, orthography as NSOrthographyMBS) as NSLinguisticValueMBS()

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns an array of linguistic tags and token ranges.
Notes:

range: The range from which to return tags.
unit: The linguistic unit. See NSLinguisticTaggerUnit for possible values.
tagScheme: The tag scheme. See NSLinguisticTagScheme for possible values.
options: The linguistic tagger options to use. See NSLinguisticTaggerOptions for possible values.

An array of the values in the requested range (tag and tokenRange set).

When the returned array contains an entry that doesn't have a corresponding tag scheme, that entry is an empty string ("").
This is a convenience method for initializing a linguistic tagger, setting the
string property, and calling the tagsInRange method. If you analyze the same string more than once, you should create a linguistic tagger object instead of calling this method.

Available in macOS 10.13 and newer.

115.1.55 tagsInRange(range as NSRangeMBS, Scheme as String, options as Integer) as NSLinguisticValueMBS()

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns an array of linguistic tags and token ranges.
Notes:

range: The range to analyze.
tagScheme: The tag scheme. For possible values, see NSLinguisticTagScheme.
options: The linguistic tagger options to use. See NSLinguisticTaggerOptions for possible values.

Available in macOS 10.7 and newer.
See also:

- 115.1.56 tagsInRange(range as NSRangeMBS, unit as Integer, Scheme as String, options as Integer) as NSLinguisticValueMBS() 19727

115.1.56 tagsInRange(range as NSRangeMBS, unit as Integer, Scheme as String, options as Integer) as NSLinguisticValueMBS()

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns an array of linguistic tags and token ranges.
Notes:

range: The range to analyze.
unit: The linguistic unit. For possible values, see NSLinguisticTaggerUnit.
tagScheme: The tag scheme. For possible values, see NSLinguisticTagScheme.
options: The linguistic tagger options to use. See NSLinguisticTaggerOptions for possible values.

Available in macOS 10.13 and newer.

Returns all tokens intersecting a given range, supplying tags and ranges. The tagger segments the string into sentences and tokens as necessary, and return those ranges along with a tag for any scheme in its array of tag schemes. For example, if the tag scheme is NSLinguisticTagSchemeLexicalClass, the tags specify the part of speech (for word tokens) or the type of whitespace or punctuation (for whitespace or punctuation tokens). If the tag scheme is NSLinguisticTagSchemeLemma, the tags specify the stem form of the word (if known) for each word token.
See also:

- 115.1.55 tagsInRange(range as NSRangeMBS, Scheme as String, options as Integer) as NSLinguisticValueMBS() 19726

115.1.57 tokenRangeAtIndex(charIndex as Integer, Unit as Integer) as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns the range of the linguistic unit containing the specified character index.
Notes:

charIndex: The character index to begin examination.
unit: The linguistic unit. For possible values, see NSLinguisticTaggerUnit.

Returns the range of the substring for the linguistic unit.
Available in macOS 10.13 and newer.

115.1.58 Properties

115.1.59 dominantLanguage as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns the dominant language of the string set for the linguistic tagger.
Notes:

The BCP-47 tag identifying the dominant language of the string, or the tag "und" if a specific language cannot be determined.
Available in macOS 10.13 and newer.
(Read only property)

115.1.60 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

115.1.61 Text as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: The string being analyzed by the linguistic tagger.
Notes: (Read and Write property)

115.1.62 Constants

115.1.63 NSLinguisticTaggerJoinNames = 16

MBS MacCocoa Plugin, Plugin Version: 17.3.

Function: One of the option constants.
Notes: Typically, multiple-word names will be returned as multiple tokens, following the standard tokenization practice of the tagger. If this option is set, then multiple-word names will be joined together and returned as a single token.

115.1.64 NSLinguisticTaggerOmitOther = 8

MBS MacCocoa Plugin, Plugin Version: 17.3.

Function: One of the option constants.
Notes: Omit tokens of type NSLinguisticTagOther (non-linguistic items, such as symbols).

115.1.65 NSLinguisticTaggerOmitPunctuation = 2

MBS MacCocoa Plugin, Plugin Version: 17.3.

Function: One of the option constants.
Notes: Omit tokens of type NSLinguisticTagPunctuation (all punctuation).

115.1.66 NSLinguisticTaggerOmitWhitespace = 4

MBS MacCocoa Plugin, Plugin Version: 17.3.

Function: One of the option constants.
Notes: Omit tokens of type NSLinguisticTagWhitespace (whitespace of all sorts).

115.1.67 NSLinguisticTaggerOmitWords = 1

MBS MacCocoa Plugin, Plugin Version: 17.3.

Function: One of the option constants.
Notes: Omit tokens of type NSLinguisticTagWord (items considered to be words).

115.1.68 NSLinguisticTaggerUnitDocument = 3

MBS MacCocoa Plugin, Plugin Version: 17.3.

Function: One of the constants for a tagger unit.
Notes: The document in its entirety.

115.1.69 NSLinguisticTaggerUnitParagraph = 2

MBS MacCocoa Plugin, Plugin Version: 17.3.

Function: One of the constants for a tagger unit.
Notes: An individual paragraph.

115.1.70 NSLinguisticTaggerUnitSentence = 1

MBS MacCocoa Plugin, Plugin Version: 17.3.

Function: One of the constants for a tagger unit.
Notes: An individual sentence.

115.1.71 NSLinguisticTaggerUnitWord = 0

MBS MacCocoa Plugin, Plugin Version: 17.3.

Function: One of the constants for a tagger unit.
Notes: An individual word.

115.2 class NSLinguisticValueMBS

115.2.1 class NSLinguisticValueMBS

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: The class for linguistic tokens.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

115.2.4 Methods

115.2.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: The private constructor.

115.2.6 Properties

115.2.7 sentenceRange as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: The sentence range.
Notes:

Only filled by tagAtIndex when used without unit.
(Read and Write property)

115.2.8 Tag as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: The linguistic tag.
Notes: (Read and Write property)

115.2.9 Text as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: The text for the token.
Notes: (Read and Write property)

115.2.10 tokenRange as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: The token range.
Notes: (Read and Write property)

115.3 class NSOrthographyMBS

115.3.1 class NSOrthographyMBS

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: A description of the linguistic content of a piece of text typically used for spelling and grammar checking.
Notes:

An NSOrthography instance describes:

- Which scripts the text contains.
- A dominant language and possibly other languages for each of these scripts.
- A dominant script and language for the text as a whole.

Scripts are uniformly described by standard four-letter tags (Latn, Grek, Cyrl, etc.) with the supertags Jpan and Kore typically used for Japanese and Korean text, Hans and Hant for Chinese text; the tag Zyyy is used if a specific script cannot be identified. See Internationalization and Localization Guide for more information on internationalization.

Languages are uniformly described by BCP-47 tags , preferably in canonical form; the tag und is used if a specific language cannot be determined.

115.3.4 Methods

115.3.5 allLanguages as String()

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns an array containing all the languages appearing in the values of the language map.
Notes: Available in macOS 10.6 and newer.

115.3.6 allScripts as String()

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns an array containing all the scripts appearing as keys in the language map.
Notes: Available in macOS 10.6 and newer.

115.3.7 Constructor(script as string, map as dictionary)

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Creates and returns an orthography instance with the specified dominant script and language map.
Notes:

script: The dominant script.
map: A dictionary containing the language map.

Returns an initialized orthography object for the specified script and language map.

115.3.8 copy as NSOrthographyMBS

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Create a copy of the object.

115.3.9 defaultOrthographyForLanguage(language as string) as NSOrthographyMBS

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Queries default orthography for a language.
Notes: Available in macOS 10.13 and newer.

115.3.10 dominantLanguageForScript(script as string) as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns the dominant language for the specified script.
Notes: Available in macOS 10.6 and newer.

115.3.11 languagesForScript(script as string) as String()

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns the list of languages for the specified script.
Notes: Available in macOS 10.6 and newer.

115.3.12 orthographyWithDominantScript(script as string, map as dictionary) as NSOrthographyMBS

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Creates and returns an orthography instance with the specified dominant script and language map.
Notes:

script: The dominant script.
map: A dictionary containing the language map.

Returns an initialized orthography object for the specified script and language map.

115.3.13 Properties

115.3.14 dominantLanguage as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns the first language in the list of languages for the dominant script.
Notes:

Available in macOS 10.6 and newer.
(Read only property)

115.3.15 dominantScript as String

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: The dominant script for the text.
Notes:

The dominant script should be a script tag, such as Latn, Cyrl, etc.
Available in macOS 10.6 and newer.
(Read only property)

115.3.16 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

115.3.17 languageMap as Dictionary

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: A dictionary that map script tags to arrays of language tags.
Notes:

The dictionary's keys are script tags (such as Latn, Cyrl, and so forth) and whose values are arrays of language tags (such as en, fr, de, etc.)
(Read only property)

Chapter 116

Linux

116.1 module LinuxIconMBS

116.1.1 module LinuxIconMBS

MBS Linux Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The module for linux icons.

116.1.8 Methods

116.1.9 FileIcon(file as FolderItem, size as integer = 48) as Picture

MBS Linux Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries file icon for file.
Example:

```
dim f2 as FolderItem = SpecialFolder.Desktop
Canvas2.Backdrop = LinuxIconMBS.FileIcon(f2, Canvas2.Width)
```

Notes: Returns nil in case of error.

116.1.10 FilePreview(file as FolderItem, size as integer = 48) as Picture

MBS Linux Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries preview icon for file.
Notes: Returns nil in case of error.

116.1.11 FileThumbnail(file as FolderItem) as FolderItem

MBS Linux Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries thumbnail path for a given file.
Example:

```
// make an image file
dim p as picture = logoMBS(500) // from Main plugin
dim f as FolderItem = SpecialFolder.Desktop.Child("MBS.jpg")
p.Save(f, p.SaveAsJPEG, 90)

// show thumbnail
dim ThumbnailFile as FolderItem = LinuxIconMBS.FileThumbnail(f)
if ThumbnailFile <>nil then
Canvas6.Backdrop = Picture.Open(ThumbnailFile)
end if
```

Notes:

Returns nil in case of error.
Otherwise this may be URL for png file with thumbnail.

116.1.12 GenericIconName(MimeType as String) as String

MBS Linux Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries generic icon name for mime type.

116.1.13 Icon(MimeType as String, size as integer = 48) as Picture

MBS Linux Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries icon for mime type.
Example:

```
Canvas1.Backdrop = LinuxIconMBS.Icon("image/jpeg", Canvas1.Width)
```

Notes: Returns nil in case of error.

116.1.14 SymbolicIcon(MimeType as String, size as integer = 48) as Picture

MBS Linux Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries symbolic icon for given mime type.

Example:

Canvas3.Backdrop = LinuxIconMBS.SymbolicIcon("image/jpeg", Canvas3.Width)

Notes: Returns nil in case of error.

116.2 class LinuxProcessMBS

116.2.1 class LinuxProcessMBS

MBS Linux Plugin, Plugin Version: 14.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class for querying linux process details.
Example:

```
// show the path of current process
dim myPID as Integer = LinuxProcessMBS.PID
dim myProcess as LinuxProcessMBS = LinuxProcessMBS.ProcessByPID(myPID)

MsgBox myProcess.path
```

Notes:

If your app has not enough permission to read info about other app, values may be missing.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

116.2.6 Methods

116.2.7 Constructor

MBS Linux Plugin, Plugin Version: 14.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The private constructor.

116.2.8 PID as Integer

MBS Linux Plugin, Plugin Version: 14.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The Process ID of the current process (your app).
Example:

```
dim myPID as Integer = LinuxProcessMBS.PID
MsgBox "my process ID is: "+str(myPID)
```

116.2.9 ProcessByPID(ProcessID as Integer) as LinuxProcessMBS

MBS Linux Plugin, Plugin Version: 14.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries the information for a process with given ID.
Example:

```
// show the name of current process
dim myPID as Integer = LinuxProcessMBS.PID
dim myProcess as LinuxProcessMBS = LinuxProcessMBS.ProcessByPID(myPID)

MsgBox myProcess.name
```

Notes: Returns nil on error.

116.2.10 Processes as LinuxProcessMBS()

MBS Linux Plugin, Plugin Version: 14.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns array with all processes.
Example:

```
// shows all process names in listbox
dim Processes() as LinuxProcessMBS = LinuxProcessMBS.Processes
```

```
for each p as LinuxProcessMBS in Processes
listbox1.addrow p.name
next
```

116.2.11 Properties

116.2.12 CommandLine as String

MBS Linux Plugin, Plugin Version: 14.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The command line used to create this process.
Example:

```
// show the command line of current process
dim myPID as Integer = LinuxProcessMBS.PID
dim myProcess as LinuxProcessMBS = LinuxProcessMBS.ProcessByPID(myPID)
MsgBox myProcess.CommandLine
```

Notes: (Read only property)

116.2.13 CurrentWorkingDirectory as String

MBS Linux Plugin, Plugin Version: 14.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The current working directory.
Example:

```
// show the current working directory of current process
dim myPID as Integer = LinuxProcessMBS.PID
dim myProcess as LinuxProcessMBS = LinuxProcessMBS.ProcessByPID(myPID)

MsgBox myProcess.CurrentWorkingDirectory
```

Notes: (Read only property)

116.2.14 Environment as Dictionary

MBS Linux Plugin, Plugin Version: 14.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The environment variables.
Notes: (Read only property)

116.2.15 Name as String

MBS Linux Plugin, Plugin Version: 14.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The name of the process.
Example:

```
// shows all process names in listbox
dim Processes() as LinuxProcessMBS = LinuxProcessMBS.Processes

for each p as LinuxProcessMBS in Processes
listbox1.addrow p.name
next
```

Notes: (Read only property)

116.2.16 NumberOfThreads as Integer

MBS Linux Plugin, Plugin Version: 14.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The number of threads used by this process.
Notes: (Read only property)

116.2.17 OpenFiles as Dictionary

MBS Linux Plugin, Plugin Version: 14.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries details about open files.
Example:

```
// show the paths of open files of current process in listbox
dim myPID as Integer = LinuxProcessMBS.PID
dim myProcess as LinuxProcessMBS = LinuxProcessMBS.ProcessByPID(myPID)
dim OpenFiles as Dictionary = myProcess.OpenFiles

for each key as Variant in OpenFiles.keys
listbox1.addrow OpenFiles.Value(key).StringValue
next
```

Notes:

This dictionary contains the file descriptor number as key and the path to the file as text.
(Read only property)

116.2.18 ParentProcessID as Integer

MBS Linux Plugin, Plugin Version: 14.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The parent process ID.
Notes: (Read only property)

116.2.19 Path as String

MBS Linux Plugin, Plugin Version: 14.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The path for this process.
Example:

```
// show the path of current process
dim myPID as Integer = LinuxProcessMBS.PID
dim myProcess as LinuxProcessMBS = LinuxProcessMBS.ProcessByPID(myPID)
MsgBox myProcess.Path
```

Notes: (Read only property)

116.2.20 ProcessID as Integer

MBS Linux Plugin, Plugin Version: 14.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The process ID.
Notes: (Read only property)

116.2.21 StartTime as Date

MBS Linux Plugin, Plugin Version: 14.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The start time of the process.
Example:

```
// show the start time of current process
dim myPID as Integer = LinuxProcessMBS.PID
dim myProcess as LinuxProcessMBS = LinuxProcessMBS.ProcessByPID(myPID)
dim d as date = myProcess.StartTime
MsgBox d.LongDate+" "+d.LongTime
```

Notes: (Read only property)

116.2.22 State as String

MBS Linux Plugin, Plugin Version: 14.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The state of the process.
Notes:

Can be Running, Sleeping, Disk Sleep, Zombie, Trace or Writing pages.
(Read only property)

116.3 class LinuxSuMBS

116.3.1 class LinuxSuMBS

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class to run stuff with sudo.
Example:

```
dim s as new LinuxSuMBS

s.Command = "/usr/bin/whoami"
s.User = "root"
s.Alert = "Please Root?"
s.Message "Can I install something for you?"

if s.ExecuteSudo then
MsgBox "OK"
else
MsgBox s.LastErrorMessage
end if
```

Notes: Uses the gksu library.

116.3.4 Methods

116.3.5 AskPassword(prompt as String) as String

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Asks for the password.
Notes:

Returns password.
Stores error in LastError and LastErrorMessage properties.
See also:

- 116.3.26 AskPassword(prompt as String, byref ErrorCode as Integer, byref ErrorMessage as String) as string 19752

116.3.6 Available as boolean

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Whether the gksu library was found and loaded.
Notes:

Should return true on linux.
If missing, install the libgksu2-0 library.

116.3.7 ExecuteRun as boolean

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Runs the command.
Notes:

Returns true on success.
Stores error in LastError and LastErrorMessage properties.

116.3.8 ExecuteSu as boolean

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Runs the command with su.
Notes:

Returns true on success.
Stores error in LastError and LastErrorMessage properties.

116.3.9 ExecuteSudo as boolean

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Runs the command with sudo.
Example:

```
dim s as new LinuxSuMBS

s.Command = "/usr/bin/whoami"
s.User = "root"
s.Alert = "Please Root?"
s.Message "Can I install something for you?"

if s.ExecuteSudo then
MsgBox "OK"
else
MsgBox s.LastErrorMessage
end if
```

Notes:

Returns true on success.
Stores error in LastError and LastErrorMessage properties.

116.3.10 Properties

116.3.11 Alert as String

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The alert message.
Notes: (Read and Write property)

116.3.12 AlwaysAskPassword as Boolean

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Whether to always ask for a password.
Notes: (Read and Write property)

116.3.13 Command as String

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The command will run with the target user.

Notes: (Read and Write property)

116.3.14 Debug as Boolean

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Whether debuging information should be printed.
Notes: (Read and Write property)

116.3.15 Description as String

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The description text.
Notes: (Read and Write property)

116.3.16 ExitCode as Integer

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The exit code of the last command run.
Notes: (Read and Write property)

116.3.17 Grab as Boolean

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Grab?
Notes: (Read and Write property)

116.3.18 Handle as Integer

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

116.3.19 KeepEnvironment as Boolean

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Should the environment be kept as it is?
Notes:

Defaults to true. Notice that setting this to false may cause the X authorization stuff to fail.
(Read and Write property)

116.3.20 LastError as Integer

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

116.3.21 LastErrorMessage as String

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The last error message.
Notes: (Read and Write property)

116.3.22 LoginShell as Boolean

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The shell in which the command will be run be a login shell?
Notes:

Finds out if the shell created by the underlying su process will be a login shell.
(Read and Write property)

116.3.23 Message as String

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The message text.
Notes: (Read and Write property)

116.3.24 User as String

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: What user the command will be run as.
Notes:

The default is root, but you can run the command as any user.
(Read and Write property)

116.3.25 Events

116.3.26 AskPassword(prompt as String, byref ErrorCode as Integer, byref ErrorMessage as String) as string

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: .

Function: The event to ask for password.
Notes:

If you prefer your own dialog.
Return password or set error parameters.
See also:

- 116.3.5 AskPassword(prompt as String) as String 19747

116.3.27 PasswordNoNeeded

MBS Linux Plugin, Plugin Version: 16.1, Platform: Linux, Targets: .

Function: No password is needed.

116.3.28 Constants

116.3.29 ErrorCanceled = 11

MBS Linux Plugin, Plugin Version: 16.1.

Function: One of the error codes.
Notes: The user cancelled.

116.3.30 ErrorChildFailed = 9

MBS Linux Plugin, Plugin Version: 16.1.

Function: One of the error codes.
Notes: Child failed.

116.3.31 ErrorExec = 5

MBS Linux Plugin, Plugin Version: 16.1.

Function: One of the error codes.
Notes: Execution failed.

116.3.32 ErrorFork = 4

MBS Linux Plugin, Plugin Version: 16.1.

Function: One of the error codes.
Notes: Forking failed.

116.3.33 ErrorHelper = 1

MBS Linux Plugin, Plugin Version: 16.1.

Function: One of the error codes.
Notes: The helper tool failed.

116.3.34 ErrorNoCommand = 2

MBS Linux Plugin, Plugin Version: 16.1.

Function: One of the error codes.
Notes: Missing command.

116.3.35 ErrorNoPassword = 3

MBS Linux Plugin, Plugin Version: 16.1.

Function: One of the error codes.
Notes: Missing password.

116.3.36 ErrorNotAllowed = 10

MBS Linux Plugin, Plugin Version: 16.1.

Function: One of the error codes.
Notes: Not allowed.

116.3.37 ErrorPipe = 6

MBS Linux Plugin, Plugin Version: 16.1.

Function: One of the error codes.
Notes: Pipe failed.

116.3.38 ErrorPiperead = 7

MBS Linux Plugin, Plugin Version: 16.1.

Function: One of the error codes.
Notes: Pipe read error.

116.3.39 ErrorWrongAutoPass = 12

MBS Linux Plugin, Plugin Version: 16.1.

Function: One of the error codes.
Notes: Wrong auto Password.

116.3.40 ErrorWrongPass = 8

MBS Linux Plugin, Plugin Version: 16.1.

Function: One of the error codes.
Notes: Wrong Password

116.3.41 ErrorXauth = 0

MBS Linux Plugin, Plugin Version: 16.1.

Function: One of the error codes.
Notes: XAuth failed.

Chapter 117

LMFit

117.1 class LMFitControlMBS

117.1.1 class LMFitControlMBS

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Collection of input parameters for fit control.

117.1.2 Blog Entries

- MBS Xojo Plugins, version 19.6pr1

117.1.3 Blog Entries

- MBS Xojo Plugins, version 19.6pr1

117.1.4 Methods

117.1.5 MsgFileStderr

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set msgfile to stderr.

117.1.6 MsgFileStdout

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set msgfile to stdout.

117.1.7 Properties

117.1.8 epsilon as Double

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Step used to calculate the Jacobian, should be slightly larger than the relative error in the user-supplied functions.
Notes: (Read and Write property)

117.1.9 ftol as Double

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Relative error desired in the sum of squares.
Notes:

Termination occurs when both the actual and predicted relative reductions in the sum of squares are at most ftol.
(Read and Write property)

117.1.10 gtol as Double

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Orthogonality desired between fvec and its derivs.
Notes:

Termination occurs when the cosine of the angle between fvec and any column of the Jacobian is at most gtol in absolute value.
(Read and Write property)

117.1.11 msgfile as FolderItem

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Progress messages will be written to this file.
Notes: (Read and Write property)

117.1.12 m_maxpri as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: -1, or max number of residuals to print.
Notes: (Read and Write property)

117.1.13 n_maxpri as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: -1, or max number of parameters to print.
Notes: (Read and Write property)

117.1.14 patience as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Used to set the maximum number of function evaluations to patience*(number_of_parameters+1).
Notes: (Read and Write property)

117.1.15 scale_diag as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: If 1, the variables will be rescaled internally.
Notes:

Recommended value is 1.
(Read and Write property)

117.1.16 stepbound as Double

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Used in determining the initial step bound.
Notes:

This bound is set to the product of stepbound and the Euclidean norm of diag*x if nonzero, or else to stepbound itself. In most cases stepbound should lie in the interval (0.1,100.0). Generally, the value 100.0 is recommended.
(Read and Write property)

117.1.17 verbosity as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The verbosity flags.
Notes:

OR'ed: 1: print some messages; 2: print Jacobian.
(Read and Write property)

117.1.18 xtol as Double

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Relative error between last two approximations.
Notes:

Termination occurs when the relative error between two consecutive iterates is at most xtol.
(Read and Write property)

117.2 class LMFitMBS

117.2.1 class LMFitMBS

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class to run Levenberg-Marquardt least squares fitting algorithm.
Notes: Based on lmfit library from Joachim Wuttke, Forschungszentrum Juelich GmbH (2004-2013).

117.2.6 Methods

117.2.7 LMCurve(NPar as Integer, Par as Ptr, mDat as Integer, t as Ptr, y as Ptr, control as LMFitControlMBS, status as LMFitStatusMBS, tag as variant = nil)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs curve algorithm.
Notes:

NPar is the number of variables (INPUT, positive integer).
Par is the solution vector (INPUT/OUTPUT, array of length n). On input it must be set to an estimated solution. On output it yields the final estimate of the solution.

mDat is the number of functions to be minimized (INPUT, positive integer). It must fulfill m>=n.

Calls evaluateCurve event to query values.

control contains INPUT variables that control the fit algorithm, as declared and explained in lmstruct.h
status contains OUTPUT variables that inform about the fit result, as declared and explained in lmstruct.h
See also:

- 117.2.8 LMCurve(NPar as Integer, Par() as double, mDat as Integer, t() as double, y() as double, control as LMFitControlMBS, status as LMFitStatusMBS, tag as variant = nil) 19762

117.2.8 LMCurve(NPar as Integer, Par() as double, mDat as Integer, t() as double, y() as double, control as LMFitControlMBS, status as LMFitStatusMBS, tag as variant = nil)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs curve algorithm.
Notes:

NPar is the number of variables (INPUT, positive integer).
Par is the solution vector (INPUT/OUTPUT, array of length n). On input it must be set to an estimated solution. On output it yields the final estimate of the solution.
mDat is the number of functions to be minimized (INPUT, positive integer). It must fulfill m>=n.

Calls evaluateCurve event to query values.

control contains INPUT variables that control the fit algorithm, as declared and explained in lmstruct.h
status contains OUTPUT variables that inform about the fit result, as declared and explained in lmstruct.h
See also:

- 117.2.7 LMCurve(NPar as Integer, Par as Ptr, mDat as Integer, t as Ptr, y as Ptr, control as LMFitControlMBS, status as LMFitStatusMBS, tag as variant = nil) 19761

117.2.9 LMMin(NPar as Integer, Par as Ptr, mDat as Integer, control as LMFitControlMBS, status as LMFitStatusMBS, tag as variant = nil)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs Levenberg-Marquardt minimization.
Notes:

This routine contains the core algorithm of our library.

It minimizes the sum of the squares of m nonlinear functions in n variables by a modified Levenberg-Marquardt algorithm. The function evaluation is done by the user-provided routine 'evaluate'. The Jacobian is then calculated by a forward-difference approximation.

Parameters:

NPar is the number of variables (INPUT, positive integer).
Par is the solution vector (INPUT/OUTPUT, array of length n). On input it must be set to an estimated solution. On output it yields the final estimate of the solution. This should be memoryblock with double values.
mDat is the number of functions to be minimized (INPUT, positive integer). It must fulfill m>=n.

Calls evaluateMin event to query values.

control contains INPUT variables that control the fit algorithm, as declared and explained in lmstruct.h
status contains OUTPUT variables that inform about the fit result, as declared and explained in lmstruct.h
See also:

- 117.2.10 LMMin(NPar as Integer, Par() as double, mDat as Integer, control as LMFitControlMBS, status as LMFitStatusMBS, tag as variant = nil) 19763

117.2.10 LMMin(NPar as Integer, Par() as double, mDat as Integer, control as LMFitControlMBS, status as LMFitStatusMBS, tag as variant = nil)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs Levenberg-Marquardt minimization.
Notes:

This routine contains the core algorithm of our library.

It minimizes the sum of the squares of m nonlinear functions in n variables by a modified Levenberg-Marquardt algorithm. The function evaluation is done by the user-provided routine 'evaluate'. The Jacobian is then calculated by a forward-difference approximation.

Parameters:

NPar is the number of variables (INPUT, positive integer).
Par is the solution vector (INPUT/OUTPUT, array of length n). On input it must be set to an estimated solution. On output it yields the final estimate of the solution.
mDat is the number of functions to be minimized (INPUT, positive integer). It must fulfill m>=n.

Calls evaluateMin event to query values.

control contains INPUT variables that control the fit algorithm, as declared and explained in lmstruct.h
status contains OUTPUT variables that inform about the fit result, as declared and explained in lmstruct.h
See also:

- 117.2.9 LMMin(NPar as Integer, Par as Ptr, mDat as Integer, control as LMFitControlMBS, status as LMFitStatusMBS, tag as variant = nil) 19762

117.2.11 Properties

117.2.12 provideArrays as Boolean

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to fill parameter array for evaluateMin event.
Notes:

If provideArrays property is true, we provide values via parameters array, which may be slower than using par pointer.
(Read and Write property)

117.2.13 Events

117.2.14 evaluateCurve(t as double, par as Ptr, nPar as Integer, parameters() as double, tag as variant) as double

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: .

Function: Evaluate is a event that calculates the m functions.
Notes:

The parameter par, nPar, parameters and mDat are passed through from the call to LMCurve.

fvec is an array of length m; on OUTPUT, it must contain the m function values for the parameter vector x.

If you return a nonzero value, lmmin will terminate.
Return zero to continue.

If provideArrays property is true, we provide values via parameters array, which may be slower than using par pointer.

117.2.15 evaluateMin(par as Ptr, nPar as Integer, parameters() as double, mDat as Integer, fvec as Ptr, tag as variant) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: .

Function: Evaluate is a event that calculates the m functions.
Notes:

The parameter par, nPar, parameters and mDat are passed through from the call to LMMin.

fvec is an array of length m; on OUTPUT, it must contain the m function values for the parameter vector x.

If you return a nonzero value, lmmin will terminate.
Return zero to continue.

If provideArrays property is true, we provide values via parameters array, which may be slower than using par pointer.

117.3 class LMFitStatusMBS

117.3.1 class LMFitStatusMBS

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Collection of output parameters for status info.

117.3.2 Blog Entries

- MBS Xojo Plugins, version 19.6pr1

117.3.3 Blog Entries

- MBS Xojo Plugins, version 19.6pr1

117.3.4 Properties

117.3.5 fnorm as Double

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Norm of the residue vector fvec.
Notes: (Read and Write property)

117.3.6 nfev as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Actual number of iterations.
Notes: (Read and Write property)

117.3.7 outcome as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Status indicator.
Notes:

Nonnegative values are used as index for the message text.
(Read and Write property)

117.3.8 outcomeInfoMessage as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The info message text.
Notes:

The plugin looks up text based on outcome value.
(Read only property)

117.3.9 outcomeShortMessage as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The short message text.
Notes:

The plugin looks up text based on outcome value.
(Read only property)

117.3.10 userbreak as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set when function evaluation requests termination.
Notes: (Read and Write property)

Chapter 118

Login Items

118.1 class LoginItemsMBS

118.1.1 class LoginItemsMBS

MBS MacOSX Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: A class to handle login items on Mac OS X.
Notes:

After creating a new object, the constructor may fail sometimes while updateing the list. lasterror is -609 in that case. His happens most likely just after login when the system events process is not yet ready. In that case, let your app wait a few seconds and try again.

For newer Mac OS X versions, please use LSSharedFileListMBS class instead.

118.1.2 Blog Entries

- Adding Login Items on Mac OS X

118.1.3 Blog Entries

- Adding Login Items on Mac OS X

118.1.4 Methods

118.1.5 AddFile(file as FolderItem, hidden as boolean=false) as boolean

MBS MacOSX Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Adds a file to the login items.
Notes:

Returns true on success.

For newer Mac OS X versions, please use LSSharedFileListMBS class instead.

118.1.6 AddURL(url as string, hidden as boolean=false) as boolean

MBS MacOSX Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Adds an url to the item list.
Notes:

Returns true on success.

For newer Mac OS X versions, please use LSSharedFileListMBS class instead.

118.1.7 DisplayName(index as Integer) as String

MBS MacOSX Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

Function: The display name of the item with the given index.
Example:

```
dim l as LoginItemsMBS

l=new LoginItemsMBS
MsgBox l.displayName(0) // shows name of first item
```

Notes: The display name may be localized.

118.1.8 File(index as Integer) as FolderItem

MBS MacOSX Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The file reference of the item with the given index.
Notes: Index is from 0 to count-1.

118.1.9 IsHidden(index as Integer) as boolean

MBS MacOSX Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Whether the item with the given index should be hidden after launch.
Notes:

Index is from 0 to count-1.

This value does not work in Mac OS X 10.4, but works in 10.5.

118.1.10 Name(index as Integer) as String

MBS MacOSX Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

Function: The name of the item with the given index.
Example:

```
dim l as LoginItemsMBS

l=new LoginItemsMBS
MsgBox l.Name(0) // shows name of first item
```

Notes: This is the file name. To get the name for display, use displayname.

118.1.11 OldAddLoginItem(file as folderitem,hide as boolean,allusers as boolean) as boolean

MBS MacOSX Plugin, Plugin Version: 7.5, Platform: macOS, Targets: Desktop only.

Function: Adds a file to the loginitems list.
Example:

```
dim f as folderItem
dim r as new LoginItemsMBS

f=app.applicationFileMBS
if r.OldAddLoginItem(f,false,false) then
msgBox f.displayName+" has been added to the login items!"
```

```
else
msgBox "Something went wrong."
end if
```

Notes:

This is the old method which edits the preferences file directly.
Do not use it unless you really need to. The new functions in this class handle login items using a system service and will be safer for future releases of Mac OS X.

hide matches the checkbox in the loginitems list.
allusers decides whether to set it for all user or the current one.

This function will add a LoginItem to the list of LoginItems when called. The properties given to the new LoginItem are passed when calling the function. Note that *no* check is made when adding the LoginItem to ensure that the path points to a valid application. Note that the LoginItem Is always added to the *end* of the list of LoginItems.

First Parameter (appfile):
The absolute path of the application to be launched expressed as a Xojo folderitem.

Second Parameter (hide):
A value representing if you want your application to be hidden at login time. True if you want the application to be hidden after it is launched. If you want the application to show up normally use be hidden use false.

Third Parameter (allusers):
A constant which represents which users preferences we want to change. In this case there are two alternatives: False which changes the preferences of the current user. The second alternative is True.
The kAllUsers LoginItems are launched for all users on the system. You must be root or admin to use the kAllUsers option.

Function Returns:
This function returns a boolean value representing if the function was successful.
The function returns true if the LoginItem was successfully added. False if otherwise. No additional error codes are returned.

Other Notes:
This code doesn't work properly if more than one application is attempting to write to the LoginItems preference at once.
Also no check is made to ensure that what you are adding to the LoginItem list isn't a duplicate. If there is a duplicate however only one instance of the application is launched.

118.1.12 OldCountOfLoginItems(allusers as boolean) as Integer

MBS MacOSX Plugin, Plugin Version: 7.5, Platform: macOS, Targets: Desktop only.

Function: This function will return the number of LoginItems for the user requested.
Example:

```
// Add this code for syncronization:

dim cf as CFPreferencesMBS
dim b as Boolean

cf=new CFPreferencesMBS
b=cf.AppSynchronize(cf.kCFPreferencesCurrentApplication)

// Count items

dim r as new LoginItemsMBS
msgbox str(r.OldCountOfLoginItems(false))
```

Notes:

This is the old method which edits the preferences file directly.
Do not use it unless you really need to. The new functions in this class handle login items using a system service and will be safer for future releases of Mac OS X.

This function returns the number of LoginItems for the user requested as a signed integer.

118.1.13 OldLoginItemPropertyAtIndex(what as Integer, index as Integer, allusers as boolean) as string

MBS MacOSX Plugin, Plugin Version: 7.5, Platform: macOS, Targets: Desktop only.

Function: Returns a property from the loginitems list.
Example:

```
dim i as Integer
dim c as Integer
dim l as Integer
dim path,name,hide as string
dim r as new LoginItemsMBS

c=r.OldCountOfLoginItems(false)

MsgBox str(c)+" Login items found for this user."
```

```
c=c-1
for i=0 to c
name=r.OldLoginItemPropertyAtIndex(2,i,false)
hide=r.OldLoginItemPropertyAtIndex(3,i,false)
path=r.OldLoginItemPropertyAtIndex(1,i,false)

list.addrow name
l=list.lastIndex
list.cell(l,1)=hide
list.cell(l,2)=path
list.cell(l,3)=str(i)
next
```

Notes:

This is the old method which edits the preferences file directly.
Do not use it unless you really need to. The new functions in this class handle login items using a system service and will be safer for future releases of Mac OS X.

Index is from 0 to count-1.
What can be 1 for the absolute path of the LoginItem, 2 for the LoginItem name or 3 for a string with "false" or "true" for the hiding option.

Returns "" on any error.

118.1.14 OldRemoveLoginItem(file as folderitem,allusers as boolean) as boolean

MBS MacOSX Plugin, Plugin Version: 7.5, Platform: macOS, Targets: Desktop only.

Function: Removes a file to the loginitems list.
Example:

```
dim f as folderItem
dim r as new LoginItemsMBS

f=app.applicationFileMBS
if r.OldRemoveLoginItem(f,false) then
msgBox f.displayName+" has been added to the login items!"
else
msgBox "Something went wrong."
end if
```

Notes:

This is the old method which edits the preferences file directly.
Do not use it unless you really need to. The new functions in this class handle login items using a system service and will be safer for future releases of Mac OS X.

The items are compared by path.
Returns true if item was found and the new list is written correctly to disk.
allusers decides whether to set it for all user or the current one.

118.1.15 OldRemoveLoginItemAtIndex(index as Integer, allusers as boolean) as boolean

MBS MacOSX Plugin, Plugin Version: 7.5, Platform: macOS, Targets: Desktop only.

Function: Removes an entry from the loginitem list.
Notes:

This is the old method which edits the preferences file directly.
Do not use it unless you really need to. The new functions in this class handle login items using a system service and will be safer for future releases of Mac OS X.

Index is from 0 to count-1.

118.1.16 Remove(index as Integer) as boolean

MBS MacOSX Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Removes the item from the login items list.
Notes:

Index is from 0 to count-1.
The count property is updated.

118.1.17 RemoveFile(file as FolderItem) as boolean

MBS MacOSX Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Removes the items matching this file reference from the list.
Notes:

Returns true on success.
Count is updated.

118.1.18 RemoveURL(url as string) as boolean

MBS MacOSX Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Removes the item matching the given URL.
Notes: Returns true on success.

118.1.19 Update

MBS MacOSX Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Reloads the list of items.
Notes:

Update is done after each modification method and in the constructor.
You should never need to call this method.

118.1.20 URL(index as Integer) as String

MBS MacOSX Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The URL of the item with the given index.
Notes: Index is from 0 to count-1.

118.1.21 Properties

118.1.22 Count as Integer

MBS MacOSX Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Number of items in the list currently.
Notes: (Read and Write property)

118.1.23 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The handle to the NSArray Reference used internally for the item list.
Notes: (Read and Write property)

118.1.24 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The last error code.
Notes:

Value can be 0 for success or -1 for a parameter error in the plugins or some other Mac OS X error code.
(Read and Write property)

118.2 class LSSharedFileListItemMBS

118.2.1 class LSSharedFileListItemMBS

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for a list item.
Notes: Requires Mac OS X 10.5.

118.2.2 Methods

118.2.3 DisplayName as string

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Obtain item's display name.
Example:

```
dim l as new LSSharedFileListMBS(LSSharedFileListMBS.kRecentDocumentItems)

if l.Handle=0 then
MsgBox "Failed to get list."
else
dim a(-1) as LSSharedFileListItemMBS = l.Snapshot
dim lines(-1) as string

for each x as LSSharedFileListItemMBS in a
lines.append x.DisplayName
next

MsgBox Join(lines, EndOfLine)
end if
```

118.2.4 Icon as Variant

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Obtain item's icon.
Notes: Returns an IconMBS object.

118.2.5 ID as UInt32

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Obtain unique item id.
Example:

```
dim l as new LSSharedFileListMBS(LSSharedFileListMBS.kSessionLoginItems)

if l.Handle=0 then
MsgBox "Failed to get list."
else
dim a(-1) as LSSharedFileListItemMBS = l.Snapshot
dim lines(-1) as string

for each x as LSSharedFileListItemMBS in a
lines.append x.DisplayName+": "+str(x.ID)
next

MsgBox Join(lines, EndOfLine)
end if
```

118.2.6 Resolve(flags as UInt32) as folderitem

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Resolve item and return its folderitem.
Example:

```
dim l as new LSSharedFileListMBS(LSSharedFileListMBS.kRecentDocumentItems)

if l.Handle=0 then
MsgBox "Failed to get list."
else
dim a(-1) as LSSharedFileListItemMBS = l.Snapshot
dim lines(-1) as string

for each x as LSSharedFileListItemMBS in a
lines.append x.Resolve(0).NativePath
next

MsgBox Join(lines, EndOfLine)
end if
```

Notes: Pass values like 0, kNoUserInteraction, kDoNotMountVolumes or kDoNotMountVolumes+kNoUser-

Interaction.

118.2.7 ResolveURL(flags as UInt32) as string

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Resolve item and return its URL.
Example:

```
dim l as new LSSharedFileListMBS(LSSharedFileListMBS.kRecentDocumentItems)

if l.Handle=0 then
MsgBox "Failed to get list."
else
dim a(-1) as LSSharedFileListItemMBS = l.Snapshot
dim lines(-1) as string

for each x as LSSharedFileListItemMBS in a
lines.append x.ResolveURL(x.kNoUserInteraction)
next

MsgBox Join(lines, EndOfLine)
end if
```

Notes: Pass values like 0, kNoUserInteraction, kDoNotMountVolumes or kDoNotMountVolumes+kNoUser-Interaction.

118.2.8 Properties

118.2.9 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal reference to the item.
Notes: (Read and Write property)

118.2.10 Lasterror as Integer

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last error code.

Notes: (Read and Write property)

118.2.11 ItemHidden as boolean

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Is item hidden in UI?
Example:

```
dim l as new LSSharedFileListMBS(LSSharedFileListMBS.kSessionLoginItems)

if l.Handle=0 then
MsgBox "Failed to get list."
else
dim a(-1) as LSSharedFileListItemMBS = l.Snapshot
dim lines(-1) as string

for each x as LSSharedFileListItemMBS in a
lines.append x.DisplayName+": "+str(x.ItemHidden)
next

MsgBox Join(lines, EndOfLine)
end if
```

Notes: (Read and Write computed property)

118.2.12 LoginItemHidden as boolean

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Should UI hide login item's window?
Example:

```
dim l as new LSSharedFileListMBS(LSSharedFileListMBS.kSessionLoginItems)

if l.Handle=0 then
MsgBox "Failed to get list."
else
dim a(-1) as LSSharedFileListItemMBS = l.Snapshot
dim lines(-1) as string

for each x as LSSharedFileListItemMBS in a
lines.append x.DisplayName+": "+str(x.LoginItemHidden)
next
```

```
MsgBox Join(lines, EndOfLine)
end if
```

Notes:

Requires Mac OS X 10.6.
(Read and Write computed property)

118.2.13 Constants

118.2.14 kDoNotMountVolumes = 2

MBS MacFrameworks Plugin, Plugin Version: 9.8.

Function: One of the flags for resolve.
Notes: do not mount volumes during resolution

118.2.15 kNoUserInteraction = 1

MBS MacFrameworks Plugin, Plugin Version: 9.8.

Function: One of the flags for resolve.
Notes: no user interaction during resolution

118.3 class LSSharedFileListMBS

118.3.1 class LSSharedFileListMBS

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: The shared list class.
Notes:

The shared file list API is for sharing and storing list of references to file system objects. The shared file list is a persistent list of objects, where each item has assigned display name, icon, and url as well as other optional properties.
Each list can also have various properties attached.

Requires Mac OS X 10.5.

118.3.2 Blog Entries

- MBS Plugins updated for Xojo 2019r2

118.3.3 Blog Entries

- MBS Plugins updated for Xojo 2019r2
- MBS Real Studio Plugins, version 12.4pr8
- Adding Login Items on Mac OS X

118.3.4 Methods

118.3.5 Constructor(type as Integer)

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates shared file list reference to be used for changing list and reading its various properties.
Notes: type: A constant indicating list type to create. See the constants in this class.

118.3.6 GetSeedValue as UInt32

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns seed value of the shared list.

118.3.7 InsertFile(AfterItem as LSSharedFileListItemMBS, DisplayName as string, Icon as object, file as folderitem) as LSSharedFileListItemMBS

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Insert item into shared list.
Example:

```
// Add iPhoto to launch items

// pick app
dim app as FolderItem = SpecialFolder.Applications.Child("iPhoto.app")

// get list object
dim l as new LSSharedFileListMBS(LSSharedFileListMBS.kSessionLoginItems)

// insert file
dim item as LSSharedFileListItemMBS = l.InsertFile(l.kLSSharedFileListItemBeforeFirst, "Launch iPhoto",
nil, app)

// check error
if l.Lasterror = 0 then
MsgBox "OK"
else
MsgBox "Failed: "+str(l.Lasterror)
end if
```

Notes:

Inserts item into shared list at specified location. If the item already exists in the list it will be moved and its icon, display name and properties will be updated.

AfterItem: Item after which new item has to be inserted. To insert at the beginning of the list use kLSSharedFileListItemBeforeFirst or to insert at the end of the list use kLSSharedFileListItemLast.

DisplayName: Display name of the new item. Can be NULL.
Icon: IconMBS of the new item. Can be nil.
File: FolderItem of the new item.

118.3.8 InsertURL(AfterItem as LSSharedFileListItemMBS, DisplayName as string, Icon as object, URL as string) as LSSharedFileListItemMBS

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Insert item into shared list.
Notes:

Inserts item into shared list at specified location. If the item already exists in the list it will be moved and its icon, display name and properties will be updated.

AfterItem: Item after which new item has to be inserted. To insert at the beginning of the list use kLSSharedFileListItemBeforeFirst or to insert at the end of the list use kLSSharedFileListItemLast.

DisplayName: Display name of the new item. Can be "".
Icon: IconMBS object for the icon. Can be nil.
URL: URL of the new item.

118.3.9 kLSSharedFileListItemBeforeFirst as LSSharedFileListItemMBS

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: A virtual item reference for inserting new item at beginning of the list.
Example:

```
dim n as LSSharedFileListItemMBS = LSSharedFileListMBS.kLSSharedFileListItemBeforeFirst
MsgBox str(n.Handle) // a special handle value for this virtual item: 1
```

118.3.10 kLSSharedFileListItemLast as LSSharedFileListItemMBS

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: A virtual item reference for inserting new item at end of the list.
Example:

```
dim n as LSSharedFileListItemMBS = LSSharedFileListMBS.kLSSharedFileListItemLast
MsgBox str(n.Handle) // a special handle value for this virtual item: 2
```

118.3.11 Move(item as LSSharedFileListItemMBS, MoveAfterItem as LSSharedFileListItemMBS)

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Moves item at specified location.
Notes:

item: Item to move.
MoveAfterItem: New icon of the new item. Use kLSSharedFileListItemBeforeFirst and kLSSharedFileListItemLast to move at the beginning or the end of the shared list.

118.3.12 Remove(item as LSSharedFileListItemMBS)

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Remove item from shared list.
Example:

```
// Remove iPhoto from launch items

// get list object
dim l as new LSSharedFileListMBS(LSSharedFileListMBS.kSessionLoginItems)

// get items
dim items(-1) as LSSharedFileListItemMBS = l.Snapshot

// check all items
for each item as LSSharedFileListItemMBS in items
dim file as FolderItem = item.Resolve(LSSharedFileListItemMBS.kNoUserInteraction)

if file<>nil then
if file.Name = "iPhoto.app" then
l.Remove item

if l.Lasterror = 0 then
MsgBox "OK"
else
MsgBox "Error: "+str(l.Lasterror)
end if
Return
end if
end if

next
```

118.3.13 RemoveAllItems

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Remove all items from shared list.

118.3.14 SetAuthorization(handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Set authorization reference for the shared list.
Notes: Before attempting to perform a privileged operation on the shared list caller must authorize appropriate rights. For example, modifying kGlobalLoginItems list requires "system.global-login-items." right authorized.

118.3.15 Snapshot as LSSharedFileListItemMBS()

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates snapshot array, which is list of all items at the moment this method was called.
See also:

- 118.3.16 Snapshot(byref seed as UInt32) as LSSharedFileListItemMBS() 19787

118.3.16 Snapshot(byref seed as UInt32) as LSSharedFileListItemMBS()

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates snapshot array, which is list of all items at the moment this method was called.
Notes: seed: Returned seed value at which snapshot was taken.
See also:

- 118.3.15 Snapshot as LSSharedFileListItemMBS() 19787

118.3.17 Properties

118.3.18 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal reference to the list.
Notes: (Read and Write property)

118.3.19 Lasterror as Integer

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

118.3.20 RecentItemsMaxAmount as Integer

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Maximum amount of items in the list.
Notes: (Read and Write computed property)

118.3.21 VolumesComputerVisible as boolean

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Is Computer item visible in favorite volumes list?
Notes: (Read and Write computed property)

118.3.22 VolumesIDiskVisible as boolean

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Is iDisk item visible in favorite volumes list.
Notes: (Read and Write computed property)

118.3.23 VolumesNetworkVisible as boolean

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Is Network item visible in favorite volumes list?
Notes: (Read and Write computed property)

118.3.24 Events

118.3.25 Changed

MBS MacFrameworks Plugin, Plugin Version: 9.8, Platform: macOS, Targets: .

Function: The event called whenever the list is changed by an application.

118.3.26 Constants

118.3.27 kFavoriteItems = 2

MBS MacFrameworks Plugin, Plugin Version: 9.8.

Function: One of the list type constants.
Example:

```
dim l as new LSSharedFileListMBS(LSSharedFileListMBS.kFavoriteItems)

if l.Handle=0 then
MsgBox "Failed to get list."
else
dim a(-1) as LSSharedFileListItemMBS = l.Snapshot
dim lines(-1) as string

for each x as LSSharedFileListItemMBS in a
lines.append x.DisplayName
next

MsgBox Join(lines, EndOfLine)
end if
```

118.3.28 kFavoriteVolumes = 1

MBS MacFrameworks Plugin, Plugin Version: 9.8.

Function: One of the list type constants.
Example:

```
dim l as new LSSharedFileListMBS(LSSharedFileListMBS.kFavoriteVolumes)

if l.Handle=0 then
MsgBox "Failed to get list."
else
```

```
dim a(-1) as LSSharedFileListItemMBS = l.Snapshot
dim lines(-1) as string

for each x as LSSharedFileListItemMBS in a
lines.append x.DisplayName
next

MsgBox Join(lines, EndOfLine)
end if
```

118.3.29 kGlobalLoginItems = 7

MBS MacFrameworks Plugin, Plugin Version: 9.8.

Function: One of the list type constants.
Example:

```
dim l as new LSSharedFileListMBS(LSSharedFileListMBS.kGlobalLoginItems)

if l.Handle=0 then
MsgBox "Failed to get list."
else
dim a(-1) as LSSharedFileListItemMBS = l.Snapshot
dim lines(-1) as string

for each x as LSSharedFileListItemMBS in a
lines.append x.DisplayName
next

MsgBox Join(lines, EndOfLine)
end if
```

118.3.30 kRecentApplicationItems = 3

MBS MacFrameworks Plugin, Plugin Version: 9.8.

Function: One of the list type constants.
Example:

```
dim l as new LSSharedFileListMBS(LSSharedFileListMBS.kRecentApplicationItems)

if l.Handle=0 then
MsgBox "Failed to get list."
```

```
else
dim a(-1) as LSSharedFileListItemMBS = l.Snapshot
dim lines(-1) as string

for each x as LSSharedFileListItemMBS in a
lines.append x.DisplayName
next

MsgBox Join(lines, EndOfLine)
end if
```

118.3.31 kRecentDocumentItems = 4

MBS MacFrameworks Plugin, Plugin Version: 9.8.

Function: One of the list type constants.
Example:

```
dim l as new LSSharedFileListMBS(LSSharedFileListMBS.kRecentDocumentItems)

if l.Handle=0 then
MsgBox "Failed to get list."
else
dim a(-1) as LSSharedFileListItemMBS = l.Snapshot
dim lines(-1) as string

for each x as LSSharedFileListItemMBS in a
lines.append x.DisplayName
next

MsgBox Join(lines, EndOfLine)
end if
```

118.3.32 kRecentServerItems = 5

MBS MacFrameworks Plugin, Plugin Version: 9.8.

Function: One of the list type constants.
Example:

```
dim l as new LSSharedFileListMBS(LSSharedFileListMBS.kRecentServerItems)

if l.Handle=0 then
```

```
MsgBox "Failed to get list."
else
dim a(-1) as LSSharedFileListItemMBS = l.Snapshot
dim lines(-1) as string

for each x as LSSharedFileListItemMBS in a
lines.append x.DisplayName
next

MsgBox Join(lines, EndOfLine)
end if
```

118.3.33 kSessionLoginItems = 6

MBS MacFrameworks Plugin, Plugin Version: 9.8.

Function: One of the list type constants.
Example:

```
dim l as new LSSharedFileListMBS(LSSharedFileListMBS.kSessionLoginItems)

if l.Handle=0 then
MsgBox "Failed to get list."
else
dim a(-1) as LSSharedFileListItemMBS = l.Snapshot
dim lines(-1) as string

for each x as LSSharedFileListItemMBS in a
lines.append x.DisplayName
next

MsgBox Join(lines, EndOfLine)
end if
```

118.4 module ServiceManagementModuleMBS

118.4.1 module ServiceManagementModuleMBS

MBS MacCF Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The module with function to add helper to login items.
Notes: This API seems to be sandbox safe and working with Mac App Store.

118.4.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.4pr6
- MBS Real Studio Plugins, version 12.3pr9

- Adding Login Items on Mac OS X

118.4.4 Methods

118.4.5 AllJobDictionaries(domain as string) as Dictionary()

MBS MacCF Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Returns the job description dictionaries for all jobs in the given domain.
Notes:

domain: The desired domain (e.g. kSMDomainSystemLaunchd).

Returns a new array containing all job dictionaries, or empty array if an error occurred. Must be released by the caller.
Available in OS X v10.6 and later.

118.4.6 CreateAuthorization as AuthorizationMBS

MBS MacCF Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Creates an authorization for Job operations.
Notes: Creates an authorization with kSMRightBlessPrivilegedHelper and flags InteractionAllowed, PreAuthorize and ExtendRights.

118.4.7 JobBless(domain as string, executableLabel as string, auth as AuthorizationMBS, byref error as Variant) as boolean

MBS MacCF Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Submits the executable for the given label as a launchd job.
Notes:

domain: The job's domain. Only kSMDomainSystemLaunchd is supported.
executableLabel: The label of the privileged executable to install. This label must be one of the keys found in the SMPrivilegedExecutables dictionary in the application's Info.plist.
auth: An authorization reference containing the kSMRightBlessPrivilegedHelper right.
Error: An output reference to a CFErrorMBS describing the specific error encountered while submitting the executable tool, or nil if successful. It is the responsibility of the application to release the error reference.

Returns true if the job was successfully submitted, otherwise false.

JobBless submits the executable for the given label as a launchd job. This function obviates the need for a setuid helper invoked via AuthorizationExecuteWithPrivileges in order to install a launchd plist.

If the job is already installed, success is returned.

In order to use this function the following requirements must be met:

- The calling application and target executable tool must both be signed.
- The calling application's Info.plist must include a "SMPrivilegedExecutables" dictionary of strings. Each string is a textual representation of a code signing requirement used to determine whether the application owns the privileged tool once installed (i.e. in order for subsequent versions to update the installed version).

Each key of SMPrivilegedExecutables is a reverse-DNS label for the helper tool (must be globally unique).

- The helper tool must have an embedded Info.plist containing an "SMAuthorizedClients" array of strings. Each string is a textual representation of a code signing requirement describing a client which is allowed to add and remove the tool.
- The helper tool must have an embedded launchd plist. The only required key in this plist is the Label key. When the launchd plist is extracted and written to disk, the key for ProgramArguments will be

set to an array of 1 element pointing to a standard location. You cannot specify your own program arguments, so do not rely on custom command line arguments being passed to your tool. Pass any parameters via IPC.

- The helper tool must reside in the Contents/Library/LaunchServices directory inside the application bundle, and its name must be its launchd job label. So if your launchd job label is "com.apple.Mail.helper", this must be the name of the tool in your application bundle.

Available in OS X v10.6 and later.

118.4.8 JobDictionary(domain as string, jobLabel as string) as Dictionary

MBS MacCF Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Returns the job description dictionary for the given job label.
Notes:

domain: The job's domain (e.g. kSMDomainSystemLaunchd).
jobLabel: The label identifier for the job to copy.

Return a new dictionary describing the job, or nil if the job could not be found.
Available in OS X v10.6 and later.

118.4.9 JobRemove(domain as string, jobLabel as string, auth as AuthorizationMBS, wait as boolean, byref error as CFErrorMBS) as boolean

MBS MacCF Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Removes the job with the given label from the specified domain.
Notes:

domain: The job's domain (e.g. kSMDomainSystemLaunchd).
jobLabel: The label for the job to remove.
auth: An AuthorizationRef containing the kSMRightModifySystemDaemons right if the given domain is kSMDomainSystemLaunchd.
wait: Pass true to block until the process for the given job has exited.
Error: An output reference to a CFErrorMBS describing the specific error encountered while submitting the job dictionary, or nil if no error occurred. It is the responsibility of the application to release the error reference.

Returns true if the job was removed successfully, otherwise false.

JobSubmit removes the job specified by label from the domain. If the job is currently running, it will conditionally block until the running process has exited.

Available in OS X v10.6 and later.

118.4.10 JobSubmit(domain as string, job as Dictionary, auth as AuthorizationMBS, byref error as CFErrorMBS) as boolean

MBS MacCF Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Submits the given job to the specified domain.
Notes:

domain: The job's domain (e.g. kSMDomainSystemLaunchd).
job: A dictionary describing a job.
auth: An AuthorizationRef containing the kSMRightModifySystemDaemons right if the given domain is kSMDomainSystemLaunchd.
Error: An output reference to a CFErrorMBS describing the specific error encountered while submitting the job dictionary, or NULL if no error occurred. It is the responsibility of the application to release the error reference.

Returns true if the job was submitted successfully, otherwise false.

JobSubmit submits the given job to the specified domain.
Available in OS X v10.6 and later.

118.4.11 kSMDomainSystemLaunchd as string

MBS MacCF Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: System-level launchd domain.

118.4.12 kSMDomainUserLaunchd as string

MBS MacCF Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: User-level launchd domain.

118.4.13 kSMInfoKeyAuthorizedClients as string

MBS MacCF Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Authorized clients property list key.

118.4.14 kSMInfoKeyPrivilegedExecutables as string

MBS MacCF Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Privileged executables property list key.

118.4.15 LoginItemRunning(identifier as string) as boolean

MBS MacCF Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Checks whether a login item is running.
Notes: Actually checks if there is a record for your helper, so if it crashed, this returns still true.

118.4.16 LoginItemSetEnabled(identifier as string, enabled as boolean) as boolean

MBS MacCF Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Enable a helper application located in the main application bundle's Contents/Library/LoginItems directory.
Notes:

identifier: The bundle identifier of the helper application bundle.
enabled: The Boolean enabled state of the helper application. This value is effective only for the currently logged in user. If true, the helper application will be started immediately (and upon subsequent logins) and kept running. If false, the helper application will no longer be kept running.

Returns true if the requested change has taken effect.

118.4.17 RegisterHelperApp(name as string, Update as boolean = false) as boolean

MBS MacCF Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Registers a helper application in the Launch Services database.
Notes:

The app must exist with given name inside the bundle in Library/LoginItems folder.

Update: A Boolean value specifying whether Launch Services should update existing information registered for the application, if any. If this parameter is false, the application will not be registered if it has already been registered previously and its current modification date has not changed from when it was last registered; if the parameter is true, the application's registered information will be updated even if its modification date has not changed.

Returns true on success and false on failure.

Chapter 119

Mac

119.1 Globals

119.1.1 CurrentAppearanceThemeMBS as string

MBS MacOSX Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns which theme is used on your computer.
Example:

msgbox "You are using this theme: "+CurrentAppearanceThemeMBS

Notes:

Possible values:
com.apple.theme.appearance.platinum
com.apple.theme.appearance.aqua
com.apple.theme.appearance.aqua.blue
com.apple.theme.appearance.aqua.graphite
Returns "" on any error.
Available in CarbonLib 1.4 and later. Available in Mac OS X 10.1 and later.

On Windows or Linux an empty string is returned.

119.1.2 SetDesktopPictureMBS(file as folderitem) as Integer

MBS Picture Plugin, Plugin Version: 3.3, Platforms: macOS, Windows, Targets: All.

Function: Asks the Finder/Explorer to change the desktop picture.
Notes:

File must be a valid folderitem for an existing file to define a new desktop picture.
Returns a Mac OS or Windows error code or -1 if the function is not available.

You can use file=nil to remove the desktop wallpaper on Windows.

119.1.3 Blog Entries

- MBS Plugins updated for Xojo 2019r2

119.2 class SummaryMBS

119.2.1 class SummaryMBS

MBS MacOSX Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: A class using SearchKit on Mac OS X 10.4 and newer to summarize texts.
Example:

```
dim s as new SummaryMBS("Hello World. This is just a test.")

MsgBox s.SentenceSummaryString(1)
```

119.2.2 Blog Entries

- MBS Plugins 10.3 Release Notes
- MBS REALbasic Plugins, version 10.3pr4

119.2.3 Blog Entries

- MBS Plugins 10.3 Release Notes
- MBS REALbasic Plugins, version 10.3pr4

119.2.4 Methods

119.2.5 Constructor(text as string)

MBS MacOSX Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Creates a summary object based on a text string.
Example:

```
dim s as new SummaryMBS("Hello World. This is just a test.")

MsgBox s.SentenceSummaryString(1)
```

Notes:

text: The text string that you want to summarize.
On success the handle property is not zero.

The constructor creates a summarization object that pre-analyzes a text string to support fast summarization.
Available in Mac OS X v10.4 and later.

119.2.6 ParagraphAtIndex(index as Integer) as string

MBS MacOSX Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Gets a specified paragraph from the text in a summarization object.
Example:

```
dim s as new SummaryMBS("Hello World. This is just a test.")
MsgBox s.ParagraphAtIndex(0)
```

Notes:

index: The ordinal number of the paragraph in the original text, with the first paragraph designated by zero (this function uses zero-based indexing).

Return a string containing the specified paragraph, or "" on failure.

Available in Mac OS X v10.4 and later.

119.2.7 ParagraphIndexOfParagraphs as Integer()

MBS MacOSX Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns the array containing the ordinal number for each paragraph in the original text.

119.2.8 ParagraphIndexOfSentences as Integer()

MBS MacOSX Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns an array of indexes to map a sentence index to it's paragraph index.

119.2.9 ParagraphSummaryString(numParagraphs as Integer) as string

MBS MacOSX Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Gets a text string consisting of a summary with, at most, the requested number of paragraphs.
Notes:

numParagraphs: The maximum number of paragraphs you want in the summary.
Returns a string containing the requested summary.
Available in Mac OS X v10.4 and later.

119.2.10 RankOrderOfParagraphs as Integer()

MBS MacOSX Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns an array with the summarization relevance rank of each paragraph in the original text.

119.2.11 RankOrderOfSentences as Integer()

MBS MacOSX Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns an array with the summarization relevance rank of each sentence in the original text.

119.2.12 SentenceAtIndex(index as Integer) as string

MBS MacOSX Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Gets a specified sentence from the text in a summarization object.
Example:

```
dim s as new SummaryMBS("Hello World. This is just a test.")
MsgBox s.SentenceAtIndex(0)
```

Notes:

index: The ordinal number of the sentence in the original text, with the first sentence designated by zero (this function uses zero-based indexing).
Returns a string containing the specified sentence, or NULL on failure.
Available in Mac OS X v10.4 and later.

119.2.13 SentenceIndexOfSentences as Integer()

MBS MacOSX Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns an array of the ordinal number for each sentence in the original text.

119.2.14 SentenceSummaryString(numSentences as Integer) as string

MBS MacOSX Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Gets a text string consisting of a summary with, at most, the requested number of sentences.
Example:

```
dim s as new SummaryMBS("Hello World. This is just a test.")

MsgBox s.SentenceSummaryString(1)
```

Notes:

numSentences: The maximum number of sentences you want in the summary.
Returns a string containing the requested summary.
Available in Mac OS X v10.4 and later.

119.2.15 Properties

119.2.16 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The internal reference to the SKSummary object.
Example:

```
dim s as new SummaryMBS("Hello World. This is just a test.")
MsgBox str(s.handle)
```

Notes: (Read and Write property)

119.2.17 ParagraphCount as Integer

MBS MacOSX Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Gets the number of paragraphs in a summarization object.
Example:

```
dim s as new SummaryMBS("Hello World. This is just a test.")
MsgBox str(s.ParagraphCount)
```

Notes: (Read only property)

119.2.18 SentenceCount as Integer

MBS MacOSX Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Gets the number of sentences in a summarization object.
Example:

```
dim s as new SummaryMBS("Hello World. This is just a test.")
MsgBox str(s.SentenceCount)
```

Notes: (Read only property)

119.3 class TextInputSourceMBS

119.3.1 class TextInputSourceMBS

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The class for text input source on Mac OS X.
Notes:

Text input sources fall into three general categories:

- Keyboard input sources, including keyboard layouts, keyboard input methods and input modes
- Palette input sources, including the character palette, keyboard viewer, and private dictionary panels
- Ink input sources

Palette input sources and ink input source are categorized as non-keyboard input sources. However, palette input sources might still involve some keyboard interaction. Keyboard input methods can be mode-enabled (for instance, Kotoeri). Hence, they are potentially the parent of several input modes directly selectable in the user interface (for instance, hiragana, katakana, and romaji). With mode-enabled input methods, the parent input method is not directly selectable. Non-mode-enabled input methods are directly selectable.

Some input sources are provided and installed with OS X. Other input sources can be installed as third party products themselves or as part of the installation of certain applications. International Preferences displays a list of all visible installed input sources. You can use International Preferences to enable or disable most input sources that are intended to be visible in the user interface. Setup Assistant also enables some input sources. A separate user interface provides a way to enable ink input sources.

You can use some of the functions in Text Input Source Services to enable or disable input sources programmatically in your application. One keyboard input source must be enabled. Only one ink input source may be enabled. Multiple instances of other input source types may be enabled.

Some enabled input sources are invisible but programmatically selectable, such as ink. Some are visible but not programmatically selectable, such as mode-savvy parent input methods (these must be visible so that International Preferences can display the parent input method for a group of input modes).

Input modes can only be changed from disabled to enabled if their parent input method is enabled. Input modes can only be selected if they and their parent input method are enabled.

Exactly one keyboard input source is selected at any time: the current keyboard input source. Selecting a new keyboard input source deselects the previous keyboard input source. Multiple palette input sources may be selected. For instance, there may be one or more character palettes and one or more keyboard viewers selected in addition to the selected keyboard input source. Selecting or deselecting a palette (or ink) input

source does not affect any other input source. Input methods that provide associated input palettes may programmatically deselect the palette when the input method is deselected, for example.

Text Input Source Source Services specifies modern, non-Script-Manager-based programming interfaces for operating on text input sources and performs the following functions:

- Finds information about text input sources
- Selects, enables, and disables text input sources
- Receives notifications about relevant changes in text input sources.

Available in OS X v10.5 and later.

119.3.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr8

119.3.3 Blog Entries

- MBS Real Studio Plugins, version 12.5pr8

119.3.4 Methods

119.3.5 BundleID as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The reverse DNS BundleID associated with the input source.
Example:

MsgBox TextInputSourceMBS.CurrentKeyboardInputSource.BundleID

119.3.6 Category as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The category of this input source.
Example:

```
MsgBox TextInputSourceMBS.CurrentKeyboardInputSource.Category
```

Notes: Can be kTISCategoryKeyboardInputSource, kTISCategoryPaletteInputSource, and kTISCategoryInkInputSource.

119.3.7 CreateASCIICapableInputSourceList as TextInputSourceMBS()

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Creates a list of ASCII-capable keyboard input sources.
Notes: This list represents a snapshot of ASCII-capable keyboard input sources enabled when the call was made. Successive calls to CreateASCIICapableInputSourceList may return different results because, for example, in between the calls the user may enable or disable an input source in the International Preferences pane. When a keyboard input source is enabled or disabled, by the user or programmatically, the distributed CF notification kTISNotifyEnabledKeyboardInputSourcesChanged is posted.

119.3.8 CreateInputSourceList(properties as dictionary, includeAllInstalled as boolean) as TextInputSourceMBS()

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Creates a list of input sources that match specified properties.
Example:

```
// show keyboard viewer
Dim d As New Dictionary
d.Value(TextInputSourceMBS.kTISPropertyInputSourceID) = "com.apple.KeyboardViewer"

Dim sources() As TextInputSourceMBS = TextInputSourceMBS.CreateInputSourceList(d, False)
If UBound(Sources) >= 0 Then
sources(0).SelectIt
End If
```

Notes:

properties: A dictionary of property keys and corresponding values to filter the input source list. May be nil, in which case no filtering is performed.
includeAllInstalled: Typically, set to false so that only enabled input sources are included; set to true to include all installed input sources that match the filter .

Returns an array for a list of text input source references that match the specified properties.

This list represents a snapshot of input sources that matched the properties specified when you made the call. If you want to include input sources that are installed but not currently enabled, set the includeAllInstalled parameter to true. Typically, you do this to obtain a text input source reference for a newly installed input source. In this case, the properties parameter would include very specific criteria limiting the matching input sources.

Important: Calling this function with the includeAllInstalled parameter set to true can have significant memory impact on the calling application if the properties parameter is nil (match all) or if it specifies criteria that might match many installed input sources. This setting might force caching of data for all matching input sources and result in an allocation of up to 120K.
If you are calling CreateInputSourceList to find a specific input source or sources from among the sources included in the list, first call CreateInputSourceList with includeAllInstalled set to false and check whether the returned array includes the desired input source(s). If this is not the case, call CreateInputSourceList again with the includeAllInstalled parameter set to true.
none

119.3.9 CurrentASCIICapableKeyboardInputSource as TextInputSourceMBS

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns a text input source reference for the most recently used ASCII-capable keyboard input source.
Example:

```
dim t as TextInputSourceMBS
t = TextInputSourceMBS.CurrentASCIICapableKeyboardInputSource

MsgBox t.LocalizedName
```

Notes:

Returns text input source reference for the most recently used ASCII-capable keyboard input source.

If no ASCII-capable keyboard input source has been used yet, the function returns the default ASCII-capable keyboard layout chosen by Setup Assistant.

119.3.10 CurrentASCIICapableKeyboardLayoutInputSource as TextInputSourceMBS

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns a text input source reference for the most recently used ASCII-capable keyboard layout.
Example:

```
dim t as TextInputSourceMBS
t = TextInputSourceMBS.CurrentASCIICapableKeyboardLayoutInputSource

MsgBox t.LocalizedName
```

Notes:

Returns A text input source reference for the most recently used ASCII-capable keyboard layout.

If no ASCII-capable keyboard input source has been used, the function returns the default ASCII-capable keyboard layout chosen by Setup Assistant.

This function is used by input methods to get the keyboard layout used for key translation if no specific keyboard layout override exists. The CurrentASCIICapableKeyboardInputSource can return input sources that are not keyboard layouts.

119.3.11 CurrentKeyboardInputSource as TextInputSourceMBS

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns a text input source reference for the currently selected keyboard input source.
Example:

```
dim t as TextInputSourceMBS
t = TextInputSourceMBS.CurrentKeyboardInputSource
MsgBox t.LocalizedName
```

119.3.12 CurrentKeyboardLayoutInputSource as TextInputSourceMBS

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns a text input source reference for the keyboard layout currently in use.
Example:

```
dim t as TextInputSourceMBS
t = TextInputSourceMBS.CurrentKeyboardLayoutInputSource
```

MsgBox t.LocalizedName

Notes: If the currently selected keyboard input source is a keyboard layout, the text input source reference refers to that layout. If the currently selected keyboard input source is an input method or mode, the text input source reference refers to the keyboard layout used by that input method or mode.

119.3.13 Deselect

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Deselects the specified input source.
Notes:

inputSource: The input source you want to deselect.

Lasterror is set.

Deselect is for use with palette or ink input sources only. It has no effect on other input sources. When palette input sources are disabled, the palette disappears. Ink input sources are usually deselected and disabled at the same time.

119.3.14 Disable

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Disables the specified input source.
Notes:

Sets lasterror. Lasterror is paramErr (-50) if the input source cannot be disabled. Otherwise, lasterror is noErr (0).

Disable is primarily intended for input methods, or for applications that supply their own input sources (for example, applications that provide keyboard layouts or palette input methods, and keyboard input methods that provide their own keyboard layouts and input modes). It makes the specified input source unavailable for selection and removes it from the user interface.

119.3.15 Enable

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Enables the specified input source.
Notes:

Lasterror is set. Lasterror is paramErr (-50) if the input source cannot be enabled. Otherwise, it is noErr (0).

Enable is primarily for input methods or for applications that supply their own input sources (for example, applications that provide keyboard layouts or palette input methods, and keyboard input methods that provide their own keyboard layouts and input modes). It makes the specified input source available in the user interface for selection.

For Enable to succeed, the input source must be capable of being enabled (that is, kTISPropertyInputSourceIsEnableCapable is set to true). Furthermore, if the input source is an input mode, its parent must already be enabled for the mode to become enabled.

119.3.16 Icon as Variant

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Queries IconMBS object for this input source.
Notes: Icon references are the typical icon format for keyboard layouts and input methods. If an icon reference is not available for the specified input source, the value is nil.

119.3.17 IconImageFile as folderitem

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The file containing the image (typically TIFF) to be used as the input source icon.
Notes: If an image file URL is not available for the specified input source, the value is nil. Note that other image formats (for example, JPEG, PNG) may also be used in the future.

119.3.18 IconImageURL as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The URL to the file containing the image (typically TIFF) to be used as the input source icon.
Notes: If an image file URL is not available for the specified input source, the value is nil. Note that other image formats (for example, JPEG, PNG) may also be used in the future.

119.3.19 InputMethodKeyboardLayoutOverride as TextInputSourceMBS

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns a text input source reference for the currently selected input method's keyboard layout override.
Example:

```
dim t as TextInputSourceMBS
t = TextInputSourceMBS.InputMethodKeyboardLayoutOverride
if t = nil then
MsgBox "Nil"
else
MsgBox t.LocalizedName
end if
```

Notes: If the current keyboard input source is an input method or mode that has a keyboard layout override, a text input source reference for that keyboard layout is returned. Otherwise, the function returns nil.

119.3.20 InputModeID as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: A reverse DNS string that identifies a particular usage class for input modes.
Example:

```
MsgBox TextInputSourceMBS.CurrentKeyboardInputSource.InputModeID
```

Notes:

For example, com.apple.inputmethod.Japanese.Katakana identifies a standard Katakana-input usage class that may be associated with input modes from several different input methods.
You can attach this input mode to a TSMDocument using the TSMSetDocumentProperty function with the tag kTSMDocumentInputModePropertyTag, to control the input mode usage class that should be used with that TSM document.

119.3.21 InputSourceForLanguage(language as string) as TextInputSourceMBS

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns a text input source reference for the input source that should be used to input the specified language.
Notes:

language: A BCP 47 language code (in the same form returned by the Core Foundation function CFLocaleCreateCanonicalLanguageIdentifierFromString function) that represents the language an input source should be returned for.

Returns an enabled input source that can input the specified language. If more than one such input source exists and at least one has been used, the most recently used input source is chosen. If none has been used, one is chosen based on the intended languages of the input sources. If no enabled input source exists that can input the specified language, the function returns nil.

If a text field is expected to have input in a particular language, an application can call InputSourceForLanguage and then SelectIt to select an input source appropriate for that language. This function is a replacement for the deprecated KeyScript programming interface's capability to select the default input source associated with a particular script code.

119.3.22 IsASCIICapable as boolean

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Whether the input source is intended to be capable of ASCII input.

119.3.23 IsEnableCapable as boolean

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Whether the input source can ever be programmatically enabled using Enable.
Notes:

You can enable most input sources programmatically at any time. IsEnableCapable is set to true for these input sources.
Some input sources can never be programmatically enabled. These are mainly input method private keyboard layouts used by the input method via the function SetInputMethodKeyboardLayoutOverride. You cannot directly enable these layouts, nor use them as keyboard layout input sources. IsEnableCapable is set to false for these.
Some input sources can be programmatically enabled only under the correct conditions. These are mainly input modes, which can be changed from disabled to enabled only if their parent input method is enabled. However, they can already be in the enabled state, but not currently selectable if their parent input method is disabled. IsEnableCapable is true for these.

119.3.24 IsEnabled as boolean

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Whether the input source is currently enabled.
Example:

MsgBox str(TextInputSourceMBS.CurrentKeyboardInputSource.IsEnabled)

119.3.25 IsSelectCapable as boolean

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Whether the input source can ever be programmatically selected using Select.
Notes:

This static property of an input source does not depend on any current state. For input sources that can be programmatically selected if they are enabled, IsSelectCapable is set to true.
For input sources that can never be programmatically selected even if they are enabled, IsSelectCapable is set to false. Such sources are mainly input methods that have modes (parent input methods); only their modes can be selected.
For input sources that are enabled and can only be programmatically selected under the correct conditions, IsSelectCapable is set to true. Such input sources are mainly input modes, which can only be selected if both they and their parent input method are enabled.
For input sources that can never be enabled or selected, IsSelectCapable is set to false.

119.3.26 IsSelected as boolean

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Whether the input source is currently selected.
Example:

MsgBox str(TextInputSourceMBS.CurrentKeyboardInputSource.IsSelected)

119.3.27 kTISCategoryInkInputSource as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the category identifiers.
Notes: You can install or select 0 or 1 ink input source.

119.3.28 kTISCategoryKeyboardInputSource as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the category identifiers.
Notes: This category includes keyboard layouts, keyboard input methods (both with modes and without), and keyboard input modes. At least one input source in this category is installed. Of all input sources in this category, exactly one is selected; selecting a new one deselects the previous one.

119.3.29 kTISCategoryPaletteInputSource as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the category identifiers.
Notes: This category includes character palettes and keyboard viewers. You can select 0 or more categories.

119.3.30 kTISNotifyEnabledKeyboardInputSourcesChanged as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The name of the CF distributed notification for a change to the set of enabled keyboard input sources.
Notes: Available in OS X v10.5 and later.

119.3.31 kTISNotifySelectedKeyboardInputSourceChanged as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The name of the CF distributed notification for a change to the selected keyboard input source.
Notes: Available in OS X v10.5 and later.

119.3.32 kTISPropertyBundleID as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the property keys.
Notes: This property key designates a property value, which is a string for the reverse DNS BundleID associated with the input source.

119.3.33 kTISPropertyIconImageURL as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the property keys.
Notes:

This property key designates a property value, which is a CFURLRef indicating the file containing the image (typically TIFF) to be used as the input source icon.
If an image file URL is not available for the specified input source, the value is nil. Note that other image formats (for example, JPEG, PNG) may also be used in the future.
Note: You may not use this key (and its corresponding value) used in the filter dictionary passed to the CreateInputSourceList function.

119.3.34 kTISPropertyIconRef as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the property keys.
Notes:

This property key designates a property value, which is an IconRef value for the input source icon.
Icon references are the typical icon format for keyboard layouts and input methods. If an icon reference is not available for the specified input source, the value is nil.
Note: You may not use this key (and its corresponding value) used in the filter dictionary passed to the CreateInputSourceList function.

119.3.35 kTISPropertyInputModeID as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the property keys.
Notes:

This property key designates a property value, which is a CFStringRef for a reverse DNS string that identifies a particular usage class for input modes.
For example, com.apple.inputmethod.Japanese.Katakana identifies a standard Katakana-input usage class that may be associated with input modes from several different input methods.
You can attach this input mode to a TSMDocument using the TSMSetDocumentProperty function with the tag kTSMDocumentInputModePropertyTag, to control the input mode usage class that should be used with that TSM document.

119.3.36 kTISPropertyInputSourceCategory as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the property keys.
Notes:

This property key designates a property value, which is a string indicating the category of an input source. Possible values are specified by the following property value constants: kTISCategoryKeyboardInputSource, kTISCategoryPaletteInputSource, and kTISCategoryInkInputSource.

119.3.37 kTISPropertyInputSourceID as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the property keys.
Example:

```
// show keyboard viewer
Dim d As New Dictionary
d.Value(TextInputSourceMBS.kTISPropertyInputSourceID) = "com.apple.KeyboardViewer"

Dim sources() As TextInputSourceMBS = TextInputSourceMBS.CreateInputSourceList(d, False)
If UBound(Sources) >= 0 Then
sources(0).SelectIt
End If
```

Notes:

This property key designates a property value, which is a CFStringRef for the unique reverse DNS name associated with the input source.

- For keyboard input methods and for palette or ink input sources, typically, the bundle ID, for instance, com.apple.Kotoeri.
- For keyboard input modes, typically, the bundle ID of the parent input method plus a suffix that uniquely identifies the input mode, for instance, com.apple.Kotoeri.Katakana. It is not the generic input mode name used across input methods, for instance, com.apple.inputmethod.Japanese.Katakana.
- For keyboard layouts, a new identification mechanism typically structured as com.company.keyboardlayout.name,for instance, com.apple.keyboardlayout.US.

119.3.38 kTISPropertyInputSourceIsASCIICapable as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the property keys.
Notes: This property key designates a property value, which is a boolean indicating whether the input source is intended to be capable of ASCII input.

119.3.39 kTISPropertyInputSourceIsEnableCapable as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the property keys.
Notes:

This property key designates a property value which is a boolean indicating whether the input source can ever be programmatically enabled using TISEnableInputSource.
You can enable most input sources programmatically at any time. kTISPropertyInputSourceIsEnableCapable is set to true for these input sources.
Some input sources can never be programmatically enabled. These are mainly input method private keyboard layouts used by the input method via the functionTISSetInputMethodKeyboardLayoutOverride. You cannot directly enable these layouts, nor use them as keyboard layout input sources. kTISPropertyInputSourceIsEnableCapable is set to false for these.
Some input sources can be programmatically enabled only under the correct conditions. These are mainly input modes, which can be changed from disabled to enabled only if their parent input method is enabled. However, they can already be in the enabled state, but not currently selectable if their parent input method is disabled. kTISPropertyInputSourceIsEnableCapable is true for these.

119.3.40 kTISPropertyInputSourceIsEnabled as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the property keys.
Notes: This property key designates a property value, which is a boolean indicating whether the input source is currently enabled.

119.3.41 kTISPropertyInputSourceIsSelectCapable as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the property keys.
Notes:

This property key designates a property value, which is a boolean indicating whether the input source can ever be programmatically selected using TISSelectInputSource.
This static property of an input source does not depend on any current state. For input sources that can be programmatically selected if they are enabled, kTISPropertyInputSourceIsSelectCapable is set to true.

For input sources that can never be programmatically selected even if they are enabled, kTISPropertyInputSourceIsSelectCapable is set to false. Such sources are mainly input methods that have modes (parent input methods); only their modes can be selected.
For input sources that are enabled and can only be programmatically selected under the correct conditions, kTISPropertyInputSourceIsSelectCapable is set to true. Such input sources are mainly input modes, which can only be selected if both they and their parent input method are enabled.
For input sources that can never be enabled or selected, kTISPropertyInputSourceIsSelectCapable is set to false.

119.3.42 kTISPropertyInputSourceIsSelected as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the property keys.
Notes: This property key designates a property value, which is a Boolean indicating whether the input source is currently selected.

119.3.43 kTISPropertyInputSourceLanguages as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the property keys.
Notes:

This property key designates a property value, which is a CFArrayRef for an array of CFStringRefs, where each string is the language code for a language that can be input using the input source. You can use this constant with the PropertyValue function, but you may not use it in the filter dictionary passed to the CreateInputSourceList function.
Languages codes are in the same BCP 47 form returned by the CFLocaleCreateCanonicalLanguageIdentifierFromString function. The first language code in the array is the language the input source is intended for. If no such language exists (for example, for the Unicode Hex Input keyboard layout), the first language code is an empty string.

119.3.44 kTISPropertyInputSourceType as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the property keys.
Notes:

This property key designates a property value, which is a string indicating the specific type of an input source. Possible values are specified by the following property value constants: kTISTypeKeyboardLayout, kTISTypeKeyboardInputMethodWithoutModes, kTISTypeKeyboardInputMethodModeEnabled, kTISTypeKeyboardInputMode, kTISTypeCharacterPalette, kTISTypeKeyboardViewer, and kTISTypeInk.

119.3.45 kTISPropertyLocalizedName as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the property keys.
Example:

```
dim t as TextInputSourceMBS
t = TextInputSourceMBS.CurrentKeyboardInputSource
MsgBox t.PropertyValue(t.kTISPropertyLocalizedName)
```

Notes:

This property key designates a property value, which is a string for the input source's localized name as intended for user interface use.
Uses the best match (determined by CFBundle) between the localization used by the caller and the available localizations of the input source name. In some cases, this might be an unlocalized name.

119.3.46 kTISPropertyUnicodeKeyLayoutData as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the property keys.
Notes:

This property key designates a property value, which is a Memoryblock that refers to the 'uchr' keyboard layout data for a keyboard layout input source.
The 'uchr' data is in native-endian order. If the input source is not a keyboard layout, or is a keyboard layout for which only 'KCHR data' is available, the value is nil.
Note: You may not use this key (and its corresponding value) used in the filter dictionary passed to the CreateInputSourceList function.

119.3.47 kTISTypeCharacterPalette as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the possible type values.
Notes: This type belongs to the category kTISCategoryPaletteInputSource.

119.3.48 kTISTypeInk as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the possible type values.
Notes: This type belongs to the category kTISCategoryInkInputSource. Even though it is the only type in that category, a type is provided so that clients who don't need category information can just check input source type.

119.3.49 kTISTypeKeyboardInputMethodModeEnabled as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the possible type values.
Notes: This type belongs to the category kTISCategoryKeyboardInputSource.

119.3.50 kTISTypeKeyboardInputMethodWithoutModes as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the possible type values.
Notes: This type belongs to the category kTISCategoryKeyboardInputSource.

119.3.51 kTISTypeKeyboardInputMode as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the possible type values.
Notes: This type belongs to the category kTISCategoryKeyboardInputSource.

119.3.52 kTISTypeKeyboardLayout as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the possible type values.
Notes: This type belongs to the category kTISCategoryKeyboardInputSource.

119.3.53 kTISTypeKeyboardViewer as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: One of the possible type values.
Notes: This type belongs to the category kTISCategoryPaletteInputSource.

119.3.54 LocalizedName as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The input source's localized name as intended for user interface use.
Example:

```
MsgBox TextInputSourceMBS.CurrentKeyboardInputSource.LocalizedName
```

Notes: Uses the best match (determined by CFBundle) between the localization used by the caller and the available localizations of the input source name. In some cases, this might be an unlocalized name.

119.3.55 PropertyValue(key as string) as Variant

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Gets the value of a specified property for a specified input source.
Example:

```
dim t as TextInputSourceMBS
t = TextInputSourceMBS.CurrentKeyboardInputSource
MsgBox t.PropertyValue(t.kTISPropertyLocalizedName)
```

Notes:

Key: The property key constant specifying the desired property value.

Returns a variant associated with the property key. The value type is specified for each key. Can be a string a boolean, a number, an array or an IconMBS. The function might return nil if the specified property is missing or invalid for the specified input source.

119.3.56 RegisterInputSource(file as folderitem) as Integer

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Registers any new input sources in a file or bundle so a text input source reference can be obtained immediately for each new input source.

Notes:

location: The location of the input sources in a file or bundle.

Returns a result code. The function returns paramErr (-50) if location is invalid or the input sources in the specified location cannot be registered. Otherwise, it returns noErr (0).

This function enables an installer for an input method bundle or a keyboard layout file or bundle to notify the system to register these new input sources. The system can then locate the specified file or bundle and perform any necessary cache rebuilds so that the installer can immediately call TISCreateInputSourceList with appropriate properties (for example, a bundle ID or input source ID) to get text input source references for one or more of the newly registered input sources.

You can only use this function to register the following:

Keyboard layout files or bundles in the /Library/Keyboard Layouts/ or
textasciitilde /Library/Keyboard Layouts/ directory (available to all users or to the current user, respectively). Such keyboard layouts, once enabled, are selectable.
Input method bundles in the new Library/Input Methods/ or
textasciitilde /Library/Input Methods/ directories (available to all users or to the current user, respectively).
Note: Input method bundles can include private non-selectable keyboard layouts for use with SetInputMethodKeyboardLayoutOverride. These are registered automatically when the input method is registered, and do not need to be separately registered. They are not registered using TISRegisterInputSource.
Security: Any code that calls RegisterInputSource is part of an application or service that has already been validated in some way (for instance, by the user).
See also:

- 119.3.57 RegisterInputSource(URL as string) as Integer 19823

119.3.57 RegisterInputSource(URL as string) as Integer

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Registers any new input sources in a file or bundle so a text input source reference can be obtained immediately for each new input source.
Notes:

location: The location of the input sources in a file or bundle.

Returns a result code. The function returns paramErr (-50) if location is invalid or the input sources in the specified location cannot be registered. Otherwise, it returns noErr (0).

This function enables an installer for an input method bundle or a keyboard layout file or bundle to notify

the system to register these new input sources. The system can then locate the specified file or bundle and perform any necessary cache rebuilds so that the installer can immediately call TISCreateInputSourceList with appropriate properties (for example, a bundle ID or input source ID) to get text input source references for one or more of the newly registered input sources.

You can only use this function to register the following:

Keyboard layout files or bundles in the /Library/Keyboard Layouts/ or
textasciitilde /Library/Keyboard Layouts/ directory (available to all users or to the current user, respectively). Such keyboard layouts, once enabled, are selectable.
Input method bundles in the new Library/Input Methods/ or
textasciitilde /Library/Input Methods/ directories (available to all users or to the current user, respectively).
Note: Input method bundles can include private non-selectable keyboard layouts for use with SetInputMethodKeyboardLayoutOverride. These are registered automatically when the input method is registered, and do not need to be separately registered. They are not registered using TISRegisterInputSource.
Security: Any code that calls RegisterInputSource is part of an application or service that has already been validated in some way (for instance, by the user).
See also:

- 119.3.56 RegisterInputSource(file as folderitem) as Integer 19822

119.3.58 SelectIt

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Selects the specified input source.
Example:

```
// show keyboard viewer
Dim d As New Dictionary
d.Value(TextInputSourceMBS.kTISPropertyInputSourceID) = "com.apple.KeyboardViewer"

Dim sources() As TextInputSourceMBS = TextInputSourceMBS.CreateInputSourceList(d, False)
If UBound(Sources) >= 0 Then
sources(0).SelectIt
End If
```

Notes:

Lasterror is set. Lasterror is paramErr (-50) if the input source is not selectable. Otherwise, it is noErr (0).

When the input source is a selectable keyboard, the specified input source becomes the new current keyboard input source, and the previous input source is deselected. When the input source is a palette, that palette is displayed and made available for input. Ink input sources are typically enabled and selected at the same

time. When you call SelectInputSource for a palette or ink input source, there is no effect on other input sources. When you call SelectInputSource for an already selected input source, there is, similarly, no effect.

For SelectInputSource to succeed, the input source must be selectable (that is, kTISPropertyInputSourceIsSelectCapable is set to true) and the input source must be enabled (that is, kTISPropertyInputSourceIsEnabled is set to true). Furthermore, if the input source is an input mode, its parent must be enabled for it to be selected.

We named the function SelectIt as Select is a reserved word in Xojo.

119.3.59 SetInputMethodKeyboardLayoutOverride

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Sets the keyboard layout override for an input method or mode.
Notes:

self: The input source for the keyboard layout that should be used until the current input method is deactivated (if it should be something other than the most recently used ASCII-capable keyboard layout).

Lasterorr is set. Value is paramErr (-50) if the current keyboard input source is not an input method or mode or if keyboardLayout does not designate a keyboard layout. Otherwise, it is noErr (0).

When an input method or mode is the selected input source, the most recently used ASCII-capable keyboard layout to translate key events is used. This keyboard layout is also the one that appears in Keyboard Viewer. An input source for this keyboard layout is returned by the function CurrentASCIICapableKeyboardLayoutInputSource. If a different keyboard layout should be used for a particular input method or mode, the activated input method or mode should call SetInputMethodKeyboardLayoutOverride to specify the desired keyboard layout.

For example, when a Kotoeri user selects kana layout for kana input, Kotoeri should call SetInputMethodKeyboardLayoutOverride to set the kana keyboard as the override for the appropriate input modes.

The keyboard layout set in this way is used for the final stage of key translation in the Window Server, the connection, or application-specific key translation.

The override setting is lost when the input method that set it is deactivated.

The keyboard layout used for overriding need not be enabled or explicitly selectable. It can be a non-selectable layout included in an input method bundle and automatically registered.

The default behavior is new with OS X v10.5, and eliminates the necessity that input methods have a user interface for setting the ASCII- capable keyboard for phonetic input based on Latin characters.

119.3.60 SourceID as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The unique reverse DNS name associated with the input source.
Notes:

- For keyboard input methods and for palette or ink input sources, typically, the bundle ID, for instance, com.apple.Kotoeri.
- For keyboard input modes, typically, the bundle ID of the parent input method plus a suffix that uniquely identifies the input mode, for instance, com.apple.Kotoeri.Katakana. It is not the generic input mode name used across input methods, for instance, com.apple.inputmethod.Japanese.Katakana.
- For keyboard layouts, a new identification mechanism typically structured as com.company.keyboardlayout.name,for instance, com.apple.keyboardlayout.US.

119.3.61 SourceLanguages as string()

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The array of string, where each string is the language code for a language that can be input using the input source.
Notes: Languages codes are in the same BCP 47 form returned by the CFLocaleCreateCanonicalLanguageIdentifierFromString function. The first language code in the array is the language the input source is intended for. If no such language exists (for example, for the Unicode Hex Input keyboard layout), the first language code is an empty string.

119.3.62 Type as string

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns the type of an input source.
Example:

MsgBox TextInputSourceMBS.CurrentKeyboardInputSource.Type

Notes: Value can be kTISTypeKeyboardLayout, kTISTypeKeyboardInputMethodWithoutModes, kTISTypeKeyboardInputMethodModeEnabled, kTISTypeKeyboardInputMode, kTISTypeCharacterPalette, kTISTypeKeyboardViewer, and kTISTypeInk.

119.3.63 Properties

119.3.64 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Internal object reference.
Notes: (Read and Write property)

119.3.65 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

119.4 module ValidationMBS

119.4.1 module ValidationMBS

MBS Encryption Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: This module has helper functions for App Store Validation.
Notes: Please use AppReceiptMBS and AppReceiptVerificatorMBS classes instead.

119.4.2 Blog Entries

- MBS Xojo Plugins, version 19.6pr1

119.4.3 Blog Entries

- MBS Xojo Plugins, version 19.6pr1

119.4.4 Methods

119.4.5 AppStoreReceipt(file as folderitem) as dictionary

MBS Encryption Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Reads the app store receipt.
Example:

```
// read a receipt file
dim file as FolderItem = SpecialFolder.Desktop.Child("receipt")

// query values
dim dic as Dictionary = ValidationMBS.AppStoreReceipt(file)

// show identifier
MsgBox dic.Value(ValidationMBS.kReceiptBundleIdentifer)
```

Notes:

You can use this to get details from your receipt.
Returns nil on any error.
Please pass folderitem to receipt file.

119.4.6 ExitApp(code as Integer = 173)

MBS Encryption Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Quits the application directly.
Example:

ValidationMBS.ExitApp 173

Notes:

This does not call the destructors and CancelClose events. The app is quit right away.
If you use code 173 the Finder will show error message that app needs to be downloaded again from Mac App Store.

119.4.7 GUID as string

MBS Encryption Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Reads the GUID of the Mac.
Example:

dim g as String = ValidationMBS.GUID
MsgBox EncodeHex(g)

Notes: This is normally build from the MAC ID of the ethernet card.

119.4.8 locateAppStoreReceipt as folderitem

MBS Encryption Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Locates the App Store Receipt in the application bundle.
Example:

dim f as FolderItem = ValidationMBS.locateAppStoreReceipt
MsgBox f.NativePath

Notes: Please check result if folderitem is not nil and exists before processing.

119.4.9 Validate(file as folderitem) as boolean

MBS Encryption Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Validates the receipt.
Example:

```
dim file as FolderItem = ValidationMBS.locateAppStoreReceipt

if ValidationMBS.Validate(file) = false then
ValidationMBS.ExitApp 173
else
// ok
end if
```

Notes: Returns true if valid and false if not.

119.4.10 Constants

119.4.11 kReceiptBundleIdentifer = "BundleIdentifier"

MBS Encryption Plugin, Plugin Version: 13.4.

Function: One of the keys for the receipt dictionary.
Example:

```
// read a receipt file
dim file as FolderItem = SpecialFolder.Desktop.Child("receipt")

// query values
dim dic as Dictionary = ValidationMBS.AppStoreReceipt(file)

// show identifier
MsgBox dic.Value(ValidationMBS.kReceiptBundleIdentifer)
```

Notes: The bundle identifier.

119.4.12 kReceiptBundleIdentiferData = "BundleIdentifierData"

MBS Encryption Plugin, Plugin Version: 13.4.

Function: One of the keys for the receipt dictionary.

Notes: The bundle identifier data.

119.4.13 kReceiptHash = "Hash"

MBS Encryption Plugin, Plugin Version: 13.4.

Function: One of the keys for the receipt dictionary.
Notes: The hash for the receipt.

119.4.14 kReceiptOpaqueValue = "OpaqueValue"

MBS Encryption Plugin, Plugin Version: 13.4.

Function: One of the keys for the receipt dictionary.
Notes: The opaque value used for hashing.

119.4.15 kReceiptVersion = "Version"

MBS Encryption Plugin, Plugin Version: 13.4.

Function: One of the keys for the receipt dictionary.
Example:

```
// read a receipt file
dim file as FolderItem = SpecialFolder.Desktop.Child("receipt")

// query values
dim dic as Dictionary = ValidationMBS.AppStoreReceipt(file)

// show version
MsgBox dic.Value(ValidationMBS.kReceiptVersion)
```

Notes: The version string.

Chapter 120

MapKit

120.1 control DesktopMapKitViewControlMBS

120.1.1 control DesktopMapKitViewControlMBS

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The control for showing a map in Xojo.
Notes:

This control is designed for Xojo (it may or may not work in REAL Studio if the Cocoa target is chosen)

As Xojo provides some events for us automatically like for context menu or mouse wheel, it does not mean that those events do work. The webview used in the map view seems to consume them before the plugin gets them.

120.1.2 Properties

120.1.3 View as MKMapViewMBS

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The map view used for this control.
Notes:

The plugin creates it automatically when the constructor runs.
(Read only property)

120.1.4 Events

120.1.5 annotationViewDidChangeDragState(mapView as MKMapViewMBS, annotationView as MKAnnotationViewMBS, newState as Integer, oldState as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells the control that the drag state of one of its annotation views changed.
Notes:

mapView: The map view containing the annotation view.
annotationView: The annotation view whose drag state changed.
newState: The new drag state of the annotation view.
oldState: The previous drag state of the annotation view.

The drag state typically changes in response to user interactions with the annotation view. However, the annotation view itself is responsible for changing that state as well.

120.1.6 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs the receiver that the user has begun a touch gesture.
Notes:

e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

120.1.7 BoundsChanged

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

120.1.8 ClusterAnnotationForMemberAnnotations(mapView as MKMapViewMBS, memberAnnotations() as MKAnnotationMBS) as MKClusterAnnotationMBS

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Asks you to provide a cluster annotation object for the specified annotations.
Notes:

mapView: The map view containing the specified annotations.
memberAnnotations: The annotations to be clustered together. The returned MKClusterAnnotation object must include the specific annotations in this parameter.

Return the cluster annotation object.

Use this method to customize the cluster annotations displayed on your map. Normally, MapKit creates cluster annotation objects automatically when one or more annotations with the same cluster identifier are too close together. However, you can implement this method and return a custom cluster annotation object for the specified set of annotations.

120.1.9 didAddAnnotationViews(mapView as MKMapViewMBS, AnnotationViews() as MKAnnotationViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells the control that one or more annotation views were added to the map.
Notes:

mapView: The map view that added the annotation views.
views: An array of MKAnnotationView objects representing the views that were added.

By the time this method is called, the specified views are already added to the map.

120.1.10 DidAddOverlayRenderers(mapView as MKMapViewMBS, renderers() as MKOverlayRendererMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells you that one or more renderer objects were added to the map.
Notes:

mapView: The map view that added the renderer objects.
renderers: The renderer objects that were added.

The map view adds renderer objects when it needs them to draw their contents, which might be prior to those contents appearing onscreen. It calls this method to let you know that the renderer is active and in use. By the time this method is called, the specified renderers have already been added to the map.

120.1.11 didAddOverlayViews(mapView as MKMapViewMBS, overlayViews() as NSViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event to inform you about added overlay views.

120.1.12 didDeselectAnnotationView(mapView as MKMapViewMBS, view as MKAnnotationViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells the control that one of its annotation views was deselected.
Notes:

mapView: The map view containing the annotation view.
view: The annotation view that was deselected.

You can use this method to track changes in the selection state of annotation views.

120.1.13 didFailLoadingMap(mapView as MKMapViewMBS, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells the control that the specified view was unable to load the map data.
Notes:

mapView: The map view that started the load operation.
error: The reason that the map data could not be loaded.

This method might be called in situations where the device does not have access to the network or is unable to load the map data for some reason. It may also be called if a request for additional map tiles comes in while a previous request for tiles is still pending. You can use this message to notify the user that the map data is unavailable.

120.1.14 didFailToLocateUserWithError(mapView as MKMapViewMBS, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells the control that an attempt to locate the user's position failed.

Notes:

mapView: The map view that is tracking the user's location.
error: An error object containing the reason why location tracking failed.

120.1.15 didFinishLoadingMap(mapView as MKMapViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells the control that the specified map view successfully loaded the needed map data.
Notes:

mapView: The map view that started the load operation.

This method is called when the map tiles associated with the current request have been loaded. Map tiles are requested when a new visible area is scrolled into view and tiles are not already available. Map tiles may also be requested for portions of the map that are not currently visible. For example, the map view may load tiles immediately surrounding the currently visible area as needed to handle small pans by the user.

120.1.16 DidFinishRenderingMap(mapView as MKMapViewMBS, fullyRendered as boolean)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells you that the map view has finished rendering all visible tiles.
Notes:

fullyRendered: This parameter is set to true if the map view was able to render all tiles completely or false if errors prevented all tiles from being rendered.

This method lets you know when the map view finishes rendering all of the currently visible tiles to the best of its ability. This method is called regardless of whether all tiles were rendered successfully. If there were errors loading one or more tiles that prevented map view from rendering them, the fullyRendered parameter is set to false.

120.1.17 didSelectAnnotationView(mapView as MKMapViewMBS, view as MKAnnotationViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells the control that one of its annotation views was selected.
Notes:

mapView: The map view containing the annotation view.
view: The annotation view that was selected.

You can use this method to track changes in the selection state of annotation views.

120.1.18 didStopLocatingUser(mapView as MKMapViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells the control that the map view stopped tracking the user's location.
Notes:

mapView: The map view that stopped tracking the user's location.

This method is called when the value of the showsUserLocation property changes to false.

120.1.19 didUpdateUserLocation(mapView as MKMapViewMBS, userLocation as MKUserLocationMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells the control that the location of the user was updated.
Notes:

mapView: The map view that is tracking the user's location.
userLocation: The location object representing the user's latest location. This property may be nil.

While the showsUserLocation property is set to true, this method is called whenever a new location update is received by the map view. This method is also called if the map view's user tracking mode is set to MKUserTrackingModeFollowWithHeading and the heading changes.

This method is not called if the application is currently running in the background. If you want to receive location updates while running in the background, you must use the Core Location framework.

120.1.20 EnableMenuItems

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event where you can enable menu items.

120.1.21 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs the receiver that the user has ended a touch gesture.
Notes:

e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

120.1.22 FrameChanged

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

120.1.23 GotFocus

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

120.1.24 LostFocus

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

120.1.25 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs the receiver that the user has begun a pinch gesture.
Notes:

e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.

Return true if you handled this event.

120.1.26 MenuAction(HitItem as MenuItem) As Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

120.1.27 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control's region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

120.1.28 MouseDrag(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

120.1.29 MouseUp(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

120.1.30 pressureChange(e as NSEventMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes:

This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

120.1.31 regionDidChangeAnimated(mapView as MKMapViewMBS, animated as boolean)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells the control that the region displayed by the map view just changed.
Notes:

mapView: The map view whose visible region changed.
animated: If true, the change to the new region was animated.

This method is called whenever the currently displayed map region changes. During scrolling, this method may be called many times to report updates to the map position. Therefore, your implementation of this method should be as lightweight as possible to avoid affecting scrolling performance.

120.1.32 regionWillChangeAnimated(mapView as MKMapViewMBS, animated as boolean)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells the control that the region displayed by the map view is about to change.
Notes:

mapView: The map view whose visible region is about to change.
animated: If true, the change to the new region will be animated. If NO, the change will be made immediately.

This method is called whenever the currently displayed map region changes. During scrolling, this method

may be called many times to report updates to the map position. Therefore, your implementation of this method should be as lightweight as possible to avoid affecting scrolling performance.

120.1.33 rendererForOverlay(mapView as MKMapViewMBS, overlay as MKOverlayMBS) as MKOverlayRendererMBS

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Asks the control for a renderer object to use when drawing the specified overlay.
Notes:

mapView: The map view that requested the renderer object.
overlay: The overlay object that is about to be displayed.

Return the renderer to use when presenting the specified overlay on the map.

You must implement this method and use it to provide an appropriate renderer object for your overlays. The renderer object is responsible for drawing the contents of your overlay when asked to do so by the map view. Map Kit supports many different types of standard renderer objects and you may also define your own custom renderers.

If you don't implement this event, the MBS Plugin returns a default renderer.

120.1.34 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs the receiver that the user has begun a rotation gesture.
Notes:

e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

120.1.35 ScaleFactorChanged(NewFactor as Double)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

120.1.36 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs the receiver that the user has begun a swipe gesture.
Notes:

e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

120.1.37 viewForAnnotation(mapView as MKMapViewMBS, annotation as MKAnnotationMBS) as MKAnnotationViewMBS

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event to query an annotation view for the given annotation.

120.1.38 willStartLoadingMap(mapView as MKMapViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells the control that the specified map view is about to retrieve some map data.
Notes:

mapView: The map view that began loading the data.

This method is called whenever a new group of map tiles need to be downloaded from the server. This typically occurs whenever you expose portions of the map by panning or zooming the content. You can use this method to mark the time that it takes for the map view to load the data.

120.1.39 willStartLocatingUser(mapView as MKMapViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells the control that the map view will start tracking the user's position.
Notes:

mapView: The map view that is tracking the user's location.

This method is called when the value of the showsUserLocation property changes to true.

120.1.40 WillStartRenderingMap(mapView as MKMapViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells you that the map view is about to start rendering some of its tiles.
Notes: The map view calls this method when one or more tiles are revealed and require rendering.

120.2 control MapKitIOSControlMBS

120.2.1 control MapKitIOSControlMBS

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: iOS only.

Function: The control for showing a map in Xojo.
Notes: This control is designed for Xojo 2020r2 or newer.

120.2.6 Properties

120.2.7 View as MKMapViewMBS

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: iOS only.

Function: The map view used for this control.
Notes:

The plugin creates it automatically when the constructor runs.
(Read only property)

120.2.8 Events

120.2.9 annotationViewDidChangeDragState(mapView as MKMapViewMBS, annotationView as MKAnnotationViewMBS, newState as integer, oldState as integer)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Tells the control that the drag state of one of its annotation views changed.
Notes:

mapView: The map view containing the annotation view.
annotationView: The annotation view whose drag state changed.
newState: The new drag state of the annotation view.
oldState: The previous drag state of the annotation view.

The drag state typically changes in response to user interactions with the annotation view. However, the annotation view itself is responsible for changing that state as well.

120.2.10 ClusterAnnotationForMemberAnnotations(mapView as MKMapViewMBS, memberAnnotations() as MKAnnotationMBS) as MKClusterAnnotationMBS

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Asks you to provide a cluster annotation object for the specified annotations.
Notes:

mapView: The map view containing the specified annotations.
memberAnnotations: The annotations to be clustered together. The returned MKClusterAnnotation object must include the specific annotations in this parameter.

Return the cluster annotation object.

Use this method to customize the cluster annotations displayed on your map. Normally, MapKit creates cluster annotation objects automatically when one or more annotations with the same cluster identifier are too close together. However, you can implement this method and return a custom cluster annotation object for the specified set of annotations.

120.2.11 didAddAnnotationViews(mapView as MKMapViewMBS, AnnotationViews() as MKAnnotationViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Tells the control that one or more annotation views were added to the map.
Notes:

mapView: The map view that added the annotation views.
views: An array of MKAnnotationView objects representing the views that were added.

By the time this method is called, the specified views are already added to the map.

120.2.12 DidAddOverlayRenderers(mapView as MKMapViewMBS, renderers() as MKOverlayRendererMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Tells you that one or more renderer objects were added to the map.
Notes:

mapView: The map view that added the renderer objects.
renderers: The renderer objects that were added.

The map view adds renderer objects when it needs them to draw their contents, which might be prior to those contents appearing onscreen. It calls this method to let you know that the renderer is active and in use. By the time this method is called, the specified renderers have already been added to the map.

120.2.13 didAddOverlayViews(mapView as MKMapViewMBS, overlayViews() as NSViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: The event to inform you about added overlay views.

120.2.14 didDeselectAnnotationView(mapView as MKMapViewMBS, view as MKAnnotationViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Tells the control that one of its annotation views was deselected.
Notes:

mapView: The map view containing the annotation view.
view: The annotation view that was deselected.

You can use this method to track changes in the selection state of annotation views.

120.2.15 didFailLoadingMap(mapView as MKMapViewMBS, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Tells the control that the specified view was unable to load the map data.
Notes:

mapView: The map view that started the load operation.
error: The reason that the map data could not be loaded.

This method might be called in situations where the device does not have access to the network or is unable to load the map data for some reason. It may also be called if a request for additional map tiles comes in while a previous request for tiles is still pending. You can use this message to notify the user that the map data is unavailable.

120.2.16 didFailToLocateUserWithError(mapView as MKMapViewMBS, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Tells the control that an attempt to locate the user's position failed.
Notes:

mapView: The map view that is tracking the user's location.
error: An error object containing the reason why location tracking failed.

120.2.17 didFinishLoadingMap(mapView as MKMapViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Tells the control that the specified map view successfully loaded the needed map data.
Notes:

mapView: The map view that started the load operation.

This method is called when the map tiles associated with the current request have been loaded. Map tiles

are requested when a new visible area is scrolled into view and tiles are not already available. Map tiles may also be requested for portions of the map that are not currently visible. For example, the map view may load tiles immediately surrounding the currently visible area as needed to handle small pans by the user.

120.2.18 DidFinishRenderingMap(mapView as MKMapViewMBS, fullyRendered as boolean)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Tells you that the map view has finished rendering all visible tiles.
Notes:

fullyRendered: This parameter is set to true if the map view was able to render all tiles completely or false if errors prevented all tiles from being rendered.

This method lets you know when the map view finishes rendering all of the currently visible tiles to the best of its ability. This method is called regardless of whether all tiles were rendered successfully. If there were errors loading one or more tiles that prevented map view from rendering them, the fullyRendered parameter is set to false.

120.2.19 didSelectAnnotationView(mapView as MKMapViewMBS, view as MKAnnotationViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Tells the control that one of its annotation views was selected.
Notes:

mapView: The map view containing the annotation view.
view: The annotation view that was selected.

You can use this method to track changes in the selection state of annotation views.

120.2.20 didStopLocatingUser(mapView as MKMapViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Tells the control that the map view stopped tracking the user's location.
Notes:

mapView: The map view that stopped tracking the user's location.

This method is called when the value of the showsUserLocation property changes to false.

120.2.21 didUpdateUserLocation(mapView as MKMapViewMBS, userLocation as MKUserLocationMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Tells the control that the location of the user was updated.
Notes:

mapView: The map view that is tracking the user's location.
userLocation: The location object representing the user's latest location. This property may be nil.

While the showsUserLocation property is set to true, this method is called whenever a new location update is received by the map view. This method is also called if the map view's user tracking mode is set to MKUserTrackingModeFollowWithHeading and the heading changes.

This method is not called if the application is currently running in the background. If you want to receive location updates while running in the background, you must use the Core Location framework.

120.2.22 GotFocus

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

120.2.23 LostFocus

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

120.2.24 regionDidChangeAnimated(mapView as MKMapViewMBS, animated as boolean)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Tells the control that the region displayed by the map view just changed.
Notes:

mapView: The map view whose visible region changed.
animated: If true, the change to the new region was animated.

This method is called whenever the currently displayed map region changes. During scrolling, this method may be called many times to report updates to the map position. Therefore, your implementation of this method should be as lightweight as possible to avoid affecting scrolling performance.

120.2.25 regionWillChangeAnimated(mapView as MKMapViewMBS, animated as boolean)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Tells the control that the region displayed by the map view is about to change.
Notes:

mapView: The map view whose visible region is about to change.
animated: If true, the change to the new region will be animated. If NO, the change will be made immediately.

This method is called whenever the currently displayed map region changes. During scrolling, this method may be called many times to report updates to the map position. Therefore, your implementation of this method should be as lightweight as possible to avoid affecting scrolling performance.

120.2.26 rendererForOverlay(mapView as MKMapViewMBS, overlay as MKOverlayMBS) as MKOverlayRendererMBS

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Asks the control for a renderer object to use when drawing the specified overlay.
Notes:

mapView: The map view that requested the renderer object.
overlay: The overlay object that is about to be displayed.

Return the renderer to use when presenting the specified overlay on the map.

You must implement this method and use it to provide an appropriate renderer object for your overlays. The renderer object is responsible for drawing the contents of your overlay when asked to do so by the map view. Map Kit supports many different types of standard renderer objects and you may also define your own custom renderers.

If you don't implement this event, the MBS Plugin returns a default renderer.

120.2.27 viewForAnnotation(mapView as MKMapViewMBS, annotation as MKAnnotationMBS) as MKAnnotationViewMBS

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: The event to query an annotation view for the given annotation.

120.2.28 willStartLoadingMap(mapView as MKMapViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Tells the control that the specified map view is about to retrieve some map data.
Notes:

mapView: The map view that began loading the data.

This method is called whenever a new group of map tiles need to be downloaded from the server. This typically occurs whenever you expose portions of the map by panning or zooming the content. You can use this method to mark the time that it takes for the map view to load the data.

120.2.29 willStartLocatingUser(mapView as MKMapViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Tells the control that the map view will start tracking the user's position.
Notes:

mapView: The map view that is tracking the user's location.

This method is called when the value of the showsUserLocation property changes to true.

120.2.30 WillStartRenderingMap(mapView as MKMapViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.0, Platform: iOS, Targets: .

Function: Tells you that the map view is about to start rendering some of its tiles.
Notes: The map view calls this method when one or more tiles are revealed and require rendering.

120.3 control MapKitViewControlMBS

120.3.1 control MapKitViewControlMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop only.

Function: The control for showing a map in Xojo.
Notes:

This control is designed for Xojo (it may or may not work in REAL Studio if the Cocoa target is chosen)

As Xojo provides some events for us automatically like for context menu or mouse wheel, it does not mean that those events do work. The webview used in the map view seems to consume them before the plugin gets them.

120.3.8 Properties

120.3.9 View as MKMapViewMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop only.

Function: The map view used for this control.
Notes:

The plugin creates it automatically when the constructor runs.
(Read only property)

120.3.10 Events

120.3.11 annotationViewDidChangeDragState(mapView as MKMapViewMBS, annotationView as MKAnnotationViewMBS, newState as Integer, oldState as Integer)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: .

Function: Tells the control that the drag state of one of its annotation views changed.
Notes:

mapView: The map view containing the annotation view.
annotationView: The annotation view whose drag state changed.
newState: The new drag state of the annotation view.
oldState: The previous drag state of the annotation view.

The drag state typically changes in response to user interactions with the annotation view. However, the annotation view itself is responsible for changing that state as well.

120.3.12 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: .

Function: Informs the receiver that the user has begun a touch gesture.
Notes:

e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

120.3.13 BoundsChanged

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

120.3.14 ClusterAnnotationForMemberAnnotations(mapView as MKMapViewMBS, memberAnnotations() as MKAnnotationMBS) as MKClusterAnnotationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: .

Function: Asks you to provide a cluster annotation object for the specified annotations.
Notes:

mapView: The map view containing the specified annotations.
memberAnnotations: The annotations to be clustered together. The returned MKClusterAnnotation object must include the specific annotations in this parameter.

Return the cluster annotation object.

Use this method to customize the cluster annotations displayed on your map. Normally, MapKit creates cluster annotation objects automatically when one or more annotations with the same cluster identifier are too close together. However, you can implement this method and return a custom cluster annotation object for the specified set of annotations.

120.3.15 didAddAnnotationViews(mapView as MKMapViewMBS, AnnotationViews() as MKAnnotationViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: .

Function: Tells the control that one or more annotation views were added to the map.
Notes:

mapView: The map view that added the annotation views.
views: An array of MKAnnotationView objects representing the views that were added.

By the time this method is called, the specified views are already added to the map.

120.3.16 DidAddOverlayRenderers(mapView as MKMapViewMBS, renderers() as MKOverlayRendererMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: .

Function: Tells you that one or more renderer objects were added to the map.
Notes:

mapView: The map view that added the renderer objects.
renderers: The renderer objects that were added.

The map view adds renderer objects when it needs them to draw their contents, which might be prior to those contents appearing onscreen. It calls this method to let you know that the renderer is active and in use. By the time this method is called, the specified renderers have already been added to the map.

120.3.17 didAddOverlayViews(mapView as MKMapViewMBS, overlayViews() as NSViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: .

Function: The event to inform you about added overlay views.

120.3.18 didDeselectAnnotationView(mapView as MKMapViewMBS, view as MKAnnotationViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: .

Function: Tells the control that one of its annotation views was deselected.
Notes:

mapView: The map view containing the annotation view.
view: The annotation view that was deselected.

You can use this method to track changes in the selection state of annotation views.

120.3.19 didFailLoadingMap(mapView as MKMapViewMBS, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: .

Function: Tells the control that the specified view was unable to load the map data.
Notes:

mapView: The map view that started the load operation.
error: The reason that the map data could not be loaded.

This method might be called in situations where the device does not have access to the network or is unable to load the map data for some reason. It may also be called if a request for additional map tiles comes in while a previous request for tiles is still pending. You can use this message to notify the user that the map data is unavailable.

120.3.20 didFailToLocateUserWithError(mapView as MKMapViewMBS, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: .

Function: Tells the control that an attempt to locate the user's position failed.
Notes:

mapView: The map view that is tracking the user's location.
error: An error object containing the reason why location tracking failed.

120.3.21 didFinishLoadingMap(mapView as MKMapViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: .

Function: Tells the control that the specified map view successfully loaded the needed map data.
Notes:

mapView: The map view that started the load operation.

This method is called when the map tiles associated with the current request have been loaded. Map tiles

are requested when a new visible area is scrolled into view and tiles are not already available. Map tiles may also be requested for portions of the map that are not currently visible. For example, the map view may load tiles immediately surrounding the currently visible area as needed to handle small pans by the user.

120.3.22 DidFinishRenderingMap(mapView as MKMapViewMBS, fullyRendered as boolean)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: .

Function: Tells you that the map view has finished rendering all visible tiles.
Notes:

fullyRendered: This parameter is set to true if the map view was able to render all tiles completely or false if errors prevented all tiles from being rendered.

This method lets you know when the map view finishes rendering all of the currently visible tiles to the best of its ability. This method is called regardless of whether all tiles were rendered successfully. If there were errors loading one or more tiles that prevented map view from rendering them, the fullyRendered parameter is set to false.

120.3.23 didSelectAnnotationView(mapView as MKMapViewMBS, view as MKAnnotationViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: .

Function: Tells the control that one of its annotation views was selected.
Notes:

mapView: The map view containing the annotation view.
view: The annotation view that was selected.

You can use this method to track changes in the selection state of annotation views.

120.3.24 didStopLocatingUser(mapView as MKMapViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: .

Function: Tells the control that the map view stopped tracking the user's location.
Notes:

mapView: The map view that stopped tracking the user's location.

This method is called when the value of the showsUserLocation property changes to false.

120.3.25 didUpdateUserLocation(mapView as MKMapViewMBS, userLocation as MKUserLocationMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: .

Function: Tells the control that the location of the user was updated.
Notes:

mapView: The map view that is tracking the user's location.
userLocation: The location object representing the user's latest location. This property may be nil.

While the showsUserLocation property is set to true, this method is called whenever a new location update is received by the map view. This method is also called if the map view's user tracking mode is set to MKUserTrackingModeFollowWithHeading and the heading changes.

This method is not called if the application is currently running in the background. If you want to receive location updates while running in the background, you must use the Core Location framework.

120.3.26 EnableMenuItems

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event where you can enable menu items.

120.3.27 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: .

Function: Informs the receiver that the user has ended a touch gesture.
Notes:

e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

120.3.28 FrameChanged

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

120.3.29 GotFocus

MBS MacFrameworks Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

120.3.30 LostFocus

MBS MacFrameworks Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

120.3.31 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: .

Function: Informs the receiver that the user has begun a pinch gesture.
Notes:

e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

120.3.32 MenuAction(HitItem as MenuItem) As Boolean

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

120.3.33 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control's region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

120.3.34 MouseDrag(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

120.3.35 MouseUp(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

120.3.36 pressureChange(e as NSEventMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 15.1, Platform: macOS, Targets: .

Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes:

This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

120.3.37 regionDidChangeAnimated(mapView as MKMapViewMBS, animated as boolean)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: .

Function: Tells the control that the region displayed by the map view just changed.
Notes:

mapView: The map view whose visible region changed.
animated: If true, the change to the new region was animated.

This method is called whenever the currently displayed map region changes. During scrolling, this method may be called many times to report updates to the map position. Therefore, your implementation of this method should be as lightweight as possible to avoid affecting scrolling performance.

120.3.38 regionWillChangeAnimated(mapView as MKMapViewMBS, animated as boolean)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: .

Function: Tells the control that the region displayed by the map view is about to change.
Notes:

mapView: The map view whose visible region is about to change.
animated: If true, the change to the new region will be animated. If NO, the change will be made immediately.

This method is called whenever the currently displayed map region changes. During scrolling, this method may be called many times to report updates to the map position. Therefore, your implementation of this method should be as lightweight as possible to avoid affecting scrolling performance.

120.3.39 rendererForOverlay(mapView as MKMapViewMBS, overlay as MKOverlayMBS) as MKOverlayRendererMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: .

Function: Asks the control for a renderer object to use when drawing the specified overlay.
Notes:

mapView: The map view that requested the renderer object.
overlay: The overlay object that is about to be displayed.

Return the renderer to use when presenting the specified overlay on the map.

You must implement this method and use it to provide an appropriate renderer object for your overlays. The renderer object is responsible for drawing the contents of your overlay when asked to do so by the map view. Map Kit supports many different types of standard renderer objects and you may also define your own custom renderers.

If you don't implement this event, the MBS Plugin returns a default renderer.

120.3.40 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: .

Function: Informs the receiver that the user has begun a rotation gesture.
Notes:

e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

120.3.41 ScaleFactorChanged(NewFactor as Double)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

120.3.42 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: .

Function: Informs the receiver that the user has begun a swipe gesture.
Notes:

e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

120.3.43 viewForAnnotation(mapView as MKMapViewMBS, annotation as MKAnnotationMBS) as MKAnnotationViewMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: .

Function: The event to query an annotation view for the given annotation.

120.3.44 willStartLoadingMap(mapView as MKMapViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: .

Function: Tells the control that the specified map view is about to retrieve some map data.
Notes:

mapView: The map view that began loading the data.

This method is called whenever a new group of map tiles need to be downloaded from the server. This typically occurs whenever you expose portions of the map by panning or zooming the content. You can use this method to mark the time that it takes for the map view to load the data.

120.3.45 willStartLocatingUser(mapView as MKMapViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: .

Function: Tells the control that the map view will start tracking the user's position.
Notes:

mapView: The map view that is tracking the user's location.

This method is called when the value of the showsUserLocation property changes to true.

120.3.46 WillStartRenderingMap(mapView as MKMapViewMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: .

Function: Tells you that the map view is about to start rendering some of its tiles.
Notes: The map view calls this method when one or more tiles are revealed and require rendering.

120.4 class MKAnnotationViewMBS

120.4.1 class MKAnnotationViewMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The visual representation of one of your annotation objects.
Notes:

See
https://developer.apple.com/documentation/mapkit/mkannotationview
Subclass of the NSViewMBS class.

120.4.6 Methods

120.4.7 Constructor(annotation as MKAnnotationMBS, reuseIdentifier as string = """, EnableEvents as Boolean = false)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a new annotation view.
Notes:

annotation: The annotation object to associate with the new view.
reuseIdentifier: If you plan to reuse the annotation view for similar types of annotations, pass a string to identify it. Although you can pass nil if you do not intend to reuse the view, reusing annotation views is generally recommended.

Returns the initialized annotation view or nil if there was a problem initializing the object.

The reuse identifier provides a way for you to improve performance by recycling annotation views as they are scrolled on and off of the map. As views are no longer needed, they are moved to a reuse queue by the map view. When a new annotation becomes visible, your application can request a view for that annotation by passing the appropriate reuse identifier string to the dequeueReusableAnnotationViewWithIdentifier: method of MKMapView.

Added EnableEvents parameter to enable new prepareForDisplay and prepareForReuse events. But please keep reference in some global array to those objects to keep the events working.
See also:

- 120.4.8 Constructor(Handle as Integer) 19866

120.4.8 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKAnnotationView reference from a declare.
The object is retained.
See also:

- 120.4.7 Constructor(annotation as MKAnnotationMBS, reuseIdentifier as string = """, EnableEvents as Boolean = false) 19866

120.4.9 Destructor

MBS MacFrameworks Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

120.4.10 MKAnnotationCalloutInfoDidChangeNotification as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The notification name for the case callout info changed.

120.4.11 setDragState(State as Integer, animated as Boolean)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the current drag state for the annotation view.
Notes:

newDragState: The new drag state for the annotation view.
animated: If true, the change to the new drag state should be animated; otherwise, it should be made without animations.

Applications targeting iOS 4.2 and later can override this method and use it to implement drag support for custom annotation views. As the system detects user actions that would indicate a drag, it calls this method to update the drag state. In response to these changes, your custom implementation of this method should do the following:
When the drag state changes to MKAnnotationViewDragStateStarting, set the state to MKAnnotationViewDragStateDragging. If you perform an animation to indicate the beginning of a drag, and the animated parameter is true, perform that animation before changing the state.

When the state changes to either MKAnnotationViewDragStateCanceling or MKAnnotationViewDragStateEnding, set the state to MKAnnotationViewDragStateNone. If you perform an animation at the end of a drag, and the animated parameter is true, you should perform that animation before changing the state.

The default implementation of this method sets the value of the dragState property to the value in the newDragState parameter only. Therefore, direct subclasses can simply call the inherited version of this method to change the drag state; otherwise, just change the value in the draggable property directly.

Changing the state to MKAnnotationViewDragStateDragging or MKAnnotationViewDragStateNone is the way to signal to the map view that you are done with any animations you wanted to perform. For example, when a drag operation begins for a pin annotation, the MKPinAnnotationView class executes an animation to lift the pin off the map. Similarly, when the pin is dropped, the class performs a drop animation. Even if you do not perform any animations, you should call the inherited version of this method to update the dragState property.

You must not try to abort a new drag operation by changing the state from MKAnnotationViewDragStateStarting to MKAnnotationViewDragStateNone. If you do not want your annotation view to be draggable, set the draggable property to NO.

120.4.12 setSelected(selected as boolean, animated as boolean)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the selection state of the annotation view.
Notes:

selected: Contains the value true if the view should display itself as selected.
animated: Set to true if the change in selection state is animated.

You should not call this method directly. An MKMapView object calls this method in response to user interactions with the annotation.

120.4.13 Properties

120.4.14 annotation as MKAnnotationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The annotation object currently associated with the view.
Notes:

You should not change the value of this property directly. This property contains a non-nil value only while the annotation view is visible on the map. If the view is queued and waiting to be reused, the value is nil
(Read and Write property)

120.4.15 CalloutOffset as NSPointMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The offset (in points) at which to place the callout bubble.
Notes:

This property determines the additional distance by which to move the callout bubble. When this property is set to (0, 0), the anchor point of the callout bubble is placed on the top-center point of the annotation view's frame. Specifying positive offset values moves the callout bubble down and to the right, while specifying negative values moves it up and to the left.
The calloutOffset property is not used in macOS apps. Instead, macOS apps use leftCalloutOffset and rightCalloutOffset.
(Read and Write property)

120.4.16 canShowCallout as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the annotation view is able to display extra information in a callout bubble.
Notes:

If the value of this property is YES, a standard callout bubble is shown when the user taps a selected annotation view. The callout uses the title and subtitle text from the associated annotation object. If there is no title text, though, the annotation view is treated as if its enabled property is set to NO. The callout also displays any custom callout views stored in the leftCalloutAccessoryView and rightCalloutAccessoryView properties.
If the value of this property is NO, the value of the title and subtitle strings are ignored and the annotation view remains enabled by default. You can still disable the view explicitly using the enabled property.
(Read and Write property)

120.4.17 CenterOffset as NSPointMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The offset (in points) at which to display the view.
Notes:

By default, the center point of an annotation view is placed at the coordinate point of the associated annotation. You can use this property to reposition the annotation view as needed. This x and y offset values are measured in points. Positive offset values move the annotation view down and to the right, while negative values move it up and to the left.
(Read and Write property)

120.4.18 clusterAnnotationView as MKAnnotationViewMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The clustering annotation view currently standing in for this annotation view.
Notes:

When the annotation view is being displayed on the map, the value of this property is nil.
(Read only property)

120.4.19 clusteringIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: An identifier that determines whether the annotation view participates in clustering.
Notes:

The default value of this property is empty, which prevents the annotation view from being clustered with other annotation views. Setting the property to a non empty value it to participate in clustering.
Clustering occurs when there is a collision between multiple annotation views with the same identifier on the map surface. The annotation views involved in the collision are removed from the map view and replaced by a clustering annotation view, which displays the title from one of the annotations and provides access to the other annotations.
(Read and Write property)

120.4.20 collisionMode as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The collision mode to use when interpreting the collision frame rectangle.
Notes: (Read and Write property)

120.4.21 detailCalloutAccessoryView as NSViewMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The detail accessory view to be used in the standard callout.
Notes: (Read and Write property)

120.4.22 displayPriority as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The display priority of this annotation view.
Notes:

An annotation view whose priority is set to DisplayPriorityRequired is always visible on the map, whereas other priorities may result in the annotation view being hidden.
The default value of this property is DisplayPriorityRequired.
(Read and Write property)

120.4.23 draggable as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean indicating whether the annotation view is draggable.
Notes:

Setting this property to true makes an annotation draggable by the user. If true, the associated annotation object must also implement the setCoordinate: method. The default value of this property is false.
Setting this property to true, lets the map view know that the annotation is always draggable. In other words, you cannot conditionalize drag operations by attempting to stop an operation that has already been initiated; doing so can lead to undefined behavior. Once begun, the drag operation should always continue to completion.
(Read and Write property)

120.4.24 dragState as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The current drag state of the annotation view.
Notes:

To support drag operations, you must override the implementation of this property and update the drag state at the following times:
When the drag state changes to MKAnnotationViewDragStateStarting, you should set the state to MKAnnotationViewDragStateDragging. If you perform an animation to indicate the beginning of a drag, you should perform that animation before changing the state. Changing the state to the new value lets the map know that your animations are done.
When the state changes to either MKAnnotationViewDragStateCanceling or MKAnnotationViewDragStateEnding, set the state to MKAnnotationViewDragStateNone. If you perform an animation at the end of a drag, you should perform that animation before changing the state.

Changing the state to the MKAnnotationViewDragStateDragging or MKAnnotationViewDragStateNone value is the way to signal to the map view that you are done with any animations you wanted to perform. For example, when a drag operation begins for a pin annotation, the MKPinAnnotationView class executes an animation to lift the pin off the map. Similarly, when the pin is dropped, the class performs a drop animation. Even if you do not perform any animations, you should still change the value of this property to

reflect the correct state.

You must not try to abort a new drag operation by changing the state from MKAnnotationViewDragStateStarting to MKAnnotationViewDragStateNone. If you do not want your annotation view to be draggable, set the draggable property to NO.
(Read and Write property)

120.4.25 enabled as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the annotation is enabled.
Notes:

The default value of this property is YES. If the value of this property is NO, the annotation view ignores touch events and cannot be selected. Subclasses may also display the annotation contents differently depending on the value of this property.
(Read and Write property)

120.4.26 highlighted as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the annotation view is highlighted.
Notes:

You should not set the value of this property directly. The map view sets it in response to touch events entering or exiting the annotation view's bounds.
(Read and Write property)

120.4.27 image as NSImageMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The image to be displayed by the annotation view.
Notes:

Looks like MKPinAnnotationViewMBS likes to ignore it, so you may prefer to use MKAnnotationViewMBS directly.
(Read and Write property)

120.4.28 leftCalloutAccessoryView as NSViewMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The view to display on the left side of the standard callout bubble.
Notes:

The default value of this property is nil. The left callout view is typically used to display information about the annotation or to link to custom information provided by your application.
In an iOS app, if the view you specify is also a descendant of the UIControl class, you can use the map view's delegate to receive notifications when your control is tapped. If it does not descend from UIControl, your view is responsible for handling any touch events within its bounds.
In a macOS app, the callout view's view controller can implement an action method that responds when a user clicks the control in a callout view.
(Read and Write property)

120.4.29 leftCalloutOffset as NSPointMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop only.

Function: The offset in points from the middle-left of the annotation view.
Notes:

This property specifies where the anchor of the callout should be shown when it's oriented off the left side of the annotation view.
(Read and Write property)

120.4.30 reuseIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The string that identifies that this annotation view is reusable.
Notes:

You specify the reuse identifier when you create the view. You use this type later to retrieve an annotation view that was created previously but which is currently unused because its annotation is not on screen.
If you define distinctly different types of annotations (with distinctly different annotation views to go with them), you can differentiate between the annotation types by specifying different reuse identifiers for each one.
(Read only property)

120.4.31 rightCalloutAccessoryView as NSViewMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The view to display on the right side of the standard callout bubble.
Notes:

This property is set to nil by default. The right callout view is typically used to link to more detailed information about the annotation. In an iOS app, a common view to specify for this property is a button object whose type is set to UIButtonTypeDetailDisclosure.
In an iOS app, if the view you specify is also a descendant of the UIControl class, you can use the map view's delegate to receive notifications when your control is tapped. If it does not descend from UIControl, your view is responsible for handling any touch events within its bounds.
In a macOS app, the callout view's view controller can implement an action method that responds when a user clicks the control in a callout view.
(Read and Write property)

120.4.32 rightCalloutOffset as NSPointMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop only.

Function: The offset in points from the middle-right of the annotation view.
Notes:

This property specifies where the anchor of the callout should be shown when it's oriented off the right side of the annotation view.
(Read and Write property)

120.4.33 selected as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the annotation view is currently selected.
Notes:

You should not set the value of this property directly. If the property contains true, the annotation view is displaying a callout bubble.
(Read and Write property)

120.4.34 Events

120.4.35 prepareForDisplay

MBS MacFrameworks Plugin, Plugin Version: 20.4, Platform: macOS, Targets: .

Function: Notifies the annotation view that it is about to be displayed on the map.
Notes: Use this event to prepare the content of your annotation view.

120.4.36 prepareForReuse

MBS MacFrameworks Plugin, Plugin Version: 20.4, Platform: macOS, Targets: .

Function: Called when the view is removed from the reuse queue.
Notes: You can implement this event in your custom annotation views and use it to put the view in a known state before it is returned to your map view delegate.

120.4.37 Constants

120.4.38 CollisionModeCircle = 1

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants indicating how to interpret the collision frame rectangle of an annotation view.

120.4.39 CollisionModeRectangle = 0

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants indicating how to interpret the collision frame rectangle of an annotation view.

120.4.40 DisplayPriorityDefaultHigh = 750

MBS MacFrameworks Plugin.

Function: One of the display priority constants.
Notes: A constant indicating that the item's display priority is high.

120.4.41 DisplayPriorityDefaultLow = 250

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the display priority constants.
Notes: A constant indicating that the item's display priority is low.

120.4.42 DisplayPriorityRequired = 1000

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the display priority constants.
Notes: A constant indicating that the item is required.

120.4.43 DragStateCanceling = 3

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants for drag state.
Notes: Drag was cancelled.

120.4.44 DragStateDragging = 2

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants for drag state.
Notes: Drag is happening.

120.4.45 DragStateEnding = 4

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants for drag state.
Notes: Drag is ending.

120.4.46 DragStateNone = 0

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants for drag state.
Notes: No dragging.

120.4.47 DragStateStarting = 1

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants for drag state.
Notes: Drag is starting.

120.5 class MKCircleMBS

120.5.1 class MKCircleMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The MKCircle class is a concrete overlay object representing a circular area on a map.
Notes:

This class manages the data that defines the area and is typically used in conjunction with an MKCircleView object, which handles the drawing of the circular area on a map.
Subclass of the MKShapeMBS class.

120.5.2 Blog Entries

- MapKit Framework for Xojo

120.5.3 Blog Entries

- MapKit Framework for Xojo

Interfaces: MKOverlayMBS

120.5.4 Methods

120.5.5 boundingMapRect as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The projected rectangle that encompasses the overlay.
Notes:

This property contains the smallest rectangle that completely encompasses the overlay. Implementers of this interface must set this area when implementing their overlay class, and after setting it, you must not change it. The rectangle should be specified using projected coordinates—that is, coordinates obtained by projecting the globe onto a two-dimensional surface.

Part of the MKOverlayMBS interface.
See also:

- 120.5.17 boundingMapRect as MKMapRectMBS 19882

120.5.6 canReplaceMapContent as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean indicating whether the overlay content replaces the underlying map content.
Notes:

true if the map view can skip the loading and drawing of the underlying map tiles or false if the map tiles should still be drawn.

The map view uses the return value of this method as a hint to determine whether it should load and render its tiles. If your overlay covers its designated region entirely with opaque content, and effectively replaces the content of underlying map tiles, implement this method and return true. Doing so alleviates the need for the map to render its tiles.
If you do not implement this method, or if you return false from it, the map view continues to load and render its tiles.

Part of MKOverlayMBS interface.

120.5.7 circleWithCenterCoordinate(coord as CLLocationCoordinate2DMBS, radius as Double) as MKCircleMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an MKCircle object using the specified coordinate and radius.
Example:

```
dim mapview as MKMapViewMBS // your map view
dim centerCoordinate as CLLocationCoordinate2DMBS = mapview.centerCoordinate
dim radius as Integer = 300 // 300 meter

dim circle as MKCircleMBS = MKCircleMBS.circleWithCenterCoordinate(centerCoordinate, radius)
mapview.addOverlay circle
```

Notes:

coord: The center point of the circle, specified as a latitude and longitude value.
radius: The radius of the circle, measured in meters from the center point.
See also:

- 120.5.8 circleWithCenterCoordinate(Latitude as Double, Longitude as Double, radius as Double) as MKCircleMBS 19880

120.5.8 circleWithCenterCoordinate(Latitude as Double, Longitude as Double, radius as Double) as MKCircleMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an MKCircle object using the specified coordinate and radius.
Notes:

Latitude and Longitude: The center point of the circle, specified as a latitude and longitude value.
radius: The radius of the circle, measured in meters from the center point.
See also:

- 120.5.7 circleWithCenterCoordinate(coord as CLLocationCoordinate2DMBS, radius as Double) as MKCircleMBS 19879

120.5.9 circleWithMapRect(mapRect as MKMapRectMBS) as MKCircleMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates new circle object with given rectangle.

