When CURL is built to use NSS or GnuTLS, there is no way to influence the use of CRL passed to help in the verification process. When libCURL is built with OpenSSL support, X509_V_FLAG_CRL_CHECK and X509_V_FLAG_CRL_CHECK_ALL are both set, requiring CRL check against all the elements of the certificate chain if a CRL file is passed.

This option makes sense only when used in combination with the OptionSSLVerifyPeer option.

A specific error code (CURLE_SSL_CRL_BADFILE) is defined with the option. It is returned when the SSL exchange fails because the CRL file cannot be loaded. Note that a failure in certificate verification due to a revocation information found in the CRL does not trigger this specific error. (Added in 7.19.0)

### 62.21.117 SetPathIssuerCert(path as folderitem)

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Sets the path to a CA certificate in PEM format.
**Notes:**

If the option is set, an additional check against the peer certificate is performed to verify the issuer is indeed the one associated with the certificate provided by the option. This additional check is useful in multi-level PKI where one needs to enforce that the peer certificate is from a specific branch of the tree.

This option makes sense only when used in combination with the OptionSSLVerifyPeer option. Otherwise, the result of the check is not considered as failure.

A specific error code (CURLE_SSL_ISSUER_ERROR) is defined with the option, which is returned if the setup of the SSL/TLS session has failed due to a mismatch with the issuer of peer certificate (OptionSSLVerifyPeer has to be set too for the check to fail). (Added in 7.19.0)

### 62.21.118 SetPathNetRCFile(path as folderitem)

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Sets the path to the file you want libCURL to use as .netrc file.
**Notes:**

If this option is omitted, and OptionNETRC is set, libCURL will attempt to find the a .netrc file in the current user's home directory. (Added in 7.10.9)

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

### 62.21.119 SetPathProxyIssuerCert(path as folderitem)

MBS CURL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Sets the proxy issuer SSL certificate filename.
**Notes:**

Pass a string naming a file holding a CA certificate in PEM format. If the option is set, an additional check against the peer certificate is performed to verify the issuer of the the HTTPS proxy is indeed the one associated with the certificate provided by the option. This additional check is useful in multi-level PKI where one needs to enforce that the peer certificate is from a specific branch of the tree.

This option makes sense only when used in combination with the OptionProxySSLVerifyPeer option. Oth-

erwise, the result of the check is not considered as failure.

A specific error code (CURLE_SSL_ISSUER_ERROR) is defined with the option, which is returned if the setup of the SSL/TLS session has failed due to a mismatch with the issuer of peer certificate (OptionProxySSLVerifyPeer has to be set too for the check to fail).

### 62.21.120 SetupAWS(AWSAccessKeyId as String, AWSSecretAccessKey as String, Region as String, Service as String, Path as String, Domain as String, Verb as String, HashedPayload as String = """, Headers() as String = nil, queryParameters() as string = nil, NoSSL as boolean = false) as boolean

MBS CURL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Setup CURL to transfer to Amazon Webservices.
**Notes:**

This implements AWS4-HMAC-SHA256 signature for credentials, sets authentication, URL, HTTP Headers and other parameters.
For upload or post, please set input parameters first.

| | | |
|---|---|---|
| AWSAccessKeyId | Your access key for AWS. | |
| AWSSecretAccessKey | Your secret. | |

e.SMTPUsername = "xxx"
e.SetServer "smtp.test.test", true
e.AddTo "test@test.test", "Test Müller"
e.PlainText = "Hello World," + EndOfLine + "Smilies:   "

dim c as new CURLSMBS

if c.SetupEmail(e) then

dim er as Integer = c.Perform
if er = 0 then
MsgBox "Email sent"
end if
end if
```

**Notes:**

Sets URL with parameters and optionally data values for POST.

Added Realm parameter for version 20.5.

| Parameter | Description | Example |
|---|---|---|
| ConsumerKey | The oauth consumer key. | "xvz1evFS4wEEPTGEFPHBog" |

### 62.21.123 UpKeep

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Perform any connection upkeep checks.
**Notes:**

Perform any connection upkeep checks.
Some protocols have "connection upkeep" mechanisms. These mechanisms usually send some traffic on existing connections in order to keep them alive; this can prevent connections from being closed due to overzealous firewalls, for example.
Currently the only protocol with a connection upkeep mechanism is HTTP/2: when the connection upkeep interval is exceeded and Upkeep is called, an HTTP/2 PING frame is sent on the connection.
This function must be explicitly called in order to perform the upkeep work. The connection upkeep interval is set with OptionUpkeepIntervalMS.

### 62.21.124 UseSystemCertificates as Integer

MBS CURL Plugin, Plugin Version: 17.2, Platforms: macOS, Windows, Targets: All.

**Function:** Read certificate from system and installs them in CURL session,.
**Notes:**

For macOS and Windows we load the available certificates from keychain or Windows Certificate Store and pass them to CURL. This is better than having no certificates at all.
Even better is normally to provide a cacert.pem file with only the expected certificates.

Returns number of certificates loaded.

### 62.21.125 Properties

### 62.21.126 APILoaded as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

(Read only property)

### 62.21.127 Cancel as Boolean

MBS CURL Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Tells CURL instance to cancel transfer as soon as possible.
**Notes:**

Especially when using PerformMT, you may see your app hang if user tries to quit application. To prevent the hang, please set Cancel = true in window close event. So when app quits and windows get destroyed, the PerformMT will see the Cancel being true and returns soon.
(Read and Write property)

### 62.21.128 CollectDebugData as Boolean

MBS CURL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether to collect debug message data.
**Notes:**

If you set this property to true, you can grab the data from the transfer in the DebugData Property instead of collecting the pieces yourself in the DebugMessage event. Of course this is optional and you can still process data in DebugMessage event.
Due to memory limitation, collecting data will not work right if your app is running low on memory.
(Read and Write property)

### 62.21.129 CollectHeaderData as Boolean

MBS CURL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether to collect header data.
**Notes:**

If you set this property to true, you can grab the data from the transfer in the headerData Property instead of collecting the pieces yourself in the header event. Of course this is optional and you can still process data in header event.
Due to memory limitation, collecting data will not work right if your app is running low on memory.
(Read and Write property)

### 62.21.130 CollectOutputData as Boolean

MBS CURL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether to collect output data.
**Notes:**

If you set this property to true, you can grab the data from the transfer in the OutputData Property instead of collecting the pieces yourself in the write event. Of course this is optional and you can still process data in write event.
Due to memory limitation, collecting data will not work right if your app is running low on memory.
(Read and Write property)

### 62.21.131 DebugData as String

MBS CURL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The debug data from CURL.
**Notes:**

If CollectDebugData property is true, the plugin puts the data received in debugMessage event also into this property, so you can grab it after the transfer. Use ClearData method to clear when reusing CURL object.
(Read only property)

### 62.21.132 DebugWithData as Boolean

MBS CURL Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether to include data in debug messages.
**Example:**

```
dim c as new CURLSMBS
c.DebugWithData = true
c.OptionVerbose = true
c.CollectDebugData = true
```

**Notes:** (Read and Write property)

### 62.21.133 Handle as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The internal handle of the CURL object.

**Notes:** (Read and Write property)

### 62.21.134 HeaderData as String

MBS CURL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The header data from CURL.
**Notes:**

If CollectHeaderData property is true, the plugin puts the data received in header event also into this property, so you can grab it after the transfer. Use ClearData method to clear when reusing CURL object.
(Read only property)

### 62.21.135 InputData as String

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The input data.
**Notes:**

If you set input data, you do not need to use Read, RestartRead or Seek events.
The plugin will use the provided data for the upload.
Setting input data size, will also set the input file size (OptionInFileSizeLarge and OptionInFileSize).

Alternatively you can provide data in Read event or use OpenMTInputFile method to open a file on disk to upload.
(Read and Write property)

### 62.21.136 Lasterror as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The lasterror from the library.
**Notes:**

Set in the constructor while doing initialization.
Check the kError* constants.
(Read and Write property)

### 62.21.137 LasterrorMessage as String

MBS CURL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The last error message.
**Notes:** (Read only property)

### 62.21.138 LasterrorText as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The text for the lasterror code.
**Notes:**

Static string matched to the error code, so you have an idea what's wrong.
(Read and Write property)

### 62.21.139 LibraryUsed as String

MBS CURL Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Which library is in use.
**Notes:**

This is for debugging only to see which library is in use.
(Read only property)

### 62.21.140 LibVersion as string

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Returns a human readable string with the version number of libCURL and some of its important components (like OpenSSL version).
**Notes:** (Read only property)

### 62.21.141 OptionAbstractUnixSocket as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Path to an abstract Unix domain socket.
**Notes:** (Read and Write property)
See also ABSTRACT_UNIX_SOCKET option in CURL manual.

### 62.21.142 OptionAcceptEncoding as String

MBS CURL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Sets the contents of the Accept-Encoding: header sent in a HTTP request, and enables decoding of a response when a Content-Encoding: header is received.
**Example:**

```
dim c as new CURLSMBS
c.OptionAcceptEncoding = "deflate"
```

**Notes:**

Three encodings are supported: identity, which does nothing, deflate which requests the server to compress its response using the zlib algorithm, and gzip which requests the gzip algorithm. If a zero-length string is set, then an Accept-Encoding: header containing all supported encodings is sent.

This is a request, not an order; the server may or may not do it. This option must be set (to any non-NULL value) or else any unsolicited encoding done by the server is ignored. See the special file README.encoding for details (included with CURL source code).
(Read and Write property)
See also ACCEPT_ENCODING option in CURL manual.

### 62.21.143 OptionAcceptTimeoutMS as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Time-out accept operations (currently for FTP only) after this amount of milliseconds.
**Notes:** (Read and Write property)
See also ACCEPTTIMEOUT_MS option in CURL manual.

### 62.21.144 OptionAddressScope as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Pass an integer specifying the scope_id value to use when connecting to IPv6 link-local or site-local addresses.
**Notes:**

(Added in CURL 7.19.0)
(Read and Write property)
See also ADDRESS_SCOPE option in CURL manual.

### 62.21.145 OptionAppend as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** True tells the library to append to the remote file instead of overwrite it.
**Notes:**

This is only useful when uploading to an ftp site.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also APPEND option in CURL manual.

### 62.21.146 OptionAutoReferer as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** When enabled, libCURL will automatically set the Referer: field in requests where it follows a Location: redirect.
**Notes:**

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also AUTOREFERER option in CURL manual.

### 62.21.147 OptionAWSSigV4 as String

MBS CURL Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Provides AWS V4 signature authentication on HTTP(S) header.
**Notes:**

Pass a text that is the collection of specific arguments are used for creating outgoing authentication headers.
The format of the param option is:

provider1 [ :provider2 [ :region [ :service ] ] ]

provider1, provider2:
The providers arguments are used for generating some authentication parameters such as "Algorithm", "date", "request type" and "signed headers".

region:

The argument is a geographic area of a resources collection. It is extracted from the host name specified in the URL if omitted.

service:
The argument is a function provided by a cloud. It is extracted from the host name specified in the URL if omitted.

Note: This call set CURLOPT_HTTPAUTH to CURLAUTH_AWS_SIGV4. Calling CURLOPT_HTTPAUTH with CURLAUTH_AWS_SIGV4 is the same as calling this with "aws:amz" in parameter.

Example with "Test:Try", when curl will do the algorithm, it will generate "TEST-HMAC-SHA256" for "Algorithm", "x-try-date" and "X-Try-Date" for "date", "test4_request" for "request type", "SignedHeaders=content-type;host;x-try-date" for "signed headers"
If you use just "test", instead of "test:try", test will be use for every strings generated

By default, the value of this parameter is empty. Calling CURLOPT_HTTPAUTH with CURLAUTH_AWS_SIGV4 is the same as calling this with "aws:amz" in parameter.
(Read and Write property)
See also AWS_SIGV4 option in CURL manual.

### 62.21.148 OptionBufferSize as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Your preferred size (in bytes) for the receive buffer in libCURL.
**Notes:**

The main point of this would be that the write callback gets called more often and with smaller chunks. This is just treated as a request, not an order. You cannot be guaranteed to actually get the given size. (Added in 7.10)

This size is by default set as big as possible (OptionMaxWriteSize), so it only makse sense to use this option if you want it smaller.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

For slow upload/downloads, it may be better to set buffer size to 1 MB with OptionUploadBufferSize or OptionBufferSize properties to make transfers faster.
(Read and Write property)
See also BUFFERSIZE option in CURL manual.

### 62.21.149 OptionCAInfo as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A string naming a file holding one or more certificates to verify the peer with.
**Example:**

```
// if you use SSL, maybe put in a certificate or disable verification?

dim d as CURLSMBS
// your CURL object

// disable
d.OptionSSLVerifyHost = 0
d.OptionSSLVerifyPeer = 0

// or better provide root certificates:

Dim cacert As FolderItem = GetFolderItem("cacert.pem")
d.OptionCAInfo = cacert.NativePath
d.OptionSSLVerifyHost = 2
d.OptionSSLVerifyPeer = 1
```

**Notes:**

This makes sense only when used in combination with the OptionSSLVerifyPeer option. If OptionSSLVerifyPeer is false, OptionCAINFO need not even indicate an accessible file.

Note that option is by default set to the system path where libCURL's cacert bundle is assumed to be stored, as established at build time.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)
See also CAINFO option in CURL manual.

### 62.21.150 OptionCAInfoBlob as String

MBS CURL Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The CAInfo as blob value.

**Notes:**

Certificate Authority (CA) bundle in PEM format passed PEM encoded content holding one or more certificates to verify the HTTPS server with.
(Read and Write property)
See also CAINFO_BLOB option in CURL manual.

### 62.21.151 OptionCAPath as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A string naming a directory holding multiple CA certificates to verify the peer with.
**Example:**

```
dim c as new CURLSMBS
c.OptionCAPath = "/data/MyCertificates"
```

**Notes:**

The certificate directory must be prepared using the openssl c_rehash utility. This makes sense only when used in combination with the CURLOPT_SSL_VERIFYPEER option. If OptionSSLVerifyPeer is zero, OptionCAPath need not even indicate an accessible path. The OptionCAPath function apparently does not work in Windows due to some limitation in openssl. This option is OpenSSL-specific and does nothing if libCURL is built to use GnuTLS.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)
See also CAPATH option in CURL manual.

### 62.21.152 OptionCertInfo as boolean

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set to true to enable libCURL's certificate chain info gatherer.
**Notes:**

With this enabled, libCURL (if built with OpenSSL) will extract lots of information and data about the certificates in the certificate chain used in the SSL connection. This data is then possible to extract after a transfer using GetInfoCertInfo. (Added in 7.19.1)

(Read and Write property)
See also CERTINFO option in CURL manual.

### 62.21.153 OptionConnectionTimeout as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The maximum time in seconds that you allow the connection to the server to take.
**Notes:**

This only limits the connection phase, once it has connected, this option is of no more use. Set to zero to disable connection timeout (it will then only timeout on the system's internal timeouts). See also the OptionTimeout option.
(Read and Write property)
See also CONNECTTIMEOUT option in CURL manual.

### 62.21.154 OptionConnectionTimeOutMS as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The maximum time in milli seconds that you allow the connection to the server to take.
**Notes:**

This only limits the connection phase, once it has connected, this option is of no more use. Set to zero to disable connection timeout (it will then only timeout on the system's internal timeouts). See also the OptionTimeout option.
(Read and Write property)

### 62.21.155 OptionConnectOnly as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A true tells the library to perform any required proxy authentication and connection setup, but no data transfer.
**Notes:**

This option is useful with the CURLSMBS.GetInfoLastSocket function. The library can set up the connection and then the application can obtain the most recently used socket for special data transfers. (Added in 7.15.2)
(Read and Write property)
See also CONNECT_ONLY option in CURL manual.

### 62.21.156 OptionCookie as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** It will be used to set a cookie in the http request.
**Notes:**

The format of the string should be NAME=CONTENTS, where NAME is the cookie name and CONTENTS is what the cookie should contain.

If you need to set multiple cookies, you need to set them all using a single option and thus you need to concatenate them all in one single string. Set multiple cookies in one string like this: "name1=content1; name2=content2;" etc.

Using this option multiple times will only make the latest string override the previously ones.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also COOKIE option in CURL manual.

### 62.21.157 OptionCookieFile as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The cookie file content.
**Notes:**

It should contain the name of your file holding cookie data to read. The cookie data may be in Netscape / Mozilla cookie data format or just regular HTTP-style headers dumped to a file.

Given an empty or non-existing file or by passing the empty string (""), this option will enable cookies for this CURL handle, making it understand and parse received cookies and then use matching cookies in future request.

If you use this option multiple times, you just add more files to read. Subsequent files will add more cookies.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)

See also COOKIEFILE option in CURL manual.

### 62.21.158 OptionCookieJar as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** File path where to write the cookies to.
**Notes:**

This will make libCURL write all internally known cookies to the specified file, when the object is destroyed. If no cookies are known, no file will be created. Specify "-" to instead have the cookies written to stdout. Using this option also enables cookies for this session, so if you for example follow a location it will make matching cookies get sent accordingly.

If the cookie jar file can't be created or written to, libCURL will not and cannot report an error for this. Using OptionVerbose or DebugFunction event will get a warning to display, but that is the only visible feedback you get about this possibly lethal situation.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)
See also COOKIEJAR option in CURL manual.

### 62.21.159 OptionCookieList as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The cookie string.
**Notes:**

Cookie can be either in Netscape / Mozilla format or just regular HTTP-style header (Set-Cookie: ...) format. If CURL cookie engine was not enabled it will enable its cookie engine. Passing a magic string "ALL" will erase all cookies known by CURL. (Added in 7.14.1) Passing the special string "SESS" will only erase all session cookies known by CURL. (Added in 7.15.4)

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also COOKIELIST option in CURL manual.

### 62.21.160 OptionCookieSession as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set to true to mark this as a new cookie "session".
**Notes:**

It will force libCURL to ignore all cookies it is about to load that are "session cookies" from the previous session. By default, libCURL always stores and loads all cookies, independent if they are session cookies are not. Session cookies are cookies without expiry date and they are meant to be alive and existing for this "session" only.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also COOKIESESSION option in CURL manual.

### 62.21.161 OptionCRLF as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Convert Unix newlines to CRLF newlines on transfers.
**Notes:**

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also CRLF option in CURL manual.

### 62.21.162 OptionCRLFile as String

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A string naming a file with the concatenation of CRL (in PEM format) to use in the certificate validation that occurs during the SSL exchange.
**Notes:**

When CURL is built to use NSS or GnuTLS, there is no way to influence the use of CRL passed to help in the verification process. When libCURL is built with OpenSSL support, X509_V_FLAG_CRL_CHECK and X509_V_FLAG_CRL_CHECK_ALL are both set, requiring CRL check against all the elements of the certificate chain if a CRL file is passed.

This option makes sense only when used in combination with the OptionSSLVerifyPeer option.

A specific error code (CURLE_SSL_CRL_BADFILE) is defined with the option. It is returned when the SSL exchange fails because the CRL file cannot be loaded. Note that a failure in certificate verification due to a revocation information found in the CRL does not trigger this specific error. (Added in 7.19.0)
(Read and Write property)
See also CRLFILE option in CURL manual.

### 62.21.163 OptionCustomRequest as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** It will be user instead of GET or HEAD when doing an HTTP request, or instead of LIST or NLST when doing an ftp directory listing.
**Example:**

```
dim c as CURLSMBS // your CURL instance

c.URL = "ftp://..."
c.customRequest = "MLSD" // ftp advanced directory listing
```

**Notes:**

This is useful for doing DELETE or other more or less obscure HTTP requests. Don't do this at will, make sure your server supports the command first.

Restore to the internal default by setting this to "".

Many people have wrongly used this option to replace the entire request with their own, including multiple headers and POST contents. While that might work in many cases, it will cause libCURL to send invalid requests and it could possibly confuse the remote server badly. Use CURLOPT_POST and OptionPostFields to set POST data. Use OptionHTTPHeader to replace or extend the set of headers sent by libCURL. Use OptionHTTPVersion to change HTTP version.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

For WebDAV, you can set this to "MKCOL" to create a folder at the given URL.
(Read and Write property)
See also CUSTOMREQUEST option in CURL manual.

### 62.21.164 OptionDefaultProtocol as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set the protocol used when curl is given a URL without a protocol.
**Notes:** (Read and Write property)
See also DEFAULT_PROTOCOL option in CURL manual.

### 62.21.165 OptionDirListOnly as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** For FTP and SFTP based URLs a parameter set to true tells the library to list the names of files in a directory, rather than performing a full directory listing that would normally include file sizes, dates etc.
**Notes:**

For POP3 a parameter of true tells the library to list the email message or messages on the POP3 server. This can be used to change the default behaviour of libCURL, when combined with a URL that contains a message ID, to perform a "scan listing" which can then be used to determine the size of an email.

Note: For FTP this causes a NLST command to be sent to the FTP server. Beware that some FTP servers list only files in their response to NLST; they might not include subdirectories and symbolic links.

Setting this option to true also implies a directory listing even if the URL doesn't end with a slash, which otherwise is necessary.

Do NOT use this option if you also use OptionWildCardMatch as it will effectively break that feature then.
(Read and Write property)
See also DIRLISTONLY option in CURL manual.

### 62.21.166 OptionDisableUserNameInURL as Boolean

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Disallow specifying username/login in URL.
**Notes:**

The value true tells the library to not allow URLs that include an username.
(Read and Write property)

### 62.21.167 OptionDNSCacheTimeout as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The timeout in seconds.
**Notes:**

Name resolves will be kept in memory for this number of seconds. Set to zero (0) to completely disable caching, or set to -1 to make the cached entries remain forever. By default, libCURL caches this info for 60 seconds.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also DNS_CACHE_TIMEOUT option in CURL manual.

### 62.21.168 OptionDNSInterface as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set the name of the network interface that the DNS resolver should bind to.
**Notes:**

This must be an interface name (not an address). Set this option to "" to use the default setting (don't bind to a specific interface).
(Read and Write property)
See also DNS_INTERFACE option in CURL manual.

### 62.21.169 OptionDNSLocalIPv4 as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set the local IPv4 address that the resolver should bind to.
**Notes:**

The argument should be of string and contain a single numerical IPv4 address as a string.
Set this option to "" to use the default setting (don't bind to a specific IP address).
(Read and Write property)
See also DNS_LOCAL_IP4 option in CURL manual.

### 62.21.170 OptionDNSLocalIPv6 as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set the local IPv6 address that the resolver should bind to.
**Notes:**

The argument should be of type string and contain a single IPv6 address as a string.
Set this option to "" to use the default setting (don't bind to a specific IP address).
(Read and Write property)
See also DNS_LOCAL_IP6 option in CURL manual.

### 62.21.171 OptionDNSServers as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set the name servers to use for DNS resolution.
**Notes:** (Read and Write property)
See also DNS_SERVERS option in CURL manual.

### 62.21.172 OptionDNSShuffleAddresses as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether to shuffle DNS addresses.
**Notes:**

When a name is resolved and more than one IP address is returned, shuffle the order of all returned addresses so that they will be used in a random order. This is similar to the ordering behavior of gethostbyname which is no longer used on most platforms.

Addresses will not be reshuffled if a name resolution is completed using the DNS cache. DNSCacheTimeout property can be used together with this option to reduce DNS cache timeout or disable caching entirely if frequent reshuffling is needed.

Since the addresses returned will be reordered randomly, their order will not be in accordance with RFC 3484 or any other deterministic order that may be generated by the system's name resolution implementation. This may have performance impacts and may cause IPv4 to be used before IPv6 or vice versa.
Default is false.
(Read and Write property)
See also DNS_SHUFFLE_ADDRESSES option in CURL manual.

### 62.21.173 OptionDOHSSLVerifyHost as Integer

MBS CURL Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether to verify the host name in the DOH (DNS-over-HTTPS) SSL certificate.
**Notes:**

Pass a 2 as asking curl to verify the DOH (DNS-over-HTTPS) server's certificate name fields against the host name.
This option is the DOH equivalent of OptionSSLVerifyPeer and only affects requests to the DOH server.
When OptionDOHSSLVerifyHost is 2, the SSL certificate provided by the DOH server must indicate that the server name is the same as the server name to which you meant to connect to, or the connection fails.
Curl considers the DOH server the intended one when the Common Name field or a Subject Alternate Name field in the certificate matches the host name in the DOH URL to which you told Curl to connect.
When the verify value is set to 1 it is treated the same as 2. However for consistency with the other VerifyHost options we suggest use 2 and not 1.
When the verify value is set to 0, the connection succeeds regardless of the names used in the certificate. Use that ability with caution!
(Read and Write property)
See also DOH_SSL_VERIFYHOST option in CURL manual.

### 62.21.174 OptionDOHSSLVerifyPeer as Integer

MBS CURL Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether to verify the DOH SSL certificate.
**Notes:**

Pass 1 to enable or 0 to disable.
This option tells curl to verify the authenticity of the DOH (DNS-over-HTTPS) server's certificate. A value of 1 means curl verifies; 0 (zero) means it doesn't.
This option is the DOH equivalent of CURL.SetOptionSSLVerifyPeer and only affects requests to the DOH server.
When negotiating a TLS or SSL connection, the server sends a certificate indicating its identity. Curl verifies whether the certificate is authentic, i.e. that you can trust that the server is who the certificate says it is. This trust is based on a chain of digital signatures, rooted in certification authority (CA) certificates you supply. curl uses a default bundle of CA certificates (the path for that is determined at build time) and you can specify alternate certificates with the CURL.SetOptionCAInfo option or the CURL.SetOptionCAPath option.
When CURL.SetOptionDOHSSLVerifyPeer is enabled, and the verification fails to prove that the certificate is authentic, the connection fails. When the option is zero, the peer certificate verification succeeds regardless.
Authenticating the certificate is not enough to be sure about the server. You typically also want to ensure that the server is the server you mean to be talking to. Use CURL.SetOptionDOHSSLVerifyHost for that. The check that the host name in the certificate is valid for the host name you're connecting to is done independently of the CURL.SetOptionDOHSSLVerifyPeer option.

WARNING: disabling verification of the certificate allows bad guys to man-in-the-middle the communication without you knowing it. Disabling verification makes the communication insecure. Just having encryption on a transfer is not enough as you cannot be sure that you are communicating with the correct end-point.

(Read and Write property)
See also DOH_SSL_VERIFYPEER option in CURL manual.

### 62.21.175 OptionDOHSSLVerifyStatus as Integer

MBS CURL Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether to verify the DOH SSL certificate's status.
**Notes:**

Pass 2 to ask curl to verify the DOH (DNS-over-HTTPS) server's certificate name fields against the host name.
This option is the DOH equivalent of OptionSSLVerifyHost and only affects requests to the DOH server.
When OptionDOHSSLVerifyHost is 2, the SSL certificate provided by the DOH server must indicate that the server name is the same as the server name to which you meant to connect to, or the connection fails.
Curl considers the DOH server the intended one when the Common Name field or a Subject Alternate Name field in the certificate matches the host name in the DOH URL to which you told Curl to connect.
When the verify value is set to 1L it is treated the same as 2L. However for consistency with the other VerifyHost options we suggest use 2 and not 1.
When the verify value is set to 0L, the connection succeeds regardless of the names used in the certificate. Use that ability with caution!

See also OptionDOHSSLVerifyPeer to verify the digital signature of the DOH server certificate. If libcurl is built against NSS and OptionDOHSSLVerifyPeer is zero, OptionDOHSSLVerifyHost is also set to zero and cannot be overridden.
(Read and Write property)
See also DOH_SSL_VERIFYSTATUS option in CURL manual.

### 62.21.176 OptionDOHURL as String

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Provides the DNS-over-HTTPS URL.
**Notes:**

Pass in a string to a URL for the DOH server to use for name resolving. The parameter should be URL-encoded in the following format: "https://host:port/path". It MUST specify a HTTPS URL.

libcurl doesn't validate the syntax or use this variable until the transfer is issued. Even if you set a crazy value here, OptionDOHURL will still return CURLE_OK.

curl sends POST requests to the given DNS-over-HTTPS URL.

To find the DOH server itself, which might be specified using a name, libcurl will use the default name lookup function. You can bootstrap that by providing the address for the DOH server with OptionResolve.

Disable DOH use again by setting this option to "".
(Read and Write property)
See also DOH_URL option in CURL manual.

### 62.21.177 OptionEGDSocket as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The path name to the Entropy Gathering Daemon socket.
**Notes:**

It will be used to seed the random engine for SSL.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also EGDSOCKET option in CURL manual.

### 62.21.178 OptionExpect100TimeoutMS as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Sets Expect 100 timeout.
**Notes:**

Time to wait in milliseconds for a response to a HTTP request containing an Expect: 100-continue header before sending the data anyway.
(Read and Write property)
See also EXPECT_100_TIMEOUT_MS option in CURL manual.

### 62.21.179 OptionFailOnError as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** True tells the library to fail silently if the HTTP code returned is equal to or larger than 400. The default action would be to return the page normally, ignoring that code.
**Notes:**

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

This method is not fail-safe and there are occasions where non-succesful response codes will slip through, especially when authentication is involved (response codes 401 and 407).

You might get some amounts of headers transferred before this situation is detected, like for when a "100-continue" is received as a response to a POST/PUT and a 401 or 407 is received immediately afterwards.
(Read and Write property)
See also FAILONERROR option in CURL manual.

### 62.21.180 OptionFileTime as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether filetime should be querried.
**Example:**

```
// init CURL with options
dim d as new CURLSMBS
d.OptionFileTime = true
d.OptionURL = "http://www.monkeybreadsoftware.de/images/mbs.jpg"

// run query
dim e as Integer = d.Perform

// calculate date object
dim da as new date(1970,1,1,0,0,0)
da.TotalSeconds = da.TotalSeconds + d.GetInfoFileTime

// show date
ResultText.text=str(d.GetInfoFileTime)+" "+da.ShortDate+" "+da.ShortTime
```

**Notes:**

If it is true, libCURL will attempt to get the modification date of the remote document in this operation. This requires that the remote server sends the time or replies to a time querying command.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also FILETIME option in CURL manual.

### 62.21.181 OptionFollowLocation as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A boolean parameter tells the library to follow any Location: header that the server sends as part of an HTTP header.
**Example:**

```
dim c as new CURLSMBS

c.OptionFollowLocation = true
c.OptionMaxRedirs = 3
```

**Notes:**

This means that the library will re-send the same request on the new location and follow new Location: headers all the way until no more such headers are returned. OptionMaxRedirs can be used to limit the number of redirects libCURL will follow.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also FOLLOWLOCATION option in CURL manual.

### 62.21.182 OptionForbitReuse as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set to true to make the next transfer explicitly close the connection when done.
**Notes:**

Normally, libCURL keep all connections alive when done with one transfer in case there comes a succeeding one that can re-use them. This option should be used with caution and only if you understand what it does. Set to false to have libCURL keep the connection open for possibly later re-use (default behavior).

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

### 62.21.183 OptionFreshConnect as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set to true to make the next transfer use a new (fresh) connection by force.
**Example:**

```
dim c as new CURLSMBS

c.OptionFreshConnect=True
```

**Notes:**

If the connection cache is full before this connection, one of the existing connections will be closed as according to the selected or default policy. This option should be used with caution and only if you understand what it does. Set this to 0 to have libCURL attempt re-using an existing connection (default behavior).

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also FRESH_CONNECT option in CURL manual.

### 62.21.184 OptionFTPAccount as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The FTP account name to use.
**Notes:**

When an FTP server asks for "account data" after user name and password has been provided, this data is sent off using the ACCT command.
(Read and Write property)
See also FTP_ACCOUNT option in CURL manual.

### 62.21.185 OptionFTPAlternativeToUser as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The alternative username.
**Notes:**

Pass a string as parameter, pointing to a string which will be used to authenticate if the usual FTP "USER user" and "PASS password" negotiation fails. This is currently only known to be required when connecting to Tumbleweed's Secure Transport FTPS server using client certificates for authentication. (Added in 7.15.5)
(Read and Write property)
See also FTP_ALTERNATIVE_TO_USER option in CURL manual.

### 62.21.186 OptionFTPAppend as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** True tells the library to append to the remote file instead of overwrite it.
**Deprecated:** This item is deprecated and should no longer be used. You can use OptionAppend instead.
**Notes:**

This is only useful when uploading to an ftp site.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

### 62.21.187 OptionFTPCreateMissingDirs as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** If the value is 1, CURL will attempt to create any remote directory that it fails to CWD into.
**Notes:**

CWD is the command that changes working directory. (Added in 7.10.7)

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
Newer CURL Library versions allow a value of 2 to do a CWD after the directory was created, so this property changed from boolean to integer.
(Read and Write property)
See also FTP_CREATE_MISSING_DIRS option in CURL manual.

### 62.21.188 OptionFTPFileMethod as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Pass an integer that should have one of the following values.
**Notes:**

This option controls what method libCURL should use to reach a file on a FTP(S) server. The argument should be one of the following alternatives:

URLFTPMETHOD_MULTICWD = 1

libCURL does a single CWD operation for each path part in the given URL. For deep hierarchies this means very many commands. This is how RFC1738 says it should be done. This is the default but the slowest

behavior.

CURLFTPMETHOD_NOCWD = 2

libCURL does no CWD at all. libCURL will do SIZE, RETR, STOR etc and give a full path to the server for all these commands. This is the fastest behavior.

CURLFTPMETHOD_SINGLECWD = 3

libCURL does one CWD with the full target directory and then operates on the file "normally" (like in the multicwd case). This is somewhat more standards compliant than 'nocwd' but without the full penalty of 'multicwd'.
(Read and Write property)
See also FTP_FILEMETHOD option in CURL manual.

### 62.21.189 OptionFTPListOnly as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** True tells the library to just list the names of an ftp directory, instead of doing a full directory listing that would include file sizes, dates etc.
**Deprecated:** This item is deprecated and should no longer be used. You can use OptionDirListOnly instead. **Notes:**

This causes an FTP NLST command to be sent. Beware that some FTP servers list only files in their response to NLST; they might not include subdirectories and symbolic links.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

### 62.21.190 OptionFTPPort as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The port to use for ftp.
**Notes:**

It will be used to get the IP address to use for the ftp PORT instruction. The PORT instruction tells the remote server to connect to our specified IP address. The string may be a plain IP address, a host name, an network interface name (under Unix) or just a '-' letter to let the library use your systems default IP address. Default FTP operations are passive, and thus won't use PORT.

You disable PORT again and go back to using the passive version by setting this option to "".

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also FTPPORT option in CURL manual.

### 62.21.191 OptionFTPResponseTimeout as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Causes CURL to set a timeout period (in seconds) on the amount of time that the server is allowed to take in order to generate a response message for a command before the session is considered hung.
**Notes:**

While CURL is waiting for a response, this value overrides OptionTimeout. It is recommended that if used in conjunction with OptionTimeout, you set OptionFTPResponseTimeout to a value smaller than OptionTimeout. (Added in 7.10.8)

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also FTP_RESPONSE_TIMEOUT option in CURL manual.

### 62.21.192 OptionFTPSkipPasvIP as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** If set to a non-zero value, it instructs libCURL to not use the IP address the server suggests in its 227-response to libCURL's PASV command when libCURL connects the data connection.
**Notes:**

Instead libCURL will re-use the same IP address it already uses for the control connection. But it will use the port number from the 227-response. (Added in 7.14.2)

This option has no effect if PORT, EPRT or EPSV is used instead of PASV.
(Read and Write property)
See also FTP_SKIP_PASV_IP option in CURL manual.

### 62.21.193 OptionFTPSSL as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Request using SSL / TLS for the transfer.
**Example:**