120.5.10 Constructor(coord as CLLocationCoordinate2DMBS, radius as Double)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an MKCircle object using the specified coordinate and radius.
Notes:

coord: The center point of the circle, specified as a latitude and longitude value.
radius: The radius of the circle, measured in meters from the center point.
See also:

- 120.5.11 Constructor(Handle as Integer) 19880
- 120.5.12 Constructor(Latitude as Double, Longitude as Double, radius as Double) 19881
- 120.5.13 Constructor(mapRect as MKMapRectMBS) 19881

120.5.11 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKCircle reference from a declare.
The object is retained.
See also:

- 120.5.10 Constructor(coord as CLLocationCoordinate2DMBS, radius as Double) 19880
- 120.5.12 Constructor(Latitude as Double, Longitude as Double, radius as Double) 19881
- 120.5.13 Constructor(mapRect as MKMapRectMBS) 19881

120.5.12 Constructor(Latitude as Double, Longitude as Double, radius as Double)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an MKCircle object using the specified coordinate and radius.
Notes:

Latitude and Longitude: The center point of the circle, specified as a latitude and longitude value.
radius: The radius of the circle, measured in meters from the center point.
See also:

- 120.5.10 Constructor(coord as CLLocationCoordinate2DMBS, radius as Double) 19880
- 120.5.11 Constructor(Handle as Integer) 19880
- 120.5.13 Constructor(mapRect as MKMapRectMBS) 19881

120.5.13 Constructor(mapRect as MKMapRectMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates new circle object with given rectangle.
See also:

- 120.5.10 Constructor(coord as CLLocationCoordinate2DMBS, radius as Double) 19880
- 120.5.11 Constructor(Handle as Integer) 19880
- 120.5.12 Constructor(Latitude as Double, Longitude as Double, radius as Double) 19881

120.5.14 coordinate as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The coordinate of the annotation.
Notes: Part of the MKAnnotationMBS interface.
See also:

- 120.5.18 coordinate as CLLocationCoordinate2DMBS 19882

120.5.15 intersectsMapRect(mapRect as MKMapRectMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this overlay intersects with the given map rectangle.
Notes: Part of the MKOverlayMBS interface.

120.5.16 Properties

120.5.17 boundingMapRect as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The projected rectangle that encompasses the overlay.
Notes:

This property contains the smallest rectangle that completely encompasses the overlay. Implementers of this interface must set this area when implementing their overlay class, and after setting it, you must not change it. The rectangle should be specified using projected coordinates—that is, coordinates obtained by projecting the globe onto a two-dimensional surface.

Part of the MKOverlayMBS interface.
(Read only property)
See also:

- 120.5.5 boundingMapRect as MKMapRectMBS 19878

120.5.18 coordinate as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The center point of the circular area, specified as a latitude and longitude.
Notes: (Read only property)
See also:

- 120.5.14 coordinate as CLLocationCoordinate2DMBS 19881

120.5.19 radius as Double

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The radius of the circular area, measured in meters.
Notes: (Read only property)

120.6 class MKCircleRendererMBS

120.6.1 class MKCircleRendererMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The visual representation for a circular overlay.
Notes:

This renderer fills and strokes the circular region represented by the overlay object. You can change the color and other drawing attributes of the circle by modifying the properties inherited from the parent class. You typically use this class as is and do not subclass it.

You create an instance of this class in your map view rendererForOverlay event.
Subclass of the MKOverlayPathRendererMBS class.

120.6.4 Methods

120.6.5 Constructor(Circle as MKCircleMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a new overlay view using the specified circle overlay object.
Notes: circle: The circle overlay containing the information about the circular area to be drawn. The renderer maintains a strong reference to the object you provide. This parameter must not be nil.
See also:

- 120.6.6 Constructor(Handle as Integer) 19883

120.6.6 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKCircleRenderer reference from a declare.
The object is retained.
See also:

- 120.6.5 Constructor(Circle as MKCircleMBS) 19883

120.6.7 Properties

120.6.8 circle as MKCircleMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The circle overlay object that contains the information used to draw the overlay.
Notes: (Read only property)

120.7 class MKClusterAnnotationMBS

120.7.1 class MKClusterAnnotationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: An annotation that groups two or more distinct annotations into a single entity.
Notes:

A cluster annotation object stands in for the group of annotations. Cluster views promote legibility of the underlying annotations by displaying a single annotation whose title is taken from one annotation and whose subtitle indicates how many additional annotations belong to the group.

MapKit automatically creates cluster annotations when two or more annotation views become grouped too closely together on the map surface. To customize the cluster annotations displayed on your map, implement the clusterAnnotationForMemberAnnotations event in your map's control.

120.7.9 Constructor(memberAnnotations() as MKAnnotationMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes the cluster annotations with the specified individual annotations.
Notes:

memberAnnotations: The annotations to group together as a single entity.

Returns an initialized MKClusterAnnotationMBS object or nil if the object could not be created.
See also:

- 120.7.7 Constructor 19886
- 120.7.8 Constructor(Handle as Integer) 19886

120.7.10 Coordinate as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The coordinate of the annotation.
Notes: Part of the MKAnnotationMBS interface.

120.7.11 memberAnnotations as MKAnnotationMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The annotations that are grouped together by the cluster.

120.7.12 SetCoordinate(newCoordinate as CLLocationCoordinate2DMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Set the coordinate of the annotation.
Notes: Part of the MKAnnotationMBS interface.

120.7.13 SubTitle as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The subtitle of the item.
Notes: Part of the MKOverlayMBS interface.
See also:

- 120.7.17 SubTitle as String 19888

120.7.14 Title as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The title of the annotation.
Notes: Part of the MKAnnotationMBS interface.
See also:

- 120.7.18 Title as String 19888

120.7.15 Properties

120.7.16 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

120.7.17 SubTitle as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The subtitle of the item.
Notes:

Part of the MKOverlayMBS interface.
(Read and Write property)
See also:

- 120.7.13 SubTitle as String 19887

120.7.18 Title as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The title of the annotation.
Notes:

Part of the MKAnnotationMBS interface.
(Read and Write property)
See also:

- 120.7.14 Title as String 19887

120.8 class MKCoordinateRegionMBS

120.8.1 class MKCoordinateRegionMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: A structure that defines which portion of the map to display.

120.8.2 Blog Entries

- MapKit Framework for Xojo

120.8.3 Xojo Developer Magazine

- 18.6, page 74: MapKit Part 7, Implementing Maps in Xojo desktop apps with the MapKitMBS plugin by Markus Winter

120.8.6 Methods

120.8.7 Constructor(center as CLLocationCoordinate2DMBS, span as MKCoordinateSpanMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor to initialize an object of this class.

120.8.8 MakeWithDistance(center as CLLocationCoordinate2DMBS, latitudinalMeters as double, longitudinalMeters as double) as MKCoordinateRegionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a region with given center and size.

120.8.9 Properties

120.8.10 center as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The center point of the region.
Notes: (Read and Write property)

120.8.11 span as MKCoordinateSpanMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The horizontal and vertical span representing the amount of map to display.
Notes:

The span also defines the current zoom level used by the map view object.
(Read and Write property)

120.9 class MKCoordinateSpanMBS

120.9.1 class MKCoordinateSpanMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: A structure that defines the area spanned by a map region.
Notes: You use the delta values in this structure to indicate the desired zoom level of the map, with smaller delta values corresponding to a higher zoom level.

- 18.6, page 74: MapKit Part 7, Implementing Maps in Xojo desktop apps with the MapKitMBS plugin by Markus Winter

120.9.6 Methods

120.9.7 Constructor(latitudeDelta as Double, longitudeDelta as Double)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor to initialize this class.

120.9.8 Properties

120.9.9 latitudeDelta as Double

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The amount of north-to-south distance (measured in degrees) to display on the map.
Notes:

Unlike longitudinal distances, which vary based on the latitude, one degree of latitude is always approximately 111 kilometers (69 miles).
(Read and Write property)

120.9.10 longitudeDelta as Double

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The amount of east-to-west distance (measured in degrees) to display for the map region.
Notes:

The number of kilometers spanned by a longitude range varies based on the current latitude. For example, one degree of longitude spans a distance of approximately 111 kilometers (69 miles) at the equator but shrinks to 0 kilometers at the poles.
(Read and Write property)

120.10 class MKCustomAnnotationMBS

120.10.1 class MKCustomAnnotationMBS

MBS MacFrameworks Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop & iOS.

Function: The class for a custom MKAnnotationMBS.
Notes:

As MKAnnotationMBS is an interface, you need a Cocoa class to implement coordinate, title and subtitle properties.
So you can subclass this class if you like.

Interfaces: MKOverlayMBS, MKAnnotationMBS

120.11.6 Methods

120.11.7 boundingMapRect as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop & iOS.

Function: The projected rectangle that encompasses the overlay.
Notes:

This property contains the smallest rectangle that completely encompasses the overlay. Implementers of this interface must set this area when implementing their overlay class, and after setting it, you must not change it. The rectangle should be specified using projected coordinates—that is, coordinates obtained by projecting the globe onto a two-dimensional surface.

Part of the MKOverlayMBS interface.

120.11.8 canReplaceMapContent as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean indicating whether the overlay content replaces the underlying map content.
Notes:

true if the map view can skip the loading and drawing of the underlying map tiles or false if the map tiles should still be drawn.

The map view uses the return value of this method as a hint to determine whether it should load and render its tiles. If your overlay covers its designated region entirely with opaque content, and effectively replaces the content of underlying map tiles, implement this method and return true. Doing so alleviates the need for the map to render its tiles.
If you do not implement this method, or if you return false from it, the map view continues to load and render its tiles.

Part of MKOverlayMBS interface.
See also:

- 120.11.18 canReplaceMapContent as Boolean 19899

120.11.9 Constructor

Function: The constructor.
See also:

- 120.11.10 Constructor(Handle as Integer) 19897

120.11.10 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKCustomOverlay reference from a declare.
The object is retained.
See also:

- 120.11.9 Constructor 19897

120.11.11 Coordinate as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop & iOS.

Function: The center point of the circular area, specified as a latitude and longitude.

120.11.12 intersectsMapRect(mapRect as MKMapRectMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this overlay intersects with the given map rectangle.
Notes: Part of the MKOverlayMBS interface.

120.11.13 setBoundingMapRect(m as MKMapRectMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets boundingMapRect property.

120.11.14 SetCoordinate(newCoordinate as CLLocationCoordinate2DMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop & iOS.

Function: Set the coordinate of the annotation.
Notes: Part of the MKAnnotationMBS interface.

120.11.15 SubTitle as String

MBS MacFrameworks Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop & iOS.

Function: The subtitle of the item.
Notes: Part of the MKOverlayMBS interface.
See also:

- 120.11.20 subtitle as String 19899

120.11.16 Title as String

MBS MacFrameworks Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop & iOS.

Function: The title of the annotation.
Notes: Part of the MKAnnotationMBS interface.
See also:

- 120.11.21 title as String 19900

120.11.17 Properties

120.11.18 canReplaceMapContent as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop & iOS.

Function: a Boolean indicating whether the overlay content replaces the underlying map content.
Notes:

true if the map view can skip the loading and drawing of the underlying map tiles or false if the map tiles should still be drawn.

The map view uses the return value of this method as a hint to determine whether it should load and render its tiles. If your overlay covers its designated region entirely with opaque content, and effectively replaces the content of underlying map tiles, implement this method and return true. Doing so alleviates the need for the map to render its tiles.
If you do not implement this method, or if you return false from it, the map view continues to load and render its tiles.
(Read and Write property)

120.12.6 Methods

120.12.7 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKCustomOverlayRenderer reference from a declare.
The object is retained.
See also:

- 120.12.8 Constructor(overlay as MKOverlayMBS) 19902

120.12.8 Constructor(overlay as MKOverlayMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.
Notes: The overlay can be any overlay, not just a MKCustomOverlayMBS one.
See also:

- 120.12.7 Constructor(Handle as Integer) 19901

120.12.9 Destructor

MBS MacFrameworks Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

120.12.10 Events

120.12.11 canDrawMapRect(mapRect as MKMapRectMBS, zoomScale as Double) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.2, Platform: macOS, Targets: .

Function: Event to return a Boolean value indicating whether the overlay view is ready to draw its content.
Example:

```
Function canDrawMapRect(mapRect as MKMapRectMBS, zoomScale as Double) Handles canDrawMapRect
as Boolean
Return True
End Function
```

Notes:

mapRect: The map rectangle that needs to be updated.
zoomScale: The current scale factor applied to the map.

Return yes if this overlay renderer is ready to draw its contents on the map or false if it is not.

Overlay renderers can override this method in situations where they may depend on the availability of other information to draw their contents. For example, a renderer showing traffic information might want to delay drawing until it has all of the traffic data it needs. In such a case, it can return NO from this method to indicate that it is not ready. An overlay renderer might also return false if it does not draw content in the specified rectangle.

If you return false from this method, your application is responsible for calling the setNeedsDisplayInMapRect method when the overlay renderer subsequently becomes ready to draw its contents.

The default implementation of this method returns YES.

As callback may come on a thread, MBS Xojo Plugin invokes event on the main thread. For best performance, please make sure your code does not take long time to execute.

120.12.12 DrawMapRect(mapRect as MKMapRectMBS, zoomScale as Double, context as CGContextMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.2, Platform: macOS, Targets: .

Function: The event to draw the overlay's contents at the specified location on the map.
Example:

```
Sub DrawMapRect(mapRect as MKMapRectMBS, zoomScale as Double, context as CGContextMBS) Handles DrawMapRect
// change coordinate system to show just our area
Dim rect As CGRectMBS = Self.RectForMapRect(overlay.boundingMapRect)
context.ScaleCTM(1.0, -1.0)
context.TranslateCTM(0.0, -rect.size.height)

// and fill it all in red
context.SetRGBFillColor 1,0,0,0.3
context.FillRect rect

context.Flush
End Sub
```

Notes:

mapRect: The map rectangle that needs to be updated. Your drawing code should avoid drawing outside of this rectangle.
zoomScale: The current zoom factor applied to the map content. You can use this value for configuring the stroke width of lines or other attributes that might be affected by the scale of the map's contents.
context: The graphics context to use for drawing the overlay's contents.

The default implementation of this method does nothing. Subclasses are expected to implement this event and use it to draw the overlay's contents.

When determining where to draw content, make your initial calculations relative to the map itself. In other words, compute the position and size of any overlay content using map points and map rectangles, convert those values to regular CGPoint and CGRect types using the methods of this class, and then pass the converted points to any drawing primitives.
It is recommended that you use Core Graphics to draw any content for your overlays.

To improve drawing performance, the map view may divide your overlay into multiple tiles and render each one on a separate thread.

As callback may come on a thread, MBS Xojo Plugin invokes event on the main thread. For best performance, please make sure your code does not take long time to execute.

120.13 class MKDirectionsMBS

120.13.1 class MKDirectionsMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A utility object that computes directions and travel-time information based on the route information you provide.
Notes:

You use an MKDirections object to ask the Apple servers to provide walking or driving directions for a route, which you specify using an MKDirectionsRequestMBS object. After making a request, MapKit delivers the results asynchronously to the completion handler that you provide. You can also get the estimated travel time for the route.

Each MKDirectionsMBS object handles a single request for directions, although you can cancel and restart that request as needed. You can create multiple instances of this class and process different route requests at the same time, but you should make requests only when you plan to present the corresponding route information to the user. Apps may receive a MKErrorLoadingThrottled error if too many requests have been made from the current device in too short a time period.

120.13.4 Methods

120.13.5 calculateDirections(tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Begins calculating the requested route information asynchronously.
Notes:

Calls calculateDirectionsCompleted event later.

This method initiates the request for directions and calls your calculateDirectionsCompleted event with the results. The implementation of your event handler should check for errors and then incorporate the response data as appropriate.

If you call this method while a previous request is in process, this method calls your event with an error. You can determine if a request is in process by checking the value of the calculating property. You can also cancel a request as needed.

120.13.6 calculateETA(tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Begins calculating the requested travel-time information asynchronously.
Notes:

This method initiates a request for a travel-time estimate and calls your calculateETAWithCompleted event handler block with the results. Travel-time estimates take much less time to generate than directions, so use this method in situations where you want a time estimate only. The implementation of your handler should check for errors and then incorporate the response data as appropriate.

If you call this method while a previous request is in process, this method calls your event handler with an error. You can determine if a request is in process by checking the value of the calculating property. You can also cancel a request as needed.

120.13.7 cancel

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Cancels a pending request.
Notes: After canceling a request, you can call the calculateDirections method again (if you want) to restart the request process.

120.13.8 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKDirections reference from a declare.
The object is retained.
See also:

- 120.13.9 Constructor(request as MKDirectionsRequestMBS) 19907

120.13.9 Constructor(request as MKDirectionsRequestMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a directions object using the specified request.
Notes:

request: The request object containing the start and end points of the route. This parameter must not be nil.

After initializing your directions object, you must call the calculateDirections or calculateETA method to perform the request.
See also:

- 120.13.8 Constructor(Handle as Integer) 19906

120.13.10 Destructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

120.13.11 Properties

120.13.12 Calculating as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether a request is currently in process.
Notes: (Read only property)

120.13.13 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

120.13.14 Request as MKDirectionsRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The request used to create this object.
Notes: (Read only property)

120.13.15 Events

120.13.16 calculateDirectionsCompleted(response as MKDirectionsResponseMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: .

Function: The event called when calculateDirections method finished.
Notes:

This event takes three parameters:

- The response parameter contains the route information for the request. If an error occurred or no route could be determined, this parameter is nil.
- The error parameter contains information about any errors that occurred. If no errors occurred, this parameter is nil.
- The tag passed to the method.

The implementation of your block should check for a value in the error parameter and, if that parameter is nil, incorporate the route information provided in the response parameter.

120.13.17 calculateETAWithCompleted(response as MKETAResponseMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: .

Function: Event called by calculateETA when method is done.

120.14 class MKDirectionsRequestMBS

120.14.1 class MKDirectionsRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The start and end points of a route, along with the planned mode of transportation.
Notes:

You use an MKDirectionsRequestMBS object when requesting or providing directions. If your app provides directions, use this class to decode the URL sent to you by Maps. If you need to request directions from Apple, pass an instance of this class to an MKDirections object. For example, an app that provides subway directions might request walking directions to and from relevant subway stations.

For apps that provide directions, you receive direction-related URLs in your app delegate's application:openURL:sourceApplication:annotation: method. Upon receiving a URL, call the isDirectionsRequestURL method of this class to determine if the URL is related to routing directions. If it is, create an instance of this class using the provided URL and extract the map items associated with the start and end points.

To provide routing directions, your app must include special keys in its Info.plist file and be able to handle URLs sent to it by the Maps app. These keys indicate a special URL type that your app must be prepared to handle. For information about how to implement this support, see Location and Maps Programming Guide.

120.14.4 Methods

120.14.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The construtor.
See also:

- 120.14.6 Constructor(Handle as Integer) 19910
- 120.14.7 Constructor(URL as string) 19910

120.14.6 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKDirectionsRequest reference from a declare.
The object is retained.
See also:

- 120.14.5 Constructor 19909
- 120.14.7 Constructor(URL as string) 19910

120.14.7 Constructor(URL as string)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a directions request object using the specified URL.
Notes: You should use the isDirectionsRequestURL method to verify that the specified URL is of the correct format before calling this method to initialize the object.
See also:

- 120.14.5 Constructor 19909
- 120.14.6 Constructor(Handle as Integer) 19910

120.14.8 isDirectionsRequestURL(URL as string) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean indicating whether the specified URL contains a directions request.
Notes: True if the URL contains a directions request that your app should display to the user or false if it does not.

120.14.9 Properties

120.14.10 arrivalDate as Date

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop only.

Function: The arrival date for the trip.
Notes:

Specifying an arrival date provides the server with extra information that it can use to optimize the returned routes. For example, for a trip that takes place during commute hours, the server might consider alternatives

to routes that are typically congested at that time.
The use of this property is optional.
(Read and Write property)

120.14.11 arrivalDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The arrival date for the trip.
Notes:

Specifying an arrival date provides the server with extra information that it can use to optimize the returned routes. For example, for a trip that takes place during commute hours, the server might consider alternatives to routes that are typically congested at that time.
The use of this property is optional.
(Read and Write property)

120.14.12 departureDate as Date

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop only.

Function: The departure date for the trip.
Notes:

Specifying a departure date provides the server with extra information that it can use to optimize the returned routes. For example, for a trip that takes place during commute hours, the server might consider alternatives to routes that are typically congested at that time.
The use of this property is optional.
(Read and Write property)

120.14.13 departureDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The departure date for the trip.
Notes:

Specifying a departure date provides the server with extra information that it can use to optimize the returned routes. For example, for a trip that takes place during commute hours, the server might consider alternatives to routes that are typically congested at that time.
The use of this property is optional.
(Read and Write property)

120.14.14 destination as MKMapItemMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The end point for routing directions.
Notes: (Read and Write property)

120.14.15 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

120.14.16 requestsAlternateRoutes as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean indicating whether your app wants multiple routes when they are available.
Notes:

When this property is set to false, the server returns a single route between the start and end points. When this property is YES, the server may return additional routes for the user to follow. The server returns additional routes only if they are available and represent a reasonable path that the user might take.
The default value of this property is false.
(Read and Write property)

120.14.17 source as MKMapItemMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The starting point for routing directions.
Notes: (Read and Write property)

120.14.18 transportType as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The type of conveyance to which the directions should apply.
Notes:

You can use this property to specify whether you want directions suited to a particular type of transportation. For example, you can use this to specify that you want walking directions or driving directions.
The default value of this property is TransportTypeAny.
(Read and Write property)

120.14.19 Constants

120.14.20 TransportTypeAny = & h0FFFFFFF

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for any transportation option.

120.14.21 TransportTypeAutomobile = 1

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for use while driving.

120.14.22 TransportTypeTransit = 3

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for public transportation.

120.14.23 TransportTypeWalking = 2

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for a pedestrian.

120.15 class MKDirectionsResponseMBS

120.15.1 class MKDirectionsResponseMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The route information returned by Apple servers in response to one of your requests for directions.
Notes: You do not create instances of this class directly. Instead, you initiate a request for directions by calling the calculateDirection method of an MKDirectionsMBS object. The calculateDirectionCompleted event handler receives an MKDirectionsResponseMBS object with the results.

120.15.4 Methods

120.15.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.
See also:

- 120.15.6 Constructor(Handle as Integer) 19914

120.15.6 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKDirectionsResponse reference from a declare.
The object is retained.
See also:

- 120.15.5 Constructor 19914

120.15.7 routes as MKRouteMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: An array of route objects representing the directions between the start and end points.
Notes:

The array contains one or more MKRouteMBS objects, each of which represents a possible set of directions for the user to follow. If you did not request alternate routes in the original directions request, this array contains at most one object.
Each route object contains geometry information that you can use to display that route on your app's map view. Routes may also contain additional information that is relevant to that particular route, such as the expected travel time and any trip advisory notices.

120.15.8 Properties

120.15.9 destination as MKMapItemMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The end point of the route.
Notes:

The item in this property may contain additional details that were not included in the original item used to create the MKDirectionsRequestMBS object.
(Read only property)

120.15.10 firstRoute as MKRouteMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The first route.
Notes:

Mainly for debugging, so you can see the routes in debugger.
(Read only property)

120.15.11 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

120.15.12 routeCount as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Number of routes.
Notes: (Read only property)

120.15.13 source as MKMapItemMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The start point of the route.
Notes:

The item in this property may contain additional details that were not included in the original item used to create the MKDirectionsRequestMBS object.
(Read only property)

120.15.14 Constants

120.15.15 TransportTypeAny = & h0FFFFFFF

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for any transportation option.

120.15.16 TransportTypeAutomobile = 1

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for use while driving.

120.15.17 TransportTypeTransit = 3

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for public transportation.

120.15.18 TransportTypeWalking = 2

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for a pedestrian.

120.16 class MKDistanceFormatterMBS

120.16.1 class MKDistanceFormatterMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A utility object that converts between a geographic distance and a string-based expression of that distance.
Example:

```
dim f as new MKDistanceFormatterMBS

f.Units = f.UnitsMetric
f.UnitStyle = f.UnitStyleFull

MsgBox f.stringFromDistance(1234.56)
```

Notes: You use a distance formatter when you need to display distances to the user or when you want to parse user-specified text to obtain a numerical value for a distance. When formatting strings containing distances, a distance formatter object takes into account the user's locale and language settings. You can also specify a custom locale or custom units for any distances that you format.

120.16.4 Methods

120.16.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.
See also:

- 120.16.6 Constructor(Handle as Integer)

120.16.6 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKDistanceFormatter reference from a declare.
The object is retained.
See also:

- 120.16.5 Constructor 19918

120.16.7 distanceFromString(distance as String) as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the distance value parsed from the specified string.
Notes:

distance: A formatted string that specifies a distance.

Returns the distance value represented by the string or -1.0 if the string does not contain a recognized distance value.

This method searches the provided string for a number that could represent a distance. Distances must be specified as purely numerical values. Do not specify distances as fractions such as "1/4 mile".

120.16.8 formatter as MKDistanceFormatterMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The singelton instance for easy use.
Example:

```
// shows e.g. 1,2km
// depending on the locale
MsgBox MKDistanceFormatterMBS.formatter.stringFromDistance(1234)
```

Notes: The plugin keeps an object, so you get the same one everytime and you can reuse it often.

120.16.9 stringFromDistance(distance as Double) as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a string representation of the specified distance.
Notes:

distance: The distance value that you want to convert to a string.

Returns a user-readable string that describes the distance based on the formatter settings.

120.16.10 Properties

120.16.11 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

120.16.12 Locale as NSLocaleMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The locale to use when formatting strings.
Notes:

If you do not specify an explicit locale, the formatter uses the user's current locale information.
(Read and Write property)

120.16.13 Units as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The measuring system (imperial or metric) to use for units.
Notes:

You can use this property to explicitly set the measuring system for units. The default value of this property is UnitsDefault, which bases the measuring system on the user's locale.
(Read and Write property)

120.16.14 UnitStyle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The preferred style for units.
Notes:

Units can be abbreviated or fully spelled out. The default value of this property is UnitStyleDefault, which bases the style on the user's locale and language settings.
(Read and Write property)

120.16.15 Constants

120.16.16 UnitsDefault = 0

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that reflect the type of units to use in the string.
Notes: The format uses the locale information to determine which units to use. Some locales mix metric and imperial units so do not assume this means one or the other.

120.16.17 UnitsImperial = 2

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that reflect the type of units to use in the string.
Notes: The format uses imperial units.

120.16.18 UnitsImperialWithYards = 3

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that reflect the type of units to use in the string.
Notes: The format uses imperial units that include measurements in yards.

120.16.19 UnitsMetric = 1

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that reflect the type of units to use in the string.
Notes: The format uses metric units.

120.16.20 UnitStyleAbbreviated = 1

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that indicate the format style to use for strings.
Notes: Use abbreviated units. For example, use the abbreviation km instead of kilometer.

120.16.21 UnitStyleDefault = 0

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that indicate the format style to use for strings.
Notes: The decision to abbreviate is based on the current locale and user language settings.

120.16.22 UnitStyleFull = 2

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that indicate the format style to use for strings.
Notes: Spell out units in full. For example, use kilometer instead of the abbreviation km.

120.17 class MKETAResponseMBS

120.17.1 class MKETAResponseMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The travel-time information returned by Apple servers.
Notes: You do not create instances of this class directly. Instead, you initiate a request for the travel time by calling the calculateETA method of an MKDirectionsMBS object. The completion event handler receives an MKETAResponseMBS object with the results.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKETAResponse reference from a declare.
The object is retained.
See also:

- 120.17.5 Constructor 19923

120.17.7 Properties

120.17.8 destination as MKMapItemMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The end point of the route.
Notes:

The item in this property may contain additional details that were not included in the original item used to create the MKDirectionsRequestMBS object.
(Read only property)

120.17.9 distance as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The expected travel distance, in meters.
Notes:

This property contains the overall distance traversed by the route.
(Read only property)

120.17.10 expectedArrivalDate as Date

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop only.

Function: The expected arrival time.
Notes:

The value of this property is dependent on whether you specified a departure date or arrival date in your MKDirectionsRequestMBS object. If you specified a departure date, the date in this property is computed by starting at your departure date and adding the expected travel time. If you specified an arrival time but not a departure date, this property is set to your arrival time. If you did not specify an arrival date or departure date, this property is set to the date computed by adding the travel time to the current time.
(Read only property)

120.17.11 expectedArrivalDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The expected arrival time.
Notes:

The value of this property is dependent on whether you specified a departure date or arrival date in your MKDirectionsRequestMBS object. If you specified a departure date, the date in this property is computed by starting at your departure date and adding the expected travel time. If you specified an arrival time but not a departure date, this property is set to your arrival time. If you did not specify an arrival date or departure date, this property is set to the date computed by adding the travel time to the current time.
(Read only property)

120.17.12 expectedDepartureDate as Date

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop only.

Function: The expected departure time.
Notes:

The value of this property is dependent on whether you specified a departure date or arrival date in your MKDirectionsRequestMBS object. If you specified a departure date, that date is copied to this property. If you specified an arrival date but not a departure date, the departure date is computed by subtracting the expected travel time from your arrival date. If you did not specify an arrival date or departure date, this property is set to the current time.
(Read only property)

120.17.13 expectedDepartureDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The expected departure time.
Notes:

The value of this property is dependent on whether you specified a departure date or arrival date in your MKDirectionsRequestMBS object. If you specified a departure date, that date is copied to this property. If you specified an arrival date but not a departure date, the departure date is computed by subtracting the expected travel time from your arrival date. If you did not specify an arrival date or departure date, this property is set to the current time.
(Read only property)

120.17.14 expectedTravelTime as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The expected travel time in seconds.
Notes:

The expected travel time reflects the time it takes to traverse the route, taking expected traffic into account. The actual amount of time may vary based on changes in traffic and other travel conditions.

(Read only property)

120.17.15 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

120.17.16 source as MKMapItemMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The start point of the route.
Notes:

This item in this property may contain additional details that were not included in the original item used to create the MKDirectionsRequestMBS object.
(Read only property)

120.17.17 transportType as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The type of conveyance used to determine the travel time.
Notes:

You specify the desired transportation type in your MKDirectionsRequestMBS object. If you specified TransportTypeAny, this property contains the transportation type used to generate the estimated information.
(Read only property)

120.17.18 Constants

120.17.19 TransportTypeAny = & h0FFFFFFF

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for any transportation option.

120.17.20 TransportTypeAutomobile = 1

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for use while driving.

120.17.21 TransportTypeTransit = 3

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for public transportation.

120.17.22 TransportTypeWalking = 2

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for a pedestrian.

120.18 class MKGeodesicPolylineMBS

120.18.1 class MKGeodesicPolylineMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A line-based shape that follows the contours of the Earth to create the shortest path between the specified points.
Notes:

A geodesic polyline contains a set of points that are connected end-to-end in the order that you provide them. The first and last points are not automatically connected to each other. When displayed on a two-dimensional map view, the line segment between any two points may appear curved.
Subclass of the MKPolylineMBS class.

120.18.4 Methods

120.18.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.
See also:

- 120.18.6 Constructor(coords() as CLLocationCoordinate2DMBS) 19928
- 120.18.7 Constructor(Handle as Integer) 19929
- 120.18.8 Constructor(points() as MKMapPointMBS) 19929

120.18.6 Constructor(coords() as CLLocationCoordinate2DMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a geodesic polyline using the specified coordinates.
Notes:

coords: The array of coordinates that define the path.

Returns a new geodesic polyline object.
See also:

- 120.18.5 Constructor 19928
- 120.18.7 Constructor(Handle as Integer) 19929
- 120.18.8 Constructor(points() as MKMapPointMBS) 19929

120.18.7 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKGeodesicPolyline reference from a declare.
The object is retained.
See also:

- 120.18.5 Constructor 19928
- 120.18.6 Constructor(coords() as CLLocationCoordinate2DMBS) 19928
- 120.18.8 Constructor(points() as MKMapPointMBS) 19929

120.18.8 Constructor(points() as MKMapPointMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a geodesic polyline using the specified map points.
Notes:

points: The array of map points that define the path.

Returns a new geodesic polyline object.
See also:

- 120.18.5 Constructor 19928
- 120.18.6 Constructor(coords() as CLLocationCoordinate2DMBS) 19928
- 120.18.7 Constructor(Handle as Integer) 19929

120.18.9 polylineWithCoordinates(coords() as CLLocationCoordinate2DMBS) as MKGeodesicPolylineMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a geodesic polyline using the specified coordinates.
Notes:

coords: The array of coordinates that define the path.

Returns a new geodesic polyline object.

120.18.10 polylineWithPoints(points() as MKMapPointMBS) as MKGeodesicPolylineMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a geodesic polyline using the specified map points.
Notes:

points: The array of map points that define the path.

Returns a new geodesic polyline object.

120.19 class MKLocalSearchCompleterMBS

120.19.1 class MKLocalSearchCompleterMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A utility object for generating a list of completion strings based on a partial search string that you provide.
Notes:

You use an MKLocalSearchCompleter object to retrieve auto-complete suggestions for your own map-based search controls. As the user types text, you feed the current text string into the search completer object, which delivers possible string completions that match locations or points of interest.

You create and configure MKLocalSearchCompleterMBS objects yourself. You should subclass this class to fill the event handler. You should also specify a search region to restrict results to a designated area.

Update the value of the completer's queryFragment property to begin a search query. You can update this property in real time as the user types new characters into a text field because the completer object waits a short amount of time for the query string to stabilize. When modifications to the query strong stop, the completer initiates a new search and returns the results to your delegate as an array of MKLocalSearchCompletionMBS objects.

120.19.6 Methods

120.19.7 cancel

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Cancels an in-progress search operation.
Notes: If a search operation is currently in progress, this method attempts to cancels it. If cancellation is successful, the search completer does not notify its delegate. If no search operation is in progress, this method does nothing.

120.19.8 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

120.19.9 Destructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

120.19.10 results as MKLocalSearchCompletionMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The most recently received search completions.
Notes: This property is nil initially. After a successful query, the property is set to the array of MKLocalSearchCompletionMBS objects returned by that query. Each new successful query replaces the previous value of this property.

120.19.11 Properties

120.19.12 filterType as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The filter options for the search results.
Notes:

Use this property to determine whether you want completions that represent points-of-interest or whether completions might yield additional relevant query strings.
(Read and Write property)

120.19.13 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

120.19.14 QueryFragment as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The search string for which you want completions.
Notes:

Assigning a string to this property initiates a search based on that string. The completer object waits a short amount of time before initiating new searches. This delay gives you enough time to update the search string based on typed input from the user. For example, if you are using a text field to manage the input from the user, you could use the TextChange event to update the value of this property.
(Read and Write property)

120.19.15 region as MKCoordinateRegionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The region that defines the geographic scope of the search.
Notes:

Use this property to limit search results to the specified geographic area. The default value of this property is a region that spans the entire world.
(Read and Write property)

120.19.16 Searching as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether a search operation is in progress.
Notes: (Read only property)

120.19.17 Events

120.19.18 DidFailWithError(error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: .

Function: Called when the specified search completer is unable to generate a list of search results.
Notes:

completer: The search completer object reporting the error.
error: The error object containing the reason for the failure.

Use this object to process any errors that occurred while generating search results. Even when an error occurs, the search completer starts a new search if it already has a new search string. Depending on the error, you might do nothing or let the user know that you were unable to obtain a list of search completions.

120.19.19 DidUpdateResults

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: .

Function: Called when the specified search completer updates its array of search completions.
Notes: After receiving results from a query, the search completer updates its results property with the new MKLocalSearchCompletionMBS objects and calls this method. Use this method to update your app's interface based on the new search results. For example, you might update a table that you use to display search results to the user.

120.19.20 Constants

120.19.21 FilterTypeLocationsAndQueries = 0

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants indicating the types of search completions to return.
Notes: Points of interest and query suggestions. Specify this value when you want both map-based points of interest and common query terms used to find locations. For example, the search string "cof" yields a completion for "coffee".

120.19.22 FilterTypeLocationsOnly = 1

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants indicating the types of search completions to return.

Notes: Points of interest only. Specify this value when you want the search string to yield completions that correspond to a specific point-of-interest on the map.

120.20 class MKLocalSearchCompletionMBS

120.20.1 class MKLocalSearchCompletionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A fully formed string that completes a partial string.
Notes:

You do not create instances of this class directly. Instead, you use an MKLocalSearchCompleterMBS to initiate a search based on a set of partial search strings. That object stores any matches in its results property. Retrieve any MKLocalSearchCompletionMBS objects from that property and display the search terms in your interface or use one to initiate a search for content based on that search term.

When displaying text completions for a partial search term in your user interface, you might want to use a bold version of a font or add some other highlighting to the portion of the completion string that caused it to match the partial search term. To help you add this styling, the completion object includes highlight ranges for the title and subtitle strings.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

120.20.6 Methods

120.20.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructors.

120.20.8 subtitleHighlightRanges as NSRangeMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The ranges of characters to highlight in the subtitle string.
Notes:

This property contains an array of NSRangeMBS objects, each defining a range of characters in the subtitle string. Use this property to identify the ranges of characters in the subtitle string that you should highlight. Highlighting the matching text of a search completion is optional, but does provide helpful information to the user and is recommended.

Zerobased ranges.

120.20.9 titleHighlightRanges as NSRangeMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The ranges of characters to highlight in the title string.
Notes:

This property contains an array of NSRangeNBS objects, each defining a range of characters in the title string. Use this property to identify the ranges of characters in the title string that you should highlight. Highlighting the matching text of a search completion is optional, but does provide helpful information to the user and is recommended.

Range is zero based.

120.20.10 Properties

120.20.11 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

120.20.12 subtitle as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The subtitle (if any) associated with the point-of-interest.
Notes:

The string in this property may be empty.
(Read only property)

120.20.13 title as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The title string associated with the point-of-interest.
Notes:

This string is guaranteed not to be empty.
(Read only property)

120.21 class MKLocalSearchMBS

120.21.1 class MKLocalSearchMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A utility object for initiating map-based searches and processing the results.
Notes: Use an MKLocalSearchMBS object to execute a single search request. You might use this class to search for addresses or points of interest on the map. Upon completion of the request, the object delivers the results to the SearchFinished event handler that you provide.

120.21.6 Methods

120.21.7 cancel

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Cancels an in-progress search operation.
Notes: If no search operation is in progress, this method does nothing.

120.21.8 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKLocalSearch reference from a declare.
The object is retained.
See also:

- 120.21.9 Constructor(request as MKLocalSearchRequestMBS) 19940

120.21.9 Constructor(request as MKLocalSearchRequestMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a search object configured with the specified parameters.
Notes:

request: The search request information. This parameter must not be nil.

This method stores a copy of the object in the request parameter. So any changes you make to your request object after calling this method are ignored.
See also:

- 120.21.8 Constructor(Handle as Integer) 19939

120.21.10 Start(tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Starts the search and delivers the results to the specified completion handler.
Notes:

Triggers SearchFinished event later.

You use this method to initiate a map-based search operation. The search runs until the results are delivered, at which point the specified completion handler is called.
You should call this method only once to start the search operation. Calling this method while the search is running does not stop the original search operation from finishing. However, for each subsequent call, the search object executes your completion handler and passes an error object to it.
The provided completion handler is always executed on your app's main thread. The local search object keeps a reference to the completion handler block until the results (or an error) are delivered, at which point it relinquishes that reference.

120.21.11 Properties

120.21.12 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

120.21.13 Searching as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean indicating whether the search is currently in progress.
Notes:

The value of this property is set to true when a search is initiated and remains in that state until the search results (or an appropriate error) are delivered, at which time the property is set to false.
(Read only property)

120.21.14 Events

120.21.15 SearchFinished(response as MKLocalSearchResponseMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: .

Function: The event handler that processes the results. This parameter must not be nil.
Notes: Called by Start asynchronously.

120.22 class MKLocalSearchRequestMBS

120.22.1 class MKLocalSearchRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The parameters to use when searching for points of interest on the map.
Notes: You create an MKLocalSearchRequest object when you want to search for map locations based on a natural language string. For example, if your interface allows the user to type in addresses, you would place the typed text in this object and pass it to an MKLocalSearch object to begin the search process. When specifying your search strings, include a map region to narrow the search results to the specified geographical area.

120.22.6 Methods

120.22.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.
See also:

- 120.22.8 Constructor(completion as MKLocalSearchCompletionMBS) 19943
- 120.22.9 Constructor(Handle as Integer) 19943

120.22.8 Constructor(completion as MKLocalSearchCompletionMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a search request based on the specified search completion data.
Notes:

completion: A search completion object obtained from an MKLocalSearchCompleterMBS object. The search request uses the provided object to set the value of the naturalLanguageQuery property.

Use this method when initializing your object from MKLocalSearchCompleterMBS objects. You do not need to use this method if you intend to provide the search string and region information yourself.
See also:

- 120.22.7 Constructor 19942
- 120.22.9 Constructor(Handle as Integer) 19943

120.22.9 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKLocalSearchRequest reference from a declare.
The object is retained.
See also:

- 120.22.7 Constructor 19942
- 120.22.8 Constructor(completion as MKLocalSearchCompletionMBS) 19943

120.22.10 Copy as MKLocalSearchRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the request.

120.22.11 Properties

120.22.12 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

120.22.13 naturalLanguageQuery as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A string containing the desired search item.
Notes:

You specify this parameter as a string describing the map-based item you want to look for. The text is equivalent to what the user would type in a search field in the Maps app. For example, the text might contain all or part of an address or it might contain the name of a point of interest.
(Read and Write property)

120.22.14 region as MKCoordinateRegionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A map region that provides a hint as to where to search.
Notes:

You can use this parameter to narrow the list of search results to those inside or close to the specified region. Specifying a region does not guarantee that the results will all be inside the region. It is merely a hint to the search engine.
(Read and Write property)

120.23 class MKLocalSearchResponseMBS

120.23.1 class MKLocalSearchResponseMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The results from a map-based search.
Notes: You do not create instances of this class directly. After initiating a map search using an MKLocalSearchMBS object, MapKit passes an instance of this class to your event handler.

120.23.6 Methods

120.23.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.
See also:

- 120.23.8 Constructor(Handle as Integer) 19946

120.23.8 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKLocalSearchResponse reference from a declare.
The object is retained.
See also:

- 120.23.7 Constructor 19945

120.23.9 mapItems as MKMapItemMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: An array of map items representing the search results.
Notes: This property contains an array of MKMapItemMBS objects, each of which represents a returned search result. You can use these objects to retrieve information about the search result, such as the name of the point of interest, the address, the geographic location, and so on.

120.23.10 Properties

120.23.11 boundingRegion as MKCoordinateRegionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The map region that encloses the returned search results.
Notes:

The returned region is the smallest bounding box that encloses all of the map items. If there is only one search result, the size of the region may be (0, 0).
(Read only property)

120.23.12 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

120.24 class MKMapCameraMBS

120.24.1 class MKMapCameraMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A virtual camera for defining the appearance of the map.
Notes:

A camera object defines a virtual viewpoint above the map surface and affects how the map is presented to the user. You use a camera object to specify the location of the camera on the map, the compass heading indicating the camera's viewing direction, the pitch of the camera relative to the map perpendicular, and the camera's altitude above the map. These factors create a map view with a three dimensional perspective. After creating an instance of this class, configure it with the desired attributes and assign it to your map view. When you assign a camera to your map view, the map centers the map using the value in your camera object's centerCoordinate property, updating the map's own region information in the process. The map also takes the camera's the pitch and altitude into account when calculating the visible region, ensuring that the region always encompasses the visible content on the map.

120.24.4 Methods

120.24.5 camera as MKMapCameraMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new camera object for you to configure.
Notes: You must change the values of the returned camera object before using it.

120.24.6 cameraLookingAtCenterCoordinate(centerCoordinate as CLLocationCoordinate2DMBS, distance as double, pitch as double, heading as double) as MKMapCameraMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new camera object using the specified distance, pitch, and heading information.
Notes:

centerCoordinate: The coordinate point on which the map should be centered.
distance: The line-of-sight distance from the camera to the center coordinate of the map.
pitch: The viewing angle of the camera, measured in degrees. A value of 0 results in a camera pointed straight down at the map. Angles greater than 0 result in a camera that is pitched toward the horizon by the specified number of degrees.
heading: The heading of the camera (measured in degrees) relative to true north. The value 0 means that the top edge of the map view corresponds to true north. The value 90 means the top of the map is pointing due east. The value 180 means the top of the map points due south, and so on.

Returns a new camera object initialized with the specified information.
The altitude of the camera is obtained by multiplying distance by the cosine of the pitch value.
See also:

- 120.24.7 cameraLookingAtCenterCoordinate(centerCoordinate as CLLocationCoordinate2DMBS, eyeCoordinate as CLLocationCoordinate2DMBS, eyeAltitude as double) as MKMapCameraMBS 19948

120.24.7 cameraLookingAtCenterCoordinate(centerCoordinate as CLLocationCoordinate2DMBS, eyeCoordinate as CLLocationCoordinate2DMBS, eyeAltitude as double) as MKMapCameraMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new camera object using the specified viewing angle information.
Notes:

centerCoordinate: The coordinate point on which the map should be centered.
eyeCoordinate: The coordinate point at which to place the camera. If the value for this parameter is equal to the value in the centerCoordinate parameter, the map is displayed as if the camera is looking straight down. If this point is offset from the centerCoordinate value, the map is displayed with an appropriate heading and pitch angle.
eyeAltitude: The altitude (in meters) above the ground at which to place the camera.

Returns a new camera object initialized with the specified information.

This method calculates the required pitch and heading angles to accommodate the specified eye position and altitude.
See also:

- 120.24.6 cameraLookingAtCenterCoordinate(centerCoordinate as CLLocationCoordinate2DMBS, distance as double, pitch as double, heading as double) as MKMapCameraMBS 19947

120.24.8 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new camera object for you to configure.
Notes: You must change the values of the returned camera object before using it.
See also:

- 120.24.9 Constructor(centerCoordinate as CLLocationCoordinate2DMBS, distance as double, pitch as double, heading as double) 19949
- 120.24.10 Constructor(centerCoordinate as CLLocationCoordinate2DMBS, eyeCoordinate as CLLocationCoordinate2DMBS, eyeAltitude as double) 19950
- 120.24.11 Constructor(Handle as Integer) 19950

120.24.9 Constructor(centerCoordinate as CLLocationCoordinate2DMBS, distance as double, pitch as double, heading as double)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new camera object using the specified distance, pitch, and heading information.
Notes:

centerCoordinate: The coordinate point on which the map should be centered.
distance: The line-of-sight distance from the camera to the center coordinate of the map.
pitch: The viewing angle of the camera, measured in degrees. A value of 0 results in a camera pointed straight down at the map. Angles greater than 0 result in a camera that is pitched toward the horizon by the specified number of degrees.
heading: The heading of the camera (measured in degrees) relative to true north. The value 0 means that the top edge of the map view corresponds to true north. The value 90 means the top of the map is pointing due east. The value 180 means the top of the map points due south, and so on.

Returns a new camera object initialized with the specified information.
The altitude of the camera is obtained by multiplying distance by the cosine of the pitch value.
See also:

- 120.24.8 Constructor 19949
- 120.24.10 Constructor(centerCoordinate as CLLocationCoordinate2DMBS, eyeCoordinate as CLLocationCoordinate2DMBS, eyeAltitude as double) 19950
- 120.24.11 Constructor(Handle as Integer) 19950

120.24.10 Constructor(centerCoordinate as CLLocationCoordinate2DMBS, eyeCoordinate as CLLocationCoordinate2DMBS, eyeAltitude as double)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new camera object using the specified viewing angle information.
Notes:

centerCoordinate: The coordinate point on which the map should be centered.
eyeCoordinate: The coordinate point at which to place the camera. If the value for this parameter is equal to the value in the centerCoordinate parameter, the map is displayed as if the camera is looking straight down. If this point is offset from the centerCoordinate value, the map is displayed with an appropriate heading and pitch angle.
eyeAltitude: The altitude (in meters) above the ground at which to place the camera.

Returns a new camera object initialized with the specified information.

This method calculates the required pitch and heading angles to accommodate the specified eye position and altitude.
See also:

- 120.24.8 Constructor 19949
- 120.24.9 Constructor(centerCoordinate as CLLocationCoordinate2DMBS, distance as double, pitch as double, heading as double) 19949
- 120.24.11 Constructor(Handle as Integer) 19950

120.24.11 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKMapCamera reference from a declare.
The object is retained.
See also:

- 120.24.8 Constructor 19949
- 120.24.9 Constructor(centerCoordinate as CLLocationCoordinate2DMBS, distance as double, pitch as double, heading as double) 19949
- 120.24.10 Constructor(centerCoordinate as CLLocationCoordinate2DMBS, eyeCoordinate as CLLocationCoordinate2DMBS, eyeAltitude as double) 19950

120.24.12 copy as MKMapCameraMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the camera object.

120.24.13 Properties

120.24.14 altitude as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The altitude above the ground, measured in meters.
Notes:

The value you specify for this property must not be less than 0.
Changing this property may also change the maximum pitch that is allowed for the map. If the current pitch value exceeds the new maximum, the pitch property is clamped to the new maximum.
(Read and Write property)

120.24.15 centerCoordinate as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The map coordinate at the center of the map view.
Notes:

This point represents the coordinate on which the map should be centered. When the camera pitch is 0, this property also corresponds to the geographic position of the camera. Changing the pitch to a nonzero value moves the camera but does not affect this property.
(Read and Write property)

120.24.16 heading as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The heading of the camera (measured in degrees) relative to true north.
Notes:

The value 0 means that the top edge of the map view corresponds to true north. The value 90 means the top of the map is pointing due east. The value 180 means the top of the map points due south, and so on.
(Read and Write property)

120.24.17 pitch as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The viewing angle of the camera, measured in degrees.
Notes:

A value of 0 results in a camera pointed straight down at the map. Angles greater than 0 result in a camera that is pitched toward the horizon by the specified number of degrees. If the map type is MapTypeSatellite or MapTypeHybrid, the pitch value is clamped to 0.
The value in this property may be clamped to a maximum value to maintain map readability. There is no fixed maximum value, though, because the actual maximum value is dependent on the current altitude of the camera.
(Read and Write property)

120.25 class MKMapItemMBS

120.25.1 class MKMapItemMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A point of interest on the map.
Notes:

A map item includes a geographic location and any interesting data that might apply to that location, such as the address at that location and the name of a business at that address. You can also create a special MKMapItem object representing the user's current location.

Use this class to do the following:

- Share map-related data with the Maps app.
- Handle requests for directions that originate from the Maps app.

To display information in Maps, create an MKMapItem object with the information you want to display and call the openMapsWithItems method. Maps displays that location on the map and shows the information you provide.
If you implement a routing app, Maps provides you with two MKMapItem objects representing the start and end points. Use the information in those two objects to plot the route and generate directions.

120.25.6 Methods

120.25.7 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKMapItem reference from a declare.
The object is retained.
See also:

- 120.25.8 Constructor(PlaceMark as MKPlacemarkMBS) 19954

120.25.8 Constructor(PlaceMark as MKPlacemarkMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a map item object using the specified placemark object.
Notes:

placemark: The placemark object corresponding to the desired map location. This parameter must not be nil.

Use this method to create a map item for an existing placemark. Do not use it to create a map item representing the user's current location. To do that, use the mapItemForCurrentLocation method instead.
See also:

- 120.25.7 Constructor(Handle as Integer) 19954

120.25.9 mapItemForCurrentLocation as MKMapItemMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a singleton map item object representing the device's current location.
Notes: For privacy reasons, and because the user's location can change, the map item returned by this

method does not contain any coordinate data. When you need the actual location of the user, you must use the Core Location framework to retrieve it.

120.25.10 MKLaunchOptionsCameraKey as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The virtual camera to use for viewing the map.
Notes: The value of this key is an MKMapCameraMBS object that describes a virtual camera that can specify a 3D perspective for the map. If you do not specify this key, Maps uses its current settings to define the appearance of the map.

120.25.11 MKLaunchOptionsDirectionsModeDefault as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Directions that match the user's preferred transportation type.

120.25.12 MKLaunchOptionsDirectionsModeDriving as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Driving directions between the specified start and end points.

120.25.13 MKLaunchOptionsDirectionsModeKey as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The mode of transportation.
Notes: The value of this key is an NSString corresponding to one of the values described in Directions Mode Values. You specify this key to tell the Maps app which mode of transport to use when generating directions.

120.25.14 MKLaunchOptionsDirectionsModeTransit as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Public transit directions between the specified start and end points.

120.25.15 MKLaunchOptionsDirectionsModeWalking as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Walking directions between the specified start and end points.

120.25.16 MKLaunchOptionsMapCenterKey as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The coordinate value on which to center the map.
Notes: The value of this key is an NSValue object that contains an encoded CLLocationCoordinate2D structure.

120.25.17 MKLaunchOptionsMapSpanKey as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The amount of the map to display.
Notes: The value of this key is an NSValue object that contains an encoded MKCoordinateSpan structure.

120.25.18 MKLaunchOptionsMapTypeKey as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The type of map (standard, satellite, or hybrid) to display.
Notes: The value of this key is an NSNumber object whose value is an integer corresponding to an MKMapType value.

120.25.19 MKLaunchOptionsShowsTrafficKey as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether to display traffic information.
Notes: The value of this key is a Boolean value. If you do not specify this key, Maps uses its current settings to determine whether or not to display traffic.

120.25.20 openInMaps(LaunchOptions as Dictionary) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Open the Maps app and display this map item.
Notes:

launchOptions: Additional information that the Maps app can use to configure the map display. For example, you can use the launch options to specify the visible map region and the map type. For a list of keys you can put into this dictionary, see Launch Options Dictionary Keys.

This parameter may be nil.

Returns true if this map item was successfully opened by the Maps app, or false if there was an error.

You use this method to pass the current map item to the Maps app. If your map item contains descriptive information about the location (such as a name or URL), the Maps app displays that information at the specified coordinate.
If you specify the MKLaunchOptionsDirectionsModeKey option in the launchOptions dictionary, the Maps app interprets that as an attempt to map from the user's current location to the location specified by this map item.
If you do not include the MKLaunchOptionsMapCenterKey and MKLaunchOptionsMapSpanKey keys in your launchOptions dictionary, Maps constructs a region around the current item. It uses that region to set the visible portion of the map.

120.25.21 openMapsWithItems(items() as MKMapItemMBS, launchOptions as Dictionary) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Open the Maps app and display the specified map items.
Notes:

mapItems: An array containing one or more MKMapItemMBS objects representing the items you want to display on the map.
launchOptions: Additional information that the Maps app can use to configure the map display. For example, you can use the launch options to specify the visible map region, a 3D perspective, and the map type. For a list of keys you can put into this dictionary, see Launch Options Dictionary Keys.

You may specify nil for this parameter.

Returns true if the map items were successfully opened by the Maps app, or false if there was an error.

You use this method to pass one or more map items to the Maps app. For example, you might use this method to ask the Maps app to display location-based search results generated by your app. Maps displays pins at each location you specify and uses the contents of each map item object to display additional information.

If you specify the MKLaunchOptionsDirectionsModeKey option in the launchOptions dictionary, the mapItems array must have no more than two items in it. If the array contains one item, the Maps app generates directions from the user's current location to the location specified by the map item. If the array contains two items, the Maps app generates directions from the location of the first item to the location of the second item in the array.
If you do not include the MKLaunchOptionsMapCenterKey and MKLaunchOptionsMapSpanKey keys in your launchOptions dictionary, Maps constructs a region that encompasses the provided items. It uses this region to set the visible portion of the map.

120.25.22 Properties

120.25.23 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

120.25.24 isCurrentLocation as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the map item represents the user's current location.
Notes:

If the value of this property is true, the map item represents the user's current location. If true, the value in the placemark property is set to nil.
(Read only property)

120.25.25 Name as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The descriptive name associated with the map item.
Notes:

Use this property to specify the name associated with the location. For example, if there is a business at the specified location, you would use this property to specify the name of the business.
If this map item represents the user's current location, the value in property is set to a localized version of "Current Location".
(Read and Write property)

120.25.26 phoneNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The phone number associated with a business at the specified location.
Notes:

If there is a relevant phone number associated with the location, such as a phone number for a business at the location, use this property to specify that value.
(Read and Write property)

120.25.27 placemark as MKPlacemarkMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The placemark object containing the location information.
Notes:

If you created the map item using the mapItemForCurrentLocation method, the value of this property is nil and the isCurrentLocation property is set to true.
(Read only property)

120.25.28 timeZone as NSTimeZoneMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The time zone of the specified location.
Notes:

When you search for map items, MapKit populates this field with the time zone information as a convenience. You may also set the time zone for any map items you create.
(Read and Write property)

120.25.29 URL as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The URL associated with the specified location.
Notes:

If there is a relevant URL associated with the location, such as a URL for a business at the location, use this property to specify that value.
(Read and Write property)

120.26 class MKMapPointMBS

120.26.1 class MKMapPointMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The class for a point on the map.
Example:

```
// take some coordinates
dim c1 as new CLLocationCoordinate2DMBS(52.518611, 13.408333) // Berlin
dim c2 as new CLLocationCoordinate2DMBS(48.137222, 11.575556) // Munich

// convert to points on map
dim p1 as MKMapPointMBS = MKMapPointMBS.Point(c1)
dim p2 as MKMapPointMBS = MKMapPointMBS.Point(c2)

// show
MsgBox p1.StringValue+EndOfLine+p2.StringValue

// create locations
dim l1 as new CLLocationMBS(c1.latitude, c1.longitude)
dim l2 as new CLLocationMBS(c2.latitude, c2.longitude)

// show
MsgBox l1.Description+EndOfLine+l2.Description

// now get distance on two ways
dim d1 as Double = MKMapPointMBS.MetersBetweenMapPoints(p1,p2)
dim d2 as Double = l1.distanceFromLocation(l2)

// and format to show
dim s1 as string = MKDistanceFormatterMBS.formatter.stringFromDistance(d1)
dim s2 as string = MKDistanceFormatterMBS.formatter.stringFromDistance(d2)

MsgBox "Distance: "+s1+" vs. "+s2
// not the same due to rounding!
```

120.26.6 Methods

120.26.7 Constructor(other as MKMapPointMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The copy constructor.
See also:

- 120.26.8 Constructor(x as double = 0, y as double = 0) 19961

120.26.8 Constructor(x as double = 0, y as double = 0)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The map constructor.
See also:

- 120.26.7 Constructor(other as MKMapPointMBS) 19961

120.26.9 Coordinate(point as MKMapPointMBS) as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Converts point in map to coordinate.

120.26.10 Equal(other as MKMapPointMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Compares two point objects.
Notes: Returns true if both are equal.

120.26.11 MapPointsPerMeterAtLatitude(Latitude as Double) as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the number of map points that represent one meter at the given latitude.
Notes: The number of map points per meter increases as the latitude approaches the poles.

120.26.12 MetersBetweenMapPoints(point1 as MKMapPointMBS, point2 as MKMapPointMBS) as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the number of meters between two map points.
Notes: This distance reflects the actual distance between the two points on the surface of the globe, taking into account the curvature of the Earth.

120.26.13 MetersPerMapPointAtLatitude(Latitude as Double) as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the distance spanned by one map point at the specified latitude.
Example:

```
MsgBox str(MKMapPointMBS.MetersPerMapPointAtLatitude(50.0))
```

Notes:

latitude: The latitude for which to return the value.

Returns the distance (in meters) spanned by a single map point.

The distance between map points decreases as the latitude approaches the poles. This relationship parallels the relationship between longitudinal coordinates at different latitudes.

120.26.14 Point(coordinate as CLLocationCoordinate2DMBS) as MKMapPointMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Converts coordinate in point in map.
See also:

- 120.26.15 Point(x as double = 0, y as double = 0) as MKMapPointMBS 19963

120.26.15 Point(x as double = 0, y as double = 0) as MKMapPointMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new point with given values.
See also:

- 120.26.14 Point(coordinate as CLLocationCoordinate2DMBS) as MKMapPointMBS 19962

120.26.16 Properties

120.26.17 StringValue as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Formats point as text for display in debugger.
Example:

```
dim p as new MKMapPointMBS(12, 34)

MsgBox p.StringValue
```

Notes: (Read only property)

120.26.18 X as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The X coordinate.
Notes: (Read and Write property)

120.26.19 Y as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The Y coordinate.
Notes: (Read and Write property)

120.27 class MKMapRectMBS

120.27.1 class MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The class for a map rectangle.

120.27.2 Blog Entries

- MapKit Framework for Xojo

120.27.3 Blog Entries

- MapKit Framework for Xojo

120.27.4 Methods

120.27.5 Constructor(origin as MKMapPointMBS, size as MKMapSizeMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.
Notes: Copies values from point and size to build new rectangle.
See also:

- 120.27.6 Constructor(other as MKMapRectMBS) 19964
- 120.27.7 Constructor(x as double = 0, y as double = 0, w as double = 0, h as double = 0) 19965

120.27.6 Constructor(other as MKMapRectMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The copy constructor.
See also:

- 120.27.5 Constructor(origin as MKMapPointMBS, size as MKMapSizeMBS) 19964
- 120.27.7 Constructor(x as double = 0, y as double = 0, w as double = 0, h as double = 0) 19965

120.27.7 Constructor(x as double = 0, y as double = 0, w as double = 0, h as double = 0)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.
See also:

- 120.27.5 Constructor(origin as MKMapPointMBS, size as MKMapSizeMBS) 19964
- 120.27.6 Constructor(other as MKMapRectMBS) 19964

120.27.8 Contains(other as MKMapPointMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns true if point is included in rectangle area.
See also:

- 120.27.9 Contains(other as MKMapRectMBS) as Boolean 19965

120.27.9 Contains(other as MKMapRectMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns true if given rectangle is included in rectangle area.
See also:

- 120.27.8 Contains(other as MKMapPointMBS) as Boolean 19965

120.27.10 Divide(byref slice as MKMapRectMBS, byref remainder as MKMapRectMBS, amount as double, edge as Integer)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Divides rectangle in slice and remainder.

120.27.11 Equal(other as MKMapRectMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Compares two rectangle objects.
Notes: Returns true if both are equal.

120.27.12 Inset(dx as Double, dy as Double) as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Insets rectangle by given delta and returns new rectangle.

120.27.13 Intersection(other as MKMapRectMBS) as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns intersection of two map rectangles.

120.27.14 Intersects(other as MKMapRectMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether the given rectangle intersects with the current one.

120.27.15 Null as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Queries a null rectangle.

120.27.16 Offset(dx as Double, dy as Double) as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Offsets map rectangle by given offset.

120.27.17 Rect(x as double = 0, y as double = 0, width as double = 0, heigth as double = 0) as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates new rectangle with given values.

120.27.18 Region as MKCoordinateRegionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creation region covering the map rectangle.

120.27.19 Remainder as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: For map rects that span the 180th meridian, this returns the portion of the rect that lies outside of the world rect wrapped around to the other side of the world.
Notes: The portion of the rect that lies inside the world rect can be determined with rect.Intersection(MKMapRectMBS.World).

120.27.20 Union(other as MKMapRectMBS) as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns union of both rectangles.

120.27.21 World as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The world rectangle.
Notes: The rect that contains every map point in the world.

120.27.22 Properties

120.27.23 Height as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The height of the rectangle.
Notes: (Read and Write property)

120.27.24 isEmpty as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns true if rectangle is empty.
Notes: (Read only property)

120.27.25 isNull as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns true if rectangle is null rectangle.
Notes: (Read only property)

120.27.26 MaxX as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Maximum X value of rectangle.
Notes: (Read only property)

120.27.27 MaxY as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum X value of the rectangle.
Notes: (Read only property)

120.27.28 MidX as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The middle x value of this rectangle.
Notes: (Read only property)

120.27.29 MidY as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Middle Y value of rectangle.
Notes: (Read only property)

120.27.30 MinX as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Minimum X value of rectangle.
Notes: (Read only property)

120.27.31 MinY as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Minimum Y value of rectangle.
Notes: (Read only property)

120.27.32 Origin as MKMapPointMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The origin point of the rectangle.
Notes:

Returns new point object with given values.
(Read and Write property)

120.27.33 Size as MKMapSizeMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The size of the rectangle.
Notes:

Returns new size object with given values.
(Read and Write property)

120.27.34 Spans180thMeridian as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this map rectangle spans the 180th meridian.
Notes: (Read only property)

120.27.35 StringValue as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Formats rect as text for display in debugger.
Example:

```
dim r as new MKMapRectMBS(1,2,3,4)

MsgBox r.StringValue
```

Notes: (Read only property)

120.27.36 Width as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The width of the rectangle.
Notes: (Read and Write property)

120.27.37 X as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The X origin coordinate.
Notes: (Read and Write property)

120.27.38 Y as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The Y origin coordinate.
Notes: (Read and Write property)

120.28 class MKMapSizeMBS

120.28.1 class MKMapSizeMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The class for a size in maps.

120.28.2 Blog Entries

- MapKit Framework for Xojo

120.28.3 Blog Entries

- MapKit Framework for Xojo

120.28.4 Methods

120.28.5 Constructor(other as MKMapSizeMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The copy constructor.
See also:

- 120.28.6 Constructor(width as double = 0, height as double = 0) 19971

120.28.6 Constructor(width as double = 0, height as double = 0)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.
See also:

- 120.28.5 Constructor(other as MKMapSizeMBS) 19971

120.28.7 Equal(other as MKMapSizeMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Compares two size objects.
Notes: Returns true if both are equal.

120.28.8 Size(Width as double = 0, Height as double = 0) as MKMapSizeMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates new size object with given values.

120.28.9 World as MKMapSizeMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The size that contains every map point in the world.

120.28.10 Properties

120.28.11 Height as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The height of the size.
Notes: (Read and Write property)

120.28.12 StringValue as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Formats size as text for display in debugger.
Notes: (Read only property)

120.28.13 Width as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The width of the size.
Notes: (Read and Write property)

120.29 class MKMapSnapshotMBS

120.29.1 class MKMapSnapshotMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The class to take map snapshots.

120.29.2 Blog Entries

- MapKit Framework for Xojo

120.29.3 Blog Entries

- MapKit Framework for Xojo

120.29.4 Methods

120.29.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.
See also:

- 120.29.6 Constructor(Handle as Integer) 19973

120.29.6 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKMapSnapshot reference from a declare.
The object is retained.
See also:

- 120.29.5 Constructor 19973

120.29.7 Destructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

120.29.8 pointForCoordinate(coordinate as CLLocationCoordinate2DMBS) as NSPointMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Translates a point in the coordinate to the point in the image.

120.29.9 Properties

120.29.10 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

120.29.11 Image as NSImageMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The image created.
Notes:

Please use methods in NSImageMBS class to get PNG or JPEG data.
Or use methods to copy a xojo picture.
(Read only property)

120.29.12 Options as MKMapSnapshotOptionsMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The options used to create object.
Notes: (Read and Write property)

120.29.13 Tag as Variant

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The tag passed to creating the snapshot.
Notes:

e.g. a ID for a database record.
(Read and Write property)

120.30 class MKMapSnapshotOptionsMBS

120.30.1 class MKMapSnapshotOptionsMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The class for snapshot options.

120.30.2 Blog Entries

- MapKit Framework for Xojo

120.30.3 Blog Entries

- MapKit Framework for Xojo

120.30.4 Methods

120.30.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.
See also:

- 120.30.6 Constructor(Handle as Integer) 19976

120.30.6 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKMapSnapshotOptions reference from a declare.
The object is retained.
See also:

- 120.30.5 Constructor 19976

120.30.7 Copy as MKMapSnapshotOptionsMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the options.

120.30.8 Properties

120.30.9 appearance as NSAppearanceMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop only.

Function: The appearance to use for rendering.
Notes:

For MacOS 10.14 or newer.
(Read and Write property)

120.30.10 camera as MKMapCameraMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The camera to use.
Notes: (Read and Write property)

120.30.11 mapRect as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The rectangle in the map to query.
Notes: (Read and Write property)

120.30.12 mapType as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The map type to use.
Notes: (Read and Write property)

120.30.13 region as MKCoordinateRegionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The region to use.
Notes: (Read and Write property)

120.30.14 showsBuildings as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Whether to show buildings.
Notes:

Affects MKMapTypeStandard.
(Read and Write property)

120.30.15 showsPointsOfInterest as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Whether to show points of interest.
Notes:

Affects MKMapTypeStandard and MKMapTypeHybrid.
(Read and Write property)

120.30.16 size as NSSizeMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The size of the image to create.
Notes:

Defaults to 256x256 if nil.
(Read and Write property)

120.31 class MKMapSnapshotterMBS

120.31.1 class MKMapSnapshotterMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The class to take snapshots for maps.

120.31.2 Blog Entries

- MBS Xojo Plugins, version 19.1pr6
- MapKit Framework for Xojo

120.31.3 Blog Entries

- MBS Xojo Plugins, version 19.1pr6

120.31.4 Methods

120.31.5 Cancel

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Cancels the snapshot.

120.31.6 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKMapSnapshotter reference from a declare.
The object is retained.
See also:

- 120.31.7 Constructor(options as MKMapSnapshotOptionsMBS) 19980

120.31.7 Constructor(options as MKMapSnapshotOptionsMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.
Notes: We keep reference to options in options property.
See also:

- 120.31.6 Constructor(Handle as Integer) 19979

120.31.8 Destructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

120.31.9 Start(tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Starts the asynchronous snapshot process.
Notes:

The tag value is passed to the snapshot for later reference.
Triggers SnapshotCompleted event later.
Sets Error and Snapshot properties on this object.

120.31.10 Properties

120.31.11 Error as NSErrorMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The last error.
Notes: (Read and Write property)

120.31.12 Loading as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this is still loading.
Notes: (Read only property)

120.31.13 Options as MKMapSnapshotOptionsMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The options used to create object.
Notes: (Read and Write property)

120.31.14 Snapshot as MKMapSnapshotMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The last snapshot.
Notes: (Read and Write property)

120.31.15 Events

120.31.16 SnapshotCompleted(snapshot as MKMapSnapshotMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: .

Function: The event to be called when snapshot is done.

120.32 class MKMapViewMBS

120.32.1 class MKMapViewMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: An MKMapView object provides an embeddable map interface, similar to the one provided by the Maps application.
Notes:

You use this class as-is to display map information and to manipulate the map contents from your application. You can center the map on a given coordinate, specify the size of the area you want to display, and annotate the map with custom information.

In the IDE we show a generic map image as preview as the control itself doesn't perform well inside the Xojo IDE.
Subclass of the NSViewMBS class.

120.32.8 Methods

120.32.9 addAnnotation(annotation as MKAnnotationMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Adds the specified annotation to the map view.
Example:

```
dim mapview as MKMapViewMBS // your map view

// new pin
dim pin as new MKPointAnnotationMBS
```

```
pin.coordinate = mapView.centerCoordinate
pin.title = "Hello"

// show on map
mapView.addAnnotation pin
```

120.32.10 addAnnotations(annotations() as MKAnnotationMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Adds an array of annotation objects to the map view.

120.32.11 addOverlay(overlay as MKOverlayMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Adds a single overlay object to the map.
Example:

```
dim mapview as MKMapViewMBS // your map view
dim centerCoordinate as CLLocationCoordinate2DMBS = mapview.centerCoordinate
dim radius as Integer = 300 // 300 meter

dim circle as MKCircleMBS = MKCircleMBS.circleWithCenterCoordinate(centerCoordinate, radius)
mapview.addOverlay circle
```

Notes:

overlay: The overlay object to add. This object must conform to the MKOverlayMBS interface.

The specified object is added to the group of overlay objects in the MKOverlayLevelAboveLabels level. Adding an overlay causes the map view to begin monitoring the area represented by that overlay. As soon as the bounding rectangle of an overlay intersects the visible portion of the map, the map view adds a corresponding overlay view to the map. The overlay view is provided by the mapViewViewForOverlay event.

To remove an overlay from a map, use the removeOverlay method.
See also:

- 120.32.12 addOverlay(overlay as MKOverlayMBS, level as integer)

120.32.12 addOverlay(overlay as MKOverlayMBS, level as integer)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Adds the overlay object to the map at the specified level.
Notes:

overlay: The overlay object to add. This object must conform to the MKOverlayMBS interface.
level: The map level at which to place the overlay. For a list of possible values for this parameter, see level constants.

Positioning an overlay at a specific level places that overlay's visual representation in front of or behind other map content such as map labels and point-of-interest icons.
This method adds the specified overlay to the end of the list of overlay objects at the given level. Adding an overlay also causes the map view to begin monitoring the area they represent. As soon as the bounding rectangle of the overlay intersects the visible portion of the map, the map view calls your rendererForOverlay event to get the renderer object to use when drawing the overlay.
To remove an overlay from a map, use the removeOverlay: method.
See also:

- 120.32.11 addOverlay(overlay as MKOverlayMBS) 19984

120.32.13 addOverlays(overlays() as MKOverlayMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Adds an array of overlay objects to the map.
Notes:

overlays: An array of objects, each of which must conform to the MKOverlayMBS interface.

The specified objects are added to the group of overlay objects in the MKOverlayLevelAboveLabels level. Adding an overlay causes the map view to begin monitoring the area represented by that overlay. As soon as the bounding rectangle of the overlay intersects the visible portion of the map, the map view tries to draw the overlay. As soon as the bounding rectangle of an overlay intersects the visible portion of the map, the map view adds a corresponding overlay view to the map. The overlay view is provided by the mapViewViewForOverlay method of the map view's delegate object.

To remove multiple overlays from a map, use the removeOverlays method.
See also:

- 120.32.14 addOverlays(overlays() as MKOverlayMBS, level as integer) 19985

120.32.14 addOverlays(overlays() as MKOverlayMBS, level as integer)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Adds an array of overlay objects to the map at the specified level.
Notes:

overlays: The array of overlay objects to add. Each object in the array must conform to the MKOverlayMBS interface.
level: The map level at which to place the overlays. For a list of possible values for this parameter, see MKOverlayLevel.

Positioning an overlay at a specific level places that overlay's visual representation in front of or behind other map content such as map labels and point-of-interest icons.

This method adds the specified overlays to the end of the list of overlay objects at the given level. Adding the overlays also causes the map view to begin monitoring the area they represent. As soon as the bounding rectangle of an overlay intersects the visible portion of the map, the map view calls your rendererForOverlay event to get the renderer object to use when drawing that overlay.

To remove multiple overlays from a map, use the removeOverlays method.
See also:

- 120.32.13 addOverlays(overlays() as MKOverlayMBS) 19985

120.32.15 annotations as MKAnnotationMBS()

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The complete list of annotations associated with the receiver.
Notes: If no annotations are associated with the map view, the value of this property is empty.

120.32.16 annotationsInMapRect(mapRect as MKMapRectMBS) as MKAnnotationMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the annotation objects located in the specified map rectangle.
Notes:

mapRect: The portion of the map that you want to search for annotations.

Returns the array of annotation objects located in mapRect.

This method offers a fast way to retrieve the annotation objects in a particular portion of the map. This method is much faster than doing a linear search of the objects in the annotations property yourself.

120.32.17 annotationViews as MKAnnotationViewMBS()

MBS MacFrameworks Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop & iOS.

Function: Queries internal list of MapView to get list of all annotation views.

120.32.18 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Returns true for Mac 64-bit targets.

120.32.19 Constructor

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new box view with size 100/100 and position 0/0
Example:

```
dim x as new MKMapViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 120.32.20 Constructor(Handle as Integer) 19987
- 120.32.21 Constructor(left as Double, top as Double, width as Double, height as Double) 19988

120.32.20 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an object based on the given NSView handle.
Example:

```
dim t as new MKMapViewMBS(0, 0, 100, 100)
dim v as new MKMapViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a MKMapView and the plugin retains this handle.
See also:

- 120.32.19 Constructor 19987
- 120.32.21 Constructor(left as Double, top as Double, width as Double, height as Double) 19988

120.32.21 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new control with the given size and position.
Example:

```
dim left,top,width,height as Integer
// define rectangle
dim x as new MKMapViewMBS(left, top, width, height)
```

Notes: On success the handle property is not zero.
See also:

- 120.32.19 Constructor 19987
- 120.32.20 Constructor(Handle as Integer) 19987

120.32.22 convertCoordinateToPointToView(coordinate as CLLocationCoordinate2DMBS, view as NSViewMBS) as NSPointMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Converts a map coordinate to a point in the specified view.
Notes:

coordinate: The map coordinate for which you want to find the corresponding point.
view: The view in whose coordinate system you want to locate the specified map coordinate. If this parameter is nil, the returned point is specified in the window's coordinate system. If view is not nil, it must belong to the same window as the map view.

Returns the point (in the appropriate view or window coordinate system) corresponding to the specified latitude and longitude value.

120.32.23 convertPointToCoordinateFromView(point as NSPointMBS, view as NSViewMBS) as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Converts a point in the specified view's coordinate system to a map coordinate.
Notes:

point: The point you want to convert.
view: The view that serves as the reference coordinate system for the point parameter.

Returns the map coordinate at the specified point.

120.32.24 convertRectToRegionFromView(rect as NSRectMBS, view as NSViewMBS) as MKCoordinateRegionMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Converts a rectangle in the specified view's coordinate system to a map region.
Example:

```
// convert mouse position in x/y to select annotation on the given mouse point
Dim xView As MKMapViewMBS = MapViewControl.View
Dim rect As New NSRectMBS(x,y,1,1)
Dim region As MKCoordinateRegionMBS = xView.convertRectToRegionFromView(rect,xView)
Dim center As CLLocationCoordinate2DMBS = region.center
Dim circle As New MKCircleMBS(center,32)
Dim mapRect As MKMapRectMBS = circle.boundingMapRect()
Dim xAnnos() As MKAnnotationMBS = xView.annotationsInMapRect(mapRect)

If xAnnos.LastRowIndex <>-1 Then
Dim xThisAnno As MKAnnotationMBS = xAnnos(0)
If xThisAnno IsA MKPointAnnotationMBS Then
me.View.selectAnnotation(xThisAnno,False)
Return True
End If
End If
```

Notes:

rect: The rectangle you want to convert.
view: The view that serves as the reference coordinate system for the rect parameter.

Returns the map region corresponding to the specified view rectangle.

120.32.25 convertRegionToRectToView(region as MKCoordinateRegionMBS, view as NSViewMBS) as NSRectMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Converts a map region to a rectangle in the specified view.
Notes:

region: The map region for which you want to find the corresponding view rectangle.
view: The view in whose coordinate system you want to locate the specified map region. If this parameter is nil, the returned rectangle is specified in the window's coordinate system. If view is not nil, it must belong to the same window as the map view.

Returns the rectangle corresponding to the specified map region.

120.32.26 dequeueReusableAnnotationViewWithIdentifier(identifier as string) as MKAnnotationViewMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a reusable annotation view located by its identifier.
Notes:

identifier: A string identifying the annotation view to be reused. This string is the same one you specify when initializing the annotation view using the Constructor method.

Returns an annotation view with the specified identifier, or nil if no such object exists in the reuse queue.

For performance reasons, you should generally reuse MKAnnotationView objects in your map views. As annotation views move offscreen, the map view moves them to an internally managed reuse queue. As new annotations move onscreen, and your code is prompted to provide a corresponding annotation view, you should always attempt to dequeue an existing view before creating a new one. Dequeueing saves time and memory during performance-critical operations such as scrolling.

120.32.27 deselectAnnotation(annotation as MKAnnotationMBS, animated as boolean)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Deselects the specified annotation and hides its callout view.
Notes:

annotation: The annotation object to deselect.
animated: If true, the callout view is animated offscreen.

120.32.28 Destructor

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

120.32.29 exchangeOverlay(index1 as Integer, index2 as Integer)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Exchanges the positions of the two overlay objects.
Notes:

index1: The index of an overlay in the MKOverlayLevelAboveLabels map level.
index2: The index of another overlay in the MKOverlayLevelAboveLabels map level.

If you need to exchange overlays in other map levels, use the exchangeOverlay method.
See also:

- 120.32.30 exchangeOverlay(Overlay1 as MKOverlayMBS, Overlay2 as MKOverlayMBS) 19991

120.32.30 exchangeOverlay(Overlay1 as MKOverlayMBS, Overlay2 as MKOverlayMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Exchanges the positions of the two overlay objects.
Notes: If the overlays are in the same map level, they exchange positions within that level's array of overlay objects. If they are in different map levels, the two objects also swap levels. Swapping the position of the overlays affects their visibility in the map view.
See also:

- 120.32.29 exchangeOverlay(index1 as Integer, index2 as Integer) 19991

120.32.31 insertOverlayAboveOverlay(overlay as MKOverlayMBS, aboveOverlay as MKOverlayMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Inserts one overlay object on top of another.
Notes:

overlay: The overlay object to insert.
sibling: An existing object in the overlays array. This object must exist in the array and must not be nil.

This method inserts the overlay into the MKOverlayLevelAboveLabels level and positions it relative to the specified sibling. When displayed, this leads to the overlay's contents being displayed above that of its sibling. If sibling is not in the same map level, this method appends the overlay to the end of the list of overlays at the indicated level.

120.32.32 insertOverlayAtIndex(overlay as MKOverlayMBS, index as Integer)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Inserts an overlay object into the list associated with the map.
Notes:

overlay: The overlay object to insert.
index: The index at which to insert the overlay object. If this value is greater than the number of objects in the overlays property, this method appends the object to the end of the array.

This method inserts the overlay into the MKOverlayLevelAboveLabels level.
See also:

- 120.32.33 insertOverlayAtIndex(overlay as MKOverlayMBS, index as integer, level as integer) 19992

120.32.33 insertOverlayAtIndex(overlay as MKOverlayMBS, index as integer, level as integer)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Inserts an overlay object into the level at the specified index.
Notes:

overlay: The overlay object to insert.
index: The index at which to insert the overlay object. If this value is greater than the number of objects in the overlays property, this method appends the object to the end of the array.
level: The map level at which to place the overlay. For a list of possible values for this parameter, see level constants.

Inserting an overlay at a specific level places that overlay's visual representation in front of or behind other map content such as map labels and point-of-interest icons.
See also:

- 120.32.32 insertOverlayAtIndex(overlay as MKOverlayMBS, index as Integer) 19992

120.32.34 insertOverlayBelowOverlay(overlay as MKOverlayMBS, belowOverlay as MKOverlayMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Inserts one overlay object below another.
Notes:

overlay: The overlay object to insert.
sibling: An existing object in the overlays array. This object must exist in the array and must not be nil.

This method inserts the overlay into the MKOverlayLevelAboveLabels level and positions it relative to the specified sibling. When displayed, this leads to the overlay's contents being displayed beneath that of its sibling. If sibling is not in the same map level, this method appends the overlay to the end of the list of overlays at the indicated level.

120.32.35 mapRectThatFits(mapRect as MKMapRectMBS) as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Adjusts the aspect ratio of the specified map rectangle to ensure that it fits in the map view's frame.
Notes:

mapRect: The initial map rectangle whose width and height you want to adjust.

Returns a map rectangle that is still centered on the same point of the map but whose width and height are adjusted to fit in the map view's frame.

You can use this method to normalize map rectangle values before displaying the corresponding area. This method returns a new map rectangle that both contains the specified rectangle and fits neatly inside the map view's frame.
See also:

- 120.32.36 mapRectThatFits(mapRect as MKMapRectMBS, edgePaddingLeft as Double, edgePaddingTop as Double, edgePaddingRight as Double, edgePaddingBottom as Double) as MKMapRectMBS 19993

120.32.36 mapRectThatFits(mapRect as MKMapRectMBS, edgePaddingLeft as Double, edgePaddingTop as Double, edgePaddingRight as Double, edgePaddingBottom as Double) as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Adjusts the aspect ratio of the specified map rectangle, incorporating the specified inset values.
Notes: A map rectangle that is still centered on the same point of the map but whose width and height are adjusted to fit in the map view's frame minus the inset values.
See also:

- 120.32.35 mapRectThatFits(mapRect as MKMapRectMBS) as MKMapRectMBS 19993

120.32.37 MKErrorDomain as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The error domain for Map Kit.

120.32.38 MKMapViewDefaultAnnotationViewReuseIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The default reuse identifier for your map's annotation views.
Notes: Use this constant to register a default annotation view. This default annotation view is used when your map view's delegate does not implement the viewForAnnotation event or when that method returns nil.

120.32.39 MKMapViewDefaultClusterAnnotationViewReuseIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The default reuse identifier for the annotation view representing a cluster of annotations.
Notes: Use this constant to register a default annotation view to use for clusters of annotations. This cluster annotation view is used when your map view's delegate does not implement the viewForAnnotation event or when that method returns nil.

120.32.40 overlays as MKOverlayMBS()

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The overlay objects currently associated with the map view.
Notes:

This property contains the union of all overlays at the different levels of the map. The objects in this array must adopt the MKOverlayMBS interface. If no overlays are associated with the map view, the value of this property is an empty array.

The order of the objects in this array does not necessary reflect their visual order on the map.

120.32.41 overlaysInLevel(level as Integer) as MKOverlayMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The overlay objects in the specified level of the map.
Notes:

level: The map level whose overlays you want. For a list of possible values for this parameter.

Returns an array of objects conforming to the MKOverlayMBS interfaces that display in the specified map level. If there are no overlays at the specified level, this method returns an empty array.

You can use this method to get all of the overlays assigned to a specific map level, which might be a subset of the complete set of overlay objects. For overlapping overlay objects, the order of objects in the array represents their visual order when displayed on the map, with objects in the beginning of the array located behind those at later indexes.

120.32.42 regionThatFits(region as MKCoordinateRegionMBS) as MKCoordinateRegionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Adjusts the aspect ratio of the specified region to ensure that it fits in the map view's frame.
Notes:

region: The initial region whose span you want to adjust.

Returns a region that is still centered on the same point of the map but whose span values are adjusted to fit in the map view's frame.

You can use this method to normalize the region values before displaying them in the map. This method returns a new region that both contains the specified region and fits neatly inside the map view's frame.

120.32.43 removeAnnotation(annotation as MKAnnotationMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Removes the specified annotation object from the map view.
Notes:

annotation: The annotation object to remove. This object must conform to the MKAnnotationMBS interface.

If the annotation is currently associated with an annotation view, and that view has a reuse identifier, this method removes the annotation view and queues it internally for later reuse. You can retrieve queued annotation views (and associate them with new annotations) using the dequeueReusableAnnotationViewWithIdentifier method.

Removing an annotation object disassociates it from the map view entirely, preventing it from being displayed on the map. Thus, you would typically call this method only when you want to hide or delete a given annotation.

120.32.44 removeAnnotations(annotations() as MKAnnotationMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Removes an array of annotation objects from the map view.
Notes:

annotations: The array of annotations to remove. Objects in the array must conform to the MKAnnotationMBS interface.

If any annotation object in the array has an associated annotation view, and if that view has a reuse identifier, this method removes the annotation view and queues it internally for later reuse. You can retrieve queued annotation views (and associate them with new annotations) using the dequeueReusableAnnotationViewWithIdentifier method.

Removing annotation objects disassociates them from the map view entirely, preventing them from being displayed on the map. Thus, you would typically call this method only when you want to hide or delete the specified annotations.

120.32.45 removeOverlay(overlay as MKOverlayMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Removes a single overlay object from the map.
Notes:

overlay: The overlay object to remove.

This method removes the overlay regardless of the level that it is in. Removing an overlay also removes its corresponding renderer, if one is in use. If the specified overlay is not currently associated with the map

view, this method does nothing.

120.32.46 removeOverlays(overlays() as MKOverlayMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Removes one or more overlay objects from the map.
Notes:

overlays: An array of objects, each of which conforms to the MKOverlayMBS interface.

This method removes the specified overlays regardless of which level each one is in. Removing an overlay also removes its corresponding renderer, if one is in use. If a given overlay object is not associated with the map view, it is ignored.

120.32.47 rendererForOverlay(overlay as MKOverlayMBS) as MKOverlayRendererMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the renderer object used to draw the contents of the specified overlay object.
Notes:

overlay: The overlay object whose renderer you want.

Returns the renderer object in use for the specified overlay or nil if the overlay is not onscreen.

This method returns the renderer object that your control provided in its xrendererForOverlay event.

120.32.48 selectAnnotation(annotation as MKAnnotationMBS, animated as boolean)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Selects the specified annotation and displays a callout view for it.
Notes:

annotation: The annotation object to select.
animated: If true, the callout view is animated into position.

If the specified annotation is not onscreen, and therefore does not have an associated annotation view, this method has no effect.

120.32.49 selectedAnnotations as MKAnnotationMBS()

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The annotations that are currently selected.
Notes: Assigning a new array to this property selects only the first annotation in the array.

120.32.50 setCamera(camera as MKMapCameraMBS, Animated as boolean = true)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Changes the camera used for determining the map's viewing parameters and optionally animates the change.
Notes:

camera: The camera object containing the viewing angle information. This parameter must not be nil.
animated: Specify true if you want the change in viewing angle to be animated or false if you want the map to reflect the changes without animations.

120.32.51 setCenterCoordinate(centerCoordinate as CLLocationCoordinate2DMBS, zoomLevel as double, animated as boolean)

MBS MacFrameworks Plugin, Plugin Version: 19.5, Platform: macOS, Targets: Desktop & iOS.

Function: hanges the center coordinate of the map with zoom and optionally animates the change.
Notes:

Zoomlevel is in range 1 to 20.

Latitude and Longitude in coordinate: The new center coordinate for the map.
animated: Specify true if you want the map view to scroll to the new location or false if you want the map to display the new location immediately.

Changing the center coordinate centers the map on the new coordinate without changing the current zoom level. It also updates the value in the region property to reflect the new center coordinate and the new span values needed to maintain the current zoom level.
See also:

- 120.32.52 setCenterCoordinate(coordinate as CLLocationCoordinate2DMBS, Animated as boolean = true)

120.32.52 setCenterCoordinate(coordinate as CLLocationCoordinate2DMBS, Animated as boolean = true)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Changes the center coordinate of the map and optionally animates the change.
Notes:

Latitude and Longitude in coordinate: The new center coordinate for the map.
animated: Specify true if you want the map view to scroll to the new location or false if you want the map to display the new location immediately.

Changing the center coordinate centers the map on the new coordinate without changing the current zoom level. It also updates the value in the region property to reflect the new center coordinate and the new span values needed to maintain the current zoom level.
See also:

- 120.32.51 setCenterCoordinate(centerCoordinate as CLLocationCoordinate2DMBS, zoomLevel as double, animated as boolean) 19998

120.32.53 setRegion(c as CLLocationCoordinate2DMBS, animated as boolean = false)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop & iOS.

Function: Changes the currently visible region and optionally animates the change.
Notes: Same as SetRegion with MKCoordinateRegionMBS but reuses current coordinate span.
See also:

- 120.32.54 setRegion(region as MKCoordinateRegionMBS, animated as boolean = false) 19999

120.32.54 setRegion(region as MKCoordinateRegionMBS, animated as boolean = false)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Changes the currently visible region and optionally animates the change.
Example:

```
dim mapview as MKMapViewMBS // your mapview

// get current region
dim r as MKCoordinateRegionMBS = mapview.region

// make new span with double deltas
dim s as new MKCoordinateSpanMBS(r.span.latitudeDelta*2, r.span.longitudeDelta*2)
```

```
// make new region
dim n as new MKCoordinateRegionMBS(r.center, s)

// and zoom there
mapview.setRegion n, true
```

Notes:

region: The new region to display in the map view.
animated: Specify true if you want the map view to animate the transition to the new region or false if you want the map to center on the specified region immediately.

Changing just the center coordinate of the region can still cause the span values to change implicitly. The span values might change because that the distances represented by a span change at different latitudes and longitudes and the map view may need to adjust the span to account for the new location. If you want to change the center coordinate without changing the zoom level, use the setCenterCoordinate instead.

When setting a new region, the map may adjust the value in the region parameter so that it fits the visible area of the map precisely. This adjustment is normal and is done to ensure that the value in the region property always reflects the visible portion of the map. However, it does mean that if you get the value of that property right after calling this method, the returned value may not match the value you set. (You can use the regionThatFits method to determine the region that will actually be set by the map.)
See also:

- 120.32.53 setRegion(c as CLLocationCoordinate2DMBS, animated as boolean = false) 19999

120.32.55 setVisibleMapRect(coordinate as MKMapRectMBS, Animated as boolean = true)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Changes the currently visible portion of the map and optionally animates the change.
Notes:

mapRect: The map rectangle to make visible in the map view.
animate: Specify true if you want the map view to animate the transition to the new map rectangle or false if you want the map to center on the specified rectangle immediately.
See also:

- 120.32.56 setVisibleMapRect(mapRect as MKMapRectMBS, edgePaddingLeft as Double, edgePaddingTop as Double, edgePaddingRight as Double, edgePaddingBottom as Double, animated as boolean) 20001

120.32.56 setVisibleMapRect(mapRect as MKMapRectMBS, edgePaddingLeft as Double, edgePaddingTop as Double, edgePaddingRight as Double, edgePaddingBottom as Double, animated as boolean)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Changes the currently visible portion of the map, allowing you to specify additional space around the edges.
Notes:

MapRect: The map rectangle to make visible in the map view.
edgePaddingLeft, edgePaddingTop, edgePaddingRight and edgePaddingBottom: The amount of additional space (measured in screen points) to make visible around the specified rectangle.
animate: Specify true if you want the map view to animate the transition to the new map rectangle or false if you want the map to center on the specified rectangle immediately.
See also:

- 120.32.55 setVisibleMapRect(coordinate as MKMapRectMBS, Animated as boolean = true) 20000

120.32.57 setZoomLevel(zoomLevel as double, animated as boolean)

MBS MacFrameworks Plugin, Plugin Version: 19.5, Platform: macOS, Targets: Desktop & iOS.

Function: Sets zoom level.
Notes: Zoomlevel is in range 1 to 20.

120.32.58 showAddress(address as string)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Convenience method to run an address geocoding and shows position on map.
Example:

```
dim mapview as MKMapViewMBS // your map view
mapView.showAddress "Markt 15, Andernach, Deutschland"
```

Notes: Uses CLGeocoderMBS geocodeAddressString method to asynchronously find the place and show it on the map.

120.32.59 showAnnotations(annotations() as MKAnnotationMBS, animated as boolean)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the visible region so that the map displays the specified annotations.
Notes:

annotations: The annotations that you want to be visible in the map.
animated: true if you want the map region change to be animated, or NO if you want the map to display the new region immediately without animations.

Calling this method updates the value in the region property and potentially other properties to reflect the new map region.

120.32.60 viewForAnnotation(annotation as MKAnnotationMBS) as MKAnnotationViewMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the annotation view associated with the specified annotation object, if any.
Example:

```
Function viewForAnnotation(mapView as MKMapViewMBS, annotation as MKAnnotationMBS) Handles
viewForAnnotation as MKAnnotationViewMBS
// return nil for default annotation view

// new annotation view
Dim v As New MKAnnotationViewMBS(annotation)

// get a picture and use it as decoration
Dim pic As Picture = LogoMBS(100)
Dim img As New NSImageMBS(pic)
img.setSize(pic.Width/2, pic.Height/2) // half size gives 2x resolution, if the picture isn't retina aware

// set image and return
v.image = img

Return v
End Function
```

Notes:

annotation: The annotation object whose view you want.

Returns the annotation view or nil if the view has not yet been created. This method may also return nil if the annotation is not in the visible map region and therefore does not have an associated annotation view.

120.32.61 Properties

120.32.62 annotationVisibleRect as NSRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The visible rectangle where annotation views are currently being displayed.
Notes: (Read only property)

120.32.63 camera as MKMapCameraMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The camera used for determining the appearance of the map.
Notes:

A camera object defines a point above the map's surface from which to view the map. Applying a camera to a map can have the effect of giving the map a 3D-like appearance. You can use a camera to rotate the map so that it is oriented to match the user's heading or to apply a pitch angle to tilt the plane of the map. (You can check the map's pitchEnabled property to determine whether the map can be pitched.)

Assigning a new camera to this property updates the map immediately and without animating the change. If you want to animate changes in camera position, use the setCamera method instead.

You must not set this property to nil. To restore the map to a flat appearance, apply a camera with a pitch angle of 0, which yields a camera looking straight down onto the map surface.
(Read and Write property)

120.32.64 centerCoordinate as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The map coordinate at the center of the map view.
Example:

```
dim mapview as MKMapViewMBS // your map view
dim centerCoordinate as CLLocationCoordinate2DMBS = mapview.centerCoordinate

// show center
MsgBox str(centerCoordinate.latitude)+" "+str(centerCoordinate.longitude)
```

Notes:

Changing the value in this property centers the map on the new coordinate without changing the current zoom level. It also updates the values in the region property to reflect the new center coordinate and the new span values needed to maintain the current zoom level.

Changing the value of this property updates the map view immediately. If you want to animate the change, use the setCenterCoordinate method instead.
(Read and Write property)

120.32.65 mapType as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The type of data displayed by the map view.
Example:

```
dim mapview as MKMapViewMBS // your map view
mapView.mapType = mapView.MKMapTypeHybrid
```

Notes:

Changing the value in this property may cause the receiver to begin loading new map content. For example, changing from MKMapTypeStandard to MKMapTypeSatellite might cause it to begin loading the satellite imagery needed for the map. If new data is needed, however, it is loaded asynchronously and appropriate messages are sent to the receiver's delegate indicating the status of the operation.
(Read and Write property)

120.32.66 PitchEnabled as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the map camera's pitch information is used.
Notes:

When this property is set to true and a valid camera is associated with the map, the camera's pitch angle is used to tilt the plane of the map. When this property is set to NO, the camera's pitch angle is ignored and the map is always displayed as if the user is looking straight down onto it.
In an app, always check the value of this property to determine whether a map can support 3D.
(Read and Write property)

120.32.67 region as MKCoordinateRegionMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The area currently displayed by the map view.
Notes:

The region encompasses both the latitude and longitude point on which the map is centered and the span of coordinates to display. The span values provide an implicit zoom value for the map. The larger the displayed area, the lower the amount of zoom. Similarly, the smaller the displayed area, the greater the amount of zoom.

Changing only the center coordinate of the region can still cause the span to change implicitly. The span might change because the distances represented by a span change at different latitudes and longitudes and the map view may need to adjust the span to account for the new location. If you want to change the center coordinate without changing the zoom level, use the centerCoordinate instead.

Changing the value of this property updates the map view immediately. When setting this property, the map may adjust the new region value so that it fits the visible area of the map precisely. This is normal and is done to ensure that the value in this property always reflects the visible portion of the map. However, it does mean that if you get the value of this property right after setting it, the returned value may not match the value you set. (You can use the regionThatFits method to determine the region that will actually be set by the map.)

If you want to animate the change in region, use the setRegion method instead.
(Read and Write property)

120.32.68 RotateEnabled as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the map camera's heading information is used.
Notes:

When this property is set to true and a valid camera is associated with the map, the camera's heading angle is used to rotate the plane of the map around its center point. When this property is set to false, the camera's heading angle is ignored and the map is always oriented so that true north is situated at the top of the map view.
(Read and Write property)

120.32.69 scrollEnabled as Boolean

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the user may scroll around the map.
Notes:

This property controls only user interactions with the map. If you set the value of this property to NO, you may still change the map location programmatically by changing the value in the region property.

The default value of this property is true.
(Read and Write property)

120.32.70 showsBuildings as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean indicating whether the map displays extruded building information.
Notes:

When this property is set to YES and the camera has a pitch angle greater than zero, the map extrudes buildings so that they extend above the map plane, creating a 3D effect. The mapType property must be set to MapTypeStandard for extruded buildings to be displayed. The default value of this property is true.
(Read and Write property)

120.32.71 ShowsCompass as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean indicating whether the map displays a compass control.
Notes:

Use this property to show or hide a control that lets users change the heading orientation of the map.
(Read and Write property)

120.32.72 showsPointsOfInterest as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean indicating whether the map displays point-of-interest information.
Notes:

When this property is set to true, the map displays icons and labels for restaurants, schools, and other relevant points of interest. The mapType property must be set to MapTypeStandard or MapTypeHybrid for points of interest to be displayed. The default value of this property is true.
(Read and Write property)

120.32.73 showsScale as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean indicating whether the map shows scale information.
Notes:

The default value of this property is false.
(Read and Write property)

120.32.74 showsTraffic as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the map displays traffic information.
Notes:

The mapType property must be set to MapTypeStandard or MapTypeHybrid for traffic information to be shown. The default value of this property is false.
(Read and Write property)

120.32.75 showsUserLocation as Boolean

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the map should try to display the user's location.
Notes:

This property does not indicate whether the user's position is actually visible on the map, only whether the map view should try to display it. Setting this property to true causes the map view to use the Core Location framework to find the current location and try to display it on the map. As long as this property is true, the map view continues to track the user's location and update it periodically. The default value of this property is false.

Showing the user's location does not guarantee that the location is visible on the map. The user might have scrolled the map to a different point, causing the current location to be offscreen. To determine whether the user's current location is currently displayed on the map, use the userLocationVisible property.
(Read and Write property)

120.32.76 showsZoomControls as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean indicating whether the map displays zoom controls.
Notes:

In macOS, use this property to show or hide the controls that let users change the zoom level of the map.
(Read and Write property)

120.32.77 userLocation as MKUserLocationMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The annotation object representing the user's current location.
Notes: (Read only property)

120.32.78 userLocationVisible as Boolean

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the device's current location is visible in the map view.
Notes:

This property tells you whether the icon used to represent the user's current location is visible in the map view. When determining whether the current location is visible, this property factors in the horizontal accuracy of the location data. Specifically, if the rectangle represented by the user's current location plus or minus minus the horizontal accuracy of that location intersects the map's visible rectangle, this property contains the value true. If that location rectangle does not intersect the map's visible rectangle, this property contains the value false.

If the user's location cannot be determined, this property contains the value false.
(Read only property)

120.32.79 visibleMapRect as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The area currently displayed by the map view.
Notes:

This property represents the same basic information as the region property but specified as a map rectangle instead of a region.
Changing the value of this property updates the map view immediately. If you want to animate the change, use the setVisibleMapRect method instead.
(Read and Write property)

120.32.80 zoomEnabled as Boolean

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the user may use pinch gestures to zoom in and out of the map.
Notes:

This property controls only user interactions with the map. If you set the value of this property to NO, you may still change the zoom level programmatically by changing the value in the region property.

The default value of this property is true.
(Read and Write property)

120.32.81 zoomLevel as Double

MBS MacFrameworks Plugin, Plugin Version: 19.5, Platform: macOS, Targets: Desktop & iOS.

Function: Queries current zoom level.
Example:

```
dim m as MKMapViewMBS // your map view

// zoom in one level
m.zoomLevel = m.zoomLevel + 1
```

Notes:

A value between 1 and 20.
(Read and Write property)

120.32.82 Constants

120.32.83 ErrorDirectionsNotFound = 4

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the error constants for the Map Kit framework.
Notes: The specified directions could not be found.

120.32.84 ErrorLoadingThrottled = 2

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the error constants for the Map Kit framework.
Notes:

The data was not loaded because data throttling is in effect.
This error can occur if an app makes frequent requests for data over a short period of time.

120.32.85 ErrorPlacemarkNotFound = 3

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the error constants for the Map Kit framework.
Notes: The specified placemark could not be found.

120.32.86 ErrorServerFailure = 1

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the error constants for the Map Kit framework.
Notes: The map server was unable to return the desired information.

120.32.87 ErrorUnknown = 0

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the error constants for the Map Kit framework.
Notes: An unknown error occurred.

120.32.88 FeatureVisibilityAdaptive = 0

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants indicating the visibility of different map features.
Notes: For features in the normal state, title text is displayed and subtitle text is hidden. When a feature is selected, the title and subtitle text are hidden when the feature requires a callout.

120.32.89 FeatureVisibilityHidden = 1

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants indicating the visibility of different map features.
Notes: Always hidden.

120.32.90 FeatureVisibilityVisible = 2

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants indicating the visibility of different map features.
Notes: Always visible.

120.32.91 MapTypeHybrid = 2

MBS MacFrameworks Plugin, Plugin Version: 14.1.

Function: One of the map types.
Notes: Displays a satellite image of the area with road and road name information layered on top.

120.32.92 MapTypeHybridFlyover = 4

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the map type constants.
Notes: A hybrid satellite image with flyover data where available.

120.32.93 MapTypeMutedStandard = 5

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the map type constants.
Notes: A street map where your data is emphasized over the underlying map details.

120.32.94 MapTypeSatellite = 1

MBS MacFrameworks Plugin, Plugin Version: 14.1.

Function: One of the map types.
Notes: Displays satellite imagery of the area.

120.32.95 MapTypeSatelliteFlyover = 3

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the map type constants.
Notes: A satellite image of the area with flyover data where available.

120.32.96 MapTypeStandard = 0

MBS MacFrameworks Plugin, Plugin Version: 14.1.

Function: One of the map types.
Notes: Displays a street map that shows the position of all roads and some road names.

120.32.97 OverlayLevelAboveLabels = 1

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants indicating the position of overlays relative to other content.
Notes: Above labels

120.32.98 OverlayLevelAboveRoads = 0

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants indicating the position of overlays relative to other content.
Notes: Above roads

120.33 class MKMarkerAnnotationViewMBS

120.33.1 class MKMarkerAnnotationViewMBS

MBS MacFrameworks Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop & iOS.

Function: An annotation view that displays a balloon-shaped marker at the designated location.
Notes:

Return an instance of this class from the viewForAnnotation event of your map view delegate when you want to display the same types of markers used in the Maps app.
The default displayPriority for an instance of this class is FeatureDisplayPriorityDefaultLow.

Available on macOS 11.0
Subclass of the MKAnnotationViewMBS class.

120.33.6 Methods

120.33.7 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Returns true on macOS 11.0 and newer.

120.33.8 Constructor(annotation as MKAnnotationMBS, reuseIdentifier as string = """, EnableEvents as Boolean = false)

MBS MacFrameworks Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.
See also:

- 120.33.9 Constructor(Handle as Integer) 20014

120.33.9 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKMarkerAnnotationView reference from a declare.
The object is retained.
See also:

- 120.33.8 Constructor(annotation as MKAnnotationMBS, reuseIdentifier as string = """, EnableEvents as Boolean = false) 20014

120.33.10 Properties

120.33.11 animatesWhenAdded as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean that indicates whether the marker animates into position onscreen.
Notes:

The default value of this property is false.
(Read and Write property)

120.33.12 glyphImage as NSImageMBS

MBS MacFrameworks Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop & iOS.

Function: An image to display in the marker balloon.
Notes:

Use this property or the glyphText property to specify the marker balloon content. If you specify both an image and text, MapKit displays the text.
MapKit displays the glyph image when the marker is in the normal state. Create glyph images as template images so that MapKit can apply the glyph tint color to the image. Normally, you set the size of this image to 20 by 20 points on iOS and 40 by 40 points on tvOS. However, if you don't provide a separate selected image in the selectedGlyphImage property, make the size of this image 40 by 40 points on iOS and 60 by 40 points on tvOS instead. MapKit scales images that are larger or smaller than those sizes.
(Read and Write property)

120.33.13 glyphText as String

MBS MacFrameworks Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop & iOS.

Function: The text to display in the marker balloon.
Notes:

Use this property or the glyphText property to specify the marker balloon content. If you specify both an image and text, MapKit displays the text.
MapKit limits the amount of space available for displaying your glyph text. Specify no more than two or three characters for any strings you assign to this property.
(Read and Write property)

120.33.14 glyphTintColor as NSColorMBS

MBS MacFrameworks Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop & iOS.

Function: The color to apply to the glyph text or image.
Notes:

The default value of this property is nil, which applies the standard tint color for the current map style.
(Read and Write property)

120.33.15 markerTintColor as NSColorMBS

MBS MacFrameworks Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop & iOS.

Function: The background color of the marker balloon.
Notes:

The default value of this property is nil, which applies the standard color that's appropriate for the current map style.

(Read and Write property)

120.33.16 selectedGlyphImage as NSImageMBS

MBS MacFrameworks Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop & iOS.

Function: An image to display when the user selects the marker.
Notes:

MapKit displays the glyph image when the marker is in the selected state. If you specify an image for this property, you should also specify an image in the glyphImage property.
Create glyph images as template images so that MapKit can apply the glyph tint color to the image. Set the size of this image to 40 by 40 points on iOS and 60 by 40 points on tvOS. MapKit scales images that are larger or smaller than those sizes.
(Read and Write property)

120.33.17 subtitleVisibility as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop & iOS.

Function: The visibility of the subtitle text rendered beneath the marker balloon.
Notes:

MapKit shows the text when the user selects a marker.
(Read and Write property)

120.33.18 titleVisibility as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop & iOS.

Function: The visibility of the title text rendered beneath the marker balloon.
Notes: (Read and Write property)

120.33.19 Constants

120.33.20 FeatureVisibilityAdaptive = 0

MBS MacFrameworks Plugin, Plugin Version: 20.4.

Function: One of the feature visibility constants.
Notes: A constant indicating that the feature adapts to the current map state.

120.33.21 FeatureVisibilityHidden = 1

MBS MacFrameworks Plugin, Plugin Version: 20.4.

Function: One of the feature visibility constants.
Notes: A constant indicating that the feature is always hidden.

120.33.22 FeatureVisibilityVisible = 2

MBS MacFrameworks Plugin, Plugin Version: 20.4.

Function: One of the feature visibility constants.
Notes: A constant indicating that the feature is always visible.

120.34 class MKMultiPointMBS

120.34.1 class MKMultiPointMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The MKMultiPoint class is an abstract superclass used to define shapes composed of multiple points.
Notes:

You should not create instances of this class directly. Instead, you should create instances of the MKPolyline or MKPolygon classes. However, you can use the method and properties of this class to access information about the specific points associated with the line or polygon.
Subclass of the MKShapeMBS class.

120.34.9 Coordinates as MKMapPointMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Queries list of coordinates for all the points.

120.34.10 points as MKMapPointMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Queries array with points.

120.34.11 Properties

120.34.12 pointCount as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Queries number of points for this multi point object.
Notes: (Read only property)

120.35 class MKMultiPolygonMBS

120.35.1 class MKMultiPolygonMBS

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A collection of multiple closed polygon shapes.
Notes:

Use a MKMultiPolygon when you have multiple distinct polygon shapes that you intend to render using the same style.
Available on macOS 10.15 and iOS 13 or newer.
Subclass of the MKShapeMBS class.

120.35.2 Blog Entries

Interfaces: MKOverlayMBS

120.35.4 Methods

120.35.5 boundingMapRect as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The projected rectangle that encompasses the overlay.
Notes:

This property contains the smallest rectangle that completely encompasses the overlay. Implementers of this interface must set this area when implementing their overlay class, and after setting it, you must not change it. The rectangle should be specified using projected coordinates—that is, coordinates obtained by projecting the globe onto a two-dimensional surface.

Part of the MKOverlayMBS interface.

120.35.6 canReplaceMapContent as Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Returns a Boolean indicating whether the overlay content replaces the underlying map content.
Notes:

true if the map view can skip the loading and drawing of the underlying map tiles or false if the map tiles should still be drawn.

The map view uses the return value of this method as a hint to determine whether it should load and render its tiles. If your overlay covers its designated region entirely with opaque content, and effectively replaces the content of underlying map tiles, implement this method and return true. Doing so alleviates the need for the map to render its tiles.
If you do not implement this method, or if you return false from it, the map view continues to load and render its tiles.

Part of MKOverlayMBS interface.

120.35.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The private constructor.

120.35.8 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKMultiPolygon reference from a declare.
The object is retained.
See also:

- 120.35.7 Constructor 20021
- 120.35.9 Constructor(polygons() as MKPolygonMBS) 20022

120.35.9 Constructor(polygons() as MKPolygonMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Create a multipolygon object using the provided polygons.
See also:

- 120.35.7 Constructor 20021
- 120.35.8 Constructor(Handle as Integer) 20021

120.35.10 coordinate as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The center point of the circular area, specified as a latitude and longitude.

120.35.11 intersectsMapRect(mapRect as MKMapRectMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Whether this overlay intersects with the given map rectangle.
Notes: Part of the MKOverlayMBS interface.

120.35.12 multiPolygon(polygons() as MKPolygonMBS) as MKMultiPolygonMBS

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Create a multipolygon object using the provided polygons.

120.35.13 polygons as MKPolygonMBS()

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: An array containing the polygons that make up the multipolygon object.

120.36 class MKMultiPolygonRendererMBS

120.36.1 class MKMultiPolygonRendererMBS

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The visual representation for a multipolygon overlay.
Notes:

Use this renderer to provide the style for multiple polygons created using MKMultiPolygonMBS.
Available on macOS 10.15 and iOS 13 or newer.
Subclass of the MKOverlayPathRendererMBS class.

120.36.4 Methods

120.36.5 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKMultiPolygonRenderer reference from a declare.
The object is retained.
See also:

- 120.36.6 Constructor(multiPolygon as MKMultiPolygonMBS) 20023

120.36.6 Constructor(multiPolygon as MKMultiPolygonMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Initializes and returns a renderer that handles drawing for the specified multipolygon overlay object.
See also:

- 120.36.5 Constructor(Handle as Integer) 20023

120.36.7 Properties

120.36.8 multiPolygon as MKMultiPolygonMBS

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The multipolygon object that the renderer uses to draw the overlay's contents.
Notes: (Read only property)

120.37 class MKMultiPolylineMBS

120.37.1 class MKMultiPolylineMBS

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A collection of multipolyline shapes, each consisting of one or more connected line segments.
Notes:

Use a MKMultiPolyline object when you have multiple distinct polyline shapes that you intend to render using the same style.
Available on macOS 10.15 and iOS 13 or newer.
Subclass of the MKShapeMBS class.

120.37.2 Blog Entries

Interfaces: MKOverlayMBS

120.37.4 Methods

120.37.5 boundingMapRect as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The projected rectangle that encompasses the overlay.
Notes:

This property contains the smallest rectangle that completely encompasses the overlay. Implementers of this interface must set this area when implementing their overlay class, and after setting it, you must not change it. The rectangle should be specified using projected coordinates—that is, coordinates obtained by projecting the globe onto a two-dimensional surface.

Part of the MKOverlayMBS interface.

120.37.6 canReplaceMapContent as Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Returns a Boolean indicating whether the overlay content replaces the underlying map content.
Notes:

true if the map view can skip the loading and drawing of the underlying map tiles or false if the map tiles should still be drawn.

The map view uses the return value of this method as a hint to determine whether it should load and render its tiles. If your overlay covers its designated region entirely with opaque content, and effectively replaces the content of underlying map tiles, implement this method and return true. Doing so alleviates the need for the map to render its tiles.
If you do not implement this method, or if you return false from it, the map view continues to load and render its tiles.

Part of MKOverlayMBS interface.

120.37.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The private constructor.

120.37.9 Constructor(polylines() as MKPolylineMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Create a multipolyline object using the provided polylines.
See also:

- 120.37.7 Constructor 20026
- 120.37.8 Constructor(Handle as Integer) 20026

120.37.10 coordinate as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The center point of the circular area, specified as a latitude and longitude.

120.37.11 intersectsMapRect(mapRect as MKMapRectMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Whether this overlay intersects with the given map rectangle.
Notes: Part of the MKOverlayMBS interface.

120.37.12 multiPolyline(polylines() as MKPolylineMBS) as MKMultiPolylineMBS

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Create a multipolyline object using the provided polylines.

120.37.13 polylines as MKPolylineMBS()

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: An array containing the polyline objects that make up the multipolyline object.

120.38 class MKMultiPolylineRendererMBS

120.38.1 class MKMultiPolylineRendererMBS

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The visual representation for a multipolygon overlay.
Notes:

Use this renderer to provide the style for multiple polygons created using MKMultiPolygonMBS.
Available on macOS 10.15 and iOS 13 or newer.
Subclass of the MKOverlayPathRendererMBS class.

Function: Initializes and returns a renderer that handles drawing for the specified multipolygon overlay object.
See also:

- 120.38.5 Constructor(Handle as Integer) 20028

120.38.7 Properties

120.38.8 multiPolyline as MKMultiPolylineMBS

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The multipolygon object that the renderer uses to draw the overlay's contents.
Notes: (Read only property)

120.39 class MKOverlayPathRendererMBS

120.39.1 class MKOverlayPathRendererMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The visual representation for a path-based overlay.
Notes:

Use this renderer when your overlay's shape is defined by a CGPath object. By default, this renderer fills and strokes the path using its current attributes.
You can use this class as-is or subclass to define additional drawing behaviors. If you subclass, you should override the createPath method and use that method to build the appropriate path object. To change the path, invalidate it and recreate the path using whatever new data your subclass has obtained.
Subclass of the MKOverlayRendererMBS class.

120.39.4 Methods

120.39.5 applyFillProperties(context as CGContextMBS, zoomScale as double)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Applies the receiver's current fill-related drawing properties to the specified graphics context.
Notes:

context: The graphics context used to draw the view's contents.
zoomScale: The current zoom scale used for drawing.

This is a convenience method for applying all of the drawing properties used when filling a path. This method applies the current fill color to the specified graphics context.

120.39.6 applyStrokeProperties(context as CGContextMBS, zoomScale as double)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Applies the receiver's current stroke-related drawing properties to the specified graphics context.
Notes:

context: The graphics context used to draw the view's contents.
zoomScale: The current zoom scale used for drawing.

This is a convenience method for applying all of the drawing properties used when stroking a path. This method applies the stroke color, line width, line join, line cap, miter limit, line dash phase, and line dash attributes to the specified graphics context. This method applies the scale factor in the zoomScale parameter to the line width and line dash pattern automatically so that lines scale appropriately.
This method does not save the current graphics state before applying the new attributes. If you want to preserve the existing state, you must save it yourself and restore it later when you finish drawing.

120.39.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.
See also:

- 120.39.8 Constructor(Handle as Integer) 20031

120.39.8 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKOverlayPathRenderer reference from a declare.
The object is retained.
See also:

- 120.39.7 Constructor 20031

120.39.9 createPath

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates the path for the overlay.
Notes: The default implementation of this method does nothing. Subclasses should override it and use it to create the CGPathRef data type to be used for drawing. After creating the path, your implementation should assign it to the path property.

120.39.10 fillPath(path as CGPathMBS, context as CGContextMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Fills the area enclosed by the specified path.
Notes:

path: The path to fill.
context: The graphics context in which to draw the path.

You must set the current fill color before calling this method. Typically you do this by calling the applyFillProperties method prior to drawing. If the fillColor property is currently nil, this method does nothing.

120.39.11 GetLineDashPattern as Integer()

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: An array of numbers specifying the dash pattern to use for the path.
Notes:

The array contains one or more numbers that indicate the lengths (measured in points) of the line segments and gaps in the pattern. The values in the array alternate, starting with the first line segment length, followed by the first gap length, followed by the second line segment length, and so on.
This property is set to nil by default, which indicates no line dash pattern.

120.39.12 invalidatePath

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Updates the path associated with the overlay renderer.
Notes: Call this method when a change in the path information would require you to recreate the overlay's path. This method sets the path property to nil and tells the overlay renderer to redisplay its contents.

120.39.13 SetLineDashPattern(values() as Integer)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Sets an array of numbers specifying the dash pattern to use for the path.
Notes:

The array contains one or more numbers that indicate the lengths (measured in points) of the line segments and gaps in the pattern. The values in the array alternate, starting with the first line segment length, followed by the first gap length, followed by the second line segment length, and so on.
This property is set to nil by default, which indicates no line dash pattern.

120.39.14 strokePath(path as CGPathMBS, context as CGContextMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Draws a line along the specified path.
Notes:

path: The path to draw.
context: The graphics context in which to draw the path.

You must set the current stroke color before calling this method. Typically you do this by calling the applyStrokePropertiesToContext method prior to drawing. If the strokeColor property is currently nil, this method does nothing.

120.39.15 Properties

120.39.16 fillColor as NSColorMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The fill color to use for the path.
Notes: (Read and Write property)

120.39.17 lineCap as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The line cap style to apply to the open ends of the path.
Notes:

The line cap style is applied to the start and end points of any open subpaths. This property does not affect closed subpaths. The default line cap style is kCGLineCapRound.
(Read and Write property)

120.39.18 lineDashPhase as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The offset (in points) at which to start drawing the dash pattern.
Notes:

Use this property to start drawing a dashed line partway through a segment or gap. For example, a phase value of 6 for the patter 5-2-3-2 would cause drawing to begin in the middle of the first gap.
The default value of this property is 0.
(Read and Write property)

120.39.19 lineJoin as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The line join style to apply to corners of the path.
Notes:

The default line join style is kCGLineJoinRound.
(Read and Write property)

120.39.20 lineWidth as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The stroke width to use for the path.
Notes:

The default value of this property is 0.
(Read and Write property)

120.39.21 miterLimit as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The limiting value that helps avoid spikes at junctions between connected line segments.
Notes:

The miter limit helps you avoid spikes in paths that use the kCGLineJoinMiter join style. If the ratio of the miter length—that is, the diagonal length of the miter join—to the line thickness exceeds the miter limit, the joint is converted to a bevel join. The default miter limit is 10, which results in the conversion of miters whose angle at the joint is less than 11 degrees.
(Read and Write property)

120.39.22 Path as CGPathMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The path representing the overlay's shape.
Notes:

Getting the value of this property causes the path to be created (using the createPath method) if it does not already exist. You can assign a path object to this property explicitly. When assigning a new path object to this property, the overlay renderer stores a strong reference to the path you provide.
(Read and Write property)

120.39.23 strokeColor as NSColorMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The stroke color to use for the path.
Notes: (Read and Write property)

120.40 class MKOverlayRendererMBS

120.40.1 class MKOverlayRendererMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The shared infrastructure used to draw overlays on the map surface.
Notes:

An overlay renderer draws the visual representation of an overlay object—that is, an object that conforms to the MKOverlayMBS interface. This class defines the drawing infrastructure used by the map view. Subclasses are expected to override the drawMapRect method to draw the contents of the overlay.
The Map Kit framework provides several concrete instances of overlay renderers. Specifically, it provides renderers for each of the concrete overlay objects. You can use one of these existing renderers or define your own subclasses if you want to draw the overlay contents differently.

120.40.4 Methods

120.40.5 canDrawMapRect(Rect as MKMapRectMBS, zoomScale as Double) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean value indicating whether the overlay view is ready to draw its content.
Notes:

mapRect: The map rectangle that needs to be updated.
zoomScale: The current scale factor applied to the map.

Returns true if this overlay renderer is ready to draw its contents on the map or false if it is not.

Overlay renderers can override this method in situations where they may depend on the availability of other information to draw their contents. For example, a renderer showing traffic information might want to delay drawing until it has all of the traffic data it needs. In such a case, it can return NO from this method to indicate that it is not ready. An overlay renderer might also return NO if it does not draw content in the

specified rectangle.

If you return NO from this method, your application is responsible for calling the setNeedsDisplayInMapRect method when the overlay renderer subsequently becomes ready to draw its contents.
The default implementation of this method returns true.

120.40.6 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKOverlayRenderer reference from a declare.
The object is retained.
See also:

- 120.40.7 Constructor(overlay as MKOverlayMBS) 20037

120.40.7 Constructor(overlay as MKOverlayMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns the overlay renderer and associates it with the specified overlay object.
Notes:

overlay: The overlay object to use when drawing the overlay content on the map. This object provides the data needed to draw the overlay's shape. The overlay renderer stores a strong reference to this object.
Return Value

Initially, the overlay renderer assumes that the overlay is fully opaque and that it has a content scale factor of 1.0. You can change these values as needed using the alpha and contentScaleFactor properties.
See also:

- 120.40.6 Constructor(Handle as Integer) 20037

120.40.8 drawMapRect(Rect as MKMapRectMBS, zoomScale as Double, context as CGContextMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Draws the overlay's contents at the specified location on the map.
Notes:

mapRect: The map rectangle that needs to be updated. Your drawing code should avoid drawing outside of this rectangle.
zoomScale: The current zoom factor applied to the map content. You can use this value for configuring the stroke width of lines or other attributes that might be affected by the scale of the map's contents.
context: The graphics context to use for drawing the overlay's contents.

The default implementation of this method does nothing. Subclasses are expected to override this method and use it to draw the overlay's contents.

When determining where to draw content, make your initial calculations relative to the map itself. In other words, compute the position and size of any overlay content using map points and map rectangles, convert those values to regular CGPoint and CGRect types using the methods of this class, and then pass the converted points to any drawing primitives.
It is recommended that you use Core Graphics to draw any content for your overlays.

To improve drawing performance, the map view may divide your overlay into multiple tiles and render each one on a separate thread. Your implementation of this method must therefore be capable of safely running from multiple threads simultaneously. In addition, you should avoid drawing the entire contents of the overlay each time this method is called. Instead, always take the mapRect parameter into consideration and avoid drawing content outside that rectangle.

120.40.9 mapPointForPoint(point as CGPointMBS) as MKMapPointMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the point on the map that corresponds to the specified point in the overlay renderer's drawing area.
Notes:

point: The point in the overlay's drawing area that you want to convert.
Returns the point on the two-dimensional map projection corresponding to the specified point.

120.40.10 mapRectForRect(Rect as CGRectMBS) as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the rectangle on the map that corresponds to the specified rectangle in the overlay renderer's drawing area.
Notes:

rect: The rectangle in the overlay's drawing area that you want to convert.

Returns the rectangle on the two-dimensional map projection corresponding to the specified rectangle.

120.40.11 pointForMapPoint(mapRect as MKMapPointMBS) as CGPointMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the point in the overlay renderer's drawing area corresponding to the specified point on the map.
Notes:

mapPoint: A point on the two-dimensional map projection. If you have a coordinate value (latitude and longitude), you can use the MKMapPointForCoordinate function to convert that coordinate to a map point.

Returns the point in the overlay's drawing area that corresponds to the map point.

120.40.12 RectForMapRect(mapRect as MKMapRectMBS) as CGRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the rectangle in the overlay renderer's drawing area corresponding to the specified rectangle on the map.
Notes:

mapRect: A rectangle on the two-dimensional map projection.

Returns the rectangle in the overlay's drawing area that corresponds to the map rectangle.

120.40.13 RoadWidthAtZoomScale(zoomScale as double) as double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the width (in screen points) of roads on a map at the specified zoom level.
Notes:

zoomScale: The scale factor currently applied to the map view.

Returns the width of roads, measured in screen points. You can use the returned value to set the width of lines in drawing code that traces the path of a road.

120.40.14 setNeedsDisplay

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Invalidates the entire contents of the overlay for all zoom scales.
Notes: This method causes the entire contents of the overlay to be redrawn during the next update cycle. This method invalidates the overlay regardless of the current zoom scale associated with the map.

120.40.15 setNeedsDisplayInMapRect(mapRect as MKMapRectMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Invalidates the specified portion of the overlay at all zoom scales.
Notes:

mapRect: The portion of the overlay to update. Specify this value using a map coordinates.

Marking a rectangle as invalid causes that portion of the overlay to be redrawn during the next update cycle. This method invalidates the overlay regardless of the current zoom scale associated with the map.
See also:

- 120.40.16 setNeedsDisplayInMapRect(mapRect as MKMapRectMBS, zoomScale as double) 20040

120.40.16 setNeedsDisplayInMapRect(mapRect as MKMapRectMBS, zoomScale as double)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Invalidates the specified portion of the overlay but only at the specified zoom scale.
Notes:

mapRect: The portion of the overlay to update. Specify this value using a map coordinates.
zoomScale: The zoom scale for which you want to invalidate the overlay.

Marking a rectangle as invalid causes that portion of the overlay to be redrawn during the next update cycle. This method invalidates the overlay only at the specified zoom scale.
See also:

- 120.40.15 setNeedsDisplayInMapRect(mapRect as MKMapRectMBS) 20040

120.40.17 Properties

120.40.18 alpha as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The amount of transparency to apply to the overlay.
Notes:

The value in this property can be in the range 0.0 to 1.0, where 0.0 represents total transparency and 1.0 represents total opacity. The default value of this property is 1.0.
(Read and Write property)

120.40.19 contentScaleFactor as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The scale factor used to draw the overlay's content.
Notes:

The scale factor determines how content is mapped from the logical coordinate space (measured in points) to the device coordinate space (measured in pixels). This value is typically either 1.0 or 2.0. Higher scale factors indicate that each point is represented by more than one pixel on the screen. For example, if the scale factor is 2.0 and the drawing rectangle size is 50 x 50 points, the size of the underlying area is 100 x 100 pixels.
When drawing the content for your overlays, you can use this value to determine how best to render your content.
(Read only property)

120.40.20 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

120.40.21 overlay as MKOverlayMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The overlay object containing the data for drawing.
Notes:

The overlay object contains the coordinate at which to draw the overlay and other information that your

app provides.
(Read only property)

120.41 class MKPinAnnotationViewMBS

120.41.1 class MKPinAnnotationViewMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The MKPinAnnotationView class provides a concrete annotation view that displays a pin icon like the ones found in the Maps application.
Notes:

Using this class, you can configure the type of pin to drop and whether you want the pin to be animated into place.
Subclass of the MKAnnotationViewMBS class.

120.41.10 greenPinColor as NSColorMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the standard color for green pins.
Notes: The system uses green pins to indicate starting points on the map.

120.41.11 purplePinColor as NSColorMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the standard color for purple pins.
Notes: The system uses purple pins to indicate user-specified points on the map.

120.41.12 redPinColor as NSColorMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the standard color for red pins.
Notes: The system uses red pins to indicate destination points on the map.

120.41.13 Properties

120.41.14 animatesDrop as Boolean

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Whether to animate the dropping of the pin.
Notes: (Read and Write property)

120.41.15 pinColor as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The color of the pin head.
Notes:

The Maps application uses different pin colors for different types of map annotations. Your own map annotation should use the available pin colors in the same way.
Deprecated in favor of pinTintColor.
(Read and Write property)

120.41.16 pinTintColor as NSColorMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The color of the pin head.
Notes:

Use this property to specify custom a custom color for your pin. You can also specify one of the standard pin colors.
(Read and Write property)

120.41.17 Constants

120.41.18 ColorBlue = 2

MBS MacFrameworks Plugin, Plugin Version: 14.1.

Function: One of the color constants.
Notes: The head of the pin is blue. Purple pins indicate user-specified points on the map.

120.41.19 ColorGreen = 1

MBS MacFrameworks Plugin, Plugin Version: 14.1.

Function: One of the color constants.
Notes: The head of the pin is green. Green pins indicate starting points on the map.

120.41.20 ColorRed = 0

MBS MacFrameworks Plugin, Plugin Version: 14.1.

Function: One of the color constants.
Notes: The head of the pin is red. Red pins indicate destination points on the map.

120.42 class MKPlacemarkMBS

120.42.1 class MKPlacemarkMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: A MKPlacemark object stores placemark data for a given latitude and longitude.
Notes:

Placemark data includes information such as the country, state, city, and street address associated with the specified coordinate. Placemark objects are typically generated by a MKReverseGeocoderMBS object, although you can also create them explicitly yourself.

A placemark is also an annotation and conforms to the MKAnnotationMBS interface, whose properties and methods include the placemark coordinate and other information. Because they are annotations, you can add them directly to the map view.
Subclass of the CLPlacemarkMBS class.

Interfaces: MKAnnotationMBS

120.42.6 Methods

120.42.7 Constructor(coordinate as CLLocationCoordinate2DMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a placemark object using the specified coordinate only.
See also:

- 120.42.8 Constructor(coordinate as CLLocationCoordinate2DMBS, addressDictionary as dictionary) 20048
- 120.42.9 Constructor(coordinate as CLLocationCoordinate2DMBS, postalAddress as Variant) 20048
- 120.42.10 Constructor(Handle as Integer) 20049

120.42.8 Constructor(coordinate as CLLocationCoordinate2DMBS, addressDictionary as dictionary)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a placemark object using the specified coordinate and Address Book dictionary.
Notes: You can create placemark objects manually for entities for which you already have address information, such as contacts in the Address Book. Creating a placemark object explicitly avoids the need to query the reverse geocoder object for the same information.
See also:

- 120.42.7 Constructor(coordinate as CLLocationCoordinate2DMBS) 20048
- 120.42.9 Constructor(coordinate as CLLocationCoordinate2DMBS, postalAddress as Variant) 20048
- 120.42.10 Constructor(Handle as Integer) 20049

120.42.9 Constructor(coordinate as CLLocationCoordinate2DMBS, postalAddress as Variant)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a placemark object using the specified coordinate and CNPostalAddressMBS object.
Notes: You can create placemark objects manually for entities for which you already have address information, such as contacts in the Address Book. Creating a placemark object explicitly avoids the need to query the reverse geocoder object for the same information.
See also:

- 120.42.7 Constructor(coordinate as CLLocationCoordinate2DMBS) 20048

120.42.11 Coordinate as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The coordinate of the annotation.
Notes: Part of the MKAnnotationMBS interface.

120.42.12 SetCoordinate(newCoordinate as CLLocationCoordinate2DMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Set the coordinate of the annotation.
Notes: Part of the MKAnnotationMBS interface.

120.42.13 SubTitle as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The subtitle of the item.
Notes: Part of the MKOverlayMBS interface.

120.42.14 Title as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The title of the annotation.
Notes: Part of the MKAnnotationMBS interface.

120.42.15 Properties

120.42.16 countryCode as String

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The abbreviated country name.
Notes:

This string is the standard abbreviation used to refer to the country. For example, if the placemark location was Apple's headquarters, the value for this property would be the string "US".
(Read only property)

120.43 class MKPointAnnotationMBS

120.43.1 class MKPointAnnotationMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The MKPointAnnotation class defines a concrete annotation object located at a specified point.
Example:

```
dim mapview as MKMapViewMBS // your map view

// new pin
dim pin as new MKPointAnnotationMBS

pin.coordinate = mapView.centerCoordinate
pin.title = "Hello"

// show on map
mapView.addAnnotation pin
```

Notes:

You can use this class, rather than define your own, in situations where all you want to do is associate a point on the map with a title.
Subclass of the MKShapeMBS class.

120.43.6 Methods

120.43.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.
Example:

```
dim mapview as MKMapViewMBS // your map view

// new pin
dim pin as new MKPointAnnotationMBS

pin.coordinate = mapView.centerCoordinate
pin.title = "Hello"

// show on map
mapView.addAnnotation pin
```

120.43.8 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKPointAnnotation reference from a declare.
The object is retained.
See also:

- 120.43.7 Constructor 20052

120.43.9 Properties

120.43.10 coordinate as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The coordinate point of the annotation, specified as a latitude and longitude.
Notes: (Read and Write property)

120.44 class MKPolygonMBS

120.44.1 class MKPolygonMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The MKPolygon class represents a shape consisting of one or more points that define a closed polygon.
Notes:

The points are connected end-to-end in the order they are provided. The first and last points are connected to each other to create the closed shape.

When creating a polygon, you can mask out portions of the polygon by specifying one or more interior polygons. For the polygons you specify, this class uses the even-odd fill rule to determine the final occupied area. When applied to overlapping polygons, this rule can cause specific regions to be masked out (and thereby removed) from the total occupied area. For more information about how fill rules are applied to paths, see "Paths" in Quartz 2D Programming Guide.
Subclass of the MKMultiPointMBS class.

- 19.2, page 49: Maps Part 9—Putting GPS Data on the Map, Helping out a fellow coder with the MapKitMBS plugin by Markus Winter

Interfaces: MKOverlayMBS

120.44.6 Methods

120.44.7 boundingMapRect as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The projected rectangle that encompasses the overlay.
Notes:

This property contains the smallest rectangle that completely encompasses the overlay. Implementers of this interface must set this area when implementing their overlay class, and after setting it, you must not change it. The rectangle should be specified using projected coordinates—that is, coordinates obtained by projecting the globe onto a two-dimensional surface.

Part of the MKOverlayMBS interface.

120.44.8 canReplaceMapContent as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean indicating whether the overlay content replaces the underlying map content.
Notes:

true if the map view can skip the loading and drawing of the underlying map tiles or false if the map tiles should still be drawn.

The map view uses the return value of this method as a hint to determine whether it should load and render its tiles. If your overlay covers its designated region entirely with opaque content, and effectively replaces the content of underlying map tiles, implement this method and return true. Doing so alleviates the need for the map to render its tiles.
If you do not implement this method, or if you return false from it, the map view continues to load and render its tiles.

Part of MKOverlayMBS interface.

120.44.9 Constructor

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.
See also:

- 120.44.10 Constructor(coords() as CLLocationCoordinate2DMBS) 20056

- 120.44.11 Constructor(coords() as CLLocationCoordinate2DMBS, InteriorPolygons() as MKPolygonMBS) 20056

- 120.44.14 Constructor(points() as MKMapPointMBS, InteriorPolygons() as MKPolygonMBS) 20058

120.44.10 Constructor(coords() as CLLocationCoordinate2DMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an MKPolygon object from the specified set of coordinates.
Notes:

coords: The array of coordinates defining the shape.
Returns a new polygon object.
See also:

- 120.44.9 Constructor 20055
- 120.44.11 Constructor(coords() as CLLocationCoordinate2DMBS, InteriorPolygons() as MKPolygonMBS) 20056

120.44.11 Constructor(coords() as CLLocationCoordinate2DMBS, InteriorPolygons() as MKPolygonMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an MKPolygon object from the specified set of map points and interior polygons.
Notes:

points: The array of map points defining the shape. The data in this array is copied to the new object.
interiorPolygons: An array of MKPolygon objects that define one or more cutout regions for the receiver's polygon.
See also:

- 120.44.9 Constructor 20055

- 120.44.14 Constructor(points() as MKMapPointMBS, InteriorPolygons() as MKPolygonMBS) 20058

120.44.13 Constructor(points() as MKMapPointMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an MKPolygon object from the specified set of map points.
Notes: points: The array of map points defining the shape. The data in this array is copied to the new object.
See also:

- 120.44.9 Constructor 20055

120.44.14 Constructor(points() as MKMapPointMBS, InteriorPolygons() as MKPolygonMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an MKPolygon object from the specified set of map points and interior polygons.
Notes:

points: The array of map points defining the shape. The data in this array is copied to the new object.
interiorPolygons: An array of MKPolygon objects that define one or more cutout regions for the receiver's polygon.
See also:

- 120.44.13 Constructor(points() as MKMapPointMBS) 20057

120.44.15 coordinate as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The coordinate of the annotation.
Notes: Part of the MKAnnotationMBS interface.

120.44.16 interiorPolygons as MKPolygonMBS()

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The array of polygons nested inside the receiver.
Notes: When a polygon is rendered on screen, the area occupied by any interior polygons is masked out and not considered part of the polygon.

120.44.17 intersectsMapRect(mapRect as MKMapRectMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this overlay intersects with the given map rectangle.
Notes: Part of the MKOverlayMBS interface.

120.44.18 polygonWithCoordinates(coords() as CLLocationCoordinate2DMBS) as MKPolygonMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an MKPolygon object from the specified set of coordinates.
Notes:

coords: The array of coordinates defining the shape.
Returns a new polygon object.
See also:

- 120.44.19 polygonWithCoordinates(coords() as CLLocationCoordinate2DMBS, InteriorPolygons() as MKPolygonMBS) as MKPolygonMBS 20059

120.44.19 polygonWithCoordinates(coords() as CLLocationCoordinate2DMBS, InteriorPolygons() as MKPolygonMBS) as MKPolygonMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an MKPolygon object from the specified set of coordinates and interior polygons.
Notes:

coords: The array of coordinates defining the shape.
interiorPolygons: An array of MKPolygon objects that define one or more cutout regions for the receiver's polygon.

Returns a new polygon object.
See also:

- 120.44.18 polygonWithCoordinates(coords() as CLLocationCoordinate2DMBS) as MKPolygonMBS 20059

120.44.20 polygonWithPoints(points() as MKMapPointMBS) as MKPolygonMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an MKPolygon object from the specified set of map points.
Notes: points: The array of map points defining the shape. The data in this array is copied to the new object.
See also:

- 120.44.21 polygonWithPoints(points() as MKMapPointMBS, InteriorPolygons() as MKPolygonMBS) as MKPolygonMBS 20060

120.44.21 polygonWithPoints(points() as MKMapPointMBS, InteriorPolygons() as MKPolygonMBS) as MKPolygonMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an MKPolygon object from the specified set of map points and interior polygons.
Notes:

points: The array of map points defining the shape. The data in this array is copied to the new object.
interiorPolygons: An array of MKPolygon objects that define one or more cutout regions for the receiver's polygon.
See also:

- 120.44.20 polygonWithPoints(points() as MKMapPointMBS) as MKPolygonMBS 20059

120.45 class MKPolygonRendererMBS

120.45.1 class MKPolygonRendererMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The visual representation for a polygon overlay.
Notes:

This renderer fills and strokes the polygon represented by first filling the shape and then stroking its outline. You can change the color and other drawing attributes of the polygon by modifying the properties inherited from the parent class. You typically use this class as is and do not subclass it.
Subclass of the MKOverlayPathRendererMBS class.

120.45.8 Constructor(polygon as MKPolygonMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a new renderer that handles drawing for the specified polygon overlay object.
Notes: polygon: The polygon overlay containing information about the area to be drawn. This object must have at least three points defining the polygon to draw. This parameter must not be nil.
See also:

• 120.45.7 Constructor(Handle as Integer) 20061

120.45.9 Properties

120.45.10 polygon as MKPolygonMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The polygon object that contains the information used to draw the overlay's contents.
Notes: (Read only property)

120.46 class MKPolylineMBS

120.46.1 class MKPolylineMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The MKPolyline class represents a shape consisting of one or more points that define connecting line segments.
Notes:

The points are connected end-to-end in the order they are provided. The first and last points are not connected to each other.
Subclass of the MKMultiPointMBS class.

Interfaces: MKOverlayMBS

120.46.6 Methods

120.46.7 boundingMapRect as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The projected rectangle that encompasses the overlay.
Notes:

This property contains the smallest rectangle that completely encompasses the overlay. Implementers of this interface must set this area when implementing their overlay class, and after setting it, you must not change it. The rectangle should be specified using projected coordinates—that is, coordinates obtained by projecting the globe onto a two-dimensional surface.

Part of the MKOverlayMBS interface.

120.46.8 canReplaceMapContent as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean indicating whether the overlay content replaces the underlying map content.
Notes:

true if the map view can skip the loading and drawing of the underlying map tiles or false if the map tiles should still be drawn.

The map view uses the return value of this method as a hint to determine whether it should load and render its tiles. If your overlay covers its designated region entirely with opaque content, and effectively replaces the content of underlying map tiles, implement this method and return true. Doing so alleviates the need for the map to render its tiles.
If you do not implement this method, or if you return false from it, the map view continues to load and render its tiles.

Part of MKOverlayMBS interface.

120.46.9 Constructor

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.
See also:

120.46.10 Constructor(coords() as CLLocationCoordinate2DMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an MKPolyline object from the specified set of coordinates.
Notes:

coords: The array of coordinates defining the shape. The data in this array is copied to the new object.
Returns a new polyline object.
See also:

- 120.46.9 Constructor 20064

120.46.13 coordinate as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The coordinate of the annotation.
Notes: Part of the MKAnnotationMBS interface.

120.46.14 intersectsMapRect(mapRect as MKMapRectMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this overlay intersects with the given map rectangle.
Notes: Part of the MKOverlayMBS interface.

120.46.15 polylineWithCoordinates(coords() as CLLocationCoordinate2DMBS) as MKPolylineMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an MKPolyline object from the specified set of coordinates.
Notes:

coords: The array of coordinates defining the shape. The data in this array is copied to the new object.
Returns a new polyline object.

120.46.16 polylineWithPoints(points() as MKMapPointMBS) as MKPolylineMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an MKPolyline object from the specified set of map points.
Notes: points: The array of map points defining the shape. The data in this array is copied to the new object.

120.47 class MKPolylineRendererMBS

120.47.1 class MKPolylineRendererMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The visual representation for any polyline overlay object.
Notes:

This renderer strokes the line only; it does not fill it. You can change the color and other drawing attributes of the polyline by modifying the properties inherited from the parent class. You typically use this class as is and do not subclass it.
Subclass of the MKOverlayPathRendererMBS class.

120.47.2 Blog Entries

120.47.3 Blog Entries

- MapKit Framework for Xojo

120.47.4 Methods

120.47.5 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKPolylineRenderer reference from a declare.
The object is retained.
See also:

- 120.47.6 Constructor(polyline as MKPolylineMBS) 20067

120.47.6 Constructor(polyline as MKPolylineMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a new overlay view using the specified polyline overlay object
Notes: polyline: The polyline overlay containing information about the area to be drawn. This object must

have at least two points defining the line segment to draw. This parameter must not be nil.
See also:

- 120.47.5 Constructor(Handle as Integer) 20067

120.47.7 Properties

120.47.8 polyline as MKPolylineMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The polyline overlay object that contains the information used to draw the overlay.
Notes: (Read only property)

120.48 class MKRouteMBS

120.48.1 class MKRouteMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A single route between a requested start and end point.
Notes:

An MKRouteMBS object defines the geometry for the route—that is, it contains line segments associated with specific map coordinates. A route object may also include other information, such as the name of the route, its distance, and the expected travel time.

You do not create instances of this class directly. When you use an MKDirectionsMBS object to request directions from Apple, the returned MKDirectionsResponseMBS object contains the possible routes.

120.48.4 Methods

120.48.5 advisoryNotices as String()

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: An array of advisory notice strings for the route.
Notes: This property contains an array of strings. Each string is localized according to the user's language preferences. The strings contain additional information that is important for the user to know about the route. For example, a string might note that a portion of the route is closed during the winter or after big storms.

120.48.6 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.
See also:

• 120.48.7 Constructor(Handle as Integer) 20070

120.48.7 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKRoute reference from a declare.
The object is retained.
See also:

• 120.48.6 Constructor 20069

120.48.8 steps as MKRouteStepMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The array of steps that comprise the overall route.
Notes: The array contains one or more MKRouteStep objects representing distinct portions of the route. Each step corresponds to a single direction that must be followed along the route.

120.48.9 Properties

120.48.10 distance as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The route distance in meters.
Notes:

This property reflects the distance that the user covers while traversing the path of the route. It is not a direct distance between the start and end points of the route.
(Read only property)

120.48.11 expectedTravelTime as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The expected travel time in seconds.
Notes:

This expected travel time reflects the time it takes to traverse the route under ideal conditions. The actual amount of time may vary based on conditions.
(Read only property)

120.48.12 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

120.48.13 name as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The name assigned to the route.
Notes:

The string in this property is localized according to the user's language preferences. You can display this string to the user from your app's user interface so that the user can distinguish one route from another. The string itself describes the route using one of the route's significant features. For example, a route that uses a major highway for a significant portion of the route might use that highway for its name.
(Read only property)

120.48.14 polyline as MKPolylineMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The detailed route geometry.
Notes:

The polyline object in this property reflects the complete path of the route, including all of its steps. You can use the polyline object as an overlay in a map view.
(Read only property)

120.48.15 transportType as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The overall route transport type.
Notes:

This property reflects the primary transport type used for the route. Individual steps of the route might use different transport types.
(Read only property)

120.48.16 Constants

120.48.17 TransportTypeAny = & h0FFFFFFF

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for any transportation option.

120.48.18 TransportTypeAutomobile = 1

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for use while driving.

120.48.19 TransportTypeTransit = 3

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for public transportation.

120.48.20 TransportTypeWalking = 2

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for a pedestrian.

120.49 class MKRouteStepMBS

120.49.1 class MKRouteStepMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: One portion of an overall route.
Notes:

Each MKRouteStepMBS object corresponds to a single instruction that would need to be followed by the user when navigating between two points. For example, a step might involve following a single road until a turn is required.

You do not create instances of this class directly. An MKRouteMBS object contains the MKRouteStepMBS objects associated with a route. For more information about requesting directions, see MKDirectionsMBS. This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MapKit Framework for Xojo

120.49.4 Methods

120.49.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

120.49.6 Properties

120.49.7 distance as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The step distance in meters.
Notes:

This property reflects the distance that the user covers while traversing the path of the step. It is not a direct distance between the start and end points of the step.
(Read only property)

120.49.8 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

120.49.9 instructions as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The written instructions for following the path represented by this step.
Notes:

The string in this property is localized according to the user's language preferences. You can present this string to the user from your app's interface.
(Read only property)

120.49.10 notice as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Additional notices that apply to the step.
Notes:

Notices may include legal information or warning notices that apply to the step. For example, if the step crosses railroad tracks, it might contain a notice that warns the user not to cross the tracks when the lights are flashing.
(Read only property)

120.49.11 polyline as MKPolylineMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The detailed step geometry.
Notes:

The polyline object in this property contains the geometry for this step. You can use the polyline object as an overlay in a map view.

(Read only property)

120.49.12 transportType as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The transport type of the step.
Notes:

This property reflects the transport type employed by the step and may differ from the transport type of the overall route.
(Read only property)

120.49.13 Constants

120.49.14 TransportTypeAny = & h0FFFFFFF

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for any transportation option.

120.49.15 TransportTypeAutomobile = 1

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for use while driving.

120.49.16 TransportTypeTransit = 3

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for public transportation.

120.49.17 TransportTypeWalking = 2

MBS MacFrameworks Plugin, Plugin Version: 19.0.

Function: One of the constants that specify the type of conveyance to be used.
Notes: Directions suitable for a pedestrian.

120.50 class MKShapeMBS

120.50.1 class MKShapeMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The MKShape class is an abstract class that defines the basic properties for all shape-based annotation objects.
Notes: This class must be subclassed and cannot be used as is. Subclasses are responsible for defining the geometry of the shape and providing an appropriate value for the coordinate property inherited from the MKAnnotationMBS interface.

Interfaces: MKAnnotationMBS

120.50.4 Methods

120.50.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.
See also:

- 120.50.6 Constructor(Handle as Integer) 20077

120.50.6 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKShape reference from a declare.
The object is retained.
See also:

- 120.50.5 Constructor 20077

120.50.7 Coordinate as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The coordinate of the annotation.
Notes: Part of the MKAnnotationMBS interface.

120.50.8 SetCoordinate(newCoordinate as CLLocationCoordinate2DMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Set the coordinate of the annotation.
Notes: Part of the MKAnnotationMBS interface.

120.50.9 SubTitle as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The subtitle of the item.
Notes: Part of the MKAnnotationMBS interface.
See also:

- 120.50.13 subtitle as String 20079

120.50.10 Title as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The title of the annotation.
Notes: Part of the MKAnnotationMBS interface.
See also:

(Read and Write property)
See also:

- 120.50.10 Title as String 20078

120.51 class MKTileOverlayMBS

120.51.1 class MKTileOverlayMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: MKTileOverlay represents a data source for raster image tiles in the spherical mercator projection (EPSG:3857).

120.51.2 Blog Entries

- MapKit Framework for Xojo

120.51.3 Blog Entries

- MapKit Framework for Xojo

Interfaces: MKOverlayMBS, MKAnnotationMBS

120.51.4 Methods

120.51.5 boundingMapRect as MKMapRectMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The projected rectangle that encompasses the overlay.
Notes:

This property contains the smallest rectangle that completely encompasses the overlay. Implementers of this interface must set this area when implementing their overlay class, and after setting it, you must not change it. The rectangle should be specified using projected coordinates—that is, coordinates obtained by projecting the globe onto a two-dimensional surface.

Part of the MKOverlayMBS interface.

120.51.6 canReplaceMapContent as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean indicating whether the overlay content replaces the underlying map content.
Notes:

true if the map view can skip the loading and drawing of the underlying map tiles or false if the map tiles should still be drawn.

The map view uses the return value of this method as a hint to determine whether it should load and render its tiles. If your overlay covers its designated region entirely with opaque content, and effectively replaces the content of underlying map tiles, implement this method and return true. Doing so alleviates the need for the map to render its tiles.
If you do not implement this method, or if you return false from it, the map view continues to load and render its tiles.

Part of MKOverlayMBS interface.
See also:

- 120.51.17 canReplaceMapContent as Boolean 20084

120.51.7 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKTileOverlay reference from a declare.
The object is retained.
See also:

- 120.51.8 Constructor(URL as string) 20081

120.51.8 Constructor(URL as string)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a tile overlay object using the specified tile-access template.
Notes:

URLTemplate: A string that can be used to build a URL to access your tile images. The string you specify can point to a local file or to an image on a remote server. To facilitate retrieving multiple tiles using the string, use the placeholder values { x } , { y } , { z } , and { scale } as stand-ins for the x and y tile indexes, the zoom level, and the resolution of the tile image. If this parameter is nil, you must provide custom implementations for the tile-loading methods of this class.

Returns an initialized tile overlay object.

The default tile overlay object uses the template string you specify to request tiles. This template string should incorporate the { x } , { y } , { z } , and { scale } placeholder strings to facilitate the creation

of a URL for requesting the appropriate tile. For example, if you have a server that vends tiles when you provide a URL of the form http://myserver/tile?x=0& y=0& z=0& scale=1.0, you would specify a template string of http://myserver/tile?x= { x } & y= { y } & z= { z } & scale= { scale } . The tile overlay object substitutes actual index values in for your template's placeholders before requesting the actual tile.
See also:

- 120.51.7 Constructor(Handle as Integer) 20081

120.51.9 Coordinate as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The coordinate of the annotation.
Notes: Part of the MKAnnotationMBS interface.
See also:

- 120.51.18 coordinate as CLLocationCoordinate2DMBS 20084

120.51.10 intersectsMapRect(mapRect as MKMapRectMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this overlay intersects with the given map rectangle.
Notes: Part of the MKOverlayMBS interface.

120.51.11 loadTileAtPath(Path as MKTileOverlayPathMBS, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Loads the specified tile asynchronously.
Notes:

Path: The path structure that identifies the specific tile you want. This structure incorporates the tile's X-Y coordinate at a given zoom level and scale factor.

The default implementation of this method uses the URLForTilePath method to retrieve the URL for the specified tile and then loads that tile into memory asynchronously using an NSURLConnectionMBS object. The specified tile may be located either on the local file system or on a remote server. Subclasses may override this method and implement their own custom tile-loading behavior.

When a tile overlay renderer (that is, an instance of MKTileOverlayRendererMBS) needs to display tiles, it uses this method to request the data for each tile.

120.51.12 SetCoordinate(newCoordinate as CLLocationCoordinate2DMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Set the coordinate of the annotation.
Notes: Part of the MKAnnotationMBS interface.

120.51.13 SubTitle as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The subtitle of the item.
Notes: Part of the MKOverlayMBS interface.
See also:

- 120.51.24 subtitle as String 20086

120.51.14 Title as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The title of the annotation.
Notes: Part of the MKAnnotationMBS interface.
See also:

- 120.51.26 title as String 20086

120.51.15 URLForTilePath(Path as MKTileOverlayPathMBS) as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the URL to use to access the specified tile.
Notes:

path: The path structure that identifies the specific tile you want. This structure incorporates the tile's X-Y coordinate at a given zoom level and scale factor.

Returns the URL to use to retrieve the tile.

The default implementation of this method uses the template string you provided at initialization time to build a URL to the specified tile image. Subclasses can override this method and use a different scheme to provide URLs for tiles. Tiles can be located either on a local file system or on a remote server.

120.51.16 Properties

120.51.17 canReplaceMapContent as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the tile content is fully opaque.
Notes:

If the tile content you provide can cover the entire drawing area with opaque content, set this property to true. Doing so serves as a hint to the map view that it does not need to draw any additional content underneath your tiles. Set this property to false if your tiles contain any transparency.
The default value for this property is false.
(Read and Write property)
See also:

- 120.51.6 canReplaceMapContent as Boolean 20080

120.51.18 coordinate as CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The coordinate of the annotation.
Notes:

Part of the MKAnnotationMBS interface.
(Read only property)
See also:

- 120.51.9 Coordinate as CLLocationCoordinate2DMBS 20082

120.51.19 geometryFlipped as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates the orientation of tile indexes along the y axis.
Notes:

When set to NO, tile indexes start in the upper-left corner of the map and proceed down and to the right. Thus, the tile at (0, 0) is in the upper-left corner of the map, the tile at (1, 0) is to its immediate right and the tile at (0, 1) is immediately below it. Setting this property to true causes the map to start indexes at the lower-left corner of the map and proceed up and to the right.
The default value of this property is false.
(Read and Write property)

120.51.20 latitude as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The latitude of the coordinates.
Notes: (Read only property)

120.51.21 longitude as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The longitude of the coordinates.
Notes: (Read only property)

120.51.22 maximumZ as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum zoom level supported by the tiles of this overlay object.
Notes:

If you use different overlay objects to represent different tiles at different zoom levels, use this property to specify the maximum zoom level supported by this overlay's tiles. At zoom level 0, tiles cover the entire world map; at zoom level 1, tiles cover 1/4 of the world; at zoom level 2, tiles cover 1/16 of the world, and so on. The map never tries to load tiles for a zoom level greater than the value specified by this property.
The default value of this property is 21. Setting the value of this property to a number greater than the default does not guarantee the use of those extra zoom levels.
(Read and Write property)

120.51.23 minimumZ as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The minimum zoom level supported by the tiles of this overlay object.
Notes:

If you use different overlay objects to represent different tiles at different zoom levels, use this property to specify the minimum zoom level supported by this overlay's tiles. At zoom level 0, tiles cover the entire world map; at zoom level 1, tiles cover 1/4 of the world; at zoom level 2, tiles cover 1/16 of the world, and so on. The map never tries to load tiles for a zoom level less than the value specified by this property.

The default value of this property is 0.
(Read and Write property)

120.51.24 subtitle as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The subtitle of the item.
Notes:

Part of the MKOverlayMBS interface.
(Read only property)
See also:

- 120.51.13 SubTitle as String 20083

120.51.25 TileSize as CGSizeMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The size (in pixels) of your tile images.
Notes:

On Retina displays, the images are rendered pixel for pixel and are not scaled. This means that if the tile size is 256 x 256 pixels and the scale factor is 2.0, the image would be rendered as if it were 128 x 128 points in size. This behavior causes the tile to appear smaller but preserves the original image data.
The default tile size is set to 256 x 256 pixels.
(Read and Write property)

120.51.26 title as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The title of the annotation.
Notes:

Part of the MKAnnotationMBS interface.
(Read only property)
See also:

- 120.51.14 Title as String 20083

120.51.27 URLTemplate as String

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The template for generating tile image URLs.
Notes:

You specify this string at initialization time.
(Read only property)

120.51.28 Events

120.51.29 TileLoaded(path as MKTileOverlayPathMBS, tileData as MemoryBlock, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: .

Function: Called by loadTileAtPath when loading finished.
Notes:

The tileData parameter contains the raw data loaded from the corresponding image file. You can use this data to initialize an image object. If an error occurred, this parameter is nil.

The error parameter contains an error object if there was a problem loading the tile image. If no errors occurred, this parameter is nil.

120.52 class MKTileOverlayPathMBS

120.52.1 class MKTileOverlayPathMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Use this class to specify the index values for a single tile.

- 120.52.6 Constructor(x as Integer, y as Integer, z as Integer, ContentScaleFactor as double) 20088

120.52.6 Constructor(x as Integer, y as Integer, z as Integer, ContentScaleFactor as double)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.
See also:

- 120.52.5 Constructor(other as MKTileOverlayPathMBS) 20088

120.52.7 Properties

120.52.8 ContentScaleFactor as Double

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The screen scale factor for which the tile is intended.
Notes: (Read and Write property)

120.52.9 X as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The index of the tile along the x axis of the map.
Notes: (Read and Write property)

120.52.10 Y as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The index of the tile along the y axis of the map.
Notes: (Read and Write property)

120.52.11 Z as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The zoom level number for the tile.
Notes: (Read and Write property)

120.53 class MKTileOverlayRendererMBS

120.53.1 class MKTileOverlayRendererMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The renderer for a tile overlay that handles the drawing of bitmap images on the map surface.
Notes:

You create instances of this class when tile overlays become visible on the map view. A renderer works closely with its associated tile overlay object to coordinate the loading and drawing of tiles at appropriate times.
For information about how to specify the tiles to display on the map, see MKTileOverlayMBS.
Subclass of the MKOverlayRendererMBS class.

120.53.4 Methods

120.53.5 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop & iOS.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a MKTileOverlayRenderer reference from a declare.
The object is retained.
See also:

- 120.53.6 Constructor(TileOverlay as MKTileOverlayMBS) 20090

120.53.6 Constructor(TileOverlay as MKTileOverlayMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a tile renderer with the specified overlay object.
Notes: overlay: The tile overlay object whose contents you want to draw.
See also:

• 120.53.5 Constructor(Handle as Integer) 20090

120.53.7 reloadData

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: Forces tiles to be reloaded and displayed.
Notes: Use this method to remove the overlay's existing tile images and reload them from the original source. This method automatically causes the renderer to redraw the new tiles as soon as they are loaded into memory.

120.54 class MKUserLocationMBS

120.54.1 class MKUserLocationMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The MKUserLocation class defines a specific type of annotation that identifies the user's current location.
Notes: You do not create instances of this class directly. Instead, you retrieve an existing MKUserLocation object from the userLocation property of the map view displayed in your application.

Function: The title of the annotation.
Notes: Part of the MKAnnotationMBS interface.

120.54.13 Properties

120.54.14 heading as CLHeadingMBS

MBS MacFrameworks Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop & iOS.

Function: The heading for the user location.
Notes:

Returns nil if not in MKUserTrackingModeFollowWithHeading is used.
(Read only property)

120.54.15 location as CLLocationMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: The current location of the device.
Notes:

This property contains nil if the map view is not currently showing the user location or if the user's location has not yet been determined.
(Read only property)

120.54.16 updating as Boolean

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the user's location is currently being updated.
Notes: (Read only property)

Chapter 121

MarkDown

121.1 class MarkdownDocumentMBS

121.1.1 class MarkdownDocumentMBS

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class ot process markdown text.

121.1.2 Blog Entries

- MBS Xojo Plugins, version 20.6pr1

121.1.3 Blog Entries

- MBS Xojo Plugins, version 20.6pr1

121.1.4 Methods

121.1.5 Compile(flags as Integer = 35799040) as boolean

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compiles the markdown code.

121.1.6 Constructor(data as string, flags as Integer = 35799040)

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new document with the content of the file.
Notes:

Text should have EndOfLine.Unix as newline character.
Text must be in UTF-8 encoding to work best.
See also:

- 121.1.7 Constructor(file as folderitem, flags as Integer = 35799040) 20096

121.1.7 Constructor(file as folderitem, flags as Integer = 35799040)

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new document with the content of the file.
Notes:

Text should have EndOfLine.Unix as newline character.
Text must be in UTF-8 encoding to work best.
See also:

- 121.1.6 Constructor(data as string, flags as Integer = 35799040) 20096

121.1.8 CSS as string

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates CSS for the html code.

121.1.9 Document as string

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates HTML document.
Notes: Creates HTML if needed.

121.1.10 Footnotes as MarkdownFootnoteMBS()

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of foot notes.

121.1.11 GenerateCSS(File as folderitem) as Integer

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates a css file.
Notes: Returns number of bytes written. Or -1 on any error.

121.1.12 GenerateHTML(File as folderitem) as boolean

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates a html file.
Notes: Returns true on success and false on failure.

121.1.13 Properties

121.1.14 Author as MarkdownLineMBS

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The author line.
Notes:

Can be nil if not used.
(Read only property)

121.1.15 Code as MarkdownParagraphMBS

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Intermediate code generated by compile.
Notes: (Read only property)

121.1.16 Compiled as Boolean

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether document is compiled already.
Notes: (Read only property)

121.1.17 Date as MarkdownLineMBS

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The date line.
Notes:

Can be nil if not used.
(Read only property)

121.1.18 ExtraFootnotePrefix as String

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The extra footnote prefix.
Notes: (Read and Write property)

121.1.19 Handle as Integer

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Internal object reference.
Notes: (Read only property)

121.1.20 HasHTML as Boolean

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether html is available.
Notes:

Set to true when html is generated.
(Read only property)

121.1.21 Title as MarkdownLineMBS

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The title line.
Notes:

Can be nil if not used.
(Read only property)

121.1.22 URLBase as String

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The URL base.
Notes: (Read and Write property)

121.1.23 Constants

121.1.24 kAutoLink = & h4000

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: make http://foo.com link even without <>s

121.1.25 kCDATA = & h80

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: generate code for xml ! [CDATA [...]]

121.1.26 kExtraFootnote = & h200000

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: Enable markdown extra-style footnotes.

121.1.27 kInputMask = & h00030000

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.

121.1.28 kIsLabel = & h08000000

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.

121.1.29 kNoAlphaList = & h80000

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: Forbid alphabetic lists.

121.1.30 kNoDivQuote = & h40000

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: Forbid >% class% blocks.

121.1.31 kNoDList = & h100000

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: Forbid definition lists.

121.1.32 kNoExt = & h40

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: Don't allow pseudo-protocols.

121.1.33 kNoHeader = & h10000

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: Don't process header blocks.

121.1.34 kNoHTML = 8

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: Don't allow raw html through AT ALL

121.1.35 kNoImage = 2

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: Don't do image processing, block <img>.

121.1.36 kNoLinks = 1

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: Don't do link processing, block <a>tags.

121.1.37 kNoPants = 4

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: don't run smartypants.

121.1.38 kNoRelaxed = & h200

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: emphasis happens /everywhere/

121.1.39 kNoStrikethrough = & h800

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: Forbid strikethrough.

121.1.40 kNoSuperscript = & h100

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: no A^B

121.1.41 kNoTables = & h400

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: Disallow tables.

121.1.42 kSafeLink = & h8000

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: Paranoid check for link protocol.

121.1.43 kStrict = & h10

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: Disable SUPERSCRIPT, RELAXED_EMPHASIS.

121.1.44 kTabStop = & h20000

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: Expand tabs to 4 spaces.

121.1.45 kTagText = & h20

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: process text inside an html tag; no * , no <bold>, no html or [ ] expansion

121.1.46 kTOC = & h1000

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.
Notes: Do table-of-contents processing.

121.1.47 kUserFlags = & h0FFFFFFF

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag values.

121.2 class MarkdownFootnoteMBS

121.2.1 class MarkdownFootnoteMBS

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a foot note.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

121.2.2 Methods

121.2.3 Constructor

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

121.2.4 Properties

121.2.5 Document as MarkdownDocumentMBS

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The back reference to the markdown document.
Notes: (Read only property)

121.2.6 Flags as Integer

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The flags.
Notes:

Can be zero or a combination of kFlagExtraBookmark and kFlagReferenced.
(Read only property)

121.2.7 Height as Integer

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The dimensions for image link.
Notes: (Read only property)

121.2.8 Link as String

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: What this footnote points to.
Notes: (Read only property)

121.2.9 RefNumber as Integer

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The reference number.
Notes: (Read only property)

121.2.10 Tag as String

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag for the reference link.
Notes: (Read only property)

121.2.11 Title as String

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The title of the footnode.
Notes: (Read only property)

121.2.12 Width as Integer

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The dimensions for image link.
Notes: (Read only property)

121.2.13 Constants

121.2.14 kFlagExtraBookmark = 1

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the footnode flags.

121.2.15 kFlagReferenced = 2

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the footnode flags.
Notes: Set if this footnote is referenced.

121.3 class MarkdownLineMBS

121.3.1 class MarkdownLineMBS

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a line in the markdown text.
Notes:

Each input line is read into a Line, which contains the line, the offset of the first non-space character [this assumes that all tabs will be expanded to spaces!] , and a pointer to the next line.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

121.3.2 Methods

121.3.3 Constructor

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

121.3.4 Properties

121.3.5 Count as Integer

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The kind of this line.
Notes:

See kKind* constants.
(Read only property)

121.3.6 DLE as Integer

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The leading indent on the line.
Notes: (Read only property)

121.3.7 Document as MarkdownDocumentMBS

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The back reference to the markdown document.
Notes: (Read only property)

121.3.8 Flags as Integer

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Special attributes for this line.
Notes:

Can be combination of kFlag* constants.
(Read only property)

121.3.9 Kind as Integer

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The line type.
Notes:

See kKind* constants.
(Read only property)

121.3.10 NextLine as MarkdownLineMBS

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The next line.
Notes: (Read only property)

121.3.11 Text as String

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The text of the line.
Notes: (Read only property)

121.3.12 Constants

121.3.13 kFlagChecked = 2

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag constants.
Notes: The line was already processed.

121.3.14 kFlagPipeChar = 1

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the flag constants.
Notes: line contains a |

121.3.15 kKindCode = 1

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the kind values.
Notes: Code

121.3.16 kKindDash = 3

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the kind values.
Notes: Dash line

121.3.17 kKindEqual = 5

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the kind values.
Notes: Equal line

121.3.18 kKindHR = 2

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the kind values.
Notes: HR line

121.3.19 kKindText = 0

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the kind values.
Notes: Text line

121.3.20 kKindTilde = 4

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the kind values.
Notes: Tilde line

121.4 class MarkdownParagraphMBS

121.4.1 class MarkdownParagraphMBS

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class ofr a paragraph.
Notes:

A paragraph is a collection of Lines, with links to the next paragraph and (if it's a QUOTE, UL, or OL) to the reparsed contents of this paragraph.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

121.4.2 Methods

121.4.3 Constructor

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

121.4.4 Properties

121.4.5 Align as Integer

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The paragraph alignment.
Notes:

Can be kAlignPara, kAlignImplicit or kAlignCenter.
(Read only property)

121.4.6 Document as MarkdownDocumentMBS

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The back reference to the markdown document.
Notes: (Read only property)

121.4.7 Down as MarkdownParagraphMBS

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Recompiled contents of this paragraph.
Notes: (Read only property)

121.4.8 hNumber as Integer

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The header level for HDR.
Notes: (Read only property)

121.4.9 Ident as String

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: ID tag for quote.
Notes: (Read only property)

121.4.10 Lang as String

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: lang attribute for CODE
Notes: (Read only property)

121.4.11 NextParagraph as MarkdownParagraphMBS

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The next paragraph.
Notes: (Read only property)

121.4.12 Text as MarkdownLineMBS

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: All the text in this paragraph.
Notes: (Read only property)

121.4.13 Typ as Integer

MBS Tools Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of paragraph.
Notes:

See kType* constants.
(Read only property)

121.4.14 Constants

121.4.15 kAlignCenter = 2

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the alignment constants.
Notes: Center

121.4.16 kAlignImplicit = 0

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the alignment constants.
Notes: Implicit alignment

121.4.17 kAlignPara = 1

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the alignment constants.
Notes: Paragraph

121.4.18 kTypeAL = 9

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the type codes.
Notes: AL

121.4.19 kTypeCode = 1

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the type codes.
Notes: Code

121.4.20 kTypeDL = 6

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the type codes.
Notes: DL

121.4.21 kTypeHDR = 11

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the type codes.
Notes: HDR

121.4.22 kTypeHR = 12

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the type codes.
Notes: HR

121.4.23 kTypeHTML = 4

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the type codes.
Notes: HTML

121.4.24 kTypeListItem = 10

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the type codes.
Notes: ListItem

121.4.25 kTypeMarkup = 3

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the type codes.
Notes: Markup

121.4.26 kTypeOL = 8

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the type codes.
Notes: OL

121.4.27 kTypeQuote = 2

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the type codes.
Notes: Quote

121.4.28 kTypeSource = 14

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the type codes.
Notes: Source

121.4.29 kTypeStyle = 5

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the type codes.
Notes: Style

121.4.30 kTypeTable = 13

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the type codes.
Notes: Table

121.4.31 kTypeUL = 7

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the type codes.
Notes: UL

121.4.32 kTypeWhitespace = 0

MBS Tools Plugin, Plugin Version: 15.1.

Function: One of the type codes.
Notes: Whitespace

Chapter 122

Math

122.1 class BiggerNumberMBS

122.1.1 class BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a big number.
Example:

```
// speed of light in m/s
Dim SpeedOfLight As New BiggerNumberMBS("299792458")

// seconds per day
Dim SecondsPerDay As New BiggerNumberMBS(24 * 3600)

Dim DaysPerYear As New BiggerNumberMBS(365.25)

Dim LightYear As BiggerNumberMBS = SpeedOfLight * DaysPerYear * SecondsPerDay
MsgBox LightYear.StringValue+" meter per light year"

// 9.460.730.472.580.800 matches number from Wikipedia

Dim AgeOfUniversum As New BiggerNumberMBS(13810000000)

Dim MaxDistance As BiggerNumberMBS = LightYear * AgeOfUniversum

MsgBox MaxDistance.GetStringValue(10, False, 100, 3, True)+" meter maximum"
```

Notes:

This is floating point number with 320 bits in BigNumber and 2560 bits in BiggerNumber class.
Precision is about 77 digits dot for the smaller one and 617 for the bigger one.
So use first for speed and second for precision.

So if you want to store currency or other values where rounding should not happen, better store values multiplied, e.g. in cents.

Compared to normal double values, you have 5 times the bits.
And we check for math errors and raise exceptions if something goes wrong.

See LargeNumberMBS for a 4128 bit integer number, about 1200 digits in length.

122.1.8 Methods

122.1.9 Abs as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries absolute value.
Example:

```
dim o as BiggerNumberMBS = new BiggerNumberMBS(-123)
dim z as BiggerNumberMBS = o.Abs

MsgBox z.StringValue
```

Notes: Removes sign.
See also:

- 122.1.10 Abs(value as BiggerNumberMBS) as BiggerNumberMBS 20119

122.1.10 Abs(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Absolute value of x.
Example:

```
Dim c As New BiggerNumberMBS(-3)
Dim d As BiggerNumberMBS = BiggerNumberMBS.Abs(c)
Dim e As BiggerNumberMBS = c.Abs

MsgBox d.StringValue+EndOfLine+e.StringValue // shows 3
```

See also:

• 122.1.9 Abs as BiggerNumberMBS 20119

122.1.11 ACos(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Arc Cosine.
Example:

```
Dim c As New BiggerNumberMBS(0.5)
Dim d As BiggerNumberMBS = BiggerNumberMBS.ACos(c)

Dim x As Double = ACos(0.5)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: we're using the formula: acos(x) = pi/2 - asin(x)

122.1.12 ACosh(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inverse hyperbolic cosine.
Example:

```
Dim c As New BiggerNumberMBS(2.0)
Dim d As BiggerNumberMBS = BiggerNumberMBS.ACosh(c)

// ACosHMBS is in MBS Xojo Util Plugin
Dim x As Double = ACosHMBS(2.0)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: acosh(x) = ln(x + sqrt(x^2 - 1)) x in <1, infinity)

122.1.13 ACot(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Arc Cotangent.
Notes: we're using the formula: actan(x) = pi/2 - atan(x)

122.1.14 ACoth(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates inverse hyperbolic cotangent.
Notes: acoth(x) = 0.5 * ln((x+1) / (x-1)) x in (-infinity, -1) or (1, infinity)

122.1.15 Add(other as BiggerNumberMBS, round as boolean = true) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a number.
Example:

```
dim x as new BiggerNumberMBS(2)
dim d as new BiggerNumberMBS(3)
dim p as BiggerNumberMBS = x.Add(d)

MsgBox p.StringValue // shows 5
```

122.1.16 ASin(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Arc Sine.
Example:

```
Dim c As New BiggerNumberMBS(1.0)
Dim d As BiggerNumberMBS = BiggerNumberMBS.ASin(c)

Dim x As Double = ASin(1.0)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: Range is from -1 to 1.

122.1.17 ASinh(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inverse hyperbolic sine.
Example:

```
Dim c As New BiggerNumberMBS(0.5)
Dim d As BiggerNumberMBS = BiggerNumberMBS.ASinH(c)

// ASinHMBS is in MBS Xojo Util Plugin
Dim x As Double = ASinHMBS(0.5)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: asinh(x) = ln(x + sqrt(x^2 + 1))

122.1.18 ATan(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Arc Tangent.
Example:

```
Dim c As New BiggerNumberMBS(0.5)
Dim d As BiggerNumberMBS = BiggerNumberMBS.ATan(c)

Dim x As Double = ATan(0.5)

MsgBox d.StringValue+EndOfLine+Str(x)
```

122.1.19 ATanh(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates inverse hyperbolic tangent.
Example:

```
Dim c As New BiggerNumberMBS(0.5)
Dim d As BiggerNumberMBS = BiggerNumberMBS.ATanh(c)

// ATanhMBS is in MBS Xojo Util Plugin
Dim x As Double = ATanhMBS(0.5)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: atanh(x) = 0.5 * ln((1+x) / (1-x)) x in (-1, 1)

122.1.20 BitAnd(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates bitwise AND operation.
Example:

```
dim x as new BiggerNumberMBS(17)
dim y as new BiggerNumberMBS(16)
dim r as BiggerNumberMBS = x.BitAnd(y)

MsgBox r.StringValue
```

122.1.21 BitOr(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates bitwise or operation.
Example:

```
dim x as new BiggerNumberMBS(17)
dim y as new BiggerNumberMBS(16)
dim r as BiggerNumberMBS = x.BitOr(y)

MsgBox r.StringValue
```

122.1.22 BitXOr(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates bitwise xor operation.
Example:

```
dim x as new BiggerNumberMBS(17)
dim y as new BiggerNumberMBS(16)
dim r as BiggerNumberMBS = x.BitXOr(y)

MsgBox r.StringValue
```

122.1.23 Ceil as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function returns a value representing the smallest integer that is greater than or equal to x.
Example:

```
Dim c As New BiggerNumberMBS(-3.7)
Dim d As BiggerNumberMBS = c.Ceil

MsgBox d // shows -3
```

Notes:

e.g.
Ceil(-3.7) = -3
Ceil(-3.1) = -3
Ceil(-3.0) = -3
Ceil(4.0) = 4
Ceil(4.2) = 5
Ceil(4.8) = 5

122.1.24 Constructor

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initialize the number with zero value.
Example:

```
dim o as BiggerNumberMBS = new BiggerNumberMBS
MsgBox o.StringValue
```

- 122.1.33 Constructor(value as UInt64) 20130

122.1.25 Constructor(other as BiggerNumberMBS)

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initialize the number with other value.
Example:

```
dim o as BiggerNumberMBS = new BiggerNumberMBS(2.5)
dim c as BiggerNumberMBS = new BiggerNumberMBS(o)

MsgBox c.StringValue
```

- 122.1.32 Constructor(value as UInt32) 20129
- 122.1.33 Constructor(value as UInt64) 20130

122.1.26 Constructor(value as Currency)

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number object with a currency object.
Example:

```
dim v as Currency = 123.456
dim b as new BiggerNumberMBS(v)
MsgBox b.StringValue
```

- 122.1.32 Constructor(value as UInt32) 20129
- 122.1.33 Constructor(value as UInt64) 20130

122.1.27 Constructor(value as Double)

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initialize the number with double value.
Example:

```
dim o as BiggerNumberMBS = new BiggerNumberMBS(2.5)
MsgBox str(o.DoubleValue)+" = "+str(o.StringValue)#
```

- 122.1.29 Constructor(value as Int64) 20127
- 122.1.30 Constructor(value as Single) 20128
- 122.1.31 Constructor(value as String) 20128
- 122.1.32 Constructor(value as UInt32) 20129
- 122.1.33 Constructor(value as UInt64) 20130

122.1.28 Constructor(value as Int32)

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number with a 32-bit integer.
Example:

```
dim v as Int32 = 123
dim b as new BiggerNumberMBS(v)
MsgBox b.StringValue
```

- 122.1.31 Constructor(value as String) 20128
- 122.1.32 Constructor(value as UInt32) 20129
- 122.1.33 Constructor(value as UInt64) 20130

122.1.29 Constructor(value as Int64)

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number with a 64-bit integer.
Example:

```
dim v as Int64 = 123
dim b as new BiggerNumberMBS(v)
MsgBox b.StringValue
```

See also:

- 122.1.27 Constructor(value as Double) 20126
- 122.1.28 Constructor(value as Int32) 20127
- 122.1.30 Constructor(value as Single) 20128
- 122.1.31 Constructor(value as String) 20128
- 122.1.32 Constructor(value as UInt32) 20129
- 122.1.33 Constructor(value as UInt64) 20130

122.1.30 Constructor(value as Single)

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number with a 32-bit floating point number.
Example:

```
dim v as Single = 123
dim b as new BiggerNumberMBS(v)
MsgBox b.StringValue
```

See also:

- 122.1.24 Constructor 20124

- 122.1.27 Constructor(value as Double) 20126
- 122.1.28 Constructor(value as Int32) 20127
- 122.1.29 Constructor(value as Int64) 20127
- 122.1.31 Constructor(value as String) 20128
- 122.1.32 Constructor(value as UInt32) 20129
- 122.1.33 Constructor(value as UInt64) 20130

122.1.31 Constructor(value as String)

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initialize the number with string value.
Example:

```
dim o as BiggerNumberMBS = new BiggerNumberMBS("123.456")
MsgBox o.StringValue
```

- 122.1.27 Constructor(value as Double) 20126
- 122.1.28 Constructor(value as Int32) 20127
- 122.1.29 Constructor(value as Int64) 20127
- 122.1.30 Constructor(value as Single) 20128
- 122.1.32 Constructor(value as UInt32) 20129
- 122.1.33 Constructor(value as UInt64) 20130

122.1.32 Constructor(value as UInt32)

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number with an unsigned 32-bit integer.
Example:

```
dim v as UInt32 = 123
dim b as new BiggerNumberMBS(v)
MsgBox b.StringValue
```

See also:

- 122.1.24 Constructor 20124

- 122.1.27 Constructor(value as Double) 20126
- 122.1.28 Constructor(value as Int32) 20127
- 122.1.29 Constructor(value as Int64) 20127
- 122.1.30 Constructor(value as Single) 20128
- 122.1.31 Constructor(value as String) 20128
- 122.1.33 Constructor(value as UInt64) 20130

122.1.33 Constructor(value as UInt64)

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number with an unsigned 32-bit integer.
Example:

```
dim v as UInt64 = 123
dim b as new BiggerNumberMBS(v)
MsgBox b.StringValue
```

See also:

- 122.1.24 Constructor 20124

- 122.1.26 Constructor(value as Currency) 20125
- 122.1.27 Constructor(value as Double) 20126
- 122.1.28 Constructor(value as Int32) 20127
- 122.1.29 Constructor(value as Int64) 20127
- 122.1.30 Constructor(value as Single) 20128
- 122.1.31 Constructor(value as String) 20128
- 122.1.32 Constructor(value as UInt32) 20129

122.1.34 Cos(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the cosine value.
Example:

```
Dim c As New BiggerNumberMBS(1.0)
Dim d As BiggerNumberMBS = BiggerNumberMBS.Cos(c)

Dim x As Double = Cos(1.0)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: We're using the formula cos(x) = sin(x + PI/2).

122.1.35 Cosh(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Hyperbolic Cosine.
Example:

```
Dim c As New BiggerNumberMBS(0.5)
Dim d As BiggerNumberMBS = BiggerNumberMBS.CosH(c)

// CosHMBS is in MBS Xojo Util Plugin
Dim x As Double = CosHMBS(0.5)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: We're using the formula cosh(x)= (e^x + e^(-x)) / 2.

122.1.36 Cot(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Cotangent.
Notes: We're using the formula tan(x) = cos(x) / sin(x).

122.1.37 Coth(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Hyperbolic Cotangent.
Notes: We're using the formula coth(x)= (e^x + e^(-x)) / (e^x - e^(-x))

122.1.38 DegToDeg(d as BiggerNumberMBS, m as BiggerNumberMBS, s as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts degrees in the long format into one value.
Notes:

long format: (degrees, minutes, seconds)
minutes and seconds must be greater than or equal zero

result:
if d>=0 : result= d + ((s/60)+m)/60
if d<0 : result= d - ((s/60)+m)/60

((s/60)+m)/60 = (s+60*m)/3600 (second version is faster because there's only one division)

for example:
DegToDeg(10, 30, 0) = 10.5
DegToDeg(10, 24, 35.6)=10.4098(8)

122.1.39 DegToGrad(d as BiggerNumberMBS, m as BiggerNumberMBS, s as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts degrees in the long format to gradians.
See also:

- 122.1.40 DegToGrad(value as BiggerNumberMBS) as BiggerNumberMBS 20132

122.1.40 DegToGrad(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts degrees to gradians.
Notes: it returns: x * 200 / 180
See also:

- 122.1.39 DegToGrad(d as BiggerNumberMBS, m as BiggerNumberMBS, s as BiggerNumberMBS) as BiggerNumberMBS 20132

122.1.41 DegToRad(d as BiggerNumberMBS, m as BiggerNumberMBS, s as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts degrees in the long format to radians.
See also:

- 122.1.42 DegToRad(value as BiggerNumberMBS) as BiggerNumberMBS 20133

122.1.42 DegToRad(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts degrees to radians.
Notes: It returns: x * pi / 180
See also:

- 122.1.41 DegToRad(d as BiggerNumberMBS, m as BiggerNumberMBS, s as BiggerNumberMBS) as BiggerNumberMBS 20132

122.1.43 Divide(other as BiggerNumberMBS, round as boolean = true) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides the number.
Example:

```
dim x as new BiggerNumberMBS(8)
dim d as new BiggerNumberMBS(2)
dim p as BiggerNumberMBS = x.Divide(d)

MsgBox p.StringValue // shows 4
```

122.1.44 E as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value zero.
Example:

```
dim b as BiggerNumberMBS = BiggerNumberMBS.e
MsgBox b.StringValue
```

122.1.45 Equals(other as BiggerNumberMBS) as Boolean

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if two numbers are the same.
Example:

```
dim o as BiggerNumberMBS = new BiggerNumberMBS(123)
```

```
dim z as BiggerNumberMBS = new BiggerNumberMBS(123)

if o.Equals(z) then
MsgBox "equal"
else
Break // error
end if
```

Notes: Returns true if equal.

122.1.46 Exp(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates e^value.
Example:

```
dim x as new BiggerNumberMBS(2)
dim p as BiggerNumberMBS = BiggerNumberMBS.Exp(x)

MsgBox p.StringValue // shows e^2 = 7.38
```

122.1.47 Floor as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes any fraction part.
Example:

```
dim o as BiggerNumberMBS = new BiggerNumberMBS(2.3)
dim s as BiggerNumberMBS = o.Floor

MsgBox s.StringValue

dim a as BiggerNumberMBS = new BiggerNumberMBS(-2.3)
dim b as BiggerNumberMBS = a.Floor

MsgBox b.StringValue
```

122.1.48 Frac as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts the fraction part.
Example:

```
dim o as BiggerNumberMBS = new BiggerNumberMBS(2.5)
dim s as BiggerNumberMBS = o.Frac

MsgBox s.StringValue

dim a as BiggerNumberMBS = new BiggerNumberMBS(-2.5)
dim b as BiggerNumberMBS = a.Frac

MsgBox b.StringValue
```

122.1.49 GetStringValue(Base as Integer = 10, scientific as boolean = false, scientificFrom as Integer = 15, round as Integer = -1, TrimZeros as Boolean = true, comma as String = ".") as String

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries string value.
Example:

```
dim o as new BiggerNumberMBS(1234)

// show as hex
MsgBox o.GetStringValue(16)

// show as number with comma and 3 digits
dim z as new BiggerNumberMBS(12.345)
MsgBox z.GetStringValue(10, false, 15, 3, true, ",")
```

Notes:

Base: The base of the number system. Normally 10, but also 16 for hex is common.
scientific: Whether to use scientific notation.
scientificFrom: How many digits we show.
Round: Whether to round to n digits.
TrimZeros: Whether to trim unneeded zeros.
comma: The character to use as decimal dot.

122.1.50 GradToDeg(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts degrees to gradians.
Notes: it returns: x * 180 / 200

122.1.51 GradToRad(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts gradians to radians.
Notes: It returns: x * pi / 200.

122.1.52 HalfPi as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value pi/2.
Example:

```
dim b as BiggerNumberMBS = BiggerNumberMBS.HalfPi
MsgBox b.StringValue
```

122.1.53 LibTypeStr as String

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries what implementation is used for this platform.
Notes:

Shows asm in the text if assembler code is used.
Assembler code is not available for all platforms.

122.1.54 Ln(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates natural logarithm.
Example:

```
dim x as new BiggerNumberMBS(2)
dim p as BiggerNumberMBS = BiggerNumberMBS.Ln(x)

MsgBox p.StringValue // shows ln(2) = 0.69
```

122.1.55 Ln10 as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value ln(10).
Example:

```
dim b as BiggerNumberMBS = BiggerNumberMBS.Ln10
MsgBox b.StringValue
```

122.1.56 Ln2 as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value ln(2).
Example:

```
dim b as BiggerNumberMBS = BiggerNumberMBS.Ln2
MsgBox b.StringValue
```

122.1.57 Log(value as BiggerNumberMBS, base as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates logarithm in a given base.
Example:

```
dim x as new BiggerNumberMBS(100)
dim d as new BiggerNumberMBS(10)
dim p as BiggerNumberMBS = BiggerNumberMBS.Log(x, d)

MsgBox p.StringValue // shows ln(100)/ln(10) = 2
```

122.1.58 Max as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with maximum value.
Example:

```
dim b as BiggerNumberMBS = BiggerNumberMBS.Min
MsgBox b.StringValue
```

122.1.59 Min as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with minimum value.
Example:

```
dim b as BiggerNumberMBS = BiggerNumberMBS.Min
MsgBox b.StringValue
```

122.1.60 Modulate(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Modulates a number.
Example:

```
dim x as new BiggerNumberMBS(17)
dim y as new BiggerNumberMBS(3)
dim r as BiggerNumberMBS = x.Modulate(y)

MsgBox r.StringValue
```

Notes: Similar to mod keyword in Xojo.

122.1.61 Modulate2 as Integer

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Modulates by 2.
Example:

```
dim x as new BiggerNumberMBS(8)
dim y as new BiggerNumberMBS(9)

MsgBox str(x.Modulate2)+" "+str(y.Modulate2)
```

Notes: Returns 0 or 1.

122.1.62 Multiply(other as BiggerNumberMBS, round as boolean = true) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplies two numbers.
Example:

```
dim x as new BiggerNumberMBS(8)
dim d as new BiggerNumberMBS(2)
dim p as BiggerNumberMBS = x.Multiply(d)

MsgBox p.StringValue // shows 16
```

See also:

- 122.1.63 Multiply(value as Integer) as BiggerNumberMBS 20139
- 122.1.64 Multiply(value as UInt32) as BiggerNumberMBS 20140

122.1.63 Multiply(value as Integer) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiply by an integer.
Example:

```
dim x as new BiggerNumberMBS(2)
dim p as BiggerNumberMBS = x.Multiply(3)

MsgBox p.StringValue // shows 6
```

See also:

- 122.1.62 Multiply(other as BiggerNumberMBS, round as boolean = true) as BiggerNumberMBS 20139

• 122.1.64 Multiply(value as UInt32) as BiggerNumberMBS 20140

122.1.64 Multiply(value as UInt32) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiply by an unsigned integer.
Example:

```
dim x as new BiggerNumberMBS(17)
dim r as BiggerNumberMBS = x.Multiply(3)

MsgBox r.StringValue
```

See also:

• 122.1.62 Multiply(other as BiggerNumberMBS, round as boolean = true) as BiggerNumberMBS 20139

• 122.1.63 Multiply(value as Integer) as BiggerNumberMBS 20139

122.1.65 Nan as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value NaN.
Example:

```
dim b as BiggerNumberMBS = BiggerNumberMBS.Nan
MsgBox b.StringValue
```

122.1.66 Negate as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negates the number.
Example:

```
dim o as BiggerNumberMBS = new BiggerNumberMBS(123)
dim z as BiggerNumberMBS = o.Negate

MsgBox z.StringValue
```

122.1.67 NumberWithCurrency(value as Currency) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with a currency value.
Example:

```
dim v as Currency = 123.456
dim b as BiggerNumberMBS = BiggerNumberMBS.NumberWithCurrency(v)

MsgBox b.StringValue
```

122.1.68 NumberWithDouble(value as Double) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with a 64-bit floating number.
Example:

```
dim v as Double = 123.456
dim b as BiggerNumberMBS = BiggerNumberMBS.NumberWithDouble(v)

MsgBox b.StringValue
```

122.1.69 NumberWithInt32(value as Int32) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with a signed 32-bit integer.
Example:

```
dim v as Int32 = 123
dim b as BiggerNumberMBS = BiggerNumberMBS.NumberWithInt32(v)

MsgBox b.StringValue
```

122.1.70 NumberWithInt64(value as Int64) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with a signed 64-bit integer.

Example:

```
dim v as Int64 = 123
dim b as BiggerNumberMBS = BiggerNumberMBS.NumberWithInt64(v)

MsgBox b.StringValue
```

122.1.71 NumberWithInteger(value as Integer) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with an integer.
Example:

```
dim v as Integer = 123
dim b as BiggerNumberMBS = BiggerNumberMBS.NumberWithInteger(v)

MsgBox b.StringValue
```

122.1.72 NumberWithSingle(value as single) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with an 32-bit floating point number.
Example:

```
dim v as Single = 123
dim b as BiggerNumberMBS = BiggerNumberMBS.NumberWithSingle(v)

MsgBox b.StringValue
```

122.1.73 NumberWithString(value as String) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with value from string.
Example:

```
dim v as String = "123"
dim b as BiggerNumberMBS = BiggerNumberMBS.NumberWithString(v)

MsgBox b.StringValue
```

122.1.74 NumberWithUInt32(value as UInt32) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with an unsigned 32-bit integer.
Example:

```
dim v as UInt32 = 123
dim b as BiggerNumberMBS = BiggerNumberMBS.NumberWithUInt32(v)

MsgBox b.StringValue
```

122.1.75 NumberWithUInt64(value as UInt64) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with an unsigned 64-bit integer.
Example:

```
dim v as UInt64 = 123
dim b as BiggerNumberMBS = BiggerNumberMBS.NumberWithUInt64(v)

MsgBox b.StringValue
```

122.1.76 NumberWithUInteger(value as UInteger) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with an unsigned integer.
Example:

```
dim v as UInteger = 123
dim b as BiggerNumberMBS = BiggerNumberMBS.NumberWithUInteger(v)

MsgBox b.StringValue
```

122.1.77 NumberWithVariant(value as Variant) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number based on a variant.
Example:

```
dim v as Variant = 123.456
dim b as BiggerNumberMBS = BiggerNumberMBS.NumberWithVariant(v)

MsgBox b.StringValue
```

Notes: Internally redirects to other NumberWith functions based on the value type.

122.1.78 One as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value one.
Example:

```
dim b as BiggerNumberMBS = BiggerNumberMBS.One
MsgBox b.StringValue
```

122.1.79 Operator_Add(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a number.
Example:

```
dim a as new BiggerNumberMBS(3)
dim b as new BiggerNumberMBS(4)

// add
dim c as BiggerNumberMBS = a + b

MsgBox c.StringValue
```

122.1.80 Operator_AddRight(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a number.
Example:

```
dim a as new BiggerNumberMBS(3)
dim b as new BiggerNumberMBS(4)

// add
dim c as BiggerNumberMBS = a + b

MsgBox c.StringValue
```

122.1.81 Operator_Compare(other as BiggerNumberMBS) as Integer

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares two numbers.
Example:

```
dim a as new BiggerNumberMBS(1.2)
dim b as new BiggerNumberMBS(1.2)
dim c as new BiggerNumberMBS(1.3)

if a = b then
// ok
else
break
end if

if a <c then
// ok
else
Break
end if

if c >b then
// ok
else
break
end if
```

122.1.82 Operator_Convert as String

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts big number to string automatically.
Example:

```
dim b as new BiggerNumberMBS
dim n as Double = 5

// convert from double to big number automatically
b = n

// convert to string automatically
MsgBox b
```

See also:

- 122.1.83 Operator_Convert(value as String) 20146

122.1.83 Operator_Convert(value as String)

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a string to a big number.
Example:

```
dim b as new BiggerNumberMBS
dim n as string = "5"

// convert from string to big number automatically
b = n

// convert to double automatically
dim d as Double = b
MsgBox str(d)
```

See also:

- 122.1.82 Operator_Convert as String 20146

122.1.84 Operator_Divide(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides two numbers.
Example:

```
dim a as new BiggerNumberMBS(9.3)
dim b as new BiggerNumberMBS(3.0)

dim r as BiggerNumberMBS = a / b

MsgBox r.StringValue
```

122.1.85 Operator_DivideRight(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides two numbers.

122.1.86 Operator_IntegerDivide(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates an integer divide.
Example:

```
dim a as new BiggerNumberMBS(9.3)
dim b as new BiggerNumberMBS(3.0)

dim r as BiggerNumberMBS = a \b

MsgBox r.StringValue
```

Notes: Same as normal divide, but removes fraction part.

122.1.87 Operator_IntegerDivideRight(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates an integer divide.
Notes: Same as normal divide, but removes fraction part.

122.1.88 Operator_Modulo(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the modulo of two numbers.
Example:

```
dim a as new BiggerNumberMBS(9.3)
dim b as new BiggerNumberMBS(3.0)

dim r as BiggerNumberMBS = a mod b

MsgBox r.StringValue
```

122.1.89 Operator_ModuloRight(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the modulo of two numbers.

122.1.90 Operator_Multiply(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiply two numbers.
Example:

```
// speed of light in m/s
Dim SpeedOfLight As New BiggerNumberMBS("299792458")

// seconds per day
Dim SecondsPerDay As New BiggerNumberMBS(24 * 3600)

Dim DaysPerYear As New BiggerNumberMBS(365.25)

Dim LightYear As BiggerNumberMBS = SpeedOfLight * DaysPerYear * SecondsPerDay
MsgBox LightYear.StringValue+" meter per light year"

// 9.460.730.472.580.800 matches number from Wikipedia
```

```
Dim AgeOfUniversum As New BiggerNumberMBS(13810000000)

Dim MaxDistance As BiggerNumberMBS = LightYear * AgeOfUniversum

MsgBox MaxDistance.GetStringValue(10, False, 100, 3, True)+" meter maximum"
```

122.1.91 Operator_MultiplyRight(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiply two numbers.

122.1.92 Operator_Negate as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negates a number.
Example:

```
dim a as new BiggerNumberMBS(3)

// negate
dim c as BiggerNumberMBS = -a

MsgBox c.StringValue
```

122.1.93 Operator_Power(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates power of two numbers.
Example:

```
dim a as new BiggerNumberMBS(3)
dim b as new BiggerNumberMBS(4)

// pow
dim c as BiggerNumberMBS = a ^b

MsgBox c.StringValue
```

122.1.94 Operator_PowerRight(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates power of two numbers.

122.1.95 Operator_Subtract(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts one number from other.
Example:

```
dim a as new BiggerNumberMBS(3)
dim b as new BiggerNumberMBS(4)

// subtract
dim c as BiggerNumberMBS = a - b

MsgBox c.StringValue
```

122.1.96 Operator_SubtractRight(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts one number from other.

122.1.97 Pi as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value pi.
Example:

```
dim b as BiggerNumberMBS = BiggerNumberMBS.Pi
MsgBox b.StringValue
```

122.1.98 Pow(other as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the power of the number.
Example:

```
dim x as new BiggerNumberMBS(2)
dim o as new BiggerNumberMBS(5)
dim p as BiggerNumberMBS = x.Pow(o)

MsgBox p.StringValue // shows 32
```

122.1.99 RadToDeg(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts radians to degrees.
Notes: It returns: x * 180 / pi.

122.1.100 RadToGrad(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts radians to gradians.
Notes: it returns: x * 200 / pi

122.1.101 Rand as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates random number.
Notes: Mantissa and exponent are filled with random bytes to generate a random names.

122.1.102 Root(value as BiggerNumberMBS, index as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Indexth Root of x
Example:

```
Dim c As New BiggerNumberMBS(5*5*5*5)
Dim e As New BiggerNumberMBS(4)
Dim d As BiggerNumberMBS = BiggerNumberMBS.Root(c, e)

MsgBox d.StringValue
```

Notes:

index must be integer and not negative <0;1;2;3....)

if index==0 the result is one
if x==0 the result is zero and we assume root(0;0) is not defined

if index is even (2;4;6...) the result is x^(1/index) and x>0
if index is odd (1;2;3;...) the result is either

-(abs(x)^(1/index)) if x<0
or
x^(1/index)) if x>0

(for index==1 the result is equal x)

122.1.103 Round as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rounds the number.
Example:

```
dim o as BiggerNumberMBS = new BiggerNumberMBS(2.3)
dim s as BiggerNumberMBS = o.Round

MsgBox s.StringValue

dim a as BiggerNumberMBS = new BiggerNumberMBS(-2.3)
dim b as BiggerNumberMBS = a.Round
```

MsgBox b.StringValue

122.1.104 SetStringValue(Text As String, Base as Integer, byref AfterText as String, Byref ValueRead as boolean)

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses number from string.
Example:

```
// set to 1.2 and show
dim o as new BiggerNumberMBS

dim after as string
dim ValueRead as Boolean

o.SetStringValue "1.2 hello", 10, after, ValueRead

MsgBox "value: "+o.StringValue+EndOfLine+"after: "+after
Break
```

Notes:

Returns also the text after the given text following the number.
Also sets ValueRead if a value was read.

122.1.105 Sgn(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries sign of number.
Example:

```
Dim negative As New BiggerNumberMBS(-5.6)
Dim sign1 As BiggerNumberMBS = BiggerNumberMBS.Sgn(negative)

Dim positive As New BiggerNumberMBS(5.6)
Dim sign2 As BiggerNumberMBS = BiggerNumberMBS.Sgn(positive)

Break
```

122.1.106 Sin(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the sinus value.
Example:

```
Dim c As New BiggerNumberMBS(1.0)
Dim d As BiggerNumberMBS = BiggerNumberMBS.Sin(c)

Dim x As Double = Sin(1.0)

MsgBox d.StringValue+EndOfLine+Str(x)
```

122.1.107 Sinh(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Hyperbolic Sine.
Example:

```
Dim c As New BiggerNumberMBS(0.5)
Dim d As BiggerNumberMBS = BiggerNumberMBS.SinH(c)

// SinHMBS is in MBS Xojo Util Plugin
Dim x As Double = SinHMBS(0.5)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: we're using the formula sinh(x) = (e^x - e^(-x)) / 2

122.1.108 SkipFraction as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function skips the fraction.
Example:

```
Dim c As New BiggerNumberMBS(-3.7)
Dim d As BiggerNumberMBS = c.SkipFraction

MsgBox d // shows -3
```

Notes:

Similar to floor, but different for negative ones.

e.g
2.2 =>2
2.7 =>2
-2.2 =>2
-2.7 =>2

122.1.109 Sqrt as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the square root.
Example:

```
dim o as BiggerNumberMBS = new BiggerNumberMBS(256)
dim s as BiggerNumberMBS = o.Sqrt

MsgBox s.StringValue
```

122.1.110 Subtract(other as BiggerNumberMBS, round as boolean = true) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts a number.
Example:

```
dim x as new BiggerNumberMBS(2)
dim d as new BiggerNumberMBS(3)
dim p as BiggerNumberMBS = x.Subtract(d)

MsgBox p.StringValue // shows -1
```

122.1.111 Tan(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Tangent.
Example:

```
Dim c As New BiggerNumberMBS(1.0)
Dim d As BiggerNumberMBS = BiggerNumberMBS.Tan(c)

Dim x As Double = Tan(1.0)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: We're using the formula tan(x) = sin(x) / cos(x).

122.1.112 Tanh(value as BiggerNumberMBS) as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Hyperbolic Tangent.
Example:

```
Dim c As New BiggerNumberMBS(0.5)
Dim d As BiggerNumberMBS = BiggerNumberMBS.TanH(c)

// TanHMBS is in MBS Xojo Util Plugin
Dim x As Double = TanHMBS(0.5)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: We're using the formula tanh(x)= (e^x - e^(-x)) / (e^x + e^(-x))

122.1.113 TwoPi as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value 2 * PI.
Example:

```
dim b as BiggerNumberMBS = BiggerNumberMBS.TwoPi
MsgBox b.StringValue
```

122.1.114 Zero as BiggerNumberMBS

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value zero.
Example:

```
dim b as BiggerNumberMBS = BiggerNumberMBS.Zero
MsgBox b.StringValue
```

122.1.115 Properties

122.1.116 CurrencyValue as Currency

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets/Queries currency value.
Example:

```
dim u as Currency = 1234.5678
dim b as new BiggerNumberMBS(u)
MsgBox str(b.CurrencyValue)
```

Notes: (Read and Write property)

122.1.117 DataExponent as MemoryBlock

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The exponent for this number.
Notes:

Setting this may need to update flags, too.
(Read and Write property)

122.1.118 DataFlags as Integer

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The flags.
Notes:

Bits are 128 for Sign, 64 for NAN and 32 for zero.
(Read and Write property)

122.1.119 DataMantissa as MemoryBlock

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The mantissa for this number.
Notes:

Setting this may need to update flags, too.

(Read and Write property)

122.1.120 DoubleValue as Double

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get or Set the double value.
Example:

```
dim o as BiggerNumberMBS = new BiggerNumberMBS(2.5)

MsgBox str(o.DoubleValue)+" = "+str(o.StringValue)
```

Notes: (Read and Write property)

122.1.121 Int64Value as Int64

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get/Set value as Int64.
Example:

```
dim u as Int64 = & h7FFFFFFFFFFFFFFF // maximum Int64
dim b as new BiggerNumberMBS(u)
MsgBox str(b.Int64Value)

dim one as new BiggerNumberMBS(1)
b = b + one

// raises exception due to overflow
MsgBox str(b.Int64Value)
```

Notes: (Read and Write property)

122.1.122 IntegerValue as Integer

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get or Set the integer value.
Example:

```
dim o as BiggerNumberMBS = new BiggerNumberMBS(2.5)

MsgBox str(o.IntegerValue)+" = "+str(o.StringValue)
```

Notes: (Read and Write property)

122.1.123 IsInteger as Boolean

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether this number is an integer.
Example:

```
dim o as BiggerNumberMBS = new BiggerNumberMBS(1)
dim z as BiggerNumberMBS = new BiggerNumberMBS(1.5)

if o.IsInteger then
MsgBox o.StringValue+" is integer"
else
break // error
end if

if z.IsInteger then
break // error
else
MsgBox z.StringValue+" is not integer"
end if
```

Notes:

If true, there are no digits after the dot.
(Read only property)

122.1.124 IsNan as Boolean

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether this is an invalid number.
Example:

```
dim o as BiggerNumberMBS = BiggerNumberMBS.zero
dim z as BiggerNumberMBS = BiggerNumberMBS.Nan
```

```
if z.IsNan then
MsgBox z.StringValue+" is NaN"
else
break // error
end if

if o.IsNan then
break // error
else
MsgBox o.StringValue+" is not NaN"
end if
```

Notes: (Read only property)

122.1.125 IsNegative as Boolean

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether this value is negative.
Example:

```
dim o as BiggerNumberMBS = BiggerNumberMBS.one
dim z as BiggerNumberMBS = BiggerNumberMBS.one.Negate

if z.IsNegative then
MsgBox z.StringValue+" is negative"
else
break // error
end if

if o.IsNegative then
break // error
else
MsgBox o.StringValue+" is not negative"
end if
```

Notes: (Read only property)

122.1.126 IsZero as Boolean

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Checks if value is zero.
Example:

```
dim o as BiggerNumberMBS = BiggerNumberMBS.one
dim z as BiggerNumberMBS = BiggerNumberMBS.zero

if z.IsZero then
MsgBox z.StringValue+" is zero"
else
break // error
end if

if o.IsZero then
break // error
else
MsgBox o.StringValue+" is not zero"
end if
```

Notes: (Read only property)

122.1.127 StringValue as String

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get or set string value of text.
Example:

```
// set to 1.2 and show
dim o as new BiggerNumberMBS("1.2")
MsgBox o.StringValue

// set to 2.3
o.StringValue = "2.3"
MsgBox o.StringValue
```

Notes: (Read and Write property)
See also:

- 122.1.130 StringValue(Base as Integer) as String 20163

122.1.128 UInt64Value as UInt64

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get/Set value as UInt64.
Example:

```
dim u as UInt64 = 12345678901234567890
dim b as new BiggerNumberMBS(u)
MsgBox str(b.UInt64Value)
```

Notes: (Read and Write property)

122.1.129 VariantValue as Variant

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries/Sets value with variant.
Notes:

Floating point values are given as Double.
Integer types as Int32, Int64 or UInt64.
If value exceeds the ranges of those data types, we fall back to string.

When setting, the value is converted to a big number similiar to NumberWithVariant.
(Read and Write property)

122.1.130 StringValue(Base as Integer) as String

MBS DataTypes Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set string value with a given base.
Example:

```
dim o as new BiggerNumberMBS(1234)

// show as hex
MsgBox o.StringValue(16)
```

Notes: (Read and Write computed property)
See also:

- 122.1.127 StringValue as String 20162

122.2 class BigNumberErrorExceptionMBS

122.2.1 class BigNumberErrorExceptionMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception class for big number math.
Example:

```
dim b as new BigNumberMBS(5)
dim c as BigNumberMBS = BigNumberMBS.Zero

// raises exception due to division by zero
dim x as BigNumberMBS = b/c
```

Notes:

Raised when operations fail due to division by zero, invalid numbers or overflow/underflow.
Subclass of the RuntimeException class.

122.3 class BigNumberMBS

122.3.1 class BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a big number.
Example:

```
// speed of light in m/s
Dim SpeedOfLight As New BigNumberMBS("299792458")

// seconds per day
Dim SecondsPerDay As New BigNumberMBS(24 * 3600)

Dim DaysPerYear As New BigNumberMBS(365.25)

Dim LightYear As BigNumberMBS = SpeedOfLight * DaysPerYear * SecondsPerDay
MsgBox LightYear.StringValue+" meter per light year"

// 9.460.730.472.580.800 matches number from Wikipedia

Dim AgeOfUniversum As New BigNumberMBS(13810000000)

Dim MaxDistance As BigNumberMBS = LightYear * AgeOfUniversum

MsgBox MaxDistance.GetStringValue(10, False, 100, 3, True)+" meter maximum"
```

Notes:

This is floating point number with 320 bits in BigNumber and 2560 bits in BiggerNumber class.
Precision is about 77 digits dot for the smaller one and 617 for the bigger one.
So use first for speed and second for precision.

So if you want to store currency or other values where rounding should not happen, better store values multiplied, e.g. in cents.

Compared to normal double values, you have 5 times the bits.
And we check for math errors and raise exceptions if something goes wrong.

See LargeNumberMBS for a 4128 bit integer number, about 1200 digits in length.

122.3.8 Methods

122.3.9 Abs as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries absolute value.
Example:

```
dim o as BigNumberMBS = new BigNumberMBS(-123)
dim z as BigNumberMBS = o.Abs

MsgBox z.StringValue
```

Notes: Removes sign.
See also:

• 122.3.10 Abs(value as BigNumberMBS) as BigNumberMBS 20168

122.3.10 Abs(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Absolute value of x.
Example:

```
Dim c As New BigNumberMBS(-3)
Dim d As BigNumberMBS = BigNumberMBS.Abs(c)
Dim e As BigNumberMBS = c.Abs

MsgBox d.StringValue+EndOfLine+e.StringValue // shows 3
```

See also:

• 122.3.9 Abs as BigNumberMBS 20167

122.3.11 ACos(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Arc Cosine.
Example:

```
Dim c As New BigNumberMBS(0.5)
Dim d As BigNumberMBS = BigNumberMBS.ACos(c)

Dim x As Double = ACos(0.5)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: we're using the formula: acos(x) = pi/2 - asin(x)

122.3.12 ACosh(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inverse hyperbolic cosine.
Example:

```
Dim c As New BigNumberMBS(2.0)
Dim d As BigNumberMBS = BigNumberMBS.ACosh(c)

// ACosHMBS is in MBS Xojo Util Plugin
Dim x As Double = ACosHMBS(2.0)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: acosh(x) = ln(x + sqrt(x^2 - 1)) x in <1, infinity)

122.3.13 ACot(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Arc Cotangent.
Notes: we're using the formula: actan(x) = pi/2 - atan(x)

122.3.14 ACoth(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates inverse hyperbolic cotangent.
Notes: acoth(x) = 0.5 * ln((x+1) / (x-1)) x in (-infinity, -1) or (1, infinity)

122.3.15 Add(other as BigNumberMBS, round as boolean = true) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a number.
Example:

```
dim x as new BigNumberMBS(2)
dim d as new BigNumberMBS(3)
dim p as BigNumberMBS = x.Add(d)

MsgBox p.StringValue // shows 5
```

122.3.16 ASin(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Arc Sine.
Example:

```
Dim c As New BigNumberMBS(1.0)
Dim d As BigNumberMBS = BigNumberMBS.ASin(c)

Dim x As Double = ASin(1.0)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: Range is from -1 to 1.

122.3.17 ASinh(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inverse hyperbolic sine.
Example:

```
Dim c As New BigNumberMBS(0.5)
Dim d As BigNumberMBS = BigNumberMBS.ASinH(c)

// ASinHMBS is in MBS Xojo Util Plugin
Dim x As Double = ASinHMBS(0.5)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: asinh(x) = ln(x + sqrt(x^2 + 1))

122.3.18 ATan(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Arc Tangent.
Example:

```
Dim c As New BigNumberMBS(0.5)
Dim d As BigNumberMBS = BigNumberMBS.ATan(c)
```

```
Dim x As Double = ATan(0.5)

MsgBox d.StringValue+EndOfLine+Str(x)
```

122.3.19 ATanh(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates inverse hyperbolic tangent.
Example:

```
Dim c As New BigNumberMBS(0.5)
Dim d As BigNumberMBS = BigNumberMBS.ATanh(c)

// ATanhMBS is in MBS Xojo Util Plugin
Dim x As Double = ATanhMBS(0.5)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: atanh(x) = 0.5 * ln((1+x) / (1-x)) x in (-1, 1)

122.3.20 BitAnd(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates bitwise AND operation.
Example:

```
dim x as new BigNumberMBS(17)
dim y as new BigNumberMBS(16)
dim r as BigNumberMBS = x.BitAnd(y)

MsgBox r.StringValue
```

122.3.21 BitOr(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates bitwise or operation.
Example:

```
dim x as new BigNumberMBS(17)
dim y as new BigNumberMBS(16)
dim r as BigNumberMBS = x.BitOr(y)

MsgBox r.StringValue
```

122.3.22 BitXOr(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates bitwise xor operation.
Example:

```
dim x as new BigNumberMBS(17)
dim y as new BigNumberMBS(16)
dim r as BigNumberMBS = x.BitXOr(y)

MsgBox r.StringValue
```

122.3.23 Ceil as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function returns a value representing the smallest integer that is greater than or equal to x.
Example:

```
Dim c As New BigNumberMBS(-3.7)
Dim d As BigNumberMBS = c.Ceil

MsgBox d // shows -3
```

Notes:

e.g.
Ceil(-3.7) = -3
Ceil(-3.1) = -3
Ceil(-3.0) = -3
Ceil(4.0) = 4
Ceil(4.2) = 5
Ceil(4.8) = 5

122.3.24 Constructor

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initialize the number with zero value.
Example:

```
dim o as BigNumberMBS = new BigNumberMBS
MsgBox o.StringValue
```

- 122.3.32 Constructor(value as UInt32) 20177
- 122.3.33 Constructor(value as UInt64) 20178

122.3.25 Constructor(other as BigNumberMBS)

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initialize the number with other value.
Example:

```
dim o as BigNumberMBS = new BigNumberMBS(2.5)
dim c as BigNumberMBS = new BigNumberMBS(o)

MsgBox c.StringValue
```

- 122.3.28 Constructor(value as Int32) 20175
- 122.3.29 Constructor(value as Int64) 20176
- 122.3.30 Constructor(value as Single) 20176
- 122.3.31 Constructor(value as String) 20177
- 122.3.32 Constructor(value as UInt32) 20177
- 122.3.33 Constructor(value as UInt64) 20178

122.3.26 Constructor(value as Currency)

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number object with a currency object.
Example:

```
dim v as Currency = 123.456
dim b as new BigNumberMBS(v)
MsgBox b.StringValue
```

See also:

- 122.3.24 Constructor 20173

- 122.3.28 Constructor(value as Int32) 20175
- 122.3.29 Constructor(value as Int64) 20176
- 122.3.30 Constructor(value as Single) 20176
- 122.3.31 Constructor(value as String) 20177
- 122.3.32 Constructor(value as UInt32) 20177
- 122.3.33 Constructor(value as UInt64) 20178

122.3.27 Constructor(value as Double)

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initialize the number with double value.
Example:

```
dim o as BigNumberMBS = new BigNumberMBS(2.5)
MsgBox str(o.DoubleValue)+" = "+str(o.StringValue)#
```

- 122.3.28 Constructor(value as Int32) 20175
- 122.3.29 Constructor(value as Int64) 20176
- 122.3.30 Constructor(value as Single) 20176
- 122.3.31 Constructor(value as String) 20177
- 122.3.32 Constructor(value as UInt32) 20177
- 122.3.33 Constructor(value as UInt64) 20178

122.3.28 Constructor(value as Int32)

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number with a 32-bit integer.
Example:

```
dim v as Int32 = 123
dim b as new BigNumberMBS(v)
MsgBox b.StringValue
```

See also:

- 122.3.24 Constructor 20173

- 122.3.27 Constructor(value as Double) 20174
- 122.3.29 Constructor(value as Int64) 20176
- 122.3.30 Constructor(value as Single) 20176
- 122.3.31 Constructor(value as String) 20177
- 122.3.32 Constructor(value as UInt32) 20177
- 122.3.33 Constructor(value as UInt64) 20178

122.3.29 Constructor(value as Int64)

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number with a 64-bit integer.
Example:

```
dim v as Int64 = 123
dim b as new BigNumberMBS(v)
MsgBox b.StringValue
```

See also:

- 122.3.24 Constructor 20173

- 122.3.27 Constructor(value as Double) 20174
- 122.3.28 Constructor(value as Int32) 20175
- 122.3.30 Constructor(value as Single) 20176
- 122.3.31 Constructor(value as String) 20177
- 122.3.32 Constructor(value as UInt32) 20177
- 122.3.33 Constructor(value as UInt64) 20178

122.3.30 Constructor(value as Single)

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number with a 32-bit floating point number.
Example:

```
dim v as Single = 123
dim b as new BigNumberMBS(v)
MsgBox b.StringValue
```

See also:

- 122.3.24 Constructor 20173

- 122.3.26 Constructor(value as Currency) 20174

- 122.3.27 Constructor(value as Double) 20174
- 122.3.28 Constructor(value as Int32) 20175
- 122.3.29 Constructor(value as Int64) 20176
- 122.3.31 Constructor(value as String) 20177
- 122.3.32 Constructor(value as UInt32) 20177
- 122.3.33 Constructor(value as UInt64) 20178

122.3.31 Constructor(value as String)

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initialize the number with string value.
Example:

```
dim o as BigNumberMBS = new BigNumberMBS("123.456")
MsgBox o.StringValue
```

See also:

- 122.3.24 Constructor 20173

- 122.3.27 Constructor(value as Double) 20174
- 122.3.28 Constructor(value as Int32) 20175
- 122.3.29 Constructor(value as Int64) 20176
- 122.3.30 Constructor(value as Single) 20176
- 122.3.32 Constructor(value as UInt32) 20177
- 122.3.33 Constructor(value as UInt64) 20178

122.3.32 Constructor(value as UInt32)

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number with an unsigned 32-bit integer.
Example:

```
dim v as UInt32 = 123
dim b as new BigNumberMBS(v)
```

MsgBox b.StringValue

See also:

- 122.3.24 Constructor 20173
- 122.3.25 Constructor(other as BigNumberMBS) 20173
- 122.3.26 Constructor(value as Currency) 20174
- 122.3.27 Constructor(value as Double) 20174
- 122.3.28 Constructor(value as Int32) 20175
- 122.3.29 Constructor(value as Int64) 20176

- 122.3.31 Constructor(value as String) 20177
- 122.3.33 Constructor(value as UInt64) 20178

122.3.33 Constructor(value as UInt64)

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number with an unsigned 32-bit integer.
Example:

```
dim v as UInt64 = 123
dim b as new BigNumberMBS(v)
MsgBox b.StringValue
```

See also:

- 122.3.24 Constructor 20173
- 122.3.25 Constructor(other as BigNumberMBS) 20173
- 122.3.26 Constructor(value as Currency) 20174
- 122.3.27 Constructor(value as Double) 20174
- 122.3.28 Constructor(value as Int32) 20175
- 122.3.29 Constructor(value as Int64) 20176
- 122.3.30 Constructor(value as Single) 20176
- 122.3.31 Constructor(value as String) 20177
- 122.3.32 Constructor(value as UInt32) 20177

122.3.34 Cos(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the cosine value.
Example:

```
Dim c As New BigNumberMBS(1.0)
Dim d As BigNumberMBS = BigNumberMBS.Cos(c)

Dim x As Double = Cos(1.0)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: We're using the formula cos(x) = sin(x + PI/2).

122.3.35 Cosh(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Hyperbolic Cosine.
Example:

```
Dim c As New BigNumberMBS(0.5)
Dim d As BigNumberMBS = BigNumberMBS.CosH(c)

// CosHMBS is in MBS Xojo Util Plugin
Dim x As Double = CosHMBS(0.5)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: We're using the formula cosh(x)= (e^x + e^(-x)) / 2.

122.3.36 Cot(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Cotangent.
Notes: We're using the formula tan(x) = cos(x) / sin(x).

122.3.37 Coth(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Hyperbolic Cotangent.
Notes: We're using the formula coth(x)= (e^x + e^(-x)) / (e^x - e^(-x))

122.3.38 DegToDeg(d as BigNumberMBS, m as BigNumberMBS, s as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts degrees in the long format into one value.
Notes:

long format: (degrees, minutes, seconds)
minutes and seconds must be greater than or equal zero

result:
if d>=0 : result= d + ((s/60)+m)/60
if d<0 : result= d - ((s/60)+m)/60

((s/60)+m)/60 = (s+60*m)/3600 (second version is faster because there's only one division)

for example:
DegToDeg(10, 30, 0) = 10.5
DegToDeg(10, 24, 35.6)=10.4098(8)

122.3.39 DegToGrad(d as BigNumberMBS, m as BigNumberMBS, s as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts degrees in the long format to gradians.
See also:

- 122.3.40 DegToGrad(value as BigNumberMBS) as BigNumberMBS 20180

122.3.40 DegToGrad(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts degrees to gradians.
Notes: it returns: x * 200 / 180
See also:

- 122.3.39 DegToGrad(d as BigNumberMBS, m as BigNumberMBS, s as BigNumberMBS) as BigNumberMBS 20180

122.3.41 DegToRad(d as BigNumberMBS, m as BigNumberMBS, s as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts degrees in the long format to radians.
See also:

- 122.3.42 DegToRad(value as BigNumberMBS) as BigNumberMBS 20181

122.3.42 DegToRad(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts degrees to radians.
Notes: It returns: x * pi / 180
See also:

- 122.3.41 DegToRad(d as BigNumberMBS, m as BigNumberMBS, s as BigNumberMBS) as BigNumberMBS 20181

122.3.43 Divide(other as BigNumberMBS, round as boolean = true) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides the number.
Example:

```
dim x as new BigNumberMBS(8)
dim d as new BigNumberMBS(2)
dim p as BigNumberMBS = x.Divide(d)

MsgBox p.StringValue // shows 4
```

122.3.44 E as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value zero.
Example:

```
dim b as BigNumberMBS = BigNumberMBS.e
MsgBox b.StringValue
```

122.3.45 Equals(other as BigNumberMBS) as Boolean

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if two numbers are the same.
Example:

```
dim o as BigNumberMBS = new BigNumberMBS(123)
dim z as BigNumberMBS = new BigNumberMBS(123)

if o.Equals(z) then
MsgBox "equal"
else
Break // error
end if
```

Notes: Returns true if equal.

122.3.46 Exp(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates e^value.
Example:

```
dim x as new BigNumberMBS(2)
dim p as BigNumberMBS = BigNumberMBS.Exp(x)

MsgBox p.StringValue // shows e^2 = 7.38
```

122.3.47 Floor as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes any fraction part.
Example:

```
dim o as BigNumberMBS = new BigNumberMBS(2.3)
dim s as BigNumberMBS = o.Floor

MsgBox s.StringValue

dim a as BigNumberMBS = new BigNumberMBS(-2.3)
dim b as BigNumberMBS = a.Floor

MsgBox b.StringValue
```

122.3.48 Frac as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts the fraction part.
Example:

```
dim o as BigNumberMBS = new BigNumberMBS(2.5)
dim s as BigNumberMBS = o.Frac

MsgBox s.StringValue

dim a as BigNumberMBS = new BigNumberMBS(-2.5)
dim b as BigNumberMBS = a.Frac

MsgBox b.StringValue
```

122.3.49 GetStringValue(Base as Integer = 10, scientific as boolean = false, scientificFrom as Integer = 15, round as Integer = -1, TrimZeros as Boolean = true, comma as String = ".") as String

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries string value.
Example:

```
dim o as new BigNumberMBS(1234)
```

```
// show as hex
MsgBox o.GetStringValue(16)

// show as number with comma and 3 digits
dim z as new BigNumberMBS(12.345)
MsgBox z.GetStringValue(10, false, 15, 3, true, ",")
```

Notes:

Base: The base of the number system. Normally 10, but also 16 for hex is common.
scientific: Whether to use scientific notation.
scientificFrom: How many digits we show.
Round: Whether to round to n digits.
TrimZeros: Whether to trim unneeded zeros.
comma: The character to use as decimal dot.

122.3.50 GradToDeg(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts degrees to gradians.
Notes: it returns: x * 180 / 200

122.3.51 GradToRad(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts gradians to radians.
Notes: It returns: x * pi / 200.

122.3.52 HalfPi as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value pi/2.
Example:

```
dim b as BigNumberMBS = BigNumberMBS.HalfPi
MsgBox b.StringValue
```

122.3.53 LibTypeStr as String

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries what implementation is used for this platform.
Notes:

Shows asm in the text if assembler code is used.
Assembler code is not available for all platforms.

122.3.54 Ln(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates natural logarithm.
Example:

```
dim x as new BigNumberMBS(2)
dim p as BigNumberMBS = BigNumberMBS.Ln(x)

MsgBox p.StringValue // shows ln(2) = 0.69
```

122.3.55 Ln10 as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value ln(10).
Example:

```
dim b as BigNumberMBS = BigNumberMBS.Ln10
MsgBox b.StringValue
```

122.3.56 Ln2 as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value ln(2).
Example:

```
dim b as BigNumberMBS = BigNumberMBS.Ln2
MsgBox b.StringValue
```

122.3.57 Log(value as BigNumberMBS, base as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates logarithm in a given base.
Example:

```
dim x as new BigNumberMBS(100)
dim d as new BigNumberMBS(10)
dim p as BigNumberMBS = BigNumberMBS.Log(x, d)

MsgBox p.StringValue // shows ln(100)/ln(10) = 2
```

122.3.58 Max as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with maximum value.
Example:

```
dim b as BigNumberMBS = BigNumberMBS.Min
MsgBox b.StringValue
```

122.3.59 Min as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with minimum value.
Example:

```
dim b as BigNumberMBS = BigNumberMBS.Min
MsgBox b.StringValue
```

122.3.60 Modulate(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Modulates a number.
Example:

```
dim x as new BigNumberMBS(17)
```

```
dim y as new BigNumberMBS(3)
dim r as BigNumberMBS = x.Modulate(y)

MsgBox r.StringValue
```

Notes: Similar to mod keyword in Xojo.

122.3.61 Modulate2 as Integer

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Modulates by 2.
Example:

```
dim x as new BigNumberMBS(8)
dim y as new BigNumberMBS(9)

MsgBox str(x.Modulate2)+" "+str(y.Modulate2)
```

Notes: Returns 0 or 1.

122.3.62 Multiply(other as BigNumberMBS, round as boolean = true) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplies two numbers.
Example:

```
dim x as new BigNumberMBS(8)
dim d as new BigNumberMBS(2)
dim p as BigNumberMBS = x.Multiply(d)

MsgBox p.StringValue // shows 16
```

See also:

- 122.3.63 Multiply(value as Integer) as BigNumberMBS 20188
- 122.3.64 Multiply(value as UInt32) as BigNumberMBS 20188

122.3.63 Multiply(value as Integer) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiply by an integer.
Example:

```
dim x as new BigNumberMBS(2)
dim p as BigNumberMBS = x.Multiply(3)

MsgBox p.StringValue // shows 6
```

See also:

- 122.3.62 Multiply(other as BigNumberMBS, round as boolean = true) as BigNumberMBS 20187
- 122.3.64 Multiply(value as UInt32) as BigNumberMBS 20188

122.3.64 Multiply(value as UInt32) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiply by an unsigned integer.
Example:

```
dim x as new BigNumberMBS(17)
dim r as BigNumberMBS = x.Multiply(3)

MsgBox r.StringValue
```

See also:

- 122.3.62 Multiply(other as BigNumberMBS, round as boolean = true) as BigNumberMBS 20187
- 122.3.63 Multiply(value as Integer) as BigNumberMBS 20188

122.3.65 Nan as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value NaN.
Example:

```
dim b as BigNumberMBS = BigNumberMBS.Nan
MsgBox b.StringValue
```

122.3.66 Negate as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negates the number.
Example:

```
dim o as BigNumberMBS = new BigNumberMBS(123)
dim z as BigNumberMBS = o.Negate

MsgBox z.StringValue
```

122.3.67 NumberWithCurrency(value as Currency) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with a currency value.
Example:

```
dim v as Currency = 123.456
dim b as BigNumberMBS = BigNumberMBS.NumberWithCurrency(v)

MsgBox b.StringValue
```

122.3.68 NumberWithDouble(value as Double) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with a 64-bit floating number.
Example:

```
dim v as Double = 123.456
dim b as BigNumberMBS = BigNumberMBS.NumberWithDouble(v)

MsgBox b.StringValue
```

122.3.69 NumberWithInt32(value as Int32) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with a signed 32-bit integer.
Example:

```
dim v as Int32 = 123
dim b as BigNumberMBS = BigNumberMBS.NumberWithInt32(v)

MsgBox b.StringValue
```

122.3.70 NumberWithInt64(value as Int64) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with a signed 64-bit integer.
Example:

```
dim v as Int64 = 123
dim b as BigNumberMBS = BigNumberMBS.NumberWithInt64(v)

MsgBox b.StringValue
```

122.3.71 NumberWithInteger(value as Integer) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with an integer.
Example:

```
dim v as Integer = 123
dim b as BigNumberMBS = BigNumberMBS.NumberWithInteger(v)

MsgBox b.StringValue
```

122.3.72 NumberWithSingle(value as single) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with an 32-bit floating point number.

Example:

```
dim v as Single = 123
dim b as BigNumberMBS = BigNumberMBS.NumberWithSingle(v)

MsgBox b.StringValue
```

122.3.73 NumberWithString(value as String) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with value from string.
Example:

```
dim v as String = "123"
dim b as BigNumberMBS = BigNumberMBS.NumberWithString(v)

MsgBox b.StringValue
```

122.3.74 NumberWithUInt32(value as UInt32) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with an unsigned 32-bit integer.
Example:

```
dim v as UInt32 = 123
dim b as BigNumberMBS = BigNumberMBS.NumberWithUInt32(v)

MsgBox b.StringValue
```

122.3.75 NumberWithUInt64(value as UInt64) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with an unsigned 64-bit integer.
Example:

```
dim v as UInt64 = 123
dim b as BigNumberMBS = BigNumberMBS.NumberWithUInt64(v)

MsgBox b.StringValue
```

122.3.76 NumberWithUInteger(value as UInteger) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with an unsigned integer.
Example:

```
dim v as UInteger = 123
dim b as BigNumberMBS = BigNumberMBS.NumberWithUInteger(v)

MsgBox b.StringValue
```

122.3.77 NumberWithVariant(value as Variant) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number based on a variant.
Example:

```
dim v as Variant = 123.456
dim b as BigNumberMBS = BigNumberMBS.NumberWithVariant(v)

MsgBox b.StringValue
```

Notes: Internally redirects to other NumberWith functions based on the value type.

122.3.78 One as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value one.
Example:

```
dim b as BigNumberMBS = BigNumberMBS.One
MsgBox b.StringValue
```

122.3.79 Operator_Add(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a number.
Example:

```
dim a as new BigNumberMBS(3)
dim b as new BigNumberMBS(4)

// add
dim c as BigNumberMBS = a + b

MsgBox c.StringValue
```

122.3.80 Operator_AddRight(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a number.
Example:

```
dim a as new BigNumberMBS(3)
dim b as new BigNumberMBS(4)

// add
dim c as BigNumberMBS = a + b

MsgBox c.StringValue
```

122.3.81 Operator_Compare(other as BigNumberMBS) as Integer

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares two numbers.
Example:

```
dim a as new BigNumberMBS(1.2)
dim b as new BigNumberMBS(1.2)
dim c as new BigNumberMBS(1.3)

if a = b then
// ok
else
```

```
break
end if

if a <c then
// ok
else
Break
end if

if c >b then
// ok
else
break
end if
```

122.3.82 Operator_Convert as String

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts big number to string automatically.
Example:

```
dim b as new BigNumberMBS
dim n as Double = 5

// convert from double to big number automatically
b = n

// convert to string automatically
MsgBox b
```

See also:

- 122.3.83 Operator_Convert(value as String) 20194

122.3.83 Operator_Convert(value as String)

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a string to a big number.
Example:

```
dim b as new BigNumberMBS
dim n as string = "5"
```

```
// convert from string to big number automatically
b = n

// convert to double automatically
dim d as Double = b
MsgBox str(d)
```

See also:

- 122.3.82 Operator_Convert as String 20194

122.3.84 Operator_Divide(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides two numbers.
Example:

```
dim a as new BigNumberMBS(9.3)
dim b as new BigNumberMBS(3.0)

dim r as BigNumberMBS = a / b

MsgBox r.StringValue
```

122.3.85 Operator_DivideRight(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides two numbers.

122.3.86 Operator_IntegerDivide(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates an integer divide.
Example:

```
dim a as new BigNumberMBS(9.3)
dim b as new BigNumberMBS(3.0)
```

```
dim r as BigNumberMBS = a \b

MsgBox r.StringValue
```

Notes: Same as normal divide, but removes fraction part.

122.3.87 Operator_IntegerDivideRight(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates an integer divide.
Notes: Same as normal divide, but removes fraction part.

122.3.88 Operator_Modulo(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the modulo of two numbers.
Example:

```
dim a as new BigNumberMBS(9.3)
dim b as new BigNumberMBS(3.0)

dim r as BigNumberMBS = a mod b

MsgBox r.StringValue
```

122.3.89 Operator_ModuloRight(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the modulo of two numbers.

122.3.90 Operator_Multiply(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiply two numbers.
Example:

```
// speed of light in m/s
Dim SpeedOfLight As New BigNumberMBS("299792458")

// seconds per day
Dim SecondsPerDay As New BigNumberMBS(24 * 3600)

Dim DaysPerYear As New BigNumberMBS(365.25)

Dim LightYear As BigNumberMBS = SpeedOfLight * DaysPerYear * SecondsPerDay
MsgBox LightYear.StringValue+" meter per light year"

// 9.460.730.472.580.800 matches number from Wikipedia

Dim AgeOfUniversum As New BigNumberMBS(13810000000)

Dim MaxDistance As BigNumberMBS = LightYear * AgeOfUniversum

MsgBox MaxDistance.GetStringValue(10, False, 100, 3, True)+" meter maximum"
```

122.3.91 Operator_MultiplyRight(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiply two numbers.

122.3.92 Operator_Negate as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negates a number.
Example:

```
dim a as new BigNumberMBS(3)

// negate
dim c as BigNumberMBS = -a

MsgBox c.StringValue
```

122.3.93 Operator_Power(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates power of two numbers.
Example:

```
dim a as new BigNumberMBS(3)
dim b as new BigNumberMBS(4)

// pow
dim c as BigNumberMBS = a ^b

MsgBox c.StringValue
```

122.3.94 Operator_PowerRight(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates power of two numbers.

122.3.95 Operator_Subtract(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts one number from other.
Example:

```
dim a as new BigNumberMBS(3)
dim b as new BigNumberMBS(4)

// subtract
dim c as BigNumberMBS = a - b

MsgBox c.StringValue
```

122.3.96 Operator_SubtractRight(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts one number from other.

122.3.97 Pi as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value pi.
Example:

```
dim b as BigNumberMBS = BigNumberMBS.Pi
MsgBox b.StringValue
```

122.3.98 Pow(other as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the power of the number.
Example:

```
dim x as new BigNumberMBS(2)
dim o as new BigNumberMBS(5)
dim p as BigNumberMBS = x.Pow(o)

MsgBox p.StringValue // shows 32
```

122.3.99 RadToDeg(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts radians to degrees.
Notes: It returns: x * 180 / pi.

122.3.100 RadToGrad(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts radians to gradians.
Notes: it returns: x * 200 / pi

122.3.101 Rand as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates random number.
Notes: Mantissa and exponent are filled with random bytes to generate a random names.

122.3.102 Root(value as BigNumberMBS, index as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Indexth Root of x
Example:

```
Dim c As New BigNumberMBS(5*5*5*5)
Dim e As New BigNumberMBS(4)
Dim d As BigNumberMBS = BigNumberMBS.Root(c, e)

MsgBox d.StringValue
```

Notes:

index must be integer and not negative <0;1;2;3....)

if index==0 the result is one
if x==0 the result is zero and we assume root(0;0) is not defined

if index is even (2;4;6...) the result is x^(1/index) and x>0
if index is odd (1;2;3;...) the result is either

-(abs(x)^(1/index)) if x<0
or
x^(1/index)) if x>0

(for index==1 the result is equal x)

122.3.103 Round as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rounds the number.
Example:

```
dim o as BigNumberMBS = new BigNumberMBS(2.3)
dim s as BigNumberMBS = o.Round
```

```
MsgBox s.StringValue

dim a as BigNumberMBS = new BigNumberMBS(-2.3)
dim b as BigNumberMBS = a.Round

MsgBox b.StringValue
```

122.3.104 SetStringValue(Text As String, Base as Integer, byref AfterText as String, Byref ValueRead as boolean)

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses number from string.
Example:

```
// set to 1.2 and show
dim o as new BigNumberMBS

dim after as string
dim ValueRead as Boolean

o.SetStringValue "1.2 hello", 10, after, ValueRead

MsgBox "value: "+o.StringValue+EndOfLine+"after: "+after
Break
```

Notes:

Returns also the text after the given text following the number.
Also sets ValueRead if a value was read.

122.3.105 Sgn(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries sign of number.
Example:

```
Dim negative As New BigNumberMBS(-5.6)
Dim sign1 As BigNumberMBS = BigNumberMBS.Sgn(negative)

Dim positive As New BigNumberMBS(5.6)
```

```
Dim sign2 As BigNumberMBS = BigNumberMBS.Sgn(positive)

Break
```

122.3.106 Sin(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the sinus value.
Example:

```
Dim c As New BigNumberMBS(1.0)
Dim d As BigNumberMBS = BigNumberMBS.Sin(c)

Dim x As Double = Sin(1.0)

MsgBox d.StringValue+EndOfLine+Str(x)
```

122.3.107 Sinh(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Hyperbolic Sine.
Example:

```
Dim c As New BigNumberMBS(0.5)
Dim d As BigNumberMBS = BigNumberMBS.SinH(c)

// SinHMBS is in MBS Xojo Util Plugin
Dim x As Double = SinHMBS(0.5)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: we're using the formula sinh(x) = (e^x - e^(-x)) / 2

122.3.108 SkipFraction as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function skips the fraction.

Example:

```
Dim c As New BigNumberMBS(-3.7)
Dim d As BigNumberMBS = c.SkipFraction

MsgBox d // shows -3
```

Notes:

Similar to floor, but different for negative ones.

e.g
2.2 =>2
2.7 =>2
-2.2 =>2
-2.7 =>2

122.3.109 Sqrt as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the square root.
Example:

```
dim o as BigNumberMBS = new BigNumberMBS(256)
dim s as BigNumberMBS = o.Sqrt

MsgBox s.StringValue
```

122.3.110 Subtract(other as BigNumberMBS, round as boolean = true) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts a number.
Example:

```
dim x as new BigNumberMBS(2)
dim d as new BigNumberMBS(3)
dim p as BigNumberMBS = x.Subtract(d)

MsgBox p.StringValue // shows -1
```

122.3.111 Tan(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Tangent.
Example:

```
Dim c As New BigNumberMBS(1.0)
Dim d As BigNumberMBS = BigNumberMBS.Tan(c)

Dim x As Double = Tan(1.0)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: We're using the formula tan(x) = sin(x) / cos(x).

122.3.112 Tanh(value as BigNumberMBS) as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Hyperbolic Tangent.
Example:

```
Dim c As New BigNumberMBS(0.5)
Dim d As BigNumberMBS = BigNumberMBS.TanH(c)

// TanHMBS is in MBS Xojo Util Plugin
Dim x As Double = TanHMBS(0.5)

MsgBox d.StringValue+EndOfLine+Str(x)
```

Notes: We're using the formula tanh(x)= (e^x - e^(-x)) / (e^x + e^(-x))

122.3.113 TwoPi as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value 2 * PI.
Example:

```
dim b as BigNumberMBS = BigNumberMBS.TwoPi
MsgBox b.StringValue
```

122.3.114 Zero as BigNumberMBS

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number with value zero.
Example:

```
dim b as BigNumberMBS = BigNumberMBS.Zero
MsgBox b.StringValue
```

122.3.115 Properties

122.3.116 CurrencyValue as Currency

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets/Queries currency value.
Example:

```
dim u as Currency = 1234.5678
dim b as new BigNumberMBS(u)
MsgBox str(b.CurrencyValue)
```

Notes: (Read and Write property)

122.3.117 DataExponent as MemoryBlock

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The exponent for this number.
Notes:

Setting this may need to update flags, too.
(Read and Write property)

122.3.118 DataFlags as Integer

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The flags.
Notes:

Bits are 128 for Sign, 64 for NAN and 32 for zero.
(Read and Write property)

122.3.119 DataMantissa as MemoryBlock

MBS DataTypes Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The mantissa for this number.
Notes:

Setting this may need to update flags, too.

(Read and Write property)

122.3.120 DoubleValue as Double

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get or Set the double value.
Example:

```
dim o as BigNumberMBS = new BigNumberMBS(2.5)

MsgBox str(o.DoubleValue)+" = "+str(o.StringValue)
```

Notes: (Read and Write property)

122.3.121 Int64Value as Int64

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get/Set value as Int64.
Example:

```
dim u as Int64 = &h7FFFFFFFFFFFFFFF // maximum Int64
dim b as new BigNumberMBS(u)
MsgBox str(b.Int64Value)

dim one as new BigNumberMBS(1)
b = b + one

// raises exception due to overflow
MsgBox str(b.Int64Value)
```

Notes: (Read and Write property)

122.3.122 IntegerValue as Integer

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get or Set the integer value.
Example:

```
dim o as BigNumberMBS = new BigNumberMBS(2.5)

MsgBox str(o.IntegerValue)+" = "+str(o.StringValue)
```

Notes: (Read and Write property)

122.3.123 IsInteger as Boolean

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether this number is an integer.
Example:

```
dim o as BigNumberMBS = new BigNumberMBS(1)
dim z as BigNumberMBS = new BigNumberMBS(1.5)

if o.IsInteger then
MsgBox o.StringValue+" is integer"
else
break // error
end if

if z.IsInteger then
break // error
else
MsgBox z.StringValue+" is not integer"
end if
```

Notes:

If true, there are no digits after the dot.
(Read only property)

122.3.124 IsNan as Boolean

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether this is an invalid number.
Example:

```
dim o as BigNumberMBS = BigNumberMBS.zero
dim z as BigNumberMBS = BigNumberMBS.Nan
```

```
if z.IsNan then
MsgBox z.StringValue+" is NaN"
else
break // error
end if

if o.IsNan then
break // error
else
MsgBox o.StringValue+" is not NaN"
end if
```

Notes: (Read only property)

122.3.125 IsNegative as Boolean

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether this value is negative.
Example:

```
dim o as BigNumberMBS = BigNumberMBS.one
dim z as BigNumberMBS = BigNumberMBS.one.Negate

if z.IsNegative then
MsgBox z.StringValue+" is negative"
else
break // error
end if

if o.IsNegative then
break // error
else
MsgBox o.StringValue+" is not negative"
end if
```

Notes: (Read only property)

122.3.126 IsZero as Boolean

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Checks if value is zero.
Example:

```
dim o as BigNumberMBS = BigNumberMBS.one
dim z as BigNumberMBS = BigNumberMBS.zero

if z.IsZero then
MsgBox z.StringValue+" is zero"
else
break // error
end if

if o.IsZero then
break // error
else
MsgBox o.StringValue+" is not zero"
end if
```

Notes: (Read only property)

122.3.127 StringValue as String

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get or set string value of text.
Example:

```
// set to 1.2 and show
dim o as new BigNumberMBS("1.2")
MsgBox o.StringValue

// set to 2.3
o.StringValue = "2.3"
MsgBox o.StringValue
```

Notes: (Read and Write property)
See also:

- 122.3.130 StringValue(Base as Integer) as String 20211

122.3.128 UInt64Value as UInt64

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get/Set value as UInt64.
Example:

```
dim u as UInt64 = 12345678901234567890
dim b as new BigNumberMBS(u)
MsgBox str(b.UInt64Value)
```

Notes: (Read and Write property)

122.3.129 VariantValue as Variant

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries/Sets value with variant.
Notes:

Floating point values are given as Double.
Integer types as Int32, Int64 or UInt64.
If value exceeds the ranges of those data types, we fall back to string.

When setting, the value is converted to a big number similiar to NumberWithVariant.
(Read and Write property)

122.3.130 StringValue(Base as Integer) as String

MBS DataTypes Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set string value with a given base.
Example:

```
dim o as new BigNumberMBS(1234)

// show as hex
MsgBox o.StringValue(16)
```

Notes: (Read and Write computed property)
See also:

- 122.3.127 StringValue as String 20210

122.4 Globals

122.4.1 IsValidCreditCardNumberMBS(Number as String) as boolean

MBS Util Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Verifies a credit card number.
Example:

```
MsgBox "test 49927398716 gives "+str(IsValidCreditCardNumberMBS("49927398716"))+EndOfLine+_
"test 49927398717 gives "+str(IsValidCreditCardNumberMBS("49927398717"))
```

Notes:

This function implements the Luhn algorithm. This is a simple checksum formula used to validate a variety of identification numbers, such as credit card numbers, IMEI numbers, National Provider Identifier numbers in US and Canadian Social Insurance Numbers.
Returns true on success or false on failure.

If this function returns false, you can be sure the number is not valid. But if the function returns true, you may want to check the number online with some database.

122.4.2 Blog Entries

- MBS Real Studio Plugins, version 11.3pr5

122.4.3 CompareNumbersMBS(v1 as Variant, v2 as Variant) as Integer

MBS DataTypes Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares numbers.
Example:

```
Dim u As UInt64 = 12345678901234567890
Dim i As Int64 = -1

If u >i Then
Break // 12345678901234567890 >-1
Else
Break // xojo says it's smaller!
End If

If CompareNumbersMBS(u,i) >0 Then
Break // Plugin does it right
```

```
Else
Break
End If
```

Notes:

The goal: compare numbers better than Xojo.
Especially UInt64/Int64 edge cases.

We treat nil as 0 value and ptr as UInt64.
If first argument is string, we just compare both as string. If first argument is numeric and second argument is string, we convert second one to number.

122.4.4 Blog Entries

- MBS Xojo Plugins in version 20.5
- MBS Xojo Plugins, version 20.5pr3

122.4.5 ACosHMBS(x as Double) as Double

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes the inverse hyperbolic cosine of the real argument x.
Example:

```
MsgBox str(ACosHMBS(5))
```

Notes:

acosh(1) returns +0.
acosh(x) returns a NAN for x <1.
acosh(+infinity) returns +infinity.

122.4.6 ACosMBS(x as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes the principal value of the arc cosine of x in the range [0, pi] .
Example:

MsgBox str(ACosMBS(5))

Notes:

acos(1) returns +0.
acos(x) returns a NAN for | x | >1.

122.4.7 Blog Entries

- MBS SQLite Extension in version 1.1
- MBS SQLite Extension, version 1.1pr1

122.4.8 ArithmeticShiftMBS(value as UInt64, count as Integer) as UInt64

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Does an arithmetic Shift of value and cares for the sign (+ or -).
Example:

msgbox str(ArithmeticShiftMBS(5,3))

// displays 40 which is 5*(2^3) = 5 * 8

Notes: Always using 32bit.

122.4.9 ASinHMBS(x as Double) as Double

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes the principal value of the arc sine of x in the range [-pi/2, +pi/2] .
Example:

MsgBox str(ASinHMBS(5))

Notes:

asin(+-0) returns +-0.
asin(x) returns a NAN for | x | >1.

122.4.10 ASinMBS(x as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes the principal value of the arc sine of x in the range [-pi/2, +pi/2] .
Example:

MsgBox str(ASinMBS(5))

Notes:

asin(+-0) returns +-0.
asin(x) returns a NAN for | x | >1.

122.4.11 Blog Entries

- MBS SQLite Extension in version 1.1
- MBS SQLite Extension, version 1.1pr1

122.4.12 ATan2MBS(x as Double, y as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes the principal value of the arc tangent of y/x, using the signs of both arguments to determine the quadrant of the return value.
Example:

MsgBox str(ATan2MBS(3,4))

Notes:

atan2(+-0, -0) returns +-pi.
atan2(+-0, +0) returns +-0.
atan2(+-0, x) returns +-pi for x <0.
atan2(+-0, x) returns +-0 for x >0.
atan2(y, +-0) returns -pi/2 for y >0.
atan2(+-y, -infinity) returns +-pi for finite y >0.
atan2(+-y, +infinity) returns +-0 for finite y >0.
atan2(+-infinity, +x) returns +-pi/2 for finite x.
atan2(+-infinity, -infinity) returns +-3*pi/4.
atan2(+-infinity, +infinity) returns +-pi/4.

122.4.13 Blog Entries

- MBS SQLite Extension in version 1.1
- MBS SQLite Extension, version 1.1pr1

122.4.14 ATanHMBS(x as Double) as Double

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes the inverse hyperbolic tangent of the real argument x.
Example:

MsgBox str(ATanHMBS(5))

Notes:

atanh(+-0) returns +-0.
atanh(+-1) returns +-infinity.
atanh(x) returns a NaN for | x | >1.

122.4.15 ATanMBS(x as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The atan() function computes the principal value of the arc tangent of x in the range [-pi/2, +pi/2] .
Example:

MsgBox str(ATanMBS(5))

Notes:

atan(+-0) returns +-0.
atan(+-infinity) returns +-pi/2.

122.4.16 Blog Entries

- MBS SQLite Extension in version 1.1
- MBS SQLite Extension, version 1.1pr1

122.4.17 BitClearMBS(value as UInt64, mask as UInt64) as UInt64

MBS Util Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the bits in the mask from the value.
Example:

```
MsgBox bin(BitClearMBS(& b1111,& b0110)) // 1001
```

Notes: Does not work for 64 bit integers.

122.4.18 BitCountMBS(value as UInt64) as Integer

MBS Util Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts the number of bits set.
Example:

```
MsgBox str(BitCountMBS(& b101)) // 2
MsgBox str(BitCountMBS(& b10101)) // 5
MsgBox str(BitCountMBS(& b11111111111100001111)) // 16
MsgBox str(BitCountMBS(& hFFFFFFFF)) // 32
```

Notes: Does not work for 64 bit integers.

122.4.19 BitExclMBS(value as UInt64, bitNumber as Integer) as UInt64

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function:

Does an bitwiseAnd using the value and bitwisenot of 2^bitNumber.
Or: Switches off the bit bitNumber inside value.
Example:

```
msgBox str(BitExclMBS(80,4))
' displays 64 which is 80 without 16 = 2^4+2^5 without 2^4
```

Notes: Always using 64-bit.

122.4.20 Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.2pr6

122.4.21 BitInclMBS(value as UInt64, bitNumber as Integer) as UInt64

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function:

Does an bitwiseOr using the value and 2^bitNumber
Or: Switches on the bit bitNumber inside value.
Example:

```
msgBox str(BitInclMBS(64,4))
' displays 80 which is 64 + 16 = 64 + 2^4
```

Notes: Always using 64-bit.

122.4.22 Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.2pr6

122.4.23 BitIsSetMBS(value as UInt64, bitNumber as Integer) as Boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tests whether a certain bit is set inside the value
Example:

```
dim bool as boolean

bool=BitIsSetMBS(80,4)
' true, because 2^4=16 is included in 80=2^4+2^6
```

Notes: Always using 64-bit.

122.4.24 Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.2pr6

122.4.25 BitValMBS(bitNumber as Integer) as UInt64

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns 2^bitNumber
Example:

```
msgBox str(BitValMBS(5))
' displays 32
```

Notes: Always using 64-bit.

122.4.26 Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.2pr6

122.4.27 BitwiseDiffMBS(x as UInt64, y as UInt64) as UInt64

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all bits of val1 which are not in val2.
Example:

```
msgBox str(BitwiseDiffMBS(65,80))
' displays 1, because 65=2^0+2^5 includes 1=2^0, which is not part of 80=2^4+2^5.
```

Notes: Always using 32bit.

122.4.28 BitwiseNAndMBS(x as UInt64, y as UInt64) as UInt64

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: negates both values and does bitwiseAnd on them.
Example:

```
msgBox str(bitwiseNandMBS(65,80))
' displays -82
```

Notes: Always using 32bit.

122.4.29 BitwiseNOrMBS(x as UInt64, y as UInt64) as UInt64

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: negates both values and does bitwiseor on them.
Example:

```
msgBox str(bitwisenorMBS(65,80))
' displays -65
```

Notes: Always using 32bit.

122.4.30 BitwiseNotMBS(value as UInt64) as UInt64

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Does an bitwise negation of value.
Example:

```
msgBox str(BitwiseNotMBS(5))
' displays -6
```

Notes: Always using 32bit.

122.4.31 BitwiseRotateMBS(value as UInt64, count as Integer, offset as Integer, width as Integer) as UInt64

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Does an bitwise rotation of value.
Example:

```
msgBox str(BitwiseRotateMBS(5,2,0,32))
' displays 20
```

Notes: Always using 32bit.

122.4.32 ConvertFromFloat16MBS(Number as UInt16) as Single

MBS Util Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a 16bit floating point number to a 32bit floating point number.
Example:

```
dim h1 as UInt16 = ConvertToFloat16MBS(1.0)
dim f1 as single = ConvertFromFloat16MBS(h1) // should be 1.0

dim h2 as UInt16 = ConvertToFloat16MBS(-1.0)
dim f2 as single = ConvertFromFloat16MBS(h2) // should be -1.0

dim h3 as UInt16 = ConvertToFloat16MBS(1000.0)
dim f3 as single = ConvertFromFloat16MBS(h3) // should be 1000.0

dim h4 as UInt16 = ConvertToFloat16MBS(-1000.0)
dim f4 as single = ConvertFromFloat16MBS(h4) // should be -1000.0

dim inf as single = 65504.0
dim h5 as UInt16 = ConvertToFloat16MBS(inf)
dim f5 as single = ConvertFromFloat16MBS(h5) // should be 65504

dim nan as single = sqrt(-1)
dim h6 as UInt16 = ConvertToFloat16MBS(nan)
dim f6 as single = ConvertFromFloat16MBS(h6) // should be NAN

Break // check in debugger
```

122.4.33 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.5pr4

122.4.34 ConvertToFloat16MBS(Number as Single) as UInt16

MBS Util Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a 32bit floating point number to a 16bit floating point number.
Example:

```
dim h1 as UInt16 = ConvertToFloat16MBS(1.0)
dim f1 as single = ConvertFromFloat16MBS(h1) // should be 1.0

dim h2 as UInt16 = ConvertToFloat16MBS(-1.0)
dim f2 as single = ConvertFromFloat16MBS(h2) // should be -1.0

dim h3 as UInt16 = ConvertToFloat16MBS(1000.0)
dim f3 as single = ConvertFromFloat16MBS(h3) // should be 1000.0

dim h4 as UInt16 = ConvertToFloat16MBS(-1000.0)
dim f4 as single = ConvertFromFloat16MBS(h4) // should be -1000.0

dim inf as single = 65504.0
dim h5 as UInt16 = ConvertToFloat16MBS(inf)
dim f5 as single = ConvertFromFloat16MBS(h5) // should be 65504

dim nan as single = sqrt(-1)
dim h6 as UInt16 = ConvertToFloat16MBS(nan)
dim f6 as single = ConvertFromFloat16MBS(h6) // should be NAN

Break // check in debugger
```

Notes: This looses precision as 16bit fit less bits than 32 bit.

122.4.35 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.5pr4

122.4.36 CosHMBS(x as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes the hyperbolic cosine of x.
Example:

```
MsgBox str(CosHMBS(5))
```

Notes:

cosh(+-0) returns 1.
cosh(+-infinity) returns +infinity.

122.4.37 Blog Entries

- MBS SQLite Extension in version 1.1
- MBS SQLite Extension, version 1.1pr1

122.4.38 CosMBS(x as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes the cosine of x (measured in radians).
Example:

MsgBox str(CosMBS(5))

Notes:

cos(+-0) returns 1.
cos(+-infinity) returns a NaN.

122.4.39 Blog Entries

- MBS SQLite Extension in version 1.1
- MBS SQLite Extension, version 1.1pr1

122.4.40 CurrencyAddMBS(value1 as Currency, value2 as Currency) as Currency

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds two currency values.
Notes: This function uses 64bit integer math to avoid rounding issues.

122.4.41 CurrencyDivMBS(value1 as Currency, value2 as Integer) as Currency

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides currency value by integer.
Notes:

Rest is ignored.
This function uses 64bit integer math to avoid rounding issues.

122.4.42 CurrencyMulMBS(value1 as Currency, value2 as Integer) as Currency

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplies currency value with integer.
Example:

```
dim c1 as Currency = 1234567890.1234

// in xojo
dim c3 as Currency = c1 * 12345

// with plugin
dim c4 as Currency = CurrencyMulMBS(c1, 12345)

// verify by 64bit math
dim c5 as Int64 = 12345678901234
dim c6 as int64 = c5 * 12345

// and plugin is correct
MsgBox str(c3)+" "+str(c4)+" "+str(c6)
```

Notes: This function uses 64bit integer math to avoid rounding issues.

122.4.43 CurrencySubMBS(value1 as Currency, value2 as Currency) as Currency

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts value2 from value1.
Notes: This function uses 64bit integer math to avoid rounding issues.

122.4.44 CurrencyValueMBS(value as string) as Currency

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses string into currency value.
Notes: Replacement for val() which works better with large numbers and raises exceptions on errors.

122.4.45 Blog Entries

- Currency Data Type
- MBS Xojo / Real Studio Plugins, version 14.3pr9
- Currency Data Type

122.4.46 DoubleToExtendedStrMBS(x as Double) as string

MBS Util Plugin, Platform: macOS, Targets: All.

Function: Returns the double as an 80bit Float stored inside a ten byte string.
Example:

```
dim s as string
dim d as Double

d=5
s=DoubleToExtendedStrMBS(d)
msgBox s
d=extendedStrToDoubleMBS(s)
msgBox str(d)
```

Notes: Returns "" if there is not enough memory to create the string.

122.4.47 Exp2MBS(x as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes 2^x, the base-2 exponential of x.
Example:

```
MsgBox str(Exp2MBS(5))
```

Notes:

exp2(+-0) return 1.
exp2(-infinity) return +0.

exp2(+infinity) return +infinity.

122.4.48 ExpMBS(x as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes e^x, the base-e exponential of x.
Example:

MsgBox str(ExpMBS(5))

Notes:

exp(+-0) return 1.
exp(-infinity) return +0.
exp(+infinity) return +infinity.

122.4.49 Blog Entries

- REAL Server Plugin 0.4

122.4.50 ExtendedStrToDoubleMBS(v as string) as Double

MBS Util Plugin, Platform: macOS, Targets: All.

Function: Returns the 80bit Float as a double.
Example:

```
dim s as string
dim d as Double

d=5
s=DoubleToExtendedStrMBS(d)
msgBox s
d=extendedStrToDoubleMBS(s)
msgBox str(d)
```

Notes:

Returns NAN (255) if the string is not valid. e.g. "".
Returns always NAN on Windows.

122.4.51 FacMBS(x as Integer) as Double

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates (value!).
Example:

```
Sub Open()
// Fill a listbox with Fac values:
dim x as Integer
dim y as Double

for x=1 to 100
listBox1.addrow format(x,"0")
y=FacMBS(x)
if y=0 then
exit
else
listBox1.cell(listBox1.lastIndex,1)=format(y,"0")
end if
next
End Sub
```

Notes:

```
msgBox str(facMBS(5))
' displays 120 which is 1*2*3*4*5
```

122.4.52 FloorMBS(x as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function returns the largest integral value less than or equal to x.
Example:

```
MsgBox str(FloorMBS(5.45))
```

Notes:

floor(+-0) returns +-0.
floor(+-infinity) returns +-infinity.

122.4.53 Blog Entries

- REAL Server Plugin 0.4

122.4.54 FRExpMBS(inputx as Double, byref expValue as Integer) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Breaks floating-point number into normalized fraction and power of 2.
Example:

```
dim x as Double = 123.456

dim y as Integer
dim r as Double = FRExpMBS(x, y)

MsgBox str(X)+": "+str(y)+" "+str(r)
```

Notes:

This functions break the floating-point number value into a normalized fraction and an integral power of 2. They store the integer in the int object pointed to by exp.

The functions return a number x such that x has a magnitude in the interval [1/2, 1) or 0, and value = x*(2^exp).

frexp(+-0, exp) returns +-0, and stores 0 in the object pointed to by exp.

frexp(+-infinity, exp) returns +-infinity, and stores an unspecified value in the object pointed to by exp.

frexp(Nan, exp) returns a Nan, and stores an unspecified value in the object pointed to by exp.

122.4.55 HiWordMBS(i as Integer) as Integer

MBS Util Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the high word part of the integer.
Example:

```
MsgBox hex(HiWordMBS(& H12345678)) // shows 1234
```

Notes: equal to bitwiseshiftright(i,16)

122.4.56 HypotMBS(x as Double, y as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes the sqrt(x*x+y*y) without undue overflow or underflow.
Example:

```
MsgBox str(HypotMBS(3,4)) // shows 5
```

Notes:

hypot(x, y) , hypot(y, x) , and hypot(x, -y) are equivalent.
hypot(x, +-0) is equivalent to fabs(x).
hypot(+-infinity, y) returns +infinity even if y is a NaN.

122.4.57 IsFiniteMBS(x as Double) as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the parameter is finite.
Example:

```
dim x as Double

x=1/0
if not isfiniteMBS(x) then
msgbox "the result is Infinite."
end if
```

122.4.58 IsInfMBS(x as Double) as boolean

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the double passed in is an infinity value.
Example:

```
dim e as Double = 0.0000000000000000000000000000000000000000000000001
dim d as Double = 1.0/e/e/e/e/e/e/e

MsgBox str(d)+" is inf: "+str(IsInfMBS(d))
```

122.4.59 IsNANMBS(x as Double) as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the parameter is not a number.
Example:

```
dim x as Double
x=sqrt(-1)
if isnanMBS(x) then
msgbox "the square root of -1 is not correct."
end if
```

122.4.60 Log10MBS(x as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes the value of the logarithm of argument x to base 10.
Example:

```
MsgBox str(Log10MBS(5))
```

Notes:

log10(1) return +0.
log10(x) return a NaN for x <0.
log10(+infinity) return +infinity.

122.4.61 Blog Entries

- REAL Server Plugin 0.4

122.4.62 Log2MBS(x as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes the value of the logarithm of argument x to base 2.
Example:

MsgBox str(Log2MBS(5))

Notes:

log2(1) return +0.
log2(x) return a NaN for x <0.
log2(+infinity) return +infinity.

122.4.63 LogicalShiftMBS(value as UInt64, count as Integer) as UInt64

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Does an logical Shift of value and doesn't take care for the sign (+ or -).
Example:

msgbox str(LogicalShiftMBS(5,3))

Notes: Always using 32bit.

122.4.64 LogMBS(x as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes the value of the logarithm of argument x to base e.
Example:

MsgBox str(LogMBS(5))

Notes:

log(1) return +0.
log(x) return a NaN for x <0.
log(+infinity) return +infinity.

122.4.65 Blog Entries

- REAL Server Plugin 0.4

122.4.66 LoWordMBS(i as Integer) as Integer

MBS Util Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the low word part of the integer.
Example:

```
MsgBox hex(LoWordMBS(& H12345678)) // shows 5678
```

Notes: equal to bitwiseand(i,& HFFFF)

122.4.67 NormInvMBS(p as Double, mu as double = 0.0, sigma as double = 1.0) as double

MBS Util Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Calculates NormInv function like in Excel.
Example:

```
MsgBox Str(NormInvMBS(0.56, 5, 2)) // should show 5.3019
```

122.4.68 Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 21.1
- MBS Xojo Plugins, version 21.1pr1

122.4.69 PowMBS(x as Double, y as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes x raised to the power y.
Example:

```
MsgBox str(PowMBS(5,5))
```

Notes:

pow(+-0, y) returns +-infinity for y an odd integer <0.
pow(+-0, y) returns +infinity for y <0 and not an odd integer.
pow(+-0, y) returns +-0 for y an odd integer >0.
pow(+-0, y) returns +0 for y >0 and not an odd integer.

pow(-1, +-infinity) returns 1.
pow(1, y) returns 1 for any y, even a NaN.
pow(x, +-0) returns 1 for any x, even a NaN.
pow(x, y) returns a NaN for finite x <0 and finite non-integer y.
pow(x, -infinity) returns +infinity for | x | <1.
pow(x, -infinity) returns +0 for | x | >1.
pow(x, +infinity) returns +0 for | x | <1.
pow(x, +infinity) returns +infinity for | x | >1.
pow(-infinity, y) returns -0 for y an odd integer <0.
pow(-infinity, y) returns +0 for y <0 and not an odd integer.
pow(-infinity, y) returns -infinity for y an odd integer >0.
pow(-infinity, y) returns +infinity for y >0 and not an odd integer.
pow(+infinity, y) returns +0 for y <0.
pow(+infinity, y) returns +infinity for y >0.

Range errors may occur.

122.4.70 Blog Entries

- REAL Server Plugin 0.4

122.4.71 RoundMBS(x as Double, decimals as Integer = 0) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function returns the integral value nearest to x rounding half-way cases away from zero, regardless of the current rounding direction.
Example:

```
MsgBox str(RoundMBS(5.5))

dim lines(-1) as string

for i as Integer = -5 to 5
lines.Append str(i)+": "+Format(RoundMBS(123456789.123456789, i), "0.0000000")
next

MsgBox join(lines,EndOfLine)
```

Notes:

round(+-0) returns +-0.
round(+-infinity) returns +-infinity.

122.4.72 Blog Entries

- MBS REALbasic Plugins, version 11.0pr14
- REAL Server Plugin 0.4

122.4.73 SinHMBS(x as Double) as Double

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes the hyperbolic sine of x.
Example:

MsgBox str(SinHMBS(5.5))

Notes:

sinh(+-0) returns +-0.
sinh(+-infinity) returns +-infinity.

122.4.74 Blog Entries

- MBS SQLite Extension in version 1.1
- MBS SQLite Extension, version 1.1pr1

122.4.75 SinMBS(x as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes the sine of x (measured in radians).
Example:

MsgBox str(SinMBS(5.5))

Notes:

sin(+-0) returns +-0.
sin(+-infinity) returns a NaN.

122.4.76 Blog Entries

- MBS SQLite Extension in version 1.1

- MBS SQLite Extension, version 1.1pr1

122.4.77 SqrtMBS(x as Double, y as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function compute the yth root of x.
Example:

```
dim r,x,y as Double

r=SqrtMBS(x,y)
// r^y=x
```

Notes:

sqrt(-0) returns -0.
sqrt(x,y) returns a NaN if the root can't be calculated.

122.4.78 Blog Entries

- REAL Server Plugin 0.4

122.4.79 TanHMBS(x as Double) as Double

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes the hyperbolic tangent of x.
Example:

```
MsgBox str(TanHMBS(5.5))
```

Notes:

tanh(+-0) returns +-0.
tanh(+-infinity) returns +-1.

122.4.80 Blog Entries

- MBS SQLite Extension in version 1.1
- MBS SQLite Extension, version 1.1pr1

122.4.81 TanMBS(x as Double) as Double

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function computes the tangent of x (measured in radians).
Example:

```
MsgBox str(TanMBS(5.5))
```

Notes:

tan(+-0) returns +-0.
tan(+-infinity) returns a NaN.

122.4.82 Blog Entries

- MBS SQLite Extension in version 1.1
- MBS SQLite Extension, version 1.1pr1

122.4.83 DoubleToInt64MBS(value as Double) as Int64

MBS Util Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a double value to Int64.

122.4.84 Blog Entries

- MBS Real Studio Plugins, version 12.1pr7

122.4.85 DoubleToUInt64MBS(value as Double) as UInt64

MBS Util Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a double value to UInt64 correctly.
Example:

```
// set d to a very high UInt64 value
dim d as Double = pow(256.0,8.0) - 10000

// RB will convert to Int64 here! so number is cut to 9... instead of 18...
dim u1 as UInt64 = d
```

```
// plugin does it right
dim u2 as UInt64 = DoubleToUInt64MBS(d)

MsgBox str(u1)+" "+str(u2)
```

Notes: Xojo converts UInt64 to Double with an intermediate Int64 which breaks big numbers. This function does it correctly.

122.4.86 Blog Entries

- MBS Plugins 11.1 Release notes
- MBS Real Studio Plugins, version 11.1pr11

122.4.87 Int64ToDoubleMBS(value as Int64) as Double

MBS Util Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts an Int64 to Double.

122.4.88 Blog Entries

- MBS Real Studio Plugins, version 12.1pr7

122.4.89 UInt64ToDoubleMBS(value as UInt64) as Double

MBS Util Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts an UInt64 to Double.
Example:

```
dim d as Double = 18446744073709541376
MsgBox str(d) // fails

dim e as Double = UInt64ToDoubleMBS(18446744073709541376)
MsgBox str(e) // works
```

Notes: Xojo likes to use Int64 internally when doing math with UInt64, so we added this method to fix it.

- MBS Plugins 11.1 Release notes
- MBS Real Studio Plugins, version 11.1pr11

122.5 class LargeNumberErrorExceptionMBS

122.5.1 class LargeNumberErrorExceptionMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception class used to report with problems in LargeNumberMBS class.
Notes: Subclass of the RuntimeException class.

122.5.2 Blog Entries

- MBS Xojo Plugins, version 19.1pr5

122.5.3 Blog Entries

- MBS Xojo Plugins, version 19.1pr5

122.6 class LargeNumberMBS

122.6.1 class LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: An 4128 bit integer number.
Example:

```
Dim n1 As Int64 = 10000000000
Dim n2 As Int64 = 10000000000
Dim n3 As Int64 = n1 * n2 // overflow, so wrong result

Dim l1 As LargeNumberMBS = LargeNumberMBS.NumberWithInt64(n1)
Dim l2 As LargeNumberMBS = LargeNumberMBS.NumberWithInt64(n2)
Dim l3 As LargeNumberMBS = l1 * l2

Dim s4 As String = l3.StringValue // this is correct

Break
```

Notes:

Can be useful to calculate with more than Int64.
This class works with up to 1224 digits.

See BigNumberMBS for a 320 bit floating point number.

122.6.8 Methods

122.6.9 Add(other as LargeNumberMBS)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds other number.
See also:

- 122.6.10 Add(other as LargeNumberMBS) as LargeNumberMBS 20241

122.6.10 Add(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds other number and returns result.
See also:

- 122.6.9 Add(other as LargeNumberMBS) 20241

122.6.11 AddMod(v as LargeNumberMBS, Modulo as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Addition with modulo.
Example:

```
Dim v As New LargeNumberMBS(100)
Dim o As New LargeNumberMBS(200)
Dim n As New LargeNumberMBS(& hFF)

Dim r As LargeNumberMBS = v.AddMod(o, n)

MsgBox r.StringValue // shows 45 = (100+200) mod 255
```

122.6.12 CheckBit(bit as integer) as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether a bit is set.
Notes: Returns true if bit is set.

122.6.13 Clone as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the number.

122.6.14 Constructor

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new instance with value zero.
Example:

```
Dim l1 As New LargeNumberMBS
MsgBox l1.StringValue
```

See also:

- 122.6.15 Constructor(other as LargeNumberMBS) 20242
- 122.6.16 Constructor(value as Int32) 20243
- 122.6.17 Constructor(value as Int64) 20243
- 122.6.18 Constructor(value as String) 20244
- 122.6.19 Constructor(value as UInt32) 20244
- 122.6.20 Constructor(value as UInt64) 20244

122.6.15 Constructor(other as LargeNumberMBS)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the number.
Example:

```
Dim l1 As New LargeNumberMBS(123456789)
Dim l2 As New LargeNumberMBS(l1)

MsgBox l2.StringValue
```

See also:

- 122.6.14 Constructor 20242

- 122.6.16 Constructor(value as Int32) 20243
- 122.6.17 Constructor(value as Int64) 20243
- 122.6.18 Constructor(value as String) 20244
- 122.6.19 Constructor(value as UInt32) 20244
- 122.6.20 Constructor(value as UInt64) 20244

122.6.16 Constructor(value as Int32)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new instance with an 32-bit integer.
See also:

- 122.6.14 Constructor 20242
- 122.6.15 Constructor(other as LargeNumberMBS) 20242
- 122.6.17 Constructor(value as Int64) 20243
- 122.6.18 Constructor(value as String) 20244
- 122.6.19 Constructor(value as UInt32) 20244
- 122.6.20 Constructor(value as UInt64) 20244

122.6.17 Constructor(value as Int64)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new instance with an 64-bit integer.
See also:

- 122.6.14 Constructor 20242
- 122.6.15 Constructor(other as LargeNumberMBS) 20242
- 122.6.16 Constructor(value as Int32) 20243
- 122.6.18 Constructor(value as String) 20244
- 122.6.19 Constructor(value as UInt32) 20244
- 122.6.20 Constructor(value as UInt64) 20244

122.6.18 Constructor(value as String)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number based on a string.
See also:

- 122.6.14 Constructor 20242
- 122.6.15 Constructor(other as LargeNumberMBS) 20242
- 122.6.16 Constructor(value as Int32) 20243
- 122.6.17 Constructor(value as Int64) 20243
- 122.6.19 Constructor(value as UInt32) 20244
- 122.6.20 Constructor(value as UInt64) 20244

122.6.19 Constructor(value as UInt32)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new instance with an unsigned 32-bit integer.
See also:

- 122.6.14 Constructor 20242
- 122.6.15 Constructor(other as LargeNumberMBS) 20242
- 122.6.16 Constructor(value as Int32) 20243
- 122.6.17 Constructor(value as Int64) 20243
- 122.6.18 Constructor(value as String) 20244
- 122.6.20 Constructor(value as UInt64) 20244

122.6.20 Constructor(value as UInt64)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new instance with an unsigned 64-bit integer.
See also:

- 122.6.14 Constructor 20242
- 122.6.15 Constructor(other as LargeNumberMBS) 20242
- 122.6.16 Constructor(value as Int32) 20243

- 122.6.17 Constructor(value as Int64) 20243
- 122.6.18 Constructor(value as String) 20244
- 122.6.19 Constructor(value as UInt32) 20244

122.6.21 Decrement(value as UInt32 = 1)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decrement number with an integer.
Example:

```
Dim o As New LargeNumberMBS(5)
MsgBox o.StringValue
o.Increment
MsgBox o.StringValue
o.Decrement
MsgBox o.StringValue
```

Notes: This is faster than building a new LargeNumberMBS, just to subtract some small number.

122.6.22 Divide(other as LargeNumberMBS)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides value with by value.
See also:

- 122.6.23 Divide(other as LargeNumberMBS) as LargeNumberMBS 20245
- 122.6.24 Divide(value as UInt32) as LargeNumberMBS 20246

122.6.23 Divide(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides value with by value.
See also:

- 122.6.22 Divide(other as LargeNumberMBS) 20245
- 122.6.24 Divide(value as UInt32) as LargeNumberMBS 20246

122.6.24 Divide(value as UInt32) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divide by given integer and return result.
Example:

```
Dim o As New LargeNumberMBS(63)
Dim r1 As LargeNumberMBS = o.Divide(8)
Dim r2 As UInt32 = o.Modulo(8)

MsgBox r1.StringValue+" "+str(r2) // shows 7 and 7
```

Notes: For small numbers this is more efficient than creating new LargeNumberMBS to store value.
See also:

- 122.6.22 Divide(other as LargeNumberMBS) 20245
- 122.6.23 Divide(other as LargeNumberMBS) as LargeNumberMBS 20245

122.6.25 DivMod(other as LargeNumberMBS, byref DivResult as LargeNumberMBS, byref ModResult as LargeNumberMBS)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs divide and modulo together.
Example:

```
Dim d As New LargeNumberMBS(100)
Dim n As New LargeNumberMBS(13)

Dim x As LargeNumberMBS
Dim y As LargeNumberMBS

d.DivMod n, x, y

MsgBox d.StringValue + " = " + x.StringValue + " * " + n.StringValue + " + " + y.StringValue
```

Notes: Puts result into both byref parameters.

122.6.26 Equals(other as LargeNumberMBS) as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares if two numbers are equal.
Notes: Returns true if equal.

122.6.27 ExpMod(e as LargeNumberMBS, Modulo as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates an exponent.
Example:

```
Dim o As New LargeNumberMBS(2)
Dim e As New LargeNumberMBS(11)
Dim m As New LargeNumberMBS(255)
Dim r As LargeNumberMBS = o.ExpMod(e,m)

MsgBox r.StringValue // shows 8 = 2^11 mod 255
```

Notes: Returns x^e mod n where x is the current number, e a parameter and n the modulo parameter.

122.6.28 FindGCD(v as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds greatest common divisor for two positive numbers.

122.6.29 Increment(value as UInt32 = 1)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Increment number with an integer.
Example:

```
Dim o As New LargeNumberMBS(5)
MsgBox o.StringValue
o.Increment
MsgBox o.StringValue
o.Decrement
MsgBox o.StringValue
```

Notes: This is faster than building a new LargeNumberMBS, just to add some small number.

122.6.30 IsPrime(iter as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if number is a prime number.
Example:

```
Dim lines() As String

For i As Integer = 61 To 69 Step 2
Dim a As New LargeNumberMBS(i)
lines.Append a.StringValue+": "+Str(a.IsPrime(5))
Next

MsgBox Join(lines, EndOfLine)
```

Notes:

Returns 1 if prime and 0 if not.
Returns -1 in case of error.

Iter is the factor between 1 and 680 about how deep to iterate. The bigger the this factor, the more exact the check is.

Miller-Rabin Algorithm (ret=1 .. n is composit)

122.6.31 LeftShift(bits as integer) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shifts value to left by given number of bits.
Notes: Bits must be <= 32.

122.6.32 MaxInt32 as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum value which can be represented as Int32.

122.6.33 MaxInt64 as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum value which can be represented as Int64.

122.6.34 MaxUInt32 as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum value which can be represented as UInt32.

122.6.35 MaxUInt64 as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum value which can be represented as UInt64.

122.6.36 MinInt32 as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Minimum value which can be represented as Int32.

122.6.37 MinInt64 as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Minimum value which can be represented as Int64.

122.6.38 MinUInt32 as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Minimum value which can be represented as UInt32.

122.6.39 MinUInt64 as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Minimum value which can be represented as UInt64.

122.6.40 ModInverse(Modulo as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function calculates modular multiplicative inverse of an given integer a modulo m.
Example:

```
Dim l As New LargeNumberMBS(3)
Dim n As New LargeNumberMBS(26)

Dim r As LargeNumberMBS = l.ModInverse(n)

MsgBox r.StringValue
```

122.6.41 Modulo(other as LargeNumberMBS)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Modulo value.
Notes: Divides value and returns the rest.
See also:

- 122.6.42 Modulo(other as LargeNumberMBS) as LargeNumberMBS 20250
- 122.6.43 Modulo(value as UInt32) as UInt32 20251

122.6.42 Modulo(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Modulo value.
Notes: Divides value and returns the rest.
See also:

- 122.6.41 Modulo(other as LargeNumberMBS) 20250
- 122.6.43 Modulo(value as UInt32) as UInt32 20251

122.6.43 Modulo(value as UInt32) as UInt32

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divide by given integer and return remainder.
Example:

```
Dim o As New LargeNumberMBS(63)
Dim r1 As LargeNumberMBS = o.Divide(8)
Dim r2 As UInt32 = o.Modulo(8)

MsgBox r1.StringValue+" "+str(r2) // shows 7 and 7
```

Notes: For small numbers this is more efficient than creating new LargeNumberMBS to store value.
See also:

- 122.6.41 Modulo(other as LargeNumberMBS) 20250
- 122.6.42 Modulo(other as LargeNumberMBS) as LargeNumberMBS 20250

122.6.44 MulMod(v as LargeNumberMBS, Modulo as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiply with modulo.
Example:

```
Dim o As New LargeNumberMBS(50)
Dim f As New LargeNumberMBS(80)
Dim m As New LargeNumberMBS(255)
Dim r As LargeNumberMBS = o.MulMod(f, m)

MsgBox r.StringValue // shows 175 = (50 * 80) mod 255
```

122.6.45 Multiply(other as LargeNumberMBS)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplies value with other value.
See also:

- 122.6.46 Multiply(value as UInt32) as LargeNumberMBS 20252

122.6.46 Multiply(value as UInt32) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiply by given integer and return result.
Example:

```
Dim o As New LargeNumberMBS(5)
Dim r As LargeNumberMBS = o.Multiply(8)

MsgBox r.StringValue // shows 40
```

Notes: For small numbers this is more efficient than creating new LargeNumberMBS to store value.
See also:

- 122.6.45 Multiply(other as LargeNumberMBS) 20251

122.6.47 Negate as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negates the value.
Notes: Returns new value with different sign.

122.6.48 NumberWithInt32(value as Int32) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with the given Int32 value.
Example:

```
Dim l1 As LargeNumberMBS = LargeNumberMBS.NumberWithInt32(123456789)
MsgBox l1.StringValue
```

122.6.49 NumberWithInt64(value as Int64) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with the given Int64 value.
Example:

```
Dim d1 As LargeNumberMBS = LargeNumberMBS.NumberWithInt64(0)
Dim d2 As LargeNumberMBS = LargeNumberMBS.NumberWithInt64(123)
```

```
Dim d3 As LargeNumberMBS = LargeNumberMBS.NumberWithInt64(123456789012345)

MsgBox d1.StringValue+EndOfLine+d1.HexString+EndOfLine+_
d2.StringValue+EndOfLine+d2.HexString+EndOfLine+_
d3.StringValue+EndOfLine+d3.HexString
```

122.6.50 NumberWithInteger(value as Integer) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with the given integer value.
Example:

```
Dim l1 As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(123456789)
MsgBox l1.StringValue
```

122.6.51 NumberWithString(value as String) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with the given string.
Example:

```
Dim l1 As LargeNumberMBS = LargeNumberMBS.NumberWithString("123456789")
MsgBox l1.StringValue
```

122.6.52 NumberWithUInt32(value as UInt32) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with the given UInt32 value.
Example:

```
Dim l1 As LargeNumberMBS = LargeNumberMBS.NumberWithUInt32(123456789)
MsgBox l1.StringValue
```

122.6.53 NumberWithUInt64(value as UInt64) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with the given UInt64 value.
Example:

```
Dim l1 As LargeNumberMBS = LargeNumberMBS.NumberWithUInt64(123456789)
MsgBox l1.StringValue
```

122.6.54 NumberWithUInteger(value as UInteger) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with the given unsigned integer value.
Example:

```
Dim l1 As LargeNumberMBS = LargeNumberMBS.NumberWithUInteger(123456789)
MsgBox l1.StringValue
```

122.6.55 NumberWithVariant(value as variant) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with the given variant value.
Example:

```
Dim l1 As LargeNumberMBS = LargeNumberMBS.NumberWithVariant(123456789)
MsgBox l1.StringValue
```

Notes: Variant can be integer or string.

122.6.56 Operator_Add(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds other number and returns result.
Example:

```
Dim l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(20)
Dim o As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(10)
```

```
Dim r As LargeNumberMBS = l+o
Dim s As LargeNumberMBS = o+l

MsgBox r.StringValue+" "+s.StringValue
```

122.6.57 Operator_AddRight(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds other number and returns result.

122.6.58 Operator_And(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs bitwise AND operator on the values.
Example:

```
Dim l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(16+4)
Dim o As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(4+2)

Dim ra As LargeNumberMBS = l And o
Dim ro As LargeNumberMBS = l Or o

MsgBox ra.StringValue +" "+ro.StringValue
```

Notes: Returns new value.

122.6.59 Operator_Compare(other as LargeNumberMBS) as Integer

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares two values.
Example:

```
Dim l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(20)
Dim o As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(10)

If l >o Then
MsgBox "l is bigger"
```

```
Else
MsgBox "o is bigger"
end if
```

Notes: Returns -1, 1 or 0.

122.6.60 Operator_Convert as String

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts the number to string.
Example:

```
Dim l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(23)
MsgBox l
```

See also:

- 122.6.61 Operator_Convert(value as String) 20256

122.6.61 Operator_Convert(value as String)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts string to large number.
Example:

```
Dim l As LargeNumberMBS = "123"
MsgBox l
```

See also:

- 122.6.60 Operator_Convert as String 20256

122.6.62 Operator_Divide(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides value by other value.
Example:

```
Dim l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(21)
Dim o As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(3)
Dim r As LargeNumberMBS = l / o

MsgBox r.stringValue
```

122.6.63 Operator_DivideRight(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides value by other value.
Example:

```
Dim o As New LargeNumberMBS(5)

// "10" is auto converted to LargeNumberMBS and Operator_DivideRight is called
Dim r As LargeNumberMBS = "10" / o

MsgBox r.StringValue
```

122.6.64 Operator_Modulo(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Modulo value.
Example:

```
Dim l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(23)
Dim o As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(3)
Dim r As LargeNumberMBS = l Mod o

MsgBox r.stringValue
```

Notes: Divides value and returns the rest.

122.6.65 Operator_ModuloRight(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Modulo value.
Notes: Divides value and returns the rest.

122.6.66 Operator_Multiply(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplies value with other value.
Example:

```
Dim l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(4)
Dim o As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(5)
Dim r As LargeNumberMBS = o*l

MsgBox r.stringValue
```

122.6.67 Operator_MultiplyRight(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplies value with other value.
Example:

```
Dim o As New LargeNumberMBS(5)

// "10" is auto converted to LargeNumberMBS and Operator_MultiplyRight is called
Dim r As LargeNumberMBS = "10" * o

MsgBox r.StringValue
```

122.6.68 Operator_Negate as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negates the value.
Example:

```
Dim l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(20)
Dim r As LargeNumberMBS = -l

MsgBox r.StringValue
```

122.6.69 Operator_Or(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs bitwise OR operator on the values.
Example:

```
Dim l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(16+4)
Dim o As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(4+2)

Dim ra As LargeNumberMBS = l And o
Dim ro As LargeNumberMBS = l Or o

MsgBox ra.StringValue +" "+ro.StringValue
```

Notes: Returns new value.

122.6.70 Operator_Subtract(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts other number and returns result.
Example:

```
Dim l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(20)
Dim o As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(10)

Dim r As LargeNumberMBS = l-o
Dim s As LargeNumberMBS = o-l

MsgBox r.StringValue+" "+s.StringValue
```

122.6.71 Operator_SubtractRight(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts other number and returns result.
Example:

```
Dim o As New LargeNumberMBS(5)

// "10" is auto converted to LargeNumberMBS and Operator_SubtractRight is called
Dim r As LargeNumberMBS = "10" - o

MsgBox r.StringValue
```

122.6.72 Prime(byte as Integer) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new big prime number.
Example:

```
Dim lines() As String
For i As Integer = 1 To 10

Dim r As LargeNumberMBS = LargeNumberMBS.Prime(i)
lines.Append r.StringValue

Next
MsgBox Join(lines,EndOfLine)
```

Notes: Byte defines how big the prime number becomes. Range 1 to 680.

122.6.73 RightShift(bits as integer) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shifts value to right by given number of bits.
Notes: Bits must be <= 32.

122.6.74 SetZero

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets number to zero.
Example:

```
Dim l1 As LargeNumberMBS = LargeNumberMBS.NumberWithInt32(12345)
MsgBox l1.StringValue
```

```
// set to zero
l1.SetZero
MsgBox l1.StringValue
```

122.6.75 SqrMod(Modulo as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiply with itself and modulo.
Example:

```
Dim o As New LargeNumberMBS(90)
Dim m As New LargeNumberMBS(255)
Dim r As LargeNumberMBS = o.SqrMod(m)

MsgBox r.StringValue // shows 195 = (90 * 90) mod 255
```

122.6.76 sqrt as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates square root of value.
Notes: Get nearly square root of a. The answer will be a >= ret^2.

122.6.77 Square as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates square of current value.
Notes: Return x^2.

122.6.78 SubMod(v as LargeNumberMBS, Modulo as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtraction with modulo.
Example:

```
Dim v As New LargeNumberMBS(100)
Dim o As New LargeNumberMBS(200)
Dim n As New LargeNumberMBS(& hFF)

Dim r As LargeNumberMBS = v.SubMod(o, n)

MsgBox r.StringValue // shows 155 = (100-200) mod 255

// -100 is too small, so 255 is added to bring to range.
```

122.6.79 Subtract(other as LargeNumberMBS)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts other number.
See also:

- 122.6.80 Subtract(other as LargeNumberMBS) as LargeNumberMBS 20262

122.6.80 Subtract(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts other number and returns result.
See also:

- 122.6.79 Subtract(other as LargeNumberMBS) 20262

122.6.81 Properties

122.6.82 BitSize as Integer

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries bit size of the number.
Notes:

Up to 4128 bits.
(Read only property)

122.6.83 Bytes as MemoryBlock

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Provides raw bytes of number in memory.
Example:

```
Dim o As New LargeNumberMBS(& h12345678)
Dim m As MemoryBlock = o.Bytes

Break
```

Notes:

Without sign as number is always positive.
(Read only property)

122.6.84 ByteSize as Integer

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries byte size of the number.
Notes:

Up to 516 bytes.
(Read only property)

122.6.85 DoubleValue as Double

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries value as double.
Notes:

Result is not correct if value is not in range of a double.
(Read only property)

122.6.86 HexString as String

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries value as hex string.
Notes: (Read only property)

122.6.87 Int64Value as Int64

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries value as Int64.
Notes:

Result is not correct if value is not in range of a double.
(Read and Write property)

122.6.88 IntegerValue as Integer

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries value as integer.
Notes:

Result is not correct if value is not in range of a double.
(Read and Write property)

122.6.89 IsDouble as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether this value fits in double range.
Notes: (Read only property)

122.6.90 IsInt32 as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether this value fits in Int32 range.
Notes: (Read only property)

122.6.91 IsInt64 as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether this value fits in Int64 range.
Notes: (Read only property)

122.6.92 IsNegate as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether value is negative.
Notes: (Read and Write property)

122.6.93 IsUInt32 as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether this value fits in UInt32 range.
Notes: (Read only property)

122.6.94 IsUInt64 as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether this value fits in UInt64 range.
Notes: (Read only property)

122.6.95 IsZero as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether value is zero.
Notes: (Read only property)

122.6.96 StringValue as String

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries value as string.
Notes:

Result is not correct if value is not in range of a double.
(Read and Write property)

122.6.97 UInt64Value as UInt64

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries value as UInt64.
Notes:

Result is not correct if value is not in range of a double.
(Read and Write property)

122.6.98 UIntegerValue as UInteger

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries value as unsigned integer.
Notes:

Result is not correct if value is not in range of a double.
(Read and Write property)

122.6.99 VariantValue as Variant

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries value as variant.
Notes:

Result is can be string, integer or double.
(Read and Write property)

122.7 class SplineMBS

122.7.1 class SplineMBS

MBS Util Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This class calculates a 2D cubic spline.
Notes: The curve goes smooth through all points.

122.7.2 Blog Entries

122.7.4 Methods

122.7.5 a(index as Integer) as Double

MBS Util Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constant part of the coefficient.

122.7.6 b(index as Integer) as Double

MBS Util Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The 1st order coefficient.

122.7.7 c(index as Integer) as Double

MBS Util Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The 2nd order coefficient.

122.7.8 calc(x as Double) as Double

MBS Util Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Y value on the spline for a given X value.

122.7.9 Constructor(X() as Double, Y() as Double)

MBS Util Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes:

Raises an exception for invalid arrays passed, e.g. different size.
Calculates the spline curve coefficients and sets count property.

122.7.10 d(index as Integer) as Double

MBS Util Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The 3rd order coefficient.

122.7.11 x(index as Integer) as Double

MBS Util Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x value for this coefficent.

122.7.12 y(index as Integer) as Double

MBS Util Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y value for this coefficent.

122.7.13 Properties

122.7.14 count as Integer

MBS Util Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of coefficients.
Notes: (Read and Write property)

122.8 module SunTimesMBS

122.8.1 module SunTimesMBS

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A helper module to calculate sunset/sunrise times.
Example:

```
// may be an hour off due to daylight saving time

dim d as new date

dim jd as Double = SunTimesMBS.CalcJulianDate(d.day, d.Month, d.Year)

// Koblenz, Germany
const latitude = 50.356667
const longitude = 7.593889

// Miami, FL
'const latitude = 25.787778
'const longitude = -80.224167

dim sr as Double = SunTimesMBS.CalcSunriseUTC(jd, latitude, longitude)
dim ss as Double = SunTimesMBS.CalcSunsetUTC (jd, latitude, longitude)

d.gmtoffset = 0
d.hour = 0
d.minute = 0
d.second = 0

dim base as Double = d.totalseconds
d.totalseconds = sr*60 + base

MsgBox "Sunrise: "+d.longdate+" "+d.longtime

d.totalseconds = ss*60 + base

MsgBox "Sunset: "+d.longdate+" "+d.longtime
```

Notes: The example code above works well, but seems not to take into account the daylight saving time.

122.8.2 Blog Entries

- MBS Real Studio Plugins, version 12.4pr3

122.8.3 Blog Entries

- MBS Real Studio Plugins, version 12.4pr3

122.8.4 Methods

122.8.5 CalcJulianDate(day as Integer, month as Integer, year as Integer) as Double

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a julian date from given date values.

122.8.6 CalcSunriseUTC(JD as Double, latitude as Double, longitude as Double) as Double

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates sunrise time.
Notes:

Returns time on date in minutes.
Use CalcJulianDate to calculate the JD parameter.

122.8.7 CalcSunsetUTC(JD as Double, latitude as Double, longitude as Double) as Double

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates sunset time.
Notes:

Returns time on date in minutes.
Use CalcJulianDate to calculate the JD parameter.

Chapter 123

Media Keys

123.1 class MediaKeysMBS

123.1.1 class MediaKeysMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Catch some special keys with this class.
Example:

```
dim m as MediaKeysMBS // global property!