```
dim c as CURLSMBS
c.OptionUseSSL = c.kFTPSSL_ALL
c.OptionSSLVersion = c.kSSLVersionTLSv12
```

**Deprecated:** This item is deprecated and should no longer be used. You can use OptionUseSSL instead.
**Notes:**

Set to an integer using one of the values from below, to make libCURL use your desired level of SSL for the transfer.
These are all protocols that start out plain text and get "upgraded" to SSL using the STARTTLS command. This is for enabling SSL/TLS when you use FTP, SMTP, POP3, IMAP etc.

| | | |
|---|---|---|
| CURLUSESSL_NONE | 0 | Don't attempt to use SSL. |
| CURLUSESSL_TRY | 1 | Try using SSL, proceed as normal otherwise. |
| CURLUSESSL_CONTROL | 2 | Require SSL for the control connection or fail with CURLE_USE_SSL_FAILED. |
| CURLUSESSL_ALL | 3 | Require SSL for all communication or fail with CURLE_USE_SSL_FAILED. |

(Read and Write property)

### 62.21.194 OptionFTPSSLAuth as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** What kind of SSL authentication to use for FTP.
**Notes:**

Pass an integer using one of the values from below, to alter how libCURL issues "AUTH TLS" or "AUTH SSL" when FTP over SSL is activated (see CURLOPT_FTP_SSL). (Added in 7.12.2)

kFTPAUTH_DEFAULT = 0

Allow libCURL to decide

kFTPAUTH_SSL = 1

Try "AUTH SSL" first, and only if that fails try "AUTH TLS"

kFTPAUTH_TLS = 2

Try "AUTH TLS" first, and only if that fails try "AUTH SSL"

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also FTPSSLAUTH option in CURL manual.

### 62.21.195 OptionFTPSSLCCC as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** If enabled, this option makes libCURL use CCC (Clear Command Channel).
**Notes:**

It shuts down the SSL/TLS layer after authenticating. The rest of the control channel communication will be unencrypted. This allows NAT routers to follow the FTP transaction. Pass a long using one of the values below. (Added in 7.16.1)

| | | |
|---|---|---|
| CURLFTPSSL_CCC_NONE | 0 | Don't attempt to use CCC. |
| CURLFTPSSL_CCC_PASSIVE | 1 | Do not initiate the shutdown, but wait for the server to do it. Do not send a reply. |
| CURLFTPSSL_CCC_ACTIVE | 2 | Initiate the shutdown and wait for a reply. |

(Read and Write property)
See also FTP_SSL_CCC option in CURL manual.

### 62.21.196 OptionFTPUseEPRT as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** If the value is true, it tells CURL to use the EPRT (and LPRT) command when doing active FTP downloads (which is enabled by CURLOPT_FTPPORT).
**Notes:**

Using EPRT means that it will first attempt to use EPRT and then LPRT before using PORT, but if you pass FALSE (zero) to this option, it will not try using EPRT or LPRT, only plain PORT. (Added in 7.10.5)

If the server is an IPv6 host, this option will have no effect as of 7.12.3.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also FTP_USE_EPRT option in CURL manual.

### 62.21.197 OptionFTPUseEPSV as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** If the value is true, it tells CURL to use the EPSV command when doing passive FTP downloads (which it always does by default).
**Notes:**

Using EPSV means that it will first attempt to use EPSV before using PASV, but if you pass FALSE (zero) to this option, it will not try using EPSV, only plain PASV.

If the server is an IPv6 host, this option will have no effect as of 7.12.3.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also FTP_USE_EPSV option in CURL manual.

### 62.21.198 OptionFTPusePret as Boolean

MBS CURL Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** If the value is true, it tells CURL to send a PRET command before PASV (and EPSV). Certain FTP servers, mainly drftpd, require this non-standard command for directory listings as well as up and downloads in PASV mode.
**Notes:**

Has no effect when using the active FTP transfers mode. (Added in 7.20.0)
(Read and Write property)
See also FTP_USE_PRET option in CURL manual.

### 62.21.199 OptionGet as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** If the true, this forces the HTTP request to get back to GET.
**Notes:**

usable if a POST, HEAD, PUT or a custom request have been used previously using the same CURL handle.

When setting OptionGet to a true value, it will automatically set OptionNoBody to true (since 7.14.1).

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

### 62.21.200 OptionGSSAPIDelegation as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Allow GSSAPI credential delegation.
**Notes:** (Read and Write property)
See also GSSAPI_DELEGATION option in CURL manual.

### 62.21.201 OptionHappyEyeballsTimeOutMS as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The happy eyeballs timeout.
**Notes:**

Head start in milliseconds to give happy eyeballs.
(Read and Write property)
See also HAPPY_EYEBALLS_TIMEOUT_MS option in CURL manual.

### 62.21.202 OptionHAProxyProtocol as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether to send an HAProxy PROXY protocol header.
**Notes:**

Set to true to tell the library to send an HAProxy PROXY protocol header at beginning of the connection.
The default action is not to send this header.
This option is primarily useful when sending test requests to a service that expects this header.
Most applications do not need this option.
Default false, do not send HAProxy PROXY protocol header.
(Read and Write property)

See also HAPROXYPROTOCOL option in CURL manual.

### 62.21.203 OptionHeader as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** True tells the library to include the header in the body output.
**Notes:**

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

This is only relevant for protocols that actually have headers preceding the data (like HTTP).
(Read and Write property)
See also HEADER option in CURL manual.

### 62.21.204 OptionHeaderOptions as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Pass in a bitmask of "header options".
**Notes:** (Read and Write property)
See also HEADEROPT option in CURL manual.

### 62.21.205 OptionHTTPAuth as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Which http authentication to use.
**Notes:**

Pass an integer as parameter, which is set to a bitmask, to tell libCURL what authentication method(s) you want it to use. The available bits are listed below. If more than one bit is set, libCURL will first query the site to see what authentication methods it supports and then pick the best one you allow it to use. For some methods, this will induce an extra network round-trip. Set the actual name and password with the UserPassword option. (Added in 7.10.6)

kAuthBASIC = 1

HTTP Basic authentication. This is the default choice, and the only method that is in wide-spread use and supported virtually everywhere. This is sending the user name and password over the network in plain text,

easily captured by others.

kAuthDIGEST = 2

HTTP Digest authentication. Digest authentication is defined in RFC2617 and is a more secure way to do authentication over public networks than the regular old-fashioned Basic method.

kAuthGSSNEGOTIATE = 4

HTTP GSS-Negotiate authentication. The GSS-Negotiate (also known as plain "Negotiate") method was designed by Microsoft and is used in their web applications. It is primarily meant as a support for Kerberos5 authentication but may be also used along with another authentication methods. For more information see IETF draft draft-brezak-spnego-http-04.txt.

You need to build libCURL with a suitable GSS-API library for this to work.

kAuthNTLM = 8

HTTP NTLM authentication. A proprietary protocol invented and used by Microsoft. It uses a challenge-response and hash concept similar to Digest, to prevent the password from being eavesdropped.

You need to build libCURL with OpenSSL support for this option to work, or build libCURL on Windows.

kAuthANY = & hFFFFFFFF

This is a convenience macro that sets all bits and thus makes libCURL pick any it finds suitable. libCURL will automatically select the one it finds most secure.

kAuthANYSAFE = & hFFFFFFFE

This is a convenience macro that sets all bits except Basic and thus makes libCURL pick any it finds suitable. libCURL will automatically select the one it finds most secure.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also HTTPAUTH option in CURL manual.

### 62.21.206 OptionHTTPContentDecoding as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Pass a long to tell libCURL how to act on content decoding.
**Notes:**

If set to zero, content decoding will be disabled. If set to 1 it is enabled. Note however that libCURL has no default content decoding but requires you to use OptionEncoding for that. (added in 7.16.2)
(Read and Write property)
See also HTTP_CONTENT_DECODING option in CURL manual.

### 62.21.207 OptionHTTPProxyTunnel as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set the parameter to true to get the library to tunnel all operations through a given HTTP proxy.
**Notes:**

There is a big difference between using a proxy and to tunnel through it. If you don't know what this means, you probably don't want this tunneling option.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also HTTPPROXYTUNNEL option in CURL manual.

### 62.21.208 OptionHTTPTransferDecoding as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Pass an integer to tell libCURL how to act on transfer decoding.
**Notes:**

If set to zero, transfer decoding will be disabled, if set to 1 it is enabled (default). libCURL does chunked transfer decoding by default unless this option is set to zero. (added in 7.16.2)
(Read and Write property)
See also HTTP_TRANSFER_DECODING option in CURL manual.

### 62.21.209 OptionHTTPVersion as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set to one of the values described below.
**Notes:**

They force libCURL to use the specific HTTP versions. This is not sensible to do unless you have a good reason.

kHTTP_VERSION_NONE = 0

We don't care about what version the library uses. libCURL will use whatever it thinks fit.

kHTTP_VERSION_1_0 = 1

Enforce HTTP 1.0 requests.

kHTTP_VERSION_1_1 = 2

Enforce HTTP 1.1 requests.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also HTTP_VERSION option in CURL manual.

### 62.21.210 OptionIgnoreContentLength as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether to ignore the Content-Length header.
**Notes:**

This is useful for Apache 1.x (and similar servers) which will report incorrect content length for files over 2 gigabytes. If this option is used, CURL will not be able to accurately report progress, and will simply stop the download when the server ends the connection. (added in 7.14.1)
(Read and Write property)
See also IGNORE_CONTENT_LENGTH option in CURL manual.

### 62.21.211 OptionInFileSize as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** When uploading a file to a remote site, this option should be used to tell libCURL what the

expected size of the infile is.
**Notes:**

Note that this option does not limit how much data libCURL will actually send, as that is controlled entirely by what the read callback returns.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also INFILESIZE option in CURL manual.

### 62.21.212 OptionInFileSizeLarge as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** When uploading a file to a remote site, this option should be used to tell libCURL what the expected size of the infile is.
**Deprecated:** This item is deprecated and should no longer be used. You can use OptionInFileSize instead.
**Notes:**

This value should be passed as a CURL_off_t. (Added in 7.11.0)

Note that this option does not limit how much data libCURL will actually send, as that is controlled entirely by what the read callback returns.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

### 62.21.213 OptionInterface as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** This set the interface name to use as outgoing network interface.
**Notes:**

The name can be an interface name, an IP address or a host name.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also INTERFACE option in CURL manual.

### 62.21.214 OptionIPResolve as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Allows an application to select what kind of IP addresses to use when resolving host names.
**Example:**

```
dim c as new CURLSMBS
c.OptionIPResolve = c.kIPRESOLVE_V4
```

**Notes:**

This is only interesting when using host names that resolve addresses using more than one version of IP. The allowed values are:

kIPRESOLVE_WHATEVER = 0

Default, resolves addresses to all IP versions that your system allows.

kIPRESOLVE_V4 = 1

Resolve to ipv4 addresses.

kIPRESOLVE_V6 = 2

Resolve to ipv6 addresses.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also IPRESOLVE option in CURL manual.

### 62.21.215 OptionIssuerCert as String

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A string naming a file holding a CA certificate in PEM format.
**Notes:**

If the option is set, an additional check against the peer certificate is performed to verify the issuer is indeed the one associated with the certificate provided by the option. This additional check is useful in multi-level PKI where one needs to enforce that the peer certificate is from a specific branch of the tree.

This option makes sense only when used in combination with the OptionSSLVerifyPeer option. Otherwise, the result of the check is not considered as failure.

A specific error code (CURLE_SSL_ISSUER_ERROR) is defined with the option, which is returned if the setup of the SSL/TLS session has failed due to a mismatch with the issuer of peer certificate (OptionSSLVerifyPeer has to be set too for the check to fail). (Added in 7.19.0)

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)
See also ISSUERCERT option in CURL manual.

### 62.21.216 OptionIssuerCertBlob as String

MBS CURL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set issuer SSL certificate from memory blob.
**Notes:**

Pass data, which contains binary data of a CA certificate in PEM format. If the option is set, an additional check against the peer certificate is performed to verify the issuer is indeed the one associated with the certificate provided by the option. This additional check is useful in multi-level PKI where one needs to enforce that the peer certificate is from a specific branch of the tree.

This option should be used in combination with the OptionSSLVerifyPeer option. Otherwise, the result of the check is not considered as failure.

A specific error code (CURLE_SSL_ISSUER_ERROR) is defined with the option, which is returned if the setup of the SSL/TLS session has failed due to a mismatch with the issuer of peer certificate (OptionSSLVerifyPeer has to be set too for the check to fail).

This option is an alternative to OptionIssuerCert which instead expects a file name as input.
(Read and Write property)
See also ISSUERCERT_BLOB option in CURL manual.

### 62.21.217 OptionKeepSendingOnError as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether to keep sending on error.

**Notes:**

Continue to send data if the server responds early with an HTTP status code >= 300
(Read and Write property)
See also KEEP_SENDING_ON_ERROR option in CURL manual.

### 62.21.218 OptionKeyPassword as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set passphrase to private key.
**Notes:**

It will be used as the password required to use the OptionSSLKey or OptionSSHPrivateKeyfile private key. You never needed a pass phrase to load a certificate but you need one to load your private key.
(Read and Write property)
See also KEYPASSWD option in CURL manual.

### 62.21.219 OptionKRB4Level as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set the krb4 security level, this also enables krb4 awareness.
**Deprecated:** This item is deprecated and should no longer be used. You can use OptionKRBLevel instead.
**Notes:**

This is a string, 'clear', 'safe', 'confidential' or 'private'. If the string is set but doesn't match one of these, 'private' will be used. Set the string to "" to disable kerberos4. The kerberos support only works for FTP.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

### 62.21.220 OptionKRBLevel as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** FTP kerberos security level.
**Notes:**

Set the kerberos security level for FTP; this also enables kerberos awareness. This is a string that should match one of the following: 'clear', 'safe', 'confidential' or 'private'. If the string is set but doesn't match one of these, 'private' will be used. Set the string to NULL to disable kerberos support for FTP.
(Read and Write property)

See also KRBLEVEL option in CURL manual.

### 62.21.221 OptionLocalPort as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** This sets the local port number of the socket used for connection.
**Notes:**

This can be used in combination with OptionInterface and you are recommended to use OptionLocalPortRange as well when this is set. Note that port numbers are only valid 1 - 65535. (Added in 7.15.2)
(Read and Write property)
See also LOCALPORT option in CURL manual.

### 62.21.222 OptionLocalPortRange as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** This is the number of attempts libCURL should do to find a working local port number.
**Notes:**

It starts with the given OptionLocalPort and adds one to the number for each retry. Setting this value to 1 or below will make libCURL do only one try for exact port number. Note that port numbers by nature is a scarce resource that will be busy at times so setting this value to something too low might cause unnecessary connection setup failures. (Added in 7.15.2)
(Read and Write property)
See also LOCALPORTRANGE option in CURL manual.

### 62.21.223 OptionLoginOptions as String

MBS CURL Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Login options string to use for the transfer.
**Notes:**

For more information about the login options please see RFC 2384, RFC5092 and IETF draft draft-earhart-url-smtp-00.txt

CURLOPT_LOGIN_OPTIONS can be used to set protocol specific login options, such as the preferred authentication mechanism via "AUTH=NTLM" or "AUTH=*", and should be used in conjunction with the OptionUserName option.
Only IMAP, POP3 and SMTP support login options.
(Read and Write property)

See also LOGIN_OPTIONS option in CURL manual.

### 62.21.224 OptionLowSpeedLimit as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** This property contains the transfer speed in bytes per second that the transfer should be below during OptionLowSpeedTime seconds for the library to consider it too slow and abort.
**Notes:**

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also LOW_SPEED_LIMIT option in CURL manual.

### 62.21.225 OptionLowSpeedTime as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** This property contains the time in seconds that the transfer should be below the OptionLowSpeedLimit for the library to consider it too slow and abort.
**Notes:**

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also LOW_SPEED_TIME option in CURL manual.

### 62.21.226 OptionMailAuth as String

MBS CURL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** This string will be used to specify the authentication address (identity) of a submitted message that is being relayed to another server.
**Notes:**

This optional parameter allows co-operating agents in a trusted environment to communicate the authentication of individual messages and should only be used by the application program, using libCURL, if the application is itself a mail server acting in such an environment. If the application is operating as such and the AUTH address is not known or is invalid, then an empty string should be used for this parameter.

Unlike OptionMailFrom and SetOptionMailRecipients, the address should not be specified within a pair of angled brackets (<>). However, if an empty string is used then a pair of brackets will be sent by libCURL as required by RFC 2554.

(Read and Write property)
See also MAIL_AUTH option in CURL manual.

### 62.21.227 OptionMailFrom as String

MBS CURL Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A string that will be used to specify the sender address in a mail when sending an SMTP mail with libCURL.
**Notes:** (Read and Write property)
See also MAIL_FROM option in CURL manual.

### 62.21.228 OptionMaxAgeConn as Integer

MBS CURL Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The maximum age the connection should have in seconds.
**Notes:**

Older connections are not reused, but discarded.
(Read and Write property)
See also MAXAGE_CONN option in CURL manual.

### 62.21.229 OptionMaxConnects as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The set number will be the persistent connection cache size.
**Notes:**

The set amount will be the maximum amount of simultaneously open connections that libCURL may cache. Default is 5, and there isn't much point in changing this value unless you are perfectly aware of how this work and changes libCURL's behaviour. This concerns connection using any of the protocols that support persistent connections.

When reaching the maximum limit, CURL closes the oldest one in the cache to prevent the number of open connections to increase.

If you already have performed transfers with this CURL handle, setting a smaller MAXCONNECTS than before may cause open connections to get closed unnecessarily.

The Lasterror property is set. 0 for success.

You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also MAXCONNECTS option in CURL manual.

### 62.21.230 OptionMaxFileSize as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** This allows you to specify the maximum size (in bytes) of a file to download.
**Notes:**

If the file requested is larger than this value, the transfer will not start and kError_FILESIZE_EXCEEDED will be returned.

The file size is not always known prior to download, and for such files this option has no effect even if the file transfer ends up being larger than this given limit. This concerns both FTP and HTTP transfers.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also MAXFILESIZE option in CURL manual.

### 62.21.231 OptionMaxFileSizeLarge as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** This allows you to specify the maximum size (in bytes) of a file to download.
**Deprecated:** This item is deprecated and should no longer be used. You can use OptionMaxFileSize instead. **Notes:**

If the file requested is larger than this value, the transfer will not start and kError_FILESIZE_EXCEEDED will be returned. (Added in 7.11.0)

The file size is not always known prior to download, and for such files this option has no effect even if the file transfer ends up being larger than this given limit. This concerns both FTP and HTTP transfers.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

### 62.21.232 OptionMaxRecvSpeed as Int64

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Defines the maximum download speed.
**Notes:**

If a download exceeds this speed (counted in bytes per second) on cumulative average during the transfer, the transfer will pause to keep the average rate less than or equal to the parameter value. Defaults to unlimited speed. (Added in 7.15.5)
(Read and Write property)
See also MAX_RECV_SPEED option in CURL manual.

### 62.21.233 OptionMaxRecvSpeedLarge as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Defines the maximum download speed.
**Deprecated:** This item is deprecated and should no longer be used. You can use OptionMaxRecvSpeed instead. **Notes:**

If a download exceeds this speed (counted in bytes per second) on cumulative average during the transfer, the transfer will pause to keep the average rate less than or equal to the parameter value. Defaults to unlimited speed. (Added in 7.15.5)
(Read and Write property)

### 62.21.234 OptionMaxRedirs as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The set number will be the redirection limit.
**Example:**