// app initialization
m = new MediaKeysMBS

// set which keys to watch for
m.Keys(MediaKeysMBS.kMediaKeyEject) = MediaKeysMBS.kModeEventAndBlock

// and start
m.startWatchingMediaKeys
```

Notes:

First written to catch play, fast and rewind keys from Apple keyboards.
Later extended to also catch other keys.
Still not all keys are available on all keyboards.

Please have only instance of this class running your application.

123.1.2 Blog Entries

- MBS Real Studio Plugins, version 11.2pr12

123.1.4 Methods

123.1.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Initializes the key watcher.

123.1.6 startWatchingMediaKeys

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Starts watching for keys.
Example:

```
dim m as MediaKeysMBS // global property!

// app initialization
m = new MediaKeysMBS

m.Keys(MediaKeysMBS.kMediaKeyEject) = MediaKeysMBS.kModeEventAndBlock
m.startWatchingMediaKeys
```

123.1.7 stopWatchingMediaKeys

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Stops watching for keys.
Example:

```
dim m as MediaKeysMBS // global property

// when closing media window
m.stopWatchingMediaKeys
```

Notes: The destructor calls this for cleanup.

123.1.8 Properties

123.1.9 Keys(keyCode as Integer) as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Which keys should be intercepted and handled by your application.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyEject) = MediaKeysMBS.kModeEventAndBlock
```

Notes: (Read and Write computed property)

123.1.10 Events

123.1.11 receivedMediaKeyEvent(e as NSEventMBS, keyCode as Integer, keyFlags as Integer, keyState as Integer, keyRepeat as Integer)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: .

Function: The event called when the user uses one of the special keys we listen for.
Notes:

If you don't get the event, did you make sure all conditions are right?

- Requires Mac OS X 10.5
- Keys(x) set to kModeEventAndBlock or kModeEventAndPass for the keys you need?
- startWatchingMediaKeys called?
- your object is still alive in your application?

123.1.12 Constants

123.1.13 kMediaKeyBrightnessDown = 3

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyBrightnessDown) = MediaKeysMBS.kModeEventAndBlock
```

123.1.14 kMediaKeyBrightnessUp = 2

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyBrightnessUp) = MediaKeysMBS.kModeEventAndBlock
```

123.1.15 kMediaKeyCapsLock = 4

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
```

m.Keys(MediaKeysMBS.kMediaKeyCapsLock) = MediaKeysMBS.kModeEventAndBlock

Notes: Caps Lock

123.1.16 kMediaKeyContrastDown = 12

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyContrastDown) = MediaKeysMBS.kModeEventAndBlock
```

123.1.17 kMediaKeyContrastUp = 11

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyContrastUp) = MediaKeysMBS.kModeEventAndBlock
```

123.1.18 kMediaKeyDownArrow = 9

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyDownArrow) = MediaKeysMBS.kModeEventAndBlock
```

123.1.19 kMediaKeyEject = 14

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyEject) = MediaKeysMBS.kModeEventAndBlock
```

Notes: Eject key

123.1.20 kMediaKeyFast = 19

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyFast) = MediaKeysMBS.kModeEventAndBlock
```

Notes: Fast key. On by default.

123.1.21 kMediaKeyHelp = 5

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyHelp) = MediaKeysMBS.kModeEventAndBlock
```

123.1.22 kMediaKeyIlluminationDown = 22

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyIlluminationDown) = MediaKeysMBS.kModeEventAndBlock
```

123.1.23 kMediaKeyIlluminationToggle = 23

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyIlluminationToggle) = MediaKeysMBS.kModeEventAndBlock
```

123.1.24 kMediaKeyIlluminationUp = 21

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyIlluminationUp) = MediaKeysMBS.kModeEventAndBlock
```

123.1.25 kMediaKeyLaunchPanel = 13

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.

Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyLaunchPanel) = MediaKeysMBS.kModeEventAndBlock
```

123.1.26 kMediaKeyMute = 7

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyMute) = MediaKeysMBS.kModeEventAndBlock
```

Notes: Sound Mute

123.1.27 kMediaKeyNext = 17

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyNext) = MediaKeysMBS.kModeEventAndBlock
```

123.1.28 kMediaKeyNumLock = 10

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object
```

```
// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyNumLock) = MediaKeysMBS.kModeEventAndBlock
```

Notes: Num Lock key

123.1.29 kMediaKeyPlay = 16

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyPlay) = MediaKeysMBS.kModeEventAndBlock
```

Notes: Play key. On by default.

123.1.30 kMediaKeyPower = 6

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyPower) = MediaKeysMBS.kModeEventAndBlock
```

Notes: Power Key

123.1.31 kMediaKeyPrevious = 18

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.

Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyPrevious) = MediaKeysMBS.kModeEventAndBlock
```

Notes: Previous key

123.1.32 kMediaKeyRewind = 20

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyRewind) = MediaKeysMBS.kModeEventAndBlock
```

Notes: Rewind Key. On by default.

123.1.33 kMediaKeySoundDown = 1

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeySoundDown) = MediaKeysMBS.kModeEventAndBlock
```

Notes: Sound down

123.1.34 kMediaKeySoundUp = 0

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeySoundUp) = MediaKeysMBS.kModeEventAndBlock
```

Notes: Sound up

123.1.35 kMediaKeyUpArrow = 8

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyUpArrow) = MediaKeysMBS.kModeEventAndBlock
```

123.1.36 kMediaKeyVideoMirror = 15

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the key constants.
Example:

```
dim m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyVideoMirror) = MediaKeysMBS.kModeEventAndBlock
```

123.1.37 kModeBlock = 1

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the mode constants.
Notes: Block the event.

123.1.38 kModeEventAndBlock = 2

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the mode constants.
Notes: Call the receivedMediaKeyEvent event and block the event.

123.1.39 kModeEventAndPass = 3

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the mode constants.
Notes: Call the receivedMediaKeyEvent event and pass the event to other applications.

123.1.40 kModePass = 0

MBS MacFrameworks Plugin, Plugin Version: 11.2.

Function: One of the mode constants.
Notes: Pass event to other applications.

Chapter 124

MediaLibrary

124.1 class MLMediaGroupMBS

124.1.1 class MLMediaGroupMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The MLMediaGroup class provides groupings for media objects from a single source of media, such as iTunes or Aperture.
Notes:

The media objects—individual files containing a piece of media such as a photo, song, or movie—are referenced by one or more groups within each media source. These groupings serve as filters, providing hierarchical structure to the collection of objects in each source.

The structure of the group hierarchy is specific to each media source, but all sources have certain commonalities. For example, every source has a single root media group, which contains all groups and objects within that source. It is the highest-level parent group in the hierarchy and each of its descendant groups contains its own subgroups and their objects. All groups have a reference to their parent within the hierarchy. A group with no descendants contains only its own objects. If a media group does not contain any objects, it is not visible in the hierarchy.

A media group has an array of attributes which can change at any point. For example, a media group may have certain attributes that describe its objects, but these attributes appear only after the objects for that group have been loaded. When any media group attribute changes, observers are notified via KVO notification. For information about handling attributes that change, see Cocoa Bindings Programming Topics.

Every media group has a unique identifier as well as a type identifier. In certain cases, multiple groups within a source can have the same type identifier. For descriptions of group type identifiers, see MediaLibrary Constants.

All MLMediaGroup properties are read-only, so this information can be accessed but not altered.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

124.1.2 Blog Entries

- MBS Xojo Plugins, version 18.2pr1

124.1.3 Blog Entries

- MBS Xojo Plugins, version 18.2pr1

124.1.4 Methods

124.1.5 childGroups as MLMediaGroupMBS()

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: A list of child groups contained in the media group.

124.1.6 Constructor

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The private constructor.

124.1.7 mediaObjects as MLMediaObjectMBS()

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: A list of media objects in the media group.
Notes: This accessor property is nonblocking. If there is no data yet, it returns nil and automatically triggers an internal asynchronous request. A KVO notification will be sent via the main thread when data arrives.

124.1.8 MLApertureAllPhotosTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The media group that represents all photos in Aperture.

124.1.9 MLApertureAllProjectsTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The media group that represents all projects in Aperture.

124.1.10 MLApertureFacebookAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Facebook album that is visible in Aperture.

124.1.11 MLApertureFacebookGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Facebook user account in Aperture. A Facebook user account contains one or more Facebook albums.

124.1.12 MLApertureFacesAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Faces album in Aperture. Individual Faces albums are nested in the main Faces album.

124.1.13 MLApertureFlaggedTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The media group that represents the album of flagged media in Aperture.

124.1.14 MLApertureFlickrAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Flickr album that is visible in Aperture.

124.1.15 MLApertureFlickrGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Flickr user account in Aperture. A Flickr user account contains one or more Flickr albums.

124.1.16 MLApertureFolderAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a folder in Aperture.

124.1.17 MLApertureLastImportAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The media group that represents the last import album in Aperture.

124.1.18 MLApertureLastNMonthsAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The media group that represents the recent content album in Aperture, known as the Last N Months album. The value for N is usually 12 (settable in Aperture >Preferences >General).

124.1.19 MLApertureLastViewedEventAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The media group that represents the last viewed event in Aperture.

124.1.20 MLApertureLightTableTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a light table in Aperture.

124.1.21 MLAperturePhotoStreamAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a photo stream in Aperture.

124.1.22 MLAperturePlacesAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The media group that represents the Places album in Aperture.

124.1.23 MLAperturePlacesCityAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Places album for a city in Aperture. A city album is nested in a province or state album.

124.1.24 MLAperturePlacesCountryAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Places album for a country in Aperture. A country album is nested in the main Places album.

124.1.25 MLAperturePlacesPointOfInterestAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Places album for a point-of-interest in Aperture. A point of interest album is nested in a city album.

124.1.26 MLAperturePlacesProvinceAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Places album for a province or state in Aperture. A province or state album is nested in a country album.

124.1.27 MLApertureProjectAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a project in Aperture.

124.1.28 MLApertureProjectFolderAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a folder within a project in Aperture.

124.1.29 MLApertureRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The root media group for Aperture.

124.1.30 MLApertureSlideShowTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The media group that represents a slideshow in Aperture.

124.1.31 MLApertureSmugMugAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a SmugMug album that is visible in Aperture.

124.1.32 MLApertureSmugMugGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a SmugMug user account in Aperture. A SmugMug user account contains one or more SmugMug albums.

124.1.33 MLApertureUserAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a user-created album in Aperture.

124.1.34 MLApertureUserSmartAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a user-created smart album in Aperture.

124.1.35 MLFinalCutEventCalendarGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Final Cut Pro media source.
Notes: A media group that represents a collection of events from a specific time period in Final Cut Pro.

124.1.36 MLFinalCutEventGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Final Cut Pro media source.
Notes: A media group that represents an event in Final Cut Pro.

124.1.37 MLFinalCutEventLibraryGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Final Cut Pro media source.
Notes: The media group that represents the event library in Final Cut Pro. The event library contains all event calendar groups.

124.1.38 MLFinalCutFolderGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Final Cut Pro media source.
Notes: A media group that represents a folder in Final Cut Pro.

124.1.39 MLFinalCutProjectGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Final Cut Pro media source.
Notes: A media group that represents a project in Final Cut Pro.

124.1.40 MLFinalCutRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Final Cut Pro media source.
Notes: The root media group for Final Cut Pro.

124.1.41 MLFolderGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in folder-based media sources.
Notes: A media group that represents a folder in folder-based media.

124.1.42 MLFolderRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in folder-based media sources.
Notes: The root media group for folder-based media.

124.1.43 MLGarageBandFolderGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the GarageBand media source.
Notes: A media group that represents a folder in GarageBand.

124.1.44 MLGarageBandRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the GarageBand media source.
Notes: The root media group for GarageBand.

124.1.45 MLiMovieEventCalendarGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iMovie media source.
Notes: A media group that represents a collection of events from a specific time period in iMovie.

124.1.46 MLiMovieEventGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iMovie media source.
Notes: A media group that represents an event in iMovie.

124.1.47 MLiMovieEventLibraryGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iMovie media source.
Notes: The media group that represents the event library in iMovie. The event library contains all event calendar groups.

124.1.48 MLiMovieFolderGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iMovie media source.
Notes: A media group that represents a folder in iMovie.

124.1.49 MLiMovieProjectGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iMovie media source.
Notes: A media group that represents a project in iMovie.

124.1.50 MLiMovieRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iMovie media source.
Notes: The root media group for iMovie.

124.1.51 MLiPhotoAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents an album in iPhoto.

124.1.52 MLiPhotoEventAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents an event in iPhoto.

124.1.53 MLiPhotoEventsFolderTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: The media group that represents the Events album in iPhoto.

124.1.54 MLiPhotoFacebookAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Facebook album that is visible in iPhoto.

124.1.55 MLiPhotoFacebookGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Facebook user account in iPhoto. A Facebook user account contains one or more Facebook albums.

124.1.56 MLiPhotoFacesAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Faces album in iPhoto. Individual Faces albums are nested in the main Faces album.

124.1.57 MLiPhotoFlaggedAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: The media group that represents the album of flagged media in iPhoto.

124.1.58 MLiPhotoFlickrAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Flickr album that is visible in iPhoto.

124.1.59 MLiPhotoFlickrGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Flickr user account in iPhoto. A Flickr user account contains one or more Flickr albums.

124.1.60 MLiPhotoFolderAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a folder in iPhoto.

124.1.61 MLiPhotoLastImportAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: The media group that represents the Last Import album in iPhoto.

124.1.62 MLiPhotoLastNMonthsAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: The media group that represents the recent content album in iPhoto, known as the Last N Months album. The value for N is usually 12 (settable in iPhoto >Preferences >General).

124.1.63 MLiPhotoLastViewedEventAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: The media group that represents the last viewed event in iPhoto.

124.1.64 MLiPhotoLibraryAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: The media group that represents the Photos album in iPhoto.

124.1.65 MLiPhotoPhotoStreamAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a photo stream in iPhoto.

124.1.66 MLiPhotoPlacesAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: The media group that represents the Places album in iPhoto.

124.1.67 MLiPhotoPlacesCityAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Places album for a city in iPhoto. A city album is nested in a province or state album.

124.1.68 MLiPhotoPlacesCountryAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Places album for a country in iPhoto. A country album is nested in the main Places album.

124.1.69 MLiPhotoPlacesPointOfInterestAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Places album for a point-of-interest in iPhoto. A point of interest album is nested in a city album.

124.1.70 MLiPhotoPlacesProvinceAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Places album for a province or state in iPhoto. A province or state album is nested in a country album.

124.1.71 MLiPhotoRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: The root media group for iPhoto.

124.1.72 MLiPhotoSlideShowAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a slideshow album in iPhoto.

124.1.73 MLiPhotoSmartAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a smart album in iPhoto.

124.1.74 MLiPhotoSubscribedAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a subscribed album in iPhoto.

124.1.75 MLiTunesAudioBooksPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: The media group that represents the Audio Books playlist in iTunes.

124.1.76 MLiTunesFolderPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: A media group that represents a folder in iTunes.

124.1.77 MLiTunesGeniusPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: A media group that represents a genius playlist in iTunes.

124.1.78 MLiTunesiTunesUPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: The media group that represents the iTunes U playlist in iTunes.

124.1.79 MLiTunesMoviesPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: The media group that represents the Movies playlist in iTunes.

124.1.80 MLiTunesMusicPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: The media group that represents the Music playlist in iTunes.

124.1.81 MLiTunesMusicVideosPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Logic media source.
Notes: Musicvideos playlist

124.1.82 MLiTunesPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: A media group that represents a user-created playlist in iTunes.

124.1.83 MLiTunesPodcastPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: The media group that represents the Podcast playlist in iTunes.

124.1.84 MLiTunesPurchasedPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: The media group that represents the Purchased playlist in iTunes.

124.1.85 MLiTunesRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: The root media group for iTunes.

124.1.86 MLiTunesSavedGeniusPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: A media group that represents a saved genius playlist in iTunes.

124.1.87 MLiTunesSmartPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: A media group that represents a smart playlist in iTunes.

124.1.88 MLiTunesTVShowsPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: The media group that represents the TV Shows playlist in iTunes.

124.1.89 MLiTunesVideoPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Logic media source.
Notes: Video Playlist

124.1.90 MLLogicBouncesGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Logic media source.
Notes: The media group that represents all bounces in Logic.

124.1.91 MLLogicProjectsGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Logic media source.
Notes: The media group that represents all projects in Logic.

124.1.92 MLLogicProjectTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Logic media source.
Notes: A media group that represents a project in Logic. Projects may be nested.

124.1.93 MLLogicRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Logic media source.
Notes: The root media group for Logic.

124.1.94 MLPhotosAlbumsGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.95 MLPhotosAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.
Notes: A media group that represents an album in Photos.

124.1.96 MLPhotosAllCollectionsGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.97 MLPhotosAllMomentsGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.98 MLPhotosAllPhotosAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.99 MLPhotosAllYearsGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.100 MLPhotosAnimatedGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.101 MLPhotosBurstGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.102 MLPhotosCollectionGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.103 MLPhotosDepthEffectGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.104 MLPhotosFacesAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.105 MLPhotosFavoritesGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.106 MLPhotosFolderTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.107 MLPhotosFrontCameraGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.108 MLPhotosLastImportGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.109 MLPhotosLivePhotosGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.110 MLPhotosLongExposureGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.111 MLPhotosMomentGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.112 MLPhotosMyPhotoStreamTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.113 MLPhotosPanoramasGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.114 MLPhotosPublishedAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.115 MLPhotosRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.
Notes: The root media group for Photos.

124.1.116 MLPhotosScreenshotGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.117 MLPhotosSharedGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.118 MLPhotosSharedPhotoStreamTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.119 MLPhotosSloMoGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.120 MLPhotosSmartAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.
Notes: A media group that represents a smart album in Photos.

124.1.121 MLPhotosTimelapseGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.122 MLPhotosVideosGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.123 MLPhotosYearGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for media group types in the Photos media source.

124.1.124 Properties

124.1.125 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: Internet object reference.
Notes: (Read and Write property)

124.1.126 IconImage as NSImageMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The media group's icon.
Notes: (Read only property)

124.1.127 Identifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: An identifier for the media group.
Notes:

Each group's identifier is unique within a media source.
(Read only property)

124.1.128 MediaLibrary as MLMediaLibraryMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: A pointer to the media library instance that loaded the media group's source.
Notes: (Read only property)

124.1.129 MediaSourceIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: An identifier for the source that loaded the media group.
Notes: (Read only property)

124.1.130 ModificationDate as Date

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and time when the media group was last altered.
Notes: (Read only property)

124.1.131 ModificationDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The date and time when the media group was last altered.
Notes: (Read only property)

124.1.132 Name as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The name of the media group.
Notes:

This string is human-readable. It is either user created (such as the name of an iTunes playlist) or already localized.
(Read only property)

124.1.133 Parent as MLMediaGroupMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The media group's parent group.
Notes: (Read only property)

124.1.134 Properties as Dictionary

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: A dictionary of attributes describing the media group.
Notes:

These attributes are usually defined by the source app, such as iTunes. For example, an iTunes playlist is represented as a group. iTunes attaches attributes such as "Playlist Persistent ID" to the group in its attributes. The attribute names vary based on the media source. Attributes common to all sources are called out as separate properties.
(Read only property)

124.1.135 TypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: An identifier for the media group's type.
Notes:

Multiple groups within a media source can have the same type identifier. For descriptions of group type identifiers, see MediaLibrary Constants.
(Read only property)

124.1.136 URL as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The location of the media group.
Notes:

Some groups do not have a URL, in which case this returns nil. For example, a group that represents a filesystem folder on disk has a URL, but a group that represents a named face in iPhoto does not.
(Read only property)

124.2 class MLMediaLibraryMBS

124.2.1 class MLMediaLibraryMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The MLMediaLibrary class provides an interface for accessing a collection of media objects from various sources.
Notes:

It serves as the initial access point of the Media Library framework.

The media library structure is defined by MLMediaSource, MLMediaGroup, and MLMediaObject classes. At the highest level, all content within a media library instance is categorized by media source. Conceptually, a media source represents a single app, such as iTunes or Aperture. Each source contains a hierarchy of media groups that originates from a root group. These groups consist of media objects—individual files containing a piece of media such as a photo, song, or movie. Only one copy of each object exists within a media library instance, but an object can be referenced by multiple groups from a single source. The structure of the group hierarchy is specific to each media source.

A media library is initialized using the Constructor. The options argument to this method serves as a filter. By specifying which folders or sources to include or exclude during load, you can view a particular subset of groups and objects from your collection. All objects provided are thread-safe. For descriptions of possible load options, see Load Options Keys.
The typical and most efficient use case is to create and use one instance of MLMediaLibrary for the lifetime of an app. When the underlying media files and metadata on the user's system change, the corresponding data model objects (media groups and media objects) are automatically updated and KVO notifications are sent to notify the calling code of any changes. Multiple instances of MLMediaLibrary can be created and used, but their sources, groups, and objects will be independent of those provided by other instances of MLMediaLibrary.

124.2.3 Blog Entries

- MBS Xojo Plugins, version 18.2pr1

124.2.4 Methods

124.2.5 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: Whether this class available.
Notes: Returns true on Mac OS 10.7 or newer in 64-bit app.

124.2.6 Constructor(options as Dictionary)

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: Initializes the media library based on the specified load options.
Notes:

options: A dictionary of load options.

Returns a new media library.

For descriptions of possible load options, see Load Options Keys.

124.2.7 MLMediaLoadAppFoldersKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: Specifies one or more relative paths inside the caller's app bundle in which to search for media files. The value for this key is an array of strings (relative paths inside the caller's app bundle).

124.2.8 MLMediaLoadAppleLoops as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for well-known media folders used to specify the value for MLMediaLoadFoldersKey.
Notes: Identifies the folder containing audio loops from Apple.

124.2.9 MLMediaLoadExcludeSourcesKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: Defines which media sources to exclude when loading. This option is processed after MLMediaLoadIncludeSourcesKey. The value for this key is an array of strings (media source identifiers). For a list of valid media source identifiers, see Media Source Identifiers.

124.2.10 MLMediaLoadFoldersKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: Specifies the well-known folders that should be searched for media files. If this key is not present, none of the well-known folders will be provided. The value for this key is an array of strings (identifiers that correspond to well-known folder locations). For a list of well-known folder identifiers, see MLMediaLoadMoviesFolder and MLMediaLoadAppleLoops.

124.2.11 MLMediaLoadIncludeSourcesKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: Defines which media sources to include when loading. If not present, load all available media sources. This option is processed after MLMediaLoadSourceTypesKey. If MLMediaLoadIncludeSourcesKey is present but MLMediaLoadSourceTypesKey is not, then only those sources specified here will be loaded. This is useful for loading a single media source. When both keys are present, this is useful for adding one or more media sources that normally would not appear for the requested library type. The value for this key is an array of strings (media source identifiers). For a list of valid media source identifiers, see Media Source Identifiers.

124.2.12 MLMediaLoadMoviesFolder as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the identifiers for well-known media folders used to specify the value for MLMediaLoadFoldersKey.
Notes: Identifies the user's Movies folder.

124.2.13 MLMediaLoadSourceTypesKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: Defines which sources to load based on library type. If not present, this will load all sources. The value for this key is a media source type.

124.2.14 Properties

124.2.15 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: Internet object reference.
Notes: (Read and Write property)

124.2.16 mediaSources as Dictionary

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: Returns a dictionary of media sources by identifier.
Notes:

Returns nil the first time, beginning an asynchronous load of the media sources. A KVO notification is sent when all media sources have been loaded. If there are no objects in a media source, the source does not appear in this dictionary.
(Read only property)

124.3 class MLMediaObjectMBS

124.3.1 class MLMediaObjectMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The MLMediaObject class describes a single media file, such as a photo, song, or movie.
Notes:

Each media object contains basic metadata including a name, media type, URL, and so on. Additional information about each object is stored in its list of attributes. For a list of possible object attribute keys, see Media Object Attribute Keys.

A media object belongs to a single media source but can be referenced by several groups within that source. In other words, an object can appear in multiple places in the group hierarchy under a single media source. In iTunes, a movie that was purchased through the iTunes Store is referenced by both the Purchased playlist and the Movies playlist. If a user adds the movie to his own playlist, the group respresenting that playlist will also reference the movie. All three groups reference the same media object.

All MLMediaObject properties are read-only, so this information can be accessed but not altered.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

124.3.4 Methods

124.3.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The private constructor.

124.3.6 MLMediaObjectAlbumKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the property keys for a media object.
Notes: Specifies the media object's album. The value for this key is a string.

124.3.7 MLMediaObjectArtistKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the property keys for a media object.
Notes: Specifies the media object's artist. The value for this key is a string.

124.3.8 MLMediaObjectBitRateKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the property keys for a media object.
Notes: Specifies the media object's bit rate, in kilobits per second. The value for this key is a number.

124.3.9 MLMediaObjectChannelCountKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the property keys for a media object.
Notes: Specifies the media object's channel count. The value for this key is a number.

124.3.10 MLMediaObjectCommentsKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the property keys for a media object.
Notes: Specifies the contents of the comments field associated with the media object. The value for this key is a string.

124.3.11 MLMediaObjectDurationKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the property keys for a media object.
Notes: Specifies the media object's duration, in seconds. The value for this key is a number.

124.3.12 MLMediaObjectGenreKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the property keys for a media object.
Notes: Specifies the media object's genre. The value for this key is a string.

124.3.13 MLMediaObjectKeywordsKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the property keys for a media object.
Notes: Specifies the keywords associated with the media object. The value for this key is an array of strings.

124.3.14 MLMediaObjectKindKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the property keys for a media object.
Notes: Used by iTunes only. Specifies the media object's file format (shown in the "Kind" column in iTunes). The value for this key is a string.

124.3.15 MLMediaObjectProtectedKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the property keys for a media object.
Notes: Specifies whether the media object is protected by DRM (Digital Rights Management). The value for this key is a boolean value.

124.3.16 MLMediaObjectResolutionStringKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the property keys for a media object.
Notes: Specifies the media object's resolution. The value for this key is a string with size.

124.3.17 MLMediaObjectSampleRateKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the property keys for a media object.
Notes: Specifies the media object's sample rate, in samples per second (Hz). The value for this key is a number.

124.3.18 MLMediaObjectTrackNumberKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: One of the property keys for a media object.
Notes: Specifies the media object's track number. The value for this key is a number.

124.3.19 Properties

124.3.20 ArtworkImage as NSImageMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: Album artwork associated with the media object.
Notes:

Applies to iTunes media only. Returns nil if not applicable or not available.
(Read only property)

124.3.21 ContentType as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The UTI associated with the media object.
Notes: (Read only property)

124.3.22 File as FolderItem

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The location of the media object.
Notes:

For your convenience, the plugin provides here a folderitem for the URL.
(Read only property)

124.3.23 FileSize as UInt64

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The size, in bytes, of the media object.
Notes: (Read only property)

124.3.24 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: Internet object reference.
Notes: (Read and Write property)

124.3.25 Identifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: An identifier for the media object.
Notes:

Each object's identifier is unique within a media source.
(Read only property)

124.3.26 MediaLibrary as MLMediaLibraryMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: A pointer to the media library instance that loaded the media object's source.
Notes: (Read only property)

124.3.27 MediaSourceIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: An identifier for the source that loaded the media object.
Notes:

For a list of possible media source identifiers, see MLMediaLibraryMBS.
(Read only property)

124.3.28 MediaType as Integer

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The media object's type of media (image, audio, or movie).
Notes:

For a list of possible media types, see kType* constants.
(Read only property)

124.3.29 ModificationDate as Date

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and time when the media object was last altered.
Notes: (Read only property)

124.3.30 ModificationDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The date and time when the media object was last altered.
Notes: (Read only property)

124.3.31 Name as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The name of the media object.
Notes: (Read only property)

124.3.32 OriginalFile as FolderItem

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The location of the original media object, if URL is not the original (master).
Notes:

For your convenience, the plugin provides here a folderitem for the URL.
(Read only property)

124.3.33 OriginalURL as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The location of the original media object, if URL is not the original (master).
Notes:

This property is provided as a security-scoped URL. In order to gain access to the file that this URL refers to, the caller must call startAccessingSecurityScopedResource before and stopAccessingSecurityScopedResource after using the URL to access the file. For more information about security-scoped URLs, see NSURL.
(Read only property)

124.3.34 Properties as Dictionary

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: A dictionary of attributes describing the media object.
Notes:

For a list of possible object attribute keys, see Media Object Attribute Keys.
(Read only property)

124.3.35 ThumbnailFile as FolderItem

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The location of the media object's thumbnail image.
Notes:

For your convenience, the plugin provides here a folderitem for the URL.
(Read only property)

124.3.36 ThumbnailURL as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The location of the media object's thumbnail image.
Notes:

This property is provided as a security-scoped URL. In order to gain access to the file that this URL refers to, the caller must call startAccessingSecurityScopedResource before and stopAccessingSecurityScopedResource after using the URL to access the file. For more information about security-scoped URLs, see NSURL.
(Read only property)

124.3.37 URL as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The location of the media object.
Notes:

This property is provided as a security-scoped URL. In order to gain access to the file that this URL refers to, the caller must call startAccessingSecurityScopedResource before and stopAccessingSecurityScopedResource after using the URL to access the file. For more information about security-scoped URLs, see NSURL.
(Read only property)

124.3.38 Constants

124.3.39 kTypeAudio = 1

MBS Mac64bit Plugin, Plugin Version: 18.2.

Function: One of the types.
Notes: Audio

124.3.40 kTypeImage = 2

MBS Mac64bit Plugin, Plugin Version: 18.2.

Function: One of the types.
Notes: Image

124.3.41 kTypeMovie = 4

MBS Mac64bit Plugin, Plugin Version: 18.2.

Function: One of the types.
Notes: Movie

124.4 class MLMediaSourceMBS

124.4.1 class MLMediaSourceMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The MLMediaSource class identifies a specific provider of media.
Notes:

Conceptually, a media source respresents a single app, such as iTunes or Aperture. Each media source contains multiple groups of media objects—individual files containing a piece of media such as a photo, song, or movie.

The structure of the group hierarchy is specific to each media source, but all sources have certain commonalities. For example, every source has a single root media group, which contains all groups and objects within that source. It is the highest-level parent group in the hierarchy and each of its descendant groups contains its own subgroups and their objects. All groups have a reference to their parent within the hierarchy. A group with no descendants contains only its own objects. If a media group does not contain any objects, it is not visible in the hierarchy.
Every media source has a unique media source identifier within a single media library instance. For a list of possible media source identifiers, see Media Source Identifiers.
All MLMediaSourceMBS properties are read-only, so this information can be accessed but not altered.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

124.4.2 Blog Entries

- MBS Xojo Plugins, version 18.2pr1

124.4.3 Blog Entries

- MBS Xojo Plugins, version 18.2pr1

124.4.4 Methods

124.4.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The private constructor.

124.4.6 mediaGroupForIdentifier(mediaGroupIdentifier as string) as MLMediaGroupMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: Returns the media group with the specified identifier.
Notes:

mediaGroupIdentifier: The media group identifier to search for in the source.

The media source must have finished loading before this method returns valid data. Specifically, the root media group must be available before the lookup methods will succeed. Otherwise, the return value is undefined.

124.4.7 mediaGroupsForIdentifiers(mediaGroupIdentifiers() as string) as Dictionary

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: Returns the media groups with the specified identifiers.
Notes:

mediaGroupIdentifiers: An array of media group identifiers to search for in the source.

Returns a dictionary of media groups matching the specified identifiers.

The media source must have finished loading before this method returns valid data. Specifically, the root media group must be available before the lookup methods will succeed. Otherwise, the return value is undefined.

124.4.8 mediaObjectForIdentifier(mediaObjectIdentifier as string) as MLMediaObjectMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: Returns the media object with the specified identifier.
Notes:

mediaObjectIdentifier: The media object identifier to search for in the media source.

The media source must have finished loading before this method returns valid data. Specifically, the root media group must be available before the lookup methods will succeed. Otherwise, the return value is undefined.

124.4.9 mediaObjectsForIdentifiers(mediaObjectIdentifiers() as string) as Dictionary

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: Returns the media objects with the specified identifiers.
Notes:

mediaObjectIdentifiers: An array of media object identifiers to search for in the source.

Returns a dictionary of media objects matching the specified identifiers.

The media source must have finished loading before this method returns valid data. Specifically, the root media group must be available before the lookup methods will succeed. Otherwise, the return value is undefined.

124.4.10 MLMediaSourceApertureIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The identifier for the media source providing content from Aperture.

124.4.11 MLMediaSourceAppDefinedFoldersIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The identifier for the media source providing content from app defined folder.

124.4.12 MLMediaSourceCustomFoldersIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The identifier for the media source providing content from a custom folder.

124.4.13 MLMediaSourceFinalCutIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The identifier for the media source providing content from Final Cut Pro.

124.4.14 MLMediaSourceGarageBandIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The identifier for the media source providing content from GarageBand.

124.4.15 MLMediaSourceiMovieIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The identifier for the media source providing content from iMovie.

124.4.16 MLMediaSourceiPhotoIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The identifier for the media source providing content from iPhoto.

124.4.17 MLMediaSourceiTunesIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The identifier for the media source providing content from iTunes.

124.4.18 MLMediaSourceLogicIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The identifier for the media source providing content from Logic.

124.4.19 MLMediaSourceMoviesFolderIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The identifier for the media source providing content from movies folder.

124.4.20 MLMediaSourcePhotoBoothIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The identifier for the media source providing content from Photo Booth.

124.4.21 MLMediaSourcePhotosIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The identifier for the media source providing content from photos folder.

124.4.22 Properties

124.4.23 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: Internet object reference.
Notes: (Read and Write property)

124.4.24 MediaLibrary as MLMediaLibraryMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: A pointer to the media library instance that loaded this media source.
Notes: (Read only property)

124.4.25 mediaSourceIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: A unique identifier for the media source.
Notes:

For a list of possible media source identifiers, see shared methods.
(Read only property)

124.4.26 Properties as Dictionary

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: A list of attributes describing the media source.
Notes: (Read only property)

124.4.27 rootMediaGroup as MLMediaGroupMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: The base media group in the media source that contains all other groups within the source as descendant elements.
Notes:

This accessor property is nonblocking. If there is no data yet, it returns nil and automatically triggers an internal asynchronous request. When data arrives, a KVO notification is sent via the main thread.
(Read only property)

124.4.28 Constants

124.4.29 kSourceTypeAudio = 1

MBS Mac64bit Plugin, Plugin Version: 18.2.

Function: One of the source types.
Notes: Audio

124.4.30 kSourceTypeImage = 2

MBS Mac64bit Plugin, Plugin Version: 18.2.

Function: One of the source types.
Notes: Images

124.4.31 kSourceTypeMovie = 4

MBS Mac64bit Plugin, Plugin Version: 18.2.

Function: One of the source types.
Notes: Movies

124.5 class NSMediaLibraryBrowserControllerMBS

124.5.1 class NSMediaLibraryBrowserControllerMBS

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: An instance of an NSMediaLibraryBrowserController configures and displays a Media Library Browser Panel.
Notes:

A User can drag and drop media files from the Media Library Browser into views in their application.
Requires Mac OS X 10.9.

124.5.2 Blog Entries

124.5.4 Methods

124.5.5 available as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.9 and false on other platforms.

124.5.6 Constructor

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Creates a new object for the shared library browser.

124.5.7 orderFront

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Orders window to front.

124.5.8 orderOut

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Orders window out.
Notes: Hides window.

124.5.9 sharedMediaLibraryBrowserController as NSMediaLibraryBrowserControllerMBS

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Returns a new object for the shared library browser.

124.5.10 togglePanel

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Toggles the panel to hide/show.

124.5.11 Properties

124.5.12 Frame as NSRectMBS

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The bounds of the panel.
Notes: (Read and Write property)

124.5.13 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

124.5.14 mediaLibraries as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Which media library to show: audio, video or image.
Notes: (Read and Write property)

124.5.15 Visible as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The visible state of the browser panel.
Notes: (Read and Write property)

124.5.16 Constants

124.5.17 NSMediaLibraryAudio = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the media library type constants.
Notes: Audio

124.5.18 NSMediaLibraryImage = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the media library type constants.
Notes: Image

124.5.19 NSMediaLibraryMovie = 4

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the media library type constants.
Notes: Movie

Chapter 125

MemoryBlock

125.1 Globals

125.1.1 NewMemoryBlockWithBytesMBS(Data as Ptr, size as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new memoryblock with a copy of the given data.

125.1.2 NewMemoryBlockFromPtrMBS(ptr as Integer) as memoryblock

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a memoryblock for a given address in memory.

125.1.3 Memoryblock2ptrMBS(mem as memoryblock) as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the memory adress of the memoryblock

125.1.4 ptr2MemoryblockMBS(Value as Integer) as memoryblock

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a memoryblock with the bytes at position mem in memory.

125.2 class Memoryblock

125.2.1 class Memoryblock

Platforms: macOS, Linux, Windows, Targets: All.

Function: Extends Xojo's Memoryblock class.

125.2.2 Methods

125.2.3 AddressMBS(offset as Int64 = 0) as UInt64

MBS Util Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the adress of the byte at offset inside the memoryblock.

125.2.6 AddressPtrMBS(offset as Int64 = 0) as Ptr

MBS Util Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the adress of the byte at offset inside the memoryblock.

125.2.7 Blog Entries

- MBS Real Studio Plugins, version 11.3pr5

125.2.8 AndBitsMBS(Second as memoryblock, Dest as memoryblock=nil) as memoryblock

MBS Util Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a And on the bits in the memoryblock.
Example:

```
dim m1 as MemoryBlock = NewMemoryBlock(20)
dim m2 as MemoryBlock = NewMemoryBlock(20)
dim m3 as MemoryBlock = NewMemoryBlock(20)

m1.Int32Value(0)=& b10000001
m2.Int32Value(0)=& b10000000

MsgBox bin(m1.Int32Value(0))+EndOfLine+bin(m2.Int32Value(0))+EndOfLine+bin(m3.Int32Value(0))

call m1.AndBitsMBS(m2,m3)

MsgBox bin(m1.Int32Value(0))+EndOfLine+bin(m2.Int32Value(0))+EndOfLine+bin(m3.Int32Value(0))
```

Notes:

Dest is first and second memoryblock combine with a bitwiseand.
And first and second memoryblock are filled with the difference between them.

If dest is nil, a new memoryblock is created. You can speed up processing with reusing the same memoryblock in iterations. If you pass a memoryblock, the plugin does not check the size of the memoryblock.

Returns nil on any error. For example if source is a memoryblock without a known size.
See also:

- 125.2.9 AndBitsMBS(Second as memoryblock, Mask as Integer, Dest as memoryblock=nil) as memoryblock 20335

125.2.9 AndBitsMBS(Second as memoryblock, Mask as Integer, Dest as memoryblock=nil) as memoryblock

MBS Util Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a And on the bits in the memoryblock.
Example:

```
dim m1 as MemoryBlock = NewMemoryBlock(20)
dim m2 as MemoryBlock = NewMemoryBlock(20)
dim m3 as MemoryBlock = NewMemoryBlock(20)
```

```
m1.Int32Value(0)=& b11110001
m2.Int32Value(0)=& b11110000

const mask = & b11001111

MsgBox bin(m1.Int32Value(0))+EndOfLine+bin(m2.Int32Value(0))+EndOfLine+bin(m3.Int32Value(0))

call m1.AndBitsMBS(m2,mask,m3)

MsgBox bin(m1.Int32Value(0))+EndOfLine+bin(m2.Int32Value(0))+EndOfLine+bin(m3.Int32Value(0))
```

Notes:

The mask is always 8 bit. Use the & b notation to specify it.
Dest is first and second memoryblock combine with a bitwiseand.
And first and second memoryblock are filled with the difference between them. Only bits set int he given mask are used.

If dest is nil, a new memoryblock is created. You can speed up processing with reusing the same memoryblock in iterations. If you pass a memoryblock, the plugin does not check the size of the memoryblock.

Returns nil on any error. For example if source is a memoryblock without a known size.
See also:

- 125.2.8 AndBitsMBS(Second as memoryblock, Dest as memoryblock=nil) as memoryblock 20335

125.2.10 AppendMBS(other as memoryblock) as memoryblock

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a new memoryblock with the bytes of the two given memoryblocks.
Example:

```
Dim m1 As MemoryBlock = "Hello "
Dim m2 As MemoryBlock = "World!"

Dim m3 As MemoryBlock = m1.AppendMBS(m2)
Dim s As String = m3

MessageBox s
```

Notes:

This function will not work if the memoryblock has an unknown size.
If one memoryblock is nil than you get a copy of the other memoryblock.

125.2.11 BytesEqualMBS(srcOfs as Integer, numBytes as Integer, destBlk as memoryBlock, destOfs as Integer) as Boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if equal byte data.
Example:

```
dim m1 as MemoryBlock = NewMemoryBlock(100)
dim m2 as MemoryBlock = NewMemoryBlock(100)

// try with 2 different strings
m1.CString(0)="Hello"
m2.CString(0)="Hallo"

if m1.BytesEqualMBS(0, 100, m2, 0) then
MsgBox "equal"
else
MsgBox "not equal"
end if

// try with 2 equal strings
m1.CString(0)="Hello"
m2.CString(0)="Hello"

if m1.BytesEqualMBS(0, 100, m2, 0) then
MsgBox "equal"
else
MsgBox "not equal"
end if
```

Notes:

Fixed in 10.1 to return true on equal bytes and false on non equal bytes. Older plugin versions returned the wrong value.

Does not check the bounds of the memoryblock, so it can crash with wrong parameters.
Returns false if one of the memoryblocks is nil.

125.2.12 BytesZeroMBS(srcOfs as Integer, numBytes as Integer) as Boolean

MBS Util Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if all bytes in the memoryblock in the given range are zero.
Example:

```
dim m as MemoryBlock = NewMemoryBlock(100)

if m.BytesZeroMBS(0,100) then
MsgBox "all zero"
else
MsgBox "error"
end if

m.Byte(50)=1

if m.BytesZeroMBS(0,100) then
MsgBox "error"
else
MsgBox "okay"
end if
```

Notes:

Returns false on any error.
Bounds are not checked with the memoryblock, so be careful.

125.2.13 ClearBitMBS(Bit as UInt64)

MBS Util Plugin, Plugin Version: 21.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the given bit in the MemoryBlock.
Example:

```
Dim m As New MemoryBlock(100)

m.SetBitMBS(123)
Dim v1 As Boolean = m.IsBitSetMBS(123)
m.ClearBitMBS(123)
Dim v2 As Boolean = m.IsBitSetMBS(123)
Break // see debugger
```

Notes:

Sets value of the bit to zero.

Raises exception is MemoryBlock is nil.
If MemoryBlock has a known size and Bit is out of range, we raise an OutOfBoundsException.

- MBS Xojo Plugins Version 21.0 News
- MBS Xojo Plugins, version 20.6pr5

125.2.15 ConvertRGB12BitTo8BitMBS(Width as Integer)

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a memoryblock with 12 bit RGB data into 8 bit RGB data.
Notes:

Width is number of pixels.

Please make sure the memoryblock is 9 bytes bigger than input to avoid errors.
Plugin converts each 9 bytes (72 bits) with 2 RGB triple. So first 12 bits are red, next 12 bits green and last 12 bits blue.
Plugin removes last 4 bits.

125.2.16 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.3pr7

125.2.17 CopyBytesFromMacHandleMBS(srcHandle as Integer, numBytes as Integer, destOfs as Integer)

MBS Util Plugin, Platform: macOS, Targets: All.

Function: Copies bytes from Mac Handle into your memoryblock.
Notes: Same as CopyBytesFromMacPtr, only that the memory address is a so-called Handle (see documentation about the MacOS memory Manager), which is double-referenced.

125.2.18 CopyBytesFromMacPtrMBS(srcPtr as Ptr, numBytes as Integer, destOfs as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the given amount of bytes from the given address in the Mac's memory address space into the memoryBlock.
Notes: Make sure that the destination block is large enough to hold the copied bytes (if not, your application or even the whole system can crash).

125.2.19 CopyBytesMBS(srcOfs as Integer, numBytes as Integer, destBlk as memoryBlock, destOfs as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the specified amount of bytes into a second memoryBlock.
Example:

```
dim m as MemoryBlock
dim n as MemoryBlock

m=NewMemoryBlock(100)
n=NewMemoryBlock(100)

m.Long(0)=12345

m.CopyBytesMBS(0,4,n,0)

MsgBox str(n.long(0))
```

Notes: You must make sure that the destination block is large enough to hold the copied bytes (if not, your application or even the whole system can crash).
See also:

- 125.2.20 CopyBytesMBS(srcOfs as Integer, numBytes as Integer, destOfs as Integer) 20340

125.2.20 CopyBytesMBS(srcOfs as Integer, numBytes as Integer, destOfs as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the specified amount of bytes inside the memoryBlock.
Notes: You must make sure that the copied bytes fit inside the block (if they don't, your application or even the whole system can crash).

See also:

- 125.2.19 CopyBytesMBS(srcOfs as Integer, numBytes as Integer, destBlk as memoryBlock, destOfs as Integer) 20340

125.2.21 CopyBytesToMacHandleMBS(srcOfs as Integer, numBytes as Integer, destHandle as Integer)

MBS Util Plugin, Platform: macOS, Targets: All.

Function: Copies byte data from the memoryblock into the memory the handle is pointing to.
Notes: Same as CopyBytesToMacPtr, only that the memory address is a so-called Handle (see documentation about the MacOS memory Manager), which is double-referenced.

125.2.22 CopyBytesToMacPtrMBS(srcOfs as Integer, numBytes as Integer, destPtr as Ptr)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the given amount of bytes from the memoryBlock to the given address in the Mac's memory address space.
Notes: Be careful where you copy the data to - you can easily crash your computer if you write to the wrong address space.

125.2.23 CopyByteToUShortMBS(dest as memoryblock, SourceOffset as Integer, DestinationOffset as Integer, ByteCount as Integer, divisor as Integer)

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies bytes in a memoryblock to another memoryblock converting the 8bit values to 16bit values.
Notes:

Common values for divisor are 256 and 257.
No bound checking. Crashes with invalid values. Optimized for special divisor values.

125.2.24 CopyNthBitsMBS(source as memoryblock, SourceOffsetBits as Integer, DestinationOffsetBits as Integer, BitCount as Integer, StepCount as Integer, NumberOfSteps as Integer) as boolean

MBS Util Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies every nth bits in the source memoryblock to the current memoryblock.
Notes:

BitCount = the number of bits to copy from each step.
StepCount = the number of bits to not copy.
NumberOfSteps = the number of rounds to do.
There is no bound checking. The function will crash with invalid parameters!

125.2.25 CopyNthBytesMBS(source as memoryblock, SourceOffsetBytes as Integer, DestinationOffsetBytes as Integer, ByteCount as Integer, StepCount as Integer, NumberOfSteps as Integer) as boolean

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies every nth bytes in the source memoryblock to the current memoryblock.
Example:

```
dim s,d as memoryBlock

s=NewmemoryBlock(100)
d=NewmemoryBlock(100)

s.CString(0)="Hello World!"

call d.CopyNthBytesMBS(s,0,0,2,4,3)

MsgBox d.CString(0) // "Heo rl"
```

Notes:

ByteCount = the number of bytes to copy from each step.
StepCount = the number of bytes to move for each step forward in source.
NumberOfSteps = the number of steps to do.
There is no bound checking. The function will crash with invalid parameters!

125.2.26 CopyUShortToByteMBS(dest as memoryblock, SourceOffset as Integer, DestinationOffset as Integer, ByteCount as Integer, divisor as Integer)

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies shorts in a memoryblock to another memoryblock converting the 16bit values to 8bit values.
Notes:

Common values for divisor are 256 and 257.
No bound checking. Crashes with invalid values. Optimized for special divisor values.

125.2.27 CRC_32ContMBS(offset as Integer, numBytes as Integer, prevCRC as UInt32) as UInt32

MBS Util Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a 32bit Checksum about the provided block of data.

125.2.28 CRC_32MBS(offset as Integer, numBytes as Integer) as UInt32

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a 32bit Checksum about the provided block of data.

125.2.29 CRC_CCITTContMBS(offset as Integer, numBytes as Integer, prevCRC as UInt32) as UInt32

MBS Util Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a 16bit Checksum about the provided string.

125.2.30 CRC_CCITTMBS(offset as Integer, numBytes as Integer) as UInt32

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a 16bit Checksum about the provided block of data.
Notes:

See the text "About-CRC" for details about this Checksum things.
This function is also available for strings.

See the CRC_32 for more details on Checksums.

125.2.31 CRC_DillonMBS(bitWidth as Integer, offset as Integer, numBytes as Integer) as String

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a 16 to 64bit Checksum about the provided block of data.
Notes:

This function is also available for strings.

See the CRC_32 for more details on Checksums.

125.2.32 EndianS16_BtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianS16_BtoLMBS(0,mem.size/2)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.33 EndianS16_BtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianS16_BtoNMBS(0,mem.size/2)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.34 EndianS16_LtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianS16_LtoBMBS(0,mem.size/2)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.35 EndianS16_LtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianS16_LtoNMBS(0,mem.size/2)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.36 EndianS16_NtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianS16_NtoBMBS(0,mem.size/2)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.37 EndianS16_NtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianS16_NtoLMBS(0,mem.size/2)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.38 EndianS32_BtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianS32_BtoLMBS(0,mem.size/4)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.39 EndianS32_BtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianS32_BtoNMBS(0,mem.size/4)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.40 EndianS32_LtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianS32_LtoBMBS(0,mem.size/4)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.41 EndianS32_LtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianS32_LtoNMBS(0,mem.size/4)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.42 EndianS32_NtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianS32_NtoBMBS(0,mem.size/4)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.43 EndianS32_NtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianS32_NtoLMBS(0,mem.size/4)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.44 EndianSwap16MBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Swaps several 16 bit integers inside a memoryblock.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianSwap16MBS(0,mem.size/2)
```

125.2.45 EndianSwap32MBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Swaps several 32 bit integers inside a memoryblock.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianSwap32MBS(0,mem.size/4)
```

125.2.46 EndianU16_BtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianU16_BtoLMBS(0,mem.size/2)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:

S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.47 EndianU16_BtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianU16_BtoNMBS(0,mem.size/2)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.48 EndianU16_LtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianU16_LtoBMBS(0,mem.size/2)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.49 EndianU16_LtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianU16_LtoNMBS(0,mem.size/2)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.50 EndianU16_NtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
```

```
mem.EndianU16_NtoBMBS(0,mem.size/2)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.51 EndianU16_NtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianU16_NtoLMBS(0,mem.size/2)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.52 EndianU32_BtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianU32_BtoLMBS(0,mem.size/4)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.53 EndianU32_BtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianU32_BtoNMBS(0,mem.size/4)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.54 EndianU32_LtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianU32_LtoBMBS(0,mem.size/4)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.55 EndianU32_LtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianU32_LtoNMBS(0,mem.size/4)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.56 EndianU32_NtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianU32_NtoBMBS(0,mem.size/4)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.57 EndianU32_NtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
dim mem as memoryblock // your memoryblock
mem.EndianU32_NtoLMBS(0,mem.size/4)
```

Notes:

e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

125.2.58 ExpandBitsMBS(dest as memoryblock, SourceByteCount as Integer, LowValue as Integer = 0, HighValue as Integer = 255) as boolean

MBS Util Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Expands bits into bytes.
Example:

```
dim m1 as new MemoryBlock(200)
dim m2 as new MemoryBlock(1600)

for i as Integer = 0 to 127
m1.Int8Value(i) = i
next

dim n as Integer = 128
dim b as Boolean = m1.ExpandBitsMBS(m2, n)

break // see result in debugger
```

Notes:

Takes a bit from the source memoryblock and writes a byte for it to destination. Uses LowValue (default 0) if the bit is not set and HighValue (Default 255) if the bit is set.
Works only on x86 CPUs (no PPC).
Reads source memoryblock in 32 bit blocks and writes the destination in 32 byte blocks.

125.2.59 Blog Entries

- MBS REALbasic Plugins, version 10.6pr9

125.2.60 ExtractBitsMBS(Mask as Integer, Dest as memoryblock=nil) as memoryblock

MBS Util Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies bits from a memoryblock to another.
Example:

```
dim mask as Integer = & b01010101
dim m as MemoryBlock = "Hello World"

dim r as MemoryBlock = m.ExtractBitsMBS(mask)

MsgBox r.StringValue(0,r.size) // shows "@EDDE UEPDD"
```

Notes:

The mask is always 8 bit. Use the & b notation to specify it.
If dest is nil, a new memoryblock is created. You can speed up processing with reusing the same memoryblock in iterations. If you pass a memoryblock, the plugin does not check the size of the memoryblock.

Returns nil on any error. For example if source is a memoryblock without a known size.

125.2.61 FillBytesMBS(offset as Integer, count as Integer, value as Integer)

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fills memory with a specific byte value.
Notes: Caution: No bounds checking.

125.2.62 FindByteMBS(srcOfs as Integer, numBytes as Integer, byteValue as Integer) as Integer

MBS Util Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the position of the first byte which has the given value.
Example:

```
dim m as MemoryBlock = NewMemoryBlock(100)
dim n as Integer

n = m.FindByteMBS(0, 100, 0)

MsgBox str(n) // shows 0 as the byte at offset 0 is zero
```

```
m.Byte(0)=1

n = m.FindByteMBS(0, 100, 0)

MsgBox str(n) // shows 1 as the byte at offset 1 is zero

m.FillBytesMBS(0,100,5)

n = m.FindByteMBS(0, 100, 6)

MsgBox str(n) // shows -1 as there is no byte with value 6
```

Notes: Returns -1 if the byte is not found.
See also:

- 125.2.63 FindByteMBS(values() as UInt8, StartByteOffset as Integer = 0) as Integer 20360

125.2.63 FindByteMBS(values() as UInt8, StartByteOffset as Integer = 0) as Integer

MBS Util Plugin, Plugin Version: 21.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds position of a given value.
Example:

```
Dim m As MemoryBlock = "Hello World"

Dim u() As UInt8
u.Append Asc("e")
u.Append Asc("o")

Dim pos1 As Integer = m.FindByteMBS(u)
Dim pos2 As Integer = m.FindByteMBS(u, pos1+1)

// shows 1 and 4
MsgBox "Found position: "+Str(pos1)+" and "+Str(pos2)
```

Notes:

Values is an array of possible values to find.
For best performance avoid duplicates in that array.

Returns zero based byte offset.

Result is -1 if not found.

- 125.2.62 FindByteMBS(srcOfs as Integer, numBytes as Integer, byteValue as Integer) as Integer 20359

125.2.66 FindBytesMBS(srcOfs as Integer, maxBytes as Integer, target as memoryBlock, targOfs as Integer, targLen as Integer) as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds some bytes from the target memoryblock inside the current memoryblock.

125.2.67 FindNotByteMBS(srcOfs as Integer, numBytes as Integer, byteValue as Integer) as Integer

MBS Util Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the position of the first byte which has no the given value.
Example:

```
dim m as MemoryBlock = NewMemoryBlock(100)
dim n as Integer

n = m.FindNotByteMBS(0, 100, 0)

MsgBox str(n) // -1 as no value is not zero

m.Byte(30)=1

n = m.FindNotByteMBS(0, 100, 0)
```

```
MsgBox str(n) // shows 30 as the byte at offset 30 is not zero

m.Byte(0)=255

n = m.FindNotByteMBS(0, 100, 255)

MsgBox str(n) // shows 1 as the byte at offset 1 is not 255
```

Notes: Returns -1 if the no byte was found which has not the given value.

125.2.68 FindStringMBS(srcOfs as Integer, maxBytes as Integer, target as String) as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds a string inside a memoryblock.

125.2.69 GetBitMBS(Bit as UInt64) as Integer

MBS Util Plugin, Plugin Version: 21.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries value of the given bit in the MemoryBlock.
Example:

```
Dim m As New MemoryBlock(100)

m.SetBitMBS(123)
Dim v1 As Integer = m.GetBitMBS(123)
Break // see debugger
```

Notes:

Returns 1 if bit is set or 0 if not.

Raises exception is MemoryBlock is nil.
If MemoryBlock has a known size and Bit is out of range, we raise an OutOfBoundsException.

125.2.70 Blog Entries

- MBS Xojo Plugins Version 21.0 News
- MBS Xojo Plugins, version 20.6pr5

125.2.71 GetStringMBS(offset as Integer, numBytes as Integer) as String

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a string from the memoryblock.
Notes: With newer RB versions you may better use StringValue.

125.2.72 InvertBytesMBS(offset as Integer, count as Integer)

MBS Util Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inverts the given number of bytes in a memoryblock.
Example:

```
dim m as memoryblock
m=newmemoryblock(100)
' do something
m.InvertBytesMBS(0,100) // invert all bytes
```

Notes: Does work faster if count is a multiply of 4.

125.2.73 IsBitSetMBS(Bit as UInt64) as Boolean

MBS Util Plugin, Plugin Version: 21.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries value of the given bit in the MemoryBlock.
Example:

```
Dim m As New MemoryBlock(100)

m.SetBitMBS(123)

Dim v1 As Boolean = m.IsBitSetMBS(123)
Break // see debugger
```

Notes:

Returns true if bit is set or false if not.

Raises exception is MemoryBlock is nil.
If MemoryBlock has a known size and Bit is out of range, we raise an OutOfBoundsException.

125.2.74 Blog Entries

- MBS Xojo Plugins Version 21.0 News
- MBS Xojo Plugins, version 20.6pr5

125.2.75 LeftMBS(length as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a memoryblock with the first given number of bytes.
Notes:

If length is greater than the size of the memoryblock then then length is set to size.
Returns nil if length<=0 or on low memory.
This function will not work if the memoryblock has an unknown size.

125.2.76 MaxMBS(firstMem as Ptr, secondMem as Ptr, BitSize as Integer = 8, Signed as Boolean = false, offsetByte as Integer = 0, lengthBytes as Integer = 0) as boolean

MBS Util Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates max values of values in memory.
Example:

```
dim m1 as new MemoryBlock(12)
dim m2 as new MemoryBlock(12)
dim mr1 as new MemoryBlock(12)
dim mr2 as new MemoryBlock(12)

for i as Integer = 0 to 11
m1.UInt8Value(i) = i
m2.UInt8Value(11-i) = i
next

if mr1.minMBS(m1, m2) then
if mr2.maxMBS(m1, m2) then
```

```
MsgBox EncodeHex(m1)+" first"+EndOfLine+_
EncodeHex(m2)+" second"+EndOfLine+_
EncodeHex(mr1)+" min"+EndOfLine+_
EncodeHex(mr2)+" max"

end if
end if
```

Notes:

firstMem and secondMem can be ptr or memoryblock with some values. Can be same as destination (the memoryblock the method is called at)
BitSize defines integer bit depth 8, 16, 32 or 64. Signed defines if to expect signed or unsigned integers.
offsetByte defines offset in destination memoryblock. lengthBytes is length of memory. If zero, we use size of destination memoryblock.
Passing bad parameters can easily lead to crash. Return true on success and false on failure and raises exceptions for invalid parameters.

125.2.77 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr4

125.2.78 MidMBS(offset as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a memoryblock with the bytes of the given memoryblock from the given offset on.
Notes:

Offset is 0 based.
Returns nil if offset<0 or on low memory.
This function will not work if the memoryblock has an unknown size.
See also:

- 125.2.79 MidMBS(offset as Integer, length as Integer) as memoryblock 20365

125.2.79 MidMBS(offset as Integer, length as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a memoryblock with the given bytes from the middle of the memoryblock.
Notes:

Offset is 0 based.
Returns nil if offset<0 or on low memory.

If length is too long then length is set to a lower value.
This function will not work if the memoryblock has an unknown size.
See also:

- 125.2.78 MidMBS(offset as Integer) as memoryblock 20365

125.2.80 MinMBS(firstMem as Ptr, secondMem as Ptr, BitSize as Integer = 8, Signed as Boolean = false, offsetByte as Integer = 0, lengthBytes as Integer = 0) as boolean

MBS Util Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates min values of values in memory.
Example:

```
dim m1 as new MemoryBlock(24)
dim m2 as new MemoryBlock(24)
dim mr1 as new MemoryBlock(24)
dim mr2 as new MemoryBlock(24)

for i as Integer = 0 to 11
m1.UInt16Value(2*i) = i
m2.UInt16Value(2*(11-i)) = i
next

if mr1.minMBS(m1, m2, 16, false, 0, 24) then
if mr2.maxMBS(m1, m2, 16, false, 0, 24) then

MsgBox EncodeHex(m1)+" first"+EndOfLine+_
EncodeHex(m2)+" second"+EndOfLine+_
EncodeHex(mr1)+" min"+EndOfLine+_
EncodeHex(mr2)+" max"

end if
end if
```

Notes:

firstMem and secondMem can be ptr or memoryblock with some values. Can be same as destination (the memoryblock the method is called at)
BitSize defines integer bit depth 8, 16, 32 or 64. Signed defines if to expect signed or unsigned integers.
offsetByte defines offset in destination memoryblock. lengthBytes is length of memory. If zero, we use size of destination memoryblock.
Passing bad parameters can easily lead to crash. Return true on success and false on failure and raises exceptions for invalid parameters.

- MBS Xojo / Real Studio Plugins, version 14.2pr4

125.2.82 Xojo Developer Magazine

- 18.6, page 9: News

125.2.83 MirrorBitsInBytesMBS(offsetByte as Integer, lengthByte as Integer)

MBS Util Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mirrors bits in each byte.
Example:

```
dim m as new MemoryBlock(12)

m.CString(0)="HelloHello"

m.MirrorBitsInBytesMBS(0,5)

MsgBox EncodingToHexMBS(m.StringValue(5,5))+" ->"+EncodingToHexMBS(m.StringValue(0,5))
```

Notes:

offsetByte: where to start in the memoryblock
lengthByte: number of bytes to swap

Mirror means in this case, that if you a byte with bits 11001100, after the mirror, you have 00110011. So bit 0 and 7 exchange values. Same for 1 and 6, 2 and 5, 3 and 4.

125.2.84 MirrorBitsMBS(offsetBit as Integer, lengthBit as Integer)

MBS Util Plugin, Plugin Version: 7.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mirrors the bits in a memoryblock.
Notes:

e.g. "111100001" in the memoryblock would give "100001111"
This function is certainly not the fastest one, but faster than anything you can get written in Xojo.
And make sure the bounds are matched, because on memory access outside the valid ranges, the function will crash.
0 offsetBit <mem.size*8 and 0 lengthBit mem.size*8 - offsetBit

125.2.85 MirrorBytesMBS(offsetByte as Integer = 0, lengthByte as Integer = -1)

MBS Util Plugin, Plugin Version: 7.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mirrors the bytes in the given range.
Notes:

e.g. "abcdefgh" in the memoryblock would give "hgfedcba"
This function is certainly not the fastest one, but faster than anything you can get written in Xojo.
And make sure the bounds are matched, because on memory access outside the valid ranges, the function will crash.
0 offsetByte <mem.size and 0 lengthByte mem.size - offsetByte

If lengthByte is -1, we query memoryblock for size. If size is unknown or negative, the function does nothing.

125.2.86 MultiplyUInt16MBS(Factor as Double, offsetByte as Integer = 0, lengthBytes as Integer = 0, MultiplyOnlyOver as Integer = -1)

MBS Util Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplied UInt16 values in the memoryblock.
Example:

```
dim myMemOut3 as new MemoryBlock(500)
myMemOut3.MultiplyUInt16MBS(0.9)
```

Notes:

Values bigger than 65535 are set to 65535.
lengthBytes is in bytes, so 2 times the number of values.
Factor must be >= 0.0.
Offset is the offset in bytes from the beginning of the memoryblock to start. Wrong offsets (e.g. negative) can lead to crashes. lengthBytes is optional, if not specified or zero uses the length of memoryblock.

Added MultiplyOnlyOver parameter in version 18.4. If negative, we multiply all values. If positive, we multiply only values >the given value.

125.2.87 Blog Entries

- MBS Xojo Plugins, version 18.4pr7

125.2.88 MultiplyUInt8MBS(Factor as Double, offsetByte as Integer = 0, lengthBytes as Integer = 0, MultiplyOnlyOver as Integer = -1)

MBS Util Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplies UInt8 values in the memoryblock.
Example:

```
dim myMemOut3 as new MemoryBlock(500)
myMemOut3.MultiplyUInt8MBS(0.9)
```

Notes:

Values bigger than 255 are set to 255.
lengthBytes is in bytes, so 2 times the number of values.
Factor must be >= 0.0.
Offset is the offset in bytes from the beginning of the memoryblock to start. Wrong offsets (e.g. negative) can lead to crashes. lengthBytes is optional, if not specified or zero uses the length of memoryblock.

Added MultiplyOnlyOver parameter in version 18.4. If negative, we multiply all values. If positive, we multiply only values >the given value.

- MBS Xojo Plugins, version 18.4pr7

125.2.90 RightMBS(length as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a memoryblock with the given number of bytes from the right side of the memoryblock.
Example:

```
dim mem,m as MemoryBlock
mem=m.RightMBS(5)
```

Notes:

If length is more than the memoryblock's size, than length is set to size.
Returns nil if length<=0 or on low memory.
This function will not work if the memoryblock has an unknown size.

125.2.91 SetBitMBS(Bit as UInt64)

MBS Util Plugin, Plugin Version: 21.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets value of the given bit in the MemoryBlock.
Example:

```
Dim m As New MemoryBlock(100)

m.SetBitMBS(123)

Dim v1 As Boolean = m.IsBitSetMBS(123)
Break // see debugger
```

Notes:

Sets bit to 1.

Raises exception is MemoryBlock is nil.
If MemoryBlock has a known size and Bit is out of range, we raise an OutOfBoundsException.
See also:

- 125.2.92 SetBitMBS(Bit as UInt64, Value as Boolean) 20370
- 125.2.93 SetBitMBS(Bit as UInt64, Value as Integer) 20371

125.2.92 SetBitMBS(Bit as UInt64, Value as Boolean)

MBS Util Plugin, Plugin Version: 21.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets value of the given bit in the MemoryBlock.
Example:

```
Dim m As New MemoryBlock(100)

m.SetBitMBS(123, true)

Dim v1 As Boolean = m.IsBitSetMBS(123)
Break // see debugger
```

Notes:

Pass true to set bit or false to clear bit.

Raises exception is MemoryBlock is nil.

If MemoryBlock has a known size and Bit is out of range, we raise an OutOfBoundsException.
See also:

- 125.2.91 SetBitMBS(Bit as UInt64) 20370
- 125.2.93 SetBitMBS(Bit as UInt64, Value as Integer) 20371

125.2.93 SetBitMBS(Bit as UInt64, Value as Integer)

MBS Util Plugin, Plugin Version: 21.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets value of the given bit in the MemoryBlock.
Example:

```
Dim m As New MemoryBlock(100)

m.SetBitMBS(123, 1)

Dim v1 As Boolean = m.IsBitSetMBS(123)
Break // see debugger
```

Notes:

Pass 1 to set bit or 0 to clear bit.

Raises exception is MemoryBlock is nil.
If MemoryBlock has a known size and Bit is out of range, we raise an OutOfBoundsException.

125.2.94 Blog Entries

- MBS Xojo Plugins Version 21.0 News

See also:

- 125.2.91 SetBitMBS(Bit as UInt64) 20370
- 125.2.92 SetBitMBS(Bit as UInt64, Value as Boolean) 20370

125.2.95 SetStringMBS(str as String, offset as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a string inside the memoryblock.
Notes: With newer RB versions you may better use StringValue.

125.2.96 SwapBytes16MBS(offset as Integer, numBytes as Integer)

MBS Util Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Swaps words inside the given bounds inside the memoryblock.
Example:

```
dim numbytes as Integer // number of bytes in MemoryBlock
dim m as MemoryBlock // your memoryblock
dim i as Integer

for i=0 to numbytes step 2
m.UShort(i)=EndianSwap16MBS(m.UShort(i))
next
```

125.2.97 SwapBytes32MBS(offset as Integer, numBytes as Integer)

MBS Util Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Swaps longs inside the given bounds inside the memoryblock.
Example:

```
// Test SwapBytes32MBS and SwapBytes16MBS:

const h11223344=& h11223344
const h22114411=& h22114433 // 16bit swap
const h44332211=& h44332211 // 32bit swap

dim m as memoryBlock
dim ok as Integer

m=NewmemoryBlock(20)
m.Long(00)=h11223344
m.Long(04)=h11223344
m.Long(08)=h11223344
m.Long(12)=h11223344
m.Long(16)=h11223344

m.SwapBytes16MBS(4,4)
m.SwapBytes32MBS(12,4)
```

```
if m.Long(00)=h11223344 then
ok=ok+1
else
MsgBox "00: "+hex(m.Long(00))
end if

if m.Long(04)=h22114411 then
ok=ok+1
else
MsgBox "04: "+hex(m.Long(04))
end if

if m.Long(08)=h11223344 then
ok=ok+1
else
MsgBox "08: "+hex(m.Long(08))
end if

if m.Long(12)=h44332211 then
ok=ok+1
else
MsgBox "12: "+hex(m.Long(12))
end if

if m.Long(16)=h11223344 then
ok=ok+1
else
MsgBox "16: "+hex(m.Long(16))
end if

if ok=5 then
MsgBox "OK"
else
MsgBox "Fail"
end if
```

Notes:

It should do something like this:

```
dim m as memoryBlock

for i=0 to numbytes step 2
m.long(i)=EndianSwap32MBS(m.long(i))
next
```

125.2.98 SwapBytesMBS(offset as Integer, numBytes as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Swaps bytes inside the given bounds inside the memoryblock.
Notes: Reverses the order of the bytes at the given offset and length in the memoryBlock. This is helpful to change representation of values from Little Endian (used in Windows) to Big Endian (used in Mac OS) and vice versa. Thanks to Franco Vaccari for the code of this routine.

125.2.99 Properties

125.2.100 OSTypeMBS(offset as Integer) as String

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read/Write an OSType.
Notes:

Interprets 4 bytes starting at the given offset as a OSType value.
(Read and Write computed property)

125.3 class MemoryBlockMBS

125.3.1 class MemoryBlockMBS

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class to hold a memoryblock.
Example:

```
dim m as new MemoryBlockMBS

if m.Create(2000) then

// copy struing into memory
m.Memory.StringValue(0,5)="Hello"

// and read again
MsgBox m.Memory.StringValue(0,5)

end if
```

Notes:

Xojo's memoryblocks have two bad things:
- they are limited to 1 GB on Mac OS X and Mac OS Classic
- they take a lot of time to create them
- they take a lot of real memory

Xojo allocates the memory and fills it with zeros.

The plugin in contrast uses zero filled pages to create the memoryblock which nearly take no time to create them and it does only need virtual memory until the memory is really used which saved swapping space.

125.3.4 Methods

125.3.5 Close

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

125.3.6 Constructor

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: This constructor does nothing, so you can call Create yourself.
See also:

- 125.3.7 Constructor(Mem as MemoryBlock) 20376
- 125.3.8 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0) 20377
- 125.3.9 Constructor(Size as Int64) 20377
- 125.3.10 Constructor(Str as String) 20378
- 125.3.11 Constructor(Str as String, Size as Int64, Offset as Int64 = 0) 20378

125.3.7 Constructor(Mem as MemoryBlock)

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new MemoryBlockMBS with content of memoryblock.
Example:

```
dim s as string = "Hello World"
dim m as MemoryBlock = s

dim x as new MemoryBlockMBS(m)

MsgBox str(x.Size)
```

Notes: Raises exception is size is invalid or no memory is available.
See also:

- 125.3.6 Constructor 20376

- 125.3.10 Constructor(Str as String) 20378
- 125.3.11 Constructor(Str as String, Size as Int64, Offset as Int64 = 0) 20378

125.3.8 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0)

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new MemoryBlockMBS with given size and copies content of memoryblock.
Example:

```
dim s as string = "Hello World"
dim m as MemoryBlock = s

dim x as new MemoryBlockMBS(m, 9)

MsgBox str(x.Size)
```

Notes: Raises exception is size is invalid or no memory is available.
See also:

- 125.3.6 Constructor 20376
- 125.3.7 Constructor(Mem as MemoryBlock) 20376

- 125.3.10 Constructor(Str as String) 20378
- 125.3.11 Constructor(Str as String, Size as Int64, Offset as Int64 = 0) 20378

125.3.9 Constructor(Size as Int64)

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new MemoryBlockMBS with given size.
Notes: Raises exception is size is invalid or no memory is available.
See also:

- 125.3.6 Constructor 20376
- 125.3.7 Constructor(Mem as MemoryBlock) 20376
- 125.3.8 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0) 20377
- 125.3.10 Constructor(Str as String) 20378
- 125.3.11 Constructor(Str as String, Size as Int64, Offset as Int64 = 0) 20378

125.3.10 Constructor(Str as String)

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new MemoryBlockMBS with content of string.
Example:

```
dim s as string = "Hello World"
dim x as new MemoryBlockMBS(s)

MsgBox str(x.Size)
```

Notes:

Text encoding is ignored and bytes copied as they are.
Raises exception is size is invalid or no memory is available.
See also:

- 125.3.6 Constructor 20376
- 125.3.7 Constructor(Mem as MemoryBlock) 20376
- 125.3.8 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0) 20377
- 125.3.9 Constructor(Size as Int64) 20377
- 125.3.11 Constructor(Str as String, Size as Int64, Offset as Int64 = 0) 20378

125.3.11 Constructor(Str as String, Size as Int64, Offset as Int64 = 0)

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new MemoryBlockMBS with given size and copies content of string.
Example:

```
dim s as string = "Hello World"
dim x as new MemoryBlockMBS(s, 9)

MsgBox str(x.Size)
```

Notes:

Text encoding is ignored and bytes copied as they are.
Raises exception is size is invalid or no memory is available.
See also:

- 125.3.6 Constructor 20376
- 125.3.7 Constructor(Mem as MemoryBlock) 20376
- 125.3.8 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0) 20377
- 125.3.9 Constructor(Size as Int64) 20377
- 125.3.10 Constructor(Str as String) 20378

125.3.12 Create(size as Int64) as boolean

MBS Util Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new memoryblock.
Example:

```
dim m as MemoryBlockMBS
dim n as MemoryBlock
dim t as Integer

const size=2200000000

// RB: up to 1 GigaByte
// Plugin: up to 2 GigaByte - 1 Byte

m=New MemoryBlockMBS

t=ticks
if m.Create(size) then
n=m.Memory

MsgBox str(ticks-t)

end if

t=ticks
n=NewMemoryBlock(size)
if n<>nil then
MsgBox str(ticks-t)
end if
```

Notes:

Returns true on success and false on failure.
Size can be any positive value up to & h7FFFFFFF (=2^31-1).

Size became 64bit to avoid integer overflows.

125.3.13 Resize(Size as Int64) as boolean

MBS Util Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tries to resize the memorybock to the new size.
Example:

```
dim m as new MemoryBlockMBS

if m.Create(1000) then
MsgBox str(m.Size)

if m.Resize(2000) then
MsgBox str(m.Size)
end if
end if
```

Notes:

Returns true on success.
If false is returned, the memoryblockMBS is not touched.

If the new size is smaller, data is lost as the memoryblock is cut.
If the new size is bigger, the memoryblock is resized. Or if that does not work, a new memoryblock is created and data is copied. New bytes will be zero.

125.3.14 Properties

125.3.15 Address as Int64

MBS Util Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The address of the memory.

Notes:

This value became 64bit to avoid integer overflows.
(Read only property)

125.3.16 Memory as Memoryblock

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The memoryblock to access this memory.
Notes:

Keep a reference to the MemoryBlockMBS object as long as you use this memoryblock object.
(Read only property)

125.3.17 Size as Int64

MBS Util Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of this memoryblock.
Notes:

This value became 64bit to avoid integer overflows.
(Read only property)

125.4 class MemoryStorageMBS

125.4.1 class MemoryStorageMBS

MBS Util Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class to store stuff in memory outside of the app memory.
Notes:

The memory is stored using mapped memory in the system address space outside of the 32bit app memory of your app.

Normally a 32-bit app can only use 2 to 4 GB of memory. Using blocks of memory outside this address space, you can easily keep 10 GB of data in memory.

Be aware that a some point creating more storages may fail due to out of memory.
The system may decide to swap memory to disk if you run out of physical memory.

Please have your app check free space on boot disk regularly and avoid running out of disk space for swap!

125.4.6 Methods

125.4.7 Constructor(Size as Int64 = 0)

MBS Util Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: If size >0, we allocate the memory for this size right away.

125.4.8 Destructor

MBS Util Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

125.4.9 MemoryValue(Offset as Int64, Assigns s as MemoryBlock)

MBS Util Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets part of memory storage as string.
Notes:

Offset and Size are checked for range and an OutOfBoundsException can be raised.
Please use constructor before to create memory storage with given size.
See also:

- 125.4.14 MemoryValue as MemoryBlock 20384
- 125.4.10 MemoryValue(Offset as Int64, Size as Int64) as MemoryBlock 20383

125.4.10 MemoryValue(Offset as Int64, Size as Int64) as MemoryBlock

MBS Util Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries part of memory storage as memory block.
Notes: Offset and Size are checked for range and an OutOfBoundsException can be raised.
See also:

- 125.4.14 MemoryValue as MemoryBlock 20384
- 125.4.9 MemoryValue(Offset as Int64, Assigns s as MemoryBlock) 20383

125.4.12 StringValue(Offset as Int64, Size as Int64) as String

MBS Util Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries part of memory storage as string.
Notes: Offset and Size are checked for range and an OutOfBoundsException can be raised.
See also:

- 125.4.17 StringValue as String 20385
- 125.4.11 StringValue(Offset as Int64, Assigns s as String) 20384

125.4.13 Properties

125.4.14 MemoryValue as MemoryBlock

MBS Util Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The content of this memory storage as a memoryblock.
Notes: (Read and Write property)
See also:

- 125.4.9 MemoryValue(Offset as Int64, Assigns s as MemoryBlock) 20383
- 125.4.10 MemoryValue(Offset as Int64, Size as Int64) as MemoryBlock 20383

125.4.15 Size as Integer

MBS Util Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of the data in bytes.
Notes: (Read and Write property)

125.4.16 SizeAllocated as Integer

MBS Util Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of memory allocated.
Notes: (Read and Write property)

125.4.17 StringValue as String

MBS Util Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The content of this memory storage as a string.
Notes: (Read and Write property)
See also:

- 125.4.11 StringValue(Offset as Int64, Assigns s as String) 20384
- 125.4.12 StringValue(Offset as Int64, Size as Int64) as String 20384

Chapter 126

Menu

126.1 Globals

126.1.1 MenuBarHeightMBS as Integer

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns the height of the menubar in pixels.
Example:

msgbox "The menubar is "+str(MenuBarHeightMBS)+" pixels height."

Notes:

Requires the appearance manager.

Without plugin, you can use this:

declare function GetThemeMenuBarHeight lib "Carbon" (p as ptr) as Integer

dim l as Integer
dim p as memoryBlock
p=newmemoryBlock(10)

error=GetThemeMenuBarHeight(p) // 0 if okay.
menuheight=p.short(0) // in pixels. 22 on Mac OS X.

Added Cocoa support in plugin version 10.0.

Chapter 127

Midi

127.1 class AVMIDIPlayerMBS

127.1.1 class AVMIDIPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: The AVMIDIPlayer class is a player for music file formats such as MIDI and iMelody.
Notes:

Requires Mac OS X 10.10.

See also MidiPlaybackMBS class for playing notes.

127.1.4 Methods

127.1.5 Constructor(Data as MemoryBlock, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: Initializes a newly allocated MIDI player with the contents of the String, using the specified sound bank.
Notes:

Data: The data to play.
SoundBankFile: The folderitem of the sound bank. The sound bank must be a SoundFont2 or DLS bank.
Error: Returns, by-reference, a description of the error, if an error occurs.

For OS X the bank folderitem can be set to nil to use the default sound bank. However, iOS must always refer to a valid bank file.
See also:

- 127.1.6 Constructor(Data as String, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS) 20390
- 127.1.7 Constructor(File as FolderItem, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS) 20391

127.1.6 Constructor(Data as String, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: Initializes a newly allocated MIDI player with the contents of the String, using the specified sound bank.
Notes:

Data: The data to play.
SoundBankFile: The folderitem of the sound bank. The sound bank must be a SoundFont2 or DLS bank.
Error: Returns, by-reference, a description of the error, if an error occurs.

For OS X the bank folderitem can be set to nil to use the default sound bank. However, iOS must always refer to a valid bank file.
See also:

- 127.1.5 Constructor(Data as MemoryBlock, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS) 20390
- 127.1.7 Constructor(File as FolderItem, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS) 20391

127.1.7 Constructor(File as FolderItem, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: Initializes a newly allocated MIDI player with the contents of the file, using the specified sound bank.
Notes:

File: The file to play.
SoundBankFile: The folderitem of the sound bank. The sound bank must be a SoundFont2 or DLS bank.
Error: Returns, by-reference, a description of the error, if an error occurs.

For OS X the bank folderitem can be set to nil to use the default sound bank. However, iOS must always refer to a valid bank file.
See also:

- 127.1.5 Constructor(Data as MemoryBlock, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS) 20390
- 127.1.6 Constructor(Data as String, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS) 20390

127.1.8 Destructor

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: The destructor.

127.1.9 play

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: Plays the sequence.
Notes: If prepareToPlay has not been invoked, play may be delayed while the events are prerolled.

127.1.10 prepareToPlay

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: Prepares to play the sequence by prerolling all events.
Notes: This happens automatically on play if it has not already been called, but may produce a delay in startup.

127.1.11 stop

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: Stops playing the sequence.

127.1.12 Properties

127.1.13 CurrentPosition as Double

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: The current playback position, in seconds.
Notes:

You can set the currentPosition of the player while the player is playing, in which case playback will resume at the new time.

Note: No range checking on the currentPosition value is done when you set it to a new value. It is your responsibility to ensure the position is valid relative to the duration.
(Read and Write property)

127.1.14 Duration as Double

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: The length of the currently loaded file, in seconds.
Notes: (Read only property)

127.1.15 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

127.1.16 Playing as Boolean

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: Whether the sequence is playing.
Notes:

The player may have reached the end of all the events in any of its tracks, but it will return true until it is stopped.
(Read only property)

127.1.17 Rate as Double

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: The playback rate of the player.
Notes:

The default value is 1.0, normal playback rate.
(Read and Write property)

127.1.18 Events

127.1.19 Completed

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: .

Function: Called when a MIDI playback request is completed.

127.2 class MidiClientMBS

127.2.1 class MidiClientMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: A class for the global MIDI stuff on Mac OS X.
Notes:

Only make one instance of this class in your application.

From Apple's documentation:

History:

Apple's MIDI Manager (ca. 1990) had a simple model of the world. There were application and driver clients, which had MIDI in/out ports, which could be interconnected in arbitrary ways. This model failed to provide a way for applications to make reasonable assumptions about how to make bi-directional connections to a MIDI device. MIDI Manager also had limitations on the number of ports per client, and became very unwieldy with the advent of large studios and multi-port MIDI interfaces such as the MIDI Time Piece and Studio 5.

Opcode's OMS (1991) addressed some of the shortcomings of MIDI Manager. There was the concept of a studio setup document, where drivers detected their devices, and the user could define the characteristics of additional devices connected to the MIDI ports. Applications could view the studio both as a collection of MIDI source and destination "nodes", but also as a collection of devices. OMS collected information about, and made available to its clients, useful characteristics of the devices in the studio, such as their system-exclusive IDs, MIDI channels on which they were listening, which were controllers (as opposed to simple tone generators), etc.

API Overview:
This design expands slightly on OMS's device/node hierarchy, inspired by the USB MIDI spec.

Drivers own and control devices, e.g. USB interfaces, PCI cards, etc. A device is defined as a physical object that would be represented by a single icon if there were a graphical view of the studio.

Devices may have multiple logically distinct sub-components, e.g. a MIDI synthesizer and a pair of MIDI ports, both addressable via a USB port. These are called Entities.

Entities have any number of Endpoints, sources and destinations of 16-channel MIDI streams. By grouping a device's endpoints into entities, the system has enough information for an application to make reasonable assumptions about how to communicate in a bi-directional manner with each entity, as is necessary in MIDI librarian applications.

Third-party services like FreeMIDI or OMS can collect and report interesting properties of a device by attaching those properties to the devices' entities – CoreMIDI provides a central database, but no user interfaces.. It's worth noting that some device characteristics are dynamic (e.g. MIDI receive channel and system-exclusive ID's), or a matter of user preference (choice of icon, whether the device should appear in lists of possible controllers), while other properties are static and could be looked up in a database, using the device's manufacturer and model names as a key.

Persistent configurations / Device Information:
There are a number of reasons why CoreMIDI has a persistent state.

Endpoints must have persistent ID's. When a user assigns events in a sequencing application to an endpoint, the application needs a way to retain a permanent reference to the selected endpoint. A brute-force method of generating a persistent ID would be to combine the driver name, device name, entity name, and endpoint type and index into a string, but this is not very friendly to clients even if the system provides services to generate and decode these strings.

Consider a USB MIDI interface driver, in the case where there are two instances of one model of interface present. The driver needs a way to permanently distinguish, to the system and its clients, between the two interfaces. Which is # 1 and which is # 2? If # 1 gets unplugged, # 2 should not automatically become # 1; the user's documents may be referring to devices which were attached to # 2.

The system needs a persistent concept of which driver's device is attached to a serial port.

Some drivers will need to store configuration information about the devices they control. For example, the driver for a standard MIDI interface on a serial port needs to remember which external clocking speed to use (this is a simple, slightly obscure, but hardly unique example). The Alesis QS7 is capable of communicating at a variety of speeds, so its driver needs to remember the correct speed.

These needs for persistent configuration information provide a rationale for having something akin to OMS's studio setup document, a saved configuration for the system. Mobile users who work in multiple environments could select between multiple saved configurations in a Location Manager-compatible manner.

Given services with which to store driver configuration information, we then have built the groundwork for a client studio setup editor application.
Such an application can define external MIDI devices (not to be confused with the driver-owned cards/ interfaces/etc whose presence in the configuration is determined by the driver).

Moreover, since a driver knows exactly what device it is communicating with, it is capable of supplying information to the system about the characteristics of the device, such as its system-exclusive ID, whether it is General MIDI or DLS-compatible, etc.

Implementation overview:
The client API is implemented as the CoreMIDI framework, which uses IPC to communicate with a server process, MIDIServer.

The server process loads, and manages all communication with, MIDI drivers. Most of its implementation is in the CoreMIDIServer framework, which drivers may import in order to access the API.

"Drivers" are not I/O Kit drivers. They are dynamic libraries, using CFPlugin.

But unlike OMS, the system is able to begin functioning immediately, using only the MIDI devices/endpoints detected by the drivers, without forcing the user to go through a somewhat lengthy and confusing intial configuration process. Definition of external MIDI devices can be a completely optional step, only made possible when a client application requests that they be added to the configuration.

Many MIDI drivers can simply be user-side I/O Kit clients (probably for serial, USB, Firewire).

PCI card drivers will need their MIDI drivers to communicate with a separate kernel extension.

If you have an old file named EmagicUSBMIDIDriver.plugin in your /Library/Audio/MIDI Drivers folder, please remove it. It makes trouble with our Midi classes.

See also macOS specific classes AVMIDIPlayerMBS and MidiPlaybackMBS for playback. For Windows see also WindowsMidiMBS class.
See also PortMidiMBS class for cross platform Midi handling.
Subclass of the MidiObjectMBS class.

127.2.2 Blog Entries

- MBS Real Studio Plugins, version 11.3fc

127.2.3 Blog Entries

- MBS Real Studio Plugins, version 11.3fc

127.2.4 Methods

127.2.5 Available as boolean

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: True if the MIDI stuff was successfull loaded.

127.2.6 close

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

127.2.7 CreateDestination(name as CFStringMBS, TargetEndpointObject as MidiEndpointMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: Create a virtual destination in a client.
Notes:

Clients may use this to create virtual destinations.
Lasterror is set.
You must pass a valid new MidiEndpointMBS for TargetEndpointObject. Best is if you make a subclass from MidiEndpointMBS and fill the event. You can add there additional methods and properties. CreateDestination will than fill the handle property on success.

127.2.8 CreateInputPort(name as CFStringMBS, targetportobject as MidiPortMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Create an input port through which the client may receive incoming MIDI messages from any MIDI source.
Example:

```
dim mc as MidiClientMBS
dim mp as MidiPortMBS

mc=new MidiClientMBS
mc.Init NewCFStringMBS("Testapp")

mp=new MidiPortMBS
mc.CreateInputPort NewCFStringMBS("Testport"), mp

if mp.Handle=0 then
MsgBox "There was an error: "+str(mc.Lasterror)
else
MsgBox "ok"
end if
```

Notes:

After creating a port, use MIDIPortConnectSource to establish an input connection from any number of sources to your port.

Lasterror is set.

As you can subclass the MidiPortMBS class you must pass to this function a valid MidiPortMBS object so

it can be filled.

127.2.9 CreateOutputPort(name as CFStringMBS, targetportobject as MidiPortMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Create an output port through which the client may send outgoing MIDI messages to any MIDI destination.
Example:

```
dim mc as MidiClientMBS
dim mp as MidiPortMBS

mc=new MidiClientMBS
mc.Init NewCFStringMBS("Testapp")

mp=new MidiPortMBS
mc.CreateOutputPort NewCFStringMBS("Testport"), mp

if mp.Handle=0 then
MsgBox "There was an error: "+str(mc.Lasterror)
else
MsgBox "ok"
end if
```

Notes:

Output ports provide a mechanism for MIDI merging. The system assumes that each output port will be responsible for sending only a single MIDI stream to each destination, although a single port may address all of the destinations in the system.

Lasterror is set.

As you can subclass the MidiPortMBS class you must pass to this function a valid MidiPortMBS object so it can be filled.

127.2.10 CreateSource(name as CFStringMBS) as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Creates a new virtual Midi source.

Example:

```
dim m as MidiClientMBS
dim e as MidiEndpointMBS

m=new MidiClientMBS

// Initialize
m.Init NewCFStringMBS("Hallo")

// Create device:
e=m.CreateSource(NewCFStringMBS("Hallo"))

// if error is 0 and handle is not 0, it's okay
MsgBox "error: "+str(m.Lasterror)+", handle: "+str(e.Handle)
```

Notes:

Lasterror is set.
Returns nil on any error.

Clients may use this to create virtual sources.

After creating a virtual source, use Received to transmit MIDI messages from your virtual source to any clients connected to the virtual source.

127.2.11 FindObjectByUniqueID(id as Integer) as MidiObjectMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Locate a device, typedefal device, entity, or endpoint by its uniqueID.
Notes:

New for CoreMIDI 1.3.
You may cast the returned object to MidiEndpointMBS, MidiEntityMBS or MidiDeviceMBS. RB's "isa" command may help you.
Returns nil on any error. Lasterror is set.

127.2.12 GetDestination(index as Integer) as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return one of the destinations in the system.

Notes:

The index goes from 0 to NumberOfDestinations-1.
Lasterror is set.
Returns nil on any error.

127.2.13 GetDevice(index as Integer) as MidiDeviceMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return one of the devices in the system.
Notes:

To enumerate the entities in the system, you can walk through the devices, then walk through the devices' entities.

Note: If a client iterates through the devices and entities in the system, it will not ever visit any virtual sources and destinations created by other clients. Also, a device iteration will return devices which are "offline" (were present in the past but are not currently present), while iterations through the system's sources and destinations will not include the endpoints of offline devices.

Thus clients should usually prefer NumberOfSources, GetSource, NumberOfDestinations and GetDestination to iterating through devices and entities to locate endpoints.

Lasterror is set.
Returns nil on any error.

127.2.14 GetExternalDevice(index as Integer) as MidiDeviceMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return one of the external devices in the system.
Notes:

The index goes from 0 to NumberOfDevices-1.
Lasterror is set.
Returns nil on any error.

127.2.15 GetSource(index as Integer) as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return one of the sources in the system.
Notes:

The index goes from 0 to NumberOfSources-1.
Lasterror is set.
Returns nil on any error.

127.2.16 Init(name as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Creates a new Client object with the given client name.
Notes: Lasterror is set.

127.2.17 NumberOfDestinations as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Returns the number of destinations in the system.
Example:

```
dim m as new MidiClientMBS
dim n as Integer = m.NumberOfDestinations

MsgBox "NumberOfDestinations: "+str(n)
```

Notes:

Returns 0 on any error.
Lasterror is set.

127.2.18 NumberOfDevices as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Returns the number of devices in the system.
Example:

```
dim m as new MidiClientMBS
dim n as Integer = m.NumberOfDevices

MsgBox "NumberOfDevices: "+str(n)
```

Notes:

Returns 0 on any error.
Lasterror is set.

127.2.19 NumberOfExternalDevices as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Returns the number of typedefal MIDI devices in the system.
Example:

```
dim m as new MidiClientMBS
dim n as Integer = m.NumberOfExternalDevices

MsgBox "NumberOfExternalDevices: "+str(n)
```

Notes:

External MIDI devices are MIDI devices connected to endpoints via a standard MIDI cable. Their presence is completely optional, only when a UI somewhere adds them.

New for CoreMIDI 1.1.

Returns 0 on any error.
Lasterror is set.

127.2.20 NumberOfSources as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Returns the number of sources in the system.
Example:

```
dim m as new MidiClientMBS
dim n as Integer = m.NumberOfSources

MsgBox "NumberOfSources: "+str(n)
```

Notes:

Returns 0 on any error.
Lasterror is set.

127.2.21 Restart as Integer

MBS MacCF Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Stops and restarts MIDI I/O.
Notes:

This is useful for forcing CoreMIDI to ask its drivers to rescan for hardware.
Returns the Mac OS X error code.

127.2.22 Send(port as MidiPortMBS, endpoint as MidiEndpointMBS, packets as MidiPacketListMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Sends midi data using the port to the given endpoint.
Example:

```
// Not 100% if this example works:
dim client as MIDIClientMBS
dim outport as MIDIPortMBS
dim dest as MIDIEndpointMBS
dim pack as MIDIPacketMBS
dim list as MIDIPacketListMBS
dim packs(-1) as MIDIPacketMBS

client = new MidiClientMBS

if client <>nil then
client.Init newcfstringmbs("CoreMIDI")
outport = new MIDIPortMBS
client.CreateOutputPort(NewCFStringMBS("outport"), outport)
dest = client.getDestination(0)
outport.connectSource dest

pack = new MIDIPacketMBS
list = new MIDIPacketListMBS
pack.timeStamp = nil
pack.datastring = chrb(& h90)+chrb(& h5A)+chrb(& h7C)
packs.append pack
if not list.FillList(packs) then
```

```
msgBox "bad"
end

client.Send(outport, dest, list)
end
```

Notes:

Events with future timestamps are scheduled for future delivery. The system performs any needed MIDI merging.

Lasterror is set.

127.2.23 Events

127.2.24 ObjectAdded(parent as MidiObjectMBS, child as MidiObjectMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: .

Function: Called when an object is added to a MidiObject.

127.2.25 ObjectRemoved(parent as MidiObjectMBS, child as MidiObjectMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: .

Function: Called when an object is removed from a MidiObject.

127.2.26 PropertyChanged(target as MidiObjectMBS, theProperty as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: .

Function: Called when a property was changed.

127.2.27 SerialPortOwnerChanged

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: .

Function: A persistent MIDI Thru connection was created or destroyed.
Notes: New for CoreMIDI 1.3.

127.2.28 SetupChanged

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: .

Function: Some aspect of the current MIDISetup has changed.
Notes: You should ignore this message if you handle the other messages.

127.2.29 ThruConnectionsChanged

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: .

Function: A persistent MIDI Thru connection was created or destroyed.
Notes: New for CoreMIDI 1.3.

127.2.30 Constants

127.2.31 kMIDIIDNotUnique = -10843

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI error.
Notes: Attempt to set a non-unique kMIDIPropertyUniqueID on an object.

127.2.32 kMIDIInvalidClient = -10830

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI error.
Notes: An invalid MIDIClientRef was passed.

127.2.33 kMIDIInvalidPort = -10831

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI error.
Notes: An invalid MIDIPortRef was passed.

127.2.34 kMIDIInvalidUniqueID = 0

MBS MacCF Plugin, Plugin Version: 9.6.

Function: A constant for an invalid unique ID.

127.2.35 kMIDIMessageSendErr = -10838

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI error.
Notes: Communication with MIDIServer failed.

127.2.36 kMIDIMsgIOError = 7

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI Notification.
Notes: A driver I/O error occurred.

127.2.37 kMIDIMsgObjectAdded = 2

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI Notification.
Notes: A device, entity or endpoint was added.

127.2.38 kMIDIMsgObjectRemoved = 3

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI Notification.
Notes: A device, entity or endpoint was removed.

127.2.39 kMIDIMsgPropertyChanged = 4

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI Notification.
Notes: An object's property was changed.

127.2.40 kMIDIMsgSerialPortOwnerChanged = 6

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI Notification.
Notes: A persistent MIDI Thru connection was created or destroyed. No data. New for CoreMIDI 1.3.

127.2.41 kMIDIMsgSetupChanged = 1

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI Notification.
Notes: Some aspect of the current MIDISetup has changed. No data. Should ignore this message if messages 2-6 are handled.

127.2.42 kMIDIMsgThruConnectionsChanged = 5

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI Notification.
Notes: A persistent MIDI Thru connection was created or destroyed. No data. New for CoreMIDI 1.3.

127.2.43 kMIDINoConnection = -10833

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI error.
Notes: Attempt to close a non-existant connection.

127.2.44 kMIDINoCurrentSetup = -10837

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI error.
Notes: Internal error; there is no current MIDI setup object.

127.2.45 kMIDIObjectNotFound = -10842

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI error.
Notes: The requested object does not exist.

127.2.46 kMIDIServerStartErr = -10839

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI error.
Notes: Unable to start MIDIServer.

127.2.47 kMIDISetupFormatErr = -10840

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI error.
Notes: Unable to read the saved state.

127.2.48 kMIDIUnknownEndpoint = -10834

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI error.
Notes: An invalid MIDIEndpointRef was passed.

127.2.49 kMIDIUnknownProperty = -10835

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI error.
Notes: Attempt to query a property not set on the object.

127.2.50 kMIDIWrongEndpointType = -10832

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI error.
Notes: A source endpoint was passed to a function expecting a destination, or vice versa.

127.2.51 kMIDIWrongPropertyType = -10836

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI error.
Notes: Attempt to set a property with a value not of the correct type.

127.2.52 kMIDIWrongThread = -10841

MBS MacCF Plugin, Plugin Version: 9.6.

Function: One of the type constants for a MIDI error.
Notes: A driver is calling a non-I/O function in the server from a thread other than the server's main thread.

127.3 class MidiDeviceMBS

127.3.1 class MidiDeviceMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: A class for a MIDI device.
Notes:

A MIDI device, which either attaches directly to the computer and is controlled by a MIDI driver, or which is "external," meaning that it is connected to a driver-controlled device via a standard MIDI cable.
Subclass of the MidiObjectMBS class.

127.3.2 Methods

127.3.3 GetEntity(index as Integer) as MidiEntityMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return one of a given device's entities.
Notes:

The index goes from 0 to NumberOfEntities-1.
Lasterror is set.
Returns nil on any error.

127.3.4 NumberOfEntities as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Returns the number of entilities for this device.
Notes:

Returns nil on any error.
Lasterror is set.

127.4 class MidiEndpointMBS

127.4.1 class MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the CoreMidi classes.
Notes:

Entities have any number of MIDIEndpointRef's, sources and destinations of 16-channel MIDI streams.
Subclass of the MidiObjectMBS class.

127.4.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr1

127.4.3 Blog Entries

- MBS Real Studio Plugins, version 12.5pr1

127.4.4 Methods

127.4.5 close

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The destructor.
Notes:

Frees the endpoint handle.
There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

127.4.6 Entity as MidiEntityMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Returns an endpoint's entity.
Notes:

Returns nil on any error.
Lasterror is set.
New for CoreMIDI 1.3.

127.4.7 FlushOutput

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Unschedule previously-sent packets.
Notes:

Clients may use MIDIFlushOutput to cancel the sending of
packets that were previously scheduled for future delivery.
New for CoreMIDI 1.1.
Lasterror is set.

127.4.8 Received(packets as MidiPacketListMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: Distribute MIDI from a source to the client input ports which are connected to that source.
Notes:

Drivers should call this function when receiving MIDI from a source.
Clients which have created virtual sources, using MIDICreateSource, should call this function when the source is generating MIDI.
Lasterror is set.

127.4.9 Events

127.4.10 Read(endpoint as MidiEndpointMBS, list as MidiPacketListMBS)

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: .

Function: Called when data arrives at an endpoint.
Notes:

If more than 256 bytes of data is received, it may be splitted and send in several events.

For some devices a Note Off is just a Note On with a zero velocity.

127.5 class MidiEntityMBS

127.5.1 class MidiEntityMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the CoreMidi classes.
Notes:

Devices may have multiple logically distinct sub-components, e.g. a MIDI synthesizer and a pair of MIDI ports, both addressable via a USB port.

By grouping a device's endpoints into entities, the system has enough information for an application to make reasonable assumptions about how to communicate in a bi-directional manner with each entity, as is desirable in MIDI librarian applications.

These sub-components are MIDIEntityRef's.
Subclass of the MidiObjectMBS class.

127.5.2 Methods

127.5.3 Device as MidiDeviceMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Returns an entity's device.
Notes:

Returns nil on any error.
Lasterror is set.
New for CoreMIDI 1.3.

127.5.4 GetDestination(index as Integer) as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return one of a given entity's destinations.
Notes:

Lasterror is set.
Returns nil on any error.

127.5.5 GetSource(index as Integer) as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return one of a given entity's sources.
Notes:

Lasterror is set.
Returns nil on any error.

127.5.6 NumberOfDestinations as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return the number of destinations in a given entity.
Notes:

Lasterror is set.
Returns 0 on any error.

127.5.7 NumberOfSources as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return the number of sources in a given entity.
Notes:

Lasterror is set.
Returns 0 on any error.

127.6 class MidiObjectMBS

127.6.1 class MidiObjectMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: A class for a Mac OS X CoreMidi object.

127.6.2 Blog Entries

- MBS Xojo Plugins, version 17.4pr2
- MBS Real Studio Plugins, version 12.5pr2

127.6.3 Blog Entries

- MBS Xojo Plugins, version 17.4pr2
- MBS Real Studio Plugins, version 12.5pr2

127.6.4 Methods

127.6.5 kMIDIPropertyAdvanceScheduleTimeMuSec as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

device/entity/endpoint property, integer
Set by the owning driver; should not be touched by other clients.
If it is >0, then it is a recommendation of how many microseconds in advance clients should schedule output. Clients should treat this value as a minimum. For devices with a >0 advance schedule time, drivers will receive outgoing messages to the device at the time they are sent by the client, via MIDISend, and the driver is responsible for scheduling events to be played at the right times according to their timestamps.
As of CoreMIDI 1.3, this property may also be set on virtual destinations (but only the creator of the destination should do so).
When a client sends to a virtual destination with an advance schedule time of 0, the virtual destination receives its messages at their scheduled delivery time. If a virtual destination has a non-zero advance schedule time, it receives timestamped messages as soon as they are sent, and must do its own scheduling of the events.

127.6.6 kMIDIPropertyCanRoute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.7 kMIDIPropertyConnectionUniqueID as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

device/entity/endpoint property, integer or CFDataRef

UniqueID of an external device/entity/endpoint attached to this one (strongly recommended that it be an endpoint). This is for the use of a setup editor UI; not currently used internally. A driver-owned entity or endpoint has this property to refer to an external MIDI device that is connected to it.

The property is non-existant or 0 if there is no connection.

New for CoreMIDI 1.1.

Beginning with CoreMIDI 1.3, this property may be a CFDataRef containing an array of big-endian SInt32's, to allow specifying that a driver object connects to multiple external objects (via MIDI thru-ing or splitting).

This property may also exist for external devices/entities/endpoints, in which case it signifies a MIDI Thru connection to another external device/entity/endpoint (again, strongly recommended that it be an edpoint).

127.6.8 kMIDIPropertyDeviceID as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.

Notes:

Only available after you called the Init Method.
device/entity property, integer
The entity's system-exclusive ID, in user-visible form
Drivers may set this property on their devices or entities.
Setup editors may allow the user to set this property on external devices.

127.6.9 kMIDIPropertyDisplayName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

device/entity/endpoint property, string.

Provides the Apple-recommended user-visible name for an endpoint, by combining the device and endpoint names.

For objects other than endpoints, the display name is the same as the name.

New for CoreMIDI 1.5.

127.6.10 kMIDIPropertyDriverDeviceEditorApp as CFStringMBS

MBS MacCF Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

device property, string, contains the full path to an application which knows how to configure this driver-owned devices. Drivers may set this property on their owned devices. Applications must not write to it.

New for CoreMIDI 1.4.

127.6.11 kMIDIPropertyDriverOwner as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

device/entity/endpoint property, string

Name of the driver that owns a device.
Set by the owning driver, on the device; should not be touched by other clients. Property is inherited from the device by its entities and endpoints.

New for CoreMIDI 1.1.

127.6.12 kMIDIPropertyDriverVersion as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

device/entity/endpoint property, integer, returns the driver version API of the owning driver (only for driver-owned devices). Drivers need not set this property; applications should not write to it.

New for CoreMIDI 1.3.

127.6.13 kMIDIPropertyFactoryPatchNameFile as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

device/entity/endpoint property, CFData containing AliasHandle

An alias to the device's current factory patch name file.

Added in CoreMIDI 1.1. DEPRECATED as of CoreMIDI 1.3.
Use kMIDIPropertyNameConfiguration instead.

127.6.14 kMIDIPropertyImage as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

device property, CFStringRef which is a full POSIX path to a device or external device's icon, stored in any standard graphic file format such as JPEG, GIF, PNG and TIFF are all acceptable. (See CFURL for functions to convert between POSIX paths and other ways of specifying files.) The image's maximum size should be 128x128.

Drivers should set the icon on the devices they add.
A studio setup editor should allow the user to choose icons for external devices.

New for CoreMIDI 1.3.

127.6.15 kMIDIPropertyIsBroadcast as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.
entity/endpoint property, integer
1 if the endpoint broadcasts messages to all of the other endpoints in the device, 0 if not. Set by the owning driver; should not be touched by other clients.
New for CoreMIDI 1.3.

127.6.16 kMIDIPropertyIsDrumMachine as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.17 kMIDIPropertyIsEffectUnit as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.18 kMIDIPropertyIsEmbeddedEntity as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

entity/endpoint property, integer
0 if there are external MIDI connectors, 1 if not.
New for CoreMIDI 1.1.

127.6.19 kMIDIPropertyIsMixer as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.20 kMIDIPropertyIsSampler as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.21 kMIDIPropertyManufacturer as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Example:

```
dim m as MidiClientMBS
dim i, n as Integer
dim e as MIDIEndpointMBS
dim d as MIDIDeviceMBS
dim s as CFStringMBS

m = new MidiClientMBS
m.Init NewCFStringMBS("Test")
d = m.GetDevice(0)

s = d.StringProperty(d.kMIDIPropertyManufacturer)

MsgBox s.str
```

Notes:

Only available after you called the Init Method.

device/endpoint property, string
Drivers should set this property on their devices.
Setup editors may allow the user to set this property on external devices.
Creators of virtual endpoints may set this property on their endpoints.

127.6.22 kMIDIPropertyMaxReceiveChannels as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0-16

127.6.23 kMIDIPropertyMaxSysExSpeed as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.
device/entity/endpoint property, integer
Set by the owning driver; should not be touched by other clients.
maximum bytes/second of sysex messages sent to it
(default is 3125, as with MIDI 1.0)

127.6.24 kMIDIPropertyMaxTransmitChannels as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0-16

127.6.25 kMIDIPropertyModel as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

device/endpoint property, string
Drivers should set this property on their devices.
Setup editors may allow the user to set this property on external devices.
Creators of virtual endpoints may set this property on their endpoints.

127.6.26 kMIDIPropertyName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Example:

```
// init midi
dim m as new MidiClientMBS
m.Init NewCFStringMBS("TestApp")

// create a source
dim name as CFStringMBS = NewCFStringMBS("TestSource")
dim source as MidiEndpointMBS = m.CreateSource(name)

// query name property
dim s as CFStringMBS = source.StringProperty(source.kMIDIPropertyName)
MsgBox "Name: "+s.str
```

Notes:

Only available after you called the Init Method.

device/entity/endpoint property, string
Devices, entities, and endpoints may all have names. The recommended way to display an endpoint's name is to ask for the endpoint name, and display only that name if it is unique. If it is non-unique, prepend the device name.
A setup editor may allow the user to set the names of both driver-owned and external devices.

127.6.27 kMIDIPropertyNameConfiguration as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

device/entity/endpoint property, CFDictionary

This specifies the device's current patch, note and control name values using the MIDINameDocument XML format. This specification requires the use of higher-level, OS-specific constructs outside of the specification, to fully define the current names for a device.

The MIDINameConfiguration property is implementated as a CFDictionary:

key "master" maps to a CFDataRef containing an AliasHandle referring to the device's master name document.

key "banks" maps to a CFDictionaryRef. This dictionary's keys are CFStringRef names of patchBank elements in the master document, and its values are each a CFDictionaryRef: key "file" maps to a CFDataRef containing an AliasHandle to a document containing patches that override those in the master document, and key "patchNameList" maps to a CFStringRef which is the name of the patchNameList element in the overriding document.

key "currentModes" maps to a 16-element CFArrayRef, each element of which is a CFStringRef of the name of the current mode for each of the 16 MIDI channels.

Clients setting this property must take particular care to preserve dictionary values other than the ones they are interested in changing, and to properly structure the dictionary.

New for CoreMIDI 1.3.

127.6.28 kMIDIPropertyOffline as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

device/entity/endpoint property, integer

1 = device is offline (is temporarily absent), 0 = present
Set by the owning driver, on the device; should not be touched by other clients. Property is inherited from the device by its entities and endpoints.

New for CoreMIDI 1.1.

127.6.29 kMIDIPropertyPanDisruptsStereo as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.30 kMIDIPropertyPrivate as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

device/entity/endpoint property, integer

1 = endpoint is private, hidden from other clients.
May be set on a device or entity, but they will still appear in the API; only affects whether the owned endpoints are hidden.

New for CoreMIDI 1.3.

127.6.31 kMIDIPropertyReceiveChannels as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.
endpoint property, integer
The value is a bitmap of channels on which the object receives, (1«0)=ch 1...(1«15)=ch 16.
Drivers may set this property on their entities or endpoints.
Setup editors may allow the user to set this property on external endpoints.
Virtual destination may set this property on their endpoints.

127.6.32 kMIDIPropertyReceivesBankSelectLSB as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.33 kMIDIPropertyReceivesBankSelectMSB as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.34 kMIDIPropertyReceivesClock as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.35 kMIDIPropertyReceivesMTC as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.36 kMIDIPropertyReceivesNotes as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.37 kMIDIPropertyReceivesProgramChanges as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.38 kMIDIPropertySingleRealtimeEntity as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

device property, integer

Some MIDI interfaces cannot route MIDI realtime messages to individual outputs; they are broadcast. On such devices the inverse is usually also true – incoming realtime messages cannot be identified as originating from any particular source.

When this property is set on a driver device, it signifies the 0-based index of the entity on which incoming realtime messages from the device will appear to have originated from.

New for CoreMIDI 1.3.

127.6.39 kMIDIPropertySupportsGeneralMIDI as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.40 kMIDIPropertySupportsMMC as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.41 kMIDIPropertySupportsShowControl as CFStringMBS

MBS MacCF Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

device/entity property, integer (0/1). Indicates whether the device implements the MIDI.
New for CoreMIDI 1.5.

127.6.42 kMIDIPropertyTransmitChannels as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.
endpoint property, integer
The value is a bitmap of channels on which the object transmits, (1«0)=ch 1...(1«15)=ch 16
New for CoreMIDI 1.3.

127.6.43 kMIDIPropertyTransmitsBankSelectLSB as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.44 kMIDIPropertyTransmitsBankSelectMSB as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.45 kMIDIPropertyTransmitsClock as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.46 kMIDIPropertyTransmitsMTC as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.47 kMIDIPropertyTransmitsNotes as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.48 kMIDIPropertyTransmitsProgramChanges as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

127.6.49 kMIDIPropertyUniqueID as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Example:

```
// init midi
dim m as new MidiClientMBS
m.Init NewCFStringMBS("TestApp")

// create a source
dim name as CFStringMBS = NewCFStringMBS("TestSource")
dim source as MidiEndpointMBS = m.CreateSource(name)

// query name property
dim s as Integer = source.IntegerProperty(source.kMIDIPropertyUniqueID)
MsgBox "UniqueID: "+str(s)
```

Notes:

Only available after you called the Init Method.
devices, entities, endpoints all have unique ID's, integer
The system assigns unique ID's to all objects. Creators of virtual endpoints may set this property on their endpoints, though doing so may fail if the chosen ID is not unique.

127.6.50 kMIDIPropertyUserPatchNameFile as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes:

Only available after you called the Init Method.

device/entity/endpoint property, CFData containing AliasHandle

An alias to the device's current user patch name file.

Added in CoreMIDI 1.1. DEPRECATED as of CoreMIDI 1.3.
Use kMIDIPropertyNameConfiguration instead.

127.6.51 Properties(deep as boolean) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Get all of an object's properties.
Notes:

Deep parameter: true if the object's child objects are to be included (e.g. a device's entities, or an entity's endpoints).
Properties which an object inherits from its owning object (if any) are not included.

New for CoreMIDI 1.1.

Returns nil on any error.
Lasterror is set.

127.6.52 RemoveProperty(name as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Remove an object's property.
Notes: Lasterror is set.

127.6.53 Properties

127.6.54 DisplayName as String

MBS MacCF Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Provides the Apple-recommended user-visible name for an endpoint, by combining the device and endpoint names.
Notes:

For objects other than endpoints, the display name is the same as the name.
(Read only property)

127.6.55 Handle as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The handle of this object.
Notes: (Read and Write property)

127.6.56 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The last error code reported.
Notes:

0 if the function was successfull.
-1 if the function is not available or the RB parameters were bad. (e.g. nil)
else a Mac OS error code.

Some Midi specific error codes:

(Read and Write property)

kMIDIInvalidClient	-10830	
kMIDIInvalidPort	-10831	
kMIDIWrongEndpointType	-10832	want source, got destination, or vice versa
kMIDINoConnection	-10833	attempt to close a non-existant connection
kMIDIUnknownEndpoint	-10834	
kMIDIUnknownProperty	-10835	
kMIDIWrongPropertyType	-10836	
kMIDINoCurrentSetup	-10837	there is no current setup, or it contains no devices
kMIDIMessageSendErr	-10838	communication with server failed
kMIDIServerStartErr	-10839	couldn't start the server
kMIDISetupFormatErr	-10840	unparseable saved state
kMIDIWrongThread	-10841	driver is calling non I/O function in server from a thread other than server's main one:
kMIDIObjectNotFound	-10842	
kMIDIIDNotUnique	-10843	

127.6.57 Manufacturer as String

MBS MacCF Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Drivers should set this property on their devices.
Notes:

Setup editors may allow the user to set this property on external devices.
(Read only property)

127.6.58 Model as String

MBS MacCF Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The model name.
Notes: (Read only property)

127.6.59 Name as String

MBS MacCF Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The item's name.
Notes:

Devices, entities, and endpoints may all have names. The recommended way to display an endpoint's name is to ask for the endpoint name, and display only that name if it is unique. If it is non-unique, prepend the device name.

A setup editor may allow the user to set the names of both driver-owned and external devices.

(Read only property)

127.6.60 BinaryProperty(name as CFStringMBS) as CFBinaryDataMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Set or Get an object's data-type property.
Notes:

Lasterror is set.
Returns nil on any error.
(Read and Write computed property)

127.6.61 IntegerProperty(name as CFStringMBS) as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Set or Get an object's integer-type property.
Example:

```
// init midi
dim m as new MidiClientMBS
m.Init NewCFStringMBS("TestApp")

// create a source
dim name as CFStringMBS = NewCFStringMBS("TestSource")
dim source as MidiEndpointMBS = m.CreateSource(name)

// query name property
dim s as Integer = source.IntegerProperty(source.kMIDIPropertyUniqueID)
MsgBox "UniqueID: "+str(s)

// set it
source.IntegerProperty(source.kMIDIPropertyUniqueID) = 1234

// query again
dim t as Integer = source.IntegerProperty(source.kMIDIPropertyUniqueID)
MsgBox "UniqueID: "+str(t)
```

Notes:

Returns 0 on any error.
Lasterror is set.
(Read and Write computed property)

127.6.62 ObjectProperty(name as CFStringMBS) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Get or Set an object's dictionary-type property.
Notes:

Lasterror is set.
New for CoreMIDI 1.3.
Renamed from Property to ObjectProperty in v4.3 for Xojo 6 compatibility.
(Read and Write computed property)

127.6.63 StringProperty(name as CFStringMBS) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Get or Set an object's string-type property.
Example:

```
dim m as MidiClientMBS
dim i, n as Integer
dim e as MIDIEndpointMBS
dim d as MIDIDeviceMBS
dim s as CFStringMBS

m = new MidiClientMBS
m.Init NewCFStringMBS("Test")
d = m.GetDevice(0)

s = d.StringProperty(d.kMIDIPropertyManufacturer)

MsgBox s.str
```

Notes:

Lasterror is set.
(Read and Write computed property)

127.7 class MidiPacketListMBS

127.7.1 class MidiPacketListMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: A class to hold a list of MidiPackets.

127.7.2 Methods

127.7.3 FillList(packets() as MidiPacketMBS) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Fills the list with the given Xojo array of MidiPackets.
Example:

```
Dim packs(-1) As MIDIPacketMBS

Dim pack As New MIDIPacketMBS
Dim list As New MIDIPacketListMBS
Dim data As New MemoryBlock(9)

data.Byte(0) = & hF0
data.Byte(1) = & h00
data.Byte(2) = & h20
data.Byte(3) = & h1C
data.Byte(4) = & h7F
data.Byte(5) = & h04
data.Byte(6) = & h02
data.Byte(7) = & h01
data.Byte(8) = & hF7

pack.datamemory = data
pack.timeStamp = Nil 'now

packs.append pack
If Not list.FillList(packs) Then
Break // problem
Else
// send to current port and destination
client.Send(outport, currentDest, list)
End If
```

127.7.4 Item(index as Integer) as MidiPacketMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Returns the item with the given index.

127.7.5 Properties

127.7.6 Count as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The number of items in the list.
Notes: (Read and Write property)

127.8 class MidiPacketMBS

127.8.1 class MidiPacketMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: A class for a midi packet.

127.8.2 Blog Entries

- MBS Plugins 10.3 Release Notes

127.8.3 Blog Entries

- MBS Plugins 10.3 Release Notes

127.8.4 Methods

127.8.5 AbsoluteToNanoseconds(value as UInt64) as UInt64

MBS MacCF Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Converts an absolute time value to a nanoseconds time value.
Example:

```
dim x as UInt64 = MidiPacketMBS.CurrentTime

dim y as UInt64 = x + MidiPacketMBS.NanosecondsToAbsolute(5)

MsgBox str(x)+" + 5 ns = "+str(Y)
```

127.8.6 CurrentTime as UInt64

MBS MacCF Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns the current time of the computer as an absolute time value.
Example:

```
dim u as uint64 = MidiPacketMBS.CurrentTime
dim n as uint64 = MidiPacketMBS.AbsoluteToNanoseconds(u)
dim x as Double = n / 1000000000.0
```

```
MsgBox str(u)+" "+str(n)+" "+str(x)

dim d as new date
d.Minute = 0
d.Hour = 0
d.Second = 0
d.TotalSeconds = d.TotalSeconds + x

MsgBox d.ShortTime // how long the mac is running.
```

Notes: While some Macs do have host clock time being in nanoseconds, this is not guaranteed. So use the function AbsoluteToNanoseconds to convert to nanoseconds.

127.8.7 NanosecondsToAbsolute(value as UInt64) as UInt64

MBS MacCF Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Converts a nanoseconds value to an absolute time.
Example:

```
dim x as UInt64 = MidiPacketMBS.CurrentTime

dim y as UInt64 = MidiPacketMBS.NanosecondsToAbsolute(x)

dim seconds as uint64 = y / 1000000000
dim hours as uint64 = seconds / 3600
seconds = seconds - hours*3600
dim minutes as uint64 = seconds / 60
seconds = seconds - minutes*60

// shows how long the Mac is running:
MsgBox str(hours)+" hours, "+str(minutes)+" minutes, "+str(seconds)+" seconds"
```

127.8.8 Properties

127.8.9 DataMemory as MemoryBlock

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The data of the packet as a memoryblock.
Notes:

Setting this value will automatically fill the DataString property, so both are in sync.

(Read and Write property)

127.8.10 DataString as String

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The data of the packet as a string.
Notes:

Setting this value will automatically fill the DataMemory property, so both are in sync.