```
dim c as new CURLSMBS

c.OptionFollowLocation = true
c.OptionMaxRedirs = 3
```

**Notes:**

If that many redirections have been followed, the next redirect will cause an error (kError_TOO_MANY_REDIRECTS). This option only makes sense if the CURLOPT_FOLLOWLOCATION is used at the same time. Added in 7.15.1: Setting the limit to 0 will make libCURL refuse any redirect. Set it to -1 for an infinite number of redirects (which is the default)

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also MAXREDIRS option in CURL manual.

### 62.21.235 OptionMaxSendSpeed as Int64

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Defines the maximum upload speed.
**Notes:**

If an upload exceeds this speed on cumulative average during the transfer, the transfer will pause to keep the average rate less than or equal to the parameter value. Defaults to unlimited speed. (Added in 7.15.5)
Value is in bytes per second.
Useful if you have a limited pipe and you'd like your transfer not to use your entire bandwidth.
Slowing down the transfer speed is also useful for lowering CPU consumption during transfers.
(Read and Write property)
See also MAX_SEND_SPEED option in CURL manual.

### 62.21.236 OptionMaxSendSpeedLarge as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Defines the maximum upload speed.
**Deprecated:** This item is deprecated and should no longer be used. You can use OptionMaxSendSpeed instead. **Notes:**

If an upload exceeds this speed on cumulative average during the transfer, the transfer will pause to keep the average rate less than or equal to the parameter value. Defaults to unlimited speed. (Added in 7.15.5)
Value is in bytes per second.
Useful if you have a limited pipe and you'd like your transfer not to use your entire bandwidth.
Slowing down the transfer speed is also useful for lowering CPU consumption during transfers.
(Read and Write property)

### 62.21.237 OptionNetRC as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Controls usage of netrc file.
**Notes:**

This parameter controls the preference of libCURL between using user names and passwords from your textasciitilde /.netrc file, relative to user names and passwords in the URL supplied with OptionURL.

libCURL uses a user name (and supplied or prompted password) supplied with OptionUsername and OptionPassword in preference to any of the options controlled by this parameter.

An integer, set to one of the values described below.

kNETRC_OPTIONAL = 1

The use of your
textasciitilde /.netrc file is optional, and information in the URL is to be preferred. The file will be scanned with the host and user name (to find the password only) or with the host only, to find the first user name and password after that machine, which ever information is not specified in the URL.

Undefined values of the option will have this effect.

kNETRC_IGNORED = 0

The library will ignore the file and use only the information in the URL.

This is the default.

kNETRC_REQUIRED = 2

This value tells the library that use of the file is required, to ignore the information in the URL, and to search the file with the host only.

Only machine name, user name and password are taken into account (init macros and similar things aren't supported).

libCURL does not verify that the file has the correct properties set (as the standard Unix ftp client does). It should only be readable by user.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also NETRC option in CURL manual.

### 62.21.238 OptionNetRCFile as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A string containing the full path name to the file you want libCURL to use as .netrc file.
**Notes:**

If this option is omitted, and OptionNETRC is set, libCURL will attempt to find the a .netrc file in the current user's home directory. (Added in 7.10.9)

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)
See also NETRC_FILE option in CURL manual.

### 62.21.239 OptionNewDirectoryPerms as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** An integer, containing the value of the permissions that will be assigned to newly created directories on the remote server.
**Notes:**

The default value is 0755, but any valid value can be used. The only protocols that can use this are sftp://, scp://, and file://. (Added in 7.16.4)
Value must be octal, so use & o prefix for number.
(Read and Write property)
See also NEW_DIRECTORY_PERMS option in CURL manual.

### 62.21.240 OptionNewFilePerms as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** An integer, containing the value of the permissions that will be assigned to newly created files on the remote server.
**Notes:**

The default value is & o0644, but any valid value can be used. The only protocols that can use this are sftp://, scp://, and file://. (Added in 7.16.4)
Be aware that you normally specify this in octal values. So use the & o prefix in Xojo.

See also NEW_FILE_PERMS option in CURL manual.

### 62.21.241 OptionNoBody as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** True tells the library to not include the body-part in the output.
**Notes:**

This is only relevant for protocols that have separate header and body parts. On HTTP(S) servers, this will make libCURL do a HEAD request.

To change request to GET, you should use OptionGet. Change request to POST with OptionPost etc.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also NOBODY option in CURL manual.

### 62.21.242 OptionNoProxy as String

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A string with a comma- separated list of hosts which do not use a proxy, if one is specified.
**Notes:**

The only wildcard is a single * character, which matches all hosts, and effectively disables the proxy. Each name in this list is matched as either a domain which contains the hostname, or the hostname itself. For example, local.com would match local.com, local.com:80, and www.local.com, but not www.notlocal.com. (Added in 7.19.4)
(Read and Write property)
See also NOPROXY option in CURL manual.

### 62.21.243 OptionNoSignal as Integer

MBS CURL Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether to not use signals.
**Notes:**

If it is true, libCURL will not use any functions that install signal handlers or any functions that cause signals to be sent to the process. This option is mainly here to allow multi-threaded unix applications to still set/use all timeout options etc, without risking getting signals. (Added in 7.10)

If this option is set and libCURL has been built with the standard name resolver, timeouts will not occur while the name resolve takes place. Consider building libCURL with c-ares support to enable asynchronous DNS lookups, which enables nice timeouts for name resolves without signals.

Setting OptionNoSignal to true makes libCURL NOT ask the system to ignore SIGPIPE signals, which otherwise are sent by the system when trying to send data to a socket which is closed in the other end. libCURL makes an effort to never cause such SIGPIPEs to trigger, but some operating systems have no way to avoid them and even on those that have there are some corner cases when they may still happen, contrary to our desire. In addition, using CURLAUTH_NTLM_WB authentication could cause a SIGCHLD signal to be raised.
(Read and Write property)
See also NOSIGNAL option in CURL manual.

### 62.21.244 OptionPassword as String

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The password to use for the transfer.
**Notes:**

The OptionPassword option should be used in conjunction with the OptionUsername option.
(Read and Write property)
See also PASSWORD option in CURL manual.

### 62.21.245 OptionPathAsIs as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Pass path as it is and do not resolve dots.
**Notes:**

Do not squash dot-dot sequences.
(Read and Write property)
See also PATH_AS_IS option in CURL manual.

### 62.21.246 OptionPinnedPublicKey as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The public key in DER form used to validate the peer public key.
**Notes:**

Native path to key file.
This option is used only if SSLVerifyPeer is true.

(Read and Write property)
See also PINNEDPUBLICKEY option in CURL manual.

### 62.21.247 OptionPipeWait as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Wait/don't wait for pipe/mutex to clarify.
**Notes:** (Read and Write property)
See also PIPEWAIT option in CURL manual.

### 62.21.248 OptionPort as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The remote port number to connect to, instead of the one specified in the URL or the default port for the used protocol.
**Notes:**

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also PORT option in CURL manual.

### 62.21.249 OptionPost as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A boolean parameter tells the library to do a regular HTTP post.
**Notes:**

This will also make the library use the a "Content-Type: application/x-www-form-urlencoded" header. (This is by far the most commonly used POST method).

Use the OptionPostFields option to specify what data to post.

Optionally, you can provide data to POST using the Read event but then you must make sure to not set OptionPostFields to anything but "". When providing data with an event, you must transmit it using chunked transfer-encoding.

You can override the default POST Content-Type: header by setting your own with OptionHTTPHeader.

Using POST with HTTP 1.1 implies the use of a "Expect: 100-continue" header. You can disable this header with OptionHTTPHeader as usual.

If you use POST to a HTTP 1.1 server, you can send data without knowing the size before starting the POST if you use chunked encoding. You enable this by adding a header like "Transfer-Encoding: chunked" with OptionHTTPHeader. With HTTP 1.0 or without chunked transfer, you must specify the size in the request.

When setting CURLOPT_POST to a non-zero value, it will automatically set OptionNoBody to 0 (since 7.14.1).

If you issue a POST request and then want to make a HEAD or GET using the same re-used handle, you must explictly set the new request type using OptionNoBody or OptionGet or similar.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also POST option in CURL manual.

### 62.21.250 OptionPostFields as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A string which should be the full data to post in an HTTP POST operation.
**Example:**

```
dim xml as string // XML or JSON to send as payload
dim c as new CURLSMBS

c.OptionFollowLocation = true
c.OptionMaxRedirs = 3
c.OptionPostFields = xml
c.OptionUserAgent = "Test App"
c.OptionPost = true

// for SOAP use right content type
c.SetOptionHTTPHeader array("Content-Type: application/soap+xml; charset=utf-8")
```

**Notes:**

You must make sure that the data is formatted the way you want the server to receive it. libCURL will not convert or encode it for you. Most web servers will assume this data to be url-encoded. Take note.

This POST is a normal application/x-www-form-urlencoded kind (and libCURL will set that Content-Type by default when this option is used), which is the most commonly used one by HTML forms. See also the OptionPost. Using OptionPostFields implies OptionPost.

Using POST with HTTP 1.1 implies the use of a "Expect: 100-continue" header. You can disable this header with CURLOPT_HTTPHEADER as usual.

To make multipart/formdata posts (aka rfc1867-posts), check out the OptionPost option.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also COPYPOSTFIELDS option in CURL manual.

### 62.21.251 OptionPostFieldSize as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The size of the post data.
**Notes:**

Optional you can set the size of your post data.
If you specify a postfield string, this size will be set automatically.

If you specify a size and no postfield string, the Read event will request data.
(Read and Write property)
See also POSTFIELDSIZE option in CURL manual.

### 62.21.252 OptionPostFieldSizeLarge as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The size of the post data. (64 bit version)
**Deprecated:** This item is deprecated and should no longer be used. You can use OptionPostFieldSize instead. **Notes:**

Optional you can set the size of your post data.
If you specify a postfield string, this size will be set automatically.

If you specify a size and no postfield string, the Read event will request data.
(Read and Write property)

### 62.21.253 OptionPostRedir as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A bitmask to control how libCURL acts on redirects after POSTs that get a 301 or 302 response back.
**Notes:**

A parameter with bit 0 set (value CURL_REDIR_POST_301=1) tells the library to respect RFC 2616/10.3.2 and not convert POST requests into GET requests when following a 301 redirection. Setting bit 1 (value CURL_REDIR_POST_302=2) makes libCURL maintain the request method after a 302 redirect. CURL_REDIR_POST_A is a convenience define that sets both bits.

The non-RFC behaviour is ubiquitous in web browsers, so the library does the conversion by default to maintain consistency. However, a server may require a POST to remain a POST after such a redirection. This option is meaningful only when setting OptionFollowLocation. (Added in 7.17.1) (This option was known as CURLOPT_POST301 up to 7.19.0 as it only supported the 301 way before then)
(Read and Write property)
See also POSTREDIR option in CURL manual.

### 62.21.254 OptionPreProxy as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Name of pre proxy to use.
**Notes:** (Read and Write property)
See also PRE_PROXY option in CURL manual.

### 62.21.255 OptionProtocols as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A bitmask of kProtocol* constants.
**Notes:**

If used, this bitmask limits what protocols libCURL may use in the transfer. This allows you to have a libCURL built to support a wide range of protocols but still limit specific transfers to only be allowed to use a subset of them. By default libCURL will accept all protocols it supports. See also OptionRedirProtocols. (Added in 7.19.4)
(Read and Write property)
See also PROTOCOLS option in CURL manual.

### 62.21.256 OptionProxy as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set HTTP proxy to use.
**Example:**

```
dim c as CURLSMBS // your CURL object
dim psAddress as string // your proxy address
dim psPort as Integer // your proxy port

c.OptionProxy=psAddress
c.OptionProxyPort=psPort
c.OptionProxyType=c.kPROXY_HTTP
```

**Notes:**

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

The parameter should be a string holding the host name or dotted IP address. To specify port number in this string, append : [ port ] to the end of the host name. The proxy string may be prefixed with [ protocol ] :// since any such prefix will be ignored. The proxy's port number may optionally be specified with the separate option ProxyHost.

When you tell the library to use an HTTP proxy, libCURL will transparently convert operations to HTTP even if you specify an FTP URL etc. This may have an impact on what other features of the library you can use, such as CURLOPT_QUOTE and similar FTP specifics that don't work unless you tunnel through the HTTP proxy. Such tunneling is activated with HTTPProxyTunnel.

libCURL respects the environment variables http_proxy, ftp_proxy, all_proxy etc, if any of those is set. The Proxy option does however override any possibly set environment variables.

Starting with 7.14.1, the proxy host string given in environment variables can be specified the exact same way as the proxy can be set with Proxy, include protocol prefix (http://) and embedded user + password.

You can use WinHTTPClientMBS class on Windows or CFProxyMBS on Mac to discover system proxy settings.
(Read and Write property)
See also PROXY option in CURL manual.

### 62.21.257 OptionProxyAuth as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Which proxy authentication to use.
**Notes:**

Pass an integer as parameter, which is set to a bitmask, to tell libCURL what authentication method(s) you want it to use for your proxy authentication. If more than one bit is set, libCURL will first query the site to see what authentication methods it supports and then pick the best one you allow it to use. For some methods, this will induce an extra network round-trip. Set the actual name and password with the ProxyUserPassword option. The bitmask can be constructed by or'ing together the bits listed above for the HTTPAuth option. As of this writing, only Basic, Digest and NTLM work. (Added in 7.10.7)

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also PROXYAUTH option in CURL manual.

### 62.21.258 OptionProxyCAInfo as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The CApath or CAfile used to validate the proxy certificate.
**Example:**

```
// if you use SSL, maybe put in a certificate or disable verification?

dim d as CURLSMBS
// your CURL object

// disable
d.OptionProxySSLVerifyHost = 0
d.OptionProxySSLVerifyPeer = 0

// or better provide root certificates:

Dim cacert As FolderItem = GetFolderItem("cacert.pem")
d.OptionProxyCAInfo = cacert.NativePath
d.OptionProxySSLVerifyHost = 2
d.OptionProxySSLVerifyPeer = 1
```

**Notes:**

Pass native file path.

This option is used only if CURLSMBS.OptionProxySSLVerifyPeer is true
(Read and Write property)
See also PROXY_CAINFO option in CURL manual.

### 62.21.259 OptionProxyCAInfoBlob as String

MBS CURL Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The CAInfo for proxy as blob value.
**Notes:**

This option is for connecting to an HTTPS proxy, not an HTTPS server.

(Read and Write property)
See also PROXY_CAINFO_BLOB option in CURL manual.

### 62.21.260 OptionProxyCAPath as String

See also PROXY_CRLFILE option in CURL manual.

### 62.21.262 OptionProxyIssuerCert as String

MBS CURL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Sets the proxy issuer SSL certificate filename.
**Notes:**

Pass a string naming a file holding a CA certificate in PEM format. If the option is set, an additional check against the peer certificate is performed to verify the issuer of the the HTTPS proxy is indeed the one associated with the certificate provided by the option. This additional check is useful in multi-level PKI where one needs to enforce that the peer certificate is from a specific branch of the tree.

This option makes sense only when used in combination with the OptionProxySSLVerifyPeer option. Otherwise, the result of the check is not considered as failure.

A specific error code (CURLE_SSL_ISSUER_ERROR) is defined with the option, which is returned if the setup of the SSL/TLS session has failed due to a mismatch with the issuer of peer certificate (OptionProxySSLVerifyPeer has to be set too for the check to fail).
(Read and Write property)
See also PROXY_ISSUERCERT option in CURL manual.

### 62.21.263 OptionProxyIssuerCertBlob as String

MBS CURL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set proxy issuer SSL certificate from memory blob.
**Notes:**

Pass data, which contains binary data of a CA certificate in PEM format. If the option is set, an additional check against the peer certificate is performed to verify the issuer of the the HTTPS proxy is indeed the one associated with the certificate provided by the option. This additional check is useful in multi-level PKI where one needs to enforce that the peer certificate is from a specific branch of the tree.

This option should be used in combination with the OptionProxySSLVerifyPeer option. Otherwise, the result of the check is not considered as failure.

A specific error code (CURLE_SSL_ISSUER_ERROR) is defined with the option, which is returned if the setup of the SSL/TLS session has failed due to a mismatch with the issuer of peer certificate (OptionProxySSLVerifyPeer has to be set too for the check to fail).

This option is an alternative to OptionProxyIssuerCert which instead expects a file name as input.
(Read and Write property)
See also PROXY_ISSUERCERT_BLOB option in CURL manual.

### 62.21.264 OptionProxyKeyPassword as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

You can set this value and later you can read it, but you cannot read the default value.

You can use OptionProxy with port, e.g. "12.34.56.78:8080" or pass port here and proxy without port.

For some users it seems like the option with OptionProxy including port works better.
(Read and Write property)
See also PROXYPORT option in CURL manual.

### 62.21.279 OptionProxySSLVersion as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** What version to specifically try to use for proxy.
**Notes:**

The SSL and TLS versions have typically developed from the most insecure version to be more and more secure in this order through history: SSL v2, SSLv3, TLS v1.0, TLS v1.1, TLS v1.2 and the most recent TLS v1.3.

Use one of the available defines for this purpose. The available options are:

See also kSSLVersion* constants.

| | | |
|---|---|---|
| Default | 0 | The default acceptable version range. The minimum acceptable version is by default TLS v1.0 since 7.39.0 (unless the TLS library has a stricter rule). |
| TLSv1 | 1 | TLS v1.0 or later |
| SSLv2 | 2 | SSL v2 (but not SSLv3) |
| SSLv3 | 3 | SSL v3 (but not SSLv2) |
| TLSv1.0 | 4 | TLS v1.0 or later (Added in 7.34.0) |
| TLSv1.1 | 5 | TLS v1.1 or later (Added in 7.34.0) |
| TLSv1.2 | 6 | TLS v1.2 or later (Added in 7.34.0) |
| TLSv1.3 | 7 | TLS v1.3 or later (Added in 7.52.0) |

The maximum TLS version can be set by using one of the CURL_SSLVERSION_MAX_ macros below. It is also possible to OR one of the CURL_SSLVERSION_ macros with one of the CURL_SSLVERSION_MAX_ macros.

| | | |
|---|---|---|
| Default | & h10000 | The flag defines the maximum supported TLS version by libcurl, or the default value from the SSL library is used. libcurl will use a sensible default maximum, which was TLS v1.2 up to before 7.61.0 and is TLS v1.3 since then - assuming the TLS library support it. (Added in 7.54.0) |
| Max TLSv1.0 | & h40000 | The flag defines maximum supported TLS version as TLS v1.0. (Added in 7.54.0) |
| Max TLSv1.1 | & h50000 | The flag defines maximum supported TLS version as TLS v1.1. (Added in 7.54.0) |
| Max TLSv1.2 | & h60000 | The flag defines maximum supported TLS version as TLS v1.2. (Added in 7.54.0) |
| Max TLSv1.3 | & h70000 | The flag defines maximum supported TLS version as TLS v1.3. (Added in 7.54.0) |

Please note that MBS Plugin does not yet support TLS v1.3 now, but may in future.
(Read and Write property)
See also PROXY_SSLVERSION option in CURL manual.

### 62.21.280 OptionProxyTLS13Ciphers as String

**Function:** Specify which TLS 1.3 ciphers suites to use for proxy.
**Notes:**

The list of cipher suites to use for the TLS 1.3 connection to a proxy. The list must be syntactically correct, it consists of one or more cipher suite strings separated by colons.

You'll find more details about cipher lists on this URL:

https://curl.haxx.se/docs/ssl-ciphers.html

The application does not have to keep the string around after setting this option.

**Function:** If this integer value is set to 1 (one), it tells libCURL to set the transfer mode (binary or ASCII) for FTP transfers done via an HTTP proxy, by appending ;type=a or ;type=i to the URL.
**Notes:**

Without this setting, or it being set to 0 (zero, the default), OptionTransferText has no effect when doing FTP via a proxy. Beware that not all proxies support this feature. (Added in 7.18.0)

(Read and Write property)
See also PROXY_TRANSFER_MODE option in CURL manual.

### 62.21.285 OptionProxyType as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** This option is to set type of the proxy.
**Notes:**

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

Available options for this are kPROXY_HTTP, kPROXY_SOCKS4 (added in 7.15.2) kPROXY_SOCKS5.
The HTTP type is default.
(Read and Write property)
See also PROXYTYPE option in CURL manual.

### 62.21.286 OptionProxyUsername as String

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A string, which should be pointing to the user name to use for the transfer while connecting to Proxy.
**Notes:**

In order to specify the password to be used in conjunction with the user name use the OptionProxyPassword option.
(Read and Write property)
See also PROXYUSERNAME option in CURL manual.

### 62.21.287 OptionPut as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A non-zero parameter tells the library to use HTTP PUT to transfer data.
**Notes:**

The data should be set with OptionInFileSize.

This option is deprecated and starting with version 7.12.1 you should instead use OptionUpload.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also PUT option in CURL manual.

### 62.21.288 OptionRandomFile as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A file name for the random file.
**Notes:**

The file will be used to read from to seed the random engine for SSL. The more random the specified file is, the more secure the SSL connection will become.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)
See also RANDOM_FILE option in CURL manual.

### 62.21.289 OptionRange as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A string which should contain the specified range you want.
**Notes:**

It should be in the format "X-Y", where X or Y may be left out. HTTP transfers also support several intervals, separated with commas as in "X-Y,N-M". Using this kind of multiple intervals will cause the HTTP server to send the response document in pieces (using standard MIME separation techniques). Pass a NULL to this option to disable the use of ranges.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also RANGE option in CURL manual.

### 62.21.290 OptionRedirProtocols as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** An integer that holds a bitmask of kProtocol* constants.
**Notes:**

If used, this bitmask limits what protocols libCURL may use in a transfer that it follows to in a redirect when OptionFollowLocation is enabled. This allows you to limit specific transfers to only be allowed to use a subset of protocols in redirections. By default libCURL will allow all protocols except for FILE and SCP. This is a difference compared to pre-7.19.4 versions which unconditionally would follow to all protocols supported. (Added in 7.19.4)
(Read and Write property)
See also REDIR_PROTOCOLS option in CURL manual.

**Notes:**

Sets the authorisation identity (identity to act as).
Pass a text as parameter, which should be pointing to the authorisation identity (authzid) for the transfer.
Only applicable to the PLAIN SASL authentication mechanism where it is optional.

When not specified only the authentication identity (authcid) as specified by the username will be sent to the server, along with the password. The server will derive a authzid from the authcid when not provided, which it will then uses internally.
When the authzid is specified, the use of which is server dependent, it can be used to access another user's inbox, that the user has been granted access to, or a shared mailbox for example.
(Read and Write property)

**Notes:**

Set to true to enable or false to disable. As part of the gssapi negotiation a protection mode is negotiated. The rfc1961 says in section 4.3/4.4 it should be protected, but the NEC reference implementation does not. If enabled, this option allows the unprotected exchange of the protection mode negotiation. (Added in 7.19.4).

(Read and Write property)
See also SSH_KNOWNHOSTS option in CURL manual.

### 62.21.311 OptionSSHPrivateKeyfile as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Example:**

```
Dim c As New CURLSMBS

c.OptionSSHPrivateKeyfile = "/Users/test/.ssh/id_rsa"
c.OptionSSHPublicKeyfile = "/Users/test/.ssh/id_rsa.pub"
c.OptionUsername = "test"
```

**Notes:**

If not used, libCURL defaults to using
textasciitilde /.ssh/id_dsa. If the file is password-protected, set the password with OptionSSLKeyPassword.
(Added in 7.16.1)

For a SFTP transfer (= file transfer over SSH), you would tell the plugin your public and private keys, so the plugin can login.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)

c.OptionUsername = "test"
```

**Notes:**

If not used, libCURL defaults to using
textasciitilde /.ssh/id_dsa.pub. (Added in 7.16.1)

For a SFTP transfer (= file transfer over SSH), you would tell the plugin your public and private keys, so the plugin can login.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.

**Function:** Set SSL client certificate from memory blob.
**Notes:**

Pass data, which contains a client certificate. The format must be "P12" on Secure Transport or Schannel. The format must be "P12" or "PEM" on OpenSSL. The string "P12" or "PEM" must be specified with OptionSSLCertType.

### 62.21.326 OptionSSLKeyType as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The string should be the format of your private key.
**Notes:**

Supported formats are "PEM", "DER" and "ENG".

The format "ENG" enables you to load the private key from a crypto engine. In this case OptionSSLKEY is used as an identifier passed to the engine. You have to set the crypto engine with OptionSSLENGINE. "DER" format key file currently does not work because of a bug in OpenSSL.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also SSLKEYTYPE option in CURL manual.

### 62.21.327 OptionSSLOptions as Integer

**Function:** Whether to use the SSL session ID cache.
**Notes:**

Pass false to disable libCURL's use of SSL session-ID caching. Set this to true to enable it. By default all transfers are done using the cache. Note that while nothing ever should get hurt by attempting to reuse SSL session-IDs, there seem to be broken SSL implementations in the wild that may require you to disable this in order for you to succeed. (Added in 7.16.0)
(Read and Write property)
See also SSL_SESSIONID_CACHE option in CURL manual.

### 62.21.329 OptionSSLVerifyHost as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** This option determines whether libCURL verifies that the server cert is for the server it is known as.
**Example:**

```
// if you use SSL, maybe put in a certificate or disable verification?

dim d as CURLSMBS
// your CURL object

// disable
d.OptionSSLVerifyHost = 0
d.OptionSSLVerifyPeer = 0

// or better provide root certificates:

Dim cacert As FolderItem = GetFolderItem("cacert.pem")
d.OptionCAInfo = cacert.NativePath
d.OptionSSLVerifyHost = 2
d.OptionSSLVerifyPeer = 1
```

**Notes:**

When negotiating an SSL connection, the server sends a certificate indicating its identity.

When OptionSSLVerifyHost is 2, that certificate must indicate that the server is the server to which you meant to connect, or the connection fails.

CURL considers the server the intended one when the Common Name field or a Subject Alternate Name field in the certificate matches the host name in the URL to which you told CURL to connect.

When the value is 1, the certificate must contain a Common Name field, but it doesn't matter what name it says. (This is not ordinarily a useful setting).

When the value is 0, the connection succeeds regardless of the names in the certificate.

The default, since 7.10, is 2.

The checking this option controls is of the identity that the server claims. The server could be lying. To control lying, see OptionSSLVerifyPeer.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

When you don't set the options for certificate path or load system certificates, the MBS Plugin will disable the verify step to let the transfer run.
(Read and Write property)
See also SSL_VERIFYHOST option in CURL manual.

### 62.21.330 OptionSSLVerifyPeer as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Configure whether this CURL instance will verify the SSL peer certificate.
**Example:**

```
// if you use SSL, maybe put in a certificate or disable verification?

dim d as CURLSMBS
// your CURL object

// disable
d.OptionSSLVerifyHost = 0
d.OptionSSLVerifyPeer = 0

// or better provide root certificates:

Dim cacert As FolderItem = GetFolderItem("cacert.pem")
d.OptionCAInfo = cacert.NativePath
d.OptionSSLVerifyHost = 2
d.OptionSSLVerifyPeer = 1
```

**Notes:**

This option determines whether CURL verifies the authenticity of the peer's certificate. A value of 1 means CURL verifies; zero means it doesn't. The default is nonzero, but before 7.10, it was zero.

When negotiating an SSL connection, the server sends a certificate indicating its identity. CURL verifies whether the certificate is authentic, i.e. that you can trust that the server is who the certificate says it is. This trust is based on a chain of digital signatures, rooted in certification authority (CA) certificates you supply. As of 7.10, CURL installs a default bundle of CA certificates and you can specify alternate certificates with the OptionCAINFO option or the OptionCAPATH option.

When OptionSSLVerifyPeer is nonzero, and the verification fails to prove that the certificate is authentic, the connection fails. When the option is zero, the connection succeeds regardless.

Authenticating the certificate is not by itself very useful. You typically want to ensure that the server, as authentically identified by its certificate, is the server you mean to be talking to. Use OptionSSLVerifyHost to control that.

When you don't set the options for certificate path or load system certificates, the MBS Plugin will disable the verify step to let the transfer run.
(Read and Write property)
See also SSL_VERIFYPEER option in CURL manual.

### 62.21.331 OptionSSLVerifyStatus as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set if we should verify the certificate status.
**Notes:** (Read and Write property)
See also SSL_VERIFYSTATUS option in CURL manual.

### 62.21.332 OptionSSLVersion as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** What version of SSL/TLS to attempt to use.
**Example:**

```
dim c as CURLSMBS
c.OptionUseSSL = c.kFTPSSL_ALL
c.OptionSSLVersion = c.kSSLVersionTLSv12
```

**Notes:**

The SSL and TLS versions have typically developed from the most insecure version to be more and more secure in this order through history: SSL v2, SSLv3, TLS v1.0, TLS v1.1, TLS v1.2 and the most recent TLS v1.3.

Use one of the available defines for this purpose. The available options are:

See also kSSLVersion* constants.

The maximum TLS version can be set by using one of the CURL_SSLVERSION_MAX_ macros below. It is also possible to OR one of the CURL_SSLVERSION_ macros with one of the CURL_SSLVER-

| | | |
|---|---|---|
| Default | 0 | The default acceptable version range. The minimum acceptable version is by default TLS v1.0 since 7.39.0 (unless the TLS library has a stricter rule). |
| TLSv1 | 1 | TLS v1.0 or later |
| SSLv2 | 2 | SSL v2 (but not SSLv3) |
| SSLv3 | 3 | SSL v3 (but not SSLv2) |
| TLSv1.0 | 4 | TLS v1.0 or later (Added in 7.34.0) |
| TLSv1.1 | 5 | TLS v1.1 or later (Added in 7.34.0) |

| Default | & h10000 | The flag defines the maximum supported TLS version by libcurl, or the default value from the SSL library is used. libcurl will use a sensible default maximum, which was TLS v1.2 up to before 7.61.0 and is TLS v1.3 since then - assuming the TLS library support it. (Added in 7.54.0) |
| Max TLSv1.0 | & h40000 | The flag defines maximum supported TLS version as TLS v1.0. (Added in 7.54.0) |
| Max TLSv1.1 | & h50000 | The flag defines maximum supported TLS version as TLS v1.1. (Added in 7.54.0) |
| Max TLSv1.2 | & h60000 | The flag defines maximum supported TLS version as TLS v1.2. (Added in 7.54.0) |
| Max TLSv1.3 | & h70000 | The flag defines maximum supported TLS version as TLS v1.3. (Added in 7.54.0) |

Please note that MBS Plugin does not yet support TLS v1.3 now, but may in future.
(Read and Write property)
See also SSLVERSION option in CURL manual.

See also TCP_FASTOPEN option in CURL manual.

### 62.21.338 OptionTCPKeepAlive as Boolean

MBS CURL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** If set to true, TCP keepalive probes will be sent.
**Notes:**

The delay and frequency of these probes can be controlled by the OptionTCPKeepIdle and OptionTCPKeep-Interval options, provided the operating system supports them. Set to false (default behavior) to disable keepalive probes (Added in 7.25.0).
(Read and Write property)

See also TCP_KEEPALIVE option in CURL manual.

### 62.21.339 OptionTCPKeepIdle as Integer

MBS CURL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Sets the delay, in seconds, that the operating system will wait while the connection is idle before sending keepalive probes.
**Notes:**

Not all operating systems support this option. (Added in 7.25.0)
(Read and Write property)
See also TCP_KEEPIDLE option in CURL manual.

### 62.21.340 OptionTCPKeepInterval as Integer

MBS CURL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Sets the interval, in seconds, that the operating system will wait between sending keepalive probes.
**Notes:**

Not all operating systems support this option. (Added in 7.25.0)
(Read and Write property)
See also TCP_KEEPINTVL option in CURL manual.

### 62.21.341 OptionTCPNoDelay as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** An integer specifying whether the TCP_NODELAY option should be set or cleared (true = set, false = clear).
**Notes:**

The option is cleared by default. This will have no effect after the connection has been established.

Setting this option will disable TCP's Nagle algorithm. The purpose of this algorithm is to try to minimize the number of small packets on the network (where "small packets" means TCP segments less than the Maximum Segment Size (MSS) for the network).

Maximizing the amount of data sent per TCP segment is good because it amortizes the overhead of the send. However, in some cases (most notably telnet or rlogin) small segments may need to be sent without delay. This is less efficient than sending larger amounts of data at a time, and can contribute to congestion

on the network if overdone.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also TCP_NODELAY option in CURL manual.

### 62.21.342 OptionTFTPBlockSize as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Specify block size to use for TFTP data transmission.
**Notes:**

Valid range as per RFC 2348 is 8-65464 bytes. The default of 512 bytes will be used if this option is not specified. The specified block size will only be used pending support by the remote server. If the server does not return an option acknowledgement or returns an option acknowledgement with no blksize, the default of 512 bytes will be used. (added in 7.19.4)
(Read and Write property)
See also TFTP_BLKSIZE option in CURL manual.

### 62.21.343 OptionTFTPNoOptions as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether not send any tftp option requests to the server.
**Notes:** (Read and Write property)
See also TFTP_NO_OPTIONS option in CURL manual.

### 62.21.344 OptionTimeCondition as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The Time condition option.
**Notes:**

This defines how the OptionTimeValue time value is treated. You can set this parameter to kTimeConditionIfModifiedSince (1) or kTimeConditionIfUnModifiedSince (2). This feature applies to HTTP and FTP.

The last modification time of a file is not always known and in such instances this feature will have no effect even if the given time condition would have not been met.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also TIMECONDITION option in CURL manual.

### 62.21.345 OptionTimeOut as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The maximum time in seconds that you allow the libCURL transfer operation to take.
**Notes:**

Normally, name lookups can take a considerable time and limiting operations to less than a few minutes risk aborting perfectly normal operations. This option will cause CURL to use the SIGALRM to enable time-outing system calls.

In unix-like systems, this might cause signals to be used unless CURLOPT_NOSIGNAL is set.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also TIMEOUT option in CURL manual.

### 62.21.346 OptionTimeOutMS as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Pass a long as parameter containing the maximum time in milli seconds that you allow the libCURL transfer operation to take.
**Notes:**

Normally, name lookups can take a considerable time and limiting operations to less than a few minutes risk aborting perfectly normal operations. This option will cause CURL to use the SIGALRM to enable time-outing system calls.
(Read and Write property)
See also TIMEOUT_MS option in CURL manual.

### 62.21.347 OptionTimeValue as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** This should be the time in seconds since 1 jan 1970, and the time will be used in a condition as specified with OptionTimeCondition.

**Notes:**

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also TIMEVALUE option in CURL manual.

### 62.21.348 OptionTLS13Ciphers as String

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Specify which TLS 1.3 ciphers suites to use.
**Notes:**

string holding the list of cipher suites to use for the TLS 1.3 connection. The list must be syntactically correct, it consists of one or more cipher suite strings separated by colons.

You'll find more details about cipher lists on this URL:

https://curl.haxx.se/docs/ssl-ciphers.html

The application does not have to keep the string around after setting this option.
(Read and Write property)
See also TLS13_CIPHERS option in CURL manual.

### 62.21.349 OptionTLSAuthPassword as String

MBS CURL Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Sets the TSL authentication password.
**Notes:**

Please also set OptionTLSAuthType.
The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also TLSAUTH_PASSWORD option in CURL manual.

### 62.21.350 OptionTLSAuthType as String

MBS CURL Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Sets the TLS authentication type.
**Notes:**

You can set this to "SRP" to use Secure Remote Password authentication.
Please also set username and password.
The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also TLSAUTH_TYPE option in CURL manual.

### 62.21.351 OptionTLSAuthUsername as String

MBS CURL Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Sets the TSL authentication user name.
**Notes:**

Please also set OptionTLSAuthType.
The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also TLSAUTH_USERNAME option in CURL manual.

### 62.21.352 OptionTransferEncoding as Boolean

MBS CURL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Adds a request for compressed Transfer Encoding in the outgoing HTTP request.
**Notes:**

If the server supports this and so desires, it can respond with the HTTP response sent using a compressed Transfer-Encoding that will be automatically uncompressed by libCURL on reception.

Transfer-Encoding differs slightly from the Content-Encoding you ask for with OptionAcceptEncoding in that a Transfer-Encoding is strictly meant to be for the transfer and thus MUST be decoded before the data arrives in the client. Traditionally, Transfer-Encoding has been much less used and supported by both HTTP clients and HTTP servers.
(Read and Write property)
See also TRANSFER_ENCODING option in CURL manual.

### 62.21.353 OptionTransferText as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** True tells the library to use ASCII mode for ftp transfers, instead of the default binary transfer.
**Notes:**

For win32 systems it does not set the stdout to binary mode. This option can be usable when transferring text data between systems with different views on certain characters, such as newlines or similar.

libCURL does not do a complete ASCII conversion when doing ASCII transfers over FTP. This is a known limitation/flaw that nobody has rectified. libCURL simply sets the mode to ascii and performs a standard transfer.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also TRANSFERTEXT option in CURL manual.

### 62.21.354 OptionUnixSocketPath as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Path to Unix domain socket.
**Notes:** (Read and Write property)
See also UNIX_SOCKET_PATH option in CURL manual.

### 62.21.355 OptionUnrestrictedAuth as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A boolean parameter tells the library it can continue to send authentication (user+password) when following locations, even when hostname changed.
**Notes:**

This option is meaningful only when setting FollowOption.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also UNRESTRICTED_AUTH option in CURL manual.

### 62.21.356 OptionUpkeepIntervalMS as Integer

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Connection upkeep interval.
**Notes:**

Some protocols have "connection upkeep" mechanisms. These mechanisms usually send some traffic on existing connections in order to keep them alive; this can prevent connections from being closed due to overzealous firewalls, for example.

The user needs to explicitly call Upkeep in order to perform the upkeep work.

Currently the only protocol with a connection upkeep mechanism is HTTP/2: when the connection upkeep interval is exceeded and Upkeep is called, an HTTP/2 PING frame is sent on the connection.
(Read and Write property)
See also UPKEEP_INTERVAL_MS option in CURL manual.

### 62.21.357 OptionUpload as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** True tells the library to prepare for an upload.
**Notes:**

The OptionInFileSize or OptionInFileSizeLarge options are also interesting for uploads. If the protocol is HTTP, uploading means using the PUT request unless you tell libCURL otherwise.

Using PUT with HTTP 1.1 implies the use of a "Expect: 100-continue" header. You can disable this header with OptionHTTPHeader as usual.

If you use PUT to a HTTP 1.1 server, you can upload data without knowing the size before starting the transfer if you use chunked encoding. You enable this by adding a header like "Transfer-Encoding: chunked" with OptionHTTPHeader. With HTTP 1.0 or without chunked transfer, you must specify the size.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also UPLOAD option in CURL manual.

### 62.21.358 OptionUploadBufferSize as Integer

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Set preferred upload buffer size.
**Notes:**

Pass a long specifying your preferred size (in bytes) for the upload buffer in libcurl. It makes libcurl uses a larger buffer that gets passed to the next layer in the stack to get sent off. In some setups and for some protocols, there's a huge performance benefit of having a larger upload buffer.

This is just treated as a request, not an order. You cannot be guaranteed to actually get the given size.

The upload buffer size is by default 64 kilobytes. The maximum buffer size allowed to be set is 2 megabytes. The minimum buffer size allowed to be set is 16 kilobytes.

Since curl 7.61.1 the upload buffer is allocated on-demand - so if the handle isn't used for upload, this buffer will not be allocated at all.

For slow upload/downloads, it may be better to set buffer size to 1 MB with OptionUploadBufferSize or OptionBufferSize properties to make transfers faster.
(Read and Write property)
See also UPLOAD_BUFFERSIZE option in CURL manual.