This will not work:
DataString="90 5A 7C"

But this is better:
DataString=chrb(& h90)+chrb(& h5A)+chrb(& h7C)

or with the DataMemory property:
m=newmemoryblock(3)
m.byte(0)=& h90
m.byte(1)=& h5A
m.byte(2)=& h7C
DataMemory=m
(Read and Write property)

127.8.11 TimeStamp as MemoryBlock

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The timestamp of the packet.
Example:

```
dim pack as MIDIPacketMBS
dim m as memoryblock

m=newmemoryblock(8)
m.Long(0) = 2345678 // some time value
m.Long(4) = 3456789
pack = new MIDIPacketMBS
pack.TimeStamp = m
```

Notes:

A host clock time (64 bit value) representing the time of an event, as returned by MidiPacketMBS.CurrentTime.

As a convenience, you can use zero to use the current time.
And using nil for the memoryblock represents a value of zero (=now).
(Read and Write property)

127.8.12 TimeStampValue as UInt64

MBS MacCF Plugin, Plugin Version: 7.0, Platform: macOS, Targets: All.

Function: The timestamp of the packet.
Notes:

A host clock time (64 bit value) representing the time of an event, as returned by MidiPacketMBS.CurrentTime.

As a convenience, you can use zero to use the current time.
(Read and Write property)

127.9 class MidiPlaybackMBS

127.9.1 class MidiPlaybackMBS

MBS MacOSX Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: A class to do Midi playback on Mac OS X.
Notes:

With sandbox, you need the com.apple.security.temporary-exception.audio-unit-host entitlement as of September 2013.
see
https://developer.apple.com/library/mac/qa/qa1483/_index.html

See also AVMIDIPlayerMBS class for playing midi files.

127.9.4 Methods

127.9.5 Callback as Integer

MBS MacOSX Plugin, Plugin Version: 6.0, Platform: macOS, Targets: All.

Function: Needed for the MidiPortMBS class to know which function to call
Example:

```
dim p as MidiPlaybackMBS
dim m as MidiPortMBS
// do something useful
m.SetCallback p.Callback, p
```

Notes:

Return the address of the callback method used to process Midi data.
The method is to be used together with the SetCallback method in the MidiPortMBS class.

127.9.6 Constructor(UsesInternalReverb as boolean=false, AutoStart as boolean=true)

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: Initializes the midi playback.
Notes:

After calling the constructor the Inited flag is true on success.
If AutoStart is false the midi playback is not started.

127.9.7 CPULoad as single

MBS MacOSX Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: The CPU load of the graph.
Notes:

Returns a short-term running average of the current CPU load of the graph.

127.9.8 InstrumentCount as Integer

MBS MacOSX Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: The number of instruments.

127.9.9 InstrumentID(index as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: The ID of the instrument with the given index.

127.9.10 InstrumentName(index as Integer) as string

MBS MacOSX Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: The name of the instrument with the given index.
Example:

```
// show list of all names
dim m as new MidiPlaybackMBS

dim u as Integer = m.InstrumentCount-1
for i as Integer = 0 to u
Listbox1.AddRow m.InstrumentName(i)
next
```

Notes: Index from 0 to InstrumentCount-1.

127.9.11 IsRunning as boolean

MBS MacOSX Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Whether the midi playback is running.
Notes: Lasterror is set.

127.9.12 LoadSoundBankFile(file as folderitem)

MBS MacOSX Plugin, Plugin Version: 8.5, Platform: macOS, Targets: All.

Function: Loads a sound bank file.
Example:

```
Sub LoadSoundFont (SoundFontName as string)
```

```
dim j as Integer
dim f as folderitem
dim e as string

//GET SOUNDFONT
f = Volume(0).Child("Library").Child("Audio").Child("Sounds").Child("Banks").Child(SoundFontName)

if f <>Nil then
//INSTALL SOUNDFONT
me.LoadSoundBankFile(f)
Window1.PopupMenu1.DeleteAllRows
for j = 0 to 127
if me.InstrumentName(j) <>"" then
Window1.PopupMenu1.addrow me.InstrumentName(j)
end if
next
Window1.PopupMenu1.ListIndex = 0
else
e = "Could not locate the SoundFont: "+ SoundFontName
e = e + " Please make sure the file is a valid soundfont file"
e = e + " and is located in the folder YourHardDrive/Library/Audio/Sounds/Banks"
e = e + " and has the extension .sf2"
MsgBox e
end if

End Sub
```

Notes:

This function can load files with .sf2 extension placed in the location: Library/Audio/Sounds/Banks.

Lasterror is set.

To avoid crashes on Mac OS X 10.5, the midi playback is stopped before loading is done and restarted if necessary after loading completed.

As a side effect stopping the midi playback may reset volume, reverb and tuning.

127.9.13 MaxCPULoad as single

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: The Maximum CPU load of the graph

Notes: Returns the max CPU load of the graph since this call was last made or the graph was last started.

127.9.14 SendMidiEvent(Status as Integer, Data1 as Integer, Data2 as Integer, OffsetSampleFrame as Integer)

MBS MacOSX Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: Sends midi data for playback.

127.9.15 Start

MBS MacOSX Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Starts the midi playback.
Notes: Lasterror is set.

127.9.16 Stop

MBS MacOSX Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Stops the midi playback.
Notes:

Lasterror is set.

As a side effect stopping the midi playback may reset volume, reverb and tuning.

127.9.17 Properties

127.9.18 FilterNodeHandle as Integer

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The internal reference for the filter graph node.
Notes: (Read only property)

127.9.19 GraphHandle as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: The handle for the AUGraph.
Notes: (Read only property)

127.9.20 Inited as boolean

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: Whether the constructor was successful.
Notes:

This property is false if the constructor failed to initialize.
(Read only property)

127.9.21 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: The last error code.
Notes: (Read only property)

127.9.22 OutputNodeHandle as Integer

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The internal reference for the output graph node.
Notes: (Read only property)

127.9.23 SynthNodeHandle as Integer

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The internal reference for the synth graph node.
Notes: (Read only property)

127.9.24 SynthUnitHandle as Integer

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The internal reference for the synth audio unit.
Notes: (Read only property)

127.9.25 InstrumentIDOnChannel(Channel as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: Which instrument is playing on which channel.
Notes: (Read and Write computed property)

127.9.26 ReverbVolume as single

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: The reverb volume.
Notes:

The value range is -120 to 40 dB.
(Read and Write computed property)

127.9.27 StreamFromDisk as boolean

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: Whether we are streaming from disk.
Notes:

Currently setting this value can crash the application.
(Read and Write computed property)

127.9.28 Tuning as single

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: The tuning setting.
Notes:

Value is in cents from -1200 to 1200.
(Read and Write computed property)

127.9.29 UsesInternalReverb as boolean

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: One of the audio unit properties.
Example:

```
dim m as new MidiPlaybackMBS

MsgBox "UsesInternalRever: "+str(m.UsesInternalReverb)
m.UsesInternalReverb=true
MsgBox "UsesInternalRever: "+str(m.UsesInternalReverb)
```

Notes:

Lasterror is set.
(Read and Write computed property)

127.9.30 Volume as single

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: The volume.
Notes:

The value is in dB from -120 to 40.
(Read and Write computed property)

127.10 class MidiPortMBS

127.10.1 class MidiPortMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: A class for a MIDI port.
Notes:

A MIDIPortMBS, which may be an input port or output port, is an object through which a client may communicate with any number of MIDI sources or destinations.
Subclass of the MidiObjectMBS class.

127.10.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr1

127.10.3 Blog Entries

- MBS Real Studio Plugins, version 12.5pr1

127.10.4 Methods

127.10.5 close

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

127.10.6 ConnectSource(source as MidiEndpointMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Establish a connection from a source to a client's input port.
Notes: Lasterror is set.

127.10.7 DisconnectSource(source as MidiEndpointMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Close a previously-established source-to-input port connection.
Notes: Lasterror is set.

127.10.8 SetCallback(callback as Integer, reference as object)

MBS MacCF Plugin, Plugin Version: 6.0, Platform: macOS, Targets: All.

Function: Connects the MidiPort to send data to given MidiPlayback reference.
Example:

```
dim p as MidiPlaybackMBS
dim m as MidiPortMBS
// do something useful
m.SetCallback p.Callback, p
```

Notes:

The method is to be used together with the Callback function in the MidiPlaybackMBS class.
Read event is still being called if needed.

You can call again with 0 as callback to clear it.

127.10.9 Events

127.10.10 Read(endpoint as MidiEndpointMBS, list as MidiPacketListMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: .

Function: Called when data arrives at this port.
Notes:

If more than 256 bytes of data is received, it may be splitted and send in several events.

For some devices a Note Off is just a Note On with a zero velocity.

127.11 class MIDISysexSendRequestMBS

127.11.1 class MIDISysexSendRequestMBS

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: An asynchronous request to send a single system-exclusive MIDI event to a MIDI destination.
Example:

```
// build a data package
Dim data As New MemoryBlock(9)

data.Byte(0) = & hF0
data.Byte(1) = & h00
data.Byte(2) = & h20
data.Byte(3) = & h1C
data.Byte(4) = & h7F
data.Byte(5) = & h04
data.Byte(6) = & h02
data.Byte(7) = & h01
data.Byte(8) = & hF7

// make new secon request
Dim sendRequest As New MIDISysexSendRequestMBS
sendRequest.Data = data
sendRequest.Destination = currentDest
sendRequest.Send

// store reference for later as send is asynchron
Window1.sendRequest = sendRequest
```

127.11.2 Methods

127.11.3 close

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

127.11.4 Send

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: Send a single system-exclusive event, asynchronously.
Notes: Keep a reference to this object until the call Completes.

127.11.5 Properties

127.11.6 BytesToSend as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: Initially set when sending starts to the number of bytes to be sent.
Notes:

MIDISendSysex will decrement this counter as bytes are sent.
(Read and Write property)

127.11.7 Data as Memoryblock

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: The memoryblock with the data you want to send.
Notes: (Read and Write property)

127.11.8 Destination as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: The endpoint to which the event is to be sent.
Notes: (Read and Write property)

127.11.9 IsComplete as boolean

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: The client may set this to true at any time to abort transmission.
Notes:

The implementation sets this to true when all bytes have been sent.
Renamed from Complete to IsComplete in v4.3 for Xojo 6 compatibility.

(Read and Write property)

127.11.10 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: The last error code.
Notes:

0 for success.
(Read and Write property)

127.11.11 Length as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: The length of the memoryblock.
Notes:

If 0, the memoryblock.size property is taken, but not all memoryblocks know their size.
(Read and Write property)

127.11.12 Events

127.11.13 Complete

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: .

Function: An event to notify the client of the completion of a call to MIDISendSysex.

127.12 class MidiThruConnectionControlTransformMBS

127.12.1 class MidiThruConnectionControlTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: A class for a control transformation midi connection.
Notes:

Note: must order control transforms appropriately – first, filter out and remap. Further transforms can follow, and will apply to the remapped control number (if any).
N.B. All transformations are done using 14-bit control values, so, when doing an add/min/max transform on a 7-bit value, the parameter must be a 14-bit value, e.g. to add n, param must be n «7.

127.12.2 Properties

127.12.3 ControlNumber as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The control number.
Notes: (Read and Write property)

127.12.4 ControlType as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The control type.
Notes:

implementation note: some code tests bits of these values

constants:

kMIDIControlType_7Bit	0	control numbers may be 0-127
kMIDIControlType_14Bit	1	control numbers may be 0-31
kMIDIControlType_7BitRPN	2	control numbers may be 0-16383
kMIDIControlType_14BitRPN	3	
kMIDIControlType_7BitNRPN	4	
kMIDIControlType_14BitNRPN	5	

(Read and Write property)

127.12.5 Parameter as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The parameter for the transformation.
Notes: (Read and Write property)

127.12.6 RemappedControlType as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The Remapped Control Type.
Notes:

Only used when transform is kMIDITransform_MapControl
(Read and Write property)

127.12.7 Transform as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The transformation code to apply.
Notes:

Some constants:

kMIDITransform_None	0	no param
kMIDITransform_FilterOut	1	filter out event type, no param
kMIDITransform_MapControl	2	param is remapped control number
kMIDITransform_Add	8	param is value to add
kMIDITransform_Scale	9	param is amount to scale by: fixed point bbbb.bbbb bbbb bbbb
kMIDITransform_MinValue	10	
kMIDITransform_MaxValue	11	
kMIDITransform_MapValue	12	param is index of map in connection's map array

(Read and Write property)

127.13 class MidiThruConnectionEndpointMBS

127.13.1 class MidiThruConnectionEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: A class for an endpoint specifications.
Notes:

When filling one of these out, clients can leave uniqueID 0 if the endpoint exists.
When when one is provided back to the client, the endpoint may be null if it doesn't exist, but the uniqueID will always be non-zero.

127.13.2 Methods

127.13.3 close

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

127.13.4 Properties

127.13.5 Endpoint as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The endpoint to use for a connection.
Notes: (Read and Write property)

127.13.6 UniqueID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: An unique ID for an endpoint.
Notes: (Read and Write property)

127.14 class MidiThruConnectionMBS

127.14.1 class MidiThruConnectionMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: A class for a midi connection.
Notes:

This class defines functions to create MIDI play-through connections between the MIDI sources and destinations. These connections may be persistent or transitory, owned by a client.

By using connections instead of doing MIDI Thru operations themselves, the overhead of moving MIDI messages between the server and the client for thru-ing is reduced.

The aim of these functions is to permit as flexible a set of transformations as possible while keeping the API and data structures relatively simple.

127.14.2 Blog Entries

127.14.4 Methods

127.14.5 close

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

127.14.6 Create(PersistentOwnerID as CFStringMBS, params as MidiThruConnectionParamsMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Creates a new connection.
Notes:

If inPersistentOwnerID is nil, then the connection is marked as owned by the client and will be automatically disposed with the client.
If it is non-nil, then it should be a unique identifier, e.g. "com.mycompany.MyCoolProgram".

127.14.7 Properties

127.14.8 Handle as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The handle for the Connection.
Notes: (Read and Write property)

127.14.9 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The last error code reported.
Notes: (Read and Write property)

127.14.10 Parameter as MidiThruConnectionParamsMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The parameters for the connection.
Notes:

Lasterror is set.
(Read and Write computed property)

127.15 class MidiThruConnectionParamsMBS

127.15.1 class MidiThruConnectionParamsMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The class for the parameters of a midi connection.

127.15.4 Methods

127.15.5 close

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

127.15.6 Properties

127.15.7 ChannelPressure as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: One of the transformations.
Notes: (Read and Write property)

127.15.8 ControlTransformsCount as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The number of control transformations used.
Notes:

If you create a MidiThruConnectionParamsMBS object than this number is counted from the entries in the ControlTransform array.
(Read and Write property)

127.15.9 DestinationsCount as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The number of destinations.
Notes:

If you create a MidiThruConnectionParamsMBS object than this number is counted from the entries in the destination array.
(Read and Write property)

127.15.10 FilterOutAllControls as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Unknown.
Notes: (Read and Write property)

127.15.11 FilterOutBeatClock as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Unknown.
Notes: (Read and Write property)

127.15.12 FilterOutMTC as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Unknown.
Notes: (Read and Write property)

127.15.13 FilterOutSysEx as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Unknown.
Notes: (Read and Write property)

127.15.14 FilterOutTuneRequest as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Unknown.
Notes: (Read and Write property)

127.15.15 HighNote as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The high note value.
Notes:

Ignored if mapping.
If highNote <lowNote, then 0..highNote and lowNote..127 are passed.
(Read and Write property)

127.15.16 HighVelocity as Integer

MBS MacCF Plugin, Plugin Version: 20.1, Platform: macOS, Targets: All.

Function: Higher velocity limit.
Notes:

Note events with a velocity greater than this, if it is not 0, are filtered out.
(Read and Write property)

127.15.17 KeyPressure as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: One of the transformations.
Notes: (Read and Write property)

127.15.18 LowNote as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The low note value.
Notes:

Ignored if mapping.
If highNote <lowNote, then 0..highNote and lowNote..127 are passed.
(Read and Write property)

127.15.19 LowVelocity as Integer

MBS MacCF Plugin, Plugin Version: 20.1, Platform: macOS, Targets: All.

Function: Lower velocity limit.
Notes:

Note events with a velocity less than this value are filtered out.
(Read and Write property)

127.15.20 MapsCount as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The number of mappings used.
Notes:

If you create a MidiThruConnectionParamsMBS object than this number is counted from the entries in the Map array.
(Read and Write property)

127.15.21 NoteNumber as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: One of the transformations.
Notes: (Read and Write property)

127.15.22 PitchBend as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: One of the transformations.
Notes: (Read and Write property)

127.15.23 ProgramChange as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: One of the transformations.
Notes: (Read and Write property)

127.15.24 SourcesCount as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The number of sources used.
Notes:

If you create a MidiThruConnectionParamsMBS object than this number is counted from the entries in the Source array.
(Read and Write property)

127.15.25 Velocity as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: One of the transformations.
Notes: (Read and Write property)

127.15.26 ChannelMap(index as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The array with the value mappings.
Notes:

Map each of the source 16 MIDI channels to channel 0-15 (1-16) or 0xFF to filter out.
(Read and Write computed property)

127.15.27 ControlTransform(index as Integer) as MidiThruConnectionControlTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The array of control transformations.
Notes: (Read and Write computed property)

127.15.28 Destination(index as Integer) as MidiThruConnectionEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The array of destination endpoints.
Notes: (Read and Write computed property)

127.15.29 Map(index as Integer) as MidiThruConnectionValueMapMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The list of mappings for this midi connection.
Notes:

Index is from 0 to 15.
(if you need more, send me an email and I upper the limit.)
(Read and Write computed property)

127.15.30 Source(index as Integer) as MidiThruConnectionEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The array of source endpoints.
Notes: (Read and Write computed property)

127.16 class MidiThruConnectionTransformMBS

127.16.1 class MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The class for a Midi connection transformation.

127.16.2 Properties

127.16.3 Parameter as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The parameter of the transformation.
Notes: (Read and Write property)

127.16.4 Transform as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The transformation code.
Notes:

Some constants:

kMIDITransform_None	0	no param
kMIDITransform_FilterOut	1	filter out event type, no param
kMIDITransform_MapControl	2	param is remapped control number
kMIDITransform_Add	8	param is value to add
kMIDITransform_Scale	9	param is amount to scale by: fixed point bbbb.bbbb bbbb bbbb
kMIDITransform_MinValue	10	
kMIDITransform_MaxValue	11	
kMIDITransform_MapValue	12	param is index of map in connection's map array

(Read and Write property)

127.17 class MidiThruConnectionValueMapMBS

127.17.1 class MidiThruConnectionValueMapMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: A value map for a Midi connection.
Notes: This is an array to map Midi values from 0 to 127 to new values from 0 to 127.

127.17.2 Properties

127.17.3 Value(index as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The value Map.
Notes:

Index is from 0 to 127.
Use only values from 0 to 127.
(Read and Write computed property)

127.18 class PortMidiDeviceInfoMBS

127.18.1 class PortMidiDeviceInfoMBS

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for device information.

127.18.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.3pr5

127.18.3 Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.3pr5

127.18.4 Properties

127.18.5 HasInput as Boolean

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if input is available.
Notes: (Read only property)

127.18.6 HasOutput as Boolean

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if output is available.
Notes: (Read only property)

127.18.7 InterfaceName as String

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Underlying MIDI API.
Notes:

e.g. MMSystem, DirectX or CoreMidi.
(Read only property)

127.18.8 Name as String

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The device name.
Notes:

e.g. USB MidiSport 1x1
(Read only property)

127.19 class PortMidiEventMBS

127.19.1 class PortMidiEventMBS

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a piece of midi data.
Notes:

See this website for a list of Midi status codes:
https://www.midi.org/specifications-old/item/table-2-expanded-messages-list-status-bytes

127.19.2 Blog Entries

- MBS REALbasic Plugins, version 11.0pr14

127.19.4 Methods

127.19.5 Set(status as Integer, data1 as Integer, data2 as Integer)

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the value to the given data.

127.19.6 SetRaw(data0 as Integer, data1 as Integer, data2 as Integer, data3 as Integer)

MBS Audio Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the raw data by setting all 4 bytes together.

127.19.7 Properties

127.19.8 CurrentEvent as PortMidiEventMBS

MBS Audio Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current event played.
Notes:

You can use this to show current note playing.
(Read only property)

127.19.9 Data1 as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The first data value in the midi event.
Notes: (Read and Write property)

127.19.10 Data2 as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The second data value in the midi event.
Notes: (Read and Write property)

127.19.11 RawData0 as Integer

MBS Audio Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The first byte of the raw data in this event.
Notes:

Same as Status property.
(Read and Write property)

127.19.12 RawData1 as Integer

MBS Audio Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The second byte of the raw data in this event.
Notes:

Same as Data1 property.
(Read and Write property)

127.19.13 RawData2 as Integer

MBS Audio Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The third byte of the raw data in this event.
Notes:

Same as Data2 property.
(Read and Write property)

127.19.14 RawData3 as Integer

MBS Audio Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The forth byte of the raw data in this event.
Notes: (Read and Write property)

127.19.15 RawMessage as Integer

MBS Audio Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The raw content of the event as a integer.
Notes:

Take care about platform differences like the byte order.
(Read and Write property)

127.19.16 Status as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The status value.
Notes: (Read and Write property)

127.19.17 When as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time value of this midi data.
Notes:

Should be milliseconds.
(Read and Write property)

127.20 class PortMidiMBS

127.20.1 class PortMidiMBS

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PortMidi library wrapped for use in Xojo.
Notes:

Error codes:

```
const pmNoError              = 0
const pmHostError            = -10000
const pmInvalidDeviceId      = -9999
const pmInsufficientMemory   = -9998
const pmBufferTooSmall       = -9997
const pmBufferOverflow       = -9996
const pmBadPtr               = -9995
const pmBadData              = -9994
const pmInternalError        = -9993
const pmBufferMaxSize        = -9992
```

Requires libasound.so.2 on Linux to be installed.

127.20.2 Blog Entries

127.20.4 Methods

127.20.5 CountDevices as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts the devices.
Example:

```
dim pa as new PortMidiMBS

Dim u as Integer = pa.CountDevices-1
for i as Integer = 0 to u
dim d as PortMidiDeviceInfoMBS = pa.DeviceInfo(i)
MsgBox d.Name+", "+D.InterfaceName
next
```

Notes: Returns 0 on any error.

127.20.6 DefaultInputDeviceID as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the default device ID or pmNoDevice (-1) if there are no devices.
Notes:

On the PC, the user can specify a default device by setting an environment variable. For example, to use device # 1.

set PM_RECOMMENDED_OUTPUT_DEVICE=1

The user should first determine the available device ID by using the supplied application "testin" or "testout".

In general, the registry is a better place for this kind of info, and with USB devices that can come and go, using integers is not very reliable for device identification. Under Windows, if PM_RECOMMENDED_OUTPUT_DEVICE (or PM_RECOMMENDED_INPUT_DEVICE) is *NOT* found in the environment, then the default device is obtained by looking for a string in the registry under: HKEY_LOCAL_MACHINE/SOFTWARE/PortMidi/Recommended_Input_Device and HKEY_LOCAL_MACHINE/SOFTWARE/PortMidi/Recommended_Output_Device for a string. The number of the first device with a substring that matches the string exactly is returned. For example, if the string in the registry is "USB", and device 1 is named "In USB MidiSport 1x1", then that will be the default input because it contains the string "USB".

In addition to the name, PmDeviceInfo has the member "interf", which is the interface name. (The "interface" is the underlying software system or API used by PortMidi to access devices. Examples are MMSystem, DirectX (not implemented), ALSA, OSS (not implemented), etc.) At present, the only Win32 interface is "MMSystem", the only Linux interface is "ALSA", and the only Max OS X interface is "CoreMIDI".

To specify both the interface and the device name in the registry, separate the two with a comma and a space, e.g.:
MMSystem, In USB MidiSport 1x1
In this case, the string before the comma must be a substring of the "interf" string, and the string after the space must be a substring of the "name" name string in order to match the device.

Note: in the current release, the default is simply the first device (the input or output device with the lowest PmDeviceID).

127.20.7 DefaultOutputDeviceID as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the default device ID or pmNoDevice (-1) if there are no devices.
Notes:

On the PC, the user can specify a default device by setting an environment variable. For example, to use device # 1.

set PM_RECOMMENDED_OUTPUT_DEVICE=1

The user should first determine the available device ID by using the supplied application "testin" or "testout".

In general, the registry is a better place for this kind of info, and with USB devices that can come and go, using integers is not very reliable for device identification. Under Windows, if PM_RECOMMENDED_OUTPUT_DEVICE (or PM_RECOMMENDED_INPUT_DEVICE) is *NOT* found in the environment, then the default device is obtained by looking for a string in the registry under: HKEY_LOCAL_MACHINE/SOFTWARE/PortMidi/Recommended_Input_Device and HKEY_LOCAL_MACHINE/SOFTWARE/PortMidi/Recommended_Output_Device for a string. The number of the first device with a substring that matches the string exactly is returned. For example, if the string in the registry is "USB", and device 1 is named "In USB MidiSport 1x1", then that will be the default input because it contains the string "USB".

In addition to the name, PmDeviceInfo has the member "interf", which is the interface name. (The "interface" is the underlying software system or API used by PortMidi to access devices. Examples are MMSystem, DirectX (not implemented), ALSA, OSS (not implemented), etc.) At present, the only Win32 interface is "MMSystem", the only Linux interface is "ALSA", and the only Max OS X interface is "CoreMIDI".

To specify both the interface and the device name in the registry, separate the two with a comma and a space, e.g.:
MMSystem, In USB MidiSport 1x1
In this case, the string before the comma must be a substring of the "interf" string, and the string after the space must be a substring of the "name" name string in order to match the device.

Note: in the current release, the default is simply the first device (the input or output device with the lowest PmDeviceID).

127.20.8 DeviceInfo(DeviceID as Integer) as PortMidiDeviceInfoMBS

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns information about a certain device.
Example:

```
dim pa as new PortMidiMBS

Dim u as Integer = pa.CountDevices-1
for i as Integer = 0 to u
dim d as PortMidiDeviceInfoMBS = pa.DeviceInfo(i)
MsgBox d.Name+", "+D.InterfaceName
next
```

Notes: Returns nil on any error.

127.20.9 ErrorText(ErrorNumber as Integer) as string

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error text for the given error code.
Notes: Returns "" on any error.

127.20.10 Initialize as Integer

MBS Audio Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the PortMidi functions.
Notes:

You call this manually to trigger initialization now.
Or you just let the plugin do it automatically when you call one of the portmidi functions.
Returns the error code. (0 = okay)

127.20.11 ReInitialize as Integer

MBS Audio Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shuts down PortMidi and initializes it again.
Notes:

As PortMidi does not recognize the attachment of new MIdi devices, you can only reinitialize.

Returns a PortMidi error code.

127.20.12 Constants

127.20.13 pmBadData = -9994

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi errors.
Notes: illegal midi data, e.g. missing EOX

127.20.14 pmBadPtr = -9995

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi errors.

127.20.15 pmBufferMaxSize = -9992

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi errors.
Notes: buffer is already as large as it can be.

127.20.16 pmBufferOverflow = -9996

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi errors.

127.20.17 pmBufferTooSmall = -9997

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi errors.

127.20.18 pmHostError = -10000

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi errors.

127.20.19 pmInsufficientMemory = -9998

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi errors.

127.20.20 pmInternalError = -9993

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi errors.

127.20.21 pmInvalidDeviceId = -9999

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi errors.
Notes: out of range or output device when input is requested or input device when output is requested or device is already opened.

127.20.22 pmNoDevice = -1

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi errors.

127.20.23 pmNoError = 0

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi errors.

127.21 class PortMidiStreamMBS

127.21.1 class PortMidiStreamMBS

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Xojo class to represent a PortMidi stream.
Notes:

A single PortMidiStream is a descriptor for an open MIDI device.

See also macOS specific classes AVMIDIPlayerMBS, MidiPlaybackMBS and MidiClientMBS.

- 15.2, page 10: News

127.21.6 Methods

127.21.7 Abort as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Terminates outgoing messages immediately.
Notes:

The caller should immediately close the output port; this call may result in transmission of a partial midi message. There is no abort for Midi input because the user can simply ignore messages in the buffer and close an input device at any time.
Returns an error code.

127.21.8 Close

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

127.21.9 currentTimeStamp as Integer

MBS Audio Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries current time stamp.

127.21.10 ErrorText(ErrorNumber as Integer) as string

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error message for this error number.

127.21.11 HostError as string

MBS Audio Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries host error string.
Example:

```
dim s as new PortMidiStreamMBS
// do something that causes an error
MsgBox "HostError: "+s.HostError
```

Notes: Clears error.

127.21.12 OpenInput(DeviceID as Integer, Buffersize as Integer) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a device for reading.
Notes:

DeviceID is the id of the device used for input.

For input, the buffersize specifies the number of input events to be buffered waiting to be read using Pm_Read().
(In some cases – see below – PortMidi does not buffer output at all and merely passes data to a lower-level API, in which case buffersize is ignored.)

return value:
Upon success OpenInput returns PmNoError.
If a call to OpenInput fails a nonzero error code is returned (see PMError above) and the value of port is invalid.

127.21.13 OpenOutput(DeviceID as Integer, Buffersize as Integer, Latency as Integer) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a device for writing.
Notes:

DeviceID is the id of the device used for input.

For output, buffersize specifies the number of output events to be buffered waiting for output.
(In some cases – see below – PortMidi does not buffer output at all and merely passes data to a lower-level API, in which case buffersize is ignored.)

Latency is the delay in milliseconds applied to timestamps to determine when the output should actually occur. (If latency is <0, 0 is assumed.)
If latency is zero, timestamps are ignored and all output is delivered immediately. If latency is greater than zero, output is delayed until the message timestamp plus the latency. (NOTE: time is measured relative to the time source indicated by time_proc. Timestamps are absolute, not relative delays or offsets.) In some cases, PortMidi can obtain better timing than your application by passing timestamps along to the device driver or hardware. Latency may also help you to synchronize midi data to audio data by matching midi latency to the audio buffer latency.
Due to the may timers work on Windows, the latency is limited there.

return value:

Upon success OpenInput returns PmNoError.
If a call to OpenInput fails a nonzero error code is returned (see PMError above) and the value of port is invalid.

127.21.14 Poll as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tests whether input is available,
Notes: Returns 1 on success and 0 on failure.

127.21.15 Read(byref data as PortMidiEventMBS) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads midi data.
Notes:

Returns the number of read items.
(0 for error and 1 for success)

Read retrieves midi data into a buffer, and returns the number of events read. Result is a non-negative number unless an error occurs, in which case a PmError value will be returned.

Buffer Overflow

The problem: if an input overflow occurs, data will be lost, ultimately because there is no flow control all the way back to the data source. When data is lost, the receiver should be notified and some sort of graceful recovery should take place, e.g. you shouldn't resume receiving in the middle of a long sysex message.

With a lock-free fifo, which is pretty much what we're stuck with to enable portability to the Mac, it's tricky for the producer and consumer to synchronously reset the buffer and resume normal operation.

Solution: the buffer managed by PortMidi will be flushed when an overflow occurs. The consumer (Read()) gets an error message (pmBufferOverflow) and ordinary processing resumes as soon as a new message arrives. The remainder of a partial sysex message is not considered to be a "new message" and will be flushed as well.

127.21.16 SetChannelMask(mask as Integer) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Filters incoming messages based on channel.
Example:

```
dim s as PortMidiStreamMBS // your midi stream

call s.SetChannelMask(1+4) // Channel 1 and 3.
```

Notes:

The mask is a 16-bit bitfield corresponding to appropriate channels
All channels are allowed by default.
Returns an error code.

127.21.17 SetFilter(filters as Integer) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetFilter() sets filters on an open input stream to drop selected input types.
Notes:

By default, only active sensing messages are filtered.
To prohibit, say, active sensing and sysex messages, call SetFilter(FilterActive + FilterSysEx);

Filtering is useful when midi routing or midi thru functionality is being provided by the user application.
For example, you may want to exclude timing messages (clock, MTC, start/stop/continue), while allowing note-related messages to pass.
Or you may be using a sequencer or drum-machine for MIDI clock information but want to exclude any notes it may play.

Returns an error code.

127.21.18 Write(data as PortMidiEventMBS) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes midi data from a buffer.
Notes:

This may contain:
- short messages or
- sysex messages that are converted into a sequence of PortMidiStreamMBS objects, e.g. sending data from a file or forwarding them from midi input.

Use WriteSysEx() to write a sysex message stored as a contiguous array of bytes.

Sysex data may contain embedded real-time messages.
Returns an error code.

127.21.19 WriteShort(When as Integer, message as Integer) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a timestamped non-system-exclusive midi message.
Notes: Messages are delivered in order as received, and timestamps must be non-decreasing. (But timestamps are ignored if the stream was opened with latency = 0.)

127.21.20 WriteSysEx(When as Integer, message as memoryblock, offset as Integer) as Integer

MBS Audio Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a timestamped system-exclusive midi message.
Notes:

The data is taken from the memoryblock at the given offset.
The message must be 0 terminated.

This message must be valid and contain the special start value and a EOX value on the end.
See also:

- 127.21.21 WriteSysEx(When as Integer, message as string) as Integer 20485

127.21.21 WriteSysEx(When as Integer, message as string) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a timestamped system-exclusive midi message.
Notes: This message must be valid and contain the special start value and a EOX value on the end.
See also:

- 127.21.20 WriteSysEx(When as Integer, message as memoryblock, offset as Integer) as Integer 20485

127.21.22 Properties

127.21.23 ChannelMask as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The channel mask used.
Notes:

Use SetChannelMask to change it.
(Read only property)

127.21.24 DeviceID as Integer

MBS Audio Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The device ID.
Notes:

The ID of the device the stream is connected to.
(Read only property)

127.21.25 DeviceName as String

MBS Audio Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The device name.
Notes:

The name of the device the stream is connected to.
(Read only property)

127.21.26 Filters as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The filters setting.
Notes:

Use SetFilters to change it.
(Read only property)

127.21.27 Constants

127.21.28 FilterActive = & h4000

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: filter active sensing messages (& hFE)

127.21.29 FilterAftertouch = & h6000000

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: filter both channel and poly aftertouch

127.21.30 FilterChannelAftertouch = & h20000000

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: filter channel aftertouch (most midi controllers use this) (& hD0-& hDF)

127.21.31 FilterClock = & h1D00

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: filter clock messages (CLOCK & hF8, START & hFA, STOP & hFC, and CONTINUE & hFB)

127.21.32 FilterControl = & h8000000

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: Control Changes (CC's) (& hB0-& hBF)

127.21.33 FilterFD = & h2000

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: filter undefined FD messages

127.21.34 FilterMTC = 2

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: MIDI Time Code (& hF1)

127.21.35 FilterNote = & h3000000

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: filter note-on and note-off (& h90-& h9F and & h80-& h8F

127.21.36 FilterPitchBend = & h40000000

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: Pitch Bender (& hE0-& hEF)

127.21.37 FilterPlay = & h400

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: filter play messages (start & hFA, stop & hFC, continue & hFB)

127.21.38 FilterPolyAftertouch = & h4000000

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: per-note aftertouch (& hA0-& hAF)

127.21.39 FilterProgram = & h10000000

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: Program changes (& hC0-& hCF)

127.21.40 FilterRealTime = & hFF01

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: filter all real-time messages

127.21.41 FilterReset = & h8000

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: filter reset messages (& hFF)

127.21.42 FilterSongPosition = 4

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: Song Position (& hF2)

127.21.43 FilterSongSelect = 8

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: Song Select (& hF3)

127.21.44 FilterSysEx = 1

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: filter system exclusive messages (& hF0)

127.21.45 FilterSystemCommon = & h4E

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: All System Common messages (mtc, song position, song select, tune request)

127.21.46 FilterTick = & h200

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: filter tick messages (& hF9)

127.21.47 FilterTune = & h40

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: Tuning request (& hF6)

127.21.48 FilterUndefined = & h2000

MBS Audio Plugin, Plugin Version: 9.4.

Function: One of the PortMidi filter constants.
Notes: filter undefined real-time messages

127.22 class WindowsMidiInputInfoMBS

127.22.1 class WindowsMidiInputInfoMBS

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: A class for information about a certain Midi Device.

127.22.2 Properties

127.22.3 DriverVersion as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Version number of the device driver for the MIDI input device.
Notes:

The high-order byte is the major version number, and the low-order byte is the minor version number.
(Read only property)

127.22.4 Flags as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Some flags.
Notes:

Currently unused in Windows XP.
(Read only property)

127.22.5 ManufacturerID as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Manufacturer identifier of the device driver for the MIDI input device.
Notes: (Read only property)

127.22.6 Name as String

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Product name.
Notes:

Currently an ANSI string.
(Read only property)

127.22.7 ProductID as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Product identifier of the MIDI input device.
Notes: (Read only property)

127.23 class WindowsMidiInputMBS

127.23.1 class WindowsMidiInputMBS

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: A class to represent an open Midi Input device in Xojo.
Notes: Subclass of the WindowsMidiMBS class.

127.23.2 Blog Entries

- MBS Xojo Plugins, version 18.5pr2
- MBS Real Studio Plugins, version 13.1pr9

127.23.3 Blog Entries

- MBS Xojo Plugins, version 18.5pr2
- MBS Real Studio Plugins, version 13.1pr9

127.23.4 Methods

127.23.5 Close

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Closes the device.
Notes:

First stops recording, second resets midi output device and third Closes the device with waiting till device is done.
Handle is set to 0 and lasterror is set.

127.23.6 Idle

MBS Audio Plugin, Plugin Version: 9.7, Platform: Windows, Targets: All.

Function: Processes events.
Notes:

Midi events are buffered in data structures. This method dispatches them to the Xojo event handlers.
Call this method as often as you need events to fire. For example every 100ms in a timer.

same as WindowsMidiMBS.Idle

127.23.7 InputErrorText(errorcode as Integer) as string

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Translates an error number into a human readable text.
Notes:

Returns "" on unknown errros.
String returned has Windows ANSI text encoding.

127.23.8 Open(DeviceID as Integer, BufferSize as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Opens a Midi device.
Notes:

DeviceID is from 0 to NumberOfMidiInputDevices-1.
Buffersize is the maximum size to allocate for each SysEx receive buffer.
Minimum is 256 bytes. Windows does not handle SysEx messages bigger than 64K.
Lasterror is set.
On success the handle property is non zero.

127.23.9 Reset

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Resets the device.
Notes: Lasterror is set.

127.23.10 Start

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Starts listening for events.
Notes:

Lasterror is set.
Please do not call from Open event as that's too early.

127.23.11 Stop

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Stops recording.
Notes:

Lasterror is set.
You should not need this and just call close or let the object die.

127.23.12 Events

127.23.13 DeviceClose

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: .

Function: An event called whenever the output device is closed.
Notes: Called when you call close.

127.23.14 DeviceData(timestamp as Integer, status as Integer, data1 as Integer, data2 as Integer, RawData as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: .

Function: A simple Midi message has been received.
Notes:

Process this event fast to avoid loosing events.
Status, Data1 and Data2 are all 8 bit values.
The time stamp is specified in milliseconds, beginning at zero when the Start function was called.

127.23.15 DeviceError(timestamp as Integer, status as Integer, data1 as Integer, data2 as Integer, RawData as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: .

Function: A bad Midi message has been received.
Notes:

Process this event fast to avoid loosing events.
Status, Data1 and Data2 are all 8 bit values.
The time stamp is specified in milliseconds, beginning at zero when the Start function was called.

127.23.16 DeviceLongData(timestamp as Integer, data as string, dataMemory as memoryblock)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: .

Function: SysEx data was received.
Notes:

If data is "" no free buffer was available to store the data.
The time stamp is specified in milliseconds, beginning at zero when the Start function was called.

127.23.17 DeviceLongError(timestamp as Integer, data as string, dataMemory as memoryblock)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: .

Function: Bad SysEx data was received.
Notes:

If data is "" no free buffer was available to store the data.
The time stamp is specified in milliseconds, beginning at zero when the Start function was called.

127.23.18 DeviceOpen

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: .

Function: An event called whenever the output device is opened.
Notes:

Called when you call open.
Please do not call Start from Open event as that's too early.

127.24 class WindowsMidiMBS

127.24.1 class WindowsMidiMBS

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Windows Midi base class.
Example:

```
dim midi as WindowsMidiMBS // your midi object

Sub Open()
dim i as WindowsMidiInputInfoMBS
dim o as WindowsMidiOutputInfoMBS
dim c,n as Integer

midi=new WindowsMidiMBS

c=midi.NumberOfMidiInputDevices-1

for n=0 to c
i=midi.InputDevice(n)

listbox1.AddRow str(n+1)
listbox1.Cell(listbox1.LastIndex,1)=i.Name
listbox1.Cell(listbox1.LastIndex,2)=hex(i.DriverVersion)

next

c=midi.NumberOfMidiOutputDevices-1

for n=0 to c
o=midi.OutputDevice(n)

listbox2.AddRow str(n+1)
listbox2.Cell(listbox2.LastIndex,1)=o.Name
listbox2.Cell(listbox2.LastIndex,2)=hex(o.DriverVersion)

next

End Sub
```

Notes: See also PortMidiMBS class for cross platform Midi handling.

127.24.2 Blog Entries

- MBS Real Studio Plugins, version 13.1pr9

127.24.3 Blog Entries

- MBS Real Studio Plugins, version 13.1pr9

127.24.4 Methods

127.24.5 Connect(output as WindowsMidiOutputMBS)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The Connect function connects a MIDI input device to a MIDI thru or output device, or connects a MIDI thru device to a MIDI output device.
Notes:

self must be a MIDI input device or a MIDI thru device.
output must be the MIDI output or thru device.

After calling this function, the MIDI input device receives event data in an DeviceData event whenever a message with the same event data is sent to the output device driver.

A thru driver is a special form of MIDI output driver. The system will allow only one MIDI output device to be connected to a MIDI input device, but multiple MIDI output devices can be connected to a MIDI thru device. Whenever the given MIDI input device receives event data in an DeviceData event, a message with the same event data is sent to the given output device driver (or through the thru driver to the output drivers).

Lasterror is set.

127.24.6 DataLost as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Number of data blocks lost.
Notes:

The buffers in the plugins have a certain size.
In case midi events are coming fast in and the Idle method is not called often enough events are lost.
In that case increase the frequency of calling Idle or request the buffer size to be increased in the next plugin version.

127.24.7 Disconnect(output as WindowsMidiOutputMBS)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The Disconnect function disconnects a MIDI input device from a MIDI thru or output device, or disconnects a MIDI thru device from a MIDI output device.
Notes:

self must be a MIDI input device or a MIDI thru device.
output must be the MIDI output device to be disconnected.

MIDI input, output, and thru devices can be connected by using the Connect function. Thereafter, whenever the MIDI input device receives event data in an DeviceData event, a message with the same event data is sent to the output device driver (or through the thru driver to the output drivers).

Lasterror is set.

127.24.8 EventsLost as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Number of events lost.
Notes:

The buffers in the plugins have a certain size.
In case midi events are coming fast in and the Idle method is not called often enough events are lost.
In that case increase the frequency of calling Idle or request the buffer size to be increased in the next plugin version.

127.24.9 Idle

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Processes events.
Notes:

Midi events are buffered in data structures. This method dispatches them to the Xojo event handlers.
Call this method as often as you need events to fire. For example every 100ms in a timer.

127.24.10 InputDevice(index as Integer) as WindowsMidiInputInfoMBS

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The InputDevice function queries a specified MIDI input device to determine its capabilities.
Example:

```
dim midi as WindowsMidiMBS // your midi object
dim n,c as Integer
dim i as WindowsMidiInputInfoMBS

c=midi.NumberOfMidiInputDevices-1

for n=0 to c
i=midi.InputDevice(n)

listbox1.AddRow str(n+1)
listbox1.Cell(listbox1.LastIndex,1)=i.Name
listbox1.Cell(listbox1.LastIndex,2)=hex(i.DriverVersion)

next
```

Notes: Index is from 0 to NumberOfMidiInputDevices-1.

127.24.11 NumberOfMidiInputDevices as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Returns the number of MIDI input devices present in the system.
Example:

```
dim midi as new WindowsMidiMBS
MsgBox str(midi.NumberOfMidiInputDevices)
```

Notes: A return value of zero means that there are no devices.

127.24.12 NumberOfMidiOutputDevices as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Returns the number of MIDI output devices present in the system.
Example:

```
dim midi as new WindowsMidiMBS
MsgBox str(midi.NumberOfMidiOutputDevices)
```

Notes: A return value of zero means that there are no devices.

127.24.13 OutputDevice(index as Integer) as WindowsMidiOutputInfoMBS

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The OutputDevice function queries a specified MIDI output device to determine its capabilities.
Example:

```
dim midi as WindowsMidiMBS // your midi object
dim c,n as Integer
dim o as WindowsMidiOutputInfoMBS

c=midi.NumberOfMidiOutputDevices-1

for n=0 to c
o=midi.OutputDevice(n)

listbox2.AddRow str(n+1)
listbox2.Cell(listbox2.LastIndex,1)=o.Name
listbox2.Cell(listbox2.LastIndex,2)=hex(o.DriverVersion)

next
```

Notes: Index is from 0 to NumberOfMidiOutputDevices-1.

127.24.14 Properties

127.24.15 Handle as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The handle for this Midi input or output port.
Notes:

Depending on which Xojo class this is, value is a HMIDI, HMIDIIN or HMIDIOUT handle.
(Read only property)

127.24.16 Lasterror as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The last error code reported.
Notes:

0 is no error and -1 is parameter error from the plugin.
(Read only property)

127.25 class WindowsMidiOutputInfoMBS

127.25.1 class WindowsMidiOutputInfoMBS

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: A class for information about a certain Midi Device.

127.25.2 Properties

127.25.3 ChannelMask as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Channels that an internal synthesizer device responds to, where the least significant bit refers to channel 0 and the most significant bit to channel 15.
Notes:

Port devices that transmit on all channels set this member to & hFFFF.
(Read only property)

127.25.4 DriverVersion as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Version number of the device driver for the MIDI input device.
Notes:

The high-order byte is the major version number, and the low-order byte is the minor version number.
(Read only property)

127.25.5 Flags as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Optional functionality supported by the device.
Notes:

It can be one or more of the following:

If a device supports volume changes, the MIDICAPS_VOLUME flag will be set for the dwSupport member. If a device supports separate volume changes on the left and right channels, both the MIDICAPS_VOLUME and the MIDICAPS_LRVOLUME flags will be set for this member.

MIDICAPS_CACHE	= 4	Supports patch caching.
MIDICAPS_LRVOLUME	= 2	Supports separate left and right volume control.
MIDICAPS_STREAM	= 8	Provides direct support for the midiStreamOut function.
MIDICAPS_VOLUME	= 1	Supports volume control.

(Read only property)

127.25.6 ManufacturerID as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Manufacturer identifier of the device driver for the MIDI input device.
Notes: (Read only property)

127.25.7 Name as String

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Product name.
Notes:

Currently an ANSI string.
(Read only property)

127.25.8 Notes as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Maximum number of simultaneous notes that can be played by an internal synthesizer device.
Notes:

If the device is a port, this member is not meaningful and is set to 0.
(Read only property)

127.25.9 ProductID as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Product identifier of the MIDI input device.
Notes: (Read only property)

127.25.10 Technology as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Type of the MIDI output device.
Notes:

This value can be one of the following:

```
MOD_MIDIPORT     = 1   // output port
MOD_SYNTH        = 2   // generic internal synth
MOD_SQSYNTH      = 3   // square wave internal synth
MOD_FMSYNTH      = 4   // FM internal synth
MOD_MAPPER       = 5   // MIDI mapper
MOD_WAVETABLE    = 6   // hardware wavetable synth
MOD_SWSYNTH      = 7   // software synth
```

(Read only property)

127.25.11 Voices as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Number of voices supported by an internal synthesizer device.
Notes:

If the device is a port, this member is not meaningful and is set to 0.
(Read only property)

127.25.12 Volume as Boolean

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Whether volume control is available.
Notes:

True if yes and False if no.
(Read only property)

127.25.13 VolumeStereo as Boolean

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Whether the device can control volume on two independend channels.
Notes:

True if stereo, False if mono.
(Read only property)

127.26 class WindowsMidiOutputMBS

127.26.1 class WindowsMidiOutputMBS

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: A class to represent a Midi Output device.
Notes: Subclass of the WindowsMidiMBS class.

127.26.2 Blog Entries

- MBS Xojo Plugins, version 18.5pr2

127.26.3 Blog Entries

- MBS Xojo Plugins, version 18.5pr2

127.26.4 Methods

127.26.5 Close

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Closes the output device.
Notes:

Closes the device with waiting till device is done.
Handle is set to 0 and lasterror is set.

127.26.6 Open(DeviceID as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Opens the midi device with the given index.
Notes:

DeviceID is from 0 to NumberOfMidiOutputDevices-1.
Lasterror is set.

127.26.7 OpenDefault

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Opens the Midi mapper which opens the device the user selected as the default midi device.
Notes:

If only one midi output device is available this one is opened.
On success the handle property is not zero.
Lasterror is set.

127.26.8 OutputErrorText(errorcode as Integer) as string

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Translates an error number into a human readable text.
Notes:

Returns "" on unknown errros.
String returned has Windows ANSI text encoding.

127.26.9 Reset

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Resets the output device.
Notes: Lasterror is set.

127.26.10 SendData(data as memoryblock)

MBS Audio Plugin, Plugin Version: 12.5, Platform: Windows, Targets: All.

Function: Sends sysex data.
Notes:

Lasterror is set.

See also
http://msdn.microsoft.com/en-us/library/windows/desktop/dd798474(v=vs.85).aspx
See also:

- 127.26.11 SendData(data as memoryblock, size as Integer) 20509
- 127.26.12 SendData(data as string) 20509

127.26.11 SendData(data as memoryblock, size as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Sends sysex data.
Example:

```
dim m as MemoryBlock
dim o as WindowsMidiOutputMBS // your midi output

m=NewMemoryBlock(8)

m.Byte(0)=& hF0
m.Byte(1)=& h7F
m.Byte(2)=& h7F
m.Byte(3)=& h04
m.Byte(4)=& h01
m.Byte(5)=& h7F
m.Byte(6)=& h7F
m.Byte(7)=& hF7

o.SendData m
```

Notes:

Lasterror is set.
size is the size of the memoryblock to use. A wrong value will crash the application.

See also
http://msdn.microsoft.com/en-us/library/windows/desktop/dd798474(v=vs.85).aspx
See also:

- 127.26.10 SendData(data as memoryblock) 20508
- 127.26.12 SendData(data as string) 20509

127.26.12 SendData(data as string)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Sends sysex data.
Notes:

Lasterror is set.

See also

http://msdn.microsoft.com/en-us/library/windows/desktop/dd798474(v=vs.85).aspx
The plugin prepares MIDIHDR structure and uses your data there.
See also:

- 127.26.10 SendData(data as memoryblock) 20508
- 127.26.11 SendData(data as memoryblock, size as Integer) 20509

127.26.13 SendMessage(message as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Sends a short midi message immediately.
Example:

```
dim o as WindowsMidiOutputMBS // your windows midi output
// & h90 = Note down
// & h43 = the note number
// & h40 = the velocity
o.SendMessage & h404390
```

Notes:

The message is stored in one 32bit integer.
lowest 8 bit is status, second 8 bit is data1, third 8 bit is data2 and highest 8 bit is left 0.

Between sending note on and off messages, you need to leave time for actual playback.
Lasterror is set.

See also
http://msdn.microsoft.com/en-us/library/windows/desktop/dd798481(v=vs.85).aspx
See also:

- 127.26.14 SendMessage(status as Integer, data1 as Integer, data2 as Integer) 20510

127.26.14 SendMessage(status as Integer, data1 as Integer, data2 as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Sends a short midi message immediately.
Example:

```
dim o as WindowsMidiOutputMBS // your windows midi output
// & h90 = Note down
// & h3C = the note number
```

```
// & h40 = the velocity
o.SendMessage & h90, & h3C, & h40
```

Notes:

Lasterror is set.
Between sending note on and off messages, you need to leave time for actual playback.

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/dd798481(v=vs.85).aspx
See also:

- 127.26.13 SendMessage(message as Integer) 20510

127.26.15 Properties

127.26.16 Volume as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The volume to be used for this device.
Example:

```
dim m as WindowsMidiOutputMBS // your midi output

m.Volume=0 // all silent
m.Volume=& hFFFF0000 // right only
m.Volume=& h0000FFFF // left only or max volume for mono device
m.Volume=& h7FFF7FFF // half volume for both channels
```

Notes:

Not all devices can set the volume.
Lasterror is set.

The low-order word contains the left-channel volume setting, and the high-order word contains the right-channel setting. A value of & hFFFF represents full volume, and a value of & h0000 is silence.

If a device does not support both left and right volume control, the low-order word of dwVolume specifies the mono volume level, and the high-order word is ignored.
(Read and Write computed property)

127.26.17 Events

127.26.18 DeviceClose

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: .

Function: An event called when the device is closed.
Notes: Should be called when you call close or the object dies.

127.26.19 DeviceDataSent

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: .

Function: An event called whenever SysEx data was sent.

127.26.20 DeviceOpen

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: .

Function: An event called whenever the device was opened successfully.

127.26.21 DevicePositionCallback

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: .

Function: Called when a MEVT_F_CALLBACK Midi event is about to be executed.
Notes: A way to track progress in playback.

127.27 class WindowsMidiStreamMBS

127.27.1 class WindowsMidiStreamMBS

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: A class for a Windows Midi Stream.

127.27.2 Methods

127.27.3 Close

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Closes the Midi stream.

127.27.4 Open(DeviceID as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Opens a MIDI stream for output.
Notes:

By default, the device is opened in paused mode.
Lasterror is set.
DeviceID: The device is opened on behalf of the stream and closed again when the stream is closed.

127.27.5 Pause

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Pauses playback of a specified MIDI stream.
Notes: Lasterror is set.

127.27.6 PositionBytes as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Position of the stream in bytes.
Notes: Lasterror is set.

127.27.7 PositionMS as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function:

Position of the stream in milliseconds.

Notes: Lasterror is set.

127.27.8 PositionSamples as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Position of the stream in samples.
Notes: Lasterror is set.

127.27.9 PositionTicks as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Position of the stream in ticks.
Notes: Lasterror is set.

127.27.10 Restart

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The Restart function restarts a paused MIDI stream.
Notes: Lasterror is set.

127.27.11 SendMessage(message as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Sends a short midi message immediately.
Example:

```
dim o as WindowsMidiStreamMBS // your midi stream

// & h90 = Note down
// & h43 = the note number
```

```
// & h40 = the velocity
o.SendMessage & h404390
```

Notes:

The message is stored in one 32bit integer.
lowest 8 bit is status, second 8 bit is data1, third 8 bit is data2 and highest 8 bit is left 0.

Between sending note on and off messages, you need to leave time for actual playback.
Lasterror is set.
See also:

- 127.27.12 SendMessage(status as Integer, data1 as Integer, data2 as Integer) 20515

127.27.12 SendMessage(status as Integer, data1 as Integer, data2 as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Sends a short midi message immediately.
Example:

```
dim o as WindowsMidiStreamMBS // your midi stream

// & h90 = Note down
// & h3C = the note number
// & h40 = the velocity
o.SendMessage & h90, & h3C, & h40
```

Notes:

Lasterror is set.
Between sending note on and off messages, you need to leave time for actual playback.
See also:

- 127.27.11 SendMessage(message as Integer) 20514

127.27.13 Stop

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The Stop function turns off all notes on all MIDI channels for the specified MIDI output device.
Notes: Lasterror is set.

127.27.14 Properties

127.27.15 Handle as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The handle for the midi stream.
Notes:

Type is HMIDISTRM.
(Read only property)

127.27.16 Lasterror as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The last error code reported by one of the class functions.
Notes: (Read only property)

127.27.17 Tempo as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Tempo of the stream, in microseconds per quarter note.
Notes:

The tempo is honored only if the time division for the stream is specified in quarter note format.
Lasterror is set.
(Read and Write computed property)

127.27.18 TimeDiv as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Time division for this stream, in the format specified in the Standard MIDI Files 1.0 specification.
Notes:

The low 16 bits of this integer value contain the time division.
Lasterror is set.
(Read and Write computed property)

127.27.19 Volume as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The volume to be used for this stream.
Example:

```
dim m as WindowsMidiStreamMBS // your midi stream

m.Volume=0 // all silent
m.Volume=& hFFFF0000 // right only
m.Volume=& h0000FFFF // left only or max volume for mono device
m.Volume=& h7FFF7FFF // half volume for both channels
```

Notes:

Not all devices can set the volume.
Lasterror is set.

The low-order word contains the left-channel volume setting, and the high-order word contains the right-channel setting. A value of & hFFFF represents full volume, and a value of & h0000 is silence.

If a device does not support both left and right volume control, the low-order word of dwVolume specifies the mono volume level, and the high-order word is ignored.
Lasterror is set.
(Read and Write computed property)

Chapter 128

Navigation

128.1 class NSOpenPanelMBS

128.1.1 class NSOpenPanelMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The class for the Cocoa Open Panel.
Notes: Subclass of the NSSavePanelMBS class.

128.1.2 Blog Entries

- Customized File Open and Save Dialogs for Windows
- MBS Xojo Plugins, version 18.1pr4

- New for Mac OS X 10.10 in MBS Xojo Plugins
- MBS Xojo / Real Studio Plugins, version 14.3pr2

128.1.4 Methods

128.1.5 beginForDirectory(path as folderitem, name as string, filetypes() as string)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Presents a modeless Open panel.
Notes:

path:
Directory whose files the panel displays. When nil, the directory is the same directory used in the previous invocation of the panel; this is probably the best choice for most situations.

name:
Specifies a particular file in absoluteDirectoryPath that is selected when the Open panel is presented to the user. When nil, no file is initially selected.

fileTypes:
Array of file extensions and/or HFS file types. Specifies the files the panel allows the user to select. An empty array makes all files in path selectable by the user.

This method will later called the savePanelDidEnd event.

128.1.6 beginSheetForDirectory(path as folderitem, name as string, filetypes() as string, targetWindow as window)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Presents a sheet Open panel on a given window.
Notes:

path:
Directory whose files the panel displays. When nil, the directory is the same directory used in the previous invocation of the panel; this is probably the best choice for most situations.

name:
Specifies a particular file in path that is selected when the Open panel is presented to the user. When "", no file is initially selected.

filetypes:
Array of file extensions and/or HFS file types. Specifies the files the panel allows the user to select. An empty array makes all files in absoluteDirectoryPath selectable by the user.

targetWindow:
Window to open the sheet on.

This method will later called the savePanelDidEnd event.

Seems like on Mac OS X 10.4 the usage of sheets will raise NSExceptions for missing methods in the NSCarbonWindowFrame class.

128.1.7 Constructor

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The constructor which initializes the panel with default values.

128.1.8 Files as FolderItem()

MBS MacCocoa Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop only.

Function: Queries all folderitems.
See also:

- 128.1.9 Files(index as UInt32) as folderitem 20521

128.1.9 Files(index as UInt32) as folderitem

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The array of files.
Notes: Index is zero based.
See also:

- 128.1.8 Files as FolderItem() 20521

128.1.10 runModalForDirectory(path as folderitem, name as string, filetypes as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A convenience version of the runModalForDirectory function which passes one filetype instead of an array of file types.
Notes: See NSCancelButton and NSOkButton constants for return values.
See also:

- 128.1.11 runModalForDirectory(path as folderitem, name as string, filetypes() as string) as Integer 20522

128.1.11 runModalForDirectory(path as folderitem, name as string, filetypes() as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Runs the panel as a modal dialog with the given filetypes.
Notes:

path is the directory to use as a start point. Pass nil to use the last directory which has been used.

filetypes:
The filetypes you want to allow.

See NSCancelButton and NSOkButton constants for return values.
See also:

- 128.1.10 runModalForDirectory(path as folderitem, name as string, filetypes as string) as Integer 20521

128.1.12 runModalForTypes(filetypes as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A convenience version of the runModalForTypes function which passes one filetype instead of an array of file types.
Example:

```
Dim dlg As New NSOpenPanelMBS
Dim iResult as Integer = dlg.runModalForTypes("jpg")
```

Notes: See NSCancelButton and NSOkButton constants for return values.
See also:

- 128.1.13 runModalForTypes(filetypes() as string) as Integer 20522

128.1.13 runModalForTypes(filetypes() as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Runs the panel as a modal dialog with the given filetypes.
Example:

```
Dim dlg As New NSOpenPanelMBS
dim types() as string = array("jpg", "tif")
Dim iResult as Integer = dlg.runModalForTypes(types)
```

Notes: See NSCancelButton and NSOkButton constants for return values.
See also:

- 128.1.12 runModalForTypes(filetypes as string) as Integer 20522

128.1.14 URL(index as UInt32) as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The array of file URLs.
Notes: Index is zero based.

128.1.15 URLs as String()

MBS MacCocoa Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop only.

Function: Queries all URLs.

128.1.16 Properties

128.1.17 allowsMultipleSelection as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the panel's browser allows the user to open multiple files (and directories) at a time.
Notes: (Read and Write property)

128.1.18 canChooseDirectories as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the user can select directories in the pane's browser.
Notes:

When a directory is selected, the OK button is enabled only if flag is true.
(Read and Write property)

128.1.19 canChooseFiles as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the panel allows the user to choose files to open.
Notes: (Read and Write property)

128.1.20 canDownloadUbiquitousContents as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop only.

Function: Controls how the receiver responds to ubiquitous documents that aren't yet fully downloaded locally.
Notes:

If true, then the receiver will disallow opening non-local ubiquitous files. Also, if the user attempts to select a non-local file, the receiver will trigger or reprioritize downloading for that file so that it can be opened as soon as possible. If false, then the receiver will allow the user to select and open non-local files, giving your application responsibility for downloading and reporting progress. The default value is true, except for applications linked against the 10.9 SDK or earlier that have adopted iCloud by specifying a ubiquitous container identifier entitlement.

To provide the ideal user experience, you should set this property to NO and download the file's contents (with NSFileCoordinator) and show downloading progress (with NSProgress or NSMetadataQuery) in the context of your application, instead of relying on the open panel to do it.

Available in Mac OS X 10.10 and newer.
(Read and Write property)

128.1.21 canResolveUbiquitousConflicts as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop only.

Function: Controls how the receiver responds to ubiquitous documents with conflicting versions.
Notes:

If true, then when the user attempts to open one or more documents with conflicts, the receiver will first display conflict resolution UI, requiring the user to resolve those conflicts before the documents can be opened. If false, then the receiver does nothing in response to conflicts, allowing your application to handle them. The default value is true, except for applications linked against the 10.9 SDK or earlier that have adopted iCloud by specifying a ubiquitous container identifier entitlement.

To provide the ideal user experience, you should set this property to NO and do conflict detection and resolution (using NSURLUbiquitousItemHasUnresolvedConflictsKey and NSFileVersion) in the context of

your application, instead of relying on the open panel to do it.

Available in Mac OS X 10.10 and newer.
(Read and Write property)

128.1.22 FilesCount as UInt32

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The number of selected files.
Notes: (Read only property)

128.1.23 resolvesAliases as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver resolves aliases.
Notes:

If true, the effect is that dropping an alias on the panel or asking for filenames returns the resolved aliases. The default is true.
(Read and Write property)

128.2 class NSSavePanelMBS

128.2.1 class NSSavePanelMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The class for a Cocoa Save Panel.
Notes: Subclass of the NSPanelMBS class.

128.2.6 Methods

128.2.7 allowedFileTypes as string()

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns an array of the allowed file types.
Notes:

If the user specifies a file whose type is in the array of allowed types, the user is not presented with another dialog (see allowsOtherFileTypes for details about this dialog) when trying to save. Examples of common file types are "rtf", "tiff", and "ps". File type strings encoding HFS file types are not valid values for this attribute. A nil return value, which is the default, indicates that the user can save to any ASCII file.

Available in Mac OS X v10.3 and later.

128.2.8 beginSheetForDirectory(path as folderitem, name as string, targetWindow as window)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Presents a Save panel as a sheet with the directory specified by path and optionally, the file specified by name selected.
Notes:

If targetWindow is nil, the panel will be a modal dialog.

This method will later called the savePanelDidEnd event.

Seems like on Mac OS X 10.4 the usage of sheets will raise NSExceptions for missing methods in the NSCarbonWindowFrame class.

128.2.9 Cancel

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: You can cancel the dialog using this method.

128.2.10 Constructor

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The constructor which initializes the panel with default values.

128.2.11 File as folderitem

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The file currently shown in the panel.
Notes: May be nil.

128.2.12 FileTypeForHFSType(hfstype as string) as string

MBS MacCocoa Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Returns a string encoding a file type code.
Example:

```
dim n as new NSSavePanelMBS

MsgBox n.FileTypeForHFSType("TEXT") // shows 'TEXT'
```

Notes: When using Mac Type codes, you need to use this function to convert them in a string the file manager understands.

128.2.13 HideNSNavNodePopUpButton

MBS MacCocoa Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Hides the nagivation popup menu.
Notes: This is a function using undocumented features from the Apple NSSavePanel class, so there is not

guarantee that it will work in future versions.

128.2.14 Ok

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: You can click ok in the dialog using this method.

128.2.15 runModal as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Displays the panel and begins its event loop with the current working (or last selected) directory as the default starting point.
Notes: Returns NSOKButton or NSCancelButton or -1 on any error.

128.2.16 runModalForDirectory(path as folderitem, name as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Initializes the panel to the directory specified by path and, optionally, the file specified by filename, then displays it and begins its modal event loop; path and filename can be empty strings.
Notes:

If path is nil, the previous directory the Save panel was in is used.
See NSCancelButton and NSOkButton constants for return values.

128.2.17 setAllowedFileTypes(filetype as string)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A convenience method for setAllowedFileTypes with only one file type.
See also:

- 128.2.18 setAllowedFileTypes(filetypes() as string) 20529

128.2.18 setAllowedFileTypes(filetypes() as string)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Specifies the allowed file types.
Notes: A file type is an extension to be appended to any selected files that don't already have that extension; "nib" and "rtf" are examples. The items in types should not include the period that begins the extension. File type strings encoding HFS file types are not valid values. Pass an empty array, to allow any file type, which is the default.
See also:

- 128.2.17 setAllowedFileTypes(filetype as string) 20529

128.2.19 validateVisibleColumns

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Validates and possibly reloads the browser columns visible in the receiver by invoking the delegate method shouldShowFilename.
Notes: You might use this method if you want the browser to only allow selection of files with certain extensions based on the selection made in an accessory-view pop-up list. When the user changes the selection, you would invoke this method to revalidate the visible columns.

128.2.20 Properties

128.2.21 accessoryView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The custom accessory view for the current application.
Notes:

You can place any Cocoa control on that panel.
(Read and Write property)

128.2.22 allowsOtherFileTypes as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver allows the user to save files with an extension that's not in the list of allowed types.
Notes:

If the user tries to save a filename with a recognized extension that's not in the list of allowed types they are presented with a dialog. If this property is true, then the dialog presents the option of using the extension the user specified.

The default setting is false.
(Read and Write property)

128.2.23 canCreateDirectories as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver allows the user to create directories.
Notes: (Read and Write property)

128.2.24 canSelectHiddenExtension as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver allows the user to hide or show extensions.
Notes: (Read and Write property)

128.2.25 Directory as folderitem

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The path of the directory currently shown in the panel.
Notes:

May be nil on any error.
(Read and Write property)

128.2.26 directoryURL as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The directory shown in the panel as a URL.
Notes:

Available in Mac OS X v10.6 and later.
(Read and Write property)

128.2.27 isExpanded as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the panel is expanded.
Notes: (Read only property)

128.2.28 isExtensionHidden as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the extension-hiding checkbox is visible and checked.
Notes:

True to show the checkbox and false to hide.
(Read and Write property)

128.2.29 Message as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The message displayed in the panel.
Notes:

The default message text is an empty string.
(Read and Write property)

128.2.30 NameFieldLabel as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The string displayed in front of the filename text field.
Notes:

By default the label is "Save As:".
(Read and Write property)

128.2.31 nameFieldStringValue as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The user-editable filename currently shown in the name field.
Notes:

Available in Mac OS X v10.6 and later.
(Read and Write property)

128.2.32 Prompt as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The prompt of the default button.
Notes:

This prompt appears on all SavePanel objects (or all OpenPanel objects if the panel of this message is an NSOpenPanel instance) in your application. By default the text in the default button is "Open" for an Open panel and "Save" for a Save panel.

It is intended that short words or phrases, such as "Open", "Save", "Set", or "Choose", be used on the button. The button is not resized to accommodate long prompts.

Since this method previously affected a title field, any colon at the end of prompt is removed.
(Read and Write property)

128.2.33 requiredFileType as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The required file type (if any).
Notes:

A file specified in the Save panel is saved with the designated filename and this file type as an extension. Examples of common file types are "rtf", "tiff", and "ps". File type strings encoding HFS file types are not valid values for this attribute. An "" return value indicates that the user can save to any ASCII file.

This method is equivalent to calling allowedFileTypes and returning the first element of the list of allowed types, or "" if there are none.
(Read and Write property)

128.2.34 showsHiddenFiles as boolean

MBS MacCocoa Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Whether to show or hide the invisible files.
Notes:

This is a function using undocumented features from the Apple NSSavePanel class, so there is not guarantee that it will work in future versions.
(Read and Write property)

128.2.35 Title as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The title of the panel.
Notes: (Read and Write property)

128.2.36 treatsFilePackagesAsDirectories as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the panel displays file packages to the user as directories.
Notes: (Read and Write property)

128.2.37 Events

128.2.38 compareFilename(name1 as string, name2 as string, caseSensitive as boolean) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: .

Function: Controls the ordering of files presented by the NSSavePanel.
Notes:

If this event has no code, the default behavior is used.

The caseSensitive argument, if true, indicates that the ordering is to be case-sensitive.

Don't reorder filenames in the Save panel without good reason, because it may confuse the user to have files in one Save panel or Open panel ordered differently than those in other such panels or in the Finder. The default behavior of Save and Open panels is to order files as they appear in the Finder. Note also that by implementing this method you will reduce the operating performance of the panel.

Constants:
const NSOrderedAscending=-1 // The left operand is smaller than the right operand.
const NSOrderedSame=0 // The two operands are equal.
const NSOrderedDescending=1 // The left operand is greater than the right operand.

128.2.39 directoryDidChange(path as string, folder as folderitem)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: .

Function: Sent when the user has changed the selected directory in the panel.
Notes: If this event has no code, the default behavior is used.

128.2.40 isValidFilename(path as string, item as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: .

Function: Gives the delegate the opportunity to validate selected items.
Notes:

If this event has no code, the default behavior is used.

The NSSavePanel object sender sends this event just before the end of a modal session for each filename displayed or selected (including filenames in multiple selections). The event determines whether it wants the file identified by filename; it returns true if the filename is valid, or false if the save panel should stay in its modal loop and wait for the user to type in or select a different filename or names. If the event refuses a filename in a multiple selection, none of the filenames in the selection is accepted.

128.2.41 panelSelectionDidChange

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: .

Function: The event called whenever the selection changed in the dialog.
Notes: If this event has no code, the default behavior is used.

128.2.42 savePanelDidEnd(ReturnCode as Integer)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: .

Function: The save panel finished in sheet mode.
Notes: Returncode is NSOKButton or NSCancelButton.

128.2.43 shouldShowFilename(path as string, item as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: .

Function: Gives the delegate the opportunity to filter items that it doesn't want the user to choose.
Notes:

If this event has no code, the default behavior is used.

The NSSavePanel sends this event for each file or directory (filename) it is about to load in the browser. The delegate returns true if filename should be selectable, and false if the save panel should disable the file or directory.

128.2.44 userEnteredFilename(filename as string, confirmed as boolean) as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: .

Function: Sent when the user confirms a filename choice by hitting OK or Return in the NSSavePanel.
Notes:

You can either leave the filename alone, return a new filename, or return "" to cancel the save (and leave the Save panel as is). This method is sent before any required extension is appended to the filename and before the Save panel asks the user whether to replace an existing file.

Note that in the future, this method may be called multiple times in the sessions as the user types. In those cases, okFlag will be false until the user confirms the choice, in which case okFlag will become true. If the delegate does extensive validation or puts up alerts, it should do so only when okFlag is true.

If this event has no code, the default behavior is used.

128.2.45 willExpand(expanding as boolean)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: .

Function: Sent when the NSSavePanel is about to expand or collapse because the user clicked the disclosure triangle that displays or hides the file browser.
Notes: If this event has no code, the default behavior is used.

128.2.46 Constants

128.2.47 NSCancelButton = 0

MBS MacCocoa Plugin, Plugin Version: 7.8.

Function: One of the result codes you may need with this class.

128.2.48 NSOKButton = 1

MBS MacCocoa Plugin, Plugin Version: 7.8.

Function: One of the result codes you may need with this class.

128.3 class OpenDialogFileTypeMBS

128.3.1 class OpenDialogFileTypeMBS

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: A class for a file type for the OpenDialog class.
Notes: For Cocoa, only the type field is used and can be an UTI or file extension.

128.3.2 Methods

128.3.3 Close

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

128.3.4 Properties

128.3.5 Extension as String

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The extension for this filetype.
Notes:

Currently this value is only used on Windows.
Value e.g. "*.TXT" or "*.TXT;*.BMP".

Use a value like "*.TXT" or to match multiple types, list multiple extensions separated by semicolons like this: "*.TXT;*.BMP".

With version 8.2, we use extensions also for MacOS.
(Read and Write property)

128.3.6 Name as String

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The name of this file type.
Notes:

Currently this value is only used on Windows.
(Read and Write property)

128.3.7 Type as String

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The Mac OS type code for this file type.
Notes:

Currently this value is only used on Mac OS.
And check the documenation on the Navigation Manager if you use it as you will need a KIND Resource for this.

For Cocoa, only the type field is used and can be an UTI or file extension.
(Read and Write property)

128.4 class OpenDialogItemMBS

128.4.1 class OpenDialogItemMBS

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The class for an item selected via open dialog.
Notes: Currently only used for Windows.

128.4.2 Blog Entries

- New in the MBS Xojo Plugins 20.0
- MBS Xojo Plugins, version 20.0r7

128.4.3 Blog Entries

- New in the MBS Xojo Plugins 20.0

128.4.4 Methods

128.4.5 ReadData as String

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Reads the data.
Notes: We try to get a stream for the data from Windows and then read all available data.

128.4.6 Properties

128.4.7 Handle as Integer

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The internal object handle.
Notes:

Points to an IShellItem object.
(Read and Write property)

128.4.8 Name as String

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The display name of the file.
Notes: (Read and Write property)

128.4.9 Path as String

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The file path of the file.
Notes:

Not available for virtual files.
(Read and Write property)

128.4.10 URL as String

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The URL of the file.
Notes:

Not available for virtual files.
(Read and Write property)

128.5 class OpenDialogMBS

128.5.1 class OpenDialogMBS

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: A class for a multiple selection open dialog.
Example:

```
dim o as OpenDialogMBS
dim i,c as Integer
dim f as FolderItem

o=new OpenDialogMBS
o.ShowHiddenFiles=true
o.PromptText="Select one or more files:"
o.MultipleSelection=true
o.ActionButtonLabel="Open files"
o.CancelButtonLabel="no, thanks."
o.WindowTitle="This is a window title."
o.ClientName="Client Name?"
o.ShowDialog

c=o.FileCount
if c>0 then
for i=0 to c-1
f=o.Files(i)

Listbox1.AddRow f.NativePath
next

else
// MsgBox "no file was selected."
quit
end if
```

Notes: OpenDialogMBS does not yet use NSOpenPanel yet. So for Cocoa applications you can use NSOpenPanelMBS class directly. For the Mac App Store, you must use NSOpenPanelMBS and avoid OpenDialogMBS.

128.5.6 Methods

128.5.7 AddType(t as OpenDialogFileTypeMBS)

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Adds a file type to the list.

128.5.8 ClearTypes

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Clears the file type list.

128.5.9 CountTypes as Integer

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the number of file types in the file type list.

128.5.10 Files as FolderItem()

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries an array with all files picked.
See also:

- 128.5.11 Files(index as Integer) as folderitem 20544

128.5.11 Files(index as Integer) as folderitem

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The array with the selected files.
Notes: Index goes from 0 to filecount-1.
See also:

- 128.5.10 Files as FolderItem() 20544

128.5.12 GetCustomImageHeight as Integer

MBS Util Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop only.

Function: Returns the heigh of the custom picture in pixels.
Example:

```
dim o as new OpenDialogMBS
msgbox "GetCustomImageHeight: "+str(o.GetCustomImageHeight) // could show 72 as value.
```

Notes:

The height depends on the size of the Windows system font, so it's variable and this function calculates the size for you.

Returns 0 on any error.

128.5.13 GetType(index as Integer) as OpenDialogFileTypeMBS

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the file type with the given index.
Notes: Returns nil on any error.

128.5.14 Items as OpenDialogItemMBS()

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries items picked.
Notes: Currently only provided for Windows to get name, path, URL or data for items, which may not always have a file path.

128.5.15 RefreshCustomImage

MBS Util Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop only.

Function: Call this method after you set the custompicture property to update the window.
Notes: The control is asked to redraw and will use the CustomPicture property for the picture content. Space around is colored with window background color.

128.5.16 ShowDialog

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Shows the dialog.
Example:

```
dim o as new OpenDialogMBS
o.ShowDialog
```

Notes: Check the FileCount property to see whether something was selected.

128.5.17 Properties

128.5.18 accessoryView as Variant

MBS Util Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Customizes the panel for the application by adding a custom view to the panel.
Notes:

Only for Cocoa target. Must be a NSViewMBS or subclass.

The custom object that is added appears just above the OK and Cancel buttons at the bottom of the panel. The open panel automatically resizes itself to accommodate the view. You can invoke this method repeatedly to change the accessory view as needed. If view is nil, the panel removes the current accessory view.
(Read and Write property)

128.5.19 ActionButtonLabel as String

MBS Util Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop only.

Function: The label of the action button.
Example:

```
dim o as new OpenDialogMBS

o.ActionButtonLabel = "Hello"
o.ShowDialog
```

Notes:

Used only on Mac OS.
For RB 4.5 and earlier you need to make sure the encoding is set correctly.
Can be set to "" to use the default value.
(Read and Write property)

128.5.20 AllowFolderSelection as Boolean

MBS Util Plugin, Plugin Version: 7.5, Platform: macOS, Targets: Desktop only.

Function: Whether folders can be selected.
Example:

```
dim o as OpenDialogMBS
dim i,c as Integer
dim f as FolderItem

o=new OpenDialogMBS
o.ShowHiddenFiles=true
o.PromptText="Select one or more files/folders:"
o.MultipleSelection=true
o.ActionButtonLabel="Open files/folders"
o.CancelButtonLabel="no, thanks."
o.WindowTitle="This is a window title."
o.ClientName="Client Name?"
o.AllowFolderSelection=true
o.ShowDialog

c=o.FileCount
if c>0 then
for i=0 to c-1
f=o.Files(i)

Listbox1.AddRow f.NativePath
next
end if
```

Notes:

Default is false.
Setting this to true on Windows or Linux has no effect there.
(Read and Write property)

128.5.21 CancelButtonLabel as String

MBS Util Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop only.

Function: The text for the cancel button.
Example:

```
dim o as new OpenDialogMBS

o.CancelButtonLabel = "Hello"
o.ShowDialog
```

Deprecated: This item is deprecated and should no longer be used. **Notes:**

Used only on Mac OS Carbon.
Can be set to "" to use the default value.

Deprecated as no longer needed for Windows, Linux or MacOS Cocoa.
(Read and Write property)

128.5.22 ClientName as String

MBS Util Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop only.

Function: The name of the client.
Example:

```
dim o as new OpenDialogMBS
o.ClientName = "Hello"
o.ShowDialog
```

Deprecated: This item is deprecated and should no longer be used. **Notes:**

Used only on Mac OS Carbon.
Can be set to "" to use the default value.

Deprecated as no longer needed for Windows, Linux or MacOS Cocoa.
(Read and Write property)

128.5.23 Creator as String

MBS Util Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop only.

Function: The creator code of your application.
Notes:

This property is only used Mac OS if you specify one or more file types.
(Read and Write property)

128.5.24 CustomPicture as Picture

MBS Util Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop only.

Function: The custom picture content.
Notes:

You need to call RefreshCustomImage to refresh the picture visible to the user.
(Read and Write property)

128.5.25 File as FolderItem

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The first file selected.
Example:

```
dim o as new OpenDialogMBS
o.MultipleSelection = true
o.ShowDialog

MsgBox o.File.displaypathmbs
```

Notes:

file = files(0)
Just for the cases where you only need the first file.
(Read only property)

128.5.26 FileCount as Integer

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The number of files selected.
Example:

```
dim o as new OpenDialogMBS
```

```
o.MultipleSelection = true
o.ShowDialog

MsgBox str(o.FileCount)
```

Notes: (Read only property)

128.5.27 InitialDirectory as FolderItem

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Windows, Targets: Desktop only.

Function: The initial directory.
Example:

```
dim o as new OpenDialogMBS
o.InitialDirectory = SpecialFolder.Desktop
o.ShowDialog
```

Notes:

Set to nil to get the last directory used.
(Read and Write property)

128.5.28 Lasterror as Integer

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The last error code reported.
Notes: (Read and Write property)

128.5.29 Left as Integer

MBS Util Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop only.

Function: The horizontal position of the dialog.
Notes:

-1 is for the default position.
Used only on the Mac side.
(Read and Write property)

128.5.30 MultipleSelection as Boolean

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether you want to allow multiple file selection.
Example:

```
dim o as new OpenDialogMBS
o.MultipleSelection = true
o.ShowDialog
```

Notes: (Read and Write property)

128.5.31 ParentWindow as Window

MBS Util Plugin, Plugin Version: 6.3, Platforms: Linux, Windows, Targets: Desktop only.

Function: The parent window of the dialog.
Example:

```
dim o as new OpenDialogMBS
o.ParentWindow = window1
o.ShowDialog
```

Notes:

Only implemented for Windows and Linux.
(Read and Write property)

128.5.32 PromptText as String

MBS Util Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop only.

Function: The prompt text.
Example:

```
dim o as new OpenDialogMBS

o.PromptText = "Hello"
o.ShowDialog
```

Notes:

For RB 4.5 and earlier you need to make sure the encoding is set correctly.
Can be set to "" to use the default value.
(Read and Write property)

128.5.33 ResolveAliases as Boolean

MBS Util Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether aliases should be resolved.
Example:

```
dim o as new OpenDialogMBS
o.ResolveAliases = false
o.ShowDialog
```

Notes:

This property is only used on Mac OS X.
Default is true.

Flag seems to be broken on Mac OS X 10.7.
(Read and Write property)

128.5.34 ShowHiddenFiles as Boolean

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether hidden files should be shown.
Example:

```
dim o as new OpenDialogMBS
o.ShowHiddenFiles = true
o.ShowDialog
```

Notes:

Default is false.
(Read and Write property)

128.5.35 Top as Integer

MBS Util Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop only.

Function: The vertical position of the dialog.
Notes:

-1 is for the default position.
Used only on the Mac side.
(Read and Write property)

128.5.36 TreatFilePackagesAsDirectories as Boolean

MBS Util Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Sets the panel's behavior for displaying file packages (for example, MyApp.app) to the user.
Notes:

If true, the panel will display file packages as directories; if false, it will not.
(Read and Write property)

128.5.37 UseCustomPicture as Integer

MBS Util Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop only.

Function: Whether to add a custom picture control.
Notes:

Specify the size of the area you want. As the size is relative to the font size of the system font on windows, the results can be interesting. For example a value of 50 gives here a 72 pixel height area. Value can be from 1 to 100. Or zero to disable.

This method was added for a client who needed to show a small preview of a project file in the open dialog on Windows.
For Mac OS X you can use the NSSavePanelMBS/NSOpenPanelMBS with an accessory view.
(Read and Write property)

128.5.38 WindowTitle as String

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The window title to use.
Example:

```
dim o as new OpenDialogMBS

o.WindowTitle = "Hello World"
o.ShowDialog
```

Notes:

Can be set to "" to use the default value.
Not shown on MacOS.
(Read and Write property)

128.5.39 Events

128.5.40 FilterItem(file as folderitem, filterMode as Integer) as boolean

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Windows, Targets: .

Function: An event where you can filter the file list.
Notes:

Return true to disable the file.
The result of the event is ignored by Windows. But on Mac OS it works.
So use the event on Mac and the filetype objects on Windows.

128.5.41 SelectionChanged(file as folderitem)

MBS Util Plugin, Plugin Version: 11.0, Platform: Windows, Targets: .

Function: Called when the selection changes in the window.
Notes: This is currently only implemented for Windows and gives you only one file name.

128.6 class WinFileDialogExceptionMBS

128.6.1 class WinFileDialogExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The class for an error exception in our WinFileDialog classes.
Notes: Subclass of the RuntimeException class.

128.7 class WinFileDialogMBS

128.7.1 class WinFileDialogMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The class for a file dialog.
Notes:

All methods may raise WinFileDialogExceptionMBS in case of errors.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- 18.3, page 10: News

128.7.6 Methods

128.7.7 AddCheckButton(ControlID as Integer, label as String, Checked as boolean = false)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds a check button (check box) to the dialog.
Notes:

ControlID: The ID of the check button to add.
Label: the button text.
Checked: A boolean indicating the current state of the check button. True if checked; false otherwise.

The default state for this control is enabled and visible.

128.7.8 AddComboBox(ControlID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds a combo box to the dialog.
Notes:

ControlID: The ID of the combo box to add.

The default state for this control is enabled and visible.

128.7.9 AddControlItem(ControlID as Integer, ItemID as Integer, Label as String)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds an item to a container control in the dialog.
Notes:

ControlID: The ID of the container control to which the item is to be added.
ItemID: The ID of the item.
Label: The item's text, which can be either a label or, in the case of a drop-down list, the item itself.

The default state for this item is enabled and visible. Items in control groups cannot be changed after they have been created, with the exception of their enabled and visible states.
Container controls include option button groups, combo boxes, drop-down lists on the Open or Save button, and menus.

128.7.10 AddEditBox(ControlID as Integer, Text as String = "")

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds an edit box control to the dialog.

Notes:

ControlID: The ID of the edit box to add.
Text: The default text displayed in the edit box.

The default state for this control is enabled and visible.
To add a label next to the edit box, place it in a visual group with StartVisualGroup.

128.7.11 AddMenu(ControlID as Integer, Label as String)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds a menu to the dialog.
Notes:

ControlID: The ID of the menu to add.
Label: The menu name.

The default state for this control is enabled and visible.
To add items to this control, use AddControlItem.

128.7.12 AddPlace(Item as WinShellItemMBS, top as boolean = false)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds a folder to the list of places available for the user to open or save items.
Notes:

Item: the folder to be made available to the user. This can only be a folder.
Top: Specifies where the folder is placed within the list. Pass true for top or false for bottom.

128.7.13 AddPushButton(ControlID as Integer, Label as String)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds a button to the dialog.
Notes:

ControlID: The ID of the button to add.
Label: the button text

The default state for this control is enabled and visible..

128.7.14 AddRadioButtonList(ControlID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds an option button (also known as radio button) group to the dialog.
Notes:

ControlID: The ID of the option button group to add.
The default state for this control is enabled and visible.

128.7.15 AddSeparator(ControlID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds a separator to the dialog, allowing a visual separation of controls.
Notes:

ControlID: The control ID of the separator.

The default state for this control is enabled and visible.

128.7.16 AddText(ControlID as Integer, Text as String = "")

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds text content to the dialog.
Notes:

ControlID: The ID of the text to add.
Text: The text to show.

The default state for this control is enabled and visible.

128.7.17 ClearClientData

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Instructs the dialog to clear all persisted state information.
Notes: Persisted information can be associated with an application or a GUID. If a GUID was set by using SetClientGuid, that GUID is used to clear persisted information.

128.7.18 Close(cancel as boolean = false)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Closes the dialog.
Notes:

Pass or false/true for cancel parameter to have that being returned by Show method.

An application can call this method from an event while the dialog is open. The dialog will close and the Show method will return with the result given by cancel parameter.

If this method is called, there is no result available for the Result or Results methods, and they will fail if called.

128.7.19 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

128.7.20 EnableOpenDropDown(ControlID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Enables a drop-down list on the Open or Save button in the dialog.
Notes:

ControlID: The ID of the drop-down list.

The Open or Save button label takes on the text of the first item in the drop-down. This overrides any label set by OkButtonLabel.
Use AddControlItem to add items to the drop-down.

128.7.21 EndVisualGroup

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Stops the addition of elements to a visual group in the dialog.

128.7.22 RemoveAllControlItems(ControlID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Removes all items from a container control in the dialog.
Notes:

ControlID: The ID of the container control from which to remove the items.

Container controls include option button groups, combo boxes, drop-down lists on the Open or Save button, and menus.

128.7.23 RemoveControlItem(ControlID as Integer, ItemID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Removes an item from a container control in the dialog.
Notes:

ControlID: The ID of the container control from which the item is to be removed.
ItemId: The ID of the item.

Container controls include option button groups, combo boxes, drop-down lists on the Open or Save button, and menus.

128.7.24 SetFileTypes(FileTypes() as WinFileTypeMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The file types that the dialog can open or save.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
Dim FileTypes() As WinFileTypeMBS

FileTypes.Append New WinFileTypeMBS("JPEG image", "*.jpg")
FileTypes.Append New WinFileTypeMBS("PNG image", "*.png")
FileTypes.Append New WinFileTypeMBS("Tiff image", "*.tif;*.tiff")

d.SetFileTypes FileTypes
```

Notes:

When using the Open dialog, the file types declared there are used to filter the view. When using the Save

dialog, these values determine which file name extension is appended to the file name.
This method must be called before the dialog is shown and can only be called once for each dialog instance.
File types cannot be modified once the Common Item dialog box is displayed.

128.7.25 Show as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Launches the modal window.
Notes: Returns true on success or false on failure.
See also:

- 128.7.26 Show(parent as window) as Boolean 20562

128.7.26 Show(parent as window) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Launches the modal window.
Notes:

parent: The handle of the owner window. This value can be nil.
Returns true on success or false on failure.
See also:

- 128.7.25 Show as Boolean 20562

128.7.27 StartVisualGroup(ControlID as Integer, label as String)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Declares a visual group in the dialog. Subsequent calls to any "add" method add those elements to this group.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog

d.StartVisualGroup 1, "Metadata"
d.AddText 2, "Author:"
d.AddEditBox 3, CustomValue.Text
d.AddText 4, "Subject:"
d.AddEditBox 5, "Hello World"
d.EndVisualGroup
```

Notes:

ControlID: The ID of the visual group.
Label: text that appears next to the visual group.

Controls will continue to be added to this visual group until you call EndVisualGroup.
A visual group can be hidden and disabled like any other control, except that doing so affects all of the controls within it. Individual members of the visual group can also be hidden and disabled singly.

128.7.28 Properties

128.7.29 ClientGuid as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The client GUID.
Notes:

A dialog's state can include factors such as the last visited folder and the position and size of the dialog. Typically, this state is persisted based on the name of the executable file. By specifying a GUID, an application can have different persisted states for different versions of the dialog within the same application (for example, an import dialog and an open dialog).

SetClientGuid should be called immediately after creation of the dialog object.

Enables a calling application to associate a GUID with a dialog's persisted state.
(Read and Write property)

128.7.30 CurrentSelection as WinShellItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The user's current selection in the dialog.
Notes:

The item currently selected in the dialog. This item can be a file or folder selected in the view window, or something that the user has entered into the dialog's edit box. The latter case may require a parsing operation (cancelable by the user) that blocks the current thread.

If not result exists, the plugin returns nil and raises no failed exceptions.
(Read only property)

128.7.31 DefaultExtension as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The default extension to be added to file names.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
d.DefaultExtension = "jpg"
```

Notes:

The extension text. This string should not include a leading period. For example, "jpg" is correct, while ".jpg" is not.

If this method is called before showing the dialog, the dialog will update the default extension automatically when the user chooses a new file type (see SetFileTypes).
(Read and Write property)

128.7.32 DefaultFolder as WinShellItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The folder used as a default if there is not a recently used folder value available.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
d.DefaultFolder = New WinShellItemMBS(SpecialFolder.Desktop)
```

Notes: (Read and Write property)

128.7.33 FileName as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The text currently entered in the dialog's File name edit box.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
d.FileName = "New Document"
```

Notes:

The text in the File name edit box does not necessarily reflect the item the user chose. To get the item the user chose, use Result property.

If not result exists, the plugin returns "" and raises no failed exceptions.
(Read and Write property)

128.7.34 FileNameLabel as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The text of the label next to the file name edit box.
Notes: (Read and Write property)

128.7.35 FileTypeIndex as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The currently selected file type.
Notes:

The index of the selected file type in the file type array passed to SetFileTypes.

This is a one-based index rather than zero-based.
FileTypeIndex can be called either while the dialog is open or after it has closed.
(Read and Write property)

128.7.36 Folder as WinShellItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: A folder that is always selected when the dialog is opened, regardless of previous user action.
Notes:

Gets either the folder currently selected in the dialog, or, if the dialog is not currently displayed, the folder that is to be selected when the dialog is opened.

This folder overrides any "most recently used" folder. If this method is called while the dialog is displayed, it causes the dialog to navigate to the specified folder.
In general, we do not recommended the use of this method. If you call SetFolder before you display the dialog box, the most recent location that the user saved to or opened from is not shown. Unless there is a

very specific reason for this behavior, it is not a good or expected user experience and should therefore be avoided. In almost all instances, SetDefaultFolder is the better method.

As of Windows 7, if the path of the folder specified through psi is the default path of a known folder, the known folder's current path is used in the dialog. That path might not be the same as the path specified in psi; for instance, if the known folder has been redirected. If the known folder is a library (virtual folders Documents, Music, Pictures, and Videos), the library's path is used in the dialog. If the specified library is hidden (as they are by default as of Windows 8.1), the library's default save location is used in the dialog, such as the Microsoft OneDrive Documents folder for the Documents library. Because of these mappings, the folder location used in the dialog might not be exactly as you specified when you called this method.
(Read and Write property)

128.7.37 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

128.7.38 OkButtonLabel as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The text of the Open or Save button.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
d.OkButtonLabel = "Export"
```

Notes: (Read and Write property)

128.7.39 OptionAllNonStorageItems as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Enables the user to choose any item in the Shell namespace, not just those with SFGAO_STREAM or SFAGO_FILESYSTEM attributes. #
Notes:

This flag cannot be combined with OptionForceFileSystem.
(Read and Write property)

128.7.40 OptionAllowMultiSelect as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Enables the user to select multiple items in the open dialog.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
d.OptionAllowMultiSelect = true
```

Notes:

Note that when this flag is set, the WinFileOpenDialogMBS class must be used to retrieve those items.
(Read and Write property)

128.7.41 OptionCreatePrompt as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Prompt for creation if the item returned in the save dialog does not exist.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
d.OptionCreatePrompt = true
```

Notes:

Note that this does not actually create the item.
(Read and Write property)

128.7.42 OptionDefaultNoMiniMode as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Indicates to the Save As dialog box that it should open in expanded mode.
Notes:

Expanded mode is the mode that is set and unset by clicking the button in the lower-left corner of the Save As dialog box that switches between Browse Folders and Hide Folders when clicked. This value is not supported as of Windows 7.
(Read and Write property)

128.7.43 OptionDontAaddToRecent as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Do not add the item being opened or saved to the recent documents list.
Notes: (Read and Write property)

128.7.44 OptionFileMustExist as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The item returned must exist.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
d.OptionFileMustExist = true
```

Notes:

This is a default value for the Open dialog.
(Read and Write property)

128.7.45 OptionForceFileSystem as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Ensures that returned items are file system items.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
d.OptionForceFileSystem = true
```

Notes:

Note that this does not apply to items returned by CurrentSelection.
(Read and Write property)

128.7.46 OptionForcePreviewPaneOn as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Indicates to the Open dialog box that the preview pane should always be displayed.
Notes: (Read and Write property)

128.7.47 OptionForceShowHidden as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Include hidden and system items.
Notes: (Read and Write property)

128.7.48 OptionHideMRUPlaces as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Hide the list of places from which the user has recently opened or saved items. This value is not supported as of Windows 7.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
d.OptionHideMRUPlaces = true
```

Notes: (Read and Write property)

128.7.49 OptionHidePinnedPlaces as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Hide items shown by default in the view's navigation pane.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
d.OptionHidePinnedPlaces = true
```

Notes:

This flag is often used in conjunction with the AddPlace method, to hide standard locations and replace them with custom locations.

Windows 7 and later. Hide all of the standard namespace locations (such as Favorites, Libraries, Computer, and Network) shown in the navigation pane.

Windows Vista. Hide the contents of the Favorite Links tree in the navigation pane. Note that the category itself is still displayed, but shown as empty.
(Read and Write property)

128.7.50 OptionNoChangeDir as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Don't change the current working directory.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
d.OptionNoChangeDir = true
```

Notes: (Read and Write property)

128.7.51 OptionNoDereferenceLinks as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Shortcuts should not be treated as their target items.
Notes:

This allows an application to open a .lnk file rather than what that file is a shortcut to.
(Read and Write property)

128.7.52 OptionNoReadOnlyReturn as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Do not return read-only items.
Notes:

This is a default value for the Save dialog.
(Read and Write property)

128.7.53 OptionNoTestFileCreate as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Do not test whether creation of the item as specified in the Save dialog will be successful.
Notes:

If this flag is not set, the calling application must handle errors, such as denial of access, discovered when the item is created.
(Read and Write property)

128.7.54 OptionNoValidate as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Do not check for situations that would prevent an application from opening the selected file, such as sharing violations or access denied errors.
Notes: (Read and Write property)

128.7.55 OptionOKButtonNeedsInteraction as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: OKButton needs interaction?
Notes: (Read and Write property)

128.7.56 OptionOverwritePrompt as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: When saving a file, prompt before overwriting an existing file of the same name.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
d.OptionOverwritePrompt = true
```

Notes:

This is a default value for the Save dialog.
(Read and Write property)

128.7.57 OptionPathMustExist as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The item returned must be in an existing folder.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
d.OptionPathMustExist = true
```

Notes:

This is a default value.
(Read and Write property)

128.7.58 OptionPickFolders as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Present an Open dialog that offers a choice of folders rather than files.
Notes: (Read and Write property)

128.7.59 Options as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The current flags that are set to control dialog behavior.
Notes:

See kOptions* constants.

Generally, you should read the property, modify it to include or exclude options by setting the appropriate flags and assign it again.
(Read and Write property)

128.7.60 OptionShareaware as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: In the case of a sharing violation when an application is opening a file, call the application back through ShareViolation event for guidance.
Notes:

This flag is overridden by kOptionsNoValidate.
(Read and Write property)

128.7.61 OptionStrictFileTypes as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: In the Save dialog, only allow the user to choose a file that has one of the file name extensions specified through SetFileTypes.
Notes: (Read and Write property)

128.7.62 OptionSupportsStreamableItems as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Indicates that the caller is opening a file as a stream (BHID_Stream), so there is no need to download that file.
Notes: (Read and Write property)

128.7.63 ProminentControlID as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Places a control in the dialog so that it stands out compared to other added controls.
Notes:

Setting this property causes the control to be placed near the Open or Save button instead of being grouped with the rest of the custom controls.
Only check buttons (check boxes), push buttons, combo boxes, and menus—or a visual group that contains only a single item of one of those types—can be made prominent.
Only one control can be marked in this way. If a dialog has only one added control, that control is marked as prominent by default.
(Read and Write property)

128.7.64 Result as WinShellItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The choice that the user made in the dialog.
Notes:

Result can be called after the dialog has closed or during the handling of an OnFileOk event. Calling this method at any other time will fail. If multiple items were chosen, this method will fail. In the case of multiple items, call Results method.
Show must return a success code for a result to be available to Result.

If not result exists, the plugin returns nil and raises no failed exceptions.
(Read only property)

128.7.65 Title as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The title of the dialog.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
d.title = "Export database"
```

Notes: (Read and Write property)

128.7.66 WindowHandle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Queries window handle.
Notes:

Value is a HWND and may be used in declares.
(Read only property)

128.7.67 CheckButtonState(ControlID as Integer) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The current state of a check button (check box) in the dialog.
Notes:

ControlID: The ID of the check box.

True means checked; false, unchecked.
(Read and Write computed property)

128.7.68 ControlItemState(ControlID as Integer, ItemID as Integer) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The current state of an item in a container control found in the dialog.
Notes:

ControlID: The ID of the container control.
ItemID: The ID of the item.

See kControlState* flags.
(Read and Write computed property)

128.7.69 ControlItemText(ControlID as Integer, ItemID as Integer) as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The text of a control item.
Notes:

For example, the text that accompanies a radio button or an item in a menu.

ControlID: The ID of the container control.
ItemID: The ID of the item.

The default state of a control item is enabled and visible. Items in control groups cannot be changed after they have been created, with the exception of their enabled and visible states.
Container controls include option button groups, combo boxes, drop-down lists on the Open or Save button, and menus.
(Read and Write computed property)

128.7.70 ControlLabel(ControlID as Integer) as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The text associated with a control, such as button text or an edit box label.
Notes:

ControlID: The ID of the control whose text is to be changed.

Control labels can be changed at any time, including when the dialog is visible.
(Read and Write computed property)

128.7.71 ControlState(ControlID as Integer) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the current visibility and enabled states of a given control.
Notes:

ControlID: The ID of the control in question.

See kControlState* flags.
(Read and Write computed property)

128.7.72 EditBoxText(ControlID as Integer) as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The current text in an edit box control.
Notes:

ControlID: The ID of the edit box.
(Read and Write computed property)

128.7.73 SelectedControlItem(ControlID as Integer) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Item index from specified container controls in the dialog.
Notes:

ControlID: The ID of the container control.

Value is the ID of the item that the user selected in the control.

To determine the user's final choice, this method can be called on option button groups, combo boxes, and drop-down lists on the Open or Save button after the dialog has closed. This method cannot be called on menus.
For option button groups and combo boxes, this method can also be called while the dialog is showing, to determine the current choice.

When you query, the plugin does not raise error for failure, but returns 0.
(Read and Write computed property)

128.7.74 Events

128.7.75 ButtonClicked(ControlID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: .

Function: Called when the user clicks a command button.
Notes: ControlID: The ID of the button that the user clicked.

128.7.76 CheckButtonToggled(ControlID as Integer, Checked as Boolean)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: .

Function: Called when the user changes the state of a check button (check box).
Notes:

ControlID: The ID of the button that the user clicked.
Checked: A boolean indicating the current state of the check button. true if checked; false otherwise.

128.7.77 ControlActivating(ControlID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: .

Function: Called when an Open button drop-down list customized through EnableOpenDropDown or a Tools menu is about to display its contents.
Notes:

ControlID: The ID of the list or menu about to display.

In response to this notification, an application can update the contents of the menu or list about to be displayed, based on the current state of the dialog.

128.7.78 FileOk as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: .

Function: Called just before the dialog is about to return with a result.
Notes:

Implementations should return true to accept the current result in the dialog or false to refuse it. In the case of false, the dialog should remain open.

When this method is called, the Result and Results methods can be called.

The application can use this callback method to perform additional validation before the dialog closes, or to prevent the dialog from closing. If the application prevents the dialog from closing, it should display a UI to indicate a cause.

An application can also use this method to perform all of its work surrounding the opening or saving of files.

128.7.79 FileTypeChanged

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: .

Function: Called when the dialog is opened to notify the application of the initial chosen filetype.
Notes: This method is called when the dialog is opened to notify the application of the initially chosen filetype. If the application has code in this event that responds to type changes, it can respond to the type. For example, it could hide certain controls. The application controls the initial file type and could do its own checks, so this method is provided as a convenience.

128.7.80 FolderChanged

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: .

Function: Called when the user navigates to a new folder.

128.7.81 FolderChanging(Folder as WinShellItemMBS) as boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: .

Function: Called before FolderChanged.
Notes:

This allows the implementer to stop navigation to a particular location.

Folder: the folder to which the dialog is about to navigate.

Return true to accept or false to decline.

The calling application can set Folder during this callback to redirect navigation to an alternate folder. The actual navigation does not occur until FolderChanging has returned.

If the calling application simply prevents navigation to a particular folder, UI should be displayed with an explanation of the restriction. To obtain a parent HWND for the UI, use WindowHandle property.

Warning: If you implement this, add "return true" to allow folders to change.

128.7.82 ItemSelected(ControlID as Integer, ItemID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: .

Function: Called when an item is selected in a combo box, when a user clicks an option button (also known as a radio button), or an item is chosen from the Tools menu.
Notes:

ControlID: The ID of the control in which the user made a selection.
ItemID: The ID of the selection.

This notification is not sent when the user chooses an item from the drop-down menu attached to the Open button, because the action taken in that case is always the same: close the dialog as if the user had simply clicked the Open button. For that situation, the application can call SelectedControlItem to obtain the item the user chose from that menu.

128.7.83 Overwrite(item as WinShellItemMBS) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: .

Function: Called from the save dialog when the user chooses to overwrite a file.
Notes:

item: the item that will be overwritten.

Return one of the kResponse* constants.

128.7.84 SelectionChange

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: .

Function: Called when the user changes the selection in the dialog's view.

128.7.85 ShareViolation(item as WinShellItemMBS) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: .

Function: Enables an application to respond to sharing violations that arise from Open or Save operations.
Notes:

item: the item that has the sharing violation.
Return one of the kShareViolation* constants.

The kOptionsShareaware flag must be set through Options before this method is called.
A sharing violation could possibly arise when the application attempts to open a file, because the file could have been locked between the time that the dialog tested it and the application opened it.

128.7.86 Constants

128.7.87 kControlStateEnabled = 1

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the control states.
Notes: The control is active.

128.7.88 kControlStateEnableVisible = 3

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the control states.
Notes: The control is visible and enabled.

128.7.89 kControlStateInactive = 0

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the control states.
Notes: The control is inactive and cannot be accessed by the user.

128.7.90 kControlStateVisible = 2

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the control states.
Notes: The control is visible. The absence of this value indicates that the control is hidden.

128.7.91 kOptionsAllNonStorageItems = & h80

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: Enables the user to choose any item in the Shell namespace, not just those with SFGAO_STREAM or SFAGO_FILESYSTEM attributes. This flag cannot be combined with kOptionsForceFileSystem.

128.7.92 kOptionsAllowMultiSelect = & h200

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: Enables the user to select multiple items in the open dialog. Note that when this flag is set, the WinFileOpenDialogMBS class must be used to retrieve those items.

128.7.93 kOptionsCreatePrompt = & h2000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: Prompt for creation if the item returned in the save dialog does not exist. Note that this does not actually create the item.

128.7.94 kOptionsDefaultNoMiniMode = & h20000000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: Indicates to the Save As dialog box that it should open in expanded mode. Expanded mode is the mode that is set and unset by clicking the button in the lower-left corner of the Save As dialog box that switches between Browse Folders and Hide Folders when clicked. This value is not supported as of Windows 7.

128.7.95 kOptionsDontAaddToRecent = & h2000000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: Do not add the item being opened or saved to the recent documents list.

128.7.96 kOptionsFileMustExist = & h1000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: The item returned must exist. This is a default value for the Open dialog.

128.7.97 kOptionsForceFileSystem = & h40

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: Ensures that returned items are file system items. Note that this does not apply to items returned by CurrentSelection.

128.7.98 kOptionsForcePreviewPaneOn = & h40000000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: Indicates to the Open dialog box that the preview pane should always be displayed.

128.7.99 kOptionsForceShowHidden = & h10000000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: Include hidden and system items.

128.7.100 kOptionsHideMRUPlaces = & h20000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: Hide the list of places from which the user has recently opened or saved items. This value is not supported as of Windows 7.

128.7.101 kOptionsHidePinnedPlaces = & h40000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes:

Hide items shown by default in the view's navigation pane. This flag is often used in conjunction with the AddPlace method, to hide standard locations and replace them with custom locations.

Windows 7 and later. Hide all of the standard namespace locations (such as Favorites, Libraries, Computer, and Network) shown in the navigation pane.

Windows Vista. Hide the contents of the Favorite Links tree in the navigation pane. Note that the category itself is still displayed, but shown as empty.

128.7.102 kOptionsNoChangeDir = 8

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: Don't change the current working directory.

128.7.103 kOptionsNoDereferenceLinks = & h100000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: Shortcuts should not be treated as their target items. This allows an application to open a .lnk file rather than what that file is a shortcut to.

128.7.104 kOptionsNoReadOnlyReturn = & h8000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: Do not return read-only items. This is a default value for the Save dialog.

128.7.105 kOptionsNoTestFileCreate = & h10000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: Do not test whether creation of the item as specified in the Save dialog will be successful. If this

flag is not set, the calling application must handle errors, such as denial of access, discovered when the item is created.

128.7.106 kOptionsNoValidate = & h100

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: Do not check for situations that would prevent an application from opening the selected file, such as sharing violations or access denied errors.

128.7.107 kOptionsOKButtonNeedsInteraction = & h200000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: OKButton needs interaction?

128.7.108 kOptionsOverwritePrompt = 2

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: When saving a file, prompt before overwriting an existing file of the same name. This is a default value for the Save dialog.

128.7.109 kOptionsPathMustExist = & h800

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: The item returned must be in an existing folder. This is a default value.

128.7.110 kOptionsPickFolders = & h20

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: Present an Open dialog that offers a choice of folders rather than files.

128.7.111 kOptionsShareaware = & h4000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: In the case of a sharing violation when an application is opening a file, call the application back through ShareViolation event for guidance. This flag is overridden by kOptionsNoValidate.

128.7.112 kOptionsStrictFileTypes = 4

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: In the Save dialog, only allow the user to choose a file that has one of the file name extensions specified through SetFileTypes.

128.7.113 kOptionsSupportsStreamableItems = & h80000000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the option flags.
Notes: Indicates that the caller is opening a file as a stream (BHID_Stream), so there is no need to download that file.

128.7.114 kOverwriteAccept = 1

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the overwrite responses.
Notes: The application has determined that the file should be returned from the dialog.

128.7.115 kOverwriteDefault = 0

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the overwrite responses.
Notes: The application has not handled the event. The dialog displays a UI asking the user whether the file should be overwritten and returned from the dialog.

128.7.116 kOverwriteRefuse = 2

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the overwrite responses.
Notes: The application has determined that the file should not be returned from the dialog.

128.7.117 kShareViolationAccept = 1

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the share violation response constants.
Notes: The application has determined that the file should be returned from the dialog.

128.7.118 kShareViolationDefault = 0

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the share violation response constants.
Notes: The application has not handled the event. The dialog displays a UI that indicates that the file is in use and a different file must be chosen.

128.7.119 kShareViolationRefuse = 2

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the share violation response constants.
Notes: The application has determined that the file should not be returned from the dialog.

128.8 class WinFileDialogObserverMBS

128.8.1 class WinFileDialogObserverMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Intercepts save and open dialogs on Windows to provide events to customize.
Notes:

You can only have one instance of this class at a time.
First time you create an object, we initialize the necessary feature.

See also NSSavePanelObserverMBS class for Windows.

128.8.6 Properties

128.8.7 Enabled as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Whether the feature is enabled.
Notes:

If value is false, no events will be called.
(Read and Write property)

128.8.8 Events

128.8.9 DidShowDialog(dialog as WinFileDialogMBS, Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: .

Function: Event called after dialog showed.
Notes: You can read results from whatever modification you made.

128.8.10 WillShowDialog(dialog as WinFileDialogMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: .

Function: Event called before dialog shows.
Notes: You can do customization just before the dialog shows.

128.9 class WinFileOpenDialogMBS

128.9.1 class WinFileOpenDialogMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Extends the WinFileDialogMBS interface by adding methods specific to the open dialog.
Notes:

Requires Windows Vista or newer.
All methods may raise WinFileDialogExceptionMBS in case of errors.
Subclass of the WinFileDialogMBS class.

128.9.6 Methods

128.9.7 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The constructor.

128.9.8 Results as WinShellItemArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the user's choices in a dialog that allows multiple selection.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
Dim items As WinShellItemArrayMBS = d.Results

Dim c As Integer = items.Count
For i As Integer = 0 To c-1
Dim item As WinShellItemMBS = items.Item(i)

Listbox1.AddRow item.NativePath
Next
```

Notes:

This method can be used whether the selection consists of a single item or multiple items.

Result property can be called after the dialog has closed or during the handling of an OnFileOk event. Calling this method at any other time will fail.
Show must return a success code for a result to be available to Result/Results.

128.9.9 SelectedItems as WinShellItemArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the currently selected items in the dialog. These items may be items selected in the view, or text selected in the file name edit box.
Notes: This method can be used for single item or multiple item selections. If the user has entered new text in the file name field, this can be a time-consuming operation. When the application calls this method, the application parses the text in the filename field. For example, if this is a network share, the operation could take some time. However, this operation will not block the UI, since the user should able to stop the operation, which will result in SelectedItems raising an exception).

128.10 class WinFileSaveDialogMBS

128.10.1 class WinFileSaveDialogMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Extends the WinFileDialogMBS class by adding methods specific to the save dialog, which include those that provide support for the collection of metadata to be persisted with the file.
Notes:

All methods may raise WinFileDialogExceptionMBS in case of errors.
Subclass of the WinFileDialogMBS class.

128.10.6 Methods

128.10.7 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The constructor.

128.10.8 Properties

128.10.9 SaveAsItem as WinShellItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The item to be used as the initial entry in a Save As dialog.
Notes:

he name of the item is displayed in the file name edit box, and the containing folder is opened in the view. This would generally be used when the application is saving an item that already exists. For new items, use FileName property.
(Read and Write property)

128.11 class WinFileTypeMBS

128.11.1 class WinFileTypeMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The class for a file type.
Example:

```
Dim d As WinFileOpenDialogMBS // your dialog
Dim FileTypes() As WinFileTypeMBS

FileTypes.Append New WinFileTypeMBS("JPEG image", "*.jpg")
FileTypes.Append New WinFileTypeMBS("PNG image", "*.png")
FileTypes.Append New WinFileTypeMBS("Tiff image", "*.tif;*.tiff")

d.SetFileTypes FileTypes
```

128.11.4 Methods

128.11.5 Constructor(Name as string, Spec as String)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The constructor.

128.11.6 Properties

128.11.7 Name as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The name of the entry.
Notes: (Read and Write property)

128.11.8 Spec as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The file type specification.
Notes:

e.g. "*.jpg;*.jpeg", "*.bmp" or "*.*".
(Read and Write property)

128.12 class WinShellItemArrayMBS

128.12.1 class WinShellItemArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The class for an array of shell items.
Notes:

All methods may raise WinFileDialogExceptionMBS in case of errors.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

128.12.2 Blog Entries

128.12.4 Methods

128.12.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

128.12.6 Item(index as Integer) as WinShellItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the item at the given index in the IShellItemArray.

128.12.7 Properties

128.12.8 Count as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the number of items in the given IShellItem array.
Notes: (Read only property)

128.12.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

128.13 class WinShellItemMBS

128.13.1 class WinShellItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The class for a Shell item.
Notes: All methods may raise WinFileDialogExceptionMBS in case of errors.

128.13.2 Blog Entries

128.13.4 Methods

128.13.5 Compare(other as WinShellItemMBS, Mode as Integer = 0) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Compares two shell items.
Notes:

Default mode is to compare display names.
Returns 0 if equal or non-null value if not.

128.13.6 Constructor(item as folderItem)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Creates new shell item based on a folderitem.
See also:

- 128.13.7 Constructor(path as String) 20598

128.13.7 Constructor(path as String)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Creates new shell item based on a path.
See also:

- 128.13.6 Constructor(item as folderItem) 20597

128.13.8 Operator_Compare(other as WinShellItemMBS) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Compares two shell items.
Notes:

Returns 0 if equal or non-null value if not.
Compares display name.
This method is called by Xojo when you use = operator on items to compare.

128.13.9 ReadData as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Utility function to read data from item.
Notes:

A shell item may not point necessarily to a real file.
This method can read it even if it is not a real file, but still can be opened as IStream.

128.13.10 Thumbnail(preferredSize as Integer) as Picture

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Queries thumbnail for item.
Notes:

preferredSize is the size you'd like to have. Resulting image can be smaller or bigger.
Returns nil on any error.
If user disabled thumbnails for explorer, the shell also provides none for us, just icons.
Requires Windows Vista or newer.

128.13.11 Properties

128.13.12 DisplayName as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the display name of the shell item.
Notes:

Returns the display name relative to the parent folder. In UI this name is generally ideal for display to the user.

If no path is available, the plugin does not raise exception, but returns "".
(Read only property)

128.13.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

128.13.14 Item as FolderItem

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Queries folderitem for the item.
Notes:

Queries internally native path and builds folderitem for it.

If no path is available, the plugin does not raise exception, but returns nil.
(Read only property)

128.13.15 NativePath as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the native path of the shell item.
Notes:

Returns the item's file system path, if it has one.

If no path is available, the plugin does not raise exception, but returns "".
(Read only property)

128.13.16 Parent as WinShellItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the parent of an IShellItem object.
Notes: (Read only property)

128.13.17 URLPath as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the URL of the shell item.
Notes:

Returns the item's URL, if it has one.
Some items do not have a URL, and in those cases a call to DisplayName will fail. This name is suitable for display to the user in some cases, but note that it might not be specified for all items.

If no path is available, the plugin does not raise exception, but returns "".
(Read only property)

128.13.18 Constants

128.13.19 kCompareAllFields = & h80000000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the comparison mode constants.
Notes: Exact comparison of two instances of a Shell item.

128.13.20 kCompareCanonical = & h10000000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the comparison mode constants.
Notes: Comparison is based on a canonical name.

128.13.21 kCompareDisplayName = 0

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the comparison mode constants.
Notes: Comparison based on the display name in a folder view.

128.13.22 kCompareTestFileSystemPathIfNotEqual = & h20000000

MBS WinFrameworks Plugin, Plugin Version: 20.1.

Function: One of the comparison mode constants.
Notes: Windows 7 and later. If the Shell items are not the same, test the file system paths.

Chapter 129

Network

129.1 class AvahiBrowserMBS

129.1.1 class AvahiBrowserMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class to browse for services.

129.1.2 Blog Entries

- Bonjour on Linux

129.1.3 Blog Entries

- Bonjour on Linux

129.1.4 Methods

129.1.5 Browse(InterfaceIndex as Integer, Protocol as Integer, servicetype as string, domain as string = """, flags as Integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Browse for services of a type on the network.
Notes:

In most cases you probably want to pass kInterfaceAny and kProtocolAny in InterfaceIndex, resp. protocol

to browse on all local networks. The specified events will be called whenever a new service appears or is removed from the network. Please note that events may be collapsed to minimize traffic (i.e. a REMOVED followed by a NEW for the same service data is dropped because redundant). If you want to subscribe to service data changes, you should use AvahiResolverMBS class and keep it open, in which case you will be notified via Found event everytime the service data changes.

Only one browse call per AvahiBrowserMBS object please.
Returns true on success and false on failure.

129.1.6 Constructor(client as AvahiClientMBS)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The constructor.

129.1.7 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The destructor.

129.1.8 Properties

129.1.9 Client as AvahiClientMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The reference to the parent client object.
Notes: (Read only property)

129.1.10 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

129.1.11 Events

129.1.12 AllForNow(type as string)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: One-time event, to notify the user that more records will probably not show up in the near future, i.e. all cache entries have been read and all static servers been queried.

129.1.13 CacheExhausted(type as string)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: One-time event, to notify the user that all entries from the caches have been sent.

129.1.14 Failure(error as string, errorcode as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: Some error occurred.

129.1.15 ServiceFound(InterfaceIndex as Integer, protocol as Integer, name as string, type as string, domain as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: Found a new object on the network.

129.1.16 ServiceRemoved(InterfaceIndex as Integer, protocol as Integer, name as string, type as string, domain as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: The service has been removed from the network.

129.1.17 Constants

129.1.18 kInterfaceAny = -1

MBS Linux Plugin, Plugin Version: 12.4.

Function: Special constant to use any interface available.
Notes: Otherwise you would pass the index of the network interface you want to use.

129.1.19 kProtocolAny = -1

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the IP protocol constants.
Notes: Any protocol.

129.1.20 kProtocolIPv4 = 0

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the IP protocol constants.
Notes: Only IPv4.

129.1.21 kProtocolIPv6 = 1

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the IP protocol constants.
Notes: Only IPv6.

129.2 class AvahiClientMBS

129.2.1 class AvahiClientMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The base class for avahi.
Notes:

Typically you create an object of your subclass of AvahiClientMBS at application launch and keep it running. If events are too slow in GUI events, please use a timer with 50ms and call the AvahiClientMBS.Poll method there.

129.2.2 Methods

129.2.3 Available as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Whether the avahi library has been found and loaded.

129.2.4 Constructor(flags as Integer = 0)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes the client.

129.2.5 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The destructor.

129.2.6 DomainName as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Get domain name.

129.2.7 HostName as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Get host name.

129.2.8 Poll

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Polls for events.
Example:

```
// in a timer with 50ms
AvahiClientMBS.Poll
```

Notes:

This is automatically called by the plugin for GUI applications. If you call it in a timer, you can speedup avahi.
Console applications with their own event loop need to call Poll method regularly.

129.2.9 Version as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Get the version of the server.

129.2.10 Properties

129.2.11 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

129.2.12 Events

129.2.13 Collision

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: We're still connecting.
Notes: This state is only entered when kClientNoFail has been passed to Constructor() and the daemon is not yet available.

129.2.14 Connecting

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: Client is connecting.

129.2.15 Failure(error as string, errorcode as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: Some kind of error happened on the client side.

129.2.16 Registering

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: Client is registering.

129.2.17 Running

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: Client is running.

129.2.18 Constants

129.2.19 kClientIgnoreUserConfig = 1

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the client initialization flags.
Notes: Don't read user configuration

129.2.20 kClientNoFail = 2

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the client initialization flags.
Notes: Don't fail if the daemon is not available when avahi_client_new() is called, instead enter AVAHI_CLIENT_CONNECTING state and wait for the daemon to appear.

129.3 class AvahiDomainBrowserMBS

129.3.1 class AvahiDomainBrowserMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class to browse for domains.

129.3.2 Methods

129.3.3 BrowseDomains(InterfaceIndex as Integer, Protocol as Integer, domain as string = """, BrowserType as Integer = 0, flags as Integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Browse for domains on the local network.
Notes:

Only one BrowseDomains call per AvahiDomainBrowserMBS object please.
Returns true on success and false on failure.

129.3.4 Constructor(client as AvahiClientMBS)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The constructor.

129.3.5 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The destructor.

129.3.6 Properties

129.3.7 Client as AvahiClientMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The reference to the parent client object.
Notes: (Read only property)

129.3.8 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

129.3.9 Events

129.3.10 AllForNow

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: One-time event, to notify the user that more records will probably not show up in the near future, i.e. all cache entries have been read and all static servers been queried.

129.3.11 CacheExhausted

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: One-time event, to notify the user that all entries from the caches have been sent.

129.3.12 DomainFound(InterfaceIndex as Integer, protocol as Integer, domain as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: Found a new domain on the network.

129.3.13 DomainRemoved(InterfaceIndex as Integer, protocol as Integer, domain as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: The domain has been removed from the network.

129.3.14 Failure(error as string, errorcode as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: Some error occurred.

129.3.15 Constants

129.3.16 kBrowseTypeBrowse = 0

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the browse modes for domain browsing.
Notes: Browse for a list of available browsing domains.

129.3.17 kBrowseTypeBrowseDefault = 1

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the browse modes for domain browsing.
Notes: Browse for the default browsing domain.

129.3.18 kBrowseTypeBrowseLegacy = 4

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the browse modes for domain browsing.
Notes: Legacy browse domain - see DNS-SD spec for more information.

129.3.19 kBrowseTypeRegister = 2

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the browse modes for domain browsing.
Notes: Browse for a list of available registering domains.

129.3.20 kBrowseTypeRegisterDefault = 3

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the browse modes for domain browsing.
Notes: Browse for the default registering domain.

129.3.21 kInterfaceAny = -1

MBS Linux Plugin, Plugin Version: 12.4.

Function: Special constant to use any interface available.
Notes: Otherwise you would pass the index of the network interface you want to use.

129.3.22 kProtocolAny = -1

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the IP protocol constants.
Notes: Any protocol.

129.3.23 kProtocolIPv4 = 0

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the IP protocol constants.
Notes: Only IPv4.

129.3.24 kProtocolIPv6 = 1

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the IP protocol constants.
Notes: Only IPv6.

129.4 class AvahiResolverMBS

129.4.1 class AvahiResolverMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class to resolve service name to IP address.

129.4.2 Methods

129.4.3 Constructor(client as AvahiClientMBS)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The constructor.

129.4.4 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The destructor.

129.4.5 Resolve(InterfaceIndex as Integer, Protocol as Integer, name as string, servicetype as string, domain as string, flags as Integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Create a new service resolver object.
Notes:

Please make sure to pass all the service data you received via Found event, especially interface and protocol. The protocol argument specifies the protocol (IPv4 or IPv6) to use as transport for the queries which are sent out by this resolver. The protocol argument specifies the adress family (IPv4 or IPv6) of the address of the service we are looking for. Generally, on "protocol" you should only pass what was supplied to you as parameter to your Browse function. In protocol you should pass what your application code can deal with when connecting to the service. Or, more technically speaking: protocol specifies if the mDNS queries should be sent as UDP/IPv4 resp. UDP/IPv6 packets. protocol specifies whether the query is for a A resp. AAAA resource record.

Only one resolve call per AvahiResolverMBS object please.
Returns true on success and false on failure.

129.4.6 Properties

129.4.7 Client as AvahiClientMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The reference to the parent client object.
Notes: (Read only property)

129.4.8 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

129.4.9 Events

129.4.10 Failure(error as string, errorcode as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: Some error occurred.

129.4.11 Found(interfaceIndex as Integer, Protocol as Integer, name as string, type as string, domain as string, hostname as string, port as Integer, address as string, txt as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: An address was found.

129.4.12 Constants

129.4.13 kResultCached = 1

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the flags for events.
Notes: This response originates from the cache.

129.4.14 kResultLocal = 8

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the flags for events.
Notes: This record/service resides on and was announced by the local host. Only available in service and record browsers and only on Found event.

129.4.15 kResultMultiCast = 4

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the flags for events.
Notes: This response originates from multicast DNS.

129.4.16 kResultOurOwn = 16

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the flags for events.
Notes: This service belongs to the same local client as the browser object. Only available in avahi-client, and only for service browsers and only on Found event.

129.4.17 kResultStatic = 32

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the flags for events.
Notes: The returned data has been defined statically by some configuration option.

129.4.18 kResultWideArea = 2

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the flags for events.
Notes: This response originates from wide area DNS.

129.5 class AvahiTypeBrowserMBS

129.5.1 class AvahiTypeBrowserMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class to browse for types.

129.5.2 Methods

129.5.3 BrowseTypes(InterfaceIndex as Integer, Protocol as Integer, domain as string = """, flags as Integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Browse for service types on the local network.
Notes:

Only one BrowseTypes call per AvahiTypeBrowserMBS object please.
Returns true on success and false on failure.

129.5.4 Constructor(client as AvahiClientMBS)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The constructor.

129.5.5 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The destructor.

129.5.6 Properties

129.5.7 Client as AvahiClientMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The reference to the parent client object.
Notes: (Read only property)

129.5.8 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

129.5.9 Events

129.5.10 AllForNow

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: One-time event, to notify the user that more records will probably not show up in the near future, i.e. all cache entries have been read and all static servers been queried.

129.5.11 CacheExhausted

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: One-time event, to notify the user that all entries from the caches have been sent.

129.5.12 Failure(error as string, errorcode as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: Some error occurred.

129.5.13 TypeFound(InterfaceIndex as Integer, protocol as Integer, type as string, domain as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: Found a new type on the network.

129.5.14 TypeRemoved(InterfaceIndex as Integer, protocol as Integer, type as string, domain as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: .

Function: The type has been removed from the network.

129.5.15 Constants

129.5.16 kInterfaceAny = -1

MBS Linux Plugin, Plugin Version: 12.4.

Function: Special constant to use any interface available.
Notes: Otherwise you would pass the index of the network interface you want to use.

129.5.17 kProtocolAny = -1

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the IP protocol constants.
Notes: Any protocol.

129.5.18 kProtocolIPv4 = 0

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the IP protocol constants.
Notes: Only IPv4.

129.5.19 kProtocolIPv6 = 1

MBS Linux Plugin, Plugin Version: 12.4.

Function: One of the IP protocol constants.
Notes: Only IPv6.

129.6 class CWChannelMBS

129.6.1 class CWChannelMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The CoreWLAN class for a channel.
Notes:

Encapsulates an IEEE 802.11 channel.

Available on Mac OS X 10.7 or later.
Please also check the documentation from Apple for the CWChannel class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

129.6.2 Methods

129.6.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

129.6.4 copy as CWChannelMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of the object.

129.6.5 isEqualToChannel(channel as CWChannelMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Compares two channels.
Notes: Returns true if both are equal.

129.6.6 Operator_Compare(channel as CWChannelMBS) as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Compares two channels.

129.6.7 Properties

129.6.8 channelBand as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The channel band.
Notes: (Read only property)

129.6.9 channelNumber as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The channel number.
Notes: (Read only property)

129.6.10 channelWidth as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The channel width.
Notes: (Read only property)

129.6.11 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal reference for this object.
Notes: (Read and Write property)

129.7 class CWConfigurationMBS

129.7.1 class CWConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN configuration.
Notes:

Encapsulates a static configuration for a given IEEE 802.11 wireless interface.

Requires Mac OS X 10.6 or newer.

129.7.2 Methods

129.7.3 configuration as CWConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convenience method for getting an CWConfiguration object.
Notes:

dim c as CWConfigurationMBS = CWConfigurationMBS.configuration
MsgBox hex(c.Handle)
See also:

- 129.7.4 configuration(config as CWConfigurationMBS) as CWConfigurationMBS 20623

129.7.4 configuration(config as CWConfigurationMBS) as CWConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convenience method for getting a CWConfiguration object initialized with the given CWConfiguration object.
Notes: Available on Mac OS X 10.7 or later.
See also:

- 129.7.3 configuration as CWConfigurationMBS 20623

129.7.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an CWConfiguration.
See also:

- 129.7.6 Constructor(configuration as CWConfigurationMBS) 20624

129.7.6 Constructor(configuration as CWConfigurationMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a CWConfigurationMBS object initialized with the given CWConfigurationMBS object.
Notes: Available on Mac OS X 10.7 or later.
See also:

- 129.7.5 Constructor 20623

129.7.7 copy as CWConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of this object.

129.7.8 isEqualToConfiguration(configuration as CWConfigurationMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Test whether two configurations are equal.
Notes: Two CWConfiguration objects are considered equal if all their corresponding properties are equal.

129.7.9 mutableCopy as CWMutableConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a mutable copy of this object.
Notes: Available on Mac OS X 10.7 or later.

129.7.10 networkProfiles as CWNetworkProfileMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: An array of remembered CWNetworkProfileMBS objects.
Notes:

The order of this array corresponds to the order in which the the CWNetworkProfile objects participate in the auto-join process.

Available on Mac OS X 10.7 or later.

129.7.11 Operator_Compare(configuration as CWConfigurationMBS) as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Compares two profiles.

129.7.12 Properties

129.7.13 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

129.7.14 rememberJoinedNetworks as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: AirPort client will remember all joined networks.
Notes:

Available on Mac OS X 10.7 or later.
(Read only property)

129.7.15 requireAdministratorForAssociation as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Require an administrator password to change networks.
Notes:

Available on Mac OS X 10.7 or later.
(Read only property)

129.7.16 requireAdministratorForIBSSMode as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Require an administrator password to create a computer-to-computer network.
Notes:

Available on Mac OS X 10.7 or later.
(Read only property)

129.7.17 requireAdministratorForPower as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Require an administrator password to change the interface power state.
Notes:

Available on Mac OS X 10.7 or later.
(Read only property)

129.8 module CWGlobalsMBS

129.8.1 module CWGlobalsMBS

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The module for the global constants.
Notes: Please note that MBS Plugin implements all methods from 10.6 to 10.9 in CoreWLAN. But Apple changes things often, so some methods are only for older system, some only for newer. e.g. kCWErrorDomain is for 10.6 and CWErrorDomain for 10.7 and newer.

129.8.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.4pr2

129.8.3 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.4pr2

129.8.4 Methods

129.8.5 CWBSSIDDidChangeNotification as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names for CoreWLAN.
Notes:

Please use with NSNotificationObserverMBS class.
Posted when the BSSID of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

129.8.6 CWCountryCodeDidChangeNotification as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names for CoreWLAN.
Notes:

Please use with NSNotificationObserverMBS class.
Posted when the country code of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

129.8.7 CWErrorDomain as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN Error Domain.

129.8.8 CWLinkDidChangeNotification as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names for CoreWLAN.
Notes:

Please use with NSNotificationObserverMBS class.
Posted when the link state of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

129.8.9 CWLinkQualityDidChangeNotification as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names for CoreWLAN.
Notes:

Please use with NSNotificationObserverMBS class.
Posted when the link quality for any WLAN interface changes. The object for this notification is the corresponding BSD interface name. The userInfo dictionary for this notification contains the current RSSI and current transmit rate for the given CoreWLAN interface.

129.8.10 CWLinkQualityNotificationRSSIKey as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Dictionary key for link quality change details.
Notes: Number containing the current RSSI value for the WLAN interface. Found in the userInfo dictionary for the CWLinkQualityChangedNotification.

129.8.11 CWLinkQualityNotificationTransmitRateKey as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Dictionary key for link quality change details.

Notes: Number containing the current transmit rate value for the WLAN interface. Found in the userInfo dictionary for the CWLinkQualityChangedNotification.

129.8.12 CWModeDidChangeNotification as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names for CoreWLAN.
Notes:

Please use with NSNotificationObserverMBS class.

Posted when the mode of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

129.8.13 CWPowerDidChangeNotification as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names for CoreWLAN.
Notes:

Please use with NSNotificationObserverMBS class.
Posted when the power state of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

129.8.14 CWScanCacheDidUpdateNotification as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names for CoreWLAN.
Notes:

Please use with NSNotificationObserverMBS class.
Posted when new entries are added to the scan cache, or existing entries are updated with more current information. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

129.8.15 CWSSIDDidChangeNotification as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names for CoreWLAN.
Notes:

Please use with NSNotificationObserverMBS class.
Posted when the SSID of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

129.8.16 KeychainDeleteEAPUsernameAndPassword(ssidData as memoryblock) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Deletes the 802.1X username and password for the specified SSID.
Notes:

ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainDeleteWiFiEAPUsernameAndPassword instead.

129.8.17 KeychainDeletePassword(ssidData as memoryblock) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Deletes the password for the specified SSID and keychain domain.
Notes:

ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainDeleteWiFiPassword instead.

129.8.18 KeychainDeleteWiFiEAPUsernameAndPassword(KeychainDomain as Integer, ssidData as memoryblock) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Deletes the 802.1X username and password for the specified SSID and keychain domain.
Notes:

domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.

Returns an OSStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

129.8.19 KeychainDeleteWiFiPassword(KeychainDomain as Integer, ssidData as memoryblock) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Deletes the password for the specified SSID and keychain domain.
Notes:

domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.

Returns an OSStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

129.8.20 KeychainFindWiFiEAPUsernameAndPassword(KeychainDomain as Integer, ssidData as memoryblock, byref username as string, byref password as string) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Finds and returns the 802.1X username and password stored for the specified SSID and keychain domain.
Notes:

domain: The keychain domain, which determines which keychain will be used.

ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
username: a string passed by reference, which upon return will contain the 802.1X username for the specified SSID.
password: a string passed by reference, which upon return will contain the 802.1X password for the specified SSID.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

129.8.21 KeychainFindWiFiPassword(KeychainDomain as Integer, ssidData as memoryblock, byref password as string) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Finds and returns (by reference) the password for the specified SSID and keychain domain.
Notes:

domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
password: An string passed by reference, which upon return will contain the Wi-Fi keychain password for the specified SSID. This parameter is optional.

Returns an error code indicating whether or not a failure occurred. errSecSuccess indicates no error occurred.
Available on Mac OS X 10.9 or newer.

129.8.22 KeychainGetEAPIdentity(ssidData as memoryblock, byref SecIdentityRef as Integer) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Finds and returns the identity stored for the specified SSID and keychain domain.
Notes:

ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
identity: An Integer passed by reference, which upon return will contain the SecIdentityRef associated with the specified SSID.
The returned value must be released by the caller.

Returns an OSStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainGetWiFiEAPIdentity instead.

129.8.23 KeychainGetEAPIdentityList(byref ListSecIdentityRef() as Integer) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Finds and returns all available identities.
Notes:

ListSecIdentityRef: An array passed by reference, which upon return will be populated with a list of integers (SecIdentityRef).

Returns an OSStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

129.8.24 KeychainGetEAPUsernameAndPassword(ssidData as memoryblock, byref username as string, byref password as string) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Finds and returns the 802.1X username and password stored for the specified SSID.
Notes:

ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
username: A string passed by reference, which upon return will contain the 802.1X username for the specified SSID.
password: A string passed by reference, which upon return will contain the 802.1X password for the specified SSID.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain.

Available in Mac OS X 10.7, deprecated in 10.9. Please use FindWiFiEAPUsernameAndPassword instead.

129.8.25 KeychainGetPassword(ssidData as memoryblock, byref password as string) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Finds and returns (by reference) the password for the specified SSID.
Notes:

ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
password: A string passed by reference, which upon return will contain the Wi-Fi keychain password for the specified SSID.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainFindWiFiPassword instead.

129.8.26 KeychainGetWiFiEAPIdentity(KeychainDomain as Integer, ssidData as memoryblock, byref SecIdentityRef as Integer) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Finds and returns the identity stored for the specified SSID and keychain domain.
Notes:

domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
identity: An Integer passed by reference, which upon return will contain the SecIdentityRef associated with the specified SSID.
The returned value must be released by the caller.

Returns an OSStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

129.8.27 KeychainSetEAPIdentity(ssidData as memoryblock, SecIdentityRef as Integer) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Associates an identity to the specified SSID.
Notes:

ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
identity: The identity containing the certificate to use for 802.1X authentication.
Passing 0 clears any identity association for the specified SSID.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainSetWiFiEAPIdentity instead.

129.8.28 KeychainSetEAPUsernameAndPassword(ssidData as memoryblock, username as string, password as string) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the 802.1X username and password for the specified SSID.
Notes:

ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
username: The 802.1X username.
password: The 802.1X password. This parameter is optional.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use SetWiFiEAPUsernameAndPassword instead.

129.8.29 KeychainSetPassword(ssidData as memoryblock, password as string) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the Wi-Fi network keychain password for the specified SSID.
Notes:

ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
password: The Wi-Fi network password.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainSetWiFiPassword instead.

129.8.30 KeychainSetWiFiEAPIdentity(KeychainDomain as Integer, ssidData as memoryblock, SecIdentityRef as Integer) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Associates an identity to the specified SSID and keychain domain.
Notes:

domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
identity: The identity containing the certificate to use for 802.1X authentication. a SecIdentityRef passed as Integer.

Passing 0 clears any identity association for the specified SSID.

Returns an OSStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

129.8.31 KeychainSetWiFiEAPUsernameAndPassword(KeychainDomain as Integer, ssidData as memoryblock, Username as string, Password as string) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the 802.1X username and password for the specified SSID and keychain domain.
Notes:

domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
username: The 802.1X username.
password: The 802.1X password. This parameter is optional.

Returns an OSStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

129.8.32 KeychainSetWiFiPassword(KeychainDomain as Integer, ssidData as memoryblock, password as string) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the Wi-Fi network keychain password for the specified SSID and keychain domain.
Notes:

domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
password: The Wi-Fi network password.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.
Available on Mac OS X 10.9 or newer.

129.8.33 MergeNetworks(networks() as CWNetworkMBS) as CWNetworkMBS()

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Merges the specified set of CWNetwork objects.
Notes:

networks: The set of networks to merge.

Duplicate networks are defined as networks with the same SSID, security type, and BSS type (IBSS or Infrastructure).
When duplicate networks exist, the network with the best RSSI value will be chosen.

129.8.34 Constants

129.8.35 kCWAPFullErr = -3913

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.

Notes: Access point is unable to handle another associated station.

129.8.36 kCWAssociationDeniedErr = -3909

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Association was denied for an unspecified reason.

129.8.37 kCWAuthAlgUnsupportedErr = -3910

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Specified authentication algorithm is not supported.

129.8.38 kCWAuthenticationAlgorithmUnsupportedErr = -3910

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN Errors.
Notes: Specified authentication algorithm is not supported.

129.8.39 kCWChallengeFailureErr = -3912

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Authentication was rejected because of a challenge failure.

129.8.40 kCWChannelBand2GHz = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN channel bands used for CWChannel.
Notes: 2 GHz channel band.

129.8.41 kCWChannelBand5GHz = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN channel bands used for CWChannel.
Notes: 5 GHz channel band.

129.8.42 kCWChannelBandUnknown = 0

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN channel bands used for CWChannel.
Notes: Unknown channel band.

129.8.43 kCWChannelWidth160MHz = 4

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN channel widths used for CWChannel.
Notes: 160MHz channel width.

129.8.44 kCWChannelWidth20MHz = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN channel widths used for CWChannel.
Notes: 20MHz channel width.

129.8.45 kCWChannelWidth40MHz = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN channel widths used for CWChannel.
Notes: 40MHz channel width.

129.8.46 kCWChannelWidth80MHz = 3

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN channel widths used for CWChannel.
Notes: 80MHz channel width.

129.8.47 kCWChannelWidthUnknown = 0

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN channel widths used for CWChannel.
Notes: Unknown channel width.

129.8.48 kCWCipherKeyFlagsMulticast = 4

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN chipher key flags.
Notes: Cipher key will be used for multicast packets.

129.8.49 kCWCipherKeyFlagsNone = 0

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN chipher key flags.
Notes: Open System authentication.

129.8.50 kCWCipherKeyFlagsRx = 16

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN chipher key flags.
Notes: Cipher key will be used for packets received by the interface.

129.8.51 kCWCipherKeyFlagsTx = 8

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN chipher key flags.
Notes: Cipher key will be used for packets sent from the interface.

129.8.52 kCWCipherKeyFlagsUnicast = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN chipher key flags.
Notes: Cipher key will be used for unicast packets.

129.8.53 kCWCipherSuiteRejectedErr = -3923

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Cipher suite rejected due to network security policy.

129.8.54 kCWDSSSOFDMUnsupportedErr = -3916

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Association denied because DSSS-OFDM is not supported by requesting station.

129.8.55 kCWEAPOLErr = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN Errors.
Notes: EAPOL-related error.

129.8.56 kCWErr = -3931

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN Errors.
Notes: Generic error, no specific error code exists to describe the error condition.

129.8.57 kCWError = -3931

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Generic error.

129.8.58 kCWFormatErr = -3904

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Invalid protocol element field detected.

129.8.59 kCWHTFeaturesNotSupported = -3926

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Association was denied because the requesting station does not support HT features.

129.8.60 kCWHTFeaturesNotSupportedErr = -3926

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN Errors.
Notes: Association was denied because the requesting station does not support HT features.

129.8.61 kCWIBSSModeSecurityNone = 0

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the IBSS mode security types.
Notes: Open System authentication.

129.8.62 kCWIBSSModeSecurityWEP104 = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the IBSS mode security types.
Notes: WPA Personal authentication.

129.8.63 kCWIBSSModeSecurityWEP40 = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the IBSS mode security types.
Notes: WEP security.

129.8.64 kCWInterfaceModeHostAP = 3

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN interface operation modes.
Notes: Interface is participating in an infrastructure network as an access point.

129.8.65 kCWInterfaceModeIBSS = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN interface operation modes.
Notes: Interface is participating in an IBSS network.

129.8.66 kCWInterfaceModeNone = 0

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN interface operation modes.
Notes: Interface is not in any mode.

129.8.67 kCWInterfaceModeStation = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN interface operation modes.
Notes: Interface is participating in an infrastructure network as a non-AP station.

129.8.68 kCWInterfaceStateAssociating = 3

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the interface state constants in CoreWLAN.
Notes: CoreWLAN interface is associating.

129.8.69 kCWInterfaceStateAuthenticating = 2

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the interface state constants in CoreWLAN.
Notes: CoreWLAN interface is authenticating.

129.8.70 kCWInterfaceStateInactive = 0

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the interface state constants in CoreWLAN.
Notes: CoreWLAN interface is in the initial, inactive state.

129.8.71 kCWInterfaceStateRunning = 4

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the interface state constants in CoreWLAN.
Notes: CoreWLAN interface is running.

129.8.72 kCWInterfaceStateScanning = 1

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the interface state constants in CoreWLAN.
Notes: CoreWLAN interface is scanning.

129.8.73 kCWInvalidAKMPErr = -3920

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Invalid authentication selector requested.

129.8.74 kCWInvalidAuthenticationSequenceNumberErr = -3911

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN Errors.
Notes: Authentication frame received with an authentication sequence number out of expected sequence.

129.8.75 kCWInvalidAuthSeqNumErr = -3911

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Authentication frame received with an authentication sequence number out of expected sequence.

129.8.76 kCWInvalidFormatErr = -3904

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN Errors.
Notes: Invalid protocol element field detected.

129.8.77 kCWInvalidGroupCipherErr = -3918

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Invalid group cipher requested.

129.8.78 kCWInvalidInfoElementErr = -3917

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Invalid information element included in association request.

129.8.79 kCWInvalidInformationElementErr = -3917

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN Errors.
Notes: Invalid information element included in association request.

129.8.80 kCWInvalidPairwiseCipherErr = -3919

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Invalid pairwise cipher requested.

129.8.81 kCWInvalidParameterErr = -3900

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN Errors.
Notes: Parameter error.

129.8.82 kCWInvalidPMKErr = -3924

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: PMK rejected by the access point.

129.8.83 kCWInvalidRSNCapabilitiesErr = -3922

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Invalid RSN capabilities specified in association request.

129.8.84 kCWIPCError = -3929

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Error communicating with a separate process.

129.8.85 kCWIPCFailureErr = -3929

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN Errors.
Notes: Error communicating with a separate process.

129.8.86 kCWKeychainDomainNone = 0

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN keychain domains used in the CWKeychain API.
Notes: No keychain domain specified.

129.8.87 kCWKeychainDomainSystem = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN keychain domains used in the CWKeychain API.
Notes: The system keychain domain.

129.8.88 kCWKeychainDomainUser = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN keychain domains used in the CWKeychain API.
Notes: The login (user) keychain domain.

129.8.89 kCWNoErr = 0

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Success.

129.8.90 kCWNoMemErr = -3901

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Memory allocation failed.

129.8.91 kCWNoMemoryErr = -3901

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN Errors.
Notes: Memory allocation failed.

129.8.92 kCWNotSupportedErr = -3903

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Operation not supported.

129.8.93 kCWOperationNotPermittedErr = -3930

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN Errors.
Notes: Calling process does not have permission to perform this operation.

129.8.94 kCWOpModeHostAP = 3

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the interface operation mode constants in CoreWLAN.
Notes: Interface is participating in an infrastructure network as an access point.

129.8.95 kCWOpModeIBSS = 1

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the interface operation mode constants in CoreWLAN.
Notes: Interface is participating in an IBSS network.

129.8.96 kCWOpModeMonitorMode = 2

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the interface operation mode constants in CoreWLAN.
Notes: Interface is in 802.11 monitor mode.

129.8.97 kCWOpModeStation = 0

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the interface operation mode constants in CoreWLAN.
Notes: Interface is participating in an infrastructure network as a non-AP station.

129.8.98 kCWOpNotPermitted = -3930

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Calling process does not have permission to perform this operation.

129.8.99 kCWParamErr = -3900

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Parameter error.

129.8.100 kCWPCOTransitionTimeNotSupported = -3927

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Association was denied because the requesting station does not support the PCO transition time required by the AP.

129.8.101 kCWPCOTransitionTimeNotSupportedErr = -3927

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN Errors.
Notes: Association was denied because the requesting station does not support the PCO transition time required by the AP.

129.8.102 kCWPHYMode11a = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN physical layer modes.
Notes: IEEE 802.11a PHY.

129.8.103 kCWPHYMode11ac = 5

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN physical layer modes.
Notes: IEEE 802.11ac PHY.

129.8.104 kCWPHYMode11b = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN physical layer modes.
Notes: IEEE 802.11b PHY.

129.8.105 kCWPHYMode11g = 3

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN physical layer modes.
Notes: IEEE 802.11g PHY.

129.8.106 kCWPHYMode11n = 4

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN physical layer modes.
Notes: IEEE 802.11n PHY.

129.8.107 kCWPHYModeNone = 0

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN physical layer modes.
Notes: No PHY mode.

129.8.108 kCWReassociationDeniedErr = -3908

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Reassociation was denied because the access point was unable to determine that an association exists.

129.8.109 kCWReferenceNotBoundErr = -3928

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN Errors.
Notes: No interface is bound to the CWInterface.

129.8.110 kCWRefNotBoundErr = -3928

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: No interface is bound to the CWInterface.

129.8.111 kCWScanTypeActive = 0

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the scan type constants in CoreWLAN.
Notes: In accordance with the supported channels for the active country code, the interface will transmit probe request frames and listen for probe responses.

129.8.112 kCWScanTypeFast = 2

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the scan type constants in CoreWLAN.
Notes: The scan will return cached scan results.

129.8.113 kCWScanTypePassive = 1

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the scan type constants in CoreWLAN.
Notes: The interface will listen for beacon frames on each channel irrespective of country code.

129.8.114 kCWSecurityDynamicWEP = 6

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN security types.
Notes: Dynamic WEP security.

129.8.115 kCWSecurityEnterprise = 10

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN security types.
Notes: Enterprise authentication.

129.8.116 kCWSecurityModeDynamicWEP = 7

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the security mode constants in CoreWLAN.
Notes: Dynamic WEP 802.1X authentication.

129.8.117 kCWSecurityModeOpen = 0

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the security mode constants in CoreWLAN.
Notes: Open System authentication.

129.8.118 kCWSecurityModeWEP = 1

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the security mode constants in CoreWLAN.
Notes: WEP authentication.

129.8.119 kCWSecurityModeWPA2_Enterprise = 5

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the security mode constants in CoreWLAN.
Notes: WPA2 Enterprise authentication.

129.8.120 kCWSecurityModeWPA2_PSK = 3

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the security mode constants in CoreWLAN.
Notes: WPA2 Personal authentication.

129.8.121 kCWSecurityModeWPA_Enterprise = 4

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the security mode constants in CoreWLAN.
Notes: WPA Enterprise authentication.

129.8.122 kCWSecurityModeWPA_PSK = 2

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the security mode constants in CoreWLAN.
Notes: WPA Personal authentication.

129.8.123 kCWSecurityModeWPS = 6

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the security mode constants in CoreWLAN.
Notes: WiFi Protected Setup authentication.

129.8.124 kCWSecurityNone = 0

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN security types.
Notes: Open System authentication.

129.8.125 kCWSecurityPersonal = 5

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN security types.
Notes: Personal authentication.

129.8.126 kCWSecurityUnknown = & h7FFFFFFF

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN security types.
Notes: Unknown security type.

129.8.127 kCWSecurityWEP = 1

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN security types.
Notes: WEP security.

129.8.128 kCWSecurityWPA2Enterprise = 9

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN security types.
Notes: WPA2 Enterprise authentication.

129.8.129 kCWSecurityWPA2Personal = 4

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN security types.
Notes: WPA2 Personal authentication.

129.8.130 kCWSecurityWPAEnterprise = 7

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN security types.
Notes: WPA Enterprise authentication.

129.8.131 kCWSecurityWPAEnterpriseMixed = 8

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN security types.
Notes: WPA/WPA2 Enterprise authentication.

129.8.132 kCWSecurityWPAPersonal = 2

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN security types.
Notes: WPA Personal authentication.

129.8.133 kCWSecurityWPAPersonalMixed = 3

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN security types.
Notes: WPA/WPA2 Personal authentication.

129.8.134 kCWShortSlotUnsupportedErr = -3915

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Association denied because short slot time option is not supported by requesting station.

129.8.135 kCWSupplicantTimeoutErr = -3925

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: WPA/WPA2 handshake timed out.

129.8.136 kCWTimeoutErr = -3905

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Authentication/Association timed out.

129.8.137 kCWUknownErr = -3902

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Unexpected error condition encountered for which no error code exists.

129.8.138 kCWUnknownErr = -3902

MBS MacFrameworks Plugin, Plugin Version: 13.5.

Function: One of the CoreWLAN Errors.
Notes: Unexpected error condition encountered for which no error code exists.

129.8.139 kCWUnspecifiedFailureErr = -3906

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Access point did not specify a reason for authentication/association failure.

129.8.140 kCWUnsupportedCapabilitiesErr = -3907

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Access point cannot support all requested capabilities.

129.8.141 kCWUnsupportedRateSetErr = -3914

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Interface does not support all of the rates in the access point's basic rate set.

129.8.142 kCWUnsupportedRSNVersionErr = -3921

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the error constants in CoreWLAN.
Notes: Invalid WPA/WPA2 version specified.

129.8.143 kOldCWPHYMode11A = 0

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the physical layer mode constants in CoreWLAN.
Notes: IEEE 802.11a

129.8.144 kOldCWPHYMode11B = 1

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the physical layer mode constants in CoreWLAN.
Notes: IEEE 802.11b

129.8.145 kOldCWPHYMode11G = 2

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the physical layer mode constants in CoreWLAN.
Notes: IEEE 802.11g

129.8.146 kOldCWPHYMode11N = 3

MBS MacFrameworks Plugin, Plugin Version: 11.0.

Function: One of the physical layer mode constants in CoreWLAN.
Notes: IEEE 802.11n

129.9 class CWInterfaceMBS

129.9.1 class CWInterfaceMBS

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN interface.
Notes:

Encapsulates an CoreWLAN interface providing controlled access to various interface operations such as scanning, assocation, and IBSS creation, and providing a means to query and manipulate interface parameters.

Requires Mac OS X 10.6 or newer.

Please note that MBS Plugin implements all methods from 10.6 to 10.9 in CoreWLAN. But Apple changes things often, so some methods are only for older system, some only for newer. e.g. kCWErrorDomain is for 10.6 and CWErrorDomain for 10.7 and newer.

129.9.2 Methods

129.9.3 associateToEnterpriseNetwork(network as CWNetworkMBS, SecIdentityRef as Integer, username as string, password as string, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Connects to the given enterprise network.
Notes:

network: The network to which the interface will associate.
username: The username to use for IEEE 802.1X authentication.
password: The password to use for IEEE 802.1X authentication.
identity: The identity to use for IEEE 802.1X authentication. Holds the corresponding client certificate.
error: An NSError object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method.

Returns a Boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

This method will block for the duration of the association. This operation may require an administrator password.

129.9.4 associateToNetwork(network as CWNetworkMBS, parameters as dictionary, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to associate to the given CWNetworkMBS, with the given association parameters.
Notes:

parameters: A dicitonary object containing association parameters.
error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occured. True indicates no error occured.

See the association parameters defined in CWGlobalsMBS for more information. Certain networks will require specific authentication credentials for association (i.e. a network using WPA2 Personal authentication will require a passphrase). This method will block for the duration of the association. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.
See also:

- 129.9.5 associateToNetwork(network as CWNetworkMBS, password as string, byref error as NSErrorMBS) as boolean 20660

129.9.5 associateToNetwork(network as CWNetworkMBS, password as string, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Associates to a given network using the given network passphrase.
Notes:

network: The network to which the interface will associate.
password: The network passphrase or key. Required for association to WEP, WPA Personal, and WPA2 Personal networks.
error: An NSErrorMBS object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method. This parameter is optional and can be passed as nil.

Returns a boolean value which will indicate whether or not a failure occurred during execution. true indicates no error occurred.

This method will block for the duration of the association. This operation may require an administrator password.

Available on Mac OS X 10.7 or later.

See also:

- 129.9.4 associateToNetwork(network as CWNetworkMBS, parameters as dictionary, byref error as NSErrorMBS) as boolean 20660

129.9.6 cachedScanResults as CWNetworkMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The networks currently in the scan cache for the WLAN interface.
Notes:

Returns empty array in the case of an error.
Available on Mac OS X 10.7 or later.

129.9.7 commitConfiguration(config as CWConfigurationMBS, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Changing the interface configuration.
Notes:

config: An CWConfiguration object containing the desired changes to the current CW configuration preferences.
error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occured. True indicates no error occured.

This method uses the SFAuthorization property of the given CWInterface object to commit the given configuration. The SFAuthorization property must be authorized with administrative privileges.
See also:

- 129.9.8 commitConfiguration(config as CWConfigurationMBS, SFAuthorizationRef as Integer, byref error as NSErrorMBS) as boolean 20661

129.9.8 commitConfiguration(config as CWConfigurationMBS, SFAuthorizationRef as Integer, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Commit a configuration for the given WLAN interface.
Notes:

configuration: The configuration to commit.
authorization: An SFAuthorization object to use for authorizing the commit. This parameter is optional and can be passed as 0.
error: An NSError object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method.

Returns a Boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

This method requires the caller have root privileges or obtain administrator privileges with the authorization parameter.
See also:

- 129.9.7 commitConfiguration(config as CWConfigurationMBS, byref error as NSErrorMBS) as boolean 20661

129.9.9 Constructor

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an CWInterface for the primary interface.
Example:

```
dim c as new CWInterfaceMBS

MsgBox c.description
```

See also:

- 129.9.10 Constructor(name as string) 20662

129.9.10 Constructor(name as string)

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an interface object linked to the interface of the given name.
Example:

```
dim c as new CWInterfaceMBS("en0")

MsgBox c.description
```

See also:

- 129.9.9 Constructor 20662

129.9.11 disassociate

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Disassociates the CoreWLAN interface from the currently associated network.
Notes: This method is a no-op if the given CoreWLAN interface is not associated to a network. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.

129.9.12 enableIBSSWithParameters as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to create a computer-to-computer network with the given parameters.
Notes:

parameters: A dictionary object containing optional parameters for creating an IBSS network. This parameter is optional and may be passed as nil.
error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional and can be passed as nil.

Return a boolean value which will indicate whether or not a failure occured. True indicates no error occured.

See the IBSS creation parameters defined in CWGlobals.h for more information. If no IBSS creation parameters are present, the default behavior is to create an open authentication computer-to-computer network using the machine name as the network name. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.
See also:

- 129.9.13 enableIBSSWithParameters(byref error as NSErrorMBS) as boolean 20663
- 129.9.14 enableIBSSWithParameters(parameters as dictionary) as boolean 20664
- 129.9.15 enableIBSSWithParameters(parameters as dictionary, byref error as NSErrorMBS) as boolean 20665

129.9.13 enableIBSSWithParameters(byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to create a computer-to-computer network with the given parameters.
Notes:

parameters: A dictionary object containing optional parameters for creating an IBSS network. This parameter is optional and may be passed as nil.
error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional and can be passed as nil.

Return a boolean value which will indicate whether or not a failure occured. True indicates no error occured.

See the IBSS creation parameters defined in CWGlobals.h for more information. If no IBSS creation parameters are present, the default behavior is to create an open authentication computer-to-computer network using the machine name as the network name. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.
See also:

- 129.9.12 enableIBSSWithParameters as boolean 20663
- 129.9.14 enableIBSSWithParameters(parameters as dictionary) as boolean 20664
- 129.9.15 enableIBSSWithParameters(parameters as dictionary, byref error as NSErrorMBS) as boolean 20665

129.9.14 enableIBSSWithParameters(parameters as dictionary) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to create a computer-to-computer network with the given parameters.
Notes:

parameters: A dictionary object containing optional parameters for creating an IBSS network. This parameter is optional and may be passed as nil.
error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional and can be passed as nil.

Return a boolean value which will indicate whether or not a failure occured. True indicates no error occured.

See the IBSS creation parameters defined in CWGlobals.h for more information. If no IBSS creation parameters are present, the default behavior is to create an open authentication computer-to-computer network using the machine name as the network name. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.
See also:

- 129.9.12 enableIBSSWithParameters as boolean 20663
- 129.9.13 enableIBSSWithParameters(byref error as NSErrorMBS) as boolean 20663
- 129.9.15 enableIBSSWithParameters(parameters as dictionary, byref error as NSErrorMBS) as boolean 20665

129.9.15 enableIBSSWithParameters(parameters as dictionary, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to create a computer-to-computer network with the given parameters.
Notes:

parameters: A dictionary object containing optional parameters for creating an IBSS network. This parameter is optional and may be passed as nil.
error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional and can be passed as nil.

Return a boolean value which will indicate whether or not a failure occured. True indicates no error occured.

See the IBSS creation parameters defined in CWGlobals.h for more information. If no IBSS creation parameters are present, the default behavior is to create an open authentication computer-to-computer network using the machine name as the network name. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.
See also:

- 129.9.12 enableIBSSWithParameters as boolean 20663
- 129.9.13 enableIBSSWithParameters(byref error as NSErrorMBS) as boolean 20663
- 129.9.14 enableIBSSWithParameters(parameters as dictionary) as boolean 20664

129.9.16 interfaceNames as String()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the list of BSD names for WLAN interfaces available on the current system.
Example:

```
dim names() as string = CWInterfaceMBS.interfaceNames
MsgBox Join(names,EndOfLine)
```

Notes:

Returns an array of strings representing the supported WLAN BSD interface names avaliable on the current system (i.e. "en1", "en2"). If there are no supported interfaces for the current system, then this method will return an empty NSArray object.
Returns empty array in the case of an error.

Available on Mac OS X 10.7 or later.

129.9.17 interfaceWithName(name as string) as CWInterfaceMBS

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries the interface with the given name.
Example:

```
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")

MsgBox c.description
```

Notes: name: A string representing the name of an Airport interface.

129.9.18 isEqualToInterface(otherInterface as CWInterfaceMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Comparing interfaces.
Notes:

Two CWInterface objects are considered equal if their corresponding nameand capabilities properties are equal.

Returns true if both interfaces are equal.

129.9.19 primaryInterface as CWInterfaceMBS

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convenience method for getting an CWInterface object for the primary interface.
Example:

```
dim c as CWInterfaceMBS = CWInterfaceMBS.primaryInterface

MsgBox c.name
```

129.9.20 scanForNetworksWithName(networkName as string, byref error as NSErrorMBS) as CWNetworkMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Scans for networks.
Notes:

networkName: The name (SSID) of the network for which to scan.
error: An NSErrorMBS object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method. This parameter is optional and can be passed as nil.

Returns an array of CWNetworkMBS objects.

If ssid parameter is present, a directed scan will be performed by the interface, otherwise a broadcast scan will be performed. This method will block for the duration of the scan.

Available on Mac OS X 10.7 or later.

129.9.21 scanForNetworksWithParameters as CWNetworkMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Performs a scan with the given CoreWLAN interface, returning any found networks.
Notes:

parameters: A dicitonary object containing optional scan parameters which can be used to control the behavior of the scan. This parameter is optional.

error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns an array containing CWNetworkMBS objects representing the networks found in the scan.

See the scan parameters defined in CWGlobalsMBS for controlling scan behavior. If no scan parameters are present, the default behavior is to perform a broadcast scan on active channels, for all supported PHY modes. This method will block for the duration of the scan.
See also:

- 129.9.22 scanForNetworksWithParameters(byref error as NSErrorMBS) as CWNetworkMBS() 20668
- 129.9.23 scanForNetworksWithParameters(parameters as dictionary) as CWNetworkMBS() 20668
- 129.9.24 scanForNetworksWithParameters(parameters as dictionary, byref error as NSErrorMBS) as CWNetworkMBS() 20669

129.9.22 scanForNetworksWithParameters(byref error as NSErrorMBS) as CWNetworkMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Performs a scan with the given CoreWLAN interface, returning any found networks.
Notes:

parameters: A dicitonary object containing optional scan parameters which can be used to control the behavior of the scan. This parameter is optional.

error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns an array containing CWNetworkMBS objects representing the networks found in the scan.

See the scan parameters defined in CWGlobalsMBS for controlling scan behavior. If no scan parameters are present, the default behavior is to perform a broadcast scan on active channels, for all supported PHY modes. This method will block for the duration of the scan.
See also:

- 129.9.21 scanForNetworksWithParameters as CWNetworkMBS() 20667
- 129.9.23 scanForNetworksWithParameters(parameters as dictionary) as CWNetworkMBS() 20668
- 129.9.24 scanForNetworksWithParameters(parameters as dictionary, byref error as NSErrorMBS) as CWNetworkMBS() 20669

129.9.23 scanForNetworksWithParameters(parameters as dictionary) as CWNetworkMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Performs a scan with the given CoreWLAN interface, returning any found networks.
Notes:

parameters: A dicitonary object containing optional scan parameters which can be used to control the behavior of the scan. This parameter is optional.

error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns an array containing CWNetworkMBS objects representing the networks found in the scan.

See the scan parameters defined in CWGlobalsMBS for controlling scan behavior. If no scan parameters

are present, the default behavior is to perform a broadcast scan on active channels, for all supported PHY modes. This method will block for the duration of the scan.
See also:

- 129.9.21 scanForNetworksWithParameters as CWNetworkMBS() 20667
- 129.9.22 scanForNetworksWithParameters(byref error as NSErrorMBS) as CWNetworkMBS() 20668
- 129.9.24 scanForNetworksWithParameters(parameters as dictionary, byref error as NSErrorMBS) as CWNetworkMBS() 20669

129.9.24 scanForNetworksWithParameters(parameters as dictionary, byref error as NSErrorMBS) as CWNetworkMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Performs a scan with the given CoreWLAN interface, returning any found networks.
Notes:

parameters: A dicitonary object containing optional scan parameters which can be used to control the behavior of the scan. This parameter is optional.

error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns an array containing CWNetworkMBS objects representing the networks found in the scan.

See the scan parameters defined in CWGlobalsMBS for controlling scan behavior. If no scan parameters are present, the default behavior is to perform a broadcast scan on active channels, for all supported PHY modes. This method will block for the duration of the scan.
See also:

- 129.9.21 scanForNetworksWithParameters as CWNetworkMBS() 20667
- 129.9.22 scanForNetworksWithParameters(byref error as NSErrorMBS) as CWNetworkMBS() 20668
- 129.9.23 scanForNetworksWithParameters(parameters as dictionary) as CWNetworkMBS() 20668

129.9.25 scanForNetworksWithSSID(ssid as memoryblock, byref error as NSErrorMBS) as CWNetworkMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Scans for networks.
Notes:

ssid The SSID for which to scan.
error: An NSErrorMBS object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method. This parameter is optional and can be passed as nil.

Returns an array of CWNetworkMBS objects.

If ssid parameter is present, a directed scan will be performed by the interface, otherwise a broadcast scan will be performed. This method will block for the duration of the scan.

Available on Mac OS X 10.7 or later.

129.9.26 setChannel(channel as UInt32) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the channel for the given CoreWLAN interface.
Notes:

channel: An integer representing the channel to which the CoreWLAN interface should be tuned.
error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occured. True indicates no error occured.

The current channel cannot be changed if the CoreWLAN interface is associated to a network. channel must be supported by the given interface.
See also:

- 129.9.27 setChannel(channel as UInt32, byref error as NSErrorMBS) as boolean 20670

129.9.27 setChannel(channel as UInt32, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the channel for the given CoreWLAN interface.
Notes:

channel: An integer representing the channel to which the CoreWLAN interface should be tuned.
error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occured. True indicates no error occured.

The current channel cannot be changed if the CoreWLAN interface is associated to a network. channel must be supported by the given interface.
See also:

- 129.9.26 setChannel(channel as UInt32) as boolean 20670

129.9.28 setPairwiseMasterKey(key as Memoryblock, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the interface pairwise master key (PMK).
Notes:

key: A memoryblock containing the pairwise master key (PMK).
error: An NSError object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method.
Returns a Boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

Key must be 32 octets. If key is nil, this method clears the PMK for the interface.

129.9.29 setPower(p as boolean) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the power state for the given CoreWLAN interface.
Notes:

power: A boolean value indicating the power state to which the CoreWLAN interface should be set. False indicates the "OFF" state.

error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occured. True indicates no error occured.

This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.
See also:

- 129.9.30 setPower(p as boolean, byref error as NSErrorMBS) as boolean 20672

129.9.30 setPower(p as boolean, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the power state for the given CoreWLAN interface.
Notes:

power: A boolean value indicating the power state to which the CoreWLAN interface should be set. False indicates the "OFF" state.

error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occured. True indicates no error occured.

This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.
See also:

- 129.9.29 setPower(p as boolean) as boolean 20671

129.9.31 setWEPKey(key as Memoryblock, flags as Integer, index as Integer, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the interface WEP key.
Notes:

key: A memoryblock containing the WEP key.
flags: The cipher key flags to use for the specified key. Combination of kCWCipherKeyFlagsNone, kCWCipherKeyFlagsUnicast, kCWCipherKeyFlagsMulticast, kCWCipherKeyFlagsTx or kCWCipherKeyFlagsRx.
index: Integer which default key index to use for the specified key.
error An NSError object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method.

Returns a boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

Key must be 5 octets for WEP-40 or 13 octets for WEP-104. if key is nil, this method clears the WEP key for the interface. index must correspond to default key index 1-4.

129.9.32 setWLANChannel(channel as CWChannelMBS, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the interface channel.
Notes:

channel: A CWChannel object corresponding to the channel.
error: An NSErrorMBS object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method. This parameter is optional and can be passed as nil.

A Boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

The channel cannot be changed if the interface is associated to a network.

Available on Mac OS X 10.7 or later.

129.9.33 startIBSSModeWithSSID(ssidData as MemoryBlock, security as Integer, channel as Integer, password as string, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a computer-to-computer (ad-hoc) network with the given network name, security type, and password on the specified channel.
Notes:

security: The security type to be used. kCWIBSSModeSecurityNone, kCWIBSSModeSecurityWEP40 or kCWIBSSModeSecurityWEP104.
channel: The channel on which the network will be created.
password: The password to be used. This paramter is not applicable to open system authentication.

Returns a Boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

This operation may require an administrator password.

129.9.34 supportedChannels as Integer()

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Array of channels supported by the CoreWLAN interface for the active country code.
Notes: Dynamically queries the interface for the supported channels.

129.9.35 supportedInterfaces as String()

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Getting all supported interfaces
Notes: Returns an array containing strings representing the supported CoreWLAN interface names avaliable on the current system (i.e. "en1", "en2"). If there are no supported interfaces for the current system, then this method will return an empty array.

129.9.36 supportedPHYModes as Integer()

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Array of PHY modes supported by the CoreWLAN interface.
Notes: Dynamically queries the interface for the supported PHY modes.

129.9.37 supportedWLANChannels as CWChannelMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: An array of channels supported by the interface for the active country code.
Example:

```
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
dim channels() as CWChannelMBS = c.supportedWLANChannels
dim lines() as string
for each ch as CWChannelMBS in channels
lines.append str(ch.channelNumber) + ": "+ str(ch.channelBand)
next
MsgBox join(lines,", ")
```

Notes:

Dynamically queries the interface for the supported channels. Returns an array of CWChannel objects, or nil in the case of an error.

Available on Mac OS X 10.7 or later.

129.9.38 Properties

129.9.39 activePHYMode as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current active PHY modes for the interface.
Example:

```
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MsgBox str(c.activePHYMode)
```

Notes:

Dynamically queries the interface for the current active PHY mode.
Returns kCWPHYModeNone in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)

129.9.40 bssid as string

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current BSSID of the CoreWLAN interface.
Notes:

Dynamically queries the interface for the current BSSID.
(Read only property)

129.9.41 bssidData as Memoryblock

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current BSSID of the CoreWLAN interface.
Notes:

Dynamically queries the interface for the current BSSID.

(Read only property)

129.9.42 channel as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current channel of the CoreWLAN interface.
Notes:

Dynamically queries the interface for the current channel.
(Read only property)

129.9.43 configuration as CWConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current stored configuration for the CoreWLAN interface.
Notes: (Read only property)

129.9.44 countryCode as string

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Country code (ISO/IEC 3166-1:1997) of the CoreWLAN interface.
Notes:

Dynamically queries the interface for the current country code.
(Read only property)

129.9.45 description as string

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The object description.
Notes: (Read only property)

129.9.46 deviceAttached as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The interface has its corresponding hardware attached.
Example:

```
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MsgBox str(c.deviceAttached)
```

Notes:

Returns false in the case of an error.
Available on Mac OS X 10.7 or later.
(Read only property)

129.9.47 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

129.9.48 hardwareAddress as string

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The hardware media access control (MAC) address for the interface, returned as a UTF-8 string.
Example:

```
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MsgBox c.hardwareAddress
```

Notes:

The standard format for printing a MAC-48 address <00:00:00:00:00:00>is used to represent the MAC address as a string. Returns "" in the case of an error.

Available on Mac OS X 10.7 or later.
(Read only property)

129.9.49 interfaceMode as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current mode for the interface.
Example:

```
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MsgBox str(c.interfaceMode)
```

Notes:

Dynamically queries the interface for the current mode. Returns kCWInterfaceModeNone in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)

129.9.50 interfaceName as string

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The BSD name of the interface.
Example:

```
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MsgBox c.interfaceName
MsgBox str(c.noiseMeasurement)
```

Notes:

Available on Mac OS X 10.7 or later.
(Read only property)

129.9.51 interfaceState as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current state of the CoreWLAN interface.
Notes:

Dynamically queries the interface for the current interface state.
(Read only property)

129.9.52 name as string

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: BSD name for the CoreWLAN interface.
Example:

```
dim c as CWInterfaceMBS = CWInterfaceMBS.primaryInterface

MsgBox c.name
```

Notes: (Read only property)

129.9.53 noise as Double

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current aggregate noise measurement (dBm) of the CoreWLAN interface.
Notes:

Dynamically queries the interface for the current aggregate noise measurement.
(Read only property)

129.9.54 noiseMeasurement as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current aggregate noise measurement (dBm) for the interface.
Example:

```
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MsgBox str(c.noiseMeasurement)
```

Notes:

Dynamically queries the interface for the current aggregate noise measurement.
Returns 0 in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)

129.9.55 opMode as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current operation mode of the CoreWLAN interface.
Notes:

Dynamically queries the interface for the current operation mode.
(Read only property)

129.9.56 phyMode as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current active PHY mode of the CoreWLAN interface.
Notes:

Dynamically queries the interface for the current active PHY mode.
(Read only property)

129.9.57 power as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current power state for the CoreWLAN interface.
Notes:

Dynamically queries the interface for the current power state.
(Read only property)

129.9.58 powerOn as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The interface power state is set to "ON".
Example:

```
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MsgBox str(c.rssiValue)
```

Notes:

Available on Mac OS X 10.7 or later.
(Read only property)

129.9.59 powerSave as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current power save state for the CoreWLAN interface.
Notes:

Dynamically queries the interface for the current power save state.
Introduced in 10.6, deprecated in 10.7 and gone in 10.9.
(Read only property)

129.9.60 rssi as Double

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current aggregate RSSI measurement (dBm) of the CoreWLAN interface.
Notes:

Dynamically queries the interface for the current aggregate RSSI measurement.
(Read only property)

129.9.61 rssiValue as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current aggregate received signal strength indication (RSSI) measurement (dBm) for the interface.
Example:

```
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MsgBox str(c.rssiValue)
```

Notes:

Dynamically queries the interface for the current aggregate RSSI measurement.
Returns 0 in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)

129.9.62 security as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current security mode for the interface.
Notes:

Dynamically queries the interface for the security mode. Returns kCWSecurityUnknown in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)

129.9.63 securityMode as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current security mode of the CoreWLAN interface.
Notes:

Dynamically queries the interface for the current security mode.
(Read only property)

129.9.64 serviceActive as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The interface has its corresponding network service enabled.
Example:

```
dim c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MsgBox str(c.serviceActive)
```

Notes:

Returns false in the case of an error.

Available on Mac OS X 10.7 or later.
(Read only property)

129.9.65 ssid as string

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current SSID of the CoreWLAN interface.
Notes:

Dynamically queries the interface for the current SSID.
(Read only property)

129.9.66 ssidData as Memoryblock

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current service set identifier (SSID) for the interface, returned as data.
Notes:

Dynamically queries the interface for the current SSID. The SSID is 1-32 octets.
Returns nil in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)

129.9.67 supportsAES_CCM as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN interface supports AES-CCM (IEEE 802.11i Advanced Encryption Standard - Counter Mode with Cipher-Block Chaining Message Authentication Code).
Notes: (Read only property)

129.9.68 supportsHostAP as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN interface supports host access point mode.
Notes: (Read only property)

129.9.69 supportsIBSS as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN interface supports IBSS networks (IEEE 802.11 Independent Basic Service Set).
Notes: (Read only property)

129.9.70 supportsMonitorMode as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN interface supports monitor mode.
Notes: (Read only property)

129.9.71 supportsPMGT as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN interface supports power save modes.
Notes: (Read only property)

129.9.72 supportsShortGI20MHz as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN interface supports short guard interval in 20MHz channels.
Notes: (Read only property)

129.9.73 supportsShortGI40MHz as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN interface supports short guard interval in 40MHz channels.
Notes: (Read only property)

129.9.74 supportsTKIP as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN interface supports TKIP (IEEE 802.11i Temporal Key Integrity Protocol).
Notes: (Read only property)

129.9.75 supportsTSN as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN interface supports TSN authentication (Transitional Security Network).
Notes: (Read only property)

129.9.76 supportsWEP as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN interface supports WEP authentication (IEEE 802.11 Wired Equivalent Privacy).
Notes: (Read only property)

129.9.77 supportsWME as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN interface supports WME (IEEE 802.11e Wireless Multimedia Extensions).
Notes: (Read only property)

129.9.78 supportsWoW as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN interface supports wake on wireless capability.
Notes: (Read only property)

129.9.79 supportsWPA as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN interface supports WPA (Wi-Fi Alliance Wi-Fi Protected Access).
Notes: (Read only property)

129.9.80 supportsWPA2 as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN interface supports WPA2 (Wi-Fi Alliance Wi-Fi Protected Access 2).
Notes: (Read only property)

129.9.81 transmitPower as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current transmit power (mW) for the interface.
Notes:

Dynamically queries the interface for the current transmit power.
Returns 0 in the case of an error.

Available on Mac OS X 10.7 or later.
(Read only property)

129.9.82 transmitRate as Double

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current transmit rate (Mbps) for the interface.
Notes:

Dynamically queries the interface for the current transmit rate.
Returns 0 in the case of an error, or if the interface is not participating in a network.
Available on Mac OS X 10.7 or later.
(Read only property)

129.9.83 txPower as Double

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current target transmit power (mW) of the CoreWLAN interface.
Notes:

Dynamically queries the interface for the current transmit power.
(Read only property)

129.9.84 txRate as Double

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current transmit rate (Mbps) of the CoreWLAN interface.
Notes:

Dynamically queries the interface for the current transmit rate.
(Read only property)

129.9.85 wlanChannel as CWChannelMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current channel for the interface.
Notes:

Dynamically queries the interface for the current channel. Returns nil in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)

129.10 class CWMutableConfigurationMBS

129.10.1 class CWMutableConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Encapsulates a mutable configuration for an AirPort WLAN interface.
Notes:

Available on Mac OS X 10.7 or later.
Please also check the documentation from Apple for the CWMutableConfiguration class.
Subclass of the CWConfigurationMBS class.

129.10.2 Methods

129.10.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new mutable configuration.

129.10.4 setNetworkProfiles(values() as CWNetworkProfileMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: An array of remembered CWNetworkProfileMBS objects.
Notes: The order of this array corresponds to the order in which the the CWNetworkProfileMBS objects participate in the auto-join process.

129.10.5 setRememberJoinedNetworks(value as boolean)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: AirPort client will remember all joined networks.

129.10.6 setRequireAdministratorForAssociation(value as boolean)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Require an administrator password to change networks.

129.10.7 setRequireAdministratorForIBSSMode(value as boolean)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Require an administrator password to create a computer-to-computer network.

129.10.8 setRequireAdministratorForPower(value as boolean)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Require an administrator password to change the interface power state.

129.11 class CWMutableNetworkProfileMBS

129.11.1 class CWMutableNetworkProfileMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Encapsulates a mutable network profile entry.
Notes:

Available on Mac OS X 10.7 or later.
Please also check the documentation from Apple for the CWMutableNetworkProfile class.
Subclass of the CWNetworkProfileMBS class.

129.11.2 Methods

129.11.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.

129.11.4 setSecurity(value as Integer)

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the security mode for the network profile.
Notes: See kCWSecurity* constants.

129.11.5 setSsidData(data as Memoryblock)

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the service set identifier (SSID) for the network profile, returned as data.
Notes: The SSID is 1-32 octets.

129.12 class CWNetworkMBS

129.12.1 class CWNetworkMBS

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN wireless (IEEE 802.11) network.
Notes:

Encapsulates a wireless network providing read-only accessors to various properties of the network.

Requires Mac OS X 10.6 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

129.12.2 Methods

129.12.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

129.12.4 copy as CWNetworkMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of this object.

129.12.5 isEqualToNetwork(network as CWNetworkMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Comparing wireless networks.
Notes:

Returns true if the network objects are equal.

Two CWNetworkMBS objects are considered equal if their corresponding ssid, securityMode, and isIBSS properties are equal.

129.12.6 Operator_Compare(profile as CWNetworkMBS) as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Compares two networks.

129.12.7 supportsPHYMode(phyMode as Integer) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Method for determining which PHY modes a network supports.
Notes:

True if the network supports the specified PHY mode.

Available on Mac OS X 10.7 or later.

129.12.8 supportsSecurity(security as Integer) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Getting supported security types
Notes:

True if the network supports the specified security type.

Method for determining which security types a network supports.

Available on Mac OS X 10.7 or later.

129.12.9 Properties

129.12.10 beaconInterval as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The beacon interval (ms) for the network.
Notes:

Available on Mac OS X 10.7 or later.
(Read only property)

129.12.11 bssid as string

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Basic service set identifier for the given CWNetworkMBS.
Notes: (Read only property)

129.12.12 countryCode as string

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The country code (ISO/IEC 3166-1:1997) for the network.
Notes:

Available on Mac OS X 10.7 or later.
(Read only property)

129.12.13 description as string

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The object description.
Notes: (Read only property)

129.12.14 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

129.12.15 ibss as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The network is an IBSS network.
Notes:

Available on Mac OS X 10.7 or later.
(Read only property)

129.12.16 informationElementData as Memoryblock

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Information element data included in beacon or probe response frames.
Notes:

Available on Mac OS X 10.7 or later.
(Read only property)

129.12.17 noiseMeasurement as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The aggregate noise measurement (dBm) for the network.
Notes:

Available on Mac OS X 10.7 or later.
(Read only property)

129.12.18 rssiValue as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The aggregate received signal strength indication (RSSI) measurement (dBm) for the network.
Notes:

Available on Mac OS X 10.7 or later.
(Read only property)

129.12.19 ssid as string

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Service set identifier for the given CWNetworkMBS.
Notes: (Read only property)

129.12.20 ssidData as Memoryblock

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The service set identifier (SSID) for the network, returned as data.
Notes:

The SSID is defined as 1-32 octets.
(Read only property)

129.12.21 wlanChannel as CWChannelMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The channel for the network.
Notes:

Available on Mac OS X 10.7 or later.
(Read only property)

129.13 class CWNetworkProfileMBS

129.13.1 class CWNetworkProfileMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for a network profile.
Notes:

Encapsulates an immutable network profile entry.

Available on Mac OS X 10.7 or later.
Please also check the documentation from Apple for the CWNetworkProfile class.

129.13.2 Methods

129.13.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convenience method for getting a CWNetworkProfile object.
See also:

- 129.13.4 Constructor(networkProfile as CWNetworkProfileMBS) 20696

129.13.4 Constructor(networkProfile as CWNetworkProfileMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convenience method for getting a CWNetworkProfile object initialized with the given CWNetworkProfile object.
See also:

- 129.13.3 Constructor 20696

129.13.5 copy as CWNetworkProfileMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of the object.

129.13.6 isEqualToNetworkProfile(networkProfile as CWNetworkProfileMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Comparing network profiles.
Notes:

networkProfile: The CWNetworkProfile object with which to compare the receiver.

CWNetworkMBS objects are considered equal if their corresponding ssidData and securityType properties are equal.

129.13.7 mutableCopy as CWMutableNetworkProfileMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a mutable copy of the object.

129.13.8 networkProfile as CWNetworkProfileMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convenience method for getting a CWNetworkProfile object.

129.13.9 networkProfileWithNetworkProfile(networkProfile as CWNetworkProfileMBS) as CWNetworkProfileMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convenience method for getting a CWNetworkProfile object initialized with the given CWNetworkProfile object.
Notes: networkProfile: The CWNetworkProfile object to use to initialize a new CWNetworkProfile object.

129.13.10 Operator_Compare(networkProfile as CWNetworkProfileMBS) as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Compares two network profiles.

129.13.11 Properties

129.13.12 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

129.13.13 security as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The security mode for the network profile.
Notes:

See kCWSecurity* constants.
(Read only property)

129.13.14 ssid as string

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The service set identifier (SSID) for the network profile, encoded as a string.
Notes:

If the SSID can not be encoded as a valid UTF-8 or WinLatin1 string, this method returns "".
(Read only property)

129.13.15 ssidData as Memoryblock

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The service set identifier (SSID) for the network profile, returned as data.
Notes:

The SSID is 1-32 octets.
(Read only property)

129.14 class CWWiFiClientMBS

129.14.1 class CWWiFiClientMBS

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The interface to the Wi-Fi subsystem on OS X.
Notes:

Provides access to all Wi-Fi interfaces and allows Wi-Fi clients to setup event notifications.

CWWiFiClientMBS objects are heavy objects, therefore, clients of the CoreWLAN framework should use a single, long-running instance rather than creating several short-lived instances.

The CWWiFiClientMBS object should be used to instantiate CWInterfaceMBS objects rather than using a CWInterfaceMBS initializer directly.

MBS Plugin make sure that all events are routed to main thread.

Available on MacOS 10.10 or newer.

129.14.8 Methods

129.14.9 available as boolean

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether this class is available.
Notes: Returnes true on MacOS 10.10 or newer.

129.14.10 Constructor

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a CWWiFiClient object.
Notes: Available on MacOS 10.10 or newer.

129.14.11 Destructor

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

129.14.12 interfaceNames as String()

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the list of available Wi-Fi interface names (e.g. "en0").
Notes:

An Array of string corresponding to Wi-Fi interface names.
If no Wi-Fi interfaces are available, this method will return an empty array.
Returns nil if an error occurs.

129.14.13 interfaces as CWInterfaceMBS()

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns all available Wi-Fi interfaces.
Notes:

If no Wi-Fi interfaces are available, this method will return an empty array.
Returns nil if an error occurs.

129.14.14 interfaceWithName(name as string) as CWInterfaceMBS

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the CWInterface object bound to the Wi-Fi interface with a specific interface name.
Notes:

interfaceName: The name of an available Wi-Fi interface.

Use interfaceNames function to get a list of available Wi-Fi interface names.
Returns a CWInterface object for the default Wi-Fi interface if no interface name is specified.

129.14.15 startMonitoring(EventType as integer, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Register for specific Wi-Fi event notifications.
Notes:

type: A CWEventType value.
error: An NSError object passed by reference, which upon return will contain the error if an error occurs.

Return a boolean value indicating whether or not an error occurred. True indicates no error occurred.

129.14.16 stopMonitoring(EventType as integer, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Unregister for specific Wi-Fi event notifications.
Notes:

type: A CWEventType value.

error: An NSError object passed by reference, which upon return will contain the error if an error occurs.

Returns a boolean value indicating whether or not an error occurred. true indicates no error occurred.

129.14.17 stopMonitoringAllEvents(byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Unregister for all Wi-Fi event notifications.
Notes:

error: An NSError object passed by reference, which upon return will contain the error if an error occurs.

Returns a boolean value indicating whether or not an error occurred. true indicates no error occurred.

129.14.18 Properties

129.14.19 CWInterface as CWInterfaceMBS

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the CWInterface object for the default Wi-Fi interface.
Notes:

This method is named CWInterface as the name interface would cause an error in Xojo.
(Read only property)

129.14.20 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

129.14.21 Events

129.14.22 bssidDidChangeForWiFiInterfaceWithName(interfaceName as String)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: .

Function: Invoked when the current BSSID changes.
Notes:

interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeBSSIDDidChange event type to register for BSSID event notifications.
Use CWInterfaceMBS.bssid to query the current BSSID.

129.14.23 clientConnectionInterrupted

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: .

Function: Invoked if the connection to the Wi-Fi subsystem is temporarily interrupted.
Notes:

All event notifications for which the Wi-Fi client has registered will be automatically re-registered if the connection is interrupted.
The Wi-Fi client should re-sync any local state which is updated as a result of Wi-Fi event notifications.

129.14.24 clientConnectionInvalidated

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: .

Function: Invoked if the connection to the Wi-Fi subsystem is permanently invalidated.

129.14.25 countryCodeDidChangeForWiFiInterfaceWithName(interfaceName as String)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: .

Function: Invoked when the currently adopted country code changes.
Notes:

interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeCountryCodeDidChange event type to register for country code

event notifications.
Use CWInterfaceMBS.countryCode to query the currently adopted country code.

129.14.26 linkDidChangeForWiFiInterfaceWithName(interfaceName as String)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: .

Function: Invoked when the Wi-Fi link state changes.
Notes:

interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeLinkDidChange event type to register for link event notifications.

129.14.27 linkQualityDidChangeForWiFiInterfaceWithName(interfaceName as String, rssi as Integer, transmitRate as double)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: .

Function: Invoked when the Wi-Fi link quality changes.
Notes:

interfaceName: The name of the Wi-Fi interface.
rssi: The RSSI value for the currently associated network on the Wi-Fi interface.
transmitRate: The transmit rate for the currently associated network on the Wi-Fi interface.

Use startMonitoring with the CWEventTypeLinkQualityDidChange event type to register for link quality event notifications.
Use CWInterfaceMBS.rssiValue and CWInterfaceMBS.transmitRate to query the current RSSI and transmit rate, respectively.

129.14.28 modeDidChangeForWiFiInterfaceWithName(interfaceName as String)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: .

Function: Invoked when the Wi-Fi operating mode changes.
Notes:

interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeModeDidChange event type to register for interface mode event

notifications.
Use CWInterfaceMBS.interfaceMode to query the current operating mode.

129.14.29 powerStateDidChangeForWiFiInterfaceWithName(interfaceName as String)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: .

Function: Invoked when the Wi-Fi power state changes.
Notes:

interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypePowerDidChange event type to register for power event notifications.
Use CWInterfaceMBS.powerOn to query the current Wi-Fi power state.

129.14.30 rangingReportEventForWiFiInterfaceWithName(interfaceName as String, rangingData() as Dictionary, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: .

Function: Invoked when WiFi ranging measurement completed.
Notes:

interfaceName: The name of the Wi-Fi interface.
rangingData: Dictionary containing distance measurement data.

Use startMonitoring with the CWEventTypeRangingReportEvent event type to register for ranging event notifications.

129.14.31 scanCacheUpdatedForWiFiInterfaceWithName(interfaceName as String)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: .

Function: Invoked when the Wi-Fi interface scan cache is updated with new scan results.
Notes:

interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeScanCacheUpdated event type to register for scan cache event notifications.

Use CWInterfaceMBS.cachedScanResults to query scan cache results from the last scan.

129.14.32 ssidDidChangeForWiFiInterfaceWithName(interfaceName as String)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: .

Function: Invoked when the current SSID changes.
Notes:

interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeSSIDDidChange event type to register for SSID event notifications.
Use CWInterfaceMBS.ssidData or CWInterfaceMBS.ssid to query the current SSID.

129.14.33 virtualInterfaceStateChangedForWiFiInterfaceWithName(interfaceName as String)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: .

Function: Invoked when any state of WiFi virtual interface changes.
Notes:

interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeVirtualInterfaceStateChanged event type to register for virtual interface state changed notifications.

129.14.34 Constants

129.14.35 CWEventTypeBSSIDDidChange = 3

MBS MacFrameworks Plugin, Plugin Version: 18.2.

Function: One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
Notes: Posted when the current BSSID of any Wi-Fi interface changes.

129.14.36 CWEventTypeCountryCodeDidChange = 4

MBS MacFrameworks Plugin, Plugin Version: 18.2.

Function: One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
Notes: Posted when the adopted country code of any Wi-Fi interface changes.

129.14.37 CWEventTypeLinkDidChange = 5

MBS MacFrameworks Plugin, Plugin Version: 18.2.

Function: One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
Notes: Posted when the link state for any Wi-Fi interface changes.

129.14.38 CWEventTypeLinkQualityDidChange = 6

MBS MacFrameworks Plugin, Plugin Version: 18.2.

Function: One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
Notes: Posted when the RSSI or transmit rate for any Wi-Fi interface changes.

129.14.39 CWEventTypeModeDidChange = 7

MBS MacFrameworks Plugin, Plugin Version: 18.2.

Function: One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
Notes: Posted when the operating mode of any Wi-Fi interface changes.

129.14.40 CWEventTypeNone = 0

MBS MacFrameworks Plugin, Plugin Version: 18.2.

Function: One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
Notes: No event type specified.

129.14.41 CWEventTypePowerDidChange = 1

MBS MacFrameworks Plugin, Plugin Version: 18.2.

Function: One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
Notes: Posted when the power state of any Wi-Fi interface changes.

129.14.42 CWEventTypeRangingReportEvent = 10

MBS MacFrameworks Plugin, Plugin Version: 18.2.

Function: One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
Notes: Posted when WiFi ranging measurement completed.

129.14.43 CWEventTypeScanCacheUpdated = 8

MBS MacFrameworks Plugin, Plugin Version: 18.2.

Function: One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
Notes: Posted when the scan cache of any Wi-Fi interface is updated with new scan results.

129.14.44 CWEventTypeSSIDDidChange = 2

MBS MacFrameworks Plugin, Plugin Version: 18.2.

Function: One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
Notes: Posted when the current SSID of any Wi-Fi interface changes.

129.14.45 CWEventTypeVirtualInterfaceStateChanged = 9

MBS MacFrameworks Plugin, Plugin Version: 18.2.

Function: One of the Wi-Fi event types used in CWWiFiClientMBS.startMonitoring.
Notes: Posted when any state of any Wi-Fi virtual interface changes.

129.15 class DarwinPingMBS

129.15.1 class DarwinPingMBS

MBS Network Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class to do a ping on Mac OS X.
Deprecated: This item is deprecated and should no longer be used. **Notes:** This class has still issues, so you may prefer to run ping in the shell class.

129.15.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.4pr10

129.15.3 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.4pr10

129.15.4 Methods

129.15.5 Ping(HostToPing as string, TimeOutMS as Integer, TimeToLife as Integer) as Integer

MBS Network Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Starts a syncron ping.
Notes:

This method does not return until the time passed or the ping response was received.
Return value is a platform dependend error code. 0 is successful.

129.15.6 SimplePing(HostToPing as string, NumberOfPacketsToSend as Integer, PingTimeoutInSeconds as Integer, ReturnimmediatelyAfterReply as Integer) as Integer

MBS Network Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Starts an asyncron ping.
Notes:

This method will call the events and return when it finished.
This method can be called in a thread.

Return value is a platform dependend error code. 0 is successful.

129.15.7 Properties

129.15.8 HostToPing as String

MBS Network Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The value used in the Ping command.
Notes: (Read only property)

129.15.9 NumberOfPacketsToSend as Integer

MBS Network Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The value used in the Ping method.
Notes: (Read only property)

129.15.10 PingTimeoutInSeconds as Integer

MBS Network Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The ping timeout to use.
Notes:

0 for default.
(Read only property)

129.15.11 ReturnimmediatelyAfterReply as Integer

MBS Network Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The value used in the Ping method.
Notes: (Read only property)

129.15.12 TimeToLife as Integer

MBS Network Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time to life value for the ping packets.
Notes:

a value between 0 and 255.
(Read only property)

129.15.13 Events

129.15.14 AddressResolved(ip as string)

MBS Network Plugin, Plugin Version: 4.2, Platform: macOS, Targets: .

Function: The IP for the domain name was resolved.

129.15.15 Finished(NumberPacketsSent as Integer, NumberPacketsReceived as Integer)

MBS Network Plugin, Plugin Version: 4.2, Platform: macOS, Targets: .

Function: The pings have finished.

129.15.16 NextPing(PacketSequenceNumber as Integer)

MBS Network Plugin, Plugin Version: 4.2, Platform: macOS, Targets: .

Function: We are starting the next ping now.

129.15.17 Response(PacketSequenceNumber as Integer, ttl as Integer, RoundTripTimeInMS as Double)

MBS Network Plugin, Plugin Version: 4.2, Platform: macOS, Targets: .

Function: Got a response for the given packet.

129.15.18 SentError(PacketSequenceNumber as Integer)

MBS Network Plugin, Plugin Version: 4.2, Platform: macOS, Targets: .

Function: A packet could not be sent.

129.15.19 SentSuccess(PacketSequenceNumber as Integer)

MBS Network Plugin, Plugin Version: 4.2, Platform: macOS, Targets: .

Function: The packet has sent successfull.

129.15.20 Timeout(PacketSequenceNumber as Integer)

MBS Network Plugin, Plugin Version: 4.2, Platform: macOS, Targets: .

Function: A timeout was reached for the given packet.

129.16 class DatagramMBS

129.16.1 class DatagramMBS

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a datagram.

129.16.2 Blog Entries

- MBS Xojo Plugins, version 19.1pr1

129.16.3 Blog Entries

- MBS Xojo Plugins, version 19.1pr1

129.16.4 Properties

129.16.5 Address as String

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The address of the datagram.
Notes:

This is an IPv4.
(Read and Write property)

129.16.6 Data as String

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The data of the datagram.
Notes: (Read and Write property)

129.16.7 Length as Integer

MBS Network Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Length of Data in bytes.
Notes: (Read and Write property)

129.16.8 Port as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The port of the datagram.
Notes: (Read and Write property)

129.16.9 rawAddress as MemoryBlock

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The raw address.
Notes:

This is socket address structure as used in C.
(Read and Write property)

129.17 class DNSLookupMBS

129.17.1 class DNSLookupMBS

MBS Network Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for the result of a Lookup query.
Example:

```
dim d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
MsgBox "No DNS Server available?"
else
MsgBox DNSLookupMBS.FormatIP(d.Address)
end if
```

129.17.4 Methods

129.17.5 Addresses(index as Integer) as string

MBS Network Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the address with the given index for this host.
Example:

```
dim d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
MsgBox "No DNS Server available?"
else
dim c as Integer = d.AddressesCount-1
for i as Integer = 0 to c
MsgBox d.FormatIP(d.Addresses(i))
next
end if
```

Notes: Index from 0 to count-1.

129.17.6 Aliases(index as Integer) as string

MBS Network Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the aliasname for the given index.
Example:

```
dim d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
MsgBox "No DNS Server available?"
else
dim c as Integer = d.AliasCount-1
for i as Integer = 0 to c
MsgBox d.Aliases(i)
next

end if
```

Notes: Index is from 0 to count-1.

129.17.7 FormatIP(ip as string) as string

MBS Network Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Formats an IP from binary representation into string representation.
Example:

```
dim s as string = DNSLookupMBS.ParseIPv4("65.66.67.68")

MsgBox s // in binary representation of that IP

dim t as string = DNSLookupMBS.FormatIP(s)

MsgBox t
```

Notes:

Formats both IPv4 and IPv6 IP addresses in binary representation into human readable text.
On Windows IPv6 is only supported on Windows Vista and newer.
Returns empty string on failure.

129.17.8 LookupHostbyAddress(HostAddressBinary as string) as DNSLookupMBS

MBS Network Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the DNS server for information about a host IP address.
Example:

```
dim l as DNSLookupMBS
dim a as string

a = DNSLookupMBS.ParseIPv4("17.254.0.91")

// try it...
l = DNSLookupMBS.LookupHostbyAddress(a)

// success...
MsgBox l.Name
```

Notes:

The address must be a 4 byte IP address like the ones returned by DNSLookupMBS.Address.
Returns nil on any error.

129.17.9 LookupHostbyAddressMT(HostAddressBinary as string) as DNSLookupMBS

MBS Network Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the DNS server for information about a host IP address.
Example:

```
dim l as DNSLookupMBS
dim a as string

a = DNSLookupMBS.ParseIPv4("17.254.0.91")

// try it...
l = DNSLookupMBS.LookupHostbyAddressMT(a)

// success...
MsgBox l.Name
```

Notes:

Same as LookupHostbyAddress, but with additional multithreading.

The address must be a 4 byte IP address like the ones returned by DNSLookupMBS.Address.
Returns nil on any error.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

129.17.10 LookupHostbyName(HostName as string) as DNSLookupMBS

MBS Network Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the DNS server for information about a host name.
Example:

```
dim s as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.monkeybreadsoftware.de")

dim c as Integer = s.AddressesCount-1
for i as Integer = 0 to c
dim ss as string = s.Addresses(i)
print str(s.FormatIP(ss))
next
```

Notes:

Will fail if you pass an IP as an host. (e.g. 10.20.30.40)
Returns nil on any error.
See also:

- 129.17.11 LookupHostbyName(HostName as string, AddressType as Integer) as DNSLookupMBS 20719

129.17.11 LookupHostbyName(HostName as string, AddressType as Integer) as DNSLookupMBS

MBS Network Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the DNS server for information about a host name.
Example:

```
dim s as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("ipv6.google.com", DNSLookupMBS.AddressTypeIPv6)

if s<>nil then
dim c as Integer = s.AddressesCount-1
for i as Integer = 0 to c
dim ss as string = s.Addresses(i)
print str(s.FormatIP(ss))
next
end if

s = DNSLookupMBS.LookupHostbyName("www.six.heise.de", DNSLookupMBS.AddressTypeIPv6)

if s<>nil then
dim c as Integer = s.AddressesCount-1
for i as Integer = 0 to c
dim ss as string = s.Addresses(i)
print str(s.FormatIP(ss))
next
end if
```

Notes:

Will fail if you pass an IP as an host. (e.g. 10.20.30.40)
Returns nil on any error.

IPv6 on Windows does not work with this method.
See also:

- 129.17.10 LookupHostbyName(HostName as string) as DNSLookupMBS 20718

129.17.12 LookupHostbyNameMT(HostName as string) as DNSLookupMBS

MBS Network Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the DNS server for information about a host name.
Example:

```
dim s as DNSLookupMBS = DNSLookupMBS.LookupHostbyNameMT("www.monkeybreadsoftware.de")

dim c as Integer = s.AddressesCount-1
for i as Integer = 0 to c
dim ss as string = s.Addresses(i)
print str(s.FormatIP(ss))
next
```

Notes:

Same as LookupHostbyName, but with additional multithreading.

Will fail if you pass an IP as an host. (e.g. 10.20.30.40)
Returns nil on any error.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 129.17.13 LookupHostbyNameMT(HostName as string, AddressType as Integer) as DNSLookupMBS 20720

129.17.13 LookupHostbyNameMT(HostName as string, AddressType as Integer) as DNSLookupMBS

MBS Network Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the DNS server for information about a host name.
Example:

```
dim s as DNSLookupMBS = DNSLookupMBS.LookupHostbyNameMT("ipv6.google.com", DNSLookupMBS.AddressTypeIPv6)

if s<>nil then
dim c as Integer = s.AddressesCount-1
```

```
for i as Integer = 0 to c
dim ss as string = s.Addresses(i)
print str(s.FormatIP(ss))
next
end if

s = DNSLookupMBS.LookupHostbyNameMT("www.six.heise.de", DNSLookupMBS.AddressTypeIPv6)

if s<>nil then
dim c as Integer = s.AddressesCount-1
for i as Integer = 0 to c
dim ss as string = s.Addresses(i)
print str(s.FormatIP(ss))
next
end if
```

Notes:

Same as LookupHostbyName, but with additional multithreading.

Will fail if you pass an IP as an host. (e.g. 10.20.30.40)
Returns nil on any error.

IPv6 on Windows does not work with this method.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 129.17.12 LookupHostbyNameMT(HostName as string) as DNSLookupMBS 20720

129.17.14 ParseIPv4(ip as string) as string

MBS Network Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses an IP address in IPv4 format.
Example:

```
dim s as string = DNSLookupMBS.ParseIPv4("65.66.67.68")

MsgBox s // in binary representation of that IP

dim t as string = DNSLookupMBS.FormatIP(s)
```

```
MsgBox t
```

Notes:

Returns empty string on failure.
Works only for IPv4 strings.

129.17.15 ParseIPv6(ip as string) as string

MBS Network Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses an IP address in IPv6 format.
Example:

```
dim s as string = DNSLookupMBS.ParseIPv6("2001:0db8:85a3:08d3:1319:8a2e:0370:7344")

MsgBox s // in binary representation of that IP

dim t as string = DNSLookupMBS.FormatIP(s)

MsgBox t
```

Notes:

Returns empty string on failure.
Works only for IPv6 strings.

129.17.16 Properties

129.17.17 Address as String

MBS Network Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The primary address of the host.
Example:

```
dim d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
MsgBox "No DNS Server available?"
else
MsgBox DNSLookupMBS.FormatIP(d.Address)
end if
```

Notes:

On TCP/IP based system the address is 4 bytes long binary string.
(Read and Write property)

129.17.18 AddressesCount as Integer

MBS Network Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of addresses for this host.
Example:

```
dim d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
MsgBox "No DNS Server available?"
else
MsgBox str(d.AddressesCount)
end if
```

Notes: (Read and Write property)

129.17.19 AddressType as Integer

MBS Network Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of the address format.
Example:

```
dim d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
MsgBox "No DNS Server available?"
else
MsgBox str(d.AddressType) // shows 2 for IPv4
end if
```

Notes:

2 for IPv2

10 for IPv10
(Read and Write property)

129.17.20 AliasCount as Integer

MBS Network Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of aliases for this host.
Example:

```
dim d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
MsgBox "No DNS Server available?"
else
MsgBox str(d.AliasCount)
end if
```

Notes: (Read and Write property)

129.17.21 Name as String

MBS Network Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the host.
Example:

```
dim d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
MsgBox "No DNS Server available?"
else
MsgBox d.Name
end if
```

Notes: (Read and Write property)

129.17.22 Constants

129.17.23 AddressTypeIPv4 = 2

MBS Network Plugin, Plugin Version: 10.4.

Function: One of the address types.
Notes: An IPv4 address.

129.17.24 AddressTypeIPv6 = 10

MBS Network Plugin, Plugin Version: 10.4.

Function: One of the address types.
Notes: An IPv6 address.

129.18 class DNSServiceAddrInfoMBS

129.18.1 class DNSServiceAddrInfoMBS

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Windows, Targets: All.

Function: The class to query IP Address for hostname asynchronously.
Notes:

Queries for the IP address of a hostname by using either Multicast or Unicast DNS.
Subclass of the DNSServiceBaseMBS class.

129.18.4 Methods

129.18.5 AddrInfo(InterfaceIndex as Integer, protocol as Integer, HostName as string) as boolean

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Windows, Targets: All.

Function: Queries for the IP address of a hostname by using either Multicast or Unicast DNS.
Notes:

interfaceIndex: The interface on which to issue the query. Passing 0 causes the query to be sent on all active interfaces via Multicast or the primary interface via Unicast.
protocol: Pass in kDNSServiceProtocol_IPv4 to look up IPv4 addresses, or kDNSServiceProtocol_IPv6 to look up IPv6 addresses, or both to look up both kinds. If neither flag is set, the system will apply an intelligent heuristic, which is (currently) that it will attempt to look up both, except:

If "hostname" is a wide-area unicast DNS hostname (i.e. not a ".local." name) but this host has no routable IPv6 address, then the call will not try to look up IPv6 addresses for "hostname", since any addresses it found would be unlikely to be of any use anyway. Similarly, if this host has no routable IPv4 address, the call will not try to look up IPv4 addresses for "hostname".

hostname: The fully qualified domain name of the host to be queried for.

Lasterror is set to kDNSServiceErr_NoError (0) on success (any subsequent, asynchronous errors are delivered to the callback), otherwise returns an error code indicating the error that occurred.

Returns false on any error and true on success. Please check lasterror property when false is returned.

129.18.6 Available as boolean

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Windows, Targets: All.

Function: Whether this class is available for use.
Notes: Older versions of Bonjour did not have such functions, so there it may not be available.

129.18.7 Events

129.18.8 ServiceAddrInfo(Flags as Integer, InterfaceIndex as Integer, ErrorCode as Integer, AddressFamily as Integer, IP as string, SockAddr as MemoryBlock, HostName as string, ttl as Integer)

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Windows, Targets: .

Function: The event called when something is found.
Notes:

Flags: Possible values are kDNSServiceFlagsMoreComing and kDNSServiceFlagsAdd.
interfaceIndex: The interface to which the answers pertain.
errorCode: Will be kDNSServiceErr_NoError (0) on success, otherwise will indicate the failure that occurred. Other parameters are undefined if errorCode is nonzero.
hostname: The fully qualified domain name of the host to be queried for.
address: IPv4 or IPv6 address.
ttl: If the client wishes to cache the result for performance reasons, the TTL indicates how long the client may legitimately hold onto this result, in seconds. After the TTL expires, the client should consider the result no longer valid, and if it requires this data again, it should be re-fetched with a new query. Of course, this only applies to clients that cancel the asynchronous operation when they get a result. Clients that leave the asynchronous operation running can safely assume that the data remains valid until they get another callback telling them otherwise.

129.18.9 Constants

129.18.10 kAddressFamilyIPv4 = 2

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the address family constants.
Notes: IPv4 protocol

129.18.11 kAddressFamilyIPv6 = 30

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the address family constants.
Notes: IPv6 protocol

129.18.12 kProtocolAuto = 0

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the protocols constants.
Notes: Automatic decide.

129.18.13 kProtocolIPv4 = 1

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the protocols constants.
Notes: IPv4 protocol

129.18.14 kProtocolIPv6 = 2

MBS Network Plugin, Plugin Version: 15.0.

Function: One of the protocols constants.
Notes: IPv6 protocol

129.19 class DNSServiceBaseMBS

129.19.1 class DNSServiceBaseMBS

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: The base DNS Service class.

129.19.2 Blog Entries

129.19.4 Methods

129.19.5 Available as boolean

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Whether Bonjour (zeroconfig) is installed and useable.
Notes: If this function returns true, all the needed stuff is installed and the function have been loaded.

129.19.6 Close

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Stops the current request and releases all used memory.
Notes: This is done automatically for you by the destructor.

129.19.7 ConstructFullName(Service as string, regtype as string, domain as string) as string

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Concatenate a three-part domain name (as returned by the above callbacks) into a properly-escaped full domain name.
Notes:

Note that events in the above functions ALREADY ESCAPE strings where necessary.

service: The service name - any dots or backslashes must NOT be escaped. May be "" (to construct a PTR record name, e.g. "_ftp._tcp.apple.com.").
regtype: The service type followed by the protocol, separated by a dot (e.g. "_ftp._tcp").
domain: The domain name, e.g. "apple.com.". Literal dots or backslashes, if any, must be escaped, e.g. "1st\. Floor.apple.com."

Returns 0 on success, -1 on error.

129.19.8 GetDaemonVersion as Integer

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Queries the version of the daemon.
Notes: Value is zero on any error.

129.19.9 Initialize

MBS Network Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Initializes API.
Notes:

On Windows the plugin calls this internally at startup of application.
Now if your app installs Bonjour while running, you can call this method to let the plugin load the bonjour dll.
After successful call, the available functions return true.

Does nothing on Mac OS X or Linux.

129.19.10 Running as boolean

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: True if there is a running request.

129.19.11 Properties

129.19.12 Handle as Integer

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: The handle for this request.
Notes: (Read and Write property)

129.19.13 Lasterror as Integer

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: The last error code reported.
Notes:

0 if the function succeeded.
-1 if the function used was not available.
See the kError constants for possible errors.
(Read and Write property)

129.19.14 Constants

129.19.15 kClassIN = 1

MBS Network Plugin, Plugin Version: 10.1.

Function: The DNS class for Internet services.

129.19.16 kErrorAlreadyRegistered = -65547

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.17 kErrorBadFlags = -65543

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.18 kErrorBadInterfaceIndex = -65552

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.19 kErrorBadParam = -65540

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.20 kErrorBadReference = -65541

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.21 kErrorBadState = -65542

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.22 kErrorBadTime = -65559

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.23 kErrorDoubleNAT = -65558

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.24 kErrorFirewall = -65550

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.25 kErrorIncompatible = -65551

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.26 kErrorInvalid = -65549

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.27 kErrorNameConflict = -65548

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.28 kErrorNATTraversal = -65557

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.29 kErrorNoAuth = -65555

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.30 kErrorNoError = 0

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.31 kErrorNoMemory = -65539

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.32 kErrorNoSuchKey = -65556

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.33 kErrorNoSuchName = -65538

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.34 kErrorNoSuchRecord = -65554

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.35 kErrorNotInitialized = -65545

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.36 kErrorRefused = -65553

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.37 kErrorUnknown = -65537

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.38 kErrorUnsupported = -65544

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the error constants.

129.19.39 kFlagsAdd = 2

MBS Network Plugin, Plugin Version: 10.1.

Function: A flag for domain enumeration and browse/query events.
Notes: "Default" applies only to enumeration and is only valid in conjuction with "Add". An enumeration callback with the "Add" flag NOT set indicates a "Remove", i.e. the domain is no longer valid.

129.19.40 kFlagsAllowRemoteQuery = & h200

MBS Network Plugin, Plugin Version: 10.1.

Function: Flag for creating a record for which we will answer remote queries (queries from hosts more than one hop away; hosts not directly connected to the local link).

129.19.41 kFlagsBrowseDomains = & h40

MBS Network Plugin, Plugin Version: 10.1.

Function: Flags for specifying domain enumeration type in DNSServiceEnumerateDomains.
Notes: BrowseDomains enumerates domains recommended for browsing, RegistrationDomains enumerates

domains recommended for registration.

129.19.42 kFlagsDefault = 4

MBS Network Plugin, Plugin Version: 10.1.

Function: A flag for domain enumeration and browse/query events.
Notes: "Default" applies only to enumeration and is only valid in conjuction with "Add". An enumeration callback with the "Add" flag NOT set indicates a "Remove", i.e. the domain is no longer valid.

129.19.43 kFlagsForceMulticast = & h400

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the flags.
Notes: Flag for signifying that a query or registration should be performed exclusively via multicast DNS, even for a name in a domain (e.g. foo.apple.com.) that would normally imply unicast DNS.

129.19.44 kFlagsLongLivedQuery = & h100

MBS Network Plugin, Plugin Version: 10.1.

Function: Flag for creating a long-lived unicast query for the QueryRecord call.

129.19.45 kFlagsMoreComing = 1

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the flags used for the events.
Notes: MoreComing indicates to a callback that at least one more result is queued and will be delivered following immediately after this one. Applications should not update their UI to display browse results when the MoreComing flag is set, because this would result in a great deal of ugly flickering on the screen. Applications should instead wait until until MoreComing is not set, and then update their UI. When MoreComing is not set, that doesn't mean there will be no more answers EVER, just that there are no more answers immediately available right now at this instant. If more answers become available in the future they will be delivered as usual.

129.19.46 kFlagsNoAutoRename = 8

MBS Network Plugin, Plugin Version: 10.1.

Function: The flag for specifying renaming behavior on name conflict when registering non-shared records.
Notes: By default, name conflicts are automatically handled by renaming the service. NoAutoRename overrides this behavior - with this flag set, name conflicts will result in a callback. The NoAutorename flag is only valid if a name is explicitly specified when registering a service (i.e. the default name is not used.)

129.19.47 kFlagsRegistrationDomains = & h80

MBS Network Plugin, Plugin Version: 10.1.

Function: Flags for specifying domain enumeration type in DNSServiceEnumerateDomains.
Notes: BrowseDomains enumerates domains recommended for browsing, RegistrationDomains enumerates domains recommended for registration.

129.19.48 kFlagsShared = & h10

MBS Network Plugin, Plugin Version: 10.1.

Function: Flag for registering individual records on a connected DNSService.
Notes: Shared indicates that there may be multiple records with this name on the network (e.g. PTR records). Unique indicates that the record's name is to be unique on the network (e.g. SRV records).

129.19.49 kFlagsUnique = & h20

MBS Network Plugin, Plugin Version: 10.1.

Function: Flag for registering individual records on a connected DNSService.
Notes: Shared indicates that there may be multiple records with this name on the network (e.g. PTR records). Unique indicates that the record's name is to be unique on the network (e.g. SRV records).

129.19.50 kInterfaceIndexAny = 0

MBS Network Plugin, Plugin Version: 10.1.

Function: The constant to use for interface index to target any interface.

129.19.51 kInterfaceIndexLocalOnly = -1

MBS Network Plugin, Plugin Version: 10.1.

Function: The constant to use for interface index to target the local interface.

129.19.52 kMaxDomainName = 1005

MBS Network Plugin, Plugin Version: 10.1.

Function: Maximum length, in bytes, of a domain name represented as an *escaped* C-String including the final trailing dot, and the C-String terminating NULL at the end.

129.19.53 kMaxServiceName = 64

MBS Network Plugin, Plugin Version: 10.1.

Function: Maximum length, in bytes, of a service name represented as a literal C-String, including the terminating NULL at the end.

129.19.54 kTypeA = 1

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Host address.

129.19.55 kTypeA6 = 38

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: IPv6 address (deprecates AAAA)

129.19.56 kTypeAAAA = 28

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Ip6 Address.

129.19.57 kTypeAFSDB = 18

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: AFS cell database.

129.19.58 kTypeANY = 255

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Wildcard match.

129.19.59 kTypeATMA = 34

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: ATM Address

129.19.60 kTypeAXFR = 252

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Transfer zone of authority.

129.19.61 kTypeCERT = 37

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Certification record.

129.19.62 kTypeCNAME = 5

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Canonical name.

129.19.63 kTypeDNAME = 39

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Non-terminal DNAME (for IPv6)

129.19.64 kTypeEID = 31

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Endpoint identifier.

129.19.65 kTypeGPOS = 27

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Geographical position (withdrawn).

129.19.66 kTypeHINFO = 13

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Host information.

129.19.67 kTypeISDN = 20

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: ISDN calling address.

129.19.68 kTypeIXFR = 251

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Incremental zone transfer.

129.19.69 kTypeKEY = 25

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Security key.

129.19.70 kTypeKX = 36

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Key Exchange

129.19.71 kTypeLOC = 29

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Location Information.

129.19.72 kTypeMAILA = 254

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Transfer mail agent records.

129.19.73 kTypeMAILB = 253

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Transfer mailbox records.

129.19.74 kTypeMB = 7

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Mailbox domain name.

129.19.75 kTypeMD = 3

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Mail destination.

129.19.76 kTypeMF = 4

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Mail forwarder.

129.19.77 kTypeMG = 8

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Mail group member.

129.19.78 kTypeMINFO = 14

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Mailbox information.

129.19.79 kTypeMR = 9

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Mail rename name.

129.19.80 kTypeMX = 15

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Mail routing information.

129.19.81 kTypeNAPTR = 35

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Naming Authority PoinTeR

129.19.82 kTypeNIMLOC = 32

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Nimrod Locator.

129.19.83 kTypeNS = 2

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Authoritative server.

129.19.84 kTypeNSAP = 22

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: NSAP address.

129.19.85 kTypeNSAP_PTR = 23

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Reverse NSAP lookup (deprecated).

129.19.86 kTypeNULL = 10

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Null resource record.

129.19.87 kTypeNXT = 30

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Next domain (security).

129.19.88 kTypeOPT = 41

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: EDNS0 option (meta-RR)

129.19.89 kTypePTR = 12

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Domain name pointer.

129.19.90 kTypePX = 26

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: X.400 mail mapping.

129.19.91 kTypeRP = 17

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Responsible person.

129.19.92 kTypeRT = 21

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Router.

129.19.93 kTypeSIG = 24

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Security signature.

129.19.94 kTypeSINK = 40

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Kitchen sink (experimentatl)

129.19.95 kTypeSOA = 6

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Start of authority zone.

129.19.96 kTypeSRV = 33

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Server Selection.

129.19.97 kTypeTKEY = 249

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Transaction key.

129.19.98 kTypeTSIG = 250

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Transaction signature.

129.19.99 kTypeTXT = 16

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: One or more text strings.

129.19.100 kTypeWKS = 11

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: Well known service.

129.19.101 kTypeX25 = 19

MBS Network Plugin, Plugin Version: 10.1.

Function: One of the DNS Service type constants.
Notes: X-25 calling address.

129.20 class DNSServiceBrowseMBS

129.20.1 class DNSServiceBrowseMBS

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: A class for Apple's implementation of ZeroConfig named Bonjour.
Notes:

This class allows you to browse for services on the local network using Rendezvous.

This class requires Mac OS X 10.3 or Windows (with installed Bonjour support and the dnssd.dll) to work. Use DNSServiceDiscoveryBrowseMBS if you want to support Mac OS X 10.2.

common error codes:

```
kDNSServiceErr_NoError              = 0
kDNSServiceErr_Unknown              = -65537 (=& hFFFE FFFF)
kDNSServiceErr_NoSuchName           = -65538
kDNSServiceErr_NoMemory             = -65539
kDNSServiceErr_BadParam             = -65540
kDNSServiceErr_BadReference         = -65541
kDNSServiceErr_BadState             = -65542
kDNSServiceErr_BadFlags             = -65543
kDNSServiceErr_Unsupported          = -65544
kDNSServiceErr_NotInitialized       = -65545
kDNSServiceErr_AlreadyRegistered    = -65547
kDNSServiceErr_NameConflict         = -65548
kDNSServiceErr_Invalid              = -65549
kDNSServiceErr_Incompatible         = -65551 (client library incompatible with daemon)
kDNSServiceErr_BadinterfaceIndex    = -65552
```

Subclass of the DNSServiceBaseMBS class.

129.20.2 Methods

129.20.3 Browse(InterfaceIndex as Integer, servicetype as string, domain as string) as boolean

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: Asynchronously create a DNS Service browser to search for matching services in the local network.
Notes:

servicetype:

The type of service.

domain:
The domain in which to find the service.

Returns true if successfull.
The ServiceBrowse event may be called till this browse request is closed.

You need to keep this object alive (keep a reference in a window, a module or your app class) so you can receive events.

In a perfect application you use DNSServiceDomainEnumerationMBS class to enumerate which domains you should use.

Returns false on any error and true on success. Please check lasterror property when false is returned.

129.20.4 Events

129.20.5 ServiceBrowse(Flags as Integer, InterfaceIndex as Integer, ErrorCode as Integer, ServiceName as string, RegType as string, Domain as string)

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: .

Function: New service found or lost one.
Example:

```
sub ServiceBrowse(Flags as Integer, InterfaceIndex as Integer, ErrorCode as Integer, ServiceName as string, RegType as string, Domain as string)
// example for event implementation

const kDNSServiceFlagsAdd = 2
const kDNSServiceFlagsRemove = 0
const kDNSServiceFlagsMoreComing = 1
const kDNSServiceFlagsFinished = 0

dim Added as boolean = bitwiseAnd(flags, kDNSServiceFlagsAdd) = kDNSServiceFlagsAdd
dim Removed as boolean = bitwiseAnd(flags, kDNSServiceFlagsAdd) = kDNSServiceFlagsRemove

dim MoreComing as boolean = bitwiseAnd(flags, kDNSServiceFlagsMoreComing) = kDNSServiceFlagsMoreComing
dim Finished as boolean = bitwiseAnd(flags, kDNSServiceFlagsMoreComing) = kDNSServiceFlagsFinished
```

```
// work with the booleans to decide what to do.

end sub
```

Notes:

Values for flags:

kDNSServiceFlagsAdd	= 2
kDNSServiceFlagsRemove	= 0 (i.e. bit not set)
kDNSServiceFlagsMoreComing	= 1
kDNSServiceFlagsFinished	= 0 (i.e. bit not set)

MoreComing indicates to a Browse callback that another result is queued. Applications should not update their UI to display browse results when the MoreComing flag is set, instead deferring the update until the callback's flag is Finished.

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

InterfaceIndex can be kInterfaceIndexLocalOnly, kInterfaceIndexAny or a positive index for the interface index (1 = first device).
For interface indexes, please also check NetworkInterfaceMBS class.

129.21 class DNSServiceDiscoveryBrowseMBS

129.21.1 class DNSServiceDiscoveryBrowseMBS

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for Apple's implementation of ZeroConfig named Bonjour.
Deprecated: This item is deprecated and should no longer be used. You can use DNSServiceBrowseMBS instead. **Notes:**

This class allows you to browse for services on the local network using Bonjour.

Common error codes for Rendevouz:

kDNSServiceDiscoveryUnknownErr	-65537
kDNSServiceDiscoveryNoSuchNameErr	-65538
kDNSServiceDiscoveryNoMemoryErr	-65539
kDNSServiceDiscoveryBadParamErr	-65540
kDNSServiceDiscoveryBadReferenceErr	-65541
kDNSServiceDiscoveryBadStateErr	-65542
kDNSServiceDiscoveryBadFlagsErr	-65543
kDNSServiceDiscoveryUnsupportedErr	-65544
kDNSServiceDiscoveryNotInitializedErr	-65545
kDNSServiceDiscoveryNoCache	-65546
kDNSServiceDiscoveryAlreadyRegistered	-65547
kDNSServiceDiscoveryNameConflict	-65548
kDNSServiceDiscoveryInvalid	-65549
kDNSServiceDiscoveryMemFree	-65792

But several other Mac OS error codes may also be there.
This class requires Mac OS X 10.2 to work. Use DNSServiceBrowseMBS if you want to support Mac OS X 10.3 and Windows.

Not available on Mac OS X 10.9.

129.21.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr4
- MBS Xojo / Real Studio Plugins, version 13.2pr7

129.21.3 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr4
- MBS Xojo / Real Studio Plugins, version 13.2pr7

129.21.4 Methods

129.21.5 Available as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether Bonjour (zeroconfig) is installed.
Notes: If this function returns true, all the needed stuff is installed and the function have been loaded.

129.21.6 Browse(servicetype as string, domain as string) as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Asynchronously create a DNS Service browser to search for matching services in the local network.
Notes:

servicetype:
The type of service.

domain:
The domain in which to find the service.

Returns true if successfull.
The ServiceBrowse event may be called till this browse request is closed.

129.21.7 Close

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Stops the current request and releases all used memory.

129.21.8 Running as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: True if there is a running request.

129.21.9 Properties

129.21.10 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The handle for this request.
Notes: (Read only property)

129.21.11 Events

129.21.12 ServiceBrowse(message as Integer, name as string, type as string, domain as string, flags as Integer)

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: .

Function: New service found or lost one.
Notes:

If message=0 a new service was found. Message=1 means that a service was removed.
Flags=1 means that more data is coming. Flags=0 means the end of the current list of services. But several minutes later when a new Mac connects to the network another ServiceBrowse Event may inform you, even if flags was 0.

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

129.22 class DNSServiceDiscoveryDomainEnumerationMBS

129.22.1 class DNSServiceDiscoveryDomainEnumerationMBS

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for Apple's implementation of ZeroConfig named Bonjour.
Deprecated: This item is deprecated and should no longer be used. You can use DNSServiceDomainEnumerationMBS instead. **Notes:**

This class allows you to enumerate domains.

Common error codes for Rendevouz:

kDNSServiceDiscoveryUnknownErr	-65537
kDNSServiceDiscoveryNoSuchNameErr	-65538
kDNSServiceDiscoveryNoMemoryErr	-65539
kDNSServiceDiscoveryBadParamErr	-65540
kDNSServiceDiscoveryBadReferenceErr	-65541
kDNSServiceDiscoveryBadStateErr	-65542
kDNSServiceDiscoveryBadFlagsErr	-65543
kDNSServiceDiscoveryUnsupportedErr	-65544
kDNSServiceDiscoveryNotInitializedErr	-65545
kDNSServiceDiscoveryNoCache	-65546
kDNSServiceDiscoveryAlreadyRegistered	-65547
kDNSServiceDiscoveryNameConflict	-65548
kDNSServiceDiscoveryInvalid	-65549
kDNSServiceDiscoveryMemFree	-65792

But several other Mac OS error codes may also be there.
This class requires Mac OS X 10.2 to work. Use DNSServiceDomainEnumerationMBS if you want to support Mac OS X 10.3 and Windows.

Not available on Mac OS X 10.9.

129.22.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr4
- MBS Xojo / Real Studio Plugins, version 13.2pr7

129.22.3 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr4
- MBS Xojo / Real Studio Plugins, version 13.2pr7

129.22.4 Methods

129.22.5 Available as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether Bonjour (zeroconfig) is installed.
Notes: If this function returns true, all the needed stuff is installed and the function have been loaded.

129.22.6 Close

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Stops the current request and releases all used memory.

129.22.7 EnumerateDomains(domaintype as Integer) as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Asynchronously create a DNS Domain Enumerator to search for domains in the local network.
Notes:

domaintype:
A flag indicating whether you are looking for recommended registration domains (value=1, e.g. equivalent to the AppleTalk zone list in the AppleTalk Control Panel) or recommended browsing domains (value=0, e.g. equivalent to the AppleTalk zone list in the Chooser).

Returns true if successfull.
The ServiceDomainEnumeration event may be called till this enumerate request is closed.

129.22.8 Running as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: True if there is a running request.

129.22.9 Properties

129.22.10 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The handle for this request.
Notes: (Read only property)

129.22.11 Events

129.22.12 ServiceDomainEnumeration(message as Integer, domain as string, flags as Integer)

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: .

Function: Domains changed.
Notes:

Meaning of message:

0: Domain found.
1: Domain found (and should be selected by default).
2: Domain has been removed from network.

Flags=1 means that more data is coming. Flags=0 means the end of the current list of services. But several minutes later when a new Mac connects to the network another ServiceLookup Event may inform you, even if flags was 0.

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

129.23 class DNSServiceDiscoveryRegisterMBS

129.23.1 class DNSServiceDiscoveryRegisterMBS

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for Apple's implementation of ZeroConfig named Bonjour.
Deprecated: This item is deprecated and should no longer be used. You can use DNSServiceRegisterMBS instead. **Notes:**

This class allows you to register names on the local network using Bonjour.

Common error codes for Rendevouz:

kDNSServiceDiscoveryUnknownErr	-65537
kDNSServiceDiscoveryNoSuchNameErr	-65538
kDNSServiceDiscoveryNoMemoryErr	-65539
kDNSServiceDiscoveryBadParamErr	-65540
kDNSServiceDiscoveryBadReferenceErr	-65541
kDNSServiceDiscoveryBadStateErr	-65542
kDNSServiceDiscoveryBadFlagsErr	-65543
kDNSServiceDiscoveryUnsupportedErr	-65544
kDNSServiceDiscoveryNotInitializedErr	-65545
kDNSServiceDiscoveryNoCache	-65546
kDNSServiceDiscoveryAlreadyRegistered	-65547
kDNSServiceDiscoveryNameConflict	-65548
kDNSServiceDiscoveryInvalid	-65549
kDNSServiceDiscoveryMemFree	-65792

But several other Mac OS error codes may also be there.
This class requires Mac OS X 10.2 to work. Use DNSServiceRegisterMBS if you want to support Mac OS X 10.3 and Windows.

Not available on Mac OS X 10.9.

129.23.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr4

- MBS Xojo / Real Studio Plugins, version 13.2pr7

129.23.4 Methods

129.23.5 Available as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether Bonjour (zeroconfig) is installed.
Notes: If this function returns true, all the needed stuff is installed and the function have been loaded.

129.23.6 Close

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Stops the current request and releases all used memory.

129.23.7 Register(servicename as string, servicetype as string, domain as string, port as Integer, text as string) as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Register a named service with DNS Service Discovery.
Notes:

servicename:
The name of this service instance (e.g. "Steve's Printer")

servicetype:
The service type (e.g. "_printer._tcp."
See RFC 2782 (DNS SRV) and this website:
http://www.iana.org/assignments/port-numbers

domain:
The domain in which to register the service (e.g. "apple.com.")

port:
The local port on which this service is being offered (in network byte order)

text:
Optional protocol-specific additional information

Returns true if successfull.
The ServiceRegistration event may be called till this registration request is closed.

129.23.8 Running as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: True if there is a running request.

129.23.9 UpdateText(data as string, ttl as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Changes the TXT Record.
Notes:

data is the TXT Record composed of Pascal Strings.
ttl = time to live.
Returns an error code. (0=success)

129.23.10 Properties

129.23.11 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The handle for this request.
Notes: (Read only property)

129.23.12 Text as String

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last TXT Record text used.
Notes: (Read only property)

129.23.13 Events

129.23.14 ServiceRegistration(errorcode as Integer)

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: .

Function: Registration was done.
Notes:

errorcode is 0 if successfull.

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

129.24 class DNSServiceDiscoveryResolveMBS

129.24.1 class DNSServiceDiscoveryResolveMBS

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for Apple's implementation of ZeroConfig named Bonjour.
Deprecated: This item is deprecated and should no longer be used. You can use DNSServiceResolveMBS instead. **Notes:**

This class allows you to lookup names on the local network using Bonjour.

Common error codes for Rendevouz:

kDNSServiceDiscoveryUnknownErr	-65537
kDNSServiceDiscoveryNoSuchNameErr	-65538
kDNSServiceDiscoveryNoMemoryErr	-65539
kDNSServiceDiscoveryBadParamErr	-65540
kDNSServiceDiscoveryBadReferenceErr	-65541
kDNSServiceDiscoveryBadStateErr	-65542
kDNSServiceDiscoveryBadFlagsErr	-65543
kDNSServiceDiscoveryUnsupportedErr	-65544
kDNSServiceDiscoveryNotInitializedErr	-65545
kDNSServiceDiscoveryNoCache	-65546
kDNSServiceDiscoveryAlreadyRegistered	-65547
kDNSServiceDiscoveryNameConflict	-65548
kDNSServiceDiscoveryInvalid	-65549
kDNSServiceDiscoveryMemFree	-65792

But several other Mac OS error codes may also be there.
This class requires Mac OS X 10.2 to work. Use DNSServiceResolveMBS if you want to support Mac OS X 10.3 and Windows.

Not available on Mac OS X 10.9.

129.24.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr4
- MBS Xojo / Real Studio Plugins, version 13.2pr7

129.24.3 Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr4
- MBS Xojo / Real Studio Plugins, version 13.2pr7

129.24.4 Methods

129.24.5 Available as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether Bonjour (zeroconfig) is installed.
Notes: If this function returns true, all the needed stuff is installed and the function have been loaded.

129.24.6 Close

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Stops the current request and releases all used memory.

129.24.7 Lookup(servicename as string, servicetype as string, domain as string) as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Resolved a named instance of a service to its address, port, and (optionally) a text description.
Notes:

servicename:
The name of the service instance.

servicetype:
The type of service.

domain:
The domain in which to find the service.

Returns true if successfull.
The ServiceLookup event may be called till this lookup request is closed.

129.24.8 Running as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: True if there is a running request.

129.24.9 Properties

129.24.10 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The handle for this request.
Notes: (Read only property)

129.24.11 Events

129.24.12 ServiceLookup(ip as string, port as Integer, text as string, flags as Integer)

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: .

Function: Lookup got something.
Notes:

IP is a string like "192.168.1.14".
Flags=1 means that more data is coming. Flags=0 means the end of the current list of services. But several minutes later when a new Mac connects to the network another ServiceLookup Event may inform you, even if flags was 0.

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

129.25 class DNSServiceDomainEnumerationMBS

129.25.1 class DNSServiceDomainEnumerationMBS

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: A class for Apple's implementation of ZeroConfig named Bonjour.
Notes:

This class allows you to enumerate domains.

This class requires Mac OS X 10.3 or Windows (with installed Bonjour support and the dnssd.dll) to work. Use DNSServiceDiscoveryBrowseMBS if you want to support Mac OS X 10.2.

common error codes:

```
kDNSServiceErr_NoError              = 0
kDNSServiceErr_Unknown              = -65537 (=& hFFFE FFFF)
kDNSServiceErr_NoSuchName           = -65538
kDNSServiceErr_NoMemory             = -65539
kDNSServiceErr_BadParam             = -65540
kDNSServiceErr_BadReference         = -65541
kDNSServiceErr_BadState             = -65542
kDNSServiceErr_BadFlags             = -65543
kDNSServiceErr_Unsupported          = -65544
kDNSServiceErr_NotInitialized       = -65545
kDNSServiceErr_AlreadyRegistered    = -65547
kDNSServiceErr_NameConflict         = -65548
kDNSServiceErr_Invalid              = -65549
kDNSServiceErr_Incompatible         = -65551 (client library incompatible with daemon)
kDNSServiceErr_BadinterfaceIndex    = -65552
```

Subclass of the DNSServiceBaseMBS class.

129.25.2 Methods

129.25.3 EnumerateDomains(Flags as Integer, InterfaceIndex as Integer) as boolean

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: Asynchronously enumerate domains available for browsing and registration.
Notes:

Note that the names returned are (like all of DNS-SD) UTF-8 strings, and are escaped using standard DNS

escaping rules.
A graphical browser displaying a hierarchical tree-structured view should cut the names at the bare dots to yield individual labels, then de-escape each label according to the escaping rules, and then display the resulting UTF-8 text.

Flags for specifying domain enumeration type in DNSServiceEnumerateDomains.
BrowseDomains enumerates domains recommended for browsing, RegistrationDomains enumerates domains recommended for registration:

```
kDNSServiceFlagsBrowseDomains        = 64
kDNSServiceFlagsRegistrationDomains  = 128
```

You need to keep this object alive (keep a reference in a window, a module or your app class) so you can receive events.
For interface indexes, please also check NetworkInterfaceMBS class.

Returns false on any error and true on success. Please check lasterror property when false is returned.

129.25.4 Events

129.25.5 ServiceDomainEnumeration(flags as Integer, interfaceIndex as Integer, errorcode as Integer, Domain as string)

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: .

Function: Domains changed.
Notes:

Flags uses this flags: kFlagsAdd, kFlagsDefault.

"Default" applies only to enumeration and is only valid in conjuction with "Add"

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.
For interface indexes, please also check NetworkInterfaceMBS class.

129.26 class DNSServiceMetaQueryMBS

129.26.1 class DNSServiceMetaQueryMBS

MBS MacOSX Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Queries all Bonjour services.
Notes: Useful to learn what services are available. This queries the bonjour cache.

129.26.2 Blog Entries

- MacOSX plugin for iOS

129.26.3 Blog Entries

- MacOSX plugin for iOS

129.26.4 Properties

129.26.5 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

129.26.6 Events

129.26.7 AddService(type as string, domain as string, interfaceName as string, rrtype as Integer, rrclass as Integer)

MBS MacOSX Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: A service was found.

129.26.8 RemoveService(type as string, domain as string, interfaceName as string, rrtype as Integer, rrclass as Integer)

MBS MacOSX Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: A service was removed.
Notes: Remove is only called when a network interface is disabled or if the record expires from the cache. For network efficiency reasons, clients do not send goodbye packets for meta-query PTR records when deregistering a service.

129.27 class DNSServiceRegisterMBS

129.27.1 class DNSServiceRegisterMBS

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: A class for Apple's implementation of ZeroConfig named Bonjour.
Notes:

This class allows you to register names on the local network using Bonjour.

This class requires Mac OS X 10.3 or Windows (with installed Bonjour support and the dnssd.dll) to work. Use DNSServiceDiscoveryBrowseMBS if you want to support Mac OS X 10.2.

common error codes:

kDNSServiceErr_NoError	= 0
kDNSServiceErr_Unknown	= -65537 (=& hFFFE FFFF)
kDNSServiceErr_NoSuchName	= -65538
kDNSServiceErr_NoMemory	= -65539
kDNSServiceErr_BadParam	= -65540
kDNSServiceErr_BadReference	= -65541
kDNSServiceErr_BadState	= -65542
kDNSServiceErr_BadFlags	= -65543
kDNSServiceErr_Unsupported	= -65544
kDNSServiceErr_NotInitialized	= -65545
kDNSServiceErr_AlreadyRegistered	= -65547
kDNSServiceErr_NameConflict	= -65548
kDNSServiceErr_Invalid	= -65549
kDNSServiceErr_Incompatible	= -65551 (client library incompatible with daemon)
kDNSServiceErr_BadinterfaceIndex	= -65552

Subclass of the DNSServiceBaseMBS class.

129.27.2 Blog Entries

- Using ServerSocket with a system chosen port

129.27.3 Blog Entries

- Using ServerSocket with a system chosen port

129.27.4 Methods

129.27.5 AddRecord(rrType as Integer, TXTRecord as string, ttl as Integer)

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Windows, Targets: All.

Function: Add a record to a registered service.
Notes:

Lasterror is set.

The name of the record will be the same as the registered service's name. The record can later be updated or deregistered by UpdateRecord() or RemoveRecord().

rrtype: The type of the record (e.g. kTypeTXT, kTypeSRV, etc)
data: The raw rdata to be contained in the added resource record.
ttl: The time to live of the resource record, in seconds. Pass 0 to use a default value.

Returns false on any error and true on success. Please check lasterror property when false is returned.

129.27.6 Register(Flags as Integer, interfaceIndex as Integer, servicename as string, servicetype as string, domain as string, host as string, port as Integer, txtRecord as string) as boolean

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: Register a service that is discovered via Browse() and Resolve() calls.
Notes:

Flag for specifying renaming behavior on name conflict when registering non-shared records. NoAutorename is only valid if a name is explicitly specified when registering a service (ie the default name is not used.)

kDNSServiceFlagsNoAutoRename = 8,
kDNSServiceFlagsAutoRename = 0 (i.e. bit not set)

You need to keep this object alive (keep a reference in a window, a module or your app class) so you can receive events.

In a perfect application you use DNSServiceDomainEnumerationMBS class to enumerate which domains you should use.
For interface indexes, please also check NetworkInterfaceMBS class.

Returns false on any error and true on success. Please check lasterror property when false is returned.

129.27.7 RemoveRecord

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Windows, Targets: All.

Function: Remove a record previously added to a service record set via AddTextRecord.
Notes: Returns false on any error and true on success. Please check lasterror property when false is returned.

129.27.8 UpdateRecord(TXTRecord as string, ttl as Integer)

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Changes the TXT Record.
Notes:

data is the TXT Record composed of Pascal Strings.
ttl = time to live.

Returns false on any error and true on success. Please check lasterror property when false is returned.

129.27.9 Events

129.27.10 ServiceRegistration(flags as Integer, errorcode as Integer, Name as string, RegType as string, Domain as string)

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: .

Function: Registration was done.
Notes: Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

129.28 class DNSServiceRegisterRecordMBS

129.28.1 class DNSServiceRegisterRecordMBS

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Windows, Targets: All.

Function: A class for Apple's implementation of ZeroConfig named Bonjour.
Notes:

This class is to register a name record with the dns service.
Subclass of the DNSServiceBaseMBS class.

129.28.2 Methods

129.28.3 RegisterRecord(Flags as Integer, interfaceIndex as Integer, fullname as string, rrtype as Integer, rrClass as Integer, data as string, ttl as Integer) as boolean

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Windows, Targets: All.

Function: Registers a record on the DNS system.
Example:

```
const kDNSServiceClass_IN = 1
const kDNSServiceType_SRV = 33
const kDNSServiceFlagsShared = & h10
const kDNSServiceFlagsUnique = & h20
```

Notes:

flags: Possible values are kDNSServiceFlagsShared or kDNSServiceFlagsUnique (see flag type definitions for details).
interfaceIndex: If non-zero, specifies the interface on which to register the record (the index for a given interface is determined via the if_nametoindex() family of calls.) Passing 0 causes the record to be registered on all interfaces. See "Constants for specifying an interface index" for more details.
fullname: The full domain name of the resource record.
rrtype: The numerical type of the resource record (e.g. kDNSServiceType_PTR, kDNSServiceType_SRV, etc)
rrclass: The class of the resource record (usually kDNSServiceClass_IN)
data: the raw rdata, as it is to appear in the DNS record.
ttl: The time to live of the resource record, in seconds. Pass 0 to use a default value.

Lasterror is set. kDNSServiceErr_NoError on success (any subsequent, asynchronous errors are delivered to the event), otherwise returns an error code indicating the error that occurred (the event is never invoked)

You need to keep this object alive (keep a reference in a window, a module or your app class) so you can receive events.
For interface indexes, please also check NetworkInterfaceMBS class.

Returns false on any error and true on success. Please check lasterror property when false is returned.

129.28.4 UpdateRecord(TXTRecord as string, ttl as Integer)

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Windows, Targets: All.

Function: Changes the TXT Record.
Notes:

data is the TXT Record composed of Pascal Strings.
ttl = time to live.

Returns false on any error and true on success. Please check lasterror property when false is returned.

129.28.5 Events

129.28.6 ServiceRegistration(flags as Integer, errorcode as Integer)

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Windows, Targets: .

Function: Registration was done.
Notes: Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

129.29 class DNSServiceResolveMBS

129.29.1 class DNSServiceResolveMBS

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: A class for Apple's implementation of ZeroConfig named Bonjour.
Notes:

This class allows you to lookup names on the local network using Bonjour.

This class requires Mac OS X 10.3 or Windows (with installed Bonjour support and the dnssd.dll) to work. Use DNSServiceDiscoveryBrowseMBS if you want to support Mac OS X 10.2.

common error codes:

```
kDNSServiceErr_NoError              = 0
kDNSServiceErr_Unknown              = -65537 (=& hFFFE FFFF)
kDNSServiceErr_NoSuchName           = -65538
kDNSServiceErr_NoMemory             = -65539
kDNSServiceErr_BadParam             = -65540
kDNSServiceErr_BadReference         = -65541
kDNSServiceErr_BadState             = -65542
kDNSServiceErr_BadFlags             = -65543
kDNSServiceErr_Unsupported          = -65544
kDNSServiceErr_NotInitialized       = -65545
kDNSServiceErr_AlreadyRegistered    = -65547
kDNSServiceErr_NameConflict         = -65548
kDNSServiceErr_Invalid              = -65549
kDNSServiceErr_Incompatible         = -65551 (client library incompatible with daemon)
kDNSServiceErr_BadinterfaceIndex    = -65552
```

Subclass of the DNSServiceBaseMBS class.

129.29.2 Methods

129.29.3 Resolve(InterfaceIndex as Integer, servicename as string, servicetype as string, domain as string) as boolean

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Resolves a named instance of a service to its address, port, and (optionally) a text description.
Notes:

You need to keep this object alive (keep a reference in a window, a module or your app class) so you can

receive events.

If you call this method in response to a browse call, please pass the domain string you got in the ServiceBrowse event and do not replace it with something else.
For interface indexes, please also check NetworkInterfaceMBS class.

Returns false on any error and true on success. Please check lasterror property when false is returned.

129.29.4 Events

129.29.5 ServiceResolve(flags as Integer, InterfaceIndex as Integer, ErrorCode as Integer, Fullname as string, Hosttarget as string, Port as Integer, TxtRecord as string)

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: .

Function: Resolve got something.
Notes:

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.
For interface indexes, please also check NetworkInterfaceMBS class.

129.30 class NetSNMPMBS

129.30.1 class NetSNMPMBS

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: The class to do SNMP queries.
Example:

```
dim s as new NetSNMPMBS

s.Community = "demopublic"
s.IP = "test.net-snmp.org"

dim r as string = s.Query("system.sysUpTime.0")

MsgBox r
```

Notes:

Performs a SNMP GET query.
Using version 1, no authentication and no security options.

129.30.8 Methods

129.30.9 Constructor

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: The constructor.

129.30.10 Destructor

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: The destructor.

129.30.11 Query(ObjectID as String) as String

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: Peforms a SNMP Get Query
Example:

```
dim s as new NetSNMPMBS

s.Community = "demopublic"
s.IP = "test.net-snmp.org"

dim r as string = s.Query("system.sysUpTime.0")

MsgBox r
```

Notes:

Please set community and IP properties before.
Lasterror and ErrorMessage properties are set.

129.30.12 QueryMT(ObjectID as String) as String

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: Peforms a SNMP Get Query
Example:

```
dim s as new NetSNMPMBS

s.Community = "demopublic"
s.IP = "test.net-snmp.org"

dim r as string = s.Query("system.sysUpTime.0")

MsgBox r
```

Notes:

Please set community and IP properties before.
Lasterror and ErrorMessage properties are set.

Same as Query, but thread friendly.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

129.30.13 Properties

129.30.14 Community as String

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: The community name to use.
Notes:

e.g. "public"
(Read and Write property)

129.30.15 ErrorMessage as String

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: The last error message as text.
Notes: (Read and Write property)

129.30.16 IP as String

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: The IP and port to connect to.
Notes:

e.g. "192.168.2.5:1234"
(Read and Write property)

129.30.17 LastError as Integer

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

129.30.18 MaximumReceiveBufferSize as Integer

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: The maximum bytes to allocate for receiving buffer.
Notes:

By default 100000 bytes.
(Read and Write property)

129.30.19 Retries as Integer

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: Number of retries.
Notes:

Default is -1 to use system default.
(Read and Write property)

129.30.20 TimeOut as Integer

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: Timeout in seconds.
Notes:

Default is -1 to use system default.
(Read and Write property)

129.31 Globals

129.31.1 DNSAddressToNameIPv6MBS(HostAddress as string) as string

MBS Network Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resolves an IP to it's name.
Notes:

Only for IPv6.
Returns "" on any error (like no name known).
Improved in 13.1 plugins to work on all platforms.

129.31.2 Blog Entries

- MBS Real Studio Plugins, version 13.1pr13

129.31.3 DNSAddressToNameMBS(HostAddress as string) as string

MBS Network Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resolves an IP to it's name.
Notes:

Only for IPv4.
Returns "" on any error (like no name known).
Improved in 13.1 plugins to work on all platforms.

129.31.4 Blog Entries

- MBS Real Studio Plugins, version 13.1pr13

129.31.5 DNSNameToAddressIPv6MBS(HostName as string) as string

MBS Network Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resolves the IP address for this name.
Example:

msgBox dnsnameToAddressIPv6MBS("localhost") + endofLine + dnsnameToAddressMBS("localhost")

Notes:

Only for IPv6.
Returns "" on any error (like no name known).
Improved in 13.1 plugins to work on all platforms.

129.31.6 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.3pr1
- MBS Real Studio Plugins, version 13.1pr13

129.31.7 DNSNameToAddressMBS(HostName as string) as string

MBS Network Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resolves the IP address for this name.
Example:

msgBox dnsnameToAddressIPv6MBS("localhost") + endofLine + dnsnameToAddressMBS("localhost")

Notes:

Only for IPv4.
Returns "" on any error (like no name known).
Improved in 13.1 plugins to work on all platforms.

This may not work on Windows or Linux with Bonjour host names!

- NetworkAvailableMBS

129.31.9 OptionReuseAddressMBS(extends s as SocketCore) as Boolean

MBS Network Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries whether to allow reuse of same port.
Notes:

Internally this uses SOL_SOCKET/SO_REUSEADDR option.
Raises UnsupportedOperationException in case of failure.
See also:

- 129.31.10 OptionReuseAddressMBS(extends s as SocketCore, assigns value as Boolean) 20782

129.31.10 OptionReuseAddressMBS(extends s as SocketCore, assigns value as Boolean)

MBS Network Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets whether to allow reuse of same port.
Notes:

Internally this uses SOL_SOCKET/SO_REUSEADDR option.

see also
http://stackoverflow.com/questions/14388706/socket-options-so-reuseaddr-and-so-reuseport-how-do-they-differ-do-they-mean-t

Raises UnsupportedOperationException in case of failure.

- MBS Xojo / Real Studio Plugins, version 17.0pr1

See also:

- 129.31.9 OptionReuseAddressMBS(extends s as SocketCore) as Boolean 20781

129.31.12 OptionReusePortMBS(extends s as SocketCore) as Boolean

MBS Network Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Query whether reuse of same port and IP is allowed.
Notes:

Internally this uses SOL_SOCKET/SO_REUSEPORT option.
On Windows, this is not supported, so this property sets ReuseAddress.
Raises UnsupportedOperationException in case of failure.
See also:

- 129.31.13 OptionReusePortMBS(extends s as SocketCore, assigns value as Boolean) 20783

129.31.13 OptionReusePortMBS(extends s as SocketCore, assigns value as Boolean)

MBS Network Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets whether to allow reuse of same port and IP.
Notes:

Internally this uses SOL_SOCKET/SO_REUSEPORT option.
On Windows, this is not supported, so this property sets ReuseAddress.
Raises UnsupportedOperationException in case of failure.

129.31.14 Blog Entries

- MBS Xojo / Real Studio Plugins, version 17.0pr1

See also:

- 129.31.12 OptionReusePortMBS(extends s as SocketCore) as Boolean 20782

129.31.15 VerifyEmailMBS(email as string, NetworkCheck as boolean) as Integer

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Targets: All.

Function: Checks if an email can be valid.
Example:

```
// should be okay
dim r1 as Integer = VerifyEmailMBS("testing@monkeybreadsoftware.de", true)

// should fail
dim r2 as Integer = VerifyEmailMBS("testing@monkeybreadsoftware.test", true)

MsgBox str(r1)+EndOfLine+str(r2)
```

Notes:

If NetworkCheck is true, the DNS server is queries for whether an email service is available (MX Record).
Else we only do a syntax check.

Result is zero for scuccess or one of this error codes:

IDN support is not included. You may need to preprocess email if you need that.

1 Invalid character in local part of email address.
2 Missing dot in local part of email address.
3 Invalid character in local part of email address.
4 Unescaped special character in local part of email address.
5 No local part in email address.
6 Dot found before @ character.
7 No domain in email address.
8 Domain starting with dot.
9 Domain is not allowed to have two dots.
10 Invalid character in domain of email address.
11 Special character in domain of email address.
12 No dot in domain in email address.
13 Domain longer than allowed in email address.
14 DNS failed to find mail server for the domain in email address. (Windows)
15 DNS failed to find mail server for the domain in email address. (Mac/Linux)
16 DNS did not find a mail server for the domain in email address.
17 DNS failed to find mail server for the domain in email address
18 DNS server answers try again too often.

If you have a DNS server, which will redirect all mistyped domain names to a search website, this won't really work well and detect too many valid domain names.

- 12.2, page 10: News

129.31.18 ClearOptionsMBS(extends s as SocketCore)

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears all options.
Notes:

Works only on BSD Sockets and if the socket handle value is valid.
Raises UnsupportedOperationException in case of failure.

129.31.19 OptionKeepAliveMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the keep alive.
Notes:

Works only on BSD Sockets and if the socket handle value is valid.
Returns -1 on any error.

Enables the periodic transmission of messages on a connected socket. Should the connected party fail to respond to these messages, the connection is considered broken and processes using the socket are notified via a SIGPIPE signal when attempting to send data.
See also:

- 129.31.20 OptionKeepAliveMBS(extends s as SocketCore, assigns value as Integer) 20785

129.31.20 OptionKeepAliveMBS(extends s as SocketCore, assigns value as Integer)

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the keep alive.
Notes:

Works only on BSD Sockets and if the socket handle value is valid.

Enables the periodic transmission of messages on a connected socket. Should the connected party fail to respond to these messages, the connection is considered broken and processes using the socket are notified via a SIGPIPE signal when attempting to send data.

129.31.25 OptionMutliCastTTLMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the multicast time to live value.
Notes:

Works only on BSD Sockets and if the socket handle value is valid.
Raises UnsupportedOperationException in case of failure.
See also:

- 129.31.26 OptionMutliCastTTLMBS(extends s as SocketCore, assigns value as Integer) 20787

129.31.26 OptionMutliCastTTLMBS(extends s as SocketCore, assigns value as Integer)

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the multicast time to live value.
Example:

```
dim t as new UDPSocket

// create a socket
t.Port=80
t.Connect

// wait a second to connect
app.DoEvents 1000

// shows handle
MsgBox str(t.Handle)

// shows current value
MsgBox str(t.OptionMutliCastTTLMBS)
t.OptionMutliCastTTLMBS=10

// shows new value
MsgBox str(t.OptionMutliCastTTLMBS)
```

Notes:

Works only on BSD Sockets and if the socket handle value is valid.
Raises UnsupportedOperationException in case of failure.
See also:

- 129.31.25 OptionMutliCastTTLMBS(extends s as SocketCore) as Integer 20786

129.31.27 OptionReceiveBufferSizeMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the receiving buffer size.
Notes:

The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Raises UnsupportedOperationException in case of failure.
See also:

- 129.31.28 OptionReceiveBufferSizeMBS(extends s as SocketCore, assigns value as Integer) 20788

129.31.28 OptionReceiveBufferSizeMBS(extends s as SocketCore, assigns value as Integer)

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adjusts the receiving buffer size.
Notes:

The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Raises UnsupportedOperationException in case of failure.

See also:

- 129.31.27 OptionReceiveBufferSizeMBS(extends s as SocketCore) as Integer 20788

129.31.30 OptionSendBufferSizeMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the sending buffer size.
Example:

```
dim s as new UDPSocket

s.Port = 0
s.Connect
```

MsgBox str(s.OptionSendBufferSizeMBS)

Notes:

The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Raises UnsupportedOperationException in case of failure.
See also:

- 129.31.31 OptionSendBufferSizeMBS(extends s as SocketCore, assigns value as Integer) 20789

129.31.31 OptionSendBufferSizeMBS(extends s as SocketCore, assigns value as Integer)

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adjusts the sending buffer size.
Notes:

The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Raises UnsupportedOperationException in case of failure.

See also:

- 129.31.30 OptionSendBufferSizeMBS(extends s as SocketCore) as Integer 20788

129.31.33 OptionTOSMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the type of service value.
Notes:

Works only on BSD Sockets and if the socket handle value is valid.
Raises UnsupportedOperationException in case of failure.
See also:

- 129.31.34 OptionTOSMBS(extends s as SocketCore, assigns value as Integer) 20790

129.31.34 OptionTOSMBS(extends s as SocketCore, assigns value as Integer)

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the type of service value.
Notes:

Works only on BSD Sockets and if the socket handle value is valid.
Possible values:
IPTOS_MINCOST = 2
IPTOS_RELIABILITY = 4
IPTOS_THROUGHPUT = 8
IPTOS_LOWDELAY = 16

You may want to set it after connecting.
Raises UnsupportedOperationException in case of failure.
See also:

- 129.31.33 OptionTOSMBS(extends s as SocketCore) as Integer 20789

129.31.35 OptionTTLMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the time to live value.
Notes:

Works only on BSD Sockets and if the socket handle value is valid.
Raises UnsupportedOperationException in case of failure.
See also:

- 129.31.36 OptionTTLMBS(extends s as SocketCore, assigns value as Integer) 20790

129.31.36 OptionTTLMBS(extends s as SocketCore, assigns value as Integer)

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the time to live value.
Example:

```
dim t as new TCPSocket

// create a socket
t.Port=80
t.Address="www.apple.com"
t.Connect
```

```
// wait a second to connect
app.DoEvents 1000

// shows handle
MsgBox str(t.Handle)

// shows current value
MsgBox str(t.OptionTTLMBS)
t.OptionTTLMBS=10

// shows new value
MsgBox str(t.OptionTTLMBS)
```

Notes:

Works only on BSD Sockets and if the socket handle value is valid.
Raises UnsupportedOperationException in case of failure.
See also:

- 129.31.35 OptionTTLMBS(extends s as SocketCore) as Integer 20790

129.31.37 OptionTypeMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the type of socket.
Example:

```
dim u as new UDPSocket

u.Port = 9000
u.Connect

// shows 2 for UDP
MsgBox str(u.OptionTypeMBS)
```

Notes:

Type is 1 for stream socket, 2 for datagram socket, 3 for raw socket, 4 for reliably-delivered message socket and 5 for a sequenced packet stream.
Raises UnsupportedOperationException in case of failure.

129.31.38 Blog Entries

- MBS Real Studio Plugins, version 13.0pr6

129.32 class NetworkInterfaceMBS

129.32.1 class NetworkInterfaceMBS

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: The class for unix network interfaces.
Example:

```
// show IPv4 addresses
dim interfaces() as NetworkInterfaceMBS = NetworkInterfaceMBS.AllInterfaces

for each n as NetworkInterfaceMBS in interfaces
MsgBox n.name+": "+n.IPv4
next
```

Notes:

For Windows, please use WindowsEthernetMBS class.
The values are not updated for this class. Just when you create the interface objects, you get a snapshot of the current state.

- Tip of the day: Find network interfaces by name
- MBS Real Studio Plugins, version 13.0pr2

129.32.4 Methods

129.32.5 AllInterfaces(Merge as boolean = true) as NetworkInterfaceMBS()

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: Returns array with all interfaces.
Example:

```
// show IPv4 addresses
dim interfaces() as NetworkInterfaceMBS = NetworkInterfaceMBS.AllInterfaces

for each n as NetworkInterfaceMBS in interfaces
MsgBox n.name+": "+n.IPv4
next
```

Notes:

By default we merge several records for the same interface.
You may see one record for each protocol (IPv4, IPv6, LINK layer).

129.32.6 IndexMap as Dictionary

MBS Network Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Targets: All.

Function: Builds a dictionary to map indexes to names.
Example:

```
dim d as Dictionary = NetworkInterfaceMBS.IndexMap
dim lines() as string

for each key as Variant in d.keys
lines.Append key+": "+d.Value(key)
next

MsgBox Join(lines,EndOfLine)
```

Notes:

This is convenient method for the case you need to show list to user.

On Windows requires Windows Vista or newer.

129.32.7 IndexToName(Index as Integer) as string

MBS Network Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Targets: All.

Function: Queries name for network interface with index.
Example:

```
dim Name as string
Name = NetworkInterfaceMBS.IndexToName(1)
msgbox Name
```

Notes: On Windows requires Windows Vista or newer.

129.32.8 IPv4s as string()

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: All IPv4 addresses for this interface.

129.32.9 IPv6s as string()

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: All IPv6 addresses for this interface.

129.32.10 NameToIndex(Name as String) as Integer

MBS Network Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Targets: All.

Function: Queries index for network interface with given name..
Example:

```
dim index as Integer
index = NetworkInterfaceMBS.NameToIndex("en0")
```

Notes: On Windows requires Windows Vista or newer.

129.32.11 Properties

129.32.12 Broadcast as Boolean

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: Whether a broadcast address exists for this interface.
Notes: (Read and Write property)

129.32.13 BroadcastAddress as String

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: The broadcast address.
Notes: (Read and Write property)

129.32.14 Flags as Integer

MBS Network Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Targets: All.

Function: The interface flags.
Notes:

See if.h file in C system headers.
(Read and Write property)

129.32.15 Index as Integer

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: The index of this interface.
Notes: (Read and Write property)

129.32.16 InterfaceIndex as Integer

MBS Network Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Targets: All.

Function: The index of this interface.
Notes:

Index counts by plugin from 0 on the interfaces.
But this is real index from operation system.

On Windows requires Windows Vista or newer.
(Read and Write property)

129.32.17 IPv4 as String

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: The IPv4 address for this interface.
Example:

```
// show IPv4 addresses
dim interfaces() as NetworkInterfaceMBS = NetworkInterfaceMBS.AllInterfaces

for each n as NetworkInterfaceMBS in interfaces
MsgBox n.name+": "+n.IPv4
next
```

Notes: (Read and Write property)

129.32.18 IPv4count as Integer

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: Returns the number of IPv4 addresses for this interface.
Notes: (Read and Write property)

129.32.19 IPv6 as String

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: The IPv6 address for this interface.
Notes: (Read and Write property)

129.32.20 IPv6count as Integer

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: Returns the number of IPv6 addresses for this interface.
Notes: (Read and Write property)

129.32.21 Loopback as Boolean

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: Whether this interface is the loopback interface.
Notes: (Read and Write property)

129.32.22 MAC as String

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: The ethernet hardware address (MAC).
Notes: (Read and Write property)

129.32.23 Multicast as Boolean

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: Whether this interface supports multicast.
Notes: (Read and Write property)

129.32.24 Name as String

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: The name of the network interface.
Notes: (Read and Write property)

129.32.25 Netmask as String

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: The network mask.
Notes:

Returns the IPv4 netmask.
if that one is undefined, returns the IPv6 netmask.
This property is just kept for compatibility.
(Read only property)

129.32.26 NetmaskIPv4 as String

MBS Network Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Targets: All.

Function: The network mask for IPv4.
Notes: (Read and Write property)

129.32.27 NetmaskIPv6 as String

MBS Network Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Targets: All.

Function: The network mask for IPv6.
Notes: (Read and Write property)

129.32.28 Running as Boolean

MBS Network Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Targets: All.

Function: Whether the interface is running (resources allocated).
Notes: (Read and Write property)

129.32.29 Up as Boolean

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: Whether the interface is up.
Notes: (Read and Write property)

129.33 class PacketSocketMBS

129.33.1 class PacketSocketMBS

MBS Network Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: An extension to the socket class for easy sending packets through the net.
Notes:

A packet is made like this:
+0: Size of data block
+4: 4 byte code string
+8: 4 byte for ID
+12: variable data.

The numbers are send in low endian format so this is crossplatform.

This socket subclass can be easily made in Xojo code itself. I did it for several of my applications, so if you like it decide between making it yourself or using this one which may even be faster, because it is written in C?

This class is only available in RB 4.0 or newer, because it crashes on RB 3.5.

As the strings are transferred as binary data you need to take care that you send text e.g. as UTF8 and restore this encoding setting on receiving.
Subclass of the TCPSocket class.

129.33.4 Methods

129.33.5 SendPacket(data as string)

MBS Network Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sends a packet.
Notes: Uses ID=0 and code="" as a shortcut for the long SendPacket call.
See also:

- 129.33.6 SendPacket(data as string,code as string) 20800
- 129.33.7 SendPacket(data as string,code as string,ID as Integer) 20800

129.33.6 SendPacket(data as string,code as string)

MBS Network Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sends a packet.
Notes: Uses ID=0 as a shortcut for the long SendPacket call.
See also:

- 129.33.5 SendPacket(data as string) 20799
- 129.33.7 SendPacket(data as string,code as string,ID as Integer) 20800

129.33.7 SendPacket(data as string,code as string,ID as Integer)

MBS Network Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sends a packet.
Notes:

code and ID are optional.
Code is a 4 byte string to identify the content.
(e.g. "mess" for a message or "link" for a link.)
See also:

- 129.33.5 SendPacket(data as string) 20799
- 129.33.6 SendPacket(data as string,code as string) 20800

129.33.8 Events

129.33.9 ReceivedPacket(data as string,code as string,ID as Integer)

MBS Network Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: .

Function: A packet was received.

129.34 class RAWSocketMBS

129.34.1 class RAWSocketMBS

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for low level and raw sockets.
Example:

```
dim sock as RAWSocketMBS

// create UDP socket
sock = new RAWSocketMBS(RAWSocketMBS.AddressFamilyINet, RAWSocketMBS.SocketTypeDatagram,
RAWSocketMBS.ProtocolUDP)
```

Notes:

Similar to Xojo's built in Socket class, but more low level and with more options.
Raw sockets for things like PING may need root permissions.

129.34.8 Methods

129.34.9 Accept(byref RemoteAddress as String, byref RemotePort as Integer, NewSocket as RAWSocketMBS) as RAWSocketMBS

MBS Network Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Listens for connections on this socket.
Notes: Lasterror is set.

129.34.10 AddressFamilyINet6 as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the address family constants.
Notes:

IPv6
This is a method as value is different.
Mac 30, Windows 23 and Linux 10.

129.34.11 Bind(DestAddr as Ptr, DestAddrByteSize as Integer) as Boolean

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Binds the socket to the given destination address.
Notes:

Set ReuseAddress to bind to an address which already a socket is bound to.
Lasterror is set.
Returns true on success and false on failure.
Please specify with port and IP in destAddress where to bind against.
Structure of DestAddress is OS and address family dependent.
See also:

- 129.34.12 Bind(Port as Integer, IP as string = "") 20803

129.34.12 Bind(Port as Integer, IP as string = "")

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Binds the socket to the given port.
Notes:

If IP is not empty, you can bind the socket to only the given network interface with that IPv4.
Set ReuseAddress to bind to an address which already a socket is bound to.
Lasterror is set.
See also:

- 129.34.11 Bind(DestAddr as Ptr, DestAddrByteSize as Integer) as Boolean 20803

129.34.13 CalcChecksum(data as ptr, ByteCount as Integer) as UInt16

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates checksum for IP header.

129.34.14 Close

MBS Network Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes socket.
Notes: Same as destructor.

129.34.15 Connect(Address as String, Port as Integer, byref ErrorMessage as String) as Boolean

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convenience method to connect.
Notes:

Will parse IPv4/IPv6 or query DNS server for IP and connect.
Returns true on success.
See also:

- 129.34.16 Connect(DestAddr as Ptr, DestAddrByteSize as Integer) as Boolean 20804

129.34.16 Connect(DestAddr as Ptr, DestAddrByteSize as Integer) as Boolean

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Connects to destination address.
Notes:

lasterror is set.
Returns true on success and false on failure.
Please specify with port and IP in destAddress where package is sent to.
Structure of DestAddress is OS and address family dependent.
See also:

- 129.34.15 Connect(Address as String, Port as Integer, byref ErrorMessage as String) as Boolean 20804

129.34.17 Constructor(AddressFamily as Integer, SocketType as Integer, Protocol as Integer)

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Example:

```
dim sock as RAWSocketMBS
```

```
// create UDP socket
sock = new RAWSocketMBS(RAWSocketMBS.AddressFamilyINet, RAWSocketMBS.SocketTypeDatagram,
RAWSocketMBS.ProtocolUDP)
```

Notes:

Please pass valid combination of OS supported sockets.
Raises exception if creation is not possible.
Raw socket requires root access.

129.34.18 Destructor

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: Closes the socket.

129.34.19 htonl(value as UInt32) as UInt32

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert 32bit Integer from network to host byte order.

129.34.20 htons(value as UInt16) as UInt16

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert 16bit Integer from network to host byte order.

129.34.21 inet_addr(IPv4 as String) as UInt32

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts IPv4 to numerical representation.

129.34.22 inet_ntoa(IPv4 as UInt32) as String

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts IPv4 to string representation.

129.34.23 Listen(BackLog as Integer = 2)

MBS Network Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Accepts a new incoming connection.
Notes:

Sockets uses the accept function to enable incoming connection attempts on a socket.
RemoteAddress and RemotePort are set to address of remote peer.

If you like to pass in your own subclass object for NewSocket, we can use that socket object. Otherwise, we make a new RAWSocketMBS object.

Lasterror is set.

129.34.24 ntohl(value as UInt32) as UInt32

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert 32bit Integer from host to network byte order.

129.34.25 ntohs(value as UInt16) as UInt16

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert 16bit Integer from host to network byte order.

129.34.26 Poll

MBS Network Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Polls for activity.
Notes:

Calls events if needed.
This is called automatically via timer by the plugin.

129.34.27 Read(ByteSize as Integer, peek as boolean = false) as MemoryBlock

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read at maximum the given number of bytes in buffer.
Notes:

Pass true for peek if data should not be removed from receiving buffer.
Lasterror is set.

Be aware that you may not get whole packages here, so data may come in several chunks.
For that, please collect the data and look for whether your package is complete or a required end mark arrived.

129.34.28 ReadAll(peek as boolean = false) as MemoryBlock

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read all bytes in buffer.
Example:

```
dim sock as RAWSocketMBS
dim data as MemoryBlock = sock.ReadAll
if data = nil then
// nothing read
else

end if
```

Notes:

Pass true for peek if data should not be removed from receiving buffer.
Lasterror is set.

Be aware that you may not get whole packages here, so data may come in several chunks.
For that, please collect the data and look for whether your package is complete or a required end mark arrived.

129.34.29 ReadDatagram(peek as boolean = false) as DatagramMBS

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a datagram.
Notes:

If peek is true, the data is not removed from read buffer.

On error returns nil.

129.34.30 Send(Data as Ptr, DataByteSize as Integer, Flags as Integer = 0) as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends data.
Notes:

Data is sent to address passed with Connect method.
Returns number of bytes sent.
Lasterror is set.

129.34.31 SendMessage(Data as DatagramMBS) as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a datagram.
Notes:

Please specify with port and address of datagram where package is sent to.
Returns number of bytes sent.
Lasterror is set.
See also:

- 129.34.32 SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer 20808
- 129.34.33 SendMessage(Data as string, IP as String, Port as Integer) as Integer 20809

129.34.32 SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a datagram.
Notes:

Please specify with port and IP where package is sent to.
Returns number of bytes sent.
Lasterror is set.
See also:

- 129.34.31 SendMessage(Data as DatagramMBS) as Integer 20808
- 129.34.33 SendMessage(Data as string, IP as String, Port as Integer) as Integer 20809

129.34.33 SendMessage(Data as string, IP as String, Port as Integer) as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends data to target.
Notes:

Please specify with port and IP where package is sent to.
Returns number of bytes sent.
Lasterror is set.
See also:

- 129.34.31 SendMessage(Data as DatagramMBS) as Integer 20808
- 129.34.32 SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer 20808

129.34.34 SendTo(Data as Ptr, DataByteSize as Integer, Flags as Integer, DestAddr as Ptr, DestAddrByteSize as Integer) as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends data to dest address.
Example:

```
dim sock as RawSocketMBS
dim Flags as integer
dim r as Integer

// port
dim port as integer = val(iPort.Text)
if port <= 0 or port >= 65535 then
break
MsgBox "Wrong port: "+iPort.Text
Return
end if

// dest address

'/*
'* Socket address, internet style. C declaration for Mac
'*/
'struct sockaddr_in {
'__uint8_t sin_len; // 1 byte, Mac only
'sa_family_t sin_family; // 1 byte
'in_port_t sin_port; // 2 byte in Network byte order
'struct in_addr sin_addr; // 4 byte
'char sin_zero [ 8 ] ; // 8 bytes filler
```

```
' } ;

// convert IPv4 from text to numeric value
dim IP as Uint32 = RAWSocketMBS.inet_addr(iIP.Text)

// create destination address. This is for Mac! Windows and Linux have different structures
dim dest as new MemoryBlock(16)
dest.UInt8Value(0) = dest.size
dest.UInt8Value(1) = RAWSocketMBS.AddressFamilyINet
dest.UInt16Value(2) = RAWSocketMBS.htons(port)
dest.UInt32Value(4) = IP

// message
dim m as string = ConvertEncoding(iMessage.Text, encodings.UTF8)
dim data as MemoryBlock = m

// send
r = sock.SendTo(data, data.size, Flags, dest, dest.size)
```

Notes:

Please specify with port and IP in destAddress where package is sent to.
Returns number of bytes sent. Structure of DestAddress is OS and address family dependent.
Lasterror is set.

129.34.35 Properties

129.34.36 AddressFamily as Integer

MBS Network Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The address family of the socket.
Notes:

This is either RAWSocketMBS.AddressFamilyINet (2) for IPv4 or RAWSocketMBS.AddressFamilyINet6 (Mac 30, Windows 23 and Linux 10) for IPv6.
(Read and Write property)

129.34.37 AvailableBytes as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns number of bytes available for reading.
Notes:

Lasterror is set.
(Read only property)

129.34.38 Broadcast as Boolean

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether broadcasts are allowed.
Notes:

Set to true before sending a broadcast message.
Internally this uses SOL_SOCKET/SO_BROADCAST option.
Lasterror is set.
(Read and Write property)

129.34.39 Handle as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal socket handle.
Notes: (Read and Write property)

129.34.40 IPHeaderIncluded as Boolean

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the OS provides IP header or you.
Notes:

Default is false.
Set to true when you include IP header in data.
(Read and Write property)

129.34.41 Lasterror as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes:

Platform dependent.
(Read and Write property)

129.34.42 LocalIP as String

MBS Network Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries local IP.
Notes:

Can be 0.0.0.0 if unknown.
May only be set if connected or binded.
Lasterror is set.
(Read only property)

129.34.43 LocalPort as Integer

MBS Network Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries local port.
Notes:

Lasterror is set.
Can be -1 if unknown.
(Read only property)

129.34.44 Protocol as Integer

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The socket protocol.
Notes:

The value from constructor.
(Read and Write property)

129.34.45 ReceiveBufferSize as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the receiving buffer size.
Notes:

The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Internally this uses SOL_SOCKET/SO_RCVBUF option.
Lasterror is set.

(Read and Write property)

129.34.46 ReuseAddress as Boolean

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allows reuse of same port.
Notes:

Internally this uses SOL_SOCKET/SO_REUSEADDR option.

see also
http://stackoverflow.com/questions/14388706/socket-options-so-reuseaddr-and-so-reuseport-how-do-they-differ-do-they-mean-t

Lasterror is set.
(Read and Write property)

129.34.47 ReusePort as Boolean

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allow reuse of same port and IP.
Notes:

Internally this uses SOL_SOCKET/SO_REUSEPORT option.
On Windows, this is not supported, so this property sets ReuseAddress.
Lasterror is set.
(Read and Write property)

129.34.48 SendBufferSize as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sending buffer size.
Notes:

The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Internally this uses SOL_SOCKET/SO_SNDBUF option.
Lasterror is set.
(Read and Write property)

129.34.49 SocketError as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The native socket error.
Notes:

Internally this uses SOL_SOCKET/SO_ERROR option.
Lasterror is set.
(Read only property)

129.34.50 SocketType as Integer

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The socket type.
Notes:

The value from constructor.
(Read and Write property)

129.34.51 Events

129.34.52 DataAvailable

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: .

Function: This event is called when new data is available.
Notes: Requires the socket to be bound.

129.34.53 Error

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: .

Function: The event called if socket is in error state.

129.34.54 SendComplete

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: .

Function: The last write operation is done.

129.34.55 Constants

129.34.56 AddressFamilyINet = 2

MBS Network Plugin, Plugin Version: 17.4.

Function: One of the address family constants.
Notes: IPv4

129.34.57 ProtocolICMP = 1

MBS Network Plugin, Plugin Version: 17.4.

Function: One of the protocol constants.
Notes: ICMP

129.34.58 ProtocolIP = 0

MBS Network Plugin, Plugin Version: 17.4.

Function: One of the protocol constants.
Notes: IPv4

129.34.59 ProtocolIPv6 = 41

MBS Network Plugin, Plugin Version: 17.4.

Function: One of the protocol constants.
Notes: IPv6

129.34.60 ProtocolRaw = 255

MBS Network Plugin, Plugin Version: 17.4.

Function: One of the protocol constants.
Notes: Raw protocol

129.34.61 ProtocolTCP = 6

MBS Network Plugin, Plugin Version: 17.4.

Function: One of the protocol constants.
Notes: TCP

129.34.62 ProtocolUDP = 17

MBS Network Plugin, Plugin Version: 17.4.

Function: One of the protocol constants.
Notes: UDP

129.34.63 SocketTypeDatagram = 2

MBS Network Plugin, Plugin Version: 17.4.

Function: One of the socket types.
Notes: Datagram, e.g. UDP.

129.34.64 SocketTypeRaw = 3

MBS Network Plugin, Plugin Version: 17.4.

Function: One of the socket types.
Notes: Raw socket, requires root permissions.

129.34.65 SocketTypeStream = 1

MBS Network Plugin, Plugin Version: 17.4.

Function: One of the socket types.
Notes: Stream socket, e.g. TCP/IP.

129.35 class SSH2ChannelMBS

129.35.1 class SSH2ChannelMBS

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a SSH2 channel.

129.35.4 Methods

129.35.5 Close(Wait as Boolean = true)

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Close a channel.
Notes:

Lasterror is set.
Close an active data channel. In practice this means sending an SSH_MSG_CLOSE packet to the remote host which serves as instruction that no further data will be sent to it. The remote host may still send data back until it sends its own close message in response. To wait for the remote end to close its connection as well, follow this command with WaitClosed.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.

If wait parameter is true, the plugin does a loop to try close until it receives an okay (and not EAGAIN).

129.35.6 Constructor

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.
See also:

- 129.35.7 Constructor(session as SSH2SessionMBS) 20818

129.35.7 Constructor(session as SSH2SessionMBS)

MBS Network Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create new channel.
Notes: May raise UnsupportedOperationException if channel creation fails.
See also:

- 129.35.6 Constructor 20818

129.35.8 Destructor

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

129.35.9 EOF as boolean

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Check a channel's EOF status.
Example:

```
dim s as string
dim channel as SSH2ChannelMBS // your channel

// read all till end of channel
s = ""
do
app.YieldToNextThread
dim r as string = channel.Read(50000)
s = s + r

if channel.LastError = SSH2SessionMBS.kErrorEagain then
// no answer yet
Continue
```

```
elseif channel.LastError = SSH2SessionMBS.kErrorNone then
// we got something
if channel.EOF then
// done?
MsgBox "Result: " + s
exit
end if
else
exit
end if
loop
```

Notes:

Check if the remote host has sent an EOF status for the selected stream.
Returns true if the remote host has sent EOF, otherwise false.
Lasterror is set. On error, this function returns true.

129.35.10 Execute(command as string)

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes something on the server.
Notes:

Lasterror is set.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.

129.35.11 Flush

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flush stream for this channel.
Notes: Lasterror is set.

129.35.12 FlushAll

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flush all streams for this channel.
Notes: Lasterror is set.

129.35.13 FlushExtendedData

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flush extended data stream for this channel.
Notes: Lasterror is set.

129.35.14 FlushStdErr

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flush stderr stream for this channel.
Notes: Lasterror is set.

129.35.15 Read(length as Integer = 65536) as string

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read data from a channel stream.
Example:

```
dim s as string
dim channel as SSH2ChannelMBS // your channel

// read all till end of channel
s = ""
do
app.YieldToNextThread
dim r as string = channel.Read(50000)
s = s + r

if channel.LastError = SSH2SessionMBS.kErrorEagain then
// no answer yet
Continue
elseif channel.LastError = SSH2SessionMBS.kErrorNone then
// we got something
if channel.EOF then
// done?
MsgBox "Result: " + s
exit
end if
else
```

```
exit
end if
loop
```

Notes:

Lasterror is set.
Attempt to read data from a stdout channel stream.
Returns data read.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.
Version up to 18.2 return text marked as UTF-8, but in 18.3 we change to return text without encoding marking. So if you expect UTF-8, you can apply UTF-8 encoding with DefineEncoding.

129.35.16 ReadStdErr(length as Integer = 65536) as string

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read data from a channel stream.
Notes:

Lasterror is set.
Attempt to read data from a stderr channel stream.
Returns data read.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.

129.35.17 RequestPTY(term as string)

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Request a PTY on an established channel.
Notes:

Lasterror is set.
Note that this does not make sense for all channel types and may be ignored by the server despite returning success.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.

129.35.18 SendEOF

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Send EOF to remote server.
Notes:

Lasterror is set.
Tell the remote host that no further data will be sent on the specified channel. Processes typically interpret this as a closed stdin descriptor.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.

129.35.19 SetBlocking(blocking as boolean)

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set or clear blocking mode on channel.

129.35.20 SetEnv(name as string, value as string)

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set an environment variable on the channel.
Notes:

Lasterror is set.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.

129.35.21 Shell

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Request a shell on a channel.
Notes:

Lasterror is set.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.

129.35.22 WaitClosed

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Wait for the remote to close the channel.
Notes:

Lasterror is set.

Enter a temporary blocking state until the remote host closes the named channel. Typically sent after Close in order to examine the exit status.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.

129.35.23 WaitEOF

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Wait for the remote end to acknowledge an EOF request.
Notes:

Lasterror is set.
May give kErrorEAgain error which means you should try again later.

129.35.24 Write(data as MemoryBlock) as Integer

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write data to a channel stdout stream.
Notes:

Lasterror is set.

Write functions will use as much as possible of the buffer and put it into a single SSH protocol packet. This means that to get maximum performance when sending larger files, you should try to always pass in at least 32K of data to this function.

Returns actual number of bytes written. Lasterror being kErrorEagain when it would otherwise block. While kErrorEagain is an error, it isn't really a failure per se.
See also:

- 129.35.25 Write(text as string) as Integer 20824

129.35.25 Write(text as string) as Integer

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write data to a channel stdout stream.
Notes:

Lasterror is set.

Write functions will use as much as possible of the buffer and put it into a single SSH protocol packet. This means that to get maximum performance when sending larger files, you should try to always pass in at least 32K of data to this function.

Returns actual number of bytes written. Lasterror being kErrorEagain when it would otherwise block. While kErrorEagain is an error, it isn't really a failure per se.

Until version 18.2 we send text as UTF-8. Version 18.3 or newer send bytes as they are in whatever encoding your string has.
See also:

- 129.35.24 Write(data as MemoryBlock) as Integer 20823

129.35.26 WriteStdErr(data as MemoryBlock) as Integer

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write data to a channel stderr stream.
Notes:

Lasterror is set.

Write functions will use as much as possible of the buffer and put it into a single SSH protocol packet. This means that to get maximum performance when sending larger files, you should try to always pass in at least 32K of data to this function.

Returns actual number of bytes written. Lasterror being kErrorEagain when it would otherwise block. While kErrorEagain is an error, it isn't really a failure per se.
See also:

- 129.35.27 WriteStdErr(text as string) as Integer 20824

129.35.27 WriteStdErr(text as string) as Integer

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write data to a channel stderr stream.
Notes:

Lasterror is set.

Write functions will use as much as possible of the buffer and put it into a single SSH protocol packet. This means that to get maximum performance when sending larger files, you should try to always pass in at least 32K of data to this function.

Returns actual number of bytes written. Lasterror being kErrorEagain when it would otherwise block. While kErrorEagain is an error, it isn't really a failure per se.

Until version 18.2 we send text as UTF-8. Version 18.3 or newer send bytes as they are in whatever encoding your string has.
See also:

- 129.35.26 WriteStdErr(data as MemoryBlock) as Integer 20824

129.35.28 Properties

129.35.29 ExitStatus as Integer

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the remote exit code.
Notes:

Returns the exit code raised by the process running on the remote host at the other end of the named channel. Note that the exit status may not be available if the remote end has not yet set its status to closed. Returns 0 on failure, otherwise the Exit Status reported by remote host.
(Read only property)

129.35.30 Handle as Integer

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Internal object reference.
Notes: (Read and Write property)

129.35.31 LastError as Integer

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes:

See SSH2SessionMBS.kError* constants.
(Read and Write property)

129.35.32 Session as SSH2SessionMBS

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The session this channel belongs to.
Notes: (Read and Write property)

129.35.33 Tag as Variant

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag value.
Notes:

A property where you can store any value you like.
(Read and Write property)

129.35.34 Events

129.35.35 DataAvailable(Data as string, ErrorChannel as boolean)

MBS Network Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: .

Function: The event for new data coming in.
Notes:

For console app with DoEvents loop or for GUI apps.
Works starting with running Execute as that initializes the DataAvailable event.

ErrorChannel is true, if we got data from the stderr channel instead of stdout channel.

129.36 class SSH2ConnectFailedExceptionMBS

129.36.1 class SSH2ConnectFailedExceptionMBS

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception for an error in the SSH2SessionMBS.Constructor.
Notes: Subclass of the RuntimeException class.

129.37.6 Methods

129.37.7 Banner as string

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the remote banner.
Notes: Once the session has been setup and Handshake has completed successfully, this function can be used to get the server id from the banner each server presents.

129.37.8 CipherNames as String()

MBS Network Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of all ciphers.
Example:

```
// see hash and encryption algorithms available
dim CipherNames() as string = SSH2SessionMBS.CipherNames
dim DigestNames() as string = SSH2SessionMBS.DigestNames
Break
```

Notes: The list may not be the same for Mac, Windows and Linux.

129.37.9 ConfigureKeepAlive(WantReply as Boolean = true, Interval as Integer = 2)

MBS Network Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configures keep alive probes.
Notes:

Set how often keepalive messages should be sent.
WantReply indicates whether the keepalive messages should request a response from the server.
Interval is number of seconds that can pass without any I/O, use 0 to disable keepalives. To avoid some busy-loop corner-cases, if you specify an interval of 1 it will be treated as 2.

129.37.10 Constructor(IP as string, Port as Integer = 22, TimeOut as Integer = 30)

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor for using a new socket.
Notes:

The plugin creates a new socket, connects to the given IP& Port and than creates a new session for it.
Lasterror is set.
Please check if Handle property is non zero after constructor finishes.

Timeout defines timeout for connection in seconds. While waiting, the plugin yields time to other threads.
If timeout is zero, the connection will not yield and take up to the default TCP/IP timeout.

IPv4, IPv6 address or domain name with version 18.3 or newer.
See also:

- 129.37.11 Constructor(socket as TCPSocket) 20830
- 129.37.12 Constructor(socketHandle as Integer, CloseSocketLater as boolean = false) 20830

129.37.11 Constructor(socket as TCPSocket)

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor for using an existing socket.
Notes:

Initializes a new session.
socket: The socket to use. The plugin keeps reference to this socket in socket property.

You can use a Xojo socket and connect it. Once connected, pass it here, so the session can use this socket for communication.
If you connect the xojo socket in a loop on a thread, be sure to call poll method of socket, so it processes events like connecting. In main thread with timer, you would get this automatically.
See also:

- 129.37.10 Constructor(IP as string, Port as Integer = 22, TimeOut as Integer = 30) 20830
- 129.37.12 Constructor(socketHandle as Integer, CloseSocketLater as boolean = false) 20830

129.37.12 Constructor(socketHandle as Integer, CloseSocketLater as boolean = false)

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor for using an existing socket.
Notes:

Initializes a new session.
socketHandle: The socket to use. Can be TCPSocket's handle property for a Xojo socket. Or a socket connected via declares.
You can put the socket in the socket property to keep it alive as long as session is in memory.

Set CloseSocketLater = true if you pass a socket which can be closed in destructor. For Xojo socket, pass false as Xojo closes socket later.
You can use a Xojo socket and connect it. Once connected, pass it here, so the session can use this socket for communication.

- 129.37.10 Constructor(IP as string, Port as Integer = 22, TimeOut as Integer = 30) 20830
- 129.37.11 Constructor(socket as TCPSocket) 20830

129.37.13 Destructor

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

129.37.14 DigestNames as String()

MBS Network Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of all digest algorithms.
Example:

```
// see hash and encryption algorithms available
dim CipherNames() as string = SSH2SessionMBS.CipherNames
dim DigestNames() as string = SSH2SessionMBS.DigestNames
Break
```

Notes: The list may not be the same for Mac, Windows and Linux.

129.37.15 Disconnect(description as string)

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Terminate transport layer.
Notes:

Lasterror is set.
description: Human readable reason for disconnection.
See also:

- 129.37.16 Disconnect(reason as Integer, description as string, lang as string = "") 20832

129.37.16 Disconnect(reason as Integer, description as string, lang as string = "")

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Terminate transport layer.
Notes:

Lasterror is set.

reason: One of the Disconnect Reason constants.
description: Human readable reason for disconnection.
lang: Localization string describing the langauge/encoding of the description provided.
See also:

- 129.37.15 Disconnect(description as string) 20831

129.37.17 HostKey(byref Type as Integer) as string

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the remote key.

129.37.18 HostKeyHash(HashType as Integer) as string

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return a hash of the remote host's key.
Notes:

HashType: kHostKeyHashSHA1 or kHostKeyHashMD5.
Returns the computed digest of the remote system's hostkey. The length of the returned string is hash_type specific (e.g. 16 bytes for MD5, 20 bytes for SHA1).
Computed hostkey hash value, or empty string if the information is not available (either the session has not yet been started up, or the requested hash algorithm was not available). The hash consists of raw binary bytes, not hex digits, so it is not directly printable.

129.37.19 OpenDirectTCPIPChannel(host as string, port as integer, sourceHost as string = "127.0.0.1", sourcePort as Integer = 22) as SSH2ChannelMBS

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tunnel a TCP connection through an SSH session.
Notes:

host: Third party host to connect to using the SSH host as a proxy.
port: Port on third party host to connect to.
SourceHost: Host to tell the SSH server the connection originated on.
SourcePort: Port to tell the SSH server the connection originated from.

Tunnel a TCP/IP connection through the SSH transport via the remote host to a third party. Communication from the client to the SSH server remains encrypted, communication from the server to the 3rd party host travels in cleartext.

This is not a replacement for ssh in command line with -L option.

Returns a newly allocated channel object, or nil on errors.

129.37.20 OpenSession as SSH2ChannelMBS

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Establish a generic session channel.
Notes:

Lasterror is set.
Returns nil if the session start fails.

129.37.21 SessionFlag(Flag as Integer, Value as boolean)

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set a session flag.
Notes:

See kFlag* constants.
Lasterror is set.

129.37.22 SessionHandshake

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform the SSH handshake.
Notes: Lasterror is set.

129.37.23 SetBanner(Banner as string)

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the SSH prococol banner for the local client.
Notes:

Set the banner that will be sent to the remote host when the SSH session is started with Handshake. This is optional; a banner corresponding to the protocol and libssh2 version will be sent by default.
Lasterror is set.

129.37.24 SetMethodPreference(methodType as Integer, Pref as string) as Boolean

MBS Network Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set preferred key exchange method.
Example:

```
// set preferences for key exchange method:
dim r as Boolean = s.SetMethodPreference(SSH2SessionMBS.kMethodKEX, "diffie-hellman-group-exchange-sha256")
```

Notes:

methodType: One of the Method Type constants.
Pref: Coma delimited list of preferred methods to use with the most preferred listed first and the least preferred listed last. If a method is listed which is not supported by libssh2 it will be ignored and not sent to the remote host during protocol negotiation.

Set preferred methods to be negotiated. These preferences must be set prior to calling SessionHandshake, as they are used during the protocol initiation phase.

Return true on success or false on failure. Lasterror is set. Lasterror is set to LIBSSH2_ERROR_EAGAIN (-37) when it would otherwise block. While LIBSSH2_ERROR_EAGAIN is a negative number, it isn't really a failure per se.

129.37.25 SupportedAlgorithms(methodType as Integer) as String()

MBS Network Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get list of supported algorithms.
Example:

```
dim s as new SSH2SessionMBS("localhost")

dim KeyExchange() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodKEX)
dim HostKey() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodHostKey)
dim CryptCS() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodCryptCS)
dim CryptSC() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodCryptSC)
dim MacCS() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodMacCS)
dim MacSC() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodMacSC)
dim CompCS() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodCompCS)
dim CompSC() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodCompSC)
dim LangCS() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodLangCS)
dim LangSC() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodLangSC)

Break
```

Notes:

Method type: see kMethod* constants.

Get a list of supported algorithms for the given methodType. The methodType parameter is equivalent to methodType in SetMethodPreference.

In order to get a list of all supported compression algorithms, SessionFlag(SSH2SessionMBS.kFlagCompress, true) must be called before calling this function, otherwise only "none" will be returned.

On success, returns array with algorithms
Lasterror is set with error code.

129.37.26 UserAuthKeyboardInteractive(UserName as string)

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Authenticate a session using keyboard-interactive authentication.
Notes:

username: Name of user to attempt keyboard-interactive authentication for.
Lasterror is set.

Calls KeyboardCallback callback to query input from user.

129.37.27 UserAuthList(username as string) as string

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: List supported authentication methods.
Notes:

username: Username which will be used while authenticating. Note that most server implementations do not permit attempting authentication with different usernames between requests. Therefore this must be the same username you will use on later userauth calls.

Send a SSH_USERAUTH_NONE request to the remote host. Unless the remote host is configured to accept none as a viable authentication scheme (unlikely), it will return SSH_USERAUTH_FAILURE along with a listing of what authentication schemes it does support. In the unlikely event that none authentication succeeds, this method with return NULL. This case may be distinguished from a failing case by examining Authenticated.

129.37.28 UserAuthPassword(UserName as string, Password as string)

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Authenticate a session with username and password.
Notes:

username: Name of user to attempt plain password authentication for.
password: Password to use for authenticating username.

Attempt basic password authentication. Note that many SSH servers which appear to support ordinary password authentication actually have it disabled and use Keyboard Interactive authentication (routed via PAM or another authentication backed) instead.
Lasterror is set.

129.37.29 UserAuthPublicKeyFromFile(UserName as string, publickey as folderitem, privatekey as folderitem, Passphrase as string)

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Authenticate a session with a public key, read from a file.
Notes:

Lasterror is set.

username: user name to authenticate as.
publickey: Path of the public key file. (e.g. /etc/ssh/hostkey.pub). If libssh2 is built against OpenSSL, this option can be set to ""/nil.
privatekey: Path of the private key file. (e.g. /etc/ssh/hostkey)
passphrase: Passphrase to use when decoding privatekey.

Attempt public key authentication using a PEM encoded private key file stored on disk
See also:

- 129.37.30 UserAuthPublicKeyFromFile(UserName as string, publickey as string, privatekey as string, Passphrase as string) 20837

129.37.30 UserAuthPublicKeyFromFile(UserName as string, publickey as string, privatekey as string, Passphrase as string)

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Authenticate a session with a public key, read from a file.
Notes:

Lasterror is set.
username: user name to authenticate as.
publickey: Path of the public key file. (e.g. /etc/ssh/hostkey.pub). If libssh2 is built against OpenSSL, this option can be set to ""/nil.
privatekey: Path of the private key file. (e.g. /etc/ssh/hostkey)
passphrase: Passphrase to use when decoding privatekey.

Attempt public key authentication using a PEM encoded private key file stored on disk
See also:

- 129.37.29 UserAuthPublicKeyFromFile(UserName as string, publickey as folderitem, privatekey as folderitem, Passphrase as string) 20836

129.37.31 UserAuthPublicKeyFromMemory(UserName as string, publickey as string, privatekey as string, Passphrase as string)

MBS Network Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Authenticate a session with a public key, read from memory
Notes:

This function allows to authenticate a session with a public key read from memory.
Lasterror is set.

username - Remote user name to authenticate as.

publickeydata - Buffer containing the contents of a public key file. Optional.
privatekeydata - Buffer containing the contents of a private key file.
passphrase - Passphrase to use when decoding private key file.

Keys must have LF as line ending, not CR.

Attempt public key authentication using a PEM encoded private key file stored in memory.

129.37.32 Version as string

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the version for the SSH library.
Example:

MsgBox SSH2SessionMBS.Version

129.37.33 WaitSocket

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Waits on the socket for sending or receiving.

129.37.34 Properties

129.37.35 Authenticated as Boolean

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return authentication status.
Notes:

Indicates whether or not the named session has been successfully authenticated.
Returns true if authenticated and false if not.
(Read only property)

129.37.36 Blocking as Boolean

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blocking mode on session.
Notes:

blocking: Set to a non-zero value to make the channel block, or zero to make it non-blocking.

Set or clear blocking mode on the selected on the session. This will instantly affect any channels associated with this session. If a read is performed on a session with no data currently available, a blocking session will wait for data to arrive and return what it receives. A non-blocking session will return immediately with an empty buffer. If a write is performed on a session with no room for more data, a blocking session will wait for room. A non-blocking session will return immediately without writing anything.
(Read and Write property)

129.37.37 Handle as Integer

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Internal object reference.
Notes: (Read and Write property)

129.37.38 LastErrNo as Integer

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the most recent error number.
Notes:

Returns a numeric error code corresponding to the the Error Code constants.
(Read only property)

129.37.39 LastError as Integer

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

129.37.40 Socket as TCPSocket

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The socket value.
Notes:

This is set by constructor if you base the session on an existing session.
But you can assign a socket here if you like.
(Read and Write property)

129.37.41 Tag as Variant

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag value.
Notes:

A property where you can store any value you like.
(Read and Write property)

129.37.42 TimeOut as Integer

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The timeout for blocking functions.
Notes:

In milliseconds.
(Read and Write property)

129.37.43 Events

129.37.44 KeyboardCallback(Name as string, Instruction as string, PromptCount as Integer, Prompts() as SSH2UserAuthKeyboardInteractivePromptMBS, responses() as SSH2UserAuthKeyboardInteractiveResponseMBS)

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: .

Function: Event to ask for user input on a UserAuthKeyboardInteractive run.
Notes:

You can ask user for password, e.g. with a modal dialog.
You find prompt text in SSH2UserAuthKeyboardInteractivePromptMBS object and place answer in SSH2UserAuthKeyboardInteractiveResponseMBS objects.

129.37.45 Constants

129.37.46 kErrorAgentProtocol = -42

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Invalid agent protocol.

129.37.47 kErrorAlloc = -6

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Out of memory.

129.37.48 kErrorAuthenticationFailed = -18

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Authentication failed.

129.37.49 kErrorBadSocket = -45

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Bad socket handle.

129.37.50 kErrorBadUse = -39

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Bad use.

129.37.51 kErrorBannerRecv = -2

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Failed to receive banner.

129.37.52 kErrorBannerSend = -3

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Failed to send banner.

129.37.53 kErrorBufferTooSmall = -38

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Memory buffer is too small.

129.37.54 kErrorChannelClosed = -26

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Channel is already closed.

129.37.55 kErrorChannelEofSent = -27

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Chanel sent EOF.

129.37.56 kErrorChannelFailure = -21

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Generic error on a channel.

129.37.57 kErrorChannelOutoforder = -20

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Channel commands out of order.

129.37.58 kErrorChannelPacketExceeded = -25

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Channel packet exceeded.

129.37.59 kErrorChannelRequestDenied = -22

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Channel request denied.

129.37.60 kErrorChannelUnknown = -23

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Unknown channel.

129.37.61 kErrorChannelWindowExceeded = -24

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Channel window exceeded.

129.37.62 kErrorChannelWindowFull = -47

MBS Network Plugin, Plugin Version: 19.5.

Function: One of the SSH error codes.
Notes: Channel window is full.

129.37.63 kErrorCompress = -40

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Compression error.

129.37.64 kErrorDecrypt = -12

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Error with decryption.

129.37.65 kErrorEagain = -37

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Please try again later.

129.37.66 kErrorEncrypt = -44

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Error on encrypting.

129.37.67 kErrorFile = -16

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: File IO error.

129.37.68 kErrorHostkeyInit = -10

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Failed to init host key.

129.37.69 kErrorHostkeySign = -11

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Failed to sign host key.

129.37.70 kErrorInval = -34

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Input value error.

129.37.71 kErrorInvalidMac = -4

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Invalid MAC address.

129.37.72 kErrorInvalidPollType = -35

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Invalid poll type.

129.37.73 kErrorKexFailure = -5

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Key exchange failed.

129.37.74 kErrorKeyExchangeFailure = -8

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Key exchange failed.

129.37.75 kErrorKeyfileAuthFailed = -48

MBS Network Plugin, Plugin Version: 19.5.

Function: One of the SSH error codes.
Notes: Authorization with key file failed.

129.37.76 kErrorKnownHosts = -46

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Unknown host.

129.37.77 kErrorMethodNone = -17

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: No method.

129.37.78 kErrorMethodNotSupported = -33

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Method not supported.

129.37.79 kErrorNone = 0

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: No error.

129.37.80 kErrorOutOfBoundary = -41

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Out of Boundary.

129.37.81 kErrorPasswordExpired = -15

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Password expired.

129.37.82 kErrorProto = -14

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Protocol error.

129.37.83 kErrorPublickeyProtocol = -36

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Publickey protocol failed.

129.37.84 kErrorPublickeyUnverified = -19

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Publickey is not verified.

129.37.85 kErrorRequestDenied = -32

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Request denied.

129.37.86 kErrorScpProtocol = -28

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Error with SCP protocol.

129.37.87 kErrorSftpProtocol = -31

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Error with SFTP protocol.

129.37.88 kErrorSocketDisconnect = -13

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Socket got disconnected.

129.37.89 kErrorSocketNone = -1

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: No socket error.

129.37.90 kErrorSocketRecv = -43

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Socket receive failed.

129.37.91 kErrorSocketSend = -7

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Socket send failed.

129.37.92 kErrorSocketTimeout = -30

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Socket timeout.

129.37.93 kErrorTimeout = -9

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Timeout.

129.37.94 kErrorZlib = -29

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the SSH error codes.
Notes: Error with zlib (Compression).

129.37.95 kFlagCompress = 2

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the session flag constants.
Notes:

Set options for the created session. flag is the option to set, while value is typically set to 1 or 0 to enable or disable the option.
If set - before the connection negotiation is performed - libssh2 will try to negotiate compression enabling for this connection. By default libssh2 will not attempt to use compression.

129.37.96 kFlagSigPipe = 1

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the session flag constants.
Notes:

Set options for the created session. flag is the option to set, while value is typically set to 1 or 0 to enable or disable the option.
If set, libssh2 will not attempt to block SIGPIPEs but will let them trigger from the underlying socket layer.

129.37.97 kHostKeyHashMD5 = 1

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the hash types.
Notes: MD5

129.37.98 kHostKeyHashSHA1 = 2

MBS Network Plugin, Plugin Version: 14.0.

Function: One of the hash types.
Notes: SHA1

129.37.99 kHostKeyHashSHA256 = 3

MBS Network Plugin, Plugin Version: 19.5.

Function: One of the hash types.

Notes: SHA256

129.37.100 kMethodCompCS = 6

MBS Network Plugin, Plugin Version: 18.5.

Function: One of the method constants for SetMethodPreference and SupportedAlgorithms.
Notes:

Compression method.
e.g. zlib, zlib@openssh.com, none

129.37.101 kMethodCompSC = 7

MBS Network Plugin, Plugin Version: 18.5.

Function: One of the method constants for SetMethodPreference and SupportedAlgorithms.
Notes:

Compression method.
e.g. zlib, zlib@openssh.com, none

129.37.102 kMethodCryptCS = 2

MBS Network Plugin, Plugin Version: 18.5.

Function: One of the method constants for SetMethodPreference and SupportedAlgorithms.
Notes:

Crypt Method.
e.g. aes128-ctr, aes192-ctr, aes256-ctr, aes256-cbc, rijndael-cbc@lysator.liu.se, aes192-cbc, aes128-cbc, blowfish-cbc, arcfour128, arcfour, cast128-cbc, 3des-cbc.

129.37.103 kMethodCryptSC = 3

MBS Network Plugin, Plugin Version: 18.5.

Function: One of the method constants for SetMethodPreference and SupportedAlgorithms.
Notes:

Crypt Method.
e.g. aes128-ctr, aes192-ctr, aes256-ctr, aes256-cbc, rijndael-cbc@lysator.liu.se, aes192-cbc, aes128-cbc, blowfish-

cbc, arcfour128, arcfour, cast128-cbc, 3des-cbc

129.37.104 kMethodHostKey = 1

MBS Network Plugin, Plugin Version: 18.5.

Function: One of the method constants for SetMethodPreference and SupportedAlgorithms.
Notes:

Host key method.
e.g. ssh-rsa, ssh-dss

129.37.105 kMethodKEX = 0

MBS Network Plugin, Plugin Version: 18.5.

Function: One of the method constants for SetMethodPreference and SupportedAlgorithms.
Notes:

Key Exchange Method.
e.g. diffie-hellman-group-exchange-sha256, diffie-hellman-group-exchange-sha1, diffie-hellman-group14-sha1 or diffie-hellman-group1-sha1.

129.37.106 kMethodLangCS = 8

MBS Network Plugin, Plugin Version: 18.5.

Function: One of the method constants for SetMethodPreference and SupportedAlgorithms.
Notes: Language.

129.37.107 kMethodLangSC = 9

MBS Network Plugin, Plugin Version: 18.5.

Function: One of the method constants for SetMethodPreference and SupportedAlgorithms.
Notes: Language.

129.37.108 kMethodMacCS = 4

MBS Network Plugin, Plugin Version: 18.5.

Function: One of the method constants for SetMethodPreference and SupportedAlgorithms.
Notes:

MAC method (hash)
e.g. hmac-sha2-256, hmac-sha2-512, hmac-sha1, hmac-sha1-96, hmac-md5, hmac-md5-96, hmac-ripemd160, hmac-ripemd160@openssh.com

129.37.109 kMethodMacSC = 5

MBS Network Plugin, Plugin Version: 18.5.

Function: One of the method constants for SetMethodPreference and SupportedAlgorithms.
Notes:

MAC method (hash)
e.g. hmac-sha2-256, hmac-sha2-512, hmac-sha1, hmac-sha1-96, hmac-md5, hmac-md5-96, hmac-ripemd160, hmac-ripemd160@openssh.com

129.38 class SSH2TunnelMBS

129.38.1 class SSH2TunnelMBS

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a SSH tunnel.
Notes:

The MBS Plugin can spin of a new preemptive thread to run a tunnel to forward a SSH connection from local socket to remote server via SSH tunnel.
This works well for database access with MySQL.
By using our own thread, we are not blocking or blocked by your Xojo code.

The tunnel allows currently one connection through it, e.g. run one tunnel per MySQL connection to go through the tunnel. If you need multiple tunnels, please create multiple SSH tunnels.

129.38.6 Methods

129.38.7 Constructor(session as SSH2SessionMBS)

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: Please pass connected SSH session.

129.38.8 Destructor

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

129.38.9 Run

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the thread with the tunnel.

129.38.10 Properties

129.38.11 BytesReceived as Int64

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of bytes received.
Notes: (Read only property)

129.38.12 BytesSent as Int64

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of bytes sent.
Notes: (Read only property)

129.38.13 Cancel as Boolean

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to cancel tunnel.
Notes:

This property can be set to request end of the thread.
(Read and Write property)

129.38.14 Connected as Boolean

MBS Network Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries whether tunnel is connected and transfers data.
Notes:

Returns true if connected or false if not.
(Read only property)

129.38.15 KeepAlive as Boolean

MBS Network Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to sent keep-alive packets.
Example:

```
dim tunnel as SSH2TunnelMBS // your tunnel

// avoid timeing out in Socket and SSH layers
tunnel.KeepAlive = True
session.ConfigureKeepAlive
```

Notes:

If set to true, TCP keep alive probes will be sent to avoid TCP/IP timeouts.
Set to false (default behavior) to disable keep alive probes.

You may also need to use ConfigureKeepAlive on the SSH2SessionMBS class.

(Read and Write property)

129.38.16 LocalAddress as String

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The local address to use.
Notes:

Defines where we wait for a connection to forward.
IPv4 or IPv6 address.
(Read and Write property)

129.38.17 LocalPort as Integer

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The local port to use.
Notes: (Read and Write property)

129.38.18 Messages as String

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Log messages.
Notes:

Filled by thread to tell you about errors.
(Read only property)

129.38.19 RemoteAddress as String

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The remote address to use.
Notes:

When connecting through tunnel this address is used from server to connect to.
IPv4 or IPv6 address.
(Read and Write property)

129.38.20 RemotePort as Integer

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The remote port to use.
Notes:

When connecting through tunnel this port is used from server to connect to.
(Read and Write property)

129.38.21 Running as Boolean

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether tunnel is running.
Notes:

True if running, false if not.
(Read only property)

129.38.22 Session as SSH2SessionMBS

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The session used for the tunnel.
Notes: (Read only property)

129.39 class SSH2UserAuthKeyboardInteractivePromptMBS

129.39.1 class SSH2UserAuthKeyboardInteractivePromptMBS

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an interactive keyboard authentication prompt.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

129.39.2 Methods

129.39.3 Constructor

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

129.39.4 Destructor

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

129.39.5 Properties

129.39.6 Echo as Integer

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The echo flag.
Notes:

(not sure what this is)
(Read and Write property)

129.39.7 Length as Integer

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The length of the text.
Notes: (Read and Write property)

129.39.8 Text as String

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The text message.
Notes: (Read and Write property)

129.40 class SSH2UserAuthKeyboardInteractiveResponseMBS

129.40.1 class SSH2UserAuthKeyboardInteractiveResponseMBS

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a response with interactive keyboard login.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

129.40.2 Methods

129.40.3 Constructor

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

129.40.4 Destructor

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destrutor.

129.40.5 Properties

129.40.6 Text as String

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The response text.
Notes:

Usually a password.
(Read and Write property)

129.41 class TCPSocket

129.41.1 class TCPSocket

Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: .

Function: The Socket class in Xojo which is the superclass of the PacketSocketMBS class.

129.42 class TXTRecordMBS

129.42.1 class TXTRecordMBS

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: The class to represent a DNS-SD TXT record.
Example:

```
dim t as new TXTRecordMBS

call t.SetValue "Hello", "World"

MsgBox t.Bytes // show complete record
MsgBox t.Value("Hello") // lookup value
```

Notes: The constructor creates an empty TXTRecord where you can add values using TXTRecordSetValue.

129.42.2 Methods

129.42.3 Bytes as string

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Allows you to retrieve a copy of to the raw bytes within a TXTRecord.
Example:

```
dim t as new TXTRecordMBS

call t.SetValue "Hello", "World"
```

Notes: Returns a string with the raw bytes inside the TXTRecord which you can pass directly to DNSServiceRegisterMBS.Register() or to DNSServiceRegisterMBS.UpdateRecord().

129.42.4 ContainsKey(key as string) as boolean

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Allows you to determine if a given TXT Record contains a specified key.
Example:

```
dim t as new TXTRecordMBS
```

```
call t.SetValue "Hello", "World"

if t.ContainsKey("Hello") then
MsgBox "Hello found."
else
MsgBox "Hello not found ->bug."
end if

if t.ContainsKey("hallo") then
MsgBox "hallo found ->bug."
else
MsgBox "hallo not found."
end if
```

Notes:

key: An ASCII string containing the key name.

Returns true if the TXT Record contains the specified key. Otherwise, it returns false.
See also:

- 129.42.5 ContainsKey(txtRecord as string, key as string) as boolean 20864

129.42.5 ContainsKey(txtRecord as string, key as string) as boolean

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Allows you to determine if a given TXT Record contains a specified key.
Example:

```
dim t as new TXTRecordMBS

call t.SetValue "Hello", "World"

dim s as string = t.Bytes // copy record to string

// now search in that string:
if TXTRecordMBS.ContainsKey(s, "Hello") then
MsgBox "Hello found."
else
MsgBox "Hello not found ->bug."
end if

if TXTRecordMBS.ContainsKey(s, "hallo") then
MsgBox "hallo found ->bug."
```

```
else
MsgBox "hallo not found."
end if
```

Notes:

txtRecord: The txt record to search in as a string.
key: An ASCII string containing the key name.

Returns true if the TXT Record contains the specified key. Otherwise, it returns false.
See also:

- 129.42.4 ContainsKey(key as string) as boolean 20863

129.42.6 Count as Integer

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Returns the number of keys stored in the TXT Record.
Example:

```
dim t as new TXTRecordMBS

call t.SetValue "Hello1", "World1"
call t.SetValue "Hello2", "World2"
call t.SetValue "Hello3", "World3"

MsgBox str(t.Count)
```

See also:

- 129.42.7 Count(txtRecord as string) as Integer 20865

129.42.7 Count(txtRecord as string) as Integer

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Returns the number of keys stored in the TXT Record.
Example:

```
dim t as new TXTRecordMBS

call t.SetValue "Hello1", "World1"
call t.SetValue "Hello2", "World2"
```

```
call t.SetValue "Hello3", "World3"

dim s as string = t.Bytes // copy record

// now count in that record
MsgBox str(TXTRecordMBS.Count(s))
```

See also:

- 129.42.6 Count as Integer 20865

129.42.8 KeyAtIndex(index as Integer) as string

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Returns the key with the given index from the txt record.
Example:

```
dim t as new TXTRecordMBS

call t.SetValue "Hello", "World"

MsgBox t.KeyAtIndex(0) +EndOfLine + t.ValueAtIndex(0)
```

Notes:

index: the index you want in the range from zero to GetCount()-1.

It's also possible to iterate through keys in a TXT record by simply calling KeyAtIndex() repeatedly, beginning with index zero and increasing until lasterror is set to kErrorInvalid.
See also:

- 129.42.9 KeyAtIndex(txtRecord as string, index as Integer) as string 20866

129.42.9 KeyAtIndex(txtRecord as string, index as Integer) as string

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Returns the key with the given index from the txt record.
Example:

```
dim t as new TXTRecordMBS

call t.SetValue "Hello", "World"
```

```
dim s as string = t.Bytes // copy record to string

// now search in that string:
MsgBox TXTRecordMBS.KeyAtIndex(s,0) +EndOfLine + TXTRecordMBS.ValueAtIndex(s,0)
```

Notes:

txtRecord: The txt record to search in as a string.
index: the index you want in the range from zero to GetCount()-1.

It's also possible to iterate through keys in a TXT record by simply calling KeyAtIndex() repeatedly, beginning with index zero and increasing until lasterror is set to kErrorInvalid.
See also:

- 129.42.8 KeyAtIndex(index as Integer) as string 20866

129.42.10 Length as Integer

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Allows you to determine the length of the raw bytes within a TXTRecord.
Example:

```
dim t as new TXTRecordMBS

call t.SetValue "Hello1", "World1"
call t.SetValue "Hello2", "World2"
call t.SetValue "Hello3", "World3"

MsgBox str(t.Length) // shows 42
```

129.42.11 RemoveValue(key as string)

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Removes a key from a TXTRecordRef. The "key" must be an ASCII string which exists in the TXTRecord.
Example:

```
dim t as new TXTRecordMBS

call t.SetValue "Hello1", "World1"
call t.SetValue "Hello2", "World2"
```

```
call t.SetValue "Hello3", "World3"

t.RemoveValue "Hello2"

MsgBox t.Bytes
```

Notes:

key: A key name which exists in the TXTRecord.

Lasterror is kErrorNoError on success or kErrorNoSuchKey if the "key" does not exist in the TXTRecord.

129.42.12 SetValue(key as string, value as string) as Integer

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Adds a key (optionally with value) to a TXTRecordRef.
Example:

```
dim t as new TXTRecordMBS

call t.SetValue "Hello1", "World1"
call t.SetValue "Hello2", "World2"
call t.SetValue "Hello3", "World3"
```

Notes:

If the "key" already exists in the TXTRecord, then the current value will be replaced with the new value.

Keys may exist in four states with respect to a given TXT record:

- Absent (key does not appear at all)
- Present with no value ("key" appears alone)
- Present with empty value ("key=" appears in TXT record)
- Present with non-empty value ("key=value" appears in TXT record)

For more details refer to "Data Syntax for DNS-SD TXT Records" in

http://files.dns-sd.org/draft-cheshire-dnsext-dns-sd.txt

key: A string which only contains printable ASCII values (& h20-& h7E), excluding '=' (& h3D). Keys should be 8 characters or less.
value: Any binary value. For values that represent textual data, UTF-8 is STRONGLY recommended.

Returns kErrorNoError on success. Returns kErrorInvalid if the "key" string contains illegal characters. Returns kErrorNoMemory if adding this key would exceed the available storage.

The plugin currently does not create keys with empty value. If you need that, please email us.

129.42.13 Value(key as string) as string

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Allows you to retrieve the value for a given key from a TXT Record.
Example:

```
dim t as new TXTRecordMBS

call t.SetValue "Hello", "World"
MsgBox t.Value("Hello") // lookup value
```

Notes:

key: The ASCII string containing the key name.

Returns an empty string if the key does not exist in this TXT record, or exists with no value (to differentiate between these two cases use ContainsKey()).
See also:

- 129.42.14 Value(txtRecord as string, key as string) as string 20869

129.42.14 Value(txtRecord as string, key as string) as string

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Allows you to retrieve the value for a given key from a TXT Record.
Example:

```
dim t as new TXTRecordMBS

call t.SetValue "Hello", "World"

dim s as string = t.bytes
```

```
MsgBox TXTRecordMBS.Value(s, "Hello") // lookup value
```

Notes:

txtRecord: Pointer to the received TXT Record bytes.
key: The ASCII string containing the key name.

Returns an empty string if the key does not exist in this TXT record, or exists with no value (to differentiate between these two cases use ContainsKey()).
See also:

- 129.42.13 Value(key as string) as string 20869

129.42.15 ValueAtIndex(index as Integer) as string

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Returns the key with the given index from the txt record.
Example:

```
dim t as new TXTRecordMBS

call t.SetValue "Hello", "World"

MsgBox t.KeyAtIndex(0) +EndOfLine + t.ValueAtIndex(0)
```

Notes:

index: the index you want in the range from zero to GetCount()-1.

It's also possible to iterate through values in a TXT record by simply calling ValueAtIndex() repeatedly, beginning with index zero and increasing until lasterror is set to kErrorInvalid.
See also:

- 129.42.16 ValueAtIndex(txtRecord as string, index as Integer) as string 20870

129.42.16 ValueAtIndex(txtRecord as string, index as Integer) as string

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Returns the key with the given index from the txt record.
Example:

```
dim t as new TXTRecordMBS

call t.SetValue "Hello", "World"

dim s as string = t.Bytes // copy record to string

// now search in that string:
MsgBox TXTRecordMBS.KeyAtIndex(s,0) +EndOfLine + TXTRecordMBS.ValueAtIndex(s,0)
```

Notes:

txtRecord: The txt record to search in as a string.
index: the index you want in the range from zero to GetCount()-1.

It's also possible to iterate through values in a TXT record by simply calling GetValueAtIndex() repeatedly, beginning with index zero and increasing until lasterror is set to kErrorInvalid.
See also:

- 129.42.15 ValueAtIndex(index as Integer) as string 20870

129.43 class UDPSocketMBS

129.43.1 class UDPSocketMBS

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for UDP sockets.
Notes: Similar to Xojo's built in UDPSocket class, but more low level and with more options.

129.43.6 Methods

129.43.7 AddMembership(MultiAddress as string, InterfaceAddress as string = "")

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds this socket to a multicast group.
Notes:

Internally this uses IPPROTO_IP/IP_ADD_MEMBERSHIP option.
Lasterror is set.

MultiAddress: The IPv4 address of the group to join.
InterfaceAddress: The IPv4 address of the network interface to use. Can be empty for any interface.

129.43.8 Bind(Port as Integer, IP as string = "")

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Binds the socket to the given port.
Notes:

If IP is not empty, you can bind the socket to only the given network interface with that IPv4.
Set ReuseAddress to bind to an address which already a socket is bound to.
Lasterror is set.

129.43.9 Constructor

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

129.43.10 Destructor

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: Closes the socket.

129.43.11 DropMembership(MultiAddress as string, InterfaceAddress as string = "")

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes this socket from a multicast group.
Notes:

Internally this uses IPPROTO_IP/IP_DROP_MEMBERSHIP option.
Lasterror is set.

MultiAddress: The IPv4 address of the group to join.
InterfaceAddress: The IPv4 address of the network interface to use. Can be empty for any interface.

129.43.12 Poll

MBS Network Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Polls for activity.
Notes:

Calls events if needed.
This is called automatically via timer by the plugin.

129.43.13 Read(peek as boolean = false) as DatagramMBS

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a datagram.
Notes:

If peek is true, the data is not removed from read buffer.
On error returns nil.

129.43.14 SendMessage(Data as DatagramMBS) as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a datagram.
Notes:

Please specify with port and address of datagram where package is sent to.
Returns number of bytes sent.
Lasterror is set.
See also:

- 129.43.15 SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer 20875
- 129.43.16 SendMessage(Data as string, IP as String, Port as Integer) as Integer 20875

129.43.15 SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a datagram.
Notes:

Please specify with port and IP where package is sent to.
Returns number of bytes sent.
Lasterror is set.
See also:

- 129.43.14 SendMessage(Data as DatagramMBS) as Integer 20875
- 129.43.16 SendMessage(Data as string, IP as String, Port as Integer) as Integer 20875

129.43.16 SendMessage(Data as string, IP as String, Port as Integer) as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a datagram.
Notes:

Please specify with port and IP where package is sent to.
Returns number of bytes sent.
Lasterror is set.
See also:

- 129.43.14 SendMessage(Data as DatagramMBS) as Integer 20875

• 129.43.15 SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer 20875

129.43.17 Properties

129.43.18 AddressFamily as Integer

MBS Network Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The address family of the socket.
Notes:

This is either RAWSocketMBS.AddressFamilyINet (2) for IPv4 or RAWSocketMBS.AddressFamilyINet6 (Mac 30, Windows 23 and Linux 10) for IPv6.
(Read and Write property)

129.43.19 AvailableBytes as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns number of bytes available for reading.
Notes:

Lasterror is set.
(Read only property)

129.43.20 BindAddress as String

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The IP used for bind operation.
Notes:

This is set by Bind on success.
(Read and Write property)

129.43.21 BindPort as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The port used for bind operation.
Notes:

This is set by Bind on success.
(Read and Write property)

129.43.22 Broadcast as Boolean

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether broadcasts are allowed.
Notes:

Set to true before sending a broadcast message.
Internally this uses SOL_SOCKET/SO_BROADCAST option.
Lasterror is set.
(Read and Write property)

129.43.23 Handle as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal socket handle.
Notes: (Read and Write property)

129.43.24 Lasterror as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes:

Platform dependent.
(Read and Write property)

129.43.25 LocalIP as String

MBS Network Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries local IP.
Notes:

Can be 0.0.0.0 if unknown.
May only be set if connected or binded.
Lasterror is set.
(Read only property)

129.43.26 LocalPort as Integer

MBS Network Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries local port.
Notes:

Lasterror is set.
Can be -1 if unknown.
(Read only property)

129.43.27 MulticastInterface as String

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The interface to use for multicast.
Notes:

Internally this uses IPPROTO_IP/IP_MULTICAST_IF option.
Lasterror is set.

Assign empty string to use all interfaces.
May return 0.0.0.0 to indicate all interfaces.
(Read and Write property)

129.43.28 MulticastLoop as Boolean

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether multicast packets are also sent to the sending socket.
Notes:

Internally this uses IPPROTO_IP/IP_MULTICAST_LOOP option.
Lasterror is set.
(Read and Write property)

129.43.29 MulticastTimeToLive as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The multicast time to live value.
Notes:

Internally this uses IPPROTO_IP/IP_MULTICAST_TTL option.

Lasterror is set.
Range from 0 to 255.
(Read and Write property)

129.43.30 Protocol as Integer

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The socket protocol.
Notes:

Is ProtocolUDP (17) for UDP sockets.
(Read and Write property)

129.43.31 ReceiveBufferSize as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the receiving buffer size.
Notes:

The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Internally this uses SOL_SOCKET/SO_RCVBUF option.
Lasterror is set.
(Read and Write property)

129.43.32 ReuseAddress as Boolean

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allows reuse of same port.
Notes:

Internally this uses SOL_SOCKET/SO_REUSEADDR option.

see also
http://stackoverflow.com/questions/14388706/socket-options-so-reuseaddr-and-so-reuseport-how-do-they-differ-do-they-mean-t

Lasterror is set.
(Read and Write property)

129.43.33 ReusePort as Boolean

MBS Network Plugin, Plugin Version: 14.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allow reuse of same port and IP.
Notes:

Internally this uses SOL_SOCKET/SO_REUSEPORT option.
On Windows, this is not supported, so this property sets ReuseAddress.
Lasterror is set.
(Read and Write property)

129.43.34 SendBufferSize as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sending buffer size.
Notes:

The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Internally this uses SOL_SOCKET/SO_SNDBUF option.
Lasterror is set.
(Read and Write property)

129.43.35 SocketError as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The native socket error.
Notes:

Internally this uses SOL_SOCKET/SO_ERROR option.
Lasterror is set.
(Read only property)

129.43.36 SocketType as Integer

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The socket type.
Notes:

Is SocketTypeDatagram (2) for UDP sockets.
(Read and Write property)

129.43.37 TimeToLive as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time to live value.
Notes:

Internally this uses IPPROTO_IP/IP_TTL option.
Lasterror is set.
Range from 0 to 255.
(Read and Write property)

129.43.38 Type as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Socket type.
Notes:

Always 2 as this is a datagram socket.
Internally this uses SOL_SOCKET/SO_TYPE option.
Lasterror is set.
(Read only property)

129.43.39 TypeOfService as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of service value.
Notes:

Works only on BSD Sockets.

Possible values:
IPTOS_MINCOST = 2
IPTOS_RELIABILITY = 4
IPTOS_THROUGHPUT = 8
IPTOS_LOWDELAY = 16

Internally this uses IPPROTO_IP/IP_TOS option.
(May not work on Windows.

Lasterror is set.
(Read and Write property)

129.43.40 Events

129.43.41 DataAvailable

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: .

Function: This event is called when new data is available.
Notes: Requires the socket to be bound.

129.43.42 Error

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: .

Function: The event called if socket is in error state.

129.43.43 SendComplete

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: .

Function: The last write operation is done.

129.44 module WebSocketHelperMBS

129.44.1 module WebSocketHelperMBS

MBS Network Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Helper functions for implementing web sockets.
Example:

```
// short packet
dim s as string = WebSocketHelperMBS.AddHeader("Hello")
dim b as Boolean = WebSocketHelperMBS.FrameMasked(s)
dim t as string = WebSocketHelperMBS.Unmask(s)

// long packet
dim text as string = "Hello World. This is just a sample text with a little bit more characters to make it at least 127 characters long for this test."
dim s2 as string = WebSocketHelperMBS.AddHeader(text)
dim b2 as Boolean = WebSocketHelperMBS.FrameMasked(s2)
dim t2 as string = WebSocketHelperMBS.Unmask(s2)

Break // look in debugger
```

Deprecated: This item is deprecated and should no longer be used.

129.44.4 Methods

129.44.5 AddHeader(data as Memoryblock, opCode as Integer = 7) as Memoryblock

MBS Network Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds header to a frame.
Notes: Depending on the length of the frame we add two to ten bytes in front with the opcode included and the length information.
See also:

- 129.44.6 AddHeader(data as string, opCode as Integer = 7) as string 20884

129.44.6 AddHeader(data as string, opCode as Integer = 7) as string

MBS Network Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds header to a frame.
Notes: Depending on the length of the frame we add two to ten bytes in front with the opcode included and the length information.
See also:

- 129.44.5 AddHeader(data as Memoryblock, opCode as Integer = 7) as Memoryblock 20883

129.44.7 FrameMasked(data as Memoryblock) as boolean

MBS Network Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the frame is masked or not.
Notes: Returns true if the first bit of the first byte is set.
See also:

- 129.44.8 FrameMasked(data as string) as boolean 20884

129.44.8 FrameMasked(data as string) as boolean

MBS Network Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the frame is masked or not.
Notes: Returns true if the first bit of the first byte is set.
See also:

- 129.44.7 FrameMasked(data as Memoryblock) as boolean 20884

129.44.9 Unmask(data as Memoryblock) as Memoryblock

MBS Network Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unmasks a data packet.
Notes:

Does the reverse of AddHeader.
The string returned has no encoding defined.
For a text frame, you should use DefineEncoding with UTF-8.
See also:

- 129.44.10 Unmask(data as Memoryblock, byref Offset as Integer, byref Length as Integer, byref TotalLength as Integer) as Memoryblock 20885
- 129.44.11 Unmask(data as string) as string 20885
- 129.44.12 Unmask(data as string, byref Offset as Integer, byref Length as Integer, byref TotalLength as Integer) as string 20886

129.44.10 Unmask(data as Memoryblock, byref Offset as Integer, byref Length as Integer, byref TotalLength as Integer) as Memoryblock

MBS Network Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unmasks a data packet.
Notes:

Does the reverse of AddHeader.
The string returned has no encoding defined.
For a text frame, you should use DefineEncoding with UTF-8.
This method also sets Offset, Length and TotalLength parameters.
See also:

- 129.44.9 Unmask(data as Memoryblock) as Memoryblock 20884
- 129.44.11 Unmask(data as string) as string 20885
- 129.44.12 Unmask(data as string, byref Offset as Integer, byref Length as Integer, byref TotalLength as Integer) as string 20886

129.44.11 Unmask(data as string) as string

MBS Network Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unmasks a data packet.
Notes:

Does the reverse of AddHeader.
The string returned has no encoding defined.
For a text frame, you should use DefineEncoding with UTF-8.
See also:

- 129.44.9 Unmask(data as Memoryblock) as Memoryblock 20884

- 129.44.10 Unmask(data as Memoryblock, byref Offset as Integer, byref Length as Integer, byref TotalLength as Integer) as Memoryblock 20885
- 129.44.12 Unmask(data as string, byref Offset as Integer, byref Length as Integer, byref TotalLength as Integer) as string 20886

129.44.12 Unmask(data as string, byref Offset as Integer, byref Length as Integer, byref TotalLength as Integer) as string

MBS Network Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unmasks a data packet.
Notes:

Does the reverse of AddHeader.
The string returned has no encoding defined.
For a text frame, you should use DefineEncoding with UTF-8.
This method also sets Offset, Length and TotalLength parameters.
See also:

- 129.44.9 Unmask(data as Memoryblock) as Memoryblock 20884
- 129.44.10 Unmask(data as Memoryblock, byref Offset as Integer, byref Length as Integer, byref TotalLength as Integer) as Memoryblock 20885
- 129.44.11 Unmask(data as string) as string 20885

129.44.13 Constants

129.44.14 kOpCodeBinaryFrame = 2

MBS Network Plugin, Plugin Version: 12.5.

Function: One of the OpCode values.
Notes: Binary Frame

129.44.15 kOpCodeClose = 8

MBS Network Plugin, Plugin Version: 12.5.

Function: One of the OpCode values.
Notes: Close

129.44.16 kOpCodeContinuation = 0

MBS Network Plugin, Plugin Version: 12.5.

Function: One of the OpCode values.
Notes: Continuation

129.44.17 kOpCodeEnd = 7

MBS Network Plugin, Plugin Version: 12.5.

Function: One of the OpCode values.
Notes: End

129.44.18 kOpCodePing = 9

MBS Network Plugin, Plugin Version: 12.5.

Function: One of the OpCode values.
Notes: Ping

129.44.19 kOpCodePong = 10

MBS Network Plugin, Plugin Version: 12.5.

Function: One of the OpCode values.
Notes: Pong

129.44.20 kOpCodeTextFrame = 1

MBS Network Plugin, Plugin Version: 12.5.

Function: One of the OpCode values.
Notes: Text frame

129.45 class WindowsDNSRecordAAAAMBS

129.45.1 class WindowsDNSRecordAAAAMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a DNS IPv6 (AAAA) record.
Notes:

Be aware that IPv6 is not available on Windows XP and older.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

129.45.2 Methods

129.45.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes:

This constructor makes sure you don't create useless WindowsDNSRecordAAAAMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

129.45.4 Properties

129.45.5 Address as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The address in a human readable format.
Notes: (Read and Write property)

129.45.6 RawAddress as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The raw address as a 16byte string.
Notes: (Read and Write property)

129.46 class WindowsDNSRecordAMBS

129.46.1 class WindowsDNSRecordAMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a DNS address (A) record.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

129.46.2 Methods

129.46.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes:

This constructor makes sure you don't create useless WindowsDNSRecordAMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

129.46.4 Properties

129.46.5 Address as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The IPv4 address as a string.
Notes: (Read and Write property)

129.46.6 IPAddress as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The raw address as an integer.
Notes: (Read and Write property)

129.47 class WindowsDNSRecordMBS

129.47.1 class WindowsDNSRecordMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for DNS query results on Windows.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

129.47.2 Methods

129.47.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes:

This constructor makes sure you don't create useless WindowsDNSRecordMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

129.47.4 Query(name as string, type as Integer, options as Integer = 0) as WindowsDNSRecordMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a DNS query on Windows.
Notes:

The DnsQuery function type is the generic query interface to the DNS namespace, and provides application developers with a DNS query resolution interface.

name: a string that represents the name of the owner of the record set that is queried.
type: A value that represents the RR DNS Record Type that is queried.
Options: A value that contains a combination of kDNSQuery* constants.

Returns the record chain on success.

Applications that call the DnsQuery function build a query using a fully-qualified DNS name and Resource Record (RR) type, and set query options depending on the type of service desired. When the kDNSQuery-

Standard option is set, DNS uses the resolver cache, queries first with UDP, then retries with TCP if the response is truncated, and requests that the server to perform recursive resolution on behalf of the client to resolve the query.

Note When calling one of the DnsQuery function types, be aware that a DNS server may return multiple records in response to a query. A computer that is multihomed, for example, will receive multiple A records for the same IP address. The caller must use as many of the returned records as necessary.

Consider the following scenario, in which multiple returned records require additional activity on behalf of the application: A Query function call is made for a multihomed computer and the application finds that the address associated with the first A record is not responding. The application should then attempt to use other IP addresses specified in the (additional) A records returned from the Query function call.

129.47.5 Properties

129.47.6 A as WindowsDNSRecordAMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The address record.
Notes: (Read and Write property)

129.47.7 AAAA as WindowsDNSRecordAAAAMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The IPv6 address record.
Notes: (Read and Write property)

129.47.8 AFSDB as WindowsDNSRecordMXMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.9 CharSet as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: This value specifies the character set used in the associated function call.
Notes: (Read and Write property)

129.47.10 CNAME as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.11 DataLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The length, in bytes, of Data.
Notes: (Read and Write property)

129.47.12 HINFO as WindowsDNSRecordTXTMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.13 ISDN as WindowsDNSRecordTXTMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.14 MB as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.15 MD as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.16 MF as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.17 MG as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.18 MINFO as WindowsDNSRecordMInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.19 MR as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.20 MX as WindowsDNSRecordMXMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.21 Name as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A pointer to a string that represents the domain name of the record set.
Notes: (Read and Write property)

129.47.22 NextRecord as WindowsDNSRecordMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The next record in the answer.
Notes: (Read and Write property)

129.47.23 NS as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.24 Null as WindowsDNSRecordNullMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.25 RawData as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: the RAW data of this record.
Notes:

For debugging.
(Read and Write property)

129.47.26 RP as WindowsDNSRecordMInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.27 RT as WindowsDNSRecordMXMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.28 Section as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: This value specifies the section of interest returned from the DnsQuery function call.
Notes: (Read and Write property)

129.47.29 SOA as WindowsDNSRecordSOAMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.30 TTL as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The DNS RR's Time To Live value (TTL), in seconds.
Notes: (Read and Write property)

129.47.31 TXT as WindowsDNSRecordTXTMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.32 Type as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The DNS record type for this record.
Notes:

If type is kDNSTypeA, the A property is filled.
(Read and Write property)

129.47.33 X25 as WindowsDNSRecordTXTMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

129.47.34 Constants

129.47.35 kCharSetAnsi = 3

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the constants for the CharSet property.
Notes: The character set is ANSI.

129.47.36 kCharSetUnicode = 1

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the constants for the CharSet property.
Notes: The character set is Unicode.

129.47.37 kCharSetUnknown = 0

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the constants for the CharSet property.
Notes: The character set is unknown.

129.47.38 kCharSetUtf8 = 2

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the constants for the CharSet property.
Notes: The character set is UTF8.

129.47.39 kDNSClassAll = & h00ff

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the DNS classes in native byte order (little endian on Windows).

129.47.40 kDNSClassAny = & h00ff

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the DNS classes in native byte order (little endian on Windows).

129.47.41 kDNSClassCHAOS = & h0003

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the DNS classes in native byte order (little endian on Windows).

129.47.42 kDNSClassCSNET = & h0002

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the DNS classes in native byte order (little endian on Windows).

129.47.43 kDNSClassHESIOD = & h0004

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the DNS classes in native byte order (little endian on Windows).

129.47.44 kDNSClassInternet = & h0001

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the DNS classes in native byte order (little endian on Windows).

129.47.45 kDNSClassNone = & h00fe

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the DNS classes in native byte order (little endian on Windows).

129.47.46 kDNSQueryAcceptTruncatedResponse = & h00000001

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible flags for the Query function.
Notes: Returns truncated results. Does not retry under TCP.

129.47.47 kDNSQueryBypassCache = & h00000008

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible flags for the Query function.
Notes: Bypasses the resolver cache on the lookup.

129.47.48 kDNSQueryDontResetTTLValues = & h00100000

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible flags for the Query function.
Notes: If set, and if the response contains multiple records, records are stored with the TTL corresponding to the minimum value TTL from among all records. When this option is set, "Do not change the TTL of

individual records" in the returned record set is not modified.

129.47.49 kDNSQueryMulticastOnly = & h00000400

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible flags for the Query function.
Notes:

Prevents the query from using DNS and uses only Local Link Multicast Name Resolution (LLMNR).
Windows Vista and Windows Server 2008 or later.: This value is supported.

129.47.50 kDNSQueryNoHostsFile = & h00000040

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible flags for the Query function.
Notes:

Prevents the DNS query from consulting the HOSTS file.
Windows 2000 Server and Windows 2000 Professional: This value is not supported.

129.47.51 kDNSQueryNoLocalName = & h00000020

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible flags for the Query function.
Notes:

Directs DNS to ignore the local name.
Windows 2000 Server and Windows 2000 Professional: This value is not supported.

129.47.52 kDNSQueryNoMulticast = & h00000800

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible flags for the Query function.

129.47.53 kDNSQueryNoNetBT = & h00000080

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible flags for the Query function.
Notes:

Prevents the DNS query from using NetBT for resolution.
Windows 2000 Server and Windows 2000 Professional: This value is not supported.

129.47.54 kDNSQueryNoRecursion = & h00000004

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible flags for the Query function.
Notes: Directs the DNS server to perform an iterative query (specifically directs the DNS server not to perform recursive resolution to resolve the query).

129.47.55 kDNSQueryNoWireQuery = & h00000010

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible flags for the Query function.
Notes: Directs DNS to perform a query on the local cache only.

129.47.56 kDNSQueryReserved = & hff000000

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible flags for the Query function.
Notes: Reserved.

129.47.57 kDNSQueryReturnMessage = & h00000200

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible flags for the Query function.
Notes:

Directs DNS to return the entire DNS response message.
Windows 2000 Server and Windows 2000 Professional: This value is not supported.

129.47.58 kDNSQueryStandard = & h00000000

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible flags for the Query function.
Notes: Standard query.

129.47.59 kDNSQueryTreatAsFQDN = & h00001000

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible flags for the Query function.
Notes: Prevents the DNS response from attaching suffixes to the submitted name in a name resolution process

129.47.60 kDNSQueryUseTCPOnly = & h00000002

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible flags for the Query function.
Notes: Uses TCP only for the query.

129.47.61 kDNSQueryWireOnly = & h00000100

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible flags for the Query function.
Notes:

Directs DNS to perform a query using the network only, bypassing local information.
Windows 2000 Server and Windows 2000 Professional: This value is not supported.

129.47.62 kDNSRClassAll = & hff00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the DNS classes in network byte order.

129.47.63 kDNSRClassAny = & hff00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the DNS classes in network byte order.

129.47.64 kDNSRClassCHAOS = & h0300

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the DNS classes in network byte order.

129.47.65 kDNSRClassCSNET = & h0200

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the DNS classes in network byte order.

129.47.66 kDNSRClassHESIOD = & h0400

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the DNS classes in network byte order.

129.47.67 kDNSRClassInternet = & h0100

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the DNS classes in network byte order.

129.47.68 kDNSRClassNone = & hfe00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the DNS classes in network byte order.

129.47.69 kDNSRTypeA = & h0100

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.70 kDNSRTypeAAAA = & h1c00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.71 kDNSRTypeAFSDB = & h1200

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.72 kDNSRTypeALL = & hff00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.73 kDNSRTypeANY = & hff00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.74 kDNSRTypeATMA = & h2200

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.75 kDNSRTypeAXFR = & hfc00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.76 kDNSRTypeCNAME = & h0500

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.77 kDNSRTypeGPOS = & h1b00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.78 kDNSRTypeHINFO = & h0d00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.79 kDNSRTypeISDN = & h1400

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.80 kDNSRTypeIXFR = & hfb00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.81 kDNSRTypeKEY = & h1900

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.82 kDNSRTypeLOC = & h1d00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.83 kDNSRTypeMAILA = & hfe00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.84 kDNSRTypeMAILB = & hfd00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.85 kDNSRTypeMB = & h0700

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.86 kDNSRTypeMD = & h0300

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.87 kDNSRTypeMF = & h0400

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.88 kDNSRTypeMG = & h0800

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.89 kDNSRTypeMINFO = & h0e00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.90 kDNSRTypeMR = & h0900

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.91 kDNSRTypeMX = & h0f00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.92 kDNSRTypeNS = & h0200

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.93 kDNSRTypeNSAP = & h1600

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.94 kDNSRTypeNSAPPTR = & h1700

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.95 kDNSRTypeNULL = & h0a00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.96 kDNSRTypeNXT = & h1e00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.97 kDNSRTypePTR = & h0c00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.98 kDNSRTypePX = & h1a00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.99 kDNSRTypeRP = & h1100

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.100 kDNSRTypeRT = & h1500

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.101 kDNSRTypeSIG = & h1800

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.102 kDNSRTypeSOA = & h0600

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.103 kDNSRTypeSRV = & h2100

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.104 kDNSRTypeTEXT = & h1000

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.105 kDNSRTypeTKEY = & hf900

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.106 kDNSRTypeTSIG = & hfa00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.107 kDNSRTypeWINS = & h01ff

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.108 kDNSRTypeWINSR = & h02ff

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.109 kDNSRTypeWKS = & h0b00

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.110 kDNSRTypeX25 = & h1300

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in network byte order).

129.47.111 kDNSTypeA = & h0001

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in native byte order).

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in native byte order).

129.47.147 kDNSTypeTEXT = & h0010

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in native byte order).

129.47.148 kDNSTypeTKEY = & h00f9

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in native byte order).

129.47.149 kDNSTypeTSIG = & h00fa

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in native byte order).

129.47.150 kDNSTypeWINS = & hff01

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in native byte order).

129.47.151 kDNSTypeWINSR = & hff02

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in native byte order).

129.47.152 kDNSTypeWKS = & h000b

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in native byte order).

129.47.153 kDNSTypeX25 = & h0013

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in native byte order).

129.47.154 kDNSTypeZERO = & h0000

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the possible DNS record type constants (in native byte order).

129.47.155 kSectionAddtional = 3

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the constants for the Section Property.
Notes: The DNS section specified is additional DNS information.

129.47.156 kSectionAnswer = 1

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the constants for the Section Property.
Notes: The DNS section specified is a DNS answer.

129.47.157 kSectionAuthority = 2

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the constants for the Section Property.
Notes: The DNS section specified indicates a DNS authority.

129.47.158 kSectionQuestion = 0

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the constants for the Section Property.
Notes: The DNS section specified is a DNS question.

129.48 class WindowsDNSRecordMInfoMBS

129.48.1 class WindowsDNSRecordMInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a DNS mail information (MINFO) record.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

129.48.2 Methods

129.48.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes:

This constructor makes sure you don't create useless WindowsDNSRecordMInfoMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

129.48.4 Properties

129.48.5 NameErrorsMailbox as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string that represents the FQDN of the mailbox to receive error messages related to the mailing list.
Notes: (Read and Write property)

129.48.6 NameMailbox as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string that represents the fully qualified domain name (FQDN) of the mailbox responsible for the mailing list or mailbox specified in the record's owner name.
Notes: (Read and Write property)

129.49 class WindowsDNSRecordMXMBS

129.49.1 class WindowsDNSRecordMXMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a DNS mail exchanger (MX) record.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

129.49.2 Methods

129.49.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes:

This constructor makes sure you don't create useless WindowsDNSRecordMXMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

129.49.4 Properties

129.49.5 NameExchange as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string that represents the fully qualified domain name (FQDN) of the host willing to act as a mail exchange.
Notes: (Read and Write property)

129.49.6 Preference as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A preference given to this resource record among others of the same owner. Lower values are preferred.
Notes: (Read and Write property)

129.50 class WindowsDNSRecordNullMBS

129.50.1 class WindowsDNSRecordNullMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a NULL data DNS resource record
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

129.50.2 Methods

129.50.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes:

This constructor makes sure you don't create useless WindowsDNSRecordNullMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

129.50.4 Properties

129.50.5 ByteCount as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of bytes represented in Data.
Notes: (Read and Write property)

129.50.6 Data as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The raw data as a string.
Notes: (Read and Write property)

129.51 class WindowsDNSRecordPTRMBS

129.51.1 class WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a DNS pointer (PTR) record.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

129.51.2 Methods

129.51.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes:

This constructor makes sure you don't create useless WindowsDNSRecordPTRMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

129.51.4 Properties

129.51.5 NameHost as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The named host.
Notes: (Read and Write property)

129.52 class WindowsDNSRecordSOAMBS

129.52.1 class WindowsDNSRecordSOAMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a DNS start of authority (SOA) record.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

129.52.2 Methods

129.52.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes:

This constructor makes sure you don't create useless WindowsDNSRecordSOAMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

129.52.4 Properties

129.52.5 DefaultTTL as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The lower limit on the time, in seconds, that a DNS server or caching resolver are allowed to cache any resource records (RR) from the zone to which this record belongs.
Notes: (Read and Write property)

129.52.6 Expire as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The time, in seconds, before an unresponsive zone is no longer authoritative.
Notes: (Read and Write property)

129.52.7 NameAdministrator as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string that represents the name of the responsible party for the zone to which the record belongs.
Notes: (Read and Write property)

129.52.8 NamePrimaryServer as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string that represents the name of the authoritative DNS server for the zone to which the record belongs.
Notes: (Read and Write property)

129.52.9 Refresh as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The time, in seconds, before the zone containing this record should be refreshed.
Notes: (Read and Write property)

129.52.10 Retry as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The time, in seconds, before retrying a failed refresh of the zone to which this record belongs.
Notes: (Read and Write property)

129.52.11 SerialNo as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The serial number of the SOA record.
Notes: (Read and Write property)

129.53 class WindowsDNSRecordTXTMBS

129.53.1 class WindowsDNSRecordTXTMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a DNS text (TXT) record.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

129.53.2 Methods

129.53.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes:

This constructor makes sure you don't create useless WindowsDNSRecordTXTMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

129.53.4 Strings as String()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: An array of strings representing the descriptive text of the TXT resource record.

129.53.5 Properties

129.53.6 StringCount as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of strings represented in Strings array.
Notes: (Read and Write property)

129.54 class WindowsEthernetAdapterMBS

129.54.1 class WindowsEthernetAdapterMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: A class for the properties of an ethernet adapter.

129.54.2 Methods

129.54.3 Gateway(index as Integer) as WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Returns one of the IP address of the default gateway for this adapter.
Notes: Index goes from 0 to GatewayGount-1.

129.54.4 IP(index as Integer) as WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Returns one of the IP addresses associated with this adapter.
Notes: Index goes from 0 to IPcount-1.

129.54.5 Properties

129.54.6 AdapterName as String

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Name of the adapter.
Notes: (Read and Write property)

129.54.7 Address as String

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Hardware address for the adapter.
Notes: (Read and Write property)

129.54.8 CurrentIpAddress as WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: The current IP from within the IP list.
Notes:

This field is currently normally nil, but in the future it may point to the current IP inside the IP list.
But currently on Windows 2000 it seems to be always nil.
(Read and Write property)

129.54.9 Description as String

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Description for the adapter.
Notes: (Read and Write property)

129.54.10 DhcpEnabled as Boolean

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Specifies whether dynamic host configuration protocol (DHCP) is enabled for this adapter.
Notes: (Read and Write property)

129.54.11 DhcpServer as WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: IP address of the DHCP server for this adapter.
Notes: (Read and Write property)

129.54.12 Gatewaycount as Integer

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: How many gateway IPs are allocated for this adapter.
Notes: (Read and Write property)

129.54.13 HaveWins as Boolean

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Specifies whether this adapter uses Windows Internet Name Service (WINS).
Notes: (Read and Write property)

129.54.14 Index as Integer

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Adapter index.
Notes: (Read and Write property)

129.54.15 IPcount as Integer

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: How many IPs are allocated for this adapter.
Notes: (Read and Write property)

129.54.16 LeaseExpires as Integer

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Time when the current DHCP lease expires.
Notes: (Read and Write property)

129.54.17 LeaseObtained as Integer

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Time when the current DHCP lease was obtained.
Notes: (Read and Write property)

129.54.18 PrimaryWinsServer as WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: IP address of the primary WINS server.
Notes: (Read and Write property)

129.54.19 SecondaryWinsServer as WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: IP address of the secondary WINS server.
Notes: (Read and Write property)

129.54.20 Type as Integer

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Adapter type.
Notes:

The type must be of the following values:

MIB_IF_TYPE_OTHER	1
MIB_IF_TYPE_ETHERNET	6
MIB_IF_TYPE_TOKENRING	9
MIB_IF_TYPE_FDDI	15
MIB_IF_TYPE_PPP	23
MIB_IF_TYPE_LOOPBACK	24
MIB_IF_TYPE_SLIP	28

(Read and Write property)

129.55 class WindowsEthernetMBS

129.55.1 class WindowsEthernetMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: A list of the Windows Ethernet Interfaces.
Notes:

Requires Windows 98 or 2000 or newer.
Reports count=0 on Windows 95 and NT 4.0.

Only activate adapters are listed.

129.55.2 Methods

129.55.3 Item(index as Integer) as WindowsEthernetAdapterMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Returns the Ethernet Adapter object for the given index.
Notes: Index goes from 0 to count-1.

129.55.4 Update

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Updates the list.
Notes: Calls the Destructor and than the Constructor so the list is completly rebuilt.

129.55.5 Properties

129.55.6 Count as Integer

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: How much ethernet adapters are available.
Notes:

Note that there may be dummy or virtual adapters.
(Read and Write property)

129.56 class WindowsIPAddressMBS

129.56.1 class WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: An IP address.

129.56.2 Properties

129.56.3 IP as String

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: The IP as a string.
Notes:

Maximum 15 bytes long.
e.g. "192.168.0.1"
(Read and Write property)

129.56.4 Mask as String

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: The mask for the IP.
Notes:

e.g. "255.255.255.0"
(Read and Write property)

129.57 class WindowsProxyMBS

129.57.1 class WindowsProxyMBS

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to query the current windows proxy settings.

129.57.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr5
- Need Proxy Settings?

129.57.3 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr5
- Need Proxy Settings?

129.57.4 Properties

129.57.5 ByPass as String

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The proxy
Notes:

Example values:
"testserver:1234 apple.de <local>"
or
"testserver3:1234 testserver4:1234 testserver1:1234 testserver2:1234 apple.de <local>"
(Read and Write property)

129.57.6 Proxy as String

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current proxy setting.
Notes:

Example values:
"testserver:1234"

or
”https=testserver2:1234 http=testserver1:1234 gopher=testserver4:1234 ftp=testserver3:1234”
(Read and Write property)

129.57.7 UsingProxy as Boolean

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether a proxy is in use.
Notes: (Read and Write property)

129.58 class WindowsQOSMBS

129.58.1 class WindowsQOSMBS

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for Quality Windows Audio/Video Experience (qWAVE).
Notes:

Quality Windows Audio/Video Experience (qWAVE) is the next generation Quality of Service (QOS) platform introduced in Windows Vista.
qWAVE provides new features focused on streaming multimedia and real-time content over variable bandwidth networks. These features include the following.

- Auto-discovery of end-to-end QOS compatibility.
- End-to-end bandwidth estimation of maximum link capacity (bottleneck bandwidth) and real-time available bandwidth.
- Intelligent packet prioritization.
- Congestion notification.
- Flow shaping.
- Distributed admission control, including caching to improve performance and minimize latency.

Requires Windows 6 (Vista).

129.58.6 Methods

129.58.7 AddSocketToFlow(Socket as Integer, DestAddr as string, DestPort as Integer, TrafficType as Integer, Flags as Integer, byref FlowId as UInt32) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds a socket to a flow.
Notes:

Socket: Identifies the socket that the application will use to flow traffic.
DestAddr: The destination IP address to which the application will send traffic. DestAddr and DestPort are optional if the socket is already connected. If this parameter is specified, the remote IP address and port must match those used in the socket's connect call.
If the socket is not connected, this parameter must be specified. If the socket is already connected, this parameter does not need to be specified. In this case, if the parameter is still specified, the destination host and port must match what was specified during the socket connect call.
Since, under TCP, the socket connect call can be delayed, AddSocketToFlow can be called before a connection is established, passing in the remote system's IP address and port number in the DestAddr parameter.
DestPort: The port for the connection.
TrafficType: A QOSTrafficType* constant that specifies the type of traffic for which this flow will be used.
Flags: Optional flag values. Can be QOSNonAdaptiveFlow.
FlowID: Receives a flow identifier. On input, this value must be 0. On output, the buffer contains a flow identifier if the call succeeds.
If a socket is being added to an existing flow, this parameter will be the identifier of that flow.
An application can make use of this parameter if multiple sockets used can share the same QoS flow properties. The QoS subsystem, then does not have to incur the overhead of provisioning new flows for subsequent sockets with the same properties. Note that only non-adaptive flows can have multiple sockets attached to an existing flow.
A FlowID is an unsigned 32-bit integer.

Lasterror is set.

The use of IPv4/v6 mixed addresses is not supported in qWAVE. The address specified by the DestAddr parameter must be either IPv4 or IPv6.
If there is a requirement for network experiments over a specific network interface, the socket must be bound to that particular interface. Otherwise the most appropriate interface for the experiment, as indicated by the network stack, is assigned by the qWAVE subsystem.
Network traffic associated with this flow is not affected by making this call alone. For example, packet prioritization does not occur immediately.
There are two categories of applications that use this function: adaptive and non-adaptive. An adaptive application makes use of notifications and information in the FlowFundamentals for adapting to network changes such as congestion. The qWAVE service uses Link Layer Topology Discovery (LLTD) QoS extensions for adaptive flows which can be present on the destination device.
After calling this function adaptive A/V applications should call the SetFlowRate function to affect network traffic.
A non-adaptive application either does not adapt to changing network characteristics or is sending traffic to an endpoint that does not support adaptive capabilities as indicated by ERROR_NOT_SUPPORTED.
Non-adaptive applications, or adaptive applications making non-adaptive flows, should call this function with the QOSNonAdaptiveFlow flag. After calling this function A/V applications should call the setOutgoingDSCPValue, setOutgoingRate or setTrafficType function with a Operation. They do not need to be called unless shaping is desired.
See also:

- 129.58.8 AddSocketToFlow(Socket as Integer, TrafficType as Integer, Flags as Integer, byref FlowId as UInt32) as boolean 20935

129.58.8 AddSocketToFlow(Socket as Integer, TrafficType as Integer, Flags as Integer, byref FlowId as UInt32) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds a socket to a flow.
Notes:

Socket: Identifies the socket that the application will use to flow traffic.
DestAddr: The destination IP address to which the application will send traffic. DestAddr and DestPort are optional if the socket is already connected. If this parameter is specified, the remote IP address and port must match those used in the socket's connect call.
If the socket is not connected, this parameter must be specified. If the socket is already connected, this parameter does not need to be specified. In this case, if the parameter is still specified, the destination host and port must match what was specified during the socket connect call.
Since, under TCP, the socket connect call can be delayed, AddSocketToFlow can be called before a connection is established, passing in the remote system's IP address and port number in the DestAddr parameter.
DestPort: The port for the connection.
TrafficType: A QOSTrafficType* constant that specifies the type of traffic for which this flow will be used.
Flags: Optional flag values. Can be QOSNonAdaptiveFlow.
FlowID: Receives a flow identifier. On input, this value must be 0. On output, the buffer contains a flow

identifier if the call succeeds.
If a socket is being added to an existing flow, this parameter will be the identifier of that flow.
An application can make use of this parameter if multiple sockets used can share the same QoS flow properties. The QoS subsystem, then does not have to incur the overhead of provisioning new flows for subsequent sockets with the same properties. Note that only non-adaptive flows can have multiple sockets attached to an existing flow.
A FlowID is an unsigned 32-bit integer.

Lasterror is set.

The use of IPv4/v6 mixed addresses is not supported in qWAVE. The address specified by the DestAddr parameter must be either IPv4 or IPv6.
If there is a requirement for network experiments over a specific network interface, the socket must be bound to that particular interface. Otherwise the most appropriate interface for the experiment, as indicated by the network stack, is assigned by the qWAVE subsystem.
Network traffic associated with this flow is not affected by making this call alone. For example, packet prioritization does not occur immediately.
There are two categories of applications that use this function: adaptive and non-adaptive. An adaptive application makes use of notifications and information in the FlowFundamentals for adapting to network changes such as congestion. The qWAVE service uses Link Layer Topology Discovery (LLTD) QoS extensions for adaptive flows which can be present on the destination device.
After calling this function adaptive A/V applications should call the SetFlowRate function to affect network traffic.
A non-adaptive application either does not adapt to changing network characteristics or is sending traffic to an endpoint that does not support adaptive capabilities as indicated by ERROR_NOT_SUPPORTED.
Non-adaptive applications, or adaptive applications making non-adaptive flows, should call this function with the QOSNonAdaptiveFlow flag. After calling this function A/V applications should call the setOutgoingDSCPValue, setOutgoingRate or setTrafficType function with a Operation. They do not need to be called unless shaping is desired.

- 129.58.7 AddSocketToFlow(Socket as Integer, DestAddr as string, DestPort as Integer, TrafficType as Integer, Flags as Integer, byref FlowId as UInt32) as boolean 20934

129.58.9 Constructor

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: This function initializes the QOS subsystem.
Notes:

On success Handle property is not zero.
Lasterror is set.

Every process intending to use qWAVE must first call Constructor.
If a machine enters a power save mode that interrupts connectivity such as sleep or standby, existing and

active network experiments such as QOSStartTrackingClient must be reinitiated. This recreation of the flow mirrors the cleanup and creation activities also necessary for existing sockets. A new handle must be created, and the flow must be recreated and readmitted.

129.58.10 getFlowFundamentals(FlowID as Integer, byref BottleneckBandwidthSet as boolean, byref BottleneckBandwidth as UInt64, byref AvailableBandwidthSet as boolean, byref AvailableBandwidth as UInt64, byref RTTSet as boolean, byref RTT as UInt32, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries flow fundamentals.
Notes:

FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.
Flags: Optional, can be QOSQueryFlowFresh.
BottleneckBandwidthSet: This Boolean value is set to true if the BottleneckBandwidth field contains a value.
BottleneckBandwidth: Indicates the maximum end-to-end link capacity between the source and sink device, in bits.
AvailableBandwidthSet: Set to true if the AvailableBandwidth field contains a value.
AvailableBandwidth: Indicates how much bandwidth is available for submitting traffic on the end-to-end network path between the source and sink device, in bits.
RTTSet: Set to true if the RTT field contains a value.
RTT: Measures the round-trip time between the source and sink device, in microseconds.

Lasterror is set. Returns true on success or false on failure.

129.58.11 getOutgoingRate(FlowID as Integer, byref Bandwidth as UInt64, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries flow rate.
Notes:

FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.
Bandwidth: will contain a UINT64 value that indicates the flow rate specified when requesting the contract, in bits per second.
Flags: Optional, can be QOSQueryFlowFresh.
Lasterror is set. Returns true on success or false on failure.

129.58.12 getPacketPriority(FlowID as Integer, byref ConformantDSCPValue as Integer, byref NonConformantDSCPValue as Integer, byref ConformantL2Value as Integer, byref NonConformantL2Value as Integer, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries packet priorities.
Notes:

FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.
Flags: Optional, can be QOSQueryFlowFresh.

ConformantDSCPValue: Differential Services Code Point (DSCP) mark used for flow traffic that conforms to the specified flow rate.
NonConformantDSCPValue: DSCP marking used for flow traffic that exceeds the specified flow rate. Non-conformant DSCP values are only applicable only if value is QOSUseNonConformantMarkings.
ConformantL2Value: Layer-2 (L2) tag used for flow traffic that conforms to the specified flow rate. L2 tags will not be added to packets if the end-to-end path between source and sink does not support them.
NonConformantL2Value: L2 tag used for flow traffic that exceeds the specified flow rate. Non-conformant L2 values are only applicable if value is QOSUseNonConformantMarkings.

Lasterror is set. Returns true on success or false on failure.

129.58.13 RemoveAllSocketsFromFlow(FlowID as Integer) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The RemoveSocketFromFlow function notifies the QOS subsystem that a previously added flow has been terminated by the application, and that the subsystem must update its internal information accordingly.
Notes:

FlowId: A flow identifier. A QOS_FLOWID is an unsigned 32-bit integer.

Lasterror is set. Returns true on success or false on failure.
The plugin closes all flows in destructor.

129.58.14 RemoveSocketFromFlow(socketHandle as Integer, FlowID as Integer) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The RemoveSocketFromFlow function notifies the QOS subsystem that a previously added flow has been terminated by the application, and that the subsystem must update its internal information accordingly.
Notes:

Socket: Socket to be removed from the flow.
Only flows created with the QOSNonAdaptiveFlow flag may have multiple sockets added to the same flow. By passing the Socket parameter in this call, each socket can be removed individually. If the Socket parameter is not passed, the entire flow will be destroyed. If only one socket was attached to the flow, passing this socket as a parameter to this function and passing 0 as a socket are equivalent calls.
FlowId: A flow identifier. A QOS_FLOWID is an unsigned 32-bit integer.

Lasterror is set. Returns true on success or false on failure.
The plugin closes all flows in destructor.

129.58.15 setOutgoingDSCPValue(FlowID as Integer, OutgoingDSCPValue as Integer, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the outgoing DSCP value.
Notes:

FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.

Lasterror is set. Returns true on success or false on failure.

If StartTrackingClient has not already been called, calling QOSSetFlow will cause the QOS subsystem to perform the following.

- Discover whether the end-to-end network path supports prioritization.
- Track end-to-end network characteristics by way of network experiments. These experiments do not place any noteworthy stress on the network.

129.58.16 setOutgoingRate(FlowID as Integer, Bandwidth as UInt64, ShapingBehavior as Integer, Reason as Integer, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets a new outgoing rate.
Notes:

FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.
Bandwidth: The rate at which data should be sent, in units of bits per second.
Note Traffic on the network is measured at the IP level, and not at the application level. The rate that is specified should account for the IP and protocol headers.
ShapingBehavior: A shaping constant that defines the shaping behavior of the flow.
Reason: A QOSFlowRate* constant that indicates the reason for a flow rate change.
Lasterror is set. Returns true on success or false on failure.

If StartTrackingClient has not already been called, calling QOSSetFlow will cause the QOS subsystem to perform the following.

- Discover whether the end-to-end network path supports prioritization.
- Track end-to-end network characteristics by way of network experiments. These experiments do not place any noteworthy stress on the network.#

129.58.17 setTrafficType(FlowID as Integer, TrafficType as Integer, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the type of traffic
Notes:

FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.
TrafficType: One of the traffic type constants.
Lasterror is set. Returns true on success or false on failure.

If StartTrackingClient has not already been called, calling QOSSetFlow will cause the QOS subsystem to perform the following.

- Discover whether the end-to-end network path supports prioritization.
- Track end-to-end network characteristics by way of network experiments. These experiments do not place any noteworthy stress on the network.#

129.58.18 StartTrackingClient(DestAddr as string, flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The StartTrackingClient function notifies the QOS subsystem of the existence of a new client.
Notes:

Calling this function increases the likelihood that the QOS subsystem will have gathered sufficient information on the network path to assist when calling QOSSetFlow to set the flow.
Note This call is not required to add a flow with the QOSAddSocketToFlow function although it is highly recommended. Not calling this function may require network experiments to be started during the QOSSetFlow call and can result in QOSSetFlow failing with ERROR_NETWORK_BUSY on initial use.

DestAddr: The IP address of the client device. Clients are identified by their IP address and address family. Any port number specified in the sockaddr structure will be ignored.
Flags: Reserved for future use. Must be set to 0.

On receipt of a QOSStartTrackingClient call the QoS subsystem begins gathering information about the client such as the QoS capabilities and available bandwidth on the end-to-end path.
An application should call this function as soon as it becomes aware of a client device that may need QoS flow. For example this function should be called when a media player device first connects to a media server application.
Network experiments performed by QOSStartTrackingClient do not introduce noteworthy load on the network even if no stream is started for a long period of time. The qWAVE service dynamically adjusts experiment traffic based on QoS subsystem activity.
Link Layer Topology Discovery (LLTD) must be implemented on the sink PC or device for this function to work.

Lasterror is set. Returns true on success or false on failure.

129.58.19 StopTrackingClient(DestAddr as string, flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The StopTrackingClient function notifies the QoS subsystem to stop tracking a client that has previously used the StartTrackingClient function.
Notes:

If a flow is currently in progress, this function will not affect it.

DestAddr: The IP address of the client device. Clients are identified by their IP address and address family. A port number is not required and will be ignored.
Flags: Reserved for future use.

Lasterror is set. Returns true on success or false on failure.

129.58.20 Properties

129.58.21 Handle as Integer

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

129.58.22 Lasterror as Integer

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

129.58.23 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The generic window error message for the error in lasterror property.
Notes: (Read and Write property)

129.58.24 Constants

129.58.25 QOSFlowRateCongestion = 2

MBS Win Plugin, Plugin Version: 13.5.

Function: One of the flow reason constants.
Notes: Indicates that the flow has changed due to congestion.

129.58.26 QOSFlowRateContentChange = 1

MBS Win Plugin, Plugin Version: 13.5.

Function: One of the flow reason constants.
Notes: Indicates that the content of a flow has changed.

129.58.27 QOSFlowRateHigherContentEncoding = 3

MBS Win Plugin, Plugin Version: 13.5.

Function: One of the flow reason constants.
Notes: Indicates that the user has caused the flow to change.

129.58.28 QOSFlowRateNotApplicable = 0

MBS Win Plugin, Plugin Version: 13.5.

Function: One of the flow reason constants.
Notes: Indicates that there has not been a change in the flow.

129.58.29 QOSFlowRateUserCaused = 4

MBS Win Plugin, Plugin Version: 13.5.

Function: One of the flow reason constants.
Notes: Indicates that the user has caused the flow to change.

129.58.30 QOSNonAdaptiveFlow = 2

MBS Win Plugin, Plugin Version: 13.5.

Function: One of the flags.
Notes: If specified, the QoS subsystem will not gather data about the network path for this flow. As a result, functions which rely on bandwidth estimation techniques will not be available. For example, this would block QOSQueryFlow with an Operation value of QOSQueryFlowFundamentals and QOSNotifyFlow with an Operation value of QOSNotifyCongested, QOSNotifyUncongested, and QOSNotifyAvailable.

129.58.31 QOSQueryFlowFresh = 1

MBS Win Plugin, Plugin Version: 13.5.

Function: One of the flags.
Notes:

The QOS subsystem will only return fresh, not cached, data. If fresh data is unavailable, it will try to obtain such data, at the expense of possibly taking more time. If this is not possible, the call will fail with the error code ERROR_RETRY.

This flag is only applicable when the Operation parameter is set to QOSQueryFlowFundamentals.

129.58.32 QOSShapeAndMark = 1

MBS Win Plugin, Plugin Version: 13.5.

Function: One of the constants for shaping behavior of a flow.
Notes: Indicates that the Windows Scheduler will be used to enforce the requested flow rate. Data packets exceeding the rate are delayed accordingly. Packets receive conformant priority values.

129.58.33 QOSShapeOnly = 0

MBS Win Plugin, Plugin Version: 13.5.

Function: One of the constants for shaping behavior of a flow.
Notes: Indicates that the Windows packet scheduler (Pacer) will be used to enforce the requested flow rate. Data packets that exceed the rate are delayed until appropriate in order to maintain the specified flow rate. If the network supports prioritization, packets will always receive conformant priority values when QOSShapeFlow is specified.

129.58.34 QOSTrafficTypeAudioVideo = 3

MBS Win Plugin, Plugin Version: 13.5.

Function: One of the traffic type constants.
Notes:

Flow traffic has a network priority higher than QOSTrafficTypeExcellentEffort, yet lower than QOSTrafficTypeVoice. This traffic type should be used for A/V streaming scenarios such as MPEG2 streaming.
Sent traffic will contain a DSCP mark with a value of 0x28 and an 802.1p tag with a value of 5.

129.58.35 QOSTrafficTypeBackground = 1

MBS Win Plugin, Plugin Version: 13.5.

Function: One of the traffic type constants.
Notes:

Flow traffic has a network priority lower than that of QOSTrafficTypeBestEffort. This traffic type could be used for traffic of an application doing data backup.
Sent traffic will contain a DSCP mark with a value of 0x08 and an 802.1p tag with a value of 2.

129.58.36 QOSTrafficTypeBestEffort = 0

MBS Win Plugin, Plugin Version: 13.5.

Function: One of the traffic type constants.
Notes:

Flow traffic has the same network priority as regular traffic not associated with QOS.
This traffic type is the same as not specifying priority, and as a result, the DSCP mark and 802.1p tag are not added to sent traffic.

129.58.37 QOSTrafficTypeControl = 5

MBS Win Plugin, Plugin Version: 13.5.

Function: One of the traffic type constants.
Notes:

Flow traffic has the highest network priority. This traffic type should only be used for the most critical of data. For example, it may be used for data carrying user inputs.
Sent traffic will contain a DSCP mark with a value of 0x38 and an 802.1p tag with a value of 7.

129.58.38 QOSTrafficTypeExcellentEffort = 2

MBS Win Plugin, Plugin Version: 13.5.

Function: One of the traffic type constants.
Notes:

Flow traffic has a network priority higher than QOSTrafficTypeBestEffort, yet lower than QOSTrafficTypeAudioVideo. This traffic type should be used for data traffic that is more important than normal end-user scenarios, such as email.
Sent traffic will contain a DSCP mark with value of 0x28 and 802.1p tag with a value of 5.

129.58.39 QOSTrafficTypeVoice = 4

MBS Win Plugin, Plugin Version: 13.5.

Function: One of the traffic type constants.
Notes:

Flow traffic has a network priority higher than QOSTrafficTypeAudioVideo, yet lower than QOSTrafficTypeControl. This traffic type should be used for realtime voice streams such as VOIP.
Sent traffic will contain a DSCP mark with a value of 0x38 and an 802.1p tag with a value of 7.

129.58.40 QOSUseNonConformantMarkings = 2

MBS Win Plugin, Plugin Version: 13.5.

Function: One of the constants for shaping behavior of a flow.
Notes: Indicates that the flow rate requested will not be enforced. Data packets that would exceed the flow rate will receive a priority that indicates they are non-conformant. This may lead to lost and reordered packets.

129.59 class WinHTTPClientAutoProxyOptionsMBS

129.59.1 class WinHTTPClientAutoProxyOptionsMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WinHTTPClientAutoProxyOptionsMBS class is used to indicate to the WinHttpGetProxyForURL function whether to specify the URL of the Proxy Auto-Configuration (PAC) file or to automatically locate the URL with DHCP or DNS queries to the network.
Notes:

see also:
http://msdn.microsoft.com/en-us/library/windows/desktop/aa384123(v=vs.85).aspx

129.59.2 Methods

129.59.3 Constructor

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

129.59.4 Properties

129.59.5 AutoConfigUrl as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The URL for the config URL.
Notes:

If Flags includes the kAutoProxyConfigURL flag, the AutoConfigUrl contains the URL of the proxy auto-configuration (PAC) file.
If Flags does not include the kAutoProxyConfigURL flag, then AutoConfigUrl must be "".
(Read and Write property)

129.59.6 AutoDetectFlags as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The flags for auto detecting.
Notes:

If Flags includes the kAutoProxyAutoDetect flag, then AutoDetectFlags specifies what protocols are to be used to locate the PAC file. If both the DHCP and DNS auto detect flags are specified, then DHCP is used first; if no PAC URL is discovered using DHCP, then DNS is used.
If Flags does not include the kAutoProxyAutoDetect flag, then AutoDetectFlags must be zero.

Value	Meaning
kAutoDetectTypeDHCP	Use DHCP to locate the proxy auto-configuration file.
kAutoDetectTypeDNSA	Use DNS to attempt to locate the proxy auto-configuration file at a well-known location on the domain of the local computer.

(Read and Write property)

129.59.7 AutoLogonIfChallenged as Boolean

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies whether the client's domain credentials should be automatically sent in response to an NTLM or Negotiate Authentication challenge when WinHTTP requests the PAC file.
Notes:

If this flag is true, credentials should automatically be sent in response to an authentication challenge. If this flag is false and authentication is required to download the PAC file, the WinHttpGetProxyForUrl function fails.
(Read and Write property)

129.59.8 Flags as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Flags for detecting proxy.
Notes: (Read and Write property)

129.59.9 Constants

129.59.10 kAutoDetectTypeDHCP = 1

MBS Win Plugin, Plugin Version: 14.1.

Function: The flags for auto detection types.
Notes: Use DHCP to locate the proxy auto-configuration file.

129.59.11 kAutoDetectTypeDNSA = 2

MBS Win Plugin, Plugin Version: 14.1.

Function: The flags for auto detection types.
Notes: Use DNS to attempt to locate the proxy auto-configuration file at a well-known location on the domain of the local computer.

129.59.12 kAutoProxyAutoDetect = 1

MBS Win Plugin, Plugin Version: 14.1.

Function: One of the proxy flags.
Notes: Attempt to automatically discover the URL of the PAC file using both DHCP and DNS queries to the local network.

129.59.13 kAutoProxyConfigURL = 2

MBS Win Plugin, Plugin Version: 14.1.

Function: One of the proxy flags.
Notes: Download the PAC file from the URL specified by AutoConfigUrl in the WinHTTPClientAutoProxyOptionsMBS class.

129.60 class WinHTTPClientCurrentUserIEProxyConfigMBS

129.60.1 class WinHTTPClientCurrentUserIEProxyConfigMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for Internet Explorer proxy configuration information.
Notes:

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/aa384250(v=vs.85).aspx
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

129.60.2 Methods

129.60.3 Constructor

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

129.60.4 Properties

129.60.5 AutoConfigUrl as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The auto-configuration URL.
Notes:

The auto-configuration URL if the Internet Explorer proxy configuration for the current user specifies "Use automatic proxy configuration".
(Read and Write property)

129.60.6 AutoDetect as Boolean

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to auto detect proxy settings.
Notes:

If true, indicates that the Internet Explorer proxy configuration for the current user specifies "automatically detect settings".

(Read and Write property)

129.60.7 Proxy as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Contains the proxy URL if the Internet Explorer proxy configuration for the current user specifies "use a proxy server".
Notes: (Read and Write property)

129.60.8 ProxyBypass as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Optional proxy by-pass server list.
Notes: (Read and Write property)

129.61 class WinHTTPClientMBS

129.61.1 class WinHTTPClientMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for Windows to do http requests.
Notes:

The plugin only implements proxy related functions.
But this class could be extended to work like HTTPSocket.

129.61.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo / Real Studio plug-ins in version 14.1
- MBS Xojo / Real Studio Plugins, version 14.1pr1

129.61.3 Blog Entries

- MonkeyBread Software Releases the MBS Xojo / Real Studio plug-ins in version 14.1
- MBS Xojo / Real Studio Plugins, version 14.1pr1

129.61.4 Methods

129.61.5 Close as boolean

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Closes the session.

129.61.6 Constructor

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: The constructor.

129.61.7 CrackUrl(URL as string, Flags as Integer = 0) as WinHTTPClientURLComponentsMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Separates a URL into its component parts such as host name and path.
Notes:

URL: the canonical URL to separate. WinHttpCrackUrl does not check this URL for validity or correct format before attempting to crack it.

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/aa384092(v=vs.85).aspx

129.61.8 DetectAutoProxyConfigUrl(AutoDetectFlags as Integer, byref AutoConfigUrl as string) as Boolean

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Finds the URL for the Proxy Auto-Configuration (PAC) file.
Notes:

This function reports the URL of the PAC file, but it does not download the file.

AutoDetectFlags: A data type that specifies what protocols to use to locate the PAC file. If both the DHCP and DNS auto detect flags are set, DHCP is used first; if no PAC URL is discovered using DHCP, then DNS is used.

Value	Meaning
kAutoDetectTypeDHCP	Use DHCP to locate the proxy auto-configuration file.
kAutoDetectTypeDNSA	Use DNS to attempt to locate the proxy auto-configuration file at a well-known location on the domain of the local computer.

AutoConfigUrl: String that contains the configuration URL that receives the proxy data.

Returns true if successful, or false otherwise. For extended error information, call LastError. Among the error codes returned are the following.

WinHTTP implements the Web Proxy Auto-Discovery (WPAD) protocol, often referred to as autoproxy. For more information about well-known locations, see the Discovery Process section of the WPAD protocol document.
Note that because the DetectAutoProxyConfigUrl function takes time to complete its operation, it should not be called from a UI thread.

129.61.9 GetDefaultProxyConfiguration as WinHTTPClientProxyInfoMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Retrieves the default WinHTTP proxy configuration from the registry.
Notes: Returns the default proxy configuration.

129.61.10 GetIEProxyConfigForCurrentUser as WinHTTPClientCurrentUserIEProxyConfigMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Retrieves the Internet Explorer proxy configuration for the current user.
Notes:

Queries the Internet Explorer proxy settings for the current active network connection (for example, LAN, dial-up, or VPN connection).

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/aa384096(v=vs.85).aspx

129.61.11 GetProxyForHost(URL as string, Host as string, byref proxy as string, byref proxyPort as string, AutoConfigURL as string = "") as boolean

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Queries the proxy for a host.
Notes:

This is an universal functions using InternetGetProxyInfo, DetectAutoProxyUrl and InternetQueryOption.

URL: The target URL.
Host: The hostname of the target server.

Returns true on success and sets proxy and port. Returns false on failure.
AutoConfigURL is only used on first call instead of a configured auto config URL in Internet Explorer.

129.61.12 GetProxyForUrl(URL as string, AutoProxyOptions as WinHTTPClientAutoProxyOptionsMBS, byref ProxyInfo as WinHTTPClientProxyInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Retrieves the proxy data for the specified URL.
Notes:

Url: Contains the URL of the HTTP request that the application is preparing to send.
AutoProxyOptions: Specifies the auto-proxy options to use.
ProxyInfo: Receives the proxy setting.

If the function succeeds, the function returns true.
If the function fails, it returns false. Lasterror is set.

This function implements the Web Proxy Auto-Discovery (WPAD) protocol for automatically configuring the proxy settings for an HTTP request. The WPAD protocol downloads a Proxy Auto-Configuration (PAC) file, which is a script that identifies the proxy server to use for a given target URL. PAC files are typically deployed by the IT department within a corporate network environment. The URL of the PAC file can either be specified explicitly or GetProxyForUrl can be instructed to automatically discover the location of the PAC file on the local network.

GetProxyForUrl supports only ECMAScript-based PAC files.
GetProxyForUrl must be called on a per-URL basis, because the PAC file can return a different proxy server for different URLs. This is useful because the PAC file enables an IT department to implement proxy server load balancing by mapping (hashing) the target URL (specified by the lpcwszUrl parameter) to a certain proxy in a proxy server array.
GetProxyForUrl caches the autoproxy URL and the autoproxy script when auto-discovery is specified in the dwFlags member of the pAutoProxyOptions structure. For more information, see Autoproxy Cache.

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/aa384097(v=vs.85).aspx

129.61.13 InternetGetProxyInfo(URL as string, Host as string) as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Retrieves proxy data for accessing specified resources.
Notes:

This function can only be called by dynamically linking to "JSProxy.dll" (plugin loads this for you). For better autoproxy support, use HTTP Services (WinHTTP) version 5.1 instead.

Url: Secifies the URL of the target HTTP resource.
HostName: Specifies the host name of the target URL.

Returns the URL of the proxy to use in an HTTP request for the specified resource.
Returns empty string on any error.

129.61.14 Open(UserAgent as string, AccessType as Integer, ProxyName as string = ””, ProxyByPass as string = ””) as boolean

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Initializes an application's use of the WinINet functions.
Notes:

lUserAgent: Specifies the name of the application or entity calling the WinINet functions. This name is used as the user agent in the HTTP protocol.
AccessType: Type of access required. This parameter can be one of the following values.

Value	Meaning
INTERNET_OPEN_TYPE_DIRECT	Resolves all host names locally.
INTERNET_OPEN_TYPE_PRECONFIG	Retrieves the proxy or direct configuration from the registry.
INTERNET_OPEN_TYPE_PRECONFIG_WITH_NO_AUTOPROXY	Retrieves the proxy or direct configuration from the registry and prevents the use of a startup Microsoft JScript or Internet Setup (INS) file.
INTERNET_OPEN_TYPE_PROXY	Passes requests to the proxy unless a proxy bypass list is supplied and the name to be resolved bypasses the proxy. In this case, the function uses INTERNET_OPEN_TYPE_DIRECT.

ProxyName: String that specifies the name of the proxy server(s) to use when proxy access is specified by setting dwAccessType to INTERNET_OPEN_TYPE_PROXY. Do not use an empty string, because InternetOpen will use it as the proxy name. The WinINet functions recognize only CERN type proxies (HTTP only) and the TIS FTP gateway (FTP only). If Microsoft Internet Explorer is installed, these functions also support SOCKS proxies. FTP requests can be made through a CERN type proxy either by changing them to an HTTP request or by using InternetOpenUrl. If dwAccessType is not set to INTERNET_OPEN_TYPE_PROXY, this parameter is ignored and should be NULL. For more information about listing proxy servers, see the Listing Proxy Servers section of Enabling Internet Functionality.
ProxyBypass: Specifies an optional list of host names or IP addresses, or both, that should not be routed through the proxy when dwAccessType is set to INTERNET_OPEN_TYPE_PROXY. The list can contain wildcards. Do not use an empty string, because InternetOpen will use it as the proxy bypass list. If this parameter specifies the ”<local>” macro, the function bypasses the proxy for any host name that does not contain a period.
By default, WinINet will bypass the proxy for requests that use the host names ”localhost”, ”loopback”, ”127.0.0.1”, or ” [::1] ”. This behavior exists because a remote proxy server typically will not resolve these addresses properly.
Internet Explorer 9: You can remove the local computer from the proxy bypass list using the ”<-loopback>” macro.
If dwAccessType is not set to INTERNET_OPEN_TYPE_PROXY, this parameter is ignored and should be NULL.

Flags: Options. This parameter can be a combination of the following values.

Value	Meaning
INTERNET_FLAG_ASYNC	Makes only asynchronous requests on handles descended from the handle returned from this function.
INTERNET_FLAG_FROM_CACHE	Does not make network requests. All entities are returned from the cache. If the requested item is not in the cache, a suitable error, such as ERROR_FILE_NOT_FOUND, is returned.
INTERNET_FLAG_OFFLINE	Identical to INTERNET_FLAG_FROM_CACHE. Does not make network requests. All entities are returned from the cache. If the requested item is not in the cache, a suitable error, such as ERROR_FILE_NOT_FOUND, is returned.

Returns a valid handle that the application passes to subsequent WinINet functions. If Open fails, it returns false. To retrieve a specific error message, call GetLastError.

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/aa385096(v=vs.85).aspx

129.61.15 SetDefaultProxyConfiguration(info as WinHTTPClientProxyInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Sets the default WinHTTP proxy configuration in the registry.
Notes:

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/aa384113(v=vs.85).aspx

SetDefaultProxyConfiguration changes the proxy configuration set by ProxyCfg.exe.
The default proxy configuration set by this function can be overridden for an existing WinHTTP session by calling SetOption and specifying the OptionProxy flag. The default proxy configuration can be overridden for a new session by specifying the configuration with the WinHttpOpen function.
The dwAccessType member of the WinHTTPClientProxyInfoMBS structure pointed to by pProxyInfo should be set to kAccessTypeNamedProxy if a proxy is specified. Otherwise, it should be set to kAccessTypeDefaultProxy.
Any new sessions created after calling this function use the new default proxy configuration.
Even when WinHTTP is used in asynchronous mode (that is, when WINHTTP_FLAG_ASYNC has been set in WinHttpOpen), this function operates synchronously. The return value indicates success or failure. To get extended error information, call GetLastError.
Note For Windows XP and Windows 2000, see the Run-Time Requirements section of the WinHTTP start page.

129.61.16 Properties

129.61.17 Handle as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference.
Notes:

This is a HINTERNET type.
(Read and Write property)

129.61.18 Lasterror as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error.
Notes:

see also error list:
http://msdn.microsoft.com/en-us/library/aa383770(VS.85).aspx
(Read and Write property)

129.61.19 LasterrorString as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The error message for the last error.
Notes: (Read and Write property)

129.61.20 OptionConnectTimeOut as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Get or set the connect timeout.
Notes:

Lasterror is set.

Sets or retrieves an unsigned long integer value that contains the time-out value, in milliseconds. Setting this option to infinite (-1) will disable this timer.
If a TCP connection request takes longer than this time-out value, the request is canceled. The default timeout is 60 seconds. When you are attempting to connect to multiple IP addresses for a single host (a

multihomed host), the timeout limit is for each individual connection.
(Read and Write property)

129.61.21 OptionProxyPassword as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Get or set the proxy password.
Notes:

Sets or retrieves a string value that contains the password used to access the proxy.
Lasterror is set.
(Read and Write property)

129.61.22 OptionProxyUsername as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Get or set the proxy user name.
Notes:

Sets or retrieves a string value that contains the user name used to access the proxy.
Lasterror is set.
(Read and Write property)

129.61.23 Constants

129.61.24 kAccessTypeDefaultProxy = 0

MBS Win Plugin, Plugin Version: 14.1.

Function: One of the proxy access types.
Notes: Applies only when setting proxy information.

129.61.25 kAccessTypeNamedProxy = 3

MBS Win Plugin, Plugin Version: 14.1.

Function: One of the proxy access types.
Notes: Internet accessed using a proxy.

129.61.26 kAccessTypeNoProxy = 1

MBS Win Plugin, Plugin Version: 14.1.

Function: One of the proxy access types.
Notes: Internet accessed through a direct connection.

129.61.27 kAutoDetectTypeDHCP = 1

MBS Win Plugin, Plugin Version: 14.1.

Function: One of the auto detect type flags.
Notes: Use DHCP to locate the proxy auto-configuration file.

129.61.28 kAutoDetectTypeDNSA = 2

MBS Win Plugin, Plugin Version: 14.1.

Function: One of the auto detect type flags.
Notes: Use DNS to attempt to locate the proxy auto-configuration file at a well-known location on the domain of the local computer.

129.61.29 kInternetSchemeHTTP = 1

MBS Win Plugin, Plugin Version: 14.1.

Function: One of the scheme type constants.
Notes: HTTP scheme.

129.61.30 kInternetSchemeHTTPS = 2

MBS Win Plugin, Plugin Version: 14.1.

Function: One of the scheme type constants.
Notes: HTTPS scheme.

129.62 class WinHTTPClientProxyInfoMBS

129.62.1 class WinHTTPClientProxyInfoMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for the session or default proxy configuration.
Notes:

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/aa383912(v=vs.85).aspx
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

129.62.2 Methods

129.62.3 Constructor

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

129.62.4 Properties

129.62.5 AccessType as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The access type.
Notes:

Can be kAccessTypeDefaultProxy, kAccessTypeNamedProxy or kAccessTypeNoProxy.
(Read and Write property)

129.62.6 Proxy as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The proxy server list.
Notes: (Read and Write property)

129.62.7 ProxyBypass as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The proxy bypass list.
Notes: (Read and Write property)

129.62.8 Constants

129.62.9 kAccessTypeDefaultProxy = 0

MBS Win Plugin, Plugin Version: 14.1.

Function: One of the proxy access types.
Notes: Applies only when setting proxy information.

129.62.10 kAccessTypeNamedProxy = 3

MBS Win Plugin, Plugin Version: 14.1.

Function: One of the proxy access types.
Notes: Internet accessed using a proxy.

129.62.11 kAccessTypeNoProxy = 1

MBS Win Plugin, Plugin Version: 14.1.

Function: One of the proxy access types.
Notes: Internet accessed through a direct connection.

129.63 class WinHTTPClientURLComponentsMBS

129.63.1 class WinHTTPClientURLComponentsMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class containing the constituent parts of an URL.
Notes:

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/aa384078(v=vs.85).aspx
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

129.63.2 Methods

129.63.3 Constructor

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

129.63.4 Properties

129.63.5 ExtraInfo as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The extra information, for example, ?something or # something.
Notes: (Read and Write property)

129.63.6 ExtraInfoLength as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The length of the extra information, in characters.
Notes: (Read and Write property)

129.63.7 HostName as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The host name.
Notes: (Read and Write property)

129.63.8 HostNameLength as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Length of the host name, in characters.
Notes: (Read and Write property)

129.63.9 Password as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The password.
Notes: (Read and Write property)

129.63.10 PasswordLength as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Length of the password, in characters.
Notes: (Read and Write property)

129.63.11 Port as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Port number.
Notes: (Read and Write property)

129.63.12 Scheme as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The scheme name.
Notes: (Read and Write property)

129.63.13 SchemeID as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internet protocol scheme.
Notes:

Normally 1 for HTTP and 2 for HTTPS.
(Read and Write property)

129.63.14 SchemeLength as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Length of the scheme name, in characters.
Notes: (Read and Write property)

129.63.15 UrlPath as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The URL path.
Notes: (Read and Write property)

129.63.16 UrlPathLength as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Length of the URL path, in characters.
Notes: (Read and Write property)

129.63.17 UserName as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The user name.
Notes: (Read and Write property)

129.63.18 UserNameLength as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Length of the user name, in characters.
Notes: (Read and Write property)

Chapter 130

Nikon Cameras

130.1 class NikonCapInfoMBS

130.1.1 class NikonCapInfoMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The class for Capability Information.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

130.1.2 Methods

130.1.3 Constructor

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The private constructor.

130.1.4 Properties

130.1.5 Description as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The description of this capability.
Notes: (Read only property)

130.1.6 ID as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The ID of this property.
Notes:

See eNkMAIDCapability in Nikon's documentation.
(Read only property)

130.1.7 Operations as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The supported operations for this capability.
Notes:

See eNkCapOperations in Nikon's documentation.
(Read only property)

130.1.8 OperationsString as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The operation value as a string for displaying.
Notes: (Read only property)

130.1.9 Type as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The type of this capability.
Notes:

See eNkMAIDCababilityType in Nikon's documentation.
(Read only property)

130.1.10 TypeString as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The type value as a string for displaying.
Notes: (Read only property)

130.1.11 Visibility as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The visibility of this capability.
Notes:

See eNkCapVisibility in Nikon's documentation.
(Read only property)

130.1.12 VisibilityString as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The visibility value as a string for displaying.
Notes: (Read only property)

130.2 class NikonFileInfoMBS

130.2.1 class NikonFileInfoMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The class for the File Data Delivery Structure.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

130.2.2 Methods

130.2.3 Constructor

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The private constructor.

130.2.4 Properties

130.2.5 DiskFile as Boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: True if the file is delivered on disk.
Notes: (Read and Write property)

130.2.6 FileDataType as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: One of eNkMAIDFileDataTypes.
Notes:

Possible values:

(Read and Write property)

kNkMAIDFileDataType_NotSpecified	0
kNkMAIDFileDataType_JPEG	1
kNkMAIDFileDataType_TIFF	2
kNkMAIDFileDataType_FlashPix	3
kNkMAIDFileDataType_NIF	4
kNkMAIDFileDataType_QuickTime	5
kNkMAIDFileDataType_UserType	& h100

130.2.7 Length as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Number of bytes in this delivery.
Notes: (Read and Write property)

130.2.8 RemoveObject as Boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: True if the object should be removed.
Notes: (Read and Write property)

130.2.9 Start as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Index of starting byte (0-based)
Notes: (Read and Write property)

130.2.10 TotalLength as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Total number of bytes to be transferred.
Notes: (Read and Write property)

130.3 class NikonImageInfoMBS

130.3.1 class NikonImageInfoMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The class for the Image Data Delivery structure.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

130.3.2 Methods

130.3.3 Bits(index as Integer) as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Number of bits per plane per pixel.
Notes: Index from 0 to 3.

130.3.4 Constructor

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The private constructor.

130.3.5 Properties

130.3.6 ColorSpace as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The colorspace.
Notes:

Possible values:

(Read and Write property)

kNkMAIDColorSpace_LineArt	0
kNkMAIDColorSpace_Grey	1
kNkMAIDColorSpace_RGB	2
kNkMAIDColorSpace_sRGB	3
kNkMAIDColorSpace_CMYK	4
kNkMAIDColorSpace_Lab	5
kNkMAIDColorSpace_LCH	6
kNkMAIDColorSpace_AppleRGB	7
kNkMAIDColorSpace_ColorMatchRGB	8
kNkMAIDColorSpace_NTSCRGB	9
kNkMAIDColorSpace_BruceRGB	10
kNkMAIDColorSpace_AdobeRGB	11
kNkMAIDColorSpace_CIERGB	12
kNkMAIDColorSpace_AdobeWideRGB	13
kNkMAIDColorSpace_AppleRGB_Compensated	14

130.3.7 Plane as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The plane configuration.
Notes: (Read and Write property)

130.3.8 Rect as NikonRectMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The rectangle.
Notes: (Read and Write property)

130.3.9 RemoveObject as Boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: True if the object should be removed.
Notes: (Read and Write property)

130.3.10 RowBytes as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Number of bytes per row of pixels.
Notes: (Read and Write property)

130.3.11 TotalPixels as NikonSizeMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Total size of image to be transfered.
Notes: (Read and Write property)

130.4 class NikonLiveImageMBS

130.4.1 class NikonLiveImageMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The class for the live image data structure.
Notes: As there are 5 variants of the data structure for the different camera SDKs, some fields may not be filled for the camera you have.

130.4.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.5pr10

130.4.3 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.5pr10

130.4.4 Methods

130.4.5 AFframes(index as UInt32) as NikonRectMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The auto focus frames array.
Notes:

Index from 0 to 34 (fixed to 0 for D5100)
Area of the AF frame size and the AF frame center coordinates for thirty-five persons

130.4.6 Properties

130.4.7 AFAreaIndex as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The Autofocus area index.
Notes:

From 0 to 34 (fixed to 0 for D5100)
(Read and Write property)

130.4.8 AFstate as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: AF mode status of the face detection system.
Notes:

0: The face detection system is not set to AF.
1: The face detection system is set to AF.
(Read and Write property)

130.4.9 Aperture as Double

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The aperture value.
Notes:

Aperture = F number*100
Only for type 2 and 3.
(Read only property)

130.4.10 AutoFocusHeight as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The height of the auto focus area.
Notes: (Read and Write property)

130.4.11 AutoFocusWidth as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The width of the auto focus area.
Notes: (Read and Write property)

130.4.12 AutoFocusX as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The x coordinate of the auto focus area.
Notes: (Read and Write property)

130.4.13 AutoFocusY as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The y coordinate of the auto focus area.
Notes: (Read and Write property)

130.4.14 CountDownTime as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The Countdown time.
Notes:

Countdown every one second starting from 3600 (one hour); countdown starting from thirty seconds with a rise in temperature.
(Read and Write property)

130.4.15 DirectionOfRotation as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The Rotation direction.
Notes: (Read and Write property)

130.4.16 DisplayCenterX as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Display center coordinate.
Notes: (Read and Write property)

130.4.17 DisplayCenterY as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Display center coordinate.
Notes: (Read and Write property)

130.4.18 DisplayHeight as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The height of the display area size.
Notes: (Read and Write property)

130.4.19 DisplayWidth as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The width of the display area size.
Notes: (Read and Write property)

130.4.20 FaceDetectionCount as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The number of persons whose faces are detected by the system.
Notes:

From 0 to 35 (Thirty-five is the maximum number of persons for D5100.)
(Read and Write property)

130.4.21 FacePriorityAFMode as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Face priority AF mode.
Notes:

0: Face priority AF is not active.
1: Face priority AF is active.
(Read and Write property)

130.4.22 FocusDriveState as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Focus driving status.
Notes:

0: Not driving
1: Driving
(Read and Write property)

130.4.23 FocusResult as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Focusing judgment result.
Notes:

0: No information
1: Not focused
2: Focused
(Read and Write property)

130.4.24 Height as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Height of the JPEG image.
Notes: (Read and Write property)

130.4.25 JPEGData as MemoryBlock

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The JPEG data of the live image.
Notes:

You can use JPEGStringToPictureMBS to decode it.
(Read and Write property)

130.4.26 MovieRecordingInformation as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Movie recording information.
Notes:

0: During LV execution
1: During movie recording

(Read and Write property)

130.4.27 RawData as MemoryBlock

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The raw data used to build this image object and the fill the properties.
Notes: (Read and Write property)

130.4.28 RemainingMovieRecordingTime as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Remaining time of movie recording.
Notes:

From 0 to 1200000 [msec] .
It is valid during the movie recording state.
(Read and Write property)

130.4.29 SelectedFocusPoint as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The number of the selected focus area.
Notes:

Range from 0 to 11.
(Read and Write property)

130.4.30 ShutterSpeed as Double

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The shutter speed.
Notes:

Only for type 2 and 3.
(Read only property)

130.4.31 TotalHeight as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The total size of the image.
Notes: (Read and Write property)

130.4.32 TotalWidth as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The total size of the image.
Notes: (Read and Write property)

130.4.33 Width as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Width of the JPEG image.
Notes: (Read and Write property)

130.4.34 Constants

130.4.35 kAFStateDriveImpossibility = 0

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the values for state that AF can be driven.
Notes: AF drive impossibility.

130.4.36 kAFStateDrivePossible = 1

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the values for state that AF can be driven.
Notes: AF drive possible.

130.4.37 kDirectionClockWise = 2

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the constants for rotation direction.
Notes: Rotate clockwise

130.4.38 kDirectionCounterClockWise = 1

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the constants for rotation direction.
Notes: Rotate counterclockwise

130.4.39 kDirectionNone = 0

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the constants for rotation direction.
Notes: No rotation

130.4.40 kFacePriorityAFModeActive = 1

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the auto focus modes.
Notes: Active

130.4.41 kFacePriorityAFModeNotActive = 0

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the auto focus modes.
Notes: Inactive

130.4.42 kFocusDriveStateDriving = 0

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the focus driving values.
Notes: Driving

130.4.43 kFocusDriveStateNotDriving = 1

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the focus driving values.
Notes: Not driving.

130.4.44 kFocusResultInFocus = 2

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the focus result values.
Notes: In Focus

130.4.45 kFocusResultNoInformation = 0

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the focus result values.
Notes: Focused

130.4.46 kFocusResultOutOfFocus = 1

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the focus result values.
Notes: Not focused.

130.5 class NikonMBS

130.5.1 class NikonMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The class to talk to a Nikon camera.
Notes: You need to get the SDKs yourself for the various cameras, so you have the PDF manuals, the C header files and the shared libraries.

130.5.2 Blog Entries

- MBS Xojo Plugins, version 17.4pr4
- MBS Xojo / Real Studio Plugins, version 13.4pr1

130.5.3 Blog Entries

- MBS Xojo Plugins, version 17.4pr4
- MBS Xojo / Real Studio Plugins, version 13.4pr1

130.5.4 Methods

130.5.5 Acquire as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Acquires an image.

130.5.6 Async_ as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Performs an asynchronously operation.

130.5.7 AutoFocus as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Performs autofocus.
Notes: Performs operation kNkMAIDCapability_AutoFocus.

130.5.8 AvailableDatatypes as UInt32

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns available data types.

130.5.9 Capabilities(what as Integer) as NikonCapInfoMBS()

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the list of capabilities.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.10 CapabilitiesCount(what as Integer) as UInt32

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns the number of capabilities.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.11 Capability(what as Integer, ID as Integer) as NikonCapInfoMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the capability with given ID.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.12 Capture as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Performs a capture.
Notes: Performs operation kNkMAIDCapability_Capture.

130.5.13 CloseData

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Closes current data object.

130.5.14 CloseItem

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Closes current item.

130.5.15 CloseModule

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Closes current module.

130.5.16 CloseSource

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Closes current source.

130.5.17 GetCapBoolean(what as Integer, ID as Integer) as Boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a boolean value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.18 GetCapDefaultBoolean(what as Integer, ID as Integer) as Boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the default value for a capability with a boolean value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.19 GetCapDefaultDouble(what as Integer, ID as Integer) as Double

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the default value for a capability with a double value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.20 GetCapDefaultInt32(what as Integer, ID as Integer) as Int32

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the default value for a capability with an Int32 value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.21 GetCapDefaultPoint(what as Integer, ID as Integer) as NikonPointMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the default value for a capability with a point value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.22 GetCapDefaultRect(what as Integer, ID as Integer) as NikonRectMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the default value for a capability with a rectangle value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.23 GetCapDefaultSize(what as Integer, ID as Integer) as NikonSizeMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the default value for a capability with a size value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.24 GetCapDefaultString(what as Integer, ID as Integer) as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the default value for a capability with a string value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.25 GetCapDefaultUInt32(what as Integer, ID as Integer) as UInt32

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with an UInt32 value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.26 GetCapDouble(what as Integer, ID as Integer) as Double

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a double value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.27 GetCapEnumPacketString(what as Integer, ID as Integer, byref current as UInt32) as string()

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a packet string enum value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.28 GetCapEnumString(what as Integer, ID as Integer, byref current as UInt32) as string()

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a string enum value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.29 GetCapEnumUInt32(what as Integer, ID as Integer, byref current as UInt32) as UInt32()

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with an enum UInt32 value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.30 GetCapInt32(what as Integer, ID as Integer) as Int32

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with an Int32 value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.31 GetCapPoint(what as Integer, ID as Integer) as NikonPointMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a point value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.32 GetCapRange(what as Integer, ID as Integer, byref Value as Double, byref DefaultValue as Double, byref ValueIndex as UInt32, byref DefaultIndex as UInt32, byref LowerValue as Double, byref UpperValue as Double, byref Steps as UInt32) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a range value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.33 GetCapRect(what as Integer, ID as Integer) as NikonRectMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a rectangle value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.34 GetCapSize(what as Integer, ID as Integer) as NikonSizeMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a size value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.35 GetCapString(what as Integer, ID as Integer) as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a string value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.36 GetCapUInt32(what as Integer, ID as Integer) as UInt32

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with an UInt32 value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.37 GetItemCount as UInt32

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries number of items.

130.5.38 GetLiveViewImage(type as Integer) as NikonLiveImageMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a live image.
Notes:

Performs kNkMAIDCapability_GetLiveViewImage and decodes data returned into a NikonLiveImageMBS object.
Type: Which type of device you have. Value from 1 to 5.

130.5.39 GetSourceCount as UInt32

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the number of sources (cameras).

130.5.40 GetVideoImageData(Offset as UInt32, BlockSize as UInt32) as String

MBS Cameras Plugin, Plugin Version: 13.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries data of a video file.
Notes: Please use OpenData before to open the video.

130.5.41 GetVideoImageDataSize as UInt32

MBS Cameras Plugin, Plugin Version: 13.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries data size of a video.
Notes: Please use OpenData before to open the video.

130.5.42 LoadLibrary(file as folderitem) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Loads the Nikon shard library.
Notes:

Returns true on success.
Please pass folderitem pointing to dll on Windows and dylib on Mac OS X.
See also:

- 130.5.43 LoadLibrary(path as string) as boolean 20991

130.5.43 LoadLibrary(path as string) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Loads the Nikon shard library.
Notes:

Returns true on success.
Please pass string path pointing to dll on Windows and dylib on Mac OS X.
See also:

- 130.5.42 LoadLibrary(file as folderitem) as boolean 20991

130.5.44 OpenData(type as UInt32) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Opens data of given type.

130.5.45 OpenItem(index as UInt32) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Opens the item with the given index.
Notes: Index is zero based.

130.5.46 OpenModule as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Opens the module.

130.5.47 OpenSource(index as UInt32) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Opens the source with the given index.
Notes: Index is zero based.

130.5.48 PreCapture as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Prepares a capture.
Notes: Performs operation kNkMAIDCapability_PreCapture.

130.5.49 SetCapBoolean(what as Integer, ID as Integer, value as Boolean)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with a boolean value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.50 SetCapDouble(what as Integer, ID as Integer, value as Double)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with an double value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.51 SetCapEnumPackedString(what as Integer, ID as Integer, EnumIndex as UInt32) as boolean

MBS Cameras Plugin, Plugin Version: 13.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with an enum of PacketString values.
Notes:

What: Selects what to query. Can be kModule, kSource, kItem or kData.
You first query the enum to get the list of options, than you can set a new one by passing index here.

130.5.52 SetCapEnumUInt32(what as Integer, ID as Integer, Value as UInt32) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with an enum UInt32 value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.53 SetCapInt32(what as Integer, ID as Integer, value as Int32)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with an Int32 value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.54 SetCapPoint(what as Integer, ID as Integer, value as NikonPointMBS)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with a point value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.55 SetCapRange(what as Integer, ID as Integer, Value as Double, ValueIndex as UInt32) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with a range value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.56 SetCapRect(what as Integer, ID as Integer, value as NikonRectMBS)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with a rectangle value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.57 SetCapSize(what as Integer, ID as Integer, value as NikonSizeMBS)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with an size value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.58 SetCapString(what as Integer, ID as Integer, value as String)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with a string value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.59 SetCapUInt32(what as Integer, ID as Integer, value as UInt32)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with an UInt32 value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

130.5.60 Properties

130.5.61 FunctionPtr as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The main entry function pointer for the Nikon library.
Notes: (Read only property)

130.5.62 Lasterror as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The last error code.
Notes: (Read only property)

130.5.63 LoadErrorMessage as String

MBS Cameras Plugin, Plugin Version: 17.4, Platforms: macOS, Windows, Targets: Desktop only.

Function: The error message from loading library.
Notes:

Set by LoadLibrary methods to help debugging.

Windows error 193 means that 64-bit Xojo app tried to load 32-bit library or 32-bit Xojo app tried to load 64-bit library. The bit level must match between app and library. For Mac OS X the error message will tell you about wrong architecture.
(Read only property)

130.5.64 Events

130.5.65 FileDownloadComplete(info as NikonFileInfoMBS, data as Memoryblock, length as Integer)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: .

Function: Informs you about a finished file download.

130.5.66 ImageDownloadComplete(info as NikonImageInfoMBS, data as Memoryblock, length as Integer)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: .

Function: This event informs you about a finished event.

130.5.67 Progress(Command as Integer, Param as Integer, Done as UInt32, Total as UInt32, Percent as Double)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: .

Function: This event informs you about progress of an ongoing operation.

130.5.68 Constants

130.5.69 kData = 8

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the selector constants.
Notes: Apply to data.

130.5.70 kDataObjTypeFile = 16

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the data object types.
Notes: Other file

130.5.71 kDataObjTypeImage = 1

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the data object types.
Notes: Image file

130.5.72 kDataObjTypeSound = 2

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the data object types.
Notes: Sound file

130.5.73 kDataObjTypeThumbnail = 8

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the data object types.
Notes: Picture thumbnail

130.5.74 kDataObjTypeVideo = 4

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the data object types.
Notes: Video file

130.5.75 kDevice = 2

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the selector constants.
Notes: Apply to device/source.

130.5.76 kItem = 4

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the selector constants.
Notes: Apply to item.

130.5.77 kModule = 1

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the selector constants.
Notes: Apply to module.

130.5.78 kSource = 2

MBS Cameras Plugin, Plugin Version: 13.1.

Function: One of the selector constants.
Notes: Apply to device/source.

130.6 class NikonPointMBS

130.6.1 class NikonPointMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The class for a point.

130.6.2 Methods

130.6.3 Constructor(x as Integer = 0, y as Integer = 0)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The constructor.

130.6.4 Operator_Convert as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Converts the point to a string for displaying.

130.6.5 Properties

130.6.6 x as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The x coordinate.
Notes: (Read and Write property)

130.6.7 y as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The y coordinate.
Notes: (Read and Write property)

130.7 class NikonRectMBS

130.7.1 class NikonRectMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The class for a rectangle.

130.7.2 Methods

130.7.3 Constructor(x as Integer = 0, y as Integer = 0, w as Integer = 0, h as Integer = 0)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The constructor.

130.7.4 Operator_Convert as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Converts the rectangle to a string for displaying.

130.7.5 Properties

130.7.6 h as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The height of the rectangle.
Notes: (Read and Write property)

130.7.7 w as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The width of the rectangle.
Notes: (Read and Write property)

130.7.8 x as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The x coordinate of the rectangle.
Notes: (Read and Write property)

130.7.9 y as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The y coordinate of the rectangle.
Notes: (Read and Write property)

130.8 class NikonSizeMBS

130.8.1 class NikonSizeMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The class for a size.

130.8.2 Methods

130.8.3 Constructor(w as Integer = 0, h as Integer = 0)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The constructor.

130.8.4 Operator_Convert as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Converts the size to a string for displaying.

130.8.5 Properties

130.8.6 h as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The height of the size object.
Notes: (Read and Write property)

130.8.7 w as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The width of the size object.
Notes: (Read and Write property)

Chapter 131

Notifications

131.1 class NotificationCenterMBS

131.1.1 class NotificationCenterMBS

MBS MacCF Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for notifications sent on Mac OS X.
Notes:

From Apple's help, but modified:

Distributed notifications allow an application to broadcast a message to any number of other applications without needing to know who those other applications are, or even if the other applications exist. Every application type — Cocoa, Carbon, BSD — can use distributed notifications.

An application, the target application in this case, expresses an interest in receiving a broadcasted message by registering itself with the system's distributed notification center, identifying exactly what message, or notification type, it wants to receive. The notification type is defined by an arbitrary string agreed upon by the sender and receiver of the notification. As an example, Cocoa's NSWindow class defines the notification type "NSWindowDidCloseNotification", which an NSWindow instance broadcasts when its window closes. Any other object can register to receive this notification. (This notification, however, is internal to a single application and is not distributed to the rest of the system.)

In addition to the message, the application can identify the particular object sending the message. When the sender and receiver are in the same application—in other words, using nondistributed notifications—the observed object can be anything. When using distributed notifications, though, the object must be a string. A useful choice for the observed string is the bundle identifier of the target application.

In registering for the notification, the application provides a class with an Receive event, which will later be called.

Next, the broadcasting application — your preference pane — sends the notification. It calls the system's notification center, tells the center what notification to send, and optionally passes a dictionary containing additional information. The dictionary can be used to pass the modified preferences directly to the application. Or, the preference pane can choose not to use the dictionary and instead write the changes out to disk. The notification is then used to tell the application to update its preferences from the disk.

The notification center looks up all the applications that registered to receive the given notification type from the particular instance. It then notifies each application's run loop of the notification and gives it a copy of the dictionary. The selected callback function or method is executed during the application's next pass through its run loop.

When using Preference Services, be certain to flush changes to the disk with the appropriate synchronize functions before sending notifications of changes. Otherwise, due to the caching performed by Preference Services, the disk may not accurately reflect the changes when the target receives the notification. Likewise, the target application must resynchronize its preferences after receiving the notification.

131.1.3 Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.0pr10

131.1.4 Methods

131.1.5 Add(name as CFStringMBS, obj as CFObjectMBS, flags as Integer)

MBS MacCF Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds a new callback.
Notes:

This function costs around 24 bytes of memory per call which are never released (needed for the callback between framework and RB).

Values for the flags:

CFNotificationSuspensionBehaviorDrop	1	The server will not queue any notifications with this name and object while the process/app is in the background.
CFNotificationSuspensionBehaviorCoalesce	2	The server will only queue the last notification of the specified name and object; earlier notifications are dropped.
CFNotificationSuspensionBehaviorHold	3	The server will hold all matching notifications until the queue has been filled (queue size determined by the server) at which point the server may flush queued notifications.
CFNotificationSuspensionBehaviorDeliverImmediately	4	The server will deliver notifications matching this registration whether or not the process is in the background. When a notification with this suspension behavior is matched, it has the effect of first flushing any queued notifications.

131.1.6 close(name as CFStringMBS, obj as CFObjectMBS)

MBS MacCF Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Closes the given callback.

131.1.7 closeAll

MBS MacCF Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Closes all registered callbacks.
Notes: This is called by the destructor.

131.1.8 Post(name as CFStringMBS, obj as CFObjectMBS, userinfo as CFDictionaryMBS, deliverImmediately as Boolean)

MBS MacCF Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Posts a new notification.
Notes: Obj and userinfo may be nil.
See also:

- 131.1.9 Post(name as CFStringMBS, obj as CFObjectMBS, userinfo as CFDictionaryMBS, options as Integer) 21005

131.1.9 Post(name as CFStringMBS, obj as CFObjectMBS, userinfo as CFDictionaryMBS, options as Integer)

MBS MacCF Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Posts a new notification.
Example:

```
dim n as new NotificationCenterMBS
```

n.Post(NewCFStringMBS("test"), nil, nil, n.kCFNotificationPostToAllSessions + n.kCFNotificationDeliverImmediately)

Notes:

Obj and userinfo may be nil.
Requires Mac OS X 10.3.
For options you can use a combination with kCFNotificationDeliverImmediately=1 and kCFNotificationPostToAllSessions=2.
See also:

- 131.1.8 Post(name as CFStringMBS, obj as CFObjectMBS, userinfo as CFDictionaryMBS, deliverImmediately as Boolean) 21005

131.1.10 Properties

131.1.11 Available as boolean

MBS MacCF Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the needed framework was successfull loaded.
Notes: (Read only property)

131.1.12 Events

131.1.13 Received(name as CFStringMBS, obj as CFObjectMBS, userinfo as CFDictionaryMBS)

MBS MacCF Plugin, Platform: macOS, Targets: .

Function: A notification was received.
Notes: All parameters may be for any reason nil.

131.1.14 Constants

131.1.15 kCFNotificationDeliverImmediately = 1

MBS MacCF Plugin, Plugin Version: 7.4.

Function: One of the constant you can use for the Post Method.

131.1.16 kCFNotificationPostToAllSessions = 2

MBS MacCF Plugin, Plugin Version: 7.4.

Function: One of the constant you can use for the Post Method.

131.2 class NotificationMBS

131.2.1 class NotificationMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an application internal notification.
Example:

```
dim n as new NotificationMBS("DatabaseChangedNotification")
NotificationMBS.send(n)
```

Notes:

The point of notifications is to inform some other part of your application about something. For example a chart updating if the user enters data in textfields.

So you register for notifications in existing classes/windows with the NotificationReceiverMBS interface. Or you create a subclass of the NotificationObserverMBS class to receive notifications

All notifications are delivered on the same thread as the send method. If needed we could have an asyncron notification system. Please email for that.

Other notifications:

NSNotification: Notifications send from the Cocoa frameworks within your application over NSNotificationCenterMBS class or send across all applications with NSDistributedNotificationCenterMBS.

MacNotificationMBS: A notification message to the user which may have a sound, a message box and/or a jumping dock icon.

131.2.6 Methods

131.2.7 Constructor(name as string = "", ref as Variant = nil, tag as Variant = nil)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new notification with the given values.
Example:

```
dim n as new NotificationMBS("DatabaseChangedNotification")
NotificationMBS.send(n)
```

131.2.8 RegisterReceiver(target as NotificationReceiverMBS, name as string = "", ref as Variant = nil)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Registers a receiver.
Notes:

You have a class/window and you add NotificationReceiverMBS to the interfaces. Xojo will add a ReceivedNotification method which looks like this:

```
ReceivedNotification(name as string, ref as Variant, tag as Variant, notification as NotificationMBS)
```

Don't forget to call UnregisterReceiver later in the Close event or destructor.

If you register with name = "" and ref = nil, you receive all notifications. If you have a name, you get only notifications matching the name (case sensitive compare). If you have a reference object, you receive only objects for that object. And you can use both name and object.

131.2.9 Send(name as string, ref as object = nil, tag as Variant = nil)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a notification.
Example:

NotificationMBS.Send("DatabaseChangedNotification")

Notes:

This is a convenience method which creates a new NSNotificationMBS object and sends it.

All registered receivers will get the ReceivedNotification method called as well as all registered observers will get an ReceivedNotification event.
Of course notifications are filtered by name and/or referenced object.
See also:

- 131.2.10 Send(notification as NotificationMBS) 21010

131.2.10 Send(notification as NotificationMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a notification.
Example:

dim n as new NotificationMBS("DatabaseChangedNotification")
NotificationMBS.send(n)

Notes:

All registered receivers will get the ReceivedNotification method called as well as all registered observers will get an ReceivedNotification event.
Of course notifications are filtered by name and/or referenced object.
See also:

- 131.2.9 Send(name as string, ref as object = nil, tag as Variant = nil) 21010

131.2.11 SendDelayed(name as string, ref as object = nil, tag as Variant = nil)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a notification.
Example:

NotificationMBS.SendDelayed("DatabaseChangedNotification")

Notes: Same as Send method, but the notification will be delivered later on the main thread. The notification is queued and will wait until there is free CPU time.
See also:

- 131.2.12 SendDelayed(notification as NotificationMBS) 21011

131.2.12 SendDelayed(notification as NotificationMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a notification.
Example:

```
dim n as new NotificationMBS("DatabaseChangedNotification", window1, "test")
NotificationMBS.SendDelayed(n)
```

Notes: Same as Send method, but the notification will be delivered later on the main thread. The notification is queued and will wait until there is free CPU time.
See also:

- 131.2.11 SendDelayed(name as string, ref as object = nil, tag as Variant = nil) 21010

131.2.13 SendNotification

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends this notification.
Example:

```
dim n as new NotificationMBS("DatabaseChangedNotification")
n.SendNotification
```

Notes:

All registered receivers will get the ReceivedNotification method called as well as all registered observers will get an ReceivedNotification event.
Of course notifications are filtered by name and/or referenced object.

131.2.14 SendNotificationDelayed

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a notification.
Example:

```
dim n as new NotificationMBS("DatabaseChangedNotification")
n.SendNotificationDelayed
```

Notes: Same as SendNotification method, but the notification will be delivered later on the main thread. The notification is queued and will wait until there is free CPU time.

131.2.15 UnregisterReceiver(target as NotificationReceiverMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unregisters an receiver.

131.2.16 Properties

131.2.17 Name as String

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name for the notification.
Example:

```
dim n as new NotificationMBS("DatabaseChangedNotification", window1, "test")
MsgBox n.Name
```

Notes: (Read and Write property)

131.2.18 Ref as Variant

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The reference object.
Notes:

Defines which object the notification references. If nil, you target all objects.

(Read and Write property)

131.2.19 Tag as Variant

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The attached value.
Example:

```
dim n as new NotificationMBS
n.Tag = "Hello World"
```

Notes:

You can use this property as you like.
This value is sent to the receivers. It allows you to pass an additional value without needing to write a subclass of the NotificationMBS class.
(Read and Write property)

131.3 class NotificationObserverMBS

131.3.1 class NotificationObserverMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for receiving notifications.

131.3.2 Blog Entries

- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr8

131.3.3 Blog Entries

- MBS REALbasic Plugins Version 10.4 release notes

131.3.4 Methods

131.3.5 Constructor(name as string = """, ref as object = nil, tag as Variant = nil)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new notification observer.
Notes: If you register with name = "" and ref = nil, you receive all notifications. If you have a name, you get only notifications matching the name (case sensitive compare). If you have a reference object, you receive only objects for that object. And you can use both name and object.

131.3.6 Properties

131.3.7 Name as String

MBS DataTypes Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the notification to listen for.
Notes: (Read only property)

131.3.8 Ref as Object

MBS DataTypes Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The target object to listen for.
Notes: (Read only property)

131.3.9 Events

131.3.10 ReceivedNotification(name as string, ref as Variant, tag as Variant, notification as NotificationMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: .

Function: The event called if a notification was received.
Notes:

This event is registered automatically, so do not call RegisterReceiver with the NotificationObserverMBS object.

If you register with name = "" and ref = nil, you receive all notifications. If you have a name, you get only notifications matching the name (case sensitive compare). If you have a reference object, you receive only objects for that object. And you can use both name and object.

131.4 class NSDistributedNotificationCenterMBS

131.4.1 class NSDistributedNotificationCenterMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The NSDistributedNotificationCenter class provides a way to send notifications to objects in other tasks.
Notes:

It takes NSNotification objects and broadcasts them to any objects in other tasks that have registered for the notification with their task's default distributed notification center.

The NSDistributedNotificationCenter class implements a notification center that can distribute notifications asynchronously to tasks other than the one in which the notification was posted. An instance of this class are known as a distributed notification center.

Each task has a default distributed notification center that you access with the defaultCenter class method. There may be different types of distributed notification centers. Currently there is a single type—NSLocalNotificationCenterType. This type of distributed notification center handles notifications that can be sent between tasks on a single computer. For communication between tasks on different computers, use Distributed Objects Programming Topics.

Posting a distributed notification is an expensive operation. The notification gets sent to a system-wide server that distributes it to all the tasks that have objects registered for distributed notifications. The latency between posting the notification and the notification's arrival in another task is unbounded. In fact, when too many notifications are posted and the server's queue fills up, notifications may be dropped.
Subclass of the NSNotificationCenterMBS class.

131.4.2 Blog Entries

131.4.4 Methods

131.4.5 addObserver(observer as NSNotificationObserverMBS, name as string, theObject as Variant, suspensionBehavior as Integer)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds an entry to the receiver's dispatch table with a specific observer and suspended-notifications behavior, and optional notification name and sender.
Notes:

observer: Object registering as an observer. Must not be nil.
name: The name of the notification for which to register the observer; that is, only notifications with this name are delivered to the observer. When nil, the notification center doesn't use a notification's name to decide whether to deliver it to the observer.
theObject: The object whose notifications the observer wants to receive; that is, only notifications sent by this sender are delivered to the observer. When nil, the notification center doesn't use a notification's sender to decide whether to deliver it to the observer.
suspensionBehavior: Notification posting behavior when notification delivery is suspended.

The receiver does not retain notificationObserver. Therefore, you should always send removeObserver to the receiver before releasing notificationObserver.

131.4.6 Constructor

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new instance with the default distributed notification center, representing the local notification center for the computer.
Notes:

Default distributed notification center for the computer.

This method calls notificationCenterForType: with an argument of NSLocalNotificationCenterType.

131.4.7 defaultCenter as NSDistributedNotificationCenterMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the default distributed notification center, representing the local notification center for the computer.
Notes:

Default distributed notification center for the computer.

This method calls notificationCenterForType: with an argument of NSLocalNotificationCenterType.

131.4.8 notificationCenterForType(name as string) as NSDistributedNotificationCenterMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the distributed notification center for a particular notification center type.
Notes:

name: Notification center type being inquired about.

Currently only one type, NSLocalNotificationCenterType, is supported.

131.4.9 NSLocalNotificationCenterType as string

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: This constant specifies the notification center type.
Notes: Distributes notifications to all tasks on the sender's computer.

131.4.10 postNotificationName(name as string, theObject as string, userInfo as dictionary, deliverImmediately as boolean)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a notification with information and an immediate-delivery specifier, and posts it to the receiver.
Notes:

name: Name of the notification to post. Must not be nil.
theObject: Sender of the notification. May be "".
userInfo: Dictionary containing additional information. May be nil.
deliverImmediately: Specifies when to deliver the notification. When false, the receiver delivers notifications to their observers according to the suspended-notification behavior specified in the corresponding dispatch table entry. When true, the receiver delivers the notification immediately to its observers.

This is the preferred method for posting notifications.
The notificationInfo dictionary is serialized as a property list, so it can be passed to another task. In the receiving task, it is deserialized back into a dictionary. This serialization imposes some restrictions on the

objects that can be placed in the notificationInfo dictionary. See XML Property Lists for details.
See also:

- 131.4.11 postNotificationName(name as string, theObject as string, userInfo as dictionary, options as UInt32) 21019

131.4.11 postNotificationName(name as string, theObject as string, userInfo as dictionary, options as UInt32)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a notification with information, and posts it to the receiver.
Example:

```
dim notifyData as string = "Hello World"
dim notifyName as string = "Test"

Dim notifyDict As New Dictionary
notifyDict.Value("nData")=notifyData
NSDistributedNotificationCenterMBS.DefaultCenter.postNotificationName(notifyName, "", notifyDict, 2)
```

Notes:

name: Name of the notification to post. Must not be nil.
theObject: Sender of the notification. May be "".
userInfo: Dictionary containing additional information. May be nil.
options: Specifies how the notification is posted to the task and when to deliver it to its observers.

The userInfo dictionary is serialized as a property list, so it can be passed to another task. In the receiving task, it is deserialized back into a dictionary. This serialization imposes some restrictions on the objects that can be placed in the notificationInfo dictionary. See XML Property Lists for details.
See also:

- 131.4.10 postNotificationName(name as string, theObject as string, userInfo as dictionary, deliverImmediately as boolean) 21018

131.4.12 Properties

131.4.13 suspended as boolean

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A boolean value that indicates whether notification delivery is suspended.
Notes:

The NSApplication class automatically suspends distributed notification delivery when the application is not active. Applications based on the Application Kit framework should let AppKit manage the suspension of notification delivery. Foundation-only programs may have occasional need to use this method.
(Read and Write computed property)

131.4.14 Constants

131.4.15 NSNotificationDeliverImmediately = 1

MBS MacBase Plugin, Plugin Version: 9.7.

Function: One of the option constants to specify the behavior of notifications posted using the postNotificationName method.
Notes: When set, the notification is delivered immediately to all observers, regardless of their suspension behavior or suspension state. When not set, allows the normal suspension behavior of notification observers to take place.

131.4.16 NSNotificationPostToAllSessions = 2

MBS MacBase Plugin, Plugin Version: 9.7.

Function: One of the option constants to specify the behavior of notifications posted using the postNotificationName method.
Notes: When set, the notification is posted to all sessions. When not set, the notification is sent only to applications within the same login session as the posting task.

131.4.17 NSNotificationSuspensionBehaviorCoalesce = 2

MBS MacBase Plugin, Plugin Version: 9.7.

Function: One of the constants to specify the types of notification delivery suspension behaviors.
Notes: The server only queues the last notification of the specified name and object; earlier notifications are dropped. In cover methods for which suspension behavior is not an explicit argument, NSNotificationSuspensionBehaviorCoalesce is the default.

131.4.18 NSNotificationSuspensionBehaviorDeliverImmediately = 4

MBS MacBase Plugin, Plugin Version: 9.7.

Function: One of the constants to specify the types of notification delivery suspension behaviors.
Notes: The server delivers notifications matching this registration irrespective of whether Suspended is set

to true. When a notification with this suspension behavior is matched, it has the effect of first flushing any queued notifications. The effect is as if setSuspended: with an argument of false were first called if the application is suspended, followed by the notification in question being delivered, followed by a transition back to the previous suspended or unsuspended state.

131.4.19 NSNotificationSuspensionBehaviorDrop = 1

MBS MacBase Plugin, Plugin Version: 9.7.

Function: One of the constants to specify the types of notification delivery suspension behaviors.
Notes: The server does not queue any notifications with this name and object until Suspended is set to false.

131.4.20 NSNotificationSuspensionBehaviorHold = 3

MBS MacBase Plugin, Plugin Version: 9.7.

Function: One of the constants to specify the types of notification delivery suspension behaviors.
Notes: The server holds all matching notifications until the queue has been filled (queue size determined by the server), at which point the server may flush queued notifications.

131.5 class NSNotificationCenterMBS

131.5.1 class NSNotificationCenterMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: An NSNotificationCenter object (or simply, notification center) provides a mechanism for broadcasting information within a task.
Notes:

An NSNotificationCenter object is essentially a notification dispatch table.

This is for sending broadcast messages from one application to other application on same computer.
For the notification center in Mac OS X 10.8, please use NSUserNotificationMBS class.

131.5.2 Blog Entries

- MBS Real Studio Plugins, version 12.3pr11

131.5.3 Blog Entries

- MBS Real Studio Plugins, version 12.3pr11

131.5.4 Methods

131.5.5 addObserver(observer as NSNotificationObserverMBS, name as string="", theObject as Variant=nil)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Adds an entry to the receiver's dispatch table with an observer and optional criteria: notification name and sender.
Notes:

observer: Object registering as an observer. This value must not be nil.
name: The name of the notification for which to register the observer; that is, only notifications with this name are delivered to the observer. If you pass nil, the notification center doesn't use a notification's name to decide whether to deliver it to the observer.
theObject: The object whose notifications the observer wants to receive; that is, only notifications sent by this sender are delivered to the observer. If you pass nil, the notification center doesn't use a notification's sender to decide whether to deliver it to the observer.

131.5.6 Constructor

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The constructor to create a new instance of notification center pointing to the default notification center.
Notes: The current task's default notification center, which is used for system notifications.

131.5.7 defaultCenter as NSNotificationCenterMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the task's default notification center.
Notes: The current task's default notification center, which is used for system notifications.

131.5.8 postNotification(notification as NSNotificationMBS)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Posts a given notification to the receiver.
Notes: notification: The notification to post. This value must not be nil.

131.5.9 postNotificationName(name as string)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Creates a notification with a given name and sender and posts it to the receiver.
Notes:

name: The name of the notification.
theObject: The object posting the notification.
See also:

- 131.5.10 postNotificationName(name as string, theObject as Variant) 21023
- 131.5.11 postNotificationName(name as string, theObject as Variant, userInfo as dictionary) 21024

131.5.10 postNotificationName(name as string, theObject as Variant)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Creates a notification with a given name and sender and posts it to the receiver.
Notes:

name: The name of the notification.
theObject: The object posting the notification.
See also:

- 131.5.9 postNotificationName(name as string) 21023
- 131.5.11 postNotificationName(name as string, theObject as Variant, userInfo as dictionary) 21024

131.5.11 postNotificationName(name as string, theObject as Variant, userInfo as dictionary)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Creates a notification with a given name, sender, and information and posts it to the receiver.
Notes:

name: The name of the notification.
theObject: The object posting the notification.
userInfo: Information about the the notification. May be nil.

This method is the preferred method for posting notifications.
See also:

- 131.5.9 postNotificationName(name as string) 21023
- 131.5.10 postNotificationName(name as string, theObject as Variant) 21023

131.5.12 removeObserver(observer as NSNotificationObserverMBS)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Removes all the entries specifying a given observer from the receiver's dispatch table.
Notes:

observer: The observer to remove. Must not be nil.

Be sure to invoke this method before notificationObserver or any object specified in addObserver is deallocated.
See also:

- 131.5.13 removeObserver(observer as NSNotificationObserverMBS, name as string, theObject as Variant=nil) 21025

131.5.13 removeObserver(observer as NSNotificationObserverMBS, name as string, theObject as Variant=nil)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Removes matching entries from the receiver's dispatch table.
Notes:

notificationObserver: Observer to remove from the dispatch table. Specify an observer to remove only entries for this observer. Must not be nil, or message will have no effect.
notificationName: Name of the notification to remove from dispatch table. Specify a notification name to remove only entries that specify this notification name. When nil, the receiver does not use notification names as criteria for removal.
notificationSender: Sender to remove from the dispatch table. Specify a notification sender to remove only entries that specify this sender. When nil, the receiver does not use notification senders as criteria for removal.

Be sure to invoke this method before the observer object or any object specified in addObserver is deallocated.
See also:

- 131.5.12 removeObserver(observer as NSNotificationObserverMBS) 21024

131.5.14 Properties

131.5.15 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The internal reference to the notification center.
Notes: (Read and Write property)

131.6 class NSNotificationMBS

131.6.1 class NSNotificationMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: NSNotification objects encapsulate information so that it can be broadcast to other objects by an NSNotificationCenter object.
Notes:

An NSNotification object (referred to as a notification) contains a name, an object, and an optional dictionary. The name is a tag identifying the notification. The object is any object that the poster of the notification wants to send to observers of that notification (typically, it is the object that posted the notification). The dictionary stores other related objects, if any. NSNotification objects are immutable objects.

You can create a notification object with the class method notificationWithName. However, you don't usually create your own notifications directly. The NSNotificationCenter method postNotificationName allow you to conveniently post a notification without creating it first.

On Windows you can use WinNotificationMBS class for similar functionality.

This is for sending broadcast messages from one application to other application on same computer.
For the notification center in Mac OS X 10.8, please use NSUserNotificationMBS class.

131.6.4 Methods

131.6.5 Constructor(handle as Integer)

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Creates a notification object with a NSNotification reference.
Notes: The object is retained and later in destructor it is released.
See also:

- 131.6.6 Constructor(name as string, theObject as Variant = nil, userInfo as dictionary = nil) 21027

131.6.6 Constructor(name as string, theObject as Variant = nil, userInfo as dictionary = nil)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates a notification object with a specified name, object, and user information.
Example:

```
dim n as new NSNotificationMBS("Hello")
MsgBox n.name
```

Notes:

name: The name for the new notification. May not be nil.
theObject: The object for the new notification. Can be nil.
userInfo: The user information dictionary for the new notification. May be nil.
See also:

- 131.6.5 Constructor(handle as Integer) 21027

131.6.7 notificationWithName(name as string, theObject as Variant = nil, userInfo as dictionary = nil) as NSNotificationMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a notification object with a specified name, object, and user information.
Example:

```
dim n as NSNotificationMBS = NSNotificationMBS.notificationWithName("Hello")
MsgBox n.name
```

Notes:

name: The name for the new notification. May not be nil.
theObject: The object for the new notification. Can be nil.
userInfo: The user information dictionary for the new notification. May be nil.

131.6.8 Print

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Writes description for this event descriptor to the console.
Notes: You can see result in Console.app.

131.6.9 Properties

131.6.10 description as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: The descriptor for this notification.
Example:

```
dim n as NSNotificationMBS = NSNotificationMBS.notificationWithName("Hello")
MsgBox n.description
```

Notes:

This is a text representation for debugging.
(Read only property)

131.6.11 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The internal reference to the NSNotification object.
Notes: (Read and Write property)

131.6.12 name as string

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the name of the notification.
Notes:

The name of the notification. Typically you use this method to find out what kind of notification you are dealing with when you receive a notification.
Notification names can be any string. To avoid name collisions, you might want to use a prefix that's specific to your application.
(Read only property)

131.6.13 objectHandle as Integer

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The reference to the object.
Notes:

May be useful for declares.
(Read only property)

131.6.14 objectVariant as Variant

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the object associated with the notification.
Notes:

The object associated with the notification. This is often the object that posted this notification. It may be nil.
Typically you use this method to find out what object a notification applies to when you receive a notification.

See the FAQ for the list of supported NSObject types for variant conversion.
(Read only property)

131.6.15 userInfo as dictionary

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the user information dictionary associated with the receiver.
Example:

```
// tests dictionary conversion:

dim d as new Dictionary
```

```
dim x as new Dictionary
x.Value("Hello") = "World"

dim b as Boolean = true
dim s as Single = 2.3
dim dd as Double = 3.4
dim h as int64 = 1234

d.Value(1) = 1
d.Value(2) = 2.0
d.Value(3) = x
d.Value(4) = "Hello"
d.Value(5) = b
d.Value(6) = s
d.Value(7) = dd
d.Value(8) = h

dim n as new NSNotificationMBS("test", nil, d)

dim nd as Dictionary = n.userInfo

// check nd object
break
```

Notes:

Returns the user information dictionary associated with the receiver. May be nil.
The user information dictionary stores any additional objects that objects receiving the notification might use.
(Read only property)

131.7 class NSNotificationObserverMBS

131.7.1 class NSNotificationObserverMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The notification class which you use to receive notifications.
Notes:

To use this class, please create a subclass. There you can put code in the event handler to do whatever you need in case your notification is received.

Than you create in code objects form this class. Normally only one. And you call addObserver on the NSNotificationCenterMBS or NSDistributedNotificationCenterMBS objects you have to tell the system which notifications you want to receive.

Do not forget to call removeObserver on the notification center for all your observers to avoid crashes.

131.7.2 Blog Entries

- Tip of the day: Windows Notifications
- MBS Real Studio Plugins, version 12.3pr11

131.7.3 Blog Entries

- Tip of the day: Windows Notifications
- MBS Real Studio Plugins, version 12.3pr11

131.7.4 Methods

131.7.5 Constructor

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The constructor which creates the observer.
Notes: On success the handle property is not zero.

131.7.6 Destructor

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The Destructor.
Notes: Removes in plugin version 12.3 and newer the observer from the NSNotificationCenterMBS and NSDistributedNotificationCenterMBS to avoid crashes.

131.7.7 Properties

131.7.8 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The internal handle to the observer object.
Notes: (Read and Write property)

131.7.9 Events

131.7.10 GotNotification(notification as NSNotificationMBS)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: .

Function: The event called if a new notification is received.
Notes: The MBS Plugin makes sure you receive this event always on the main thread.

131.8 class WinNotificationMBS

131.8.1 class WinNotificationMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This is a class to send broadcast message to all windows applications listening for this notification.
Notes:

If you have several applications, you can send notifications from one to another.

Windows Desktop application: Sending and receiving notification works.
Windows Console application: Sending works.
Windows Web application: Sending works. Receives notification of own application, but of others.

This class is useful to tell other instance of your application or other application about something. Like for example whether background process is done.

On Mac OS X you can use NSNotificationMBS class for similar functionality.

With 14.2 plugins we added possibility to listen for any windows broadcast message. Like for example for WM_TIMECHANGE.

131.8.5 Xojo Developer Magazine

- 15.3, page 11: News

131.8.6 Methods

131.8.7 Constructor

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The default constructor.
Notes: Creates an invisible dummy window to listen for notifications.
See also:

- 131.8.8 Constructor(control as RectControl) 21035
- 131.8.9 Constructor(Window as window) 21035
- 131.8.10 Constructor(WindowHandle as Integer) 21035

131.8.8 Constructor(control as RectControl)

MBS Win Plugin, Plugin Version: 17.0, Platform: Windows, Targets: Desktop only.

Function: The control constructor.
Notes:

Takes an existing Xojo control and intercepts messages going there to listen for the notifications you are interested for.
The class keeps a reference to the control to make sure it is not destroyed before this object is destroyed.
See also:

- 131.8.7 Constructor 21034
- 131.8.9 Constructor(Window as window) 21035
- 131.8.10 Constructor(WindowHandle as Integer) 21035

131.8.9 Constructor(Window as window)

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop only.

Function: The window constructor.
Notes:

Takes an existing Xojo Window and intercepts messages going there to listen for the notifications you are interested for.
If you listen for global notifications sent to all windows, we prefer the other constructor.
The class keeps a reference to the window to make sure it is not destroyed before this object is destroyed.
See also:

- 131.8.7 Constructor 21034
- 131.8.8 Constructor(control as RectControl) 21035
- 131.8.10 Constructor(WindowHandle as Integer) 21035

131.8.10 Constructor(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 17.1, Platform: Windows, Targets: Desktop only.

Function: The window constructor.
Notes:

Takes an existing window and intercepts messages going there to listen for the notifications you are interested for.
If you listen for global notifications sent to all windows, we prefer the other constructor.
The class keeps a reference to the window to make sure it is not destroyed before this object is destroyed.
See also:

- 131.8.7 Constructor 21034
- 131.8.8 Constructor(control as RectControl) 21035
- 131.8.9 Constructor(Window as window) 21035

131.8.11 IsListeningFor(MessageID as Integer) as boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this object is listening for the given message ID.
Example:

```
dim w as new WinNotificationMBS

const WM_TIMECHANGE = &h001E
if w.ListenForMessage(WM_TIMECHANGE) then
MsgBox str(w.IsListeningFor(WM_TIMECHANGE))
end if
```

Notes: Returns true if we listen for this notification name or false if not.
See also:

- 131.8.12 IsListeningFor(name as string) as boolean 21036

131.8.12 IsListeningFor(name as string) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this object is listening for the given notification.
Example:

```
dim w as new WinNotificationMBS

if w.ListenForMessage("Hello") then
MsgBox str(w.IsListeningFor("Hello"))
end if
```

Notes: Returns true if we listen for this notification name or false if not.
See also:

- 131.8.11 IsListeningFor(MessageID as Integer) as boolean 21036

131.8.13 ListenForMessage(MessageID as Integer) as boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Listens for given notification message id.
Notes: Returns true on success and false on failure.
See also:

- 131.8.14 ListenForMessage(name as string) as boolean 21037

131.8.14 ListenForMessage(name as string) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Listens for given notification name.
Notes: Returns true on success and false on failure.
See also:

- 131.8.13 ListenForMessage(MessageID as Integer) as boolean 21037

131.8.15 SendMessage(byref result as Integer, MessageID as Integer, Value1 as Integer = 0, Value2 as Integer = 0, TimeOut as Integer = 10) as boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sends a message to all applications listening for it.
Example:

```
dim w as new WinNotificationMBS
dim Result as Integer

// send a message and wait for result
if w.SendMessage(Result, 1234567, 123, 456) then
// okay
else
// failed
end if
```

Notes:

Sends a message with given message ID.
You can pass two integer parameters.
Returns true if event was sent or false if it failed.
This doesn't tell you whether it was received by someone, but your own application receives it, too.

Timeout is in milliseconds and counts per receiving window.
Result returns the result code from the message.
See also:

- 131.8.16 SendMessage(name as string, Value1 as Integer = 0, Value2 as Integer = 0, TimeOut as Integer = 10) as boolean 21038

131.8.16 SendMessage(name as string, Value1 as Integer = 0, Value2 as Integer = 0, TimeOut as Integer = 10) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sends a message to all applications listening for it.
Example:

```
dim w as new WinNotificationMBS

if w.SendMessage(Result, "Hello", 123, 456) then
// okay
else
// failed
end if
```

Notes:

You can pass two integer parameters.
Returns true if event was sent or false if it failed.
This doesn't tell you whether it was received by someone, but your own application receives it, too.
Timeout is in milliseconds and counts per receiving window.
See also:

- 131.8.15 SendMessage(byref result as Integer, MessageID as Integer, Value1 as Integer = 0, Value2 as Integer = 0, TimeOut as Integer = 10) as boolean 21037

131.8.17 SendMessageToWindow(WindowHandle as Integer, byref result as Integer, MessageID as Integer, Value1 as Integer = 0, Value2 as Integer = 0, TimeOut as Integer = 10) as boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sends a message to all applications listening for it.
Notes:

Like SendMessage, but with a target window.
You can pass two integer parameters.

Returns true if event was sent or false if it failed.
This doesn't tell you whether it was received by someone, but your own application receives it, too.
Timeout is in milliseconds and counts per receiving window.

131.8.18 StopListeningForMessage(MessageID as Integer) as boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Stops listening for a given message ID.
Example:

```
dim w as new WinNotificationMBS

const WM_TIMECHANGE = &h001E
if w.ListenForMessage(WM_TIMECHANGE) then
if w.StopListeningForMessage(WM_TIMECHANGE) then
MsgBox "OK"
end if
end if
```

See also:

- 131.8.19 StopListeningForMessage(name as string) as boolean 21039

131.8.19 StopListeningForMessage(name as string) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Stops listening for a given notification name.
Example:

```
dim w as new WinNotificationMBS

if w.ListenForMessage("Hello") then
if w.StopListeningForMessage("Hello") then
MsgBox "OK"
end if
end if
```

See also:

- 131.8.18 StopListeningForMessage(MessageID as Integer) as boolean 21039

131.8.20 Properties

131.8.21 WindowHandle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal window handle.
Notes: (Read only property)

131.8.22 Events

131.8.23 GotNotification(Message as Integer, Name as string, Value1 as Integer, Value2 as Integer, byref Result as Integer, byref Handled as boolean)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: .

Function: A notification was received.
Notes:

Message: The message ID.
Name: If you registered by name, this is the name for the message ID.
Value1 and Value2 are parameters provided with message. (WPARAM and LPARAM)

If Handled is set to true, we pass back Result to the Windows system (LRESULT).
Else the default handler is called.

Chapter 132

OCR

132.1 class TessChoiceIteratorMBS

132.1.1 class TessChoiceIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Class to iterate over the classifier choices for a single symbol.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

132.1.2 Methods

132.1.3 Constructor

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

132.1.4 MoveNext as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to the next choice for the symbol and returns false if there are none left.

132.1.5 Properties

132.1.6 Confidence as Single

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the confidence of the current choice depending on the used language data.
Notes:

If only LSTM traineddata is used the value range is 0.0 - 1.0. All choices for one symbol should roughly add up to 1.0. If only traineddata of the legacy engine is used, the number should be interpreted as a percent probability. (0.0 - 100.0) In this case probabilities won't add up to 100. Each one stands on its own.
(Read only property)

132.1.7 Handle as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

132.1.8 Text as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the null terminated UTF-8 encoded text string for the current choice.
Notes: (Read only property)

132.2 class TessEngineMBS

132.2.1 class TessEngineMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for OCR recognition using tesseract library.
Example:

```
Dim OCR As new TessEngineMBS // your instance of tesseract

If Not ocr.Initialize("C:\Program Files\Tesseract-OCR\tessdata", "eng") Then
MsgBox "failed to initialize"
Quit
End If

Dim f As FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Dim p As Picture = f.OpenAsPicture
OCR.SetImage(p)

// get the text
Dim OCRText As String = OCR.GetText
```

Notes:

This replaces the older TesseractMBS class.

The new class is for Tesseract 4.x and 5.x versions.

- Introducing Tesseract 4 to Xojo

132.2.4 Methods

132.2.5 AllWordConfidences as Integer()

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns all word confidences (between 0 and 100) in an array.
Notes: The number of confidences should correspond to the number of space-delimited words in GetText.

132.2.6 AnalyseLayout as TessPageIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Runs page layout analysis in the mode set by SetPageSegMode.
Notes:

May optionally be called prior to Recognize to get access to just the page layout results. Returns an iterator to the results.

Returns nil on error or an empty page.

132.2.7 Clear

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Free up recognition results and any stored image data, without actually freeing any recognition data that would be time-consuming to reload.
Notes: Afterwards, you must call SetImage or TesseractRect before doing any Recognize or Get* operation.

132.2.8 Constructor

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.
Notes: Please call Initialize after this to get started.

132.2.9 GetAltoText(PageNumber as Integer) as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Make an XML-formatted string with Alto markup from the internal data structures.

132.2.10 GetAvailableLanguages as String()

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the available languages as array.
Example:

```
Dim OCR As TessEngineMBS // your instance of tesseract
Dim AvailableLanguages() As String = OCR.GetAvailableLanguages
```

132.2.11 GetBoolVariable(Name as String, byref value as boolean) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries boolean variable value.
Notes:

Returns true if the parameter was found among Tesseract parameters.
Fills in value with the value of the parameter.

132.2.12 GetBoxText(PageNumber as Integer) as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The recognized text is returned as a char* which is coded in the same format as a box file used in training.
Notes:

Constructs coordinates in the original image - not just the rectangle.
PageNumber is a 0-based page index that will appear in the box file.

132.2.13 GetDoubleVariable(Name as String, byref value as Double) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries double variable value.
Notes:

Returns true if the parameter was found among Tesseract parameters.
Fills in value with the value of the parameter.

132.2.14 GetHOCRText(PageNumber as Integer) as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Make a HTML-formatted string with hOCR markup from the internal data structures.
Notes: PageNumber is 0-based but will appear in the output as 1-based.

132.2.15 GetIntVariable(Name as String, byref value as Integer) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries integer variable value.
Notes:

Returns true if the parameter was found among Tesseract parameters.
Fills in value with the value of the parameter.

132.2.16 GetLoadedLanguages as String()

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the loaded languages as array.
Example:

```
Dim OCR As TessEngineMBS // your instance of tesseract
Dim LoadedLanguages() As String = OCR.GetLoadedLanguages
```

Notes: Includes all languages loaded by the last Init, including those loaded as dependencies of other loaded languages.

132.2.17 GetLSTMBoxText(PageNumber as Integer) as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Make a box file for LSTM training from the internal data structures.
Notes:

Constructs coordinates in the original image - not just the rectangle.
PageNumber is a 0-based page index that will appear in the box file.

132.2.18 GetStringVariable(Name as String) as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries string variable value.
Notes:

Returns true if the parameter was found among Tesseract parameters.
Fills in value with the value of the parameter.

132.2.19 GetText as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The recognized text is returned as UTF-text.

132.2.20 GetTsvText(PageNumber as Integer) as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Make a TSV-formatted string from the internal data structures.
Notes: PageNumber is 0-based but will appear in the output as 1-based.

132.2.21 GetUNLVText as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The recognized text is returned as a char* which is coded as UNLV format Latin-1 with specific reject and suspect codes.

132.2.22 GetWordStrBoxText(PageNumber as Integer) as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The recognized text is returned as a char* which is coded in the same format as a WordStr box file used in training.
Notes: PageNumber is a 0-based page index that will appear in the box file.

132.2.23 Initialize(dataPath as String, language as String, Mode as Integer = 3, configs() as String = nil) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Initializes tesseract.
Example:

```
Dim OCR As new TessEngineMBS // your instance of tesseract

If Not ocr.Initialize("C:\Program Files\Tesseract-OCR\tessdata", "eng") Then
MsgBox "failed to initialize"
Quit
End If
```

Notes:

Returns true on success and false on failure.

The datapath must be the name of the tessdata directory.
The language is (usually) an ISO 639-3 string or "" will default to eng.
It is entirely safe (and eventually will be efficient too) to call Initialize multiple times on the same instance to change language, or just to reset the classifier.

The language may be a string of the form [
textasciitilde] <lang>[+ [
textasciitilde] <lang>] * indicating that multiple languages are to be loaded. Eg hin+eng will load Hindi and English. Languages may specify internally that they want to be loaded with one or more other languages, so the
textasciitilde sign is available to override that. Eg if hin were set to load eng by default, then hin+
textasciitilde eng would force loading only hin. The number of loaded languages is limited only by memory, with the caveat that loading additional languages will impact both speed and accuracy, as there is more work to do to decide on the applicable language, and there is more chance of hallucinating incorrect words.

Warning: On changing languages, all Tesseract parameters are reset back to their default values. (Which may vary between languages.)
If you have a rare need to set a Variable that controls initialization for a second call to Init you should explicitly call End() and then use SetVariable before Init. This is only a very rare use case, since there are very few uses that require any parameters to be set before Init.

132.2.24 IsValidWord(Word as String) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Check whether a word is valid according to Tesseract's language model.
Notes: Return false if the word is invalid, true if valid.

132.2.25 LibraryLoaded as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the tesseract library was loaded.
Notes: Should be true after succesful call to LoadLibrary.

132.2.26 LibraryLoadError as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The last error from LoadLibrary as number.

132.2.27 LibraryLoadErrorMessage as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The last error from LoadLibrary as text.

132.2.28 LoadLibrary(file as folderitem) as boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads the tesseract library.
Notes:

Returns true on success and false on failure.
See LibraryLoadErrorMessage for a textual description.
See also:

- 132.2.29 LoadLibrary(path as string) as boolean 21049

132.2.29 LoadLibrary(path as string) as boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads the tesseract library.
Notes:

Returns true on success and false on failure.
See LibraryLoadErrorMessage for a textual description.

For Windows load the DLL, for Linux the tesseract.so file and for macOS the dylib file.
You may need to first load leptonica library and second the tesseract library.
See example project for sample code.
See also:

- 132.2.28 LoadLibrary(file as folderitem) as boolean 21049

132.2.30 PrintVariablesToFile(File as FolderItem) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Print Tesseract parameters to the given file.
Notes:

Returns true on success.
Fails if the file can't be created.

132.2.31 PrintVariablesToPath(Path as String) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Print Tesseract parameters to the given file.
Notes:

Returns true on success.
Fails if the file can't be created.

132.2.32 Recognize as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Recognize the image from SetAndThresholdImage, generating Tesseract internal structures.
Notes:

Returns true on success.

Optional. The Get*Text functions below will call Recognize if needed.

After Recognize, the output is kept internally until the next SetImage.

132.2.33 ResultIterator as TessResultIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries a result iterator.
Notes:

Loop over it to query details.
The result iterator is only valid until you end the engine.

132.2.34 SetCurrentWorkingDirectory(path as folderitem) as boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets current working directory.
Notes: Returns true on success.
See also:

- 132.2.35 SetCurrentWorkingDirectory(path as String) as boolean 21051

132.2.35 SetCurrentWorkingDirectory(path as String) as boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets current working directory.
Notes: Returns true on success.
See also:

- 132.2.34 SetCurrentWorkingDirectory(path as folderitem) as boolean 21051

132.2.36 SetImage(pic as picture)

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets input image via picture.
Example:

```
Dim OCR As TessEngineMBS // your instance of tesseract

Dim f As FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Dim p As Picture = f.OpenAsPicture
OCR.SetImage(p)
```

Notes:

Pass Xojo picture and we copy the pixels.
Mask or alpha channel is ignored.

132.2.37 SetImageData(Data as MemoryBlock)

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets input image via data.
Notes:

Image data can be an image file content like JPEG or PNG.
Supported formats depends on what leptonica was compiled to support.
See also:

- 132.2.38 SetImageData(Data as String) 21052

132.2.38 SetImageData(Data as String)

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets input image via data.
Notes:

Image data can be an image file content like JPEG or PNG.
Supported formats depends on what leptonica was compiled to support.
See also:

- 132.2.37 SetImageData(Data as MemoryBlock) 21052

132.2.39 SetImageFile(File as FolderItem)

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets input image via folderitem.
Example:

```
Dim OCR As TessEngineMBS // your instance of tesseract

Dim f As FolderItem = SpecialFolder.Desktop.Child("test.jpg")
OCR.SetImageFile(f)
```

Notes:

Point to an image file like JPEG or PNG.
Supported formats depends on what leptonica was compiled to support.

See also:

- 132.2.40 SetImageFile(Path as String) 21053

132.2.40 SetImageFile(Path as String)

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets input image via file path.
Notes:

Point to an image file like JPEG or PNG.
Supported formats depends on what leptonica was compiled to support.
See also:

- 132.2.39 SetImageFile(File as FolderItem) 21052

132.2.41 SetRectangle(Left as Integer, Top as Integer, Width as Integer, Height as Integer)

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Restrict recognition to a sub-rectangle of the image.
Notes:

Call after SetImage.
Each SetRectangle clears the recogntion results so multiple rectangles can be recognized with the same image.

132.2.42 SetVariable(Name as String, Value as String)

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set the value of an internal "parameter."
Example:

```
Dim OCR As TessEngineMBS // your instance of tesseract

OCR.SetVariable("tessedit_char_blacklist", "xyz")
```

Notes:

Supply the name of the parameter and the value as a string, just as you would in a config file.
Returns false if the name lookup failed.
e.g.

SetVariable("tessedit_char_blacklist", "xyz") to ignore x, y and z.
Or
SetVariable("classify_bln_numeric_mode", "1") to set numeric-only mode.

SetVariable may be used before Init, but settings will revert to defaults on End().

Note: Must be called after Initialize(). Only works for non-init variables (init variables should be passed to Initialize()).

132.2.43 Properties

132.2.44 DeadlineMSecs as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The deadline in milliseconds.
Notes: (Read and Write property)

132.2.45 Handle as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

132.2.46 InitLanguagesAsString as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the languages string used in the last valid initialization.
Example:

```
Dim OCR As TessEngineMBS // your instance of tesseract

MsgBox OCR.InitLanguagesAsString
```

Notes:

If the last initialization specified "deu+hin" then that will be returned. If hin loaded eng automatically as well, then that will not be included in this list. To find the languages actually loaded use GetLoadedLanguages function.

(Read only property)

132.2.47 InputImage as Picture

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries input image for debugging.
Notes: (Read only property)

132.2.48 InputName as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name of the input file.
Notes:

Needed for training and reading a UNLV zone file, and for searchable PDF output.
(Read and Write property)

132.2.49 MeanTextConf as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the (average) confidence value between 0 and 100.
Notes: (Read only property)

132.2.50 PageSegMode as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current page segmentation mode.
Example:

```
Dim OCR As TessEngineMBS // your instance of tesseract

OCR.PageSegMode = OCR.kPageSegModeAuto
```

Notes:

Defaults to kPageSegModeSingleBlock.
The mode is stored as an IntParam so it can also be modified by ReadConfigFile or SetVariable("tessedit_page-

seg_mode", mode as string).
(Read and Write property)

132.2.51 Resolution as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The resolution of the source image in pixels per inch so font size information can be calculated in results.
Notes:

Call this after SetImage functions.
(Read and Write property)

132.2.52 ThresholdedImage as Picture

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get a copy of the internal thresholded image from Tesseract.
Notes: (Read only property)

132.2.53 Version as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries version of tesseract library.
Example:

MsgBox TessEngineMBS.Version

Notes:

e.g. "4.1.1"
(Read only property)

132.2.54 Events

132.2.55 Cancel(words as integer) as boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: .

Function: Event called regularly to allow you to cancel.
Notes: Return true to cancel current job.

132.2.56 Progress(Left as integer, Right as Integer, Top as Integer, Bottom as Integer, Progress as Integer) as boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: .

Function: Event called regularly to allow you to monitor progress.
Notes: Return true to cancel current job.

132.2.57 Constants

132.2.58 kOcrEngineModeDefault = 3

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the OCR engine modes.
Notes: Specify this mode when calling init_*(), to indicate that any of the above modes should be automatically inferred from the variables in the language-specific config, command-line configs, or if not specified in any of the above should be set to the default kOcrEngineModeTesseractOnly.

132.2.59 kOcrEngineModeLstmOnly = 1

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the OCR engine modes.
Notes: Run just the LSTM line recognizer.

132.2.60 kOcrEngineModeTesseractLstmCombined = 2

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the OCR engine modes.
Notes: Run the LSTM recognizer, but allow fallback to Tesseract when things get difficult. deprecated

132.2.61 kOcrEngineModeTesseractOnly = 0

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the OCR engine modes.
Notes: Run Tesseract only - fastest; deprecated

132.2.62 kPageSegModeAuto = 3

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the page layout modes.
Notes: Fully automatic page segmentation, but no OSD.

132.2.63 kPageSegModeAutoOnly = 2

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the page layout modes.
Notes: Automatic page segmentation, but no OSD, or OCR.

132.2.64 kPageSegModeAutoOsd = 1

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the page layout modes.
Notes: Automatic page segmentation with orientation and script detection. (OSD)

132.2.65 kPageSegModeCircleWord = 9

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the page layout modes.
Notes: Treat the image as a single word in a circle.

132.2.66 kPageSegModeOsdOnly = 0

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the page layout modes.
Notes: Orientation and script detection only.

132.2.67 kPageSegModeRawLine = 13

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the page layout modes.
Notes: Treat the image as a single text line, bypassing hacks that are Tesseract-specific.

132.2.68 kPageSegModeSingleBlock = 6

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the page layout modes.
Notes: Assume a single uniform block of text. (Default.)

132.2.69 kPageSegModeSingleBlockVertText = 5

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the page layout modes.
Notes: Assume a single uniform block of vertically aligned text.

132.2.70 kPageSegModeSingleChar = 10

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the page layout modes.
Notes: Treat the image as a single character.

132.2.71 kPageSegModeSingleColumn = 4

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the page layout modes.
Notes: Assume a single column of text of variable sizes.

132.2.72 kPageSegModeSingleLine = 7

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the page layout modes.
Notes: Treat the image as a single text line.

132.2.73 kPageSegModeSingleWord = 8

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the page layout modes.
Notes: Treat the image as a single word.

132.2.74 kPageSegModeSparseText = 11

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the page layout modes.
Notes: Find as much text as possible in no particular order.

132.2.75 kPageSegModeSparseTextOsd = 12

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the page layout modes.
Notes: Sparse text with orientation and script det.

132.3 class TesseractChoiceIteratorMBS

132.3.1 class TesseractChoiceIteratorMBS

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Class to iterate over the classifier choices for a single symbol.

132.3.2 Methods

132.3.3 Confidence as Double

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the confidence of the current choice.
Notes: The number should be interpreted as a percent probability. (0.0 - 100.0)

132.3.4 Constructor(result as TesseractResultIteratorMBS)

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: Construction is from a ResultIterator that points to the symbol of interest. The ChoiceIterator allows a one-shot iteration over the choices for this symbol and after that is is useless.

132.3.5 NextItem as boolean

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves to the next choice for the symbol and returns false if there are none left.

132.3.6 Text as string

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the text string for the current choice.

132.3.7 Properties

132.3.8 Handle as Integer

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

132.3.9 Parent as TesseractResultIteratorMBS

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent result iterator.
Notes: (Read only property)

132.4 class TesseractErrorExceptionMBS

132.4.1 class TesseractErrorExceptionMBS

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception subclass raised for errors in OCR process.
Notes: Subclass of the RuntimeException class.

132.5 class TesseractMBS

132.5.1 class TesseractMBS

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The plugin class to provide OCR by using the tesseract open source library.
Notes: See example projects on how to use it.

132.5.4 Methods

132.5.5 Clear

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Free up recognition results and any stored image data, without actually freeing any recognition data that would be time-consuming to reload.
Notes: Afterwards, you must call SetImage or TesseractRect before doing any Recognize or Get* operation.

132.5.6 ClearAdaptiveClassifier

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Call between pages or documents etc to free up memory and forget adaptive data.

132.5.7 Constructor

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Constructor which calls only InitForAnalysePage.
See also:

- 132.5.8 Constructor(folder as folderitem, lang as string) 21065
- 132.5.9 Constructor(path as string, lang as string) 21066

132.5.8 Constructor(folder as folderitem, lang as string)

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes tesseract.
Notes:

Same as Init method.
Pass folderitem to parent folder of tessdata folder and language you need.

Instances are now mostly thread-safe and totally independent, but some global parameters remain. Basically it is safe to use multiple TessBaseAPIs in different threads in parallel, UNLESS: you use SetVariable on some of the Params in classify and textord. If you do, then the effect will be to change it for all your instances.

Note that the only members that may be called before Init are: SetInputName, SetOutputName, SetVariable, Get*Variable and PrintVariables.

The language is (usually) an ISO 639-3 string or "" will default to eng.
To use multiple languages, please concat them with plus sign: e.g. "eng+deu"
See also:

- 132.5.7 Constructor 21065
- 132.5.9 Constructor(path as string, lang as string) 21066

132.5.9 Constructor(path as string, lang as string)

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes tesseract.
Notes:

Same as Init method.
Pass path to parent folder of tessdata folder and language you need.

Instances are now mostly thread-safe and totally independent, but some global parameters remain. Basically it is safe to use multiple TessBaseAPIs in different threads in parallel, UNLESS: you use SetVariable on some of the Params in classify and textord. If you do, then the effect will be to change it for all your instances.

Note that the only members that may be called before Init are: SetInputName, SetOutputName, SetVariable, Get*Variable and PrintVariables.

The language is (usually) an ISO 639-3 string or "" will default to eng.
To use multiple languages, please concat them with plus sign: e.g. "eng+deu"
See also:

- 132.5.7 Constructor 21065
- 132.5.8 Constructor(folder as folderitem, lang as string) 21065

132.5.10 GetBoolVariable(name as string, byref value as boolean) as boolean

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a variable as boolean value.
Notes:

Returns true if the parameter was found among Tesseract parameters.
Fills in value with the value of the parameter.

132.5.11 GetBoxText(page as Integer) as string

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The recognized text is returned as a char* which is coded in the same format as a box file used in training.
Notes: Constructs coordinates in the original image - not just the rectangle. page is a 0-based page index that will appear in the box file.

132.5.12 GetDoubleVariable(name as string, byref value as Double) as boolean

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a variable as Double value.
Notes:

Returns true if the parameter was found among Tesseract parameters.
Fills in value with the value of the parameter.

132.5.13 GetHOCRText(page as Integer) as string

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make a HTML-formatted string with hOCR markup from the internal data structures.
Notes: Page is 0-based but will appear in the output as 1-based.

132.5.14 GetIntVariable(name as string, byref value as Integer) as boolean

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a variable as Integer value.
Notes:

Returns true if the parameter was found among Tesseract parameters.
Fills in value with the value of the parameter.

132.5.15 GetLastInitLanguage as string

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return the language used in the last valid initialization.

132.5.16 GetStringVariable(name as string) as string

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries variable's value as string.

132.5.17 GetText as string

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns recognized text.
Notes: Calls Recognize if needed internally.

132.5.18 GetVariableAsString(name as string) as string

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get value of named variable as a string, if it exists.

132.5.19 Init(folder as folderitem, lang as string)

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes tesseract.
Notes:

Pass folderitem to parent folder of tessdata folder and language you need.

Instances are now mostly thread-safe and totally independent, but some global parameters remain. Basically it is safe to use multiple TessBaseAPIs in different threads in parallel, UNLESS: you use SetVariable on some of the Params in classify and textord. If you do, then the effect will be to change it for all your instances.

Start tesseract. Returns zero on success and -1 on failure.

Note that the only members that may be called before Init are: SetInputName, SetOutputName, SetVariable, Get*Variable and PrintVariables.

The language is (usually) an ISO 639-3 string or "" will default to eng.
See also:

- 132.5.20 Init(path as string, lang as string)

132.5.20 Init(path as string, lang as string)

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes tesseract.
Notes:

Pass path to parent folder of tessdata folder and language you need.

Instances are now mostly thread-safe and totally independent, but some global parameters remain. Basically it is safe to use multiple TessBaseAPIs in different threads in parallel, UNLESS: you use SetVariable on some of the Params in classify and textord. If you do, then the effect will be to change it for all your instances.

Start tesseract. Returns zero on success and -1 on failure.

Note that the only members that may be called before Init are: SetInputName, SetOutputName, SetVariable, Get*Variable and PrintVariables.

The language is (usually) an ISO 639-3 string or "" will default to eng.
See also:

- 132.5.19 Init(folder as folderitem, lang as string) 21068

132.5.21 InitForAnalysePage

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Init only for page layout analysis.
Notes: Use only for calls to SetImage and AnalysePage. Calls that attempt recognition will generate an error.

132.5.22 MeanTextConf as Integer

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the (average) confidence value between 0 and 100.

132.5.23 NumDawgs as Integer

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return the number of dawgs loaded.

Notes: Should be bigger than 0 if data files have been loaded.

132.5.24 PrintVariablesToStdErr

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Print Tesseract parameters to standard error.

132.5.25 PrintVariablesToStdOut

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Print Tesseract parameters to standard output.

132.5.26 Recognize as Integer

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Recognize the image.
Notes:

Returns 0 on success.
Optional. The Get*Text functions below will call Recognize if needed. After Recognize, the output is kept internally until the next SetImage.

132.5.27 RecognizeMT as Integer

MBS OCR Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Recognize the image.
Notes:

Returns 0 on success.
Optional. The Get*Text functions below will call Recognize if needed. After Recognize, the output is kept internally until the next SetImage.

Same as Recognize, but thread friendly.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

132.5.28 ResultIterator as TesseractResultIteratorMBS

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get an iterator to the results of LayoutAnalysis and/or Recognize.
Notes: This object points to data held within the TesseractMBS class, and therefore can only be used while the TesseractMBS class still exists and has not been subjected to a call of Init, SetImage, Recognize, Clear, End, DetectOS, or anything else that changes the internal PAGE_RES.

132.5.29 SetImage(buffer as memoryblock, width as Integer, height as Integer, BytesPerPixel as Integer, BytesPerLine as Integer) as boolean

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Provide an image for Tesseract to recognize as a memoryblock.
Notes: Returns true on success and false on failure.
See also:

- 132.5.30 SetImage(Pic as Picture) as boolean 21071

132.5.30 SetImage(Pic as Picture) as boolean

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Provide an image for Tesseract to recognize.
Notes:

The plugin makes a copy of the picture.
Returns true on success and false on failure.
See also:

- 132.5.29 SetImage(buffer as memoryblock, width as Integer, height as Integer, BytesPerPixel as Integer, BytesPerLine as Integer) as boolean 21071

132.5.31 SetInputName(name as string)

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the name of the input file. Needed only for training and reading a UNLV zone file.

132.5.32 SetOutputName(name as string)

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the name of the bonus output files. Needed only for debugging.

132.5.33 SetRectangle(left as Integer, top as Integer, width as Integer, height as Integer)

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Restrict recognition to a sub-rectangle of the image.
Notes: Call after SetImage. Each SetRectangle clears the recogntion results so multiple rectangles can be recognized with the same image.

132.5.34 SetResolution(Resolution as Integer)

MBS OCR Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the resolution of the source image in pixels per inch so font size information can be calculated in results.
Notes: Call this after SetImage.

132.5.35 SetVariable(name as string, value as string) as boolean

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the value of an internal "parameter."
Notes:

Supply the name of the parameter and the value as a string, just as you would in a config file.
Returns false if the name lookup failed.
E.g. SetVariable("tessedit_char_blacklist", "xyz"); to ignore x, y and z.
Or SetVariable("classify_bln_numeric_mode", "1"); to set numeric-only mode.
SetVariable may be used before Init, but settings will revert to defaults on End().

Note: Must be called after Init(). Only works for non-init variables (init variables should be passed to Init()).

132.5.36 Version as string

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the version identifier.

132.5.37 Properties

132.5.38 Handle as Integer

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Internal Object reference.
Notes: (Read only property)

132.5.39 PageSegMode as Integer

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current page segmentation mode.
Notes:

Defaults to kPageSegModeSingleBlock.
The mode is stored as an IntParam so it can also be modified by ReadConfigFile or SetVariable("tessedit_page-seg_mode", mode as string).
(Read and Write computed property)

132.5.40 Constants

132.5.41 kPageSegModeAuto = 3

MBS OCR Plugin, Plugin Version: 12.3.

Function: One of the page segmentation mode constants.
Notes: Fully automatic page segmentation, but no OSD.

132.5.42 kPageSegModeAutoOnly = 2

MBS OCR Plugin, Plugin Version: 12.3.

Function: One of the page segmentation mode constants.
Notes: Automatic page segmentation, but no OSD, or OCR.

132.5.43 kPageSegModeAutoOSD = 1

MBS OCR Plugin, Plugin Version: 12.3.

Function: One of the page segmentation mode constants.
Notes: Automatic page segmentation with orientation and script detection. (OSD)

132.5.44 kPageSegModeCircleWord = 9

MBS OCR Plugin, Plugin Version: 12.3.

Function: One of the page segmentation mode constants.
Notes: Treat the image as a single word in a circle.

132.5.45 kPageSegModeOSDOnly = 0

MBS OCR Plugin, Plugin Version: 12.3.

Function: One of the page segmentation mode constants.
Notes: Orientation and script detection only.

132.5.46 kPageSegModeSingleBlock = 6

MBS OCR Plugin, Plugin Version: 12.3.

Function: One of the page segmentation mode constants.
Notes: Assume a single uniform block of text. (Default.)

132.5.47 kPageSegModeSingleBlockVerticalText = 5

MBS OCR Plugin, Plugin Version: 12.3.

Function: One of the page segmentation mode constants.
Notes: Assume a single uniform block of vertically aligned text.

132.5.48 kPageSegModeSingleChar = 10

MBS OCR Plugin, Plugin Version: 12.3.

Function: One of the page segmentation mode constants.
Notes: Treat the image as a single character.

132.5.49 kPageSegModeSingleColumn = 4

MBS OCR Plugin, Plugin Version: 12.3.

Function: One of the page segmentation mode constants.
Notes: Assume a single column of text of variable sizes.

132.5.50 kPageSegModeSingleLine = 7

MBS OCR Plugin, Plugin Version: 12.3.

Function: One of the page segmentation mode constants.
Notes: Treat the image as a single text line.

132.5.51 kPageSegModeSingleWord = 8

MBS OCR Plugin, Plugin Version: 12.3.

Function: One of the page segmentation mode constants.
Notes: Treat the image as a single word.

132.6 class TesseractNotInitializedExceptionMBS

132.6.1 class TesseractNotInitializedExceptionMBS

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception to report about calling tesseract methods without initialization.
Notes: Subclass of the TesseractErrorExceptionMBS class.

132.7 class TesseractResultIteratorMBS

132.7.1 class TesseractResultIteratorMBS

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Class to iterate over tesseract results, providing access to all levels of the page hierarchy, without including any tesseract headers or having to handle any tesseract structures.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

132.7.2 Methods

132.7.3 Begin

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to point to the start of the page to begin an iteration.

132.7.4 BoundingBox(Level as Integer, byref left as Integer, byref top as Integer, byref right as Integer, byref bottom as Integer) as boolean

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the bounding rectangle of the current object at the given level.
Notes:

Returns false if there is no such object at the current position.
The returned bounding box is guaranteed to match the size and position of the image returned by GetBinaryImage, but may clip foreground pixels from a grey image. The padding argument to GetImage can be used to expand the image to include more foreground pixels. See GetImage.

Coordinate system:
Integer coordinates are at the cracks between the pixels.
The top-left corner of the top-left pixel in the image is at (0,0).
The bottom-right corner of the bottom-right pixel in the image is at (width, height).
Every bounding box goes from the top-left of the top-left contained pixel to the bottom-right of the bottom-right contained pixel, so the bounding box of the single top-left pixel in the image is: (0,0)->(1,1).
If an image rectangle has been set in the API, then returned coordinates relate to the original (full) image, rather than the rectangle.

132.7.5 Confidence(Level as Integer) as Double

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the mean confidence of the current object at the given level.
Notes: The number should be interpreted as a percent probability. (0.0 - 100.0)

132.7.6 Constructor

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

132.7.7 IsAtBeginningOf(Level as Integer) as boolean

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the iterator is at the start of an object at the given level.
Notes: Possible uses include determining if a call to Next(kLevelWord) moved to the start of a kLevelParagraph.

132.7.8 IsAtFinalElement(Level as Integer, element as Integer) as boolean

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns whether the iterator is positioned at the last element in a given level.
Notes: (e.g. the last word in a line, the last line in a block)

132.7.9 NextItem(Level as Integer) as boolean

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves to the start of the next object at the given level in the page hierarchy, and returns false if the end of the page was reached.
Notes:

NOTE that kLevelSymbol will skip non-text blocks, but all other level values will visit each non-text block once.
Think of non text blocks as containing a single paragraph, with a single line, with a single imaginary word.
Calls to Next with different levels may be freely intermixed.
This function iterates words in right-to-left scripts correctly, if the appropriate language has been loaded

into Tesseract.

132.7.10 SymbolIsDropcap as boolean

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the current symbol is a dropcap.
Notes: If iterating at a higher level object than symbols, eg words, then this will return the attributes of the first symbol in that word.

132.7.11 SymbolIsSubscript as boolean

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the current symbol is a subscript.
Notes: If iterating at a higher level object than symbols, e.g. words, then this will return the attributes of the first symbol in that word.

132.7.12 SymbolIsSuperscript as boolean

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the current symbol is a superscript.
Notes: If iterating at a higher level object than symbols, eg words, then this will return the attributes of the first symbol in that word.

132.7.13 Text(Level as Integer) as string

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the text string for the current object at the given level.

132.7.14 WordFontAttributes(byref bold as boolean, byref italic as boolean, byref underlined as boolean, byref monospace as boolean, byref serif as boolean, byref smallcaps as boolean, byref pointsize as Integer, byref fontid as Integer) as string

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the font attributes of the current word.
Notes:

If iterating at a higher level object than words, e.g. textlines, then this will return the attributes of the first word in that textline.
The actual return value is a string representing a font name.
Pointsize is returned in printers points (1/72 inch.)

132.7.15 WordIsFromDictionary as boolean

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the current word was found in a dictionary.

132.7.16 WordIsNumeric as boolean

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the current word is numeric.

132.7.17 Properties

132.7.18 Handle as Integer

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Internal Object reference.
Notes: (Read only property)

132.7.19 Parent as TesseractMBS

MBS OCR Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent tesseract object.
Notes: (Read only property)

132.7.20 Constants

132.7.21 kLevelBlock = 0

MBS OCR Plugin, Plugin Version: 12.3.

Function: One of the level constants.
Notes: Block of text/image/separator line.

132.7.22 kLevelParagraph = 1

MBS OCR Plugin, Plugin Version: 12.3.

Function: One of the level constants.
Notes: Paragraph within a block.

132.7.23 kLevelSymbol = 4

MBS OCR Plugin, Plugin Version: 12.3.

Function: One of the level constants.
Notes: Symbol/character within a word.

132.7.24 kLevelTextline = 2

MBS OCR Plugin, Plugin Version: 12.3.

Function: One of the level constants.
Notes: Line within a paragraph.

132.7.25 kLevelWord = 3

MBS OCR Plugin, Plugin Version: 12.3.

Function: One of the level constants.
Notes: Word within a textline.

132.8 class TessPageIteratorMBS

132.8.1 class TessPageIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The iterator to walk over page content.
Notes:

Class to iterate over tesseract page structure, providing access to all levels of the page hierarchy, without including any tesseract headers or having to handle any tesseract structures.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

132.8.2 Methods

132.8.3 Baseline(Level as Integer, byref x1 as Integer, byref y1 as Integer, byref x2 as Integer, byref y2 as Integer) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the baseline of the current object at the given level.
Notes:

The baseline is the line that passes through (x1, y1) and (x2, y2).

Warning: with vertical text, baselines may be vertical!

Returns false if there is no baseline at the current position.

132.8.4 Begin

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the iterator to point to the start of the page to begin an iteration.

132.8.5 BinaryImage(Level as Integer) as PIcture

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a binary image of the current object at the given level.
Notes: The position and size match the return from BoundingBoxInternal, and so this could be upscaled

with respect to the original input image.

132.8.6 BoundingBox(Level as Integer, byref Left as Integer, byref Top as Integer, byref Right as Integer, byref Bottom as Integer) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the bounding rectangle of the current object at the given level.
Notes:

Returns false if there is no such object at the current position.
The returned bounding box is guaranteed to match the size and position of the image returned by GetBinaryImage, but may clip foreground pixels from a grey image. The padding argument to GetImage can be used to expand the image to include more foreground pixels. See BinaryImage below.

132.8.7 Constructor

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

132.8.8 CopyIterator as TessPageIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a copy of the iterator.

132.8.9 IsAtBeginningOf(Level as Integer) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if the iterator is at the start of an object at the given level.

132.8.10 IsAtFinalElement(Level as Integer, element as Integer) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether the iterator is positioned at the last element in a given level. (e.g. the last word in a line, the last line in a block)

132.8.11 MoveNext(Level as Integer) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to the start of the next object at the given level in the page hierarchy, and returns false if the end of the page was reached.
Notes: NOTE that symbol will skip non-text blocks, but all other PageIteratorLevel level values will visit each non-text block once. Think of non text blocks as containing a single paragraph, with a single line, with a single imaginary word. Calls to Next with different levels may be freely intermixed. This function iterates words in right-to-left scripts correctly, if the appropriate language has been loaded into Tesseract.

132.8.12 Properties

132.8.13 BlockType as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the type of the current block.
Notes: (Read only property)

132.8.14 DeskewAngle as Single

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The deskew angle.
Notes:

After rotating the block so the text orientation is upright, how many radians does one have to rotate the block anti-clockwise for it to be level?
-Pi/4 <= deskew_angle <= Pi/4
(Read only property)

132.8.15 FirstLineIndent as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The first line indent.
Notes:

For LEFT aligned paragraphs, the first text line of paragraphs of this kind are indented this many pixels from the left edge of the rest of the paragraph.
for RIGHT aligned paragraphs, the first text line of paragraphs of this kind are indented this many pixels from the right edge of the rest of the paragraph.

This value may be negative.

if IsCrown is true, the first line of this paragraph is actually flush, and first_line_indent is set to the "common" first line indent for subsequent paragraphs in this block of text.
(Read only property)

132.8.16 Handle as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

132.8.17 IsCrown as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the current item is a crown.
Notes:

True if the first line of the paragraph is aligned with the other lines of the paragraph even though subsequent paragraphs have first line indents. This typically indicates that this is the continuation of a previous paragraph or that it is the very first paragraph in the chapter.
(Read only property)

132.8.18 IsListItem as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether current item is a list item.
Notes:

True if we believe this is a member of an ordered or unordered list.
(Read only property)

132.8.19 Justification as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries justification for current block.
Notes:

LEFT if ragged right, or fully justified and script is left-to-right.
RIGHT if ragged left, or fully justified and script is right-to-left.
unknown if it looks like source code or we have very few lines.
(Read only property)

132.8.20 Orientation as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The orientation of the current block.
Notes: (Read only property)

132.8.21 TextlineOrder as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The text orientation of the current block.
Notes: (Read only property)

132.8.22 WritingDirection as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The writing direction of the current block.
Notes: (Read only property)

132.8.23 Constants

132.8.24 kBlockTypeCaptionText = 8

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the block types.
Notes: Text that belongs to an image.

132.8.25 kBlockTypeEquation = 4

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the block types.
Notes: Partition belonging to an equation region.

132.8.26 kBlockTypeFlowingImage = 9

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the block types.
Notes: Image that lives inside a column.

132.8.27 kBlockTypeFlowingText = 1

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the block types.
Notes: Text that lives inside a column.

132.8.28 kBlockTypeHeadingImage = 10

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the block types.
Notes: Image that spans more than one column.

132.8.29 kBlockTypeHeadingText = 2

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the block types.
Notes: Text that spans more than one column.

132.8.30 kBlockTypeHorzLine = 12

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the block types.
Notes: Horizontal Line.

132.8.31 kBlockTypeInlineEquation = 5

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the block types.
Notes: Partition has inline equation.

132.8.32 kBlockTypeNoise = 14

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the block types.
Notes: Lies outside of any column.

132.8.33 kBlockTypePulloutImage = 11

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the block types.
Notes: Image that is in a cross-column pull-out region.

132.8.34 kBlockTypePulloutText = 3

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the block types.
Notes: Text that is in a cross-column pull-out region.

132.8.35 kBlockTypeTable = 6

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the block types.
Notes: Partition belonging to a table region.

132.8.36 kBlockTypeUnknown = 0

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the block types.
Notes: Type is not yet known. Keep as the first element.

132.8.37 kBlockTypeVerticalText = 7

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the block types.
Notes: Text-line runs vertically.

132.8.38 kBlockTypeVertLine = 13

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the block types.
Notes: Vertical Line.

132.8.39 kJustificationCenter = 2

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the justification constants.
Notes: The text lines of the paragraph are centered about a line going down through their middle of the text lines.

132.8.40 kJustificationLeft = 1

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the justification constants.
Notes: Each line, except possibly the first, is flush to the same left tab stop.

132.8.41 kJustificationRight = 3

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the justification constants.
Notes: Each line, except possibly the first, is flush to the same right tab stop.

132.8.42 kJustificationUnknown = 0

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the justification constants.
Notes: Unknown.

132.8.43 kLevelBlock = 0

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the levels.
Notes: Block

132.8.44 kLevelParagraph = 1

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the levels.
Notes: Paragraph

132.8.45 kLevelSymbol = 4

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the levels.
Notes: Symbol

132.8.46 kLevelTextline = 2

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the levels.
Notes: Textline

132.8.47 kLevelWord = 3

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the levels.
Notes: Word

132.8.48 kOrientationPageDown = 2

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the orientations.
Notes: Orientation is down.

132.8.49 kOrientationPageLeft = 3

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the orientations.
Notes: Orientation is left.

132.8.50 kOrientationPageRight = 1

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the orientations.
Notes: Orientation is right.

132.8.51 kOrientationPageUp = 0

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the orientations.
Notes: Orientation is up.

132.8.52 kTextlineOrderLefttoRight = 0

MBS OCR Plugin, Plugin Version: 21.3.

Function: The text lines are read in the given sequence.
Notes: Mongolian is written in vertical columns top to bottom like Chinese, but the lines order left-to right.

132.8.53 kTextlineOrderRighttoLeft = 1

MBS OCR Plugin, Plugin Version: 21.3.

Function: The text lines are read in the given sequence.
Notes: In Chinese, vertical text lines are read right-to-left.

132.8.54 kTextlineOrderToptoBottom = 2

MBS OCR Plugin, Plugin Version: 21.3.

Function: The text lines are read in the given sequence.
Notes: In English, the order is top-to-bottom.

132.8.55 kWritingDirectionLefttoRight = 0

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the writing direction constants.
Notes: For English text, the writing direction is left-to-right.

132.8.56 kWritingDirectionRighttoLeft = 1

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the writing direction constants.
Notes: For Arabic the text direction is right to left.

132.8.57 kWritingDirectionToptoBottom = 2

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the writing direction constants.
Notes: For the Chinese text in the above example, the writing direction is top-to-bottom.

132.9 class TessResultIteratorMBS

132.9.1 class TessResultIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Class to iterate over tesseract results, providing access to all levels of the page hierarchy, without including any tesseract headers or having to handle any tesseract structures.
Notes:

WARNING! This class points to data held within the TessEngineMBS class, and therefore can only be used while the TessBaseAPI class still exists and has not been subjected to a call of Init, SetImage, Recognize, Clear, End DetectOS, or anything else that changes the internal PAGE_RES.

See also base class TessPageIteratorMBS class, which contains the bulk of the interface. TessResultIteratorMBS adds text-specific methods for access to OCR output.
Subclass of the TessPageIteratorMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

132.9.2 Methods

132.9.3 ChoiceIterator as TessChoiceIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries choice iterator for current object.

132.9.4 Confidence(Level as Integer) as Single

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the mean confidence of the current object at the given level.
Notes: The number should be interpreted as a percent probability. (0.0 - 100.0)

132.9.5 Constructor

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

132.9.6 CopyIterator as TessResultIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Copies the result iterator.

132.9.7 MoveNext(Level as Integer) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to the next choice for the symbol and returns false if there are none left.

132.9.8 PageIterator as TessPageIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the page iterator for this result.

132.9.9 Text(Level as Integer) as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the UTF-8 encoded text string for the current object at the given level.

132.9.10 Properties

132.9.11 FontID as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The font ID.
Notes:

The font attributes of the current word.
(Read only property)

132.9.12 FontName as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The font name.
Notes:

The font attributes of the current word.
(Read only property)

132.9.13 IsBold as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The bold font attribute.
Notes:

The font attributes of the current word.
(Read only property)

132.9.14 IsItalic as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The italic font attribute.
Notes:

The font attributes of the current word.
(Read only property)

132.9.15 IsMonoSpace as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The monospace font attribute.
Notes:

The font attributes of the current word.
(Read only property)

132.9.16 IsSerif as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The serif font attribute.
Notes:

The font attributes of the current word.
(Read only property)

132.9.17 IsSmallCaps as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The smallcaps font attribute.
Notes:

The font attributes of the current word.
(Read only property)

132.9.18 IsUnderlined as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The underlined font attribute.
Notes:

The font attributes of the current word.
(Read only property)

132.9.19 PointSize as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The point size font attribute.
Notes:

The font attributes of the current word.
Pointsize is returned in printers points (1/72 inch.)
(Read only property)

132.9.20 SymbolIsDropcap as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if the current symbol is a dropcap.
Notes:

If iterating at a higher level object than symbols, eg words, then this will return the attributes of the first symbol in that word.

(Read only property)

132.9.21 SymbolIsSubscript as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if the current symbol is a subscript.
Notes:

If iterating at a higher level object than symbols, eg words, then this will return the attributes of the first symbol in that word.
(Read only property)

132.9.22 SymbolIsSuperscript as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if the current symbol is a superscript.
Notes:

If iterating at a higher level object than symbols, eg words, then this will return the attributes of the first symbol in that word.
(Read only property)

132.9.23 WordIsFromDictionary as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if the current word was found in a dictionary.
Notes: (Read only property)

132.9.24 WordIsNumeric as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if the current word is numeric.
Notes: (Read only property)

132.9.25 WordRecognitionLanguage as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return the name of the language used to recognize this word.
Notes:

On error, this is empty.
(Read only property)

132.9.26 Constants

132.9.27 kLevelBlock = 0

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the levels.
Notes: Block

132.9.28 kLevelParagraph = 1

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the levels.
Notes: Paragraph

132.9.29 kLevelSymbol = 4

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the levels.
Notes: Symbol

132.9.30 kLevelTextline = 2

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the levels.
Notes: Textline

132.9.31 kLevelWord = 3

MBS OCR Plugin, Plugin Version: 21.3.

Function: One of the levels.
Notes: Word

Chapter 133

Open Directory

133.1 class ODNodeMBS

133.1.1 class ODNodeMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: An Open Directory node.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

133.1.6 Methods

133.1.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

133.1.8 nodeDetails(byref error as NSErrorMBS) as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a dictionary containing details about a node.
Notes:

Error: An error reference for error details. Can be nil.

Returns a dictionary containing details.

133.1.9 nodeDetailsForKeys(keys() as string, byref error as NSErrorMBS) as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a dictionary containing details about a node.
Notes:

Keys: An array of keys corresponding to the values returned in the dictionary.
Error: An error reference for error details. Can be nil.

Returns a dictionary containing details about the node corresponding to keys specified by Keys.

133.1.10 nodeWithName(session as ODSessionMBS, name as string, byref error as NSErrorMBS) as ODNodeMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a node object with a specified session and name.
Notes:

Session: The session.
Name: The name of the node.
Error: An error reference for error details. Can be nil.

Returns the created node object.

133.1.11 nodeWithType(session as ODSessionMBS, type as integer, byref error as NSErrorMBS) as ODNodeMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a node object with a specified session and type.
Notes:

Session: The session.
Type: The node type.
Error: An error reference for error details.

Returns the created node object.

133.1.12 subnodeNames(byref error as NSErrorMBS) as String()

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the names of subnodes for the node.

133.1.13 supportedAttributesForRecordType(RecordType as String, byref error as NSErrorMBS) as String()

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of attribute types supported by the node's records.
Notes:

RecordType: The record type to list supported attribute types for. Can be nil.
Error: An error reference for error details. Can be nil.

Returns an array of supported attribute types.

133.1.14 supportedRecordTypes(byref error as NSErrorMBS) as String()

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of the record types supported by the node.
Notes: If the node does not support checking for supported record types, all possible record types are returned.

133.1.15 unreachableSubnodeNames(byref error as NSErrorMBS) as String()

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of the subnodes of a given node that are currently unreachable.

133.1.16 Properties

133.1.17 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

133.1.18 nodeName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The node's name.
Notes: (Read only property)

133.1.19 Constants

133.1.20 kODNodeTypeAuthentication = & h2201

MBS MacFrameworks Plugin, Plugin Version: 19.3.

Function: One of the Open Directory node types.
Notes: A node used for authentication or record lookups.

133.1.21 kODNodeTypeConfigure = & h2202

MBS MacFrameworks Plugin, Plugin Version: 19.3.

Function: One of the Open Directory node types.
Notes: A node that specifically refers to the Directory Services configuration.

133.1.22 kODNodeTypeContacts = & h2204

MBS MacFrameworks Plugin, Plugin Version: 19.3.

Function: One of the Open Directory node types.
Notes: A node used for applications that handle contact data.

133.1.23 kODNodeTypeLocalNodes = & h2200

MBS MacFrameworks Plugin, Plugin Version: 19.3.

Function: One of the Open Directory node types.
Notes: A node that specifically looks at the local directory.

133.1.24 kODNodeTypeNetwork = & h2205

MBS MacFrameworks Plugin, Plugin Version: 19.3.

Function: One of the Open Directory node types.
Notes: A node used for looking up network resource type data.

133.2 class ODQueryMBS

133.2.1 class ODQueryMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: An Open Directory query.
Notes: Currently only partially implemented for Xojo for reading values. If you need more, please contact Monkeybread Software.

133.2.6 Methods

133.2.7 Constructor(node as ODNodeMBS, inRecordTypeOrList as Variant, inAttribute as String, matchType as Integer, inQueryValueOrList as Variant, inReturnAttributeOrList as Variant, maximumResults as Integer, byref error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an query object created with provided parameters.
Notes:

Node: The node to query.
in RecordTypeOrList: The type or types of record to query. Can be an NSString object for a single type or an NSArray object containing NSString objects for multiple types.
inAttribute: The name of the attribute to query.
MatchType: The type of query.
inQueryValueOrList: The value or values to query in the attribute. Can be a string or a memoryblock object for a single value, or an array containing string and memoryblock objects for multiple values.
inReturnAttributeOrList: The attribute or attributes to be returned from the query. Can be a string for a single attribute or an array object containing strings for multiple attributes. Passing nil is equivalent to passing kODAttributeTypeStandardOnly.
maximumResults: The maximum number of values to be returned.
Error: An error reference for error details.

133.2.8 Destructor

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

133.2.9 queryWithNode(node as ODNodeMBS, inRecordTypeOrList as Variant, inAttribute as String, matchType as Integer, inQueryValueOrList as Variant, inReturnAttributeOrList as Variant, maximumResults as Integer, byref error as NSErrorMBS) as ODQueryMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an query object created with provided parameters.
Notes:

Node: The node to query.
in RecordTypeOrList: The type or types of record to query. Can be an NSString object for a single type or an NSArray object containing NSString objects for multiple types.

inAttribute: The name of the attribute to query.
MatchType: The type of query.
inQueryValueOrList: The value or values to query in the attribute. Can be a string or a memoryblock object for a single value, or an array containing string and memoryblock objects for multiple values.
inReturnAttributeOrList: The attribute or attributes to be returned from the query. Can be a string for a single attribute or an array object containing strings for multiple attributes. Passing nil is equivalent to passing kODAttributeTypeStandardOnly.
maximumResults: The maximum number of values to be returned.
Error: An error reference for error details.

133.2.10 resultsAllowingPartial(AllowPartialResults as Boolean, byref error as NSErrorMBS) as ODRecordMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns results from a query synchronously.
Notes:

AllowPartialResults: If true, only immediately available results are returned; otherwise, the function waits until all results are available.
Error: An error reference for error details. Can be nil.

Returns the results of the query in an array of ODRecordMBS objects.

133.2.11 start

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Starts asynchronous search.

133.2.12 synchronize

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Restarts a query, disposing of any results it has obtained.
Notes: If the query was originally started asynchronously, the event is called with inResults set to nil, error.code set to kODErrorQuerySynchronize, and error.domain set to kODErrorDomainFramework.

133.2.13 Properties

133.2.14 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

133.2.15 Constants

133.2.16 kODMatchAny = 1

MBS MacFrameworks Plugin, Plugin Version: 19.3.

Function: One of the match types.
Notes: is used to search for any records (typically passed with nil search value)

133.2.17 kODMatchBeginsWith = & h2002

MBS MacFrameworks Plugin, Plugin Version: 19.3.

Function: One of the match types.
Notes: is searching values that begin with the provided value

133.2.18 kODMatchContains = & h2004

MBS MacFrameworks Plugin, Plugin Version: 19.3.

Function: One of the match types.
Notes: is searching values that contain the provided value

133.2.19 kODMatchEndsWith = & h2003

MBS MacFrameworks Plugin, Plugin Version: 19.3.

Function: One of the match types.
Notes: is searching values that end with the provided value

133.2.20 kODMatchEqualTo = & h2001

MBS MacFrameworks Plugin, Plugin Version: 19.3.

Function: One of the match types.
Notes: is searching values that are equal to the provided value

133.2.21 kODMatchGreaterThan = & h2006

MBS MacFrameworks Plugin, Plugin Version: 19.3.

Function: One of the match types.
Notes: is searching values greater than the provided value

133.2.22 kODMatchLessThan = & h2007

MBS MacFrameworks Plugin, Plugin Version: 19.3.

Function: One of the match types.
Notes: is searching values less than the provided value

133.3 class ODRecordMBS

133.3.1 class ODRecordMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: An Open Directory record.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

133.3.6 Methods

133.3.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

133.3.8 kODAttributeTypeAccessControlEntry as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type which stores directory access control directives.

133.3.9 kODAttributeTypeAddressLine1 as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Line one of multiple lines of address data for a user.

133.3.10 kODAttributeTypeAddressLine2 as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Line two of multiple lines of address data for a user.

133.3.11 kODAttributeTypeAddressLine3 as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Line three of multiple lines of address data for a user.

133.3.12 kODAttributeTypeAdminLimits as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: XML plist indicating what an admin user can edit. Found in kODRecordTypeUsers records.

133.3.13 kODAttributeTypeAdvertisedServices as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.

133.3.14 kODAttributeTypeAlias as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Alias attribute, contain pointer to another node/record/attribute.

133.3.15 kODAttributeTypeAllAttributes as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used in requesting all attribute types in a search.

133.3.16 kODAttributeTypeAllTypes as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to indicated recommended attribute types for a record type in the Config node.

133.3.17 kODAttributeTypeAltSecurityIdentities as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Used to store alternate identities for the record. Values will have standardized form as specified by Microsoft LDAP schema (1.2.840.113556.1.4.867).

Kerberos:user\@REALM

133.3.18 kODAttributeTypeAreaCode as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Area code of a user's phone number.

133.3.19 kODAttributeTypeAttrListRefCount as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute List reference count for a process.

133.3.20 kODAttributeTypeAttrListRefs as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: All the attribute list references for a process.

133.3.21 kODAttributeTypeAttrListValueRefCount as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attr List Value reference count for a process.

133.3.22 kODAttributeTypeAttrListValueRefs as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: All the attribute list value references for a process.

133.3.23 kODAttributeTypeAuthCredential as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: An authentication credential, to be used to authenticate to a Directory.

133.3.24 kODAttributeTypeAuthenticationAuthority as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Determines what mechanism is used to verify or set a user's password.
If multiple values are present, the first attributes returned take precedence.
Typically found in User records (kODRecordTypeUsers).

Authentication authorities are a multi-part string separated by semi-colons.
One component is the "type" of authority, such as those listed below:

"basic"	- is a crypt password
"ShadowHash"	- is a hashed password stored in a secure location
"ApplePasswordServer"	- is a password server-based account
"Kerberosv5"	- is a Kerberosv5 based
"LocalCachedUser"	- is a cached account based on an account from another node, using a ShadowHash password
"DisabledUser"	- is an account that has been disabled

133.3.25 kODAttributeTypeAuthenticationHint as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to identify the authentication hint phrase.

133.3.26 kODAttributeTypeAuthMethod as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Authentication method for an authentication capable record.

133.3.27 kODAttributeTypeAuthorityRevocationList as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute containing the binary of the authority revocation list.
A certificate revocation list that defines certificate authority certificates which are no longer trusted. No user certificates are included in this list.
Usually found in kODRecordTypeCertificateAuthorities records.

133.3.28 kODAttributeTypeAutomaticSearchPath as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Automatic search path defined by the search node.

133.3.29 kODAttributeTypeAutomountInformation as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

xDetermines what mechanism is used to verify or set a user's password.
If multiple values are present, the first attributes returned take precedence.
Typically found in User records (kODRecordTypeUsers).

133.3.30 kODAttributeTypeBirthday as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Single-valued attribute that defines the user's birthday.
Format is x.208 standard YYYYMMDDHHMMSSZ which we will require as GMT time.

133.3.31 kODAttributeTypeBootParams as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type in host or machine records for storing boot params.

133.3.32 kODAttributeTypeBuilding as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents the building name for a user or person record.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

133.3.33 kODAttributeTypeBuildVersion as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Build version for reference.

133.3.34 kODAttributeTypeCACertificate as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute containing the binary of the certificate of a certificate authority.
Its corresponding private key is used to sign certificates.
Usually found in kODRecordTypeCertificateAuthority records.

133.3.35 kODAttributeTypeCapacity as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute type for the capacity of a resource.
found in resource records (kODRecordTypeResources).
Example: 50

133.3.36 kODAttributeTypeCertificateRevocationList as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute containing the binary of the certificate revocation list.
This is a list of certificates which are no longer trusted.
Usually found in kODRecordTypeCertificateAuthority records.

133.3.37 kODAttributeTypeCity as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Usually, city for a user or person record.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

133.3.38 kODAttributeTypeComment as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute used for unformatted comment.

133.3.39 kODAttributeTypeCompany as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

attribute that defines the user's company.
Example: Apple Inc.

133.3.40 kODAttributeTypeComputers as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of computers.

133.3.41 kODAttributeTypeConfigAvailable as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Config avail tag.

133.3.42 kODAttributeTypeConfigFile as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Config file name.

133.3.43 kODAttributeTypeContactGUID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute type for the contact GUID of a group.
Usually found in group records (kODRecordTypeGroups)

133.3.44 kODAttributeTypeContactPerson as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute type for the contact person of the machine.
Found in host or machine records.

133.3.45 kODAttributeTypeCopyTimestamp as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Timestamp used in local account caching.

133.3.46 kODAttributeTypeCoreFWVersion as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Core FW version for reference.

133.3.47 kODAttributeTypeCountry as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents country of a record entry.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

133.3.48 kODAttributeTypeCreationTimestamp as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute showing date/time of record creation.
Format is x.208 standard YYYYMMDDHHMMSSZ which should be GMT time.

133.3.49 kODAttributeTypeCrossCertificatePair as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute containing the binary of a pair of certificates which verify each other. Both certificates have the same level of authority.
Usually found in kODRecordTypeCertificateAuthority records.

133.3.50 kODAttributeTypeCustomSearchPath as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Admin user configured custom search path defined by the search node.

133.3.51 kODAttributeTypeDataStamp as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute for checksum/meta data

133.3.52 kODAttributeTypeDateRecordCreated as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Date of record creation.

133.3.53 kODAttributeTypeDepartment as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents the department name of a user or person.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

133.3.54 kODAttributeTypeDirRefCount as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Directory reference count for a process.

133.3.55 kODAttributeTypeDirRefs as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: All the directory references for a process.

133.3.56 kODAttributeTypeDNSDomain as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: DNS Resolver domain attribute.

133.3.57 kODAttributeTypeDNSName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: DNS Resolver nameserver attribute.

133.3.58 kODAttributeTypeDNSNameServer as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: DNS Resolver nameserver attribute.

133.3.59 kODAttributeTypeEMailAddress as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Email address of usually a user record.

133.3.60 kODAttributeTypeEMailContacts as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute that defines a record's custom email addresses.
found in user records (kODRecordTypeUsers).

Example: home:johndoe\@mymail.com

133.3.61 kODAttributeTypeENetAddress as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute for hardware Ethernet address (MAC address).
Found in computer records (kODRecordTypeComputers).

133.3.62 kODAttributeTypeExpire as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for expiration date or time depending on association.

133.3.63 kODAttributeTypeFaxNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents the FAX numbers of a user or person.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

133.3.64 kODAttributeTypeFirstName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for first name of user or person record.

133.3.65 kODAttributeTypeFullName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Full name of a record (e.g., "John Doe", "John Doe's Computer")

133.3.66 kODAttributeTypeFunctionalState as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Functional state of plugin for example.

133.3.67 kODAttributeTypeFWVersion as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Framework version for reference.

133.3.68 kODAttributeTypeGroup as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of groups.

133.3.69 kODAttributeTypeGroupMembers as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type in group records containing lists of GUID values for members other than groups.

133.3.70 kODAttributeTypeGroupMembership as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Usually a list of users that below to a given group record.

133.3.71 kODAttributeTypeGroupServices as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

xml-plist attribute that defines a group's services.
Found in group records (kODRecordTypeGroups).

133.3.72 kODAttributeTypeGUID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for 36 character (128 bit) unique ID. An example value is "A579E95E-CDFE-4EBC-B7E7-F2158562170F". The standard format contains 32 uppercase hex characters and four hyphen characters.

133.3.73 kODAttributeTypeHardwareUUID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to store hardware UUID in string form for a record. Typically found in kODRecordTypeComputers.

133.3.74 kODAttributeTypeHomeDirectory as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Network home directory URL.

133.3.75 kODAttributeTypeHomeDirectoryQuota as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents the allowed usage for a user's home directory in bytes.
Found in user records (kODRecordTypeUsers).

133.3.76 kODAttributeTypeHomeDirectorySoftQuota as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to define home directory size limit in bytes when user is notified that the hard limit is approaching.

133.3.77 kODAttributeTypeHomeLocOwner as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents the owner of a workgroup's shared home directory.
Typically found in kODRecordTypeGroups records.

133.3.78 kODAttributeTypeHomePhoneNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Home telephone number of a user or person.

133.3.79 kODAttributeTypeHTML as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: HTML location.

133.3.80 kODAttributeTypeIMHandle as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents the Instant Messaging handles of a user.
Values should be prefixed with the appropriate IM type
(i.e., AIM:, Jabber:, MSN:, Yahoo:, or ICQ:).
Usually found in user records (kODRecordTypeUsers).

133.3.81 kODAttributeTypeInternetAlias as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to track internet alias.

133.3.82 kODAttributeTypeIPAddress as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: IP address expressed either as domain or IP notation.

133.3.83 kODAttributeTypeIPAddressAndENetAddress as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: A pairing of IPv4 or IPv6 addresses with Ethernet addresses (e.g., "10.1.1.1/00:16:cb:92:56:41").
Usually found on kODRecordTypeComputers for use by services that need specific pairing of the two values.
This should be in addition to kODAttributeTypeIPAddress, kODAttributeTypeIPv6Address and kODAttributeTypeENetAddress. This is necessary because not all directories return attribute values in a guaranteed order.

133.3.84 kODAttributeTypeIPv6Address as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

IPv6 address expressed in the standard notation (e.g., "fe80::236:caff:fcc2:5641")
Usually found on kODRecordTypeComputers and kODRecordTypeHosts.

133.3.85 kODAttributeTypeJobTitle as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents the job title of a user.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

133.3.86 kODAttributeTypeJPEGPhoto as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Used to store binary picture data in JPEG format.
Usually found in user, people or group records (kODRecordTypeUsers, kODRecordTypePeople, kODRecordTypeGroups).

133.3.87 kODAttributeTypeKDCAuthKey as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: KDC master key RSA encrypted with realm public key.

133.3.88 kODAttributeTypeKDCConfigData as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Contents of the kdc.conf file.

133.3.89 kODAttributeTypeKerberosRealm as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Supports Kerberized SMB Server services.

133.3.90 kODAttributeTypeKerberosServices as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: This is used to store the principals in host records (i.e., "host", "vnc", etc.)

133.3.91 kODAttributeTypeKeywords as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Keywords using for searching capability.

133.3.92 kODAttributeTypeLastName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for the last name of user or person record.

133.3.93 kODAttributeTypeLDAPReadReplicas as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of LDAP server URLs which can each be used to read directory data.

133.3.94 kODAttributeTypeLDAPSearchBaseSuffix as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Search base suffix for a LDAP server.

133.3.95 kODAttributeTypeLDAPWriteReplicas as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of LDAP server URLs which can each be used to write directory data.

133.3.96 kODAttributeTypeLocaleRelay as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.

133.3.97 kODAttributeTypeLocaleSubnets as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.

133.3.98 kODAttributeTypeLocalOnlySearchPath as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Local only search path defined by the search node.

133.3.99 kODAttributeTypeLocation as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents the location a service is available from (usually domain name).
Typically found in service record types including kODRecordTypeAFPServer, kODRecordTypeLDAPServer, and kODRecordTypeWebServer.

133.3.100 kODAttributeTypeMailAttribute as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Holds the mail account config data.

133.3.101 kODAttributeTypeMapCoordinates as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

attribute that defines coordinates for a user's location.
found in user records (kODRecordTypeUsers) and resource records (kODRecordTypeResources).
Example: 7.7,10.6

133.3.102 kODAttributeTypeMapGUID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the GUID for a record's map.

133.3.103 kODAttributeTypeMapURI as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

attribute that defines the URI of a user's location.
Usually found in user records (kODRecordTypeUsers).
Example: http://example.com/bldg1

133.3.104 kODAttributeTypeMCXFlags as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used by ManagedClient.

133.3.105 kODAttributeTypeMCXSettings as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used by ManagedClient.

133.3.106 kODAttributeTypeMetaAmbiguousName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Searches a configured list of attributes; by default: RecordName, FullName, EMailAddress.

133.3.107 kODAttributeTypeMetaAugmentedAttributes as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attributes that have been augmented.

133.3.108 kODAttributeTypeMetaAutomountMap as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to query for kODRecordTypeAutomount entries associated with a specific kODRecordTypeAutomountMap.

133.3.109 kODAttributeTypeMetaNodeLocation as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Meta attribute returning registered node name by directory node plugin.

133.3.110 kODAttributeTypeMetaRecordName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Native record name, e.g. LDAP DN

133.3.111 kODAttributeTypeMiddleName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for the middle name of user or person record.

133.3.112 kODAttributeTypeMIME as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Data contained in this attribute type is a fully qualified MIME Type.

133.3.113 kODAttributeTypeMobileNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents the mobile numbers of a user or person.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

133.3.114 kODAttributeTypeModificationTimestamp as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute showing date/time of record modification.
Format is x.208 standard YYYYMMDDHHMMSSZ which is required as GMT time.

133.3.115 kODAttributeTypeNamePrefix as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents the title prefix of a user or person. ie. Mr., Ms., Mrs., Dr., etc.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

133.3.116 kODAttributeTypeNameSuffix as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents the name suffix of a user or person.
i.e., Jr., Sr., etc.

Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

133.3.117 kODAttributeTypeNativeOnly as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used in requesting all native attribute types in a search.

133.3.118 kODAttributeTypeNestedGroups as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type in group records for the list of GUID values for nested groups.

133.3.119 kODAttributeTypeNetGroups as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute type that indicates which netgroups its record is a member of.
Found in user and host records.

133.3.120 kODAttributeTypeNetGroupTriplet as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute that defines the host, user and domain triplet combinations to support NetGroups. Each attribute value is comma separated string to maintain the triplet (e.g., host,user,domain).

133.3.121 kODAttributeTypeNetworkInterfaces as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.

133.3.122 kODAttributeTypeNetworkNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute that defines a network number. Usually found in network records (kODRecordTypeNetworks)

133.3.123 kODAttributeTypeNFSHomeDirectory as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Defines a user's home directory mount point on the local machine.

133.3.124 kODAttributeTypeNickName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents the nickname of a user or person.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

133.3.125 kODAttributeTypeNodeOptions as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Any extended options supported by the node during creation

133.3.126 kODAttributeTypeNodePath as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type in Neighborhood records describing the DS Node to search while looking up aliases in this neighborhood.

133.3.127 kODAttributeTypeNodeRefCount as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Node reference count for a process.

133.3.128 kODAttributeTypeNodeRefs as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: All the node references for a process.

133.3.129 kODAttributeTypeNodeSASLRealm as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Contains the SASL realm associated with this node (if any)

133.3.130 kODAttributeTypeNote as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Note attribute.

133.3.131 kODAttributeTypeNTDomainComputerAccount as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Supports Kerberized SMB Server services.

133.3.132 kODAttributeTypeNumTableList as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Summary of the reference table entries presented as attribute values from the Configure node.

133.3.133 kODAttributeTypeOperatingSystem as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Returns the operating system type where the daemon is running, e.g., Mac OS X or Mac OS X Server

133.3.134 kODAttributeTypeOperatingSystemVersion as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Returns the operating system version where the daemon is running, e.g., 10.6

133.3.135 kODAttributeTypeOrganizationInfo as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Usually the organization info of a user.

133.3.136 kODAttributeTypeOrganizationName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Usually the organization of a user.

133.3.137 kODAttributeTypeOriginalHomeDirectory as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Home directory URL used in local account caching.

133.3.138 kODAttributeTypeOriginalNFSHomeDirectory as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: NFS home directory used in local account caching.

133.3.139 kODAttributeTypeOriginalNodeName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Nodename used in local account caching.

133.3.140 kODAttributeTypeOwner as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute type for the owner of a record.
Typically the value is a LDAP distinguished name.

133.3.141 kODAttributeTypeOwnerGUID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute type for the owner GUID of a group.
Found in group records (kODRecordTypeGroups).

133.3.142 kODAttributeTypePagerNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents the pager numbers of a user or person.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

133.3.143 kODAttributeTypeParentLocales as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.

133.3.144 kODAttributeTypePassword as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Holds the password or credential value.

133.3.145 kODAttributeTypePasswordPlus as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Holds marker data to indicate possible authentication redirection.

133.3.146 kODAttributeTypePasswordPolicyOptions as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Collection of password policy options in single attribute.
Used in user presets record.

133.3.147 kODAttributeTypePasswordServerList as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the attribute for storing the password server's replication information.

133.3.148 kODAttributeTypePasswordServerLocation as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Specifies the IP address or domain name of the Password Server associated with a given directory node. Found in a config record named PasswordServer.

133.3.149 kODAttributeTypePGPPublicKey as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Pretty Good Privacy public encryption key.

133.3.150 kODAttributeTypePhoneContacts as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

attribute that defines a record's custom phone numbers.
found in user or people records.
Example: home fax:408-555-4444

133.3.151 kODAttributeTypePhoneNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Telephone number of a user.

133.3.152 kODAttributeTypePicture as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents the path of the picture for each user displayed in the login window.
Found in user records (kODRecordTypeUsers).

133.3.153 kODAttributeTypePIDValue as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: PID value.

133.3.154 kODAttributeTypePluginIndex as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Plugin index for reference.

133.3.155 kODAttributeTypePlugInInfo as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Information (version, signature, about, credits, etc.) about the plug-in that is actually servicing a particular directory node.
Has never been supported.

133.3.156 kODAttributeTypePort as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents the port number a service is available on.
Typically found in service record types including kODRecordTypeAFPServer, kODRecordTypeLDAPServer, and kODRecordTypeWebServer.

133.3.157 kODAttributeTypePostalAddress as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: The postal address usually excluding postal code.

133.3.158 kODAttributeTypePostalAddressContacts as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

attribute that defines a record's alternate postal addresses.
Found in user records (kODRecordTypeUsers) and resource records (kODRecordTypeResources).

133.3.159 kODAttributeTypePostalCode as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: The postal code such as zip code in the USA.

133.3.160 kODAttributeTypePresetUserIsAdmin as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Flag to indicate whether users created from this preset are administrators by default. Found in kODRecordTypePresetUsers records.

133.3.161 kODAttributeTypePrimaryComputerGUID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

An attribute that defines a primary computer of the computer group.
Added to computer group record type (kODRecordTypeComputerGroups)

133.3.162 kODAttributeTypePrimaryComputerList as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: The GUID of the computer list with which this computer record is associated.

133.3.163 kODAttributeTypePrimaryGroupID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: This is the 32 bit unique ID that represents the primary group a user is part of, or the ID of a group. Format is a signed 32 bit integer represented as a string.

133.3.164 kODAttributeTypePrimaryLocale as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.

133.3.165 kODAttributeTypePrimaryNTDomain as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Supports Kerberized SMB Server services.

133.3.166 kODAttributeTypePrinter1284DeviceID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute that defines the IEEE 1284 DeviceID of a printer.
This is used when configuring a printer.

133.3.167 kODAttributeTypePrinterLPRHost as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Standard attribute type for kODRecordTypePrinters.

133.3.168 kODAttributeTypePrinterLPRQueue as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Standard attribute type for kODRecordTypePrinters.

133.3.169 kODAttributeTypePrinterMakeAndModel as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute for definition of the Printer Make and Model. An example value would be "HP LaserJet 2200". This would be used to determine the proper PPD file to be used when configuring a printer from the Directory. This attribute is based on the IPP Printing Specification RFC and IETF IPP-LDAP Printer Record.

133.3.170 kODAttributeTypePrinterType as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Standard attribute type for kODRecordTypePrinters.

133.3.171 kODAttributeTypePrinterURI as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute that defines the URI of a printer "ipp://address" or "smb://server/queue". This is used when configuring a printer. This attribute is based on the IPP Printing Specification RFC and IETF IPP-LDAP Printer Record.

133.3.172 kODAttributeTypePrinterXRISupported as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

attribute that defines additional URIs supported by a printer.
This is used when configuring a printer. This attribute is based on the IPP Printing Specification RFC and IETF IPP-LDAP Printer Record.

133.3.173 kODAttributeTypePrintServiceInfoText as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Standard attribute type for kODRecordTypePrinters.

133.3.174 kODAttributeTypePrintServiceInfoXML as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Standard attribute type for kODRecordTypePrinters.

133.3.175 kODAttributeTypePrintServiceUserData as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute for print quota configuration or statistics (XML data).
Found in user records (kODRecordTypeUsers) or print service statistics records (kODRecordTypePrintServiceUser).

133.3.176 kODAttributeTypeProcessName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Process Name.

133.3.177 kODAttributeTypeProfiles as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Profiles associated with the record.

133.3.178 kODAttributeTypeProfilesTimestamp as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Timestamp for the profiles associated with the record.

133.3.179 kODAttributeTypeProtocolNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute that defines a protocol number. Usually found in protocol records (kODRecordTypeProtocols)

133.3.180 kODAttributeTypeProtocols as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of protocols.

133.3.181 kODAttributeTypePwdAgingPolicy as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Contains the password aging policy data for an authentication capable record.

133.3.182 kODAttributeTypeReadOnlyNode as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Can be found using dsGetDirNodeInfo and will return one of
ReadOnly, ReadWrite, or WriteOnly strings.
Note that ReadWrite does not imply fully readable or writable

133.3.183 kODAttributeTypeRealUserID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used by Managed Client

133.3.184 kODAttributeTypeRecordName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of names/keys for this record.

133.3.185 kODAttributeTypeRecordType as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute for a Record or a Directory Node.

133.3.186 kODAttributeTypeRecRefCount as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Record reference count for a process.

133.3.187 kODAttributeTypeRecRefs as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: All the record references for a process.

133.3.188 kODAttributeTypeRelationships as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

attribute that defines the relationship to the record type.
found in user records (kODRecordTypeUsers).
Example: brother:John

133.3.189 kODAttributeTypeRelativeDNPrefix as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to map the first native LDAP attribute type required in the building of the Relative Distinguished Name for LDAP record creation.

133.3.190 kODAttributeTypeResourceInfo as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: attribute that defines a resource record's info.

133.3.191 kODAttributeTypeResourceType as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute type for the kind of resource.
found in resource records (kODRecordTypeResources).

Example: ConferenceRoom

133.3.192 kODAttributeTypeRPCNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute that defines an RPC number. Usually found in RPC records (kODRecordTypeRPC)

133.3.193 kODAttributeTypeSchema as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of attribute types.

133.3.194 kODAttributeTypeSearchPath as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Search path used by the search node.

133.3.195 kODAttributeTypeSearchPolicy as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Search policy for the search node.

133.3.196 kODAttributeTypeServicesLocator as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: the URI for a record's calendar

133.3.197 kODAttributeTypeServiceType as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the service type for the service. This is the raw service type of the service. For example a service record type of kODRecordTypeWebServer might have a service type of "http" or "https".

133.3.198 kODAttributeTypeSetupAdvertising as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for Setup Assistant automatic population.

133.3.199 kODAttributeTypeSetupAutoRegister as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for Setup Assistant automatic population.

133.3.200 kODAttributeTypeSetupLocation as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for Setup Assistant automatic population.

133.3.201 kODAttributeTypeSetupOccupation as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for Setup Assistant automatic population.

133.3.202 kODAttributeTypeSMBAcctFlags as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Account control flag.

133.3.203 kODAttributeTypeSMBGroupRID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Constant for supporting PDC SMB interaction with DirectoryService.

133.3.204 kODAttributeTypeSMBHome as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: UNC address of Windows homedirectory mount point (\server\sharepoint).

133.3.205 kODAttributeTypeSMBHomeDrive as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Drive letter for homedirectory mount point.

133.3.206 kODAttributeTypeSMBKickoffTime as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute in support of SMB interaction.

133.3.207 kODAttributeTypeSMBLogoffTime as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute in support of SMB interaction.

133.3.208 kODAttributeTypeSMBLogonTime as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: SMB Primary Group Security ID, stored as a string attribute of up to 64 bytes. Found in user, group, and computer records (kODRecordTypeUsers, kODRecordTypeGroups, kODRecordTypeComputers).

133.3.209 kODAttributeTypeSMBPrimaryGroupSID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.

133.3.210 kODAttributeTypeSMBProfilePath as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Desktop management info (dock, desktop links, etc).

133.3.211 kODAttributeTypeSMBPWDLastSet as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute in support of SMB interaction.

133.3.212 kODAttributeTypeSMBRID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute in support of SMB interaction.

133.3.213 kODAttributeTypeSMBScriptPath as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Login script path.

133.3.214 kODAttributeTypeSMBSID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

SMB Security ID, stored as a string attribute of up to 64 bytes.
Found in user, group, and computer records (kODRecordTypeUsers, kODRecordTypeGroups, kODRecordTypeComputers).

133.3.215 kODAttributeTypeSMBUserWorkstations as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of workstations user can login from (machine account names).

133.3.216 kODAttributeTypeStandardOnly as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used in requesting all standard attribute types in a query.

133.3.217 kODAttributeTypeState as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: The state or province of a country.

133.3.218 kODAttributeTypeStreet as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Represents the street address of a user or person.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

133.3.219 kODAttributeTypeSubNodes as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute of a node which lists the available subnodes of that node.

133.3.220 kODAttributeTypeTimePackage as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Data of Create, Modify, Backup time in UTC.

133.3.221 kODAttributeTypeTimeToLive as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute recommending how long to cache the record's attribute values.
Format is an unsigned 32 bit representing seconds. ie. 300 is 5 minutes.

133.3.222 kODAttributeTypeTotalRefCount as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Total count of references for a process.

133.3.223 kODAttributeTypeTotalSize as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: checksum/meta data.

133.3.224 kODAttributeTypeTrustInformation as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to describe a node's trust information.

133.3.225 kODAttributeTypeUniqueID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

This is the 32 bit unique ID that represents the user in the legacy manner.
Format is a signed integer represented as a string.

133.3.226 kODAttributeTypeURL as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of URLs.

133.3.227 kODAttributeTypeUserCertificate as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute containing the binary of the user's certificate.
Usually found in user records. The certificate is data which identifies a user.
This data is attested to by a known party, and can be independently verified by a third party.

133.3.228 kODAttributeTypeUserPKCS12Data as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute containing binary data in PKCS # 12 format.
Usually found in user records. The value can contain keys, certificates, and other related information and is encrypted with a passphrase.

133.3.229 kODAttributeTypeUserShell as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to represent the user's shell setting.

133.3.230 kODAttributeTypeUserSMIMECertificate as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

Attribute containing the binary of the user's SMIME certificate.
Usually found in user records. The certificate is data which identifies a user.
This data is attested to by a known party, and can be independently verified by a third party. SMIME certificates are often used for signed or encrypted emails.

133.3.231 kODAttributeTypeVersion as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Version label.

133.3.232 kODAttributeTypeVFSDumpFreq as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.

Notes: Attribute used to support mount records.

133.3.233 kODAttributeTypeVFSLinkDir as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute used to support mount records.

133.3.234 kODAttributeTypeVFSOpts as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used in support of mount records.

133.3.235 kODAttributeTypeVFSPassNo as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute used to support mount records.

133.3.236 kODAttributeTypeVFSType as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute used to support mount records.

133.3.237 kODAttributeTypeWeblogURI as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes:

attribute that defines the URI of a user's weblog.
Usually found in user records (kODRecordTypeUsers).

Example: http://example.com/blog/jsmith

133.3.238 kODAttributeTypeXMLPlist as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: XML plist used.

133.3.239 kODRecordTypeAFPServer as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record type of AFP server records.

133.3.240 kODRecordTypeAliases as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Used to represent alias records.

133.3.241 kODRecordTypeAttributeTypes as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies records that represent each possible attribute type.

133.3.242 kODRecordTypeAugments as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Used to store augmented record data.

133.3.243 kODRecordTypeAutomount as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Used to store automount record data.

133.3.244 kODRecordTypeAutomountMap as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Used to store automountMap record data.

133.3.245 kODRecordTypeAutoServerSetup as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Used to discover automated server setup information.

133.3.246 kODRecordTypeBootp as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record in the local node for storing bootp info.

133.3.247 kODRecordTypeCertificateAuthorities as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record type that contains certificate authority informatio

133.3.248 kODRecordTypeComputerGroups as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies computer group records.

133.3.249 kODRecordTypeComputerLists as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies computer list records.

133.3.250 kODRecordTypeComputers as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies computer records.

133.3.251 kODRecordTypeConfiguration as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies configuration records.

133.3.252 kODRecordTypeEthernets as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record in the node for storing ethernets.

133.3.253 kODRecordTypeFileMakerServers as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: FileMaker servers record type that describes available FileMaker servers, used for service discovery.

133.3.254 kODRecordTypeFTPServer as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies ftp server records.

133.3.255 kODRecordTypeGroups as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies group records.

133.3.256 kODRecordTypeHosts as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies host records.

133.3.257 kODRecordTypeHostServices as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record in the local node for storing host services.

133.3.258 kODRecordTypeLDAPServer as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies LDAP server records.

133.3.259 kODRecordTypeLocations as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Location record type.

133.3.260 kODRecordTypeMounts as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies mount records.

133.3.261 kODRecordTypeNetDomains as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record in the local node for storing net domains.

133.3.262 kODRecordTypeNetGroups as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record in the local node for storing net groups.

133.3.263 kODRecordTypeNetworks as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies network records.

133.3.264 kODRecordTypeNFS as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies NFS records.

133.3.265 kODRecordTypePeople as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record type that contains "People" records used for contact information.

133.3.266 kODRecordTypePresetComputerGroups as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: The computer group record type used for presets in record creation.

133.3.267 kODRecordTypePresetComputerLists as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: The computer list record type used for presets in record creation.

133.3.268 kODRecordTypePresetComputers as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: The computer record type used for presets in record creation.

133.3.269 kODRecordTypePresetGroups as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: The group record type used for presets in record creation.

133.3.270 kODRecordTypePresetUsers as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: The user record type used for presets in record creation.

133.3.271 kODRecordTypePrinters as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies printer records.

133.3.272 kODRecordTypePrintService as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies print service records.

133.3.273 kODRecordTypePrintServiceUser as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record in the local node for storing quota usage for a user.

133.3.274 kODRecordTypeProtocols as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies protocol records.

133.3.275 kODRecordTypeQTSServer as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies quicktime streaming server records.

133.3.276 kODRecordTypeQueryInformation as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Specifically to return query information inline such as skipped nodes

133.3.277 kODRecordTypeRecordTypes as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies records that represent each possible record type.

133.3.278 kODRecordTypeResources as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies resources used in group services.

133.3.279 kODRecordTypeRPC as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies remote procedure call records.

133.3.280 kODRecordTypeServer as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies generic server records.

133.3.281 kODRecordTypeServices as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies directory based service records.

133.3.282 kODRecordTypeSharePoints as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Share point record type.

133.3.283 kODRecordTypeSMBServer as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies SMB server records.

133.3.284 kODRecordTypeUsers as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies user records.

133.3.285 kODRecordTypeWebServer as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies web server records.

133.3.286 recordDetails(byref error as NSErrorMBS) as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a dictionary of attributes with their respective values.
Notes:

Error: An error reference for error details.

Returns a dictionary of the attributes in inAttributes with their respective values.

133.3.287 recordDetailsForAttributes(inAttributes() as string, byref error as NSErrorMBS) as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a dictionary of attributes with their respective values.
Notes:

inAttributes: An array of attributes. Can be nil.
Error: An error reference for error details.

Returns a dictionary of the attributes in inAttributes with their respective values.

If inAttributes is nil, all currently retrieved attributes are returned.

133.3.288 synchronize(byref error as NSErrorMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Synchronizes the record from the directory to get current data and commit changes.
Notes:

Returns true if the record successfully synchronizes; otherwise, false.

This method only fetches those attributes that have been fetched before.

133.3.289 valuesForAttribute(inAttribute as String, byref error as NSErrorMBS) as Variant()

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the values of an attribute of the record.
Notes:

inAttribute: The attribute.
Error: An error reference for error details. Can be nil.

Returns an array of attribute values. Elements are of type String or MemoryBlock.

133.3.290 Properties

133.3.291 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

133.3.292 recordName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The official name of the record.
Notes: (Read only property)

133.3.293 recordType as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The record's type.
Notes: (Read only property)

133.4 class ODSessionMBS

133.4.1 class ODSessionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for an Open Directory session.

133.4.6 Methods

133.4.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: gets default session.

133.4.8 defaultSession as ODSessionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a shared instance of the local session.

133.4.9 nodeNames(byref error as NSErrorMBS) as String()

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the node names that are registered with this session.

133.4.10 ODSessionProxyAddress as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the options dictionary.
Notes: The address to connect to via proxy. The value is of type string.

133.4.11 ODSessionProxyPassword as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the options dictionary.
Notes: The password to connect with via proxy. The value is of type string.

133.4.12 ODSessionProxyPort as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the options dictionary.
Notes: The port to connect to via proxy. The value is of type integer.

133.4.13 ODSessionProxyUsername as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the options dictionary.
Notes: The username to connect with via proxy. The value is of type string.

133.4.14 session(options as dictionary, byref Error as NSErrorMBS) as ODSessionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a session object directed over proxy to another host.
Notes:

Options: A dictionary of options to associate with the session. Can be nil.
Error: An error reference for error details. Can be nil.

Returns the initialized session object.

133.4.15 UserName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries user name.
Notes: Convenience function to query user name of current user.

133.4.16 Properties

133.4.17 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

Chapter 134

OpenCL

134.1 class CLCommandQueueMBS

134.1.1 class CLCommandQueueMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The class for an OpenCL command queue.
Example:

```
dim devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeGPU)
dim device as CLDeviceMBS = devices(0) // we use first one

// Create a context
dim context as new CLContextMBS(device, CLContextMBS.kErrorModeLogMessagesToSystemLog)

// Create a command queue
dim queue as new CLCommandQueueMBS(context, device, 0)
```

134.1.2 Blog Entries

- OpenCL support in our plugins

134.1.3 Blog Entries

- OpenCL support in our plugins

134.1.4 Methods

134.1.5 Constructor(context as CLContextMBS, device as CLDeviceMBS, flags as Integer = 0)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Create a command-queue on a specific device.
Example:

```
dim devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeGPU)
dim device as CLDeviceMBS = devices(0) // we use first one

// Create a context
dim context as new CLContextMBS(device, CLContextMBS.kErrorModeLogMessagesToSystemLog)

// Create a command queue
dim queue as new CLCommandQueueMBS(context, device, 0)
```

Notes:

context: Must be a valid OpenCL context.
device: Must be a device associated with context. It can either be in the list of devices specified when context is created using CLContextMBS Constructor or have the same device type as the device type specified when the context is created.
flags: Specifies a list of properties for the command-queue. This is a bit-field. Only command-queue properties specified in the table below can be set in properties; otherwise the value specified in properties is considered to be not valid.

Command-Queue Properties	Description
kQueueOutOfOrderExecModeEnable	Determines whether the commands queued in the command-queue are executed in-order or out-of-order. If set, the commands in the command-queue are executed out-of-order. Otherwise, commands are executed in-order.
kQueueProfilingEnable	Enable or disable profiling of commands in the command-queue. If set, the profiling of commands is enabled. Otherwise profiling of commands is disabled. See clGetEventProfilingInfo for more information.

The OpenCL functions that are submitted to a command-queue are enqueued in the order the calls are made but can be configured to execute in-order or out-of-order. The properties argument in clCreateCommandQueue can be used to specify the execution order.

If the kQueueOutOfOrderExecModeEnable property of a command-queue is not set, the commands enqueued to a command-queue execute in order. For example, if an application calls EnqueueNDRangeKernel to execute kernel A followed by a EnqueueNDRangeKernel to execute kernel B, the application can assume that kernel A finishes first and then kernel B is executed. If the memory objects output by kernel A are

inputs to kernel B then kernel B will see the correct data in memory objects produced by execution of kernel A. If the kQueueOutOfOrderExecModeEnable property of a commandqueue is set, then there is no guarantee that kernel A will finish before kernel B starts execution.

Applications can configure the commands enqueued to a command-queue to execute out-of-order by setting the kQueueOutOfOrderExecModeEnable property of the command-queue. This can be specified when the command-queue is created or can be changed dynamically using this Constructor. In out-of-order execution mode there is no guarantee that the enqueued commands will finish execution in the order they were queued. As there is no guarantee that kernels will be executed in order, i.e. based on when the EnqueueNDRangeKernel calls are made within a command-queue, it is therefore possible that an earlier EnqueueNDRangeKernel call to execute kernel A identified by event A may execute and/or finish later than a EnqueueNDRangeKernel call to execute kernel B which was called by the application at a later point in time. To guarantee a specific order of execution of kernels, a wait on a particular event (in this case event A) can be used. The wait for event A can be specified in the event_wait_list argument to EnqueueNDRangeKernel for kernel B.

In addition, a wait for events or a barrier command can be enqueued to the command-queue. The wait for events command ensures that previously enqueued commands identified by the list of events to wait for have finished before the next batch of commands is executed. The barrier command ensures that all previously enqueued commands in a command-queue have finished execution before the next batch of commands is executed.

Similarly, commands to read, write, copy or map memory objects that are enqueued after EnqueueNDRangeKernel, EnqueueTask or EnqueueNativeKernel commands are not guaranteed to wait for kernels scheduled for execution to have completed (if the kQueueOutOfOrderExecModeEnable property is set). To ensure correct ordering of commands, the event object returned by EnqueueNDRangeKernel, EnqueueTask or EnqueueNativeKernel can be used to enqueue a wait for event or a barrier command can be enqueued that must complete before reads or writes to the memory object(s) occur.

Lasterror is set.

134.1.6 Context as CLContextMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the context specified when the command-queue is created.
Notes: Lasterror is set.

134.1.7 Device as CLDeviceMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the device specified when the command-queue is created.

Notes: Lasterror is set.

134.1.8 EnqueueBarrier

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: A synchronization point that enqueues a barrier operation.
Notes:

EnqueueBarrier is a synchronization point that ensures that all queued commands in command_queue have finished execution before the next batch of commands can begin execution.

Lasterror is set.

134.1.9 EnqueueCopyBuffer(sourceBuffer as CLMemMBS, destBuffer as CLMemMBS, sourceOffset as Integer, destOffset as Integer, size as Integer)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to copy a buffer object to another buffer object.
Notes:

sourceBuffer: the source memory object.
destBuffer: the destination memory object.
sourceOffset: The offset where to begin copying data from sourceBuffer.
destOffset: The offset where to begin copying data into destBuffer.
size: Refers to the size in bytes to copy.
EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in event_wait_list act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.
outEvent: Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.
Lasterror is set.

- 134.1.10 EnqueueCopyBuffer(sourceBuffer as CLMemMBS, destBuffer as CLMemMBS, sourceOffset as Integer, destOffset as Integer, size as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

134.1.10 EnqueueCopyBuffer(sourceBuffer as CLMemMBS, destBuffer as CLMemMBS, sourceOffset as Integer, destOffset as Integer, size as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to copy a buffer object to another buffer object.
Notes:

sourceBuffer: the source memory object.
destBuffer: the destination memory object.
sourceOffset: The offset where to begin copying data from sourceBuffer.
destOffset: The offset where to begin copying data into destBuffer.
size: Refers to the size in bytes to copy.
EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in event_wait_list act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.
outEvent: Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.
Lasterror is set.

- 134.1.9 EnqueueCopyBuffer(sourceBuffer as CLMemMBS, destBuffer as CLMemMBS, sourceOffset as Integer, destOffset as Integer, size as Integer) 21176

134.1.11 EnqueueCopyBufferToImage(SourceBuffer as CLMemMBS, destImage as CLMemMBS, sourceOffset as Integer, destOriginX as Integer, destOriginY as Integer, destOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to copy a buffer object to an image object.
Notes:

SourceBuffer: A valid buffer object.
destImage: A valid image object.

sourceOffset: The offset where to begin copying data from SourceBuffer.

destOrigin: The (x, y, z) offset in pixels where to begin copying data to destImage. If destImage is a 2D image object, the z value given by destOriginZ must be 0.

region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle to copy. If destImage is a 2D image object, the depth value given by RegionDepth must be 1.

The size in bytes of the region to be copied from SourceBuffer referred to as src_cb is computed as width * height * depth * bytes/image element if destImage is a 3D image object and is computed as width * height * bytes/image element if destImage is a 2D image object.

EventWaitList: Optionally, Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Optional. Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.

Lasterror is set.
See also:

- 134.1.12 EnqueueCopyBufferToImage(SourceBuffer as CLMemMBS, destImage as CLMemMBS, sourceOffset as Integer, destOriginX as Integer, destOriginY as Integer, destOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS) 21178

134.1.12 EnqueueCopyBufferToImage(SourceBuffer as CLMemMBS, destImage as CLMemMBS, sourceOffset as Integer, destOriginX as Integer, destOriginY as Integer, destOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to copy a buffer object to an image object.
Notes:

SourceBuffer: A valid buffer object.
destImage: A valid image object.

sourceOffset: The offset where to begin copying data from SourceBuffer.

destOrigin: The (x, y, z) offset in pixels where to begin copying data to destImage. If destImage is a 2D image object, the z value given by destOriginZ must be 0.

region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle to copy. If destImage is a 2D image object, the depth value given by RegionDepth must be 1.

The size in bytes of the region to be copied from SourceBuffer referred to as src_cb is computed as width * height * depth * bytes/image element if destImage is a 3D image object and is computed as width * height * bytes/image element if destImage is a 2D image object.

EventWaitList: Optionally, Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Optional. Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.

Lasterror is set.
See also:

- 134.1.11 EnqueueCopyBufferToImage(SourceBuffer as CLMemMBS, destImage as CLMemMBS, sourceOffset as Integer, destOriginX as Integer, destOriginY as Integer, destOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer) 21177

134.1.13 EnqueueCopyImage(sourceImage as CLMemMBS, destImage as CLMemMBS, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, destOriginX as Integer, destOriginY as Integer, destOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to copy image objects.
Notes:

sourceImage: Source image.
destImage: Dest image.

sourceOrigin: Defines the starting (x, y, z) location in pixels in src_image from where to start the data copy. If src_image is a 2D image object, the z value given by sourceOriginZ must be 0.

sourceOrigin: Defines the starting (x, y, z) location in pixels in dst_image from where to start the data copy. If dst_image is a 2D image object, the z value given by sourceOriginZ must be 0.

region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle to copy. If src_image or dst_image is a 2D image object, the depth value given by RegionDepth must be 1.

EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. The events specified in EventWaitList act as synchronization points. The context associated with

events in EventWaitList and CommandQueue must be the same.

outEvent: Optional, Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.

It is currently a requirement that the sourceImage and destImage image memory objects for EnqueueCopyImage must have the exact same image format (i.e. the cl_image_format descriptor specified when sourceImage and destImage are created must match).

sourceImage and destImage can be 2D or 3D image objects allowing us to perform the following actions:

- Copy a 2D image object to a 2D image object.
- Copy a 2D image object to a 2D slice of a 3D image object.
- Copy a 2D slice of a 3D image object to a 2D image object.
- Copy a 3D image object to a 3D image object.

Lasterror is set.

- 134.1.16 EnqueueCopyImageToBuffer(sourceImage as CLMemMBS, destBuffer as CLMemMBS, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, destOffset as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS) 21182

134.1.16 EnqueueCopyImageToBuffer(sourceImage as CLMemMBS, destBuffer as CLMemMBS, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, destOffset as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to copy an image object to a buffer object.
Notes:

sourceImage: A valid image object.
destBuffer: A valid buffer object.

sourceOrigin: Defines the (x, y, z) offset in pixels in the image from where to copy. If sourceImage is a 2D image object, the z value given by sourceOriginZ must be 0.

region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle to copy. If sourceImage is a 2D image object, the depth value given by RegionDepth must be 1.

destOffset: The offset where to begin copying data into destBuffer. The size in bytes of the region to be copied referred to as dst_cb is computed as width * height * depth * bytes/image element if sourceImage is a 3D image object and is computed as width * height * bytes/image element if sourceImage is a 2D image object.

EventWaitList: Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.

Lasterror is set.

- 134.1.15 EnqueueCopyImageToBuffer(sourceImage as CLMemMBS, destBuffer as CLMemMBS, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, destOffset as Integer) 21181

134.1.17 EnqueueMapBuffer(buffer as CLMemMBS, BlockingMap as boolean, MapFlags as Integer, offset as Integer, size as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS) as memoryblock

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to map a region of the buffer object given by buffer into the host address space and returns a pointer to this mapped region.
Notes:

BlockingMap: Optional, Indicates if the map operation is blocking or non-blocking. If BlockingMap is true, EnqueueMapBuffer does not return until the specified region in buffer can be mapped. If BlockingMap is false i.e. map operation is non-blocking, the pointer to the mapped region returned by clEnqueueMapBuffer cannot be used until the map command has completed. The event argument returns an event object which can be used to query the execution status of the map command. When the map command is completed, the application can access the contents of the mapped region using the pointer returned by EnqueueMapBuffer.
MapFlags: Is a bit-field and can be set to kMapRead to indicate that the region specified by (offset, size) in the buffer object is being mapped for reading, and/or kMapWrite to indicate that the region specified by (offset, size) in the buffer object is being mapped for writing.

buffer: A valid buffer object. The OpenCL context associated with CLCommandQueueMBS and buffer must be the same.
offset, size: The offset in bytes and the size of the region in the buffer object that is being mapped.
EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. The events specified in EventWaitList act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.
outEvent: Returns an event object that identifies this particular copy command and can be used toquery or queue a wait for this particular command to complete.

Lasterror is set.

The contents of the regions of a memory object mapped for writing (i.e. kMapWrite is set in map_flags argument to EnqueueMapBuffer or EnqueueMapImage) are considered to be undefined until this region is unmapped. Reads and writes by a kernel executing on a device to a memory region(s) mapped for writing are undefined.

Multiple command-queues can map a region or overlapping regions of a memory object for reading (i.e. MapFlags = kMapRead). The contents of the regions of a memory object mapped for reading can also be read by kernels executing on a device(s). The behavior of writes by a kernel executing on a device to a mapped region of a memory object is undefined. Mapping (and unmapping) overlapped regions of a buffer or image memory object for writing is undefined.

The behavior of OpenCL function calls that enqueue commands that write or copy to regions of a memory object that are mapped is undefined.

Lasterror is set.

134.1.18 EnqueueMapBuffer(buffer as CLMemMBS, MapFlags as Integer, offset as Integer, size as Integer) as memoryblock

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to map a region of the buffer object given by buffer into the host address space and returns a pointer to this mapped region.
Notes:

BlockingMap: Optional, Indicates if the map operation is blocking or non-blocking. If BlockingMap is true, EnqueueMapBuffer does not return until the specified region in buffer can be mapped. If BlockingMap is false i.e. map operation is non-blocking, the pointer to the mapped region returned by clEnqueueMapBuffer cannot be used until the map command has completed. The event argument returns an event object which can be used to query the execution status of the map command. When the map command is completed, the

application can access the contents of the mapped region using the pointer returned by EnqueueMapBuffer.
MapFlags: Is a bit-field and can be set to kMapRead to indicate that the region specified by (offset, size) in the buffer object is being mapped for reading, and/or kMapWrite to indicate that the region specified by (offset, size) in the buffer object is being mapped for writing.
buffer: A valid buffer object. The OpenCL context associated with CLCommandQueueMBS and buffer must be the same.
offset, size: The offset in bytes and the size of the region in the buffer object that is being mapped.
EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. The events specified in EventWaitList act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.
outEvent: Returns an event object that identifies this particular copy command and can be used toquery or queue a wait for this particular command to complete.

Lasterror is set.

The contents of the regions of a memory object mapped for writing (i.e. kMapWrite is set in map_flags argument to EnqueueMapBuffer or EnqueueMapImage) are considered to be undefined until this region is unmapped. Reads and writes by a kernel executing on a device to a memory region(s) mapped for writing are undefined.

Multiple command-queues can map a region or overlapping regions of a memory object for reading (i.e. MapFlags = kMapRead). The contents of the regions of a memory object mapped for reading can also be read by kernels executing on a device(s). The behavior of writes by a kernel executing on a device to a mapped region of a memory object is undefined. - 134.1.17 EnqueueMapBuffer(buffer as CLMemMBS, BlockingMap as boolean, MapFlags as Integer, offset as Integer, size as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS) as memoryblock 21183

134.1.19 EnqueueMapImage(image as CLMemMBS, BlockingMap as boolean, MapFlags as Integer, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, byref RowPitch as Integer, byref SlicePitch as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS) as memoryblock

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to map a region of an image object into the host address space and returns a pointer to this mapped region.
Notes:

image: A valid image object. The OpenCL context associated with CLCommandQueueMBS and image must be the same.

BlockingMap: Optional, Indicates if the map operation is blocking or non-blocking. If BlockingMap is true, EnqueueMapImage does not return until the specified region in image can be mapped. If BlockingMap is false i.e. map operation is non-blocking, the pointer to the mapped region returned by EnqueueMapImage cannot be used until the map command has completed. The event argument returns an event object which can be used to query the execution status of the map command. When the map command is completed, the application can access the contents of the mapped region using the pointer returned by EnqueueMapImage.

MapFlags: Is a bit-field and can be set to kMapRead to indicate that the region specified by (origin, region) in the image object is being mapped for reading, and/or kMapWrite to indicate that the region specified by (origin, region) in the image object is being mapped for writing.
origin, region: Define the (x, y, z) offset in pixels and (width, height, depth) in pixels of the 2D or 3D rectangle region that is to be mapped. If image is a 2D image object, the z value given by originZ must be 0 and the depth value given by regionDepth must be 1.

RowPitch: Returns the scan-line pitch in bytes for the mapped region. This must be a non-nil value.
SlicePitch: Returns the size in bytes of each 2D slice for the mapped region. For a 2D image, zero is returned if this argument is not nil. For a 3D image, image_slice_pitch must be a non-nil value.

EventWaitList: Optional, Specify events that need to complete before EnqueueMapImage can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and CLCommandQueueMBS must be the same.

outEvent: Optional, Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete. event can be nil in which case it will not be possible for the application to query the status of this command or queue a wait for this command to complete.

Lasterror is set.

If the buffer or image object is created with kMemoryUseHostPtr set in mem_flags, the following will be true:

The HostPtr specified in Constructor is guaranteed to contain the latest bits in the region being mapped when the EnqueueMapBuffer or EnqueueMapImage command has completed.
The pointer value returned by EnqueueMapBuffer or EnqueueMapImage will be derived from the HostPtr specified when the buffer or image object is created.
The contents of the regions of a memory object mapped for writing (i.e. kMapWrite is set in MapFlags argument to EnqueueMapBuffer or EnqueueMapImage) are considered to be undefined until this region is unmapped. Reads and writes by a kernel executing on a device to a memory region(s) mapped for writing are undefined.

Multiple command-queues can map a region or overlapping regions of a memory object for reading (i.e. MapFlags = kMapRead). The contents of the regions of a memory object mapped for reading can also be read by kernels executing on a device(s). The behavior of writes by a kernel executing on a device to a mapped region of a memory object is undefined. Mapping (and unmapping) overlapped regions of a buffer or image memory object for writing is undefined.

The behavior of OpenCL function calls that enqueue commands that write or copy to regions of a memory object that are mapped is undefined.

134.1.21 EnqueueMarker(byref outEvent as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a marker command.
Notes:

Enqueues a marker command to the command queue. The marker command returns an event which can be used to queue a wait on this marker event i.e. wait for all commands queued before the marker command to complete.

Lasterror is set.

134.1.22 EnqueueNativeKernel(FunctionPtr as ptr, args as memoryblock, argsSize as Integer, NumberOfMemoryObjects as Integer, MemList as memoryblock, ArgsMemoryLocations as memoryblock)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to execute a native C/C++ function not compiled using the OpenCL compiler.
Notes:

First a warning: Don't use this with Xojo methods. You can point to a function written in C which you made thread safe.

self: A valid command-queue. A native user function can only be executed on a command-queue created on a device that has kExceNativeKernel capability set in ExecutionCapabilities property.

FunctionPtr: A pointer to a host-callable user function.

args: A pointer to the args list that FunctionPtr should be called with.
argsSize: The size in bytes of the args list that args points to.

The data pointed to by args and argsSize bytes in size will be copied and a pointer to this copied region will be passed to FunctionPtr. The copy needs to be done because the memory objects (CLMemMBS.handle values) that args may contain need to be modified and replaced by appropriate pointers to global memory. When EnqueueNativeKernel returns, the memory region pointed to by args can be reused by the application.

NumberOfMemoryObjects: The number of buffer objects that are passed in args.

MemList: A list of valid buffer objects, if NumberOfMemoryObjects is greater than 0. The buffer object values specified in MemList are memory object handles (CLMemMBS.handle values) or nil.

ArgsMemoryLocations: A pointer to appropriate locations that args points to where memory object handles (CLMemMBS.handle values) are stored. Before the user function is executed, the memory object handles are replaced by pointers to global memory.

EventWaitList: Optionally, Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Optionally, Returns an event object that identifies this particular kernel execution instance.

The data pointed to by args and argsSize bytes in size will be copied and a pointer to this copied region will be passed to FunctionPtr. The copy needs to be done because the memory objects (CLMemMBS.handle values) that args may contain need to be modified and replaced by appropriate pointers to global memory. When EnqueueNativeKernel returns, the memory region pointed to by args can be reused by the application.

Lasterror is set.

21189

134.1.24 EnqueueNDRangeKernel(kernel as CLKernelMBS, GlobalWorkSize as Integer, LocalWorkSize as Integer)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to execute a kernel on a device.
Notes:

kernel: A valid kernel object. The OpenCL context associated with kernel and command_queue must be the same.
GlobalWorkSize: The number of global work-items.
LocalWorkSize: The number of work-items that make up a work-group (also referred to as the size of the work-group) that will execute the kernel specified by kernel.

The work-group size to be used for kernel can also be specified in the program source using the __attribute__((reqd_work_group_size(X, Y, Z)))qualifier. In this case the size of work group specified by local_work_size must match the value specified by the reqd_work_group_size __attribute__ qualifier.

EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.
outEvent: Optional, Returns an event object that identifies this particular kernel execution instance. Event objects are unique and can be used to identify a particular kernel execution instance later on.

Work-group instances are executed in parallel across multiple compute units or concurrently on the same compute unit.

Each work-item is uniquely identified by a global identifier. The global ID, which can be read inside the kernel, is computed using the value given by GlobalWorkSize and global_work_offset. In OpenCL 1.0, the starting global ID is always (0, 0, ... 0). In addition, a work-item is also identified within a work-group by a unique local ID. The local ID, which can also be read by the kernel, is computed using the value given by LocalWorkSize. The starting local ID is always (0, 0, ... 0).

Lasterror is set.

134.1.25 EnqueueNDRangeKernel(kernel as CLKernelMBS, GlobalWorkSize as Integer, LocalWorkSize as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to execute a kernel on a device.
Notes:

kernel: A valid kernel object. The OpenCL context associated with kernel and command_queue must be the same.
GlobalWorkSize: The number of global work-items.
LocalWorkSize: The number of work-items that make up a work-group (also referred to as the size of the work-group) that will execute the kernel specified by kernel.

The work-group size to be used for kernel can also be specified in the program source using the __attribute__((reqd_work_group_size(X, Y, Z)))qualifier. In this case the size of work group specified by local_work_size must match the value specified by the reqd_work_group_size __attribute__ qualifier.

EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.
outEvent: Optional, Returns an event object that identifies this particular kernel execution instance. Event objects are unique and can be used to identify a particular kernel execution instance later on.

Work-group instances are executed in parallel across multiple compute units or concurrently on the same compute unit.

Each work-item is uniquely identified by a global identifier. The global ID, which can be read inside the kernel, is computed using the value given by GlobalWorkSize and global_work_offset. In OpenCL 1.0, the starting global ID is always (0, 0, ... 0). In addition, a work-item is also identified within a work-group by a unique local ID. The local ID, which can also be read by the kernel, is computed using the value given by LocalWorkSize. The starting local ID is always (0, 0, ... 0).

Lasterror is set.

- 134.1.24 EnqueueNDRangeKernel(kernel as CLKernelMBS, GlobalWorkSize as Integer, LocalWorkSize as Integer) 21192

134.1.26 EnqueueReadBuffer(buffer as CLMemMBS, BlockingRead as boolean, offset as Integer, size as Integer, mem as Memoryblock, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueue commands to read from a buffer object to host memory.
Notes:

buffer: Refers to a valid buffer object.
BlockingRead: Optional, Indicates if the read operations are blocking or non-blocking. If BlockingRead is true i.e. the read command is blocking, clEnqueueReadBuffer does not return until the buffer data has been read and copied into memory pointed to by ptr.

If BlockingRead is false i.e. the read command is non-blocking, EnqueueReadBuffer queues a non-blocking read command and returns. The contents of the buffer that ptr points to cannot be used until the read command has completed. The event argument returns an event object which can be used to query the execution status of the read command. When the read command has completed, the contents of the buffer that ptr points to can be used by the application.

offset: The offset in bytes in the buffer object to read from.
size: The size in bytes of data being read.
mem: The pointer to buffer in host memory where data is to be read into.

EventWaitList: Optional, specifies events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and command_queue must be the same.

outEvent: Optional, Returns an event object that identifies this particular read command and can be used to query or queue a wait for this particular command to complete.

Calling EnqueueReadBuffer to read a region of the buffer object with the ptr argument value set to mem + offset, where mem is a pointer to the memory region specified when the buffer object being read is created with kMemoryUseHostPtr, must meet the following requirements in order to avoid undefined behavior:

All commands that use this buffer object have finished execution before the read command begins execution
The buffer object is not mapped
The buffer object is not used by any command-queue until the read command has finished execution

Lasterror is set.