### 62.21.359 OptionURL as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The actual URL to deal with.
**Example:**

```
Dim c As New CURLSMBS

// this example sends a xml request to a server
c.OptionURL = "http://www.someserver.com/service"

// some XML for a SOAP request
Dim request As String = "<?xml version=""1.0""?><methodCall><methodName>application.getValue</methodName><params><param><value>info</value></param></params></methodCall>"

c.OptionPostFields = request

Dim header(-1) As String
header.Append "Content-Type: text/xml"
c.SetOptionHTTPHeader header

// this should be c.kError_OK if okay.
Dim result As Integer = c.Perform

Dim output As String = c.OutputData
Dim debugLog As String = c.DebugData
```

```
Dim HTTPStatus As Integer = c.GetInfoResponseCode

Break
```

**Notes:**

If you need to pass username or password, please consider using the OptionUsername and OptionPassword properties. If you username or password contains characters like @ or :, you must use those properties.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

The parameter should be a char * to a zero terminated string. The string must remain present until CURL no longer needs it, as it doesn't copy the string.

If the given URL lacks the protocol part ("http://" or "ftp://" etc), it will attempt to guess which protocol to use based on the given host name. If the given protocol of the set URL is not supported, libCURL will return on error (kError_UNSUPPORTED_PROTOCOL) when you call Perform. Use VersionInfo for detailed info on which protocols that are supported.

The string given to CURLOPT_URL must be url-encoded and following the RFC 2396:
http://CURL.haxx.se/rfc/rfc2396.txt

CURLOPT_URL is the only option that must be set before Perform is called.
For file uploads or downloads, please include the file name in the URL.

Please do never include username and passwords in URLs, as those get often written to log files and would reveal your credentials!
Instead use OptionUsername and OptionPassword.

If you miss the protocol in the URL, you may get an error about HTTP/0.9 being used and not allowed.
(Read and Write property)
See also URL option in CURL manual.

### 62.21.360 OptionUserAgent as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The user agent string to pass to the server.
**Notes:**

It will be used to set the User-Agent: header in the http request sent to the remote server. This can be used to fool servers or scripts. You can also set any custom header with OptionHTTPHeader.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also USERAGENT option in CURL manual.

### 62.21.361 OptionUsername as String

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The user name to be used in protocol authentication
**Notes:**

In order to specify the password to be used in conjunction with the user name use the OptionPassword option
(Read and Write property)
See also USERNAME option in CURL manual.

### 62.21.362 OptionUseSSL as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Request using SSL / TLS for the transfer.
**Notes:**

Set to an integer using one of the values from below, to make libCURL use your desired level of SSL for the transfer.
These are all protocols that start out plain text and get "upgraded" to SSL using the STARTTLS command. This is for enabling SSL/TLS when you use FTP, SMTP, POP3, IMAP etc.

| | | |
|---|---|---|
| CURLUSESSL_NONE | 0 | Don't attempt to use SSL. |
| CURLUSESSL_TRY | 1 | Try using SSL, proceed as normal otherwise. |
| CURLUSESSL_CONTROL | 2 | Require SSL for the control connection or fail with CURLE_USE_SSL_FAILED. |
| CURLUSESSL_ALL | 3 | Require SSL for all communication or fail with CURLE_USE_SSL_FAILED. |

(Read and Write property)
See also USE_SSL option in CURL manual.

### 62.21.363 OptionVerbose as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether debug messages are sent to the DebugMessage event.
**Notes:**

Default is false.
You need to subclass the CURLSMBS class to add code in the DebugMessage event.
Or you set CollectDebugData = true and later query DebugData property.
Or you use CreateMTDebugOutputFile to stream them to a file.
(Read and Write property)
See also VERBOSE option in CURL manual.

### 62.21.364 OptionWildCardMatch as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Enable wildcard matching.
**Notes:**

Set onoff to true if you want to transfer multiple files according to a file name pattern. The pattern can be specified as part of the OptionURL option, using an fnmatch-like pattern (Shell Pattern Matching) in the last part of URL (file name).

By default, libCURL uses its internal wildcard matching implementation. You can provide your own matching function by the CURLSMBS.FileNameMatch event.

A brief introduction of its syntax follows:

- - ASTERISK

ftp://example.com/some/path/*.txt (for all txt's from the root directory)

? - QUESTION MARK

Question mark matches any (exactly one) character.

ftp://example.com/some/path/photo?.jpeg

[ - BRACKET EXPRESSION

The left bracket opens a bracket expression. The question mark and asterisk have no special meaning in a bracket expression. Each bracket expression ends by the right bracket and matches exactly one character. Some examples follow:

[ a-zA-Z0-9 ] or [ f-gF-G ] - character interval
[ abc ] - character enumeration
[ ^abc ] or [ !abc ] - negation
[ [ :name: ] ] class expression. Supported classes are alnum,lower, space, alpha, digit, print, upper, blank, graph, xdigit.
[ ] [ -!^] - special case - matches only '-', ' ] ', ' [ ', '!' or '^'. These characters have no special purpose.
[ \[ \] \\] - escape syntax. Matches ' [ ', ' ] ' or '´.

Using the rules above, a file name pattern can be constructed:

ftp://example.com/some/path/ [ a-z [ :upper: ] \\] .jpeg

This feature is only supported for FTP download. Not for SFTP or HTTP.
(Read and Write property)
See also WILDCARDMATCH option in CURL manual.

### 62.21.365 OptionXOAuth2Bearer as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The XOAUTH2 bearer token.
**Notes:** (Read and Write property)
See also XOAUTH2_BEARER option in CURL manual.

### 62.21.366 OutputData as String

MBS CURL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The output data from CURL.
**Notes:**

If CollectOutputData property is true, the plugin puts the data received in write event also into this property, so you can grab it after the transfer. Use ClearData method to clear when reusing CURL object.
(Read only property)

### 62.21.367 Paused as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Bytes uploaded so far.
**Notes:** (Read only property)

### 62.21.372 ProgressUploadTotal as Int64

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Bytes to upload in total.
**Notes:** (Read only property)

### 62.21.373 Version as CURLSVersionMBS

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Returns a version object to a filled with information about various run-time features in libCURL.
**Notes:** (Read only property)

### 62.21.374 YieldTime as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether plugin should yield time.
**Notes:**

If set the plugin will yield time to Xojo back so threads and timers work while you download.

Seems like in RB 2009 this property only has effect if you run CURL in a thread.
(Read and Write property)

### 62.21.375 Events

### 62.21.376 ChunkBegin(FileInfo as CURLSFileInfoMBS, Remains as Integer) as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: .

**Function:** The event called on begin of a new chunk.
**Notes:** If splitting of data transfer is enabled, this callback is called before download of an individual chunk started. Note that parameter "remains" works only for FTP wildcard downloading (for now), otherwise is not used.

### 62.21.377 ChunkEnd(FileInfo as CURLSFileInfoMBS, Remains as Integer) as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: .

**Function:** Download of a chunk ended.
**Notes:**

If splitting of data transfer is enabled this callback is called after download of an individual chunk finished. This event is called for skipped or downloaded files.

### 62.21.378 DebugMessage(infotype as Integer, data as string, dataSize as Integer)

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: .

**Function:** A debug event to get data of ongoing process.
**Notes:**

You may need to set OptionVerbose to true.

infotype constants:

| | | |
|---|---|---|
| kInfo_TEXT | 0 | The data is informational text. |
| kInfo_HEADER_IN | 1 | The data is header (or header-like) data received from the peer. |
| kInfo_HEADER_OUT | 2 | The data is header (or header-like) data sent to the peer. |
| kInfo_DATA_IN | 3 | The data is protocol data received from the peer. |
| kInfo_DATA_OUT | 4 | The data is protocol data sent to the peer. |
| kInfo_SSL_DATA_IN | 5 | The data is protocol data received from the peer. |
| kInfo_SSL_DATA_OUT | 6 | The data is protocol data sent to the peer. |

If you set CollectDebugData, the plugin will collect the messages and provide them via the DebugData property. You can still use this event to write your own log instead of in addition.

### 62.21.379 FileNameMatch(Pattern as String, Name as String) as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: .

**Function:** Match a file against a pattern.
**Notes:**

If you don't implement this event, you get the default implementation from CURL.
Return kFileNameMatchNoMatch, kFileNameMatchIsMatch or kFileNameMatchFailed.

### 62.21.380 Finished(Result as Integer)

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: .

**Function:** The event called when transfer has finished.
**Notes:**

For Perform and PerformMT it is called before Perform function returns, so in PerformMT this is called on the thread.
For use with CURLSMultiMBS, it is called after TransferFinished event and before TransfersFinished event.
If you want to modify GUI and use PeformMT, you may need to start a timer to do so.

### 62.21.381 Header(data as string, dataSize as Integer) as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: .

**Function:** New Header data was received.
**Notes:**

You can get error 23 if you don't return lenb(data) in this event.
Or just leave it emtpy so RB will not include it in your application the plugin will return lenb(data) itself.

If you set CollectHeaderData to true, the plugin will collect the messages and provide them via the HeaderData property. You can still use this event to write your own log instead of in addition.

### 62.21.382 Progress(dltotal as Int64, dlnow as Int64, ultotal as Int64, ulnow as Int64, percent as Double) as boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: .

**Function:** An event to report progress of ongoing transfers.
**Notes:**

This function gets called by libCURL with a frequent interval during operation (roughly once per second) no matter if data is being transfered or not. Unknown/unused argument values passed to the callback will be set to zero (like if you only download data, the upload size will remain 0).
Returning a true from this event will cause libCURL to abort the transfer and return kError_ABORTED_BY_CALLBACK.

You can run CURL from a thread to download several things at the same time or keep the GUI more responsive. For better GUI, you can even call a method like app.DoEvents to get the GUI updated more often.

When sending email, ultotal may be zero. In that case use OptionInFileSize to know size of email to upload.

### 62.21.383 Read(count as Integer) as string

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: .

**Function:** This event gets called by libCURL as soon as it needs to read data in order to send it to the peer.
**Notes:**

Return the number of bytes requested. Never return a string with lenb(string)>count. You can return 0 to inform about end of file.

If you stop the current transfer by returning 0 "pre-maturely" (i.e before the server expected it, like when you've told you will upload N bytes and you upload less than N bytes), you may experience that the server "hangs" waiting for the rest of the data that won't come.

The read event may return CURL_READFUNC_ABORT (& h10000000) to stop the current operation immediately, resulting in a kError_ABORTED_BY_CALLBACK error code from the transfer (Added in 7.12.1)

This event is not called when using PerformMT.

If you provide Input data via SetInputData or OpenMTInputFile method, this event is not called and data is taken from the data you provided.

### 62.21.384 RestartRead() as boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: .

**Function:** An event to inform you that reading on the file needs to start at the beginning again.
**Notes:**

Return true on success.
If you use a binarystream for reading you will have to set position to 0 in this event.

This event is not called when using PerformMT.

### 62.21.385 Seek(pos as Int64, whence as Integer) as Integer

MBS CURL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: .

**Function:** Called when CURL needs to perform a seek.
**Notes:**

Normally only needed if you resume a download (Seek forward) or upload is reset (seek back).
Whence is kSeekOriginCurrent, kSeekOriginEnd or kSeekOriginSet.
Please return one of this constants: kSeekReturnCantSeek, kSeekReturnFail or kSeekReturnOk.

### 62.21.386 SSHKey(KnownKey as string, KnownKeyLength as Integer, KnownKeyType as Integer, FoundKey as string, FoundKeyLength as Integer, FoundKeyType as Integer, MatchStatus as Integer) as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: .

**Function:** The event for known hosts callback for SFTP and SCP.
**Notes:**

KnownKey: The known key as string encoded with base64 if KnownKeyLength is zero, otherwise the "raw" data.
KnownKeyLength: The length of the key. Zero for base64 encoded key.
KnownKeyType: The type of the key. (0 = Unknown, 1 = RSA1, 2 = RSA, 3 = DSS)
FoundKey: The found key as string encoded with base64 if FoundKeyLength is zero, otherwise the "raw" data.
FoundKeyLength: The length of the key. Zero for base64 encoded key.
FoundKeyType: The type of the key. (0 = Unknown, 1 = RSA1, 2 = RSA, 3 = DSS)
MatchStatus: The status CURL found. (0 = OK, 1 = Mismatch, 2 = Missing)

Return one of the following values:

| | | |
|---|---|---|
| CURLKHSTAT_FINE_ADD_TO_FILE | 0 | Fine and add to file |
| CURLKHSTAT_FINE | 1 | Fine |
| CURLKHSTAT_REJECT | 2 | reject the connection, return an error |
| CURLKHSTAT_DEFER | 3 | do not accept it, but we can't answer right now so this causes a CURLE_DEFER error but otherwise the connection will be left intact etc |

### 62.21.387 Write(data as string, dataSize as Integer) as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: .

**Function:** This event gets called by libCURL as soon as there is data received that needs to be saved.
**Notes:**

Return the number of bytes actually taken care of. If that amount differs from the amount passed to your function, it'll signal an error to the library and it will abort the transfer and return kError_WRITE_ERROR.

This function may be called with zero bytes data if the transfered file is empty.

The event function will be passed as much data as possible in all invokes, but you cannot possibly make any assumptions. It may be one byte, it may be thousands. The maximum amount of data that can be passed to the write callback is defined in the CURL.h header file: CURL_MAX_WRITE_SIZE (16384).

If you set CollectOutputData to true, the plugin will automatically collect the data and provide it to you after the transfer with the OutputData property. This collecting feature will only work right, if there is enough free memory. You can of course still process data yourself in this event instead of in addition.

### 62.21.388 Constants

### 62.21.389 kAUTH_ANY = & hFFFFFFEF

MBS CURL Plugin, Plugin Version: 9.8.

**Function:** One of the authentication constants for the OptionHTTPAuth property.
**Notes:** Basic (default)

### 62.21.393 kAUTH_Bearer = 64

MBS CURL Plugin, Plugin Version: 18.3.

**Notes:** Digest

### 62.21.395 kAUTH_DIGEST_IE = 16

MBS CURL Plugin, Plugin Version: 15.2.

**Function:** One of the authentication constants for the OptionHTTPAuth property.
**Notes:** HTTP Digest authentication with an IE flavor. Digest authentication is defined in RFC 2617 and is a more secure way to do authentication over public networks than the regular old-fashioned Basic method. The IE flavor is simply that libCURL will use a special "quirk" that IE is known to have used before version 7 and that some servers require the client to use.

### 62.21.396 kAUTH_GSSNEGOTIATE = 4

MBS CURL Plugin, Plugin Version: 9.8.

**Function:** One of the authentication constants for the OptionHTTPAuth property.
**Notes:**

### 62.21.397 kAUTH_NEGOTIATE = 4

MBS CURL Plugin, Plugin Version: 15.2.

**Function:** One of the authentication constants for the OptionHTTPAuth property.
**Notes:**

HTTP Negotiate (SPNEGO) authentication. Negotiate authentication is defined in RFC 4559 and is the most secure way to perform authentication over HTTP.

You need to build libCURL with a suitable GSS-API library or SSPI on Windows for this to work.

### 62.21.398 kAUTH_NONE = 0

MBS CURL Plugin, Plugin Version: 9.8.

**Function:** One of the authentication constants for the OptionHTTPAuth property.

### 62.21.399 kAUTH_NTLM = 8

### 62.21.400 kAUTH_NTLM_WB = 32

MBS CURL Plugin, Plugin Version: 15.2.

**Function:** One of the authentication constants for the OptionHTTPAuth property.
**Notes:**

NTLM delegating to winbind helper. Authentication is performed by a separate binary application that is executed when needed. The name of the application is specified at compile time but is typically /usr/bin/ntlm_auth

Note that libCURL will fork when necessary to run the winbind application and kill it when complete, calling waitpid() to await its exit when done. On POSIX operating systems, killing the process will cause a SIGCHLD signal to be raised (regardless of whether OptionNoSignal is set), which must be handled intelligently by the application. In particular, the application must not unconditionally call wait() in its SIGCHLD signal handler to avoid being subject to a race condition. This behavior is subject to change in future versions of libCURL.

### 62.21.401 kAUTH_Only = & h80000000

MBS CURL Plugin, Plugin Version: 15.2.

**Function:** One of the authentication constants for the OptionHTTPAuth property.
**Notes:** This is a meta symbol. OR this value together with a single specific auth value to force libCURL to probe for un-restricted auth and if not, only that single auth algorithm is acceptable.

If both id and name are specified, the name will be ignored. If neither id nor name are specified, the function will fail with CURLSSLSET_UNKNOWN_BACKEND and set the "avail" pointer to the NULL-terminated list of available backends.

Upon success, the function returns kErrorOK.
If the specified SSL backend is not available, the function returns kErrorUnknownBackend.

The SSL backend can be set only once. If it has already been set, a subsequent attempt to change it will result in a kErrorTooLate.

Returns nil, if there are no backends to choose.

## 62.27.6 Methods

## 62.27.7 Constructor

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The private constructor.

## 62.27.8 List as CURLSSSLBackendMBS()

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Lists the backends.
**Example:**

```
dim list() as CURLSSSLBackendMBS = CURLSSSLBackendMBS.List

for each l as CURLSSSLBackendMBS in list
MsgBox l.name
next
```

**Notes:** The list may not be available if called too late.

### 62.27.9 SetSSLBackend(id as Integer) as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Sets the SSL backend.
**Notes:**

When built with multiple SSL backends, SetSSLBackend() allows to choose one. This function can only be called once, and it must be called *before* CURL constructor().

The backend can be identified by the id (e.g. CURLSSLBACKEND_OPENSSL). The backend can also be specified via the name parameter (passing -1 as id). If both id and name are specified, the name will be ignored. If neither id nor name are specified, the function will fail with CURLSSLSET_UNKNOWN_BACKEND and set the "avail" pointer to the NULL-terminated list of available backends.

Upon success, the function returns kErrorOK.
If the specified SSL backend is not available, the function returns kErrorUnknownBackend.

The SSL backend can be set only once. If it has already been set, a subsequent attempt to change it will result in a kErrorTooLate.

Returns nil, if there are no backends to choose.

### 63.1.4 FormatDateMBS(format as string, value as date, locale as string = "") as string

MBS Util Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

**Function:** Formats a date with C time formatting functions.
**Example:**

```
// for Mac, Windows and Linux we usually have different locale names
dim fr as string
# if TargetMacOS then
fr = "fr_FR"
# elseif TargetWin32 then
fr = "fra"
# elseif TargetLinux
fr = "fr_FR.UTF8"
# else
?
# endif

dim d as new date
MsgBox FormatDateMBS("% x % X", d, fr)
```

**Notes:**

locale is the name of the locale to use. You can pass empty string to use default/current locale.
Format is a format string like for strftime command in C.

The format specification is a string and may contain special character sequences called conversion specifications, each of which is introduced by a '% ' character and terminated by some other character known as a conversion specifier character. All other character sequences are ordinary character sequences.

The characters of ordinary character sequences (including the null byte) are copied verbatim from format to s. However, the characters of conversion specifications are replaced as follows:

Some conversion specifications can be modified by preceding the conversion specifier character by the E or O modifier to indicate that an alternative format should be used. If the alternative format or specification does not exist for the current locale, the behavior will be as if the unmodified conversion specification were used. (SU) The Single UNIX Specification mentions % Ec, % EC, % Ex, % EX, % Ey, % EY, % Od, % Oe, % OH, % OI, % Om, % OM, % OS, % Ou, % OU, % OV, % Ow, % OW, % Oy, where the effect of the O

modifier is to use alternative numeric symbols (say, roman numerals), and that of the E modifier is to use a locale-dependent alternative representation.

### 63.1.7 FormatMBS(format as string, value as Double, locale as string = "") as string

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Formats a double value.
**Example:**

```
MsgBox FormatMBS("% 1.2f", 12.345, "de_DE")
```

**Notes:**

locale is the name of the locale to use. You can pass empty string to use default/current locale.
Format is a format string like for printf command in C.

The FormatMBS formats the value under control of the format. The format is a character string which contains three types of objects: plain characters, which are simply copied to standard output, character escape sequences which are converted and copied to the standard output, and format specifications, each of

which causes printing of the next successive argument.

Character escape sequences are in backslash notation as defined in the ANSI X3.159-1989 ("ANSI C89"), with extensions. The characters and their meanings are as follows:

Each format specification is introduced by the percent character ("% "). The remainder of the format specification includes, in the following order:

Zero or more of the following flags:

### 63.1.10 ParseDateMBS(format as string, text as string, byref value as date, locale as string = "") as boolean

MBS Util Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

**Function:** Parses a date.
**Example:**

```
dim s as string = "2013-11-12 18:31:01"
dim f as string = "% Y-% m-% d % H:% M:% S"
dim d as date

if ParseDateMBS(f, s, d) then
MsgBox d.LongDate + " "+ d.LongTime
end if
```

**Notes:**

locale is the name of the locale to use. You can pass empty string to use default/current locale.
Format is a format string like for strftime command in C.

On success returns true. But even for half parsed dates you can find values in date.
Locale not supported on Windows.
The plugin does not support parsing time zones.

The ParseDateMBS function is the converse function to FormateDateMBS and converts the character string pointed to by s to values which are stored in the date, using the format specified by format. Here format is a character string that consists of field descriptors and text characters, reminiscent of scanf (in C++). Each field descriptor consists of a % character followed by another character that specifies the replacement for the field descriptor. All other characters in the format string must have a matching character in the input string, except for whitespace, which matches zero or more whitespace characters in the input string. There should be whitespace or other alphanumeric characters between any two field descriptors.

The ParseDateMBS function processes the input string from left to right. Each of the three possible input elements (whitespace, literal, or format) are handled one after the other. If the input cannot be matched to the format string the function stops. The remainder of the format and input strings are not processed.

The supported input field descriptors are listed below. In case a text string (such as a weekday or month name) is to be matched, the comparison is case insensitive. In case a number is to be matched, leading zeros are permitted but not required.

Some field descriptors can be modified by the E or O modifier characters to indicate that an alternative format or specification should be used. If the alternative format or specification does not exist in the current locale, the unmodified field descriptor is used.
The E modifier specifies that the input string may contain alternative locale-dependent versions of the date and time representation:

Returns true on success. If the functions fails to match all of the format string and therefore an error occurred the function returns false.

Before libc 5.4.13 whitespace (and the 'n' and 't' specifications) was not handled, no 'E' and 'O' locale modifier characters were accepted, and the 'C' specification was a synonym for the 'c' specification.

The 'y' (year in century) specification is taken to specify a year in the 20th century by libc4 and libc5. It is taken to be a year in the range 1950-2049 by glibc 2.0. It is taken to be a year in 1969-2068 since glibc 2.1.

For reasons of symmetry, glibc tries to support for ParseDateMBS the same format characters as for FormatDateMBS. (In most cases the corresponding fields are parsed, but no field in tm is changed.) This leads to

Similarly, because of GNU extensions to FormatDateMBS, % k is accepted as a synonym for % H, and % l

should be accepted as a synonym for % I, and % P is accepted as a synonym for % p. Finally

The glibc implementation does not require whitespace between two field descriptors.

**Function:** Returns the logical locale for the current user.
**Notes:**

Available in Mac OS X v10.4 and later.

The logical locale for the current user. The locale is formed from the settings for the current user's chosen system locale overlaid with any custom settings the user has specified in System Preferences.

This method may return a retained cached object.

Discussion:
Settings you get from this locale do not change as System Preferences are changed so that your operations are consistent. Typically you perform some operations on the returned object and then allow it to be disposed of. Moreover, since the returned object may be cached, you do not need to hold on to it indefinitely.

MsgBox "display name for en_US in fr_FR: "+displayNameString
// shows: "display name for en_US in fr_FR: anglais (États-Unis)"

// The following example uses the en_GB locale.

s.Value(ConvertEncoding("test",encodings.UTF16))="Just a"
s.Value(ConvertEncoding("Test",encodings.UTF16))="test"

MsgBox str(s.Count) // shows 4
```

**Notes:**

Think of this class like the reimplementation for dictionary class with being case sensitive and with storing items ordered.

When using variants for keys, you may get better results if all keys used have the same data type to improve comparison.
All text comparison is done either case sensitive or insensitive. Defined in constructor.
You can choose whether you want to keep the map ordered using the OrderedMap class or whether you prefer a higher speed with the HashMap class.

MBS Win Plugin, Platform: Windows, Targets: .

**Function:** One of the DDE events.
**Notes:**

A dynamic data exchange (DDE) client receives the AdviceData event after establishing an advise loop with a server. This transaction informs the client that the value of the data item has changed.

Return Values:
A DDE callback function should return DDE_FACK if it processes this transaction, DDE_FBUSY if it is too busy to process this transaction, or DDE_FNOTPROCESSED if it rejects this transaction.

Remarks:
An application must copy the data associated with the DDEBinaryDataMBS object if the application must process the data after the callback function returns.

This transaction informs the server that an advise transaction is outstanding on the specified topic name and item name pair and that data corresponding to the topic name and item name pair has changed.

Return Values:
The server should first call the NewDDEBinaryData function to create a data object that identifies the changed data and then return this object. The server should return nil if it is unable to complete the transaction.

**Notes:**

Tag is passed to the event.
Later when the block is invoked, the BlockBII event is called. If the block is invoked on the main thread, we call the event directly. Else we schedule to call the event as soon as possible on the main thread. With running the event later, we can of course not return the event result to the block caller, but only the value in the AsyncBoolResult property.

### 66.1.19 AsyncBoolResult as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

**Function:** The result for a boolean block called on a non main thread.
**Notes:**

If you use one of the BlockB methods to get a block and it's called on another thread but the main thread, we return the value of this property instead of the actual event result.

## 66.2 class SoftDeclareMBS

### 66.2.1 class SoftDeclareMBS

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** A way to do soft linking to libraries.
**Example:**

```
// Load the Stuffit Bundle on Mac OS X:
dim f as FolderItem
dim s as SoftDeclareMBS

f=FrameworksFolderMBS(-32765).Child("StuffIt.framework")
s=new SoftDeclareMBS

if s.LoadFrameworkFile(f) then
MsgBox "ok"
end if
```

**Notes:**

Deprecated. Please move to newer DeclareLibraryMBS and DeclareFunctionMBS classes.

You can make a declare like this:

Declare Function SpeakString lib "SpeechLib" (SpeakString as pstring) as Integer

But what if the SpeechLib is not installed?
Simple, but your application won't even launch on this machine.
Now you can of course use this MBS Plugin using the SpeechMBS functions, which are all week linked.
But you can also use this class to weak link to the SpeechMBS library like this:

```
dim b as boolean, m,p as memoryblock, c as SoftDeclareMBS

c=new SoftDeclareMBS
p=newmemoryBlock(256) // make the string for the first parameter
p.pstring(0)="Hello World!"

m=newmemoryBlock(4) // make the memoryblock for the parameters
m.long(0)=p.Address(0) // set the first parameter to the address of the string buffer

if c.loadlibrary("SpeechLib") then // Load librarys
if c.loadfunction("SpeakString") then // Load function
```

```
b=c.Call(1,m)
end if
end if
```

This way your application will be loaded, you can call the function, but people who don't have the SpeechLib will also here it.

### 66.2.6 Methods

### 66.2.7 CallFunction(param as string,data as memoryblock) as boolean

MBS Util Plugin, Plugin Version: 7.7, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Calls a function.
**Example:**

```
dim c as SoftDeclareMBS
dim m,p,b as memoryBlock
dim f as folderItem
dim path as string

f=ApplicationsFolderMBS(-32766) // get a folder...
path=f.NativePath

MsgBox path

b=newmemoryBlock(1024)
```

```
b.long(0)=0 // make empty C string

p=newmemoryBlock(lenb(path)+3)
p.cstring(0)=path

m=newmemoryBlock(12+10)
m.long(0)=p.AddressMBS(0)
m.long(4)=b.AddressMBS(0)
m.long(8)=1023

c=new SoftDeclareMBS
if c.LoadDLL("KERNEL32") then
if c.loadfunction("GetShortPathNameA") then
c.CallingMode=0
MsgBox "found function"
if c.CallFunction("iii",m) then
msgbox "Short path is: "+b.cstring(0)
else
msgbox "Failed to call function."
end if
else
msgbox "Loading of function "+c.FunctionName+" failed."
end if
else
msgbox "Loading of Kernel32 failed."
end if
```

**Notes:**

The param string is a combination of the characters "i" for integer, "l" for 64bit integer, "f" for single (float) and "d" for double.
Use "i" for booleans, shorts and pointers.

the memoryblock must match exactly the parameters you specified.
Returns true on success.

- 66.2.8 CallFunction(paramcount as Integer,data as memoryblock) as boolean 13301

### 66.2.8 CallFunction(paramcount as Integer,data as memoryblock) as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Calls a function.
**Example:**

```
dim c as SoftDeclareMBS
dim m,p,b as memoryBlock
dim f as folderItem
dim path as string

f=ApplicationsFolderMBS(-32766) // get a folder...
path=f.NativePath

MsgBox path

b=newmemoryBlock(1024)
b.long(0)=0 // make empty C string

p=newmemoryBlock(lenb(path)+3)
p.cstring(0)=path

m=newmemoryBlock(12+10)
m.long(0)=p.AddressMBS(0)
m.long(4)=b.AddressMBS(0)
m.long(8)=1023

c=new SoftDeclareMBS
if c.LoadDLL("KERNEL32") then
if c.loadfunction("GetShortPathNameA") then
c.CallingMode=0
MsgBox "found function"
if c.CallFunction(3,m) then
msgbox "Short path is: "+b.cstring(0)
else
msgbox "Failed to call function."
end if
else
msgbox "Loading of function "+c.FunctionName+" failed."
end if
else
msgbox "Loading of Kernel32 failed."
end if
```

**Notes:**

If paramtercount is 0, the memoryblock is ignored.
The size of the memoryblock must be minimum 4*paramcount.
Each parameter is set using m.long(n*4) where n=0 is the first parameter.
A parameter may be any integer value or an address of a memoryblock. The address can be read using memoryblock.addressMBS which is part of the plugin. You can even use only one memoryblock for all 3 parameters in the example like this:

m=newmemoryBlock(2100)
m.cstring(1024)=path
m.long(0)=m.address(20)
m.long(4)=m.address(1024)
m.long(8)=1024

First 12 bytes for the parameter table, the next 1000 bytes for the result buffer and finally a thousand bytes for the input string.

Before RB 3.1 this function was named "Call", but RB5 requires that the word "Call" is no longer valid for a function name.

Softdeclare is limited to only 6 parameters for plugin version 3.2. Plugin version 3.3 extends this to 8 parameters.

I am trying to call this to Carbon.framework using the softdeclare function:

UInt32 SwapQDTextFlags(UInt32 newFlags);

flags are OR'd

kQDUseDefaultTextRendering = 0

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The IAMCrossbar interface routes signals from an analog or digital source to a video capture filter.
**Notes:**

This interface is implemented by the Analog Video Crossbar Filter. The Analog Video Crossbar filter is modeled after a general switching matrix, with n inputs and m outputs. For example, a video card might have two external connectors: a coaxial connector for TV, and an S-video input. These would be represented as input pins on the filter. To select one of the inputs, an application would use the IAMCrossbar interface to "route" an input pin to the filter's output pin, by calling the Route method.

|---|---|
| True | Input pin |
| False | Output pin |

PinIndex: Specifies the index of the pin.
PinIndexRelated: Variable that receives the index of the related pin, or –1 if no pin is related to this pin.

The related pin is a pin on the same filter, with the same direction; it typically represents the same physical jack or connector. For example, a video tuner and an audio tuner might be related pins. Typically, if two pins are related, you should route them together.
PhysicalType: Variable that receives a member of the PhysicalConnectorType enumeration, indicating the pin's physical type.

Lasterror is set.
Output pins and input pins are both indexed from zero. To determine the number of output and input pins, call the getPinCounts method.

**Notes:**

OutputPinCount: Variable that receives the number of output pins.
InputPinCount: Variable that receives the number of input pins.

Lasterror is set.

The other IAMCrossbar methods take parameters that specify pins by index number. For these methods, output pins and input pins are both indexed from zero. Use the getPinCounts method to determine the upper bounds for each.

**Function:** The Route method routes an input pin to an output pin.
**Notes:**

OutputPinIndex: Specifies the index of the output pin.
InputPinIndex: Specifies the index of the input pin.

Lasterror is set.

Routing two pins causes the output pin to deliver data from that input pin. Only one input pin at a time can be routed to a given output pin.
Output pins and input pins are both indexed from zero. To determine the number of output and input pins, call the getPinCounts method.

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The frame size of a specified frame.
**Notes:**

The first frame that the filter delivers is numbered zero.
If the filter supports this method, the CompressionCaps_CanCrunch flag is in the Capabilities property. However, this flag can also indicate that the filter supports setting the bit rate, so it does not guarantee that the OverrideFrameSize method is supported.

**Notes:**

The first frame that the filter delivers is numbered zero.
If the filter supports this method, you can use it to override the normal key-frame distribution for a particular frame. After the filter creates a key frame, it might reset its count to determine when the next key frame should occur. For example, if the key-frame rate is 10, and an application uses this method to force frame 5 as a key frame, the filter might wait another 10 frames (until frame 15) before it creates the next key frame.

Lasterror and LastErrorMessage are set.

Instead, use the MediaControl interface on the Filter Graph Manager.
Subclass of the DirectShowMediaFilterMBS class.

### 67.10.6 Methods

### 67.10.7 AllocCapFile(FilePath as string, Size as UInt64)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The AllocCapFile method preallocates a capture file to a specified size. For best results, always capture to a defragmented, preallocated capture file that is larger than the size of the capture data.
**Notes:**

FilePath: a string that contains the name of the file to create or resize.
Size: Size of the file to allocate, in bytes.

Lasterror is set.

This method fails if the file is read-only.
It is best to allocate as much space as possible—ideally, more than needed. However, this can result in a very large file that contains relatively little data. For example, a 1-gigabyte (GB) capture file might contain a few megabytes of captured video. Use the CopyCaptureFile method to copy the data into a new file. That method copies only the data and ignores the empty portion of the original file.
If you use this method to preallocate the file, call SetMode on the file-writer filter with the value zero. If the filter is set to AM_FILE_OVERWRITE, it will delete the preallocated file. Note that some file-writer filters do not support mode 0.

### 67.10.8 Constructor

**Function:** The constructor.

### 67.10.9 Crossbar(filter as DirectShowBaseFilterMBS) as DirectShowAMCrossbarMBS

**Notes:**

See also:

This function implements the FindInterface call with LOOK_UPSTREAM_ONLY and the filter you provide.

### 67.10.10 FindPin(Source as DirectShowBaseFilterMBS, PinDirection as Integer, Category as DirectShowGUIDMBS = nil, Type as DirectShowGUIDMBS = nil, Unconnected as boolean = false, Num as Integer = 0) as DirectShowPinMBS

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The FindPin method retrieves a particular pin on a filter, or determines whether a given pin matches the specified criteria.
**Notes:**

Source: an interface on a filter, or to an interface on a pin.
PinDirection: Specifies the pin direction (input or output). See constants in DirectShowPinMBS class.
Category: A GUID that specifies one of the pin categories listed in Pin Property Set. To match any pin, regardless of category, set this parameter to nil.
Type: A major type GUID that specifies the media type. Use nil to match any media type.
Unconnected: Boolean value that specifies whether the pin must be unconnected. If true, the pin must be unconnected. If false, the pin can be connected or unconnected.
num: Zero-based index of the pin to retrieve, from the set of matching pins. If Source is a filter, and more than one pin matches the search criteria, this parameter specifies which pin to retrieve. If Source is a pin, this parameter is ignored.

Returns the pin object.
Lasterror is set.

If Source is a filter, the method searches for the nth pin on that filter that matches the search criteria, where n is given by the num parameter. If the method finds a matching pin, it returns the pin.
If Source is a pin, the method tests that pin against the search criteria. If the pin matches the criteria, the method returns the pin. Otherwise, it returns nil.

Typically, an application will not need to use this method. It is provided for unusually complex tasks, when the RenderStream method cannot build the filter graph. Use this method to retrieve a desired pin from a capture filter, and then build the rest of the graph manually.

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The FindPin method retrieves a particular pin on a filter, or determines whether a given pin matches the specified criteria.
**Notes:**

Source: an interface on a filter, or to an interface on a pin.
PinDirection: Specifies the pin direction (input or output). See constants in DirectShowPinMBS class.
Category: A GUID that specifies one of the pin categories listed in Pin Property Set. To match any pin, regardless of category, set this parameter to nil.

num: Zero-based index of the pin to retrieve, from the set of matching pins. If Source is a filter, and more than one pin matches the search criteria, this parameter specifies which pin to retrieve. If Source is a pin, this parameter is ignored.

Returns the pin object.
Lasterror is set.

If Source is a filter, the method searches for the nth pin on that filter that matches the search criteria, where n is given by the num parameter. If the method finds a matching pin, it returns the pin.
If Source is a pin, the method tests that pin against the search criteria. If the pin matches the criteria, the method returns the pin. Otherwise, it returns nil.

## 67.11 class DirectShowConfigAviMuxMBS

### 67.11.1 class DirectShowConfigAviMuxMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** This class configures the AVI Mux filter.
**Notes:**

Applications can use this class to set the master stream and to create an AVI 1.0 index.

DirectShowConfigAviMuxMBS provides backward compatibility with older Video for Windows (VFW) Audio-Video Interleaved (AVI) index formats (idx1) as well as extended AVI 2.0 index formats (indx) to allow for file sizes greater than 1 gigabyte (GB). Set and retrieve the compatibility indexes by using the OutputCompatibilityIndex property.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Points to an IConfigAviMux interface.
(Read and Write property)

### 67.11.6 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The last error code.
**Notes:**

Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

### 67.11.7 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The formatted error message for the last error.
**Notes:** (Read and Write property)

### 67.11.8 MasterStream as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Specifies the master stream that will be used to synchronize the other streams in the file.
**Notes:**

Specifies the index of the stream, or –1 to indicate no master stream. The AVI Mux writes one stream for each connected input pin. Stream numbers are indexed from zero.
Lasterror is set.

If you are capturing audio and video from two different sources, use this method to synchronize the streams. Streams coming from separate capture sources may be captured at slightly different rates. If you specify a master stream, the AVI Mux adjusts the playback rates for the other streams, to compensate for any drift that might occur.
It is recommended to use the audio stream as the master stream, because minor adjustments to the video playback rate are less noticeable than changes to the audio playback rate. Also, modifying the audio playback rate will cause the audio to be resampled by the audio driver.
This method works by adjusting the dwScale and dwRate values in the AVISTREAMHEADER structure.
(Read and Write computed property)

### 67.11.9 OutputCompatibilityIndex as Boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Get or set the AVI index format.
**Notes:**

Lasterror is set.
True: Create an AVI 1.0 index, as well as an AVI 2.0 index.

False: Create an AVI 2.0 index, but not an AVI 1.0 index.

The AVI Mux filter always creates an AVI 2.0 index ('indx' format). If the value given in fOldIndex is TRUE, the AVI Mux also creates an AVI 1.0 index ('idx1' format), for backward compatibility with Video for Windows.
The AVI 2.0 index format allows for larger files, incremental growth of files, and minimized disk seeks.
(Read and Write computed property)

## 67.12 class DirectShowConfigInterleavingMBS

### 67.12.1 class DirectShowConfigInterleavingMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The ConfigInterleaving interface controls how the AVI Mux filter interleaves audio and video samples.
**Notes:**

Video-authoring applications that handle capturing should use this interface when they need to control how audio samples and video frames will be saved on a disk.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

### 67.12.2 Methods

### 67.12.3 Constructor

### 67.12.9 Constants

### 67.12.10 kInterleaveBuffered = 3

MBS Win Plugin, Plugin Version: 12.1.

**Function:** One of the interleaving mode constants.
**Notes:**

Noninterleaved.
This mode is equivalent to kInterleaveNone but uses less file space and system overhead.

### 67.12.11 kInterleaveCapture = 1

MBS Win Plugin, Plugin Version: 12.1.

**Function:** One of the interleaving mode constants.
**Notes:**

Approximate interleaving with less overhead than kInterleaveFull.
This mode is suitable for video capture. The AVI Mux attempts to use unbuffered, overlapped write operations. Unless the interleaving parameters are configured properly, however, frames may be dropped if one

stream blocks while it waits for data from another stream. In particular, audio buffers should be less than .5 second, or else the video stream will block for excessive periods of time.

### 67.12.12 kInterleaveFull = 2

MBS Win Plugin, Plugin Version: 12.1.

**Function:** One of the interleaving mode constants.
**Notes:**

Full, precise interleaving of audio samples and video frames.
Streams will block indefinitely, waiting for equal amounts of data before interleaving. This mode is suitable for authoring and playback.

### 67.12.13 kInterleaveNone = 0

MBS Win Plugin, Plugin Version: 12.1.

**Function:** One of the interleaving mode constants.
**Notes:**

Noninterleaved.
Frames are written in the order they arrive. Files must be interleaved for playback at a later time. In this mode, the AVI Mux filter attempts to use unbuffered, overlapped write operations, to increase throughput.

## 67.13 class DirectShowDVInfoMBS

### 67.13.1 class DirectShowDVInfoMBS

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

### 67.15.1 class DirectShowEnumPinsMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Enumerates pins on a filter.
**Notes:**

The BaseFilterMBS.EnumPins method returns this interface. It is based on the standard Component Object Model (COM) enumerators.
The filter graph manager uses this interface when it connects filters. Applications can use it to retrieve pins on a filter. For more information, see Enumerating Objects in a Filter Graph.
If the number of pins on the filter changes, some methods on this interface return VFW_E_ENUM_OUT_OF_SYNC. Call the Reset method to resynchronize the enumerator.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

### 67.15.2 Methods

### 67.15.3 Clone as DirectShowEnumPinsMBS

**Function:** The Clone method makes a copy of the enumerator with the same enumeration state.
**Notes:**

Lasterror is set. Returns nil on any error.

If the number of pins changes, the enumerator is no longer consistent with the filter, and the method returns VFW_E_ENUM_OUT_OF_SYNC. Discard any data obtained from previous calls to the enumerator, because it might be invalid. Update the enumerator by calling the IEnumPins::Reset method. You can then call the Clone method safely.

## 67.16 class DirectShowFileSinkFilterMBS

### 67.16.1 class DirectShowFileSinkFilterMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The FileSinkFilter interface is implemented on filters that write media streams to a file.
**Notes:**

A file sink filter in a video capture filter graph, for instance, writes the output of the video compression filter to a file. Typically, the application running this filter graph should enable the user to enter the name of the file to be written to. This interface enables the communication of this information.
If a filter needs the name of an output file, it should expose this interface to allow an application to set the file name. Note that there is currently no base class implementation of this interface.
Any application that must set the name of the file into which the file sink filter will write should use this interface to get and set the file name.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

## 67.17 class DirectShowFilterGraphMBS

### 67.17.1 class DirectShowFilterGraphMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** This class provides methods for building a filter graph.
**Notes:**

An application can use it to add filters to the graph, connect or disconnect filters, remove filters, and perform other basic operations. However, the DirectShowGraphBuilderMBS interface inherits from this interface and provides additional methods that are more sophisticated. Therefore, applications should use DirectShowGraphBuilderMBS rather than using DirectShowFilterGraphMBS directly.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

### 67.17.2 Methods

### 67.17.3 AddFilter(SourceFilter as DirectShowBaseFilterMBS, Name as string = "")

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Adds a filter to the graph.
**Notes:**

Filter: The filter to add.
Name: name for filter.

Lasterror is set.

The name of the filter can be "", in which case the Filter Graph Manager generates a name. If the name is not "" and is not unique, this method will modify the name in an attempt to generate a new unique name. If this is successful, this method sets lasterror to VFW_S_DUPLICATE_NAME. If it cannot generate a unique name, it sets lasterror to VFW_E_DUPLICATE_NAME.
AddFilter calls the filter's JoinFilterGraph method to inform the filter that it has been added. AddFilter must be called before attempting to use the Connect, ConnectDirect, or Render method to connect or render pins belonging to the added filter.
The Filter Graph Manager holds a reference count on the filter until the filter is removed from the graph or the Filter Graph Manager is released.

### 67.17.4 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The private constructor.

### 67.17.5 SetDefaultSyncSource

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Sets the reference clock to the default clock.
**Notes:**

Lasterror is set.

This method instructs the Filter Graph Manager to choose a reference clock using its default algorithm. For more information about the algorithm that it uses, see Reference Clocks.
Usually you do not need to call this method, because the Filter Graph Manager automatically selects a clock. However, if you call SetSyncSource to override the clock, you can use SetDefaultSyncSource to restore the default clock.
This method fails if the filter graph is running or paused.

### 67.17.6 Properties

### 67.17.7 Handle as Integer

(Read and Write property)

### 67.18.6 Name as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The name of the filter.
**Notes:** (Read and Write property)

## 67.19 class DirectShowGraphBuilderMBS

### 67.19.1 class DirectShowGraphBuilderMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** This class provides methods that enable an application to build a filter graph.
**Notes:**

The GraphBuilder interface inherits from the FilterGraph interface. FilterGraph provides basic operations, such as adding a filter to the graph or connecting two pins. GraphBuilder adds further methods that construct graphs from partial information. For example, the RenderFile method builds a graph for file playback, given the name of the file. The Render method renders data from an output pin by connecting new filters to the pin.

Using these methods, an application does not need to specify every filter and pin connection in the graph. Instead, the Filter Graph Manager selects filters that are registered on the user's system, adds them to the graph, and connects them.

### 67.19.4 Methods

### 67.19.5 Abort

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The Abort method requests the Filter Graph Manager to halt its current task as quickly as possible.
**Notes:**

The current task may or may not fail to complete. Possibly the fastest option for the Filter Graph Manager is to complete the task.

Lasterror is set.

### 67.19.6 AddSourceFilter(FileName as string, FilterName as string) as DirectShowBaseFilterMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Adds a source filter for a specified file to the filter graph.
**Notes:**

FileName: the name of the file to load.
FilterName: name for the source filter.

Lasterror is set.

This method searches for an installed filter that can read the specified file. If it finds one, the method adds it to the filter graph and returns a pointer to the filter's IBaseFilter interface. To determine the media type and compression scheme of the file, the Filter Graph Manager reads the first few bytes of the file, looking for specific patterns of bytes, as documented in the article Registering a Custom File Type.

The application is responsible for building the rest of the filter graph. To do so, call EnumPins to enumerate the output pins on the source filter. Then use either the Connect method or the Render method.

If the method succeeds, the BaseFilter interface has an outstanding reference count. The caller must release the interface.

To render a file for default playback, use the RenderFile method.

The Filter Graph Manager holds a reference count on the filter until the filter is removed from the graph or the Filter Graph Manager is released.

### 67.19.7 Connect(pinOut as DirectShowPinMBS, pinIn as DirectShowPinMBS)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Connects the two pins, using intermediates if necessary.
**Notes:**

pinOut: the output pin.
pinIn: the input pin.

Lasterror is set.

This method connects two pins directly or indirectly, adding intermediate filters if necessary. The method starts by attempting a direct connection. If that fails, it tries to use any filters that are already in the filter graph and have unconnected input pins. (It enumerates these in an arbitrary order.) If that fails, it searches for filters in the registry, and tries them in order of merit.

During the connection process, the Filter Graph Manager ignores pins on intermediate filters if the pin name begins with a tilde (
textasciitilde ).

### 67.19.14 Render(pinOut as DirectShowPinMBS)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The Render method builds a filter graph that renders the data from a specified output pin.
**Notes:**

pinOut: an output pin.
Lasterror is set.

This method renders the data from a specified output pin, adding new filters to the graph as needed. Filters are tried in the same order as for the Connect method. For more information, see Intelligent Connect.
During the connection process, the Filter Graph Manager ignores pins on intermediate filters if the pin name begins with a tilde (
textasciitilde ).

### 67.19.15 RenderFile(FilePath as string)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Builds a filter graph that renders the specified file.
**Notes:**

FilePath: string that contains the name of a media file.
Lasterror is set.

If the FilePath parameter specifies a media file, the method builds a filter graph for default playback. First it adds a source filter that can read the file, using the same process as the AddSourceFilter method. Then it renders the output pins on the source filter, adding intermediate filters if necessary. It tries filters in the same order as the Connect method.
During the connection process, the Filter Graph Manager ignores pins on intermediate filters if the pin name begins with a tilde (
textasciitilde ).
Note that the RenderFile method does not remove any filters from the graph. If you call RenderFile twice, the second call simply adds more filters to the graph. When you run the graph, both sources will play at the same time.

### 67.19.16 SetLogFile(FilePath as string)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The SetLogFile method sets the file for logging actions taken when attempting to perform an operation.

## 67.21 class DirectShowMediaControlMBS

### 67.21.1 class DirectShowMediaControlMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Provides methods for controlling the flow of data through the filter graph.
**Notes:**

It includes methods for running, pausing, and stopping the graph. The Filter Graph Manager implements this interface.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

### 67.21.2 Methods

### 67.21.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The private constructor.

### 67.21.4 GetState(msTimeout as Integer = -1) as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Retrieves the state of the filter graph—paused, running, or stopped.
**Notes:**

msTimeout: Duration of the time-out, in milliseconds, or INFINITE (-1) to specify an infinite time-out.

State transitions are not necessarily synchronous. Therefore, when you call this method, the filter graph might be in transition to a new state. In that case, the method blocks until the transition completes or until the specified time-out elapses.

Lasterror is set.

Applications can use this method to determine whether playback has started after a call to Run. Generally, applications should have their own mechanism for tracking which state they have put the filter graph into. Applications typically use the current state to determine which user interface controls are enabled or disabled. For example, once the graph goes into the running state, the application might disable a "Play" button and enable "Stop" and "Pause" buttons.
If the filter graph is in a transition to a new state, the returned state is the new state, not the previous state. This method returns an error if there is a call on another thread to change the state while this method is

blocked.
Avoid specifying a time-out of INFINITE, because threads cannot process messages while waiting in GetState. If you call GetState from the thread that processes Windows messages, specify small wait times on the call in order to remain responsive to user input. This is especially important when the source is streaming over a network or from the Internet because state transitions in these environments can take significantly more time to complete.

### 67.21.5 Pause

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Pauses all the filters in the filter graph.
**Notes:**

Lasterror is set.

Pausing the filter graph cues the graph for immediate rendering when the graph is next run. While the graph is paused, filters process data but do not render it. Data is pushed through the graph and processed by transform filters as far as buffering permits, but renderer filters do not render the data. However, video renderers display a static poster frame of the first sample.

If the method returns S_FALSE, call the GetState method to wait for the state transition to complete, or to check if the transition has completed. When you call Pause to display the first frame of a video file, always follow it immediately with a call to GetState to ensure that the state transition has completed. Failure to do this can result in the video rectangle being painted black.
If the method fails, it stops the graph before returning.

### 67.21.6 RenderFile(FilePath as string)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Builds a filter graph that renders the specified file.
**Notes:**

Lasterror is set.

filePath: Specifies the name of the file to load.

### 67.21.7 Run

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Runs all the filters in the filter graph.
**Notes:**

While the graph is running, data moves through the graph and is rendered.
Lasterror is set.

If the filter graph is stopped, this method pauses the graph before running. If the graph is already running, the method returns S_OK but has no effect.
The graph runs until the application calls the Pause or Stop method. When playback reaches the end of the stream, the graph continues to run, but the filters do not stream any more data. At that point, the application can pause or stop the graph. For information about the end-of-stream event, see Pause and EC_COMPLETE.
This method does not seek to the beginning of the stream. Therefore, if you run the graph, pause it, and then run it again, playback resumes from the paused position. If you run the graph after it has reached the end of the stream, nothing is rendered. To seek the graph, use the MediaSeeking interface.
If method returns S_FALSE, it means that the method returned before all of the filters switched to a running state. The filters will complete the transition after the method returns. Optionally, you can wait for the transition to complete by calling the GetState method with a timeout value. However, this is not required.
If the Run method returns an error code, it means that one or more filters failed to run. However, some filters might be in a running state. In a multistream graph, entire streams might be playing successfully. Typically the application would tear down the graph and report an error in this case.

### 67.21.8 Stop

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Stops all the filters in the graph.
**Notes:**

Lasterror is set.

If the graph is running, this method pauses the graph before stopping it. While paused, video renderers can copy the current frame to display as a poster frame.

This method does not seek to the beginning of the stream. If you call this method and then call the Run method, playback resumes from the stopped position. To seek, use the IMediaSeeking interface.

The Filter Graph Manager pauses all the filters in the graph, and then calls the Stop method on all filters, without waiting for the pause operations to complete. Therefore, some filters might have their Stop method called before they complete their pause operation. If you develop a custom rendering filter, you might need to handle this case by pausing the filter if it receives a stop command while in a running state. However, most filters do not need to take any special action in this regard.

### 67.21.9 StopWhenReady

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Pauses the filter graph, allowing filters to queue data, and then stops the filter graph.
**Notes:**

Lasterror is set.

This method is useful if you want to seek the filter graph while the graph is stopped. As long as the filter graph is stopped, changes in the current position do not repaint the video window with a new frame. Therefore, calling SetPositions does not update the video window. To update the window after the seek operation, call StopWhenReady. This method transitions the graph to a paused state, waits for the pause operation to complete, and then transitions the graph back to stopped. The pause operation queues data in the graph, so that the video renderer receives and displays the new frame.

This method is asynchronous. It waits on a separate thread for the pause to complete. The calling thread does not block, which enables the application to respond to user input. When the method returns, the logical state of the graph is stopped, even before the pause operation completes. If you call the GetState method at this point, it returns State_Stopped.

If the application issues another state-change command (such as pause, run, or seek) before the pause operation completes, the new command cancels the pending stop command. The pause operation completes, but the graph does not stop.

This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

### 67.22.2 Methods

### 67.22.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The private constructor.

### 67.22.4 Properties

### 67.22.5 NotifyFlags as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Enables or disables event notifications.
**Notes:**

Value indicating whether to enable or disable event notifications. Must be one of the following values: 0 = Enable event notifications or AM_MEDIAEVENT_NONOTIFY = Disable event notifications.

Lasterror is set.

By default, the Filter Graph Manager posts event notifications for the application. If the NotifyFlags parameter is AM_MEDIAEVENT_NONOTIFY, the Filter Graph Manager clears any pending event notifications from the queue, and does not post any new ones.
If event notifications are disabled, the handle returned by the GetEventHandle method is signaled at the end of each stream—that is, whenever the Filter Graph Manager receives an EC_COMPLETE event.
(Read and Write computed property)

### 67.22.6 Constants

### 67.22.7 AM_MEDIAEVENT_NONOTIFY = 1

MBS Win Plugin, Plugin Version: 12.1.

**Function:** One of the notify flags constant.
**Notes:** Pass this value to NotifyFlags to disable event notification.

# 67.23 class DirectShowMediaEventMBS

## 67.23.1 class DirectShowMediaEventMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The class for media event handling.
**Notes:**

The MediaEvent interface contains methods for retrieving event notifications and for overriding the Filter Graph Manager's default handling of events. The MediaEventEx interface inherits this interface and extends it.

The Filter Graph Manager implements this interface. Applications can use it to respond to events that occur in the filter graph, such as the end of a stream or a rendering error. Filters post events to the filter graph using the IMediaEventSink interface.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

## 67.23.2 Methods

## 67.23.3 CancelDefaultHandling(eventCode as Integer)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Cancels the Filter Graph Manager's default handling for a specified event.
**Notes:**

The event notification is passed to the application.
Lasterror is set.

To restore the default handling for an event, call the RestoreDefaultHandling method with the event code.

## 67.23.4 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The private constructor.

### 67.23.5 FreeEventParams(eventCode as Integer, Param1 as Integer, Param2 as Integer)

**Function:** Frees resources associated with the parameters of an event.
**Notes:**

EventCode: Event code.
Param1: First event parameter.
Param2: Second event parameter.

Lasterorr is set.
After you call the GetEvent method to retrieve an event notification, you must call FreeEventParams. This method frees any resources that were allocated for the event parameters. Pass in the same variables used for the GetEvent call.

### 67.23.6 RestoreDefaultHandling(eventCode as Integer)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Restores the Filter Graph Manager's default handling for a specified event.
**Notes:**

Lasterror is set.
By default, the Filter Graph Manager handles some events (such as EC_REPAINT) without passing them to the application. If you call the CancelDefaultHandling method to override the default handling for an event, you can restore the default behavior by calling RestoreDefaultHandling with the same event code.

### 67.23.7 Properties

### 67.23.8 Handle as Integer

### 67.23.12 AM_MEDIAEVENT_NONOTIFY = 1

MBS Win Plugin, Plugin Version: 12.1.

**Function:** One of the notify flags constant.
**Notes:** Pass this value to NotifyFlags to disable event notification.

## 67.24 class DirectShowMediaFilterMBS

### 67.24.1 class DirectShowMediaFilterMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The MediaFilter interface controls the streaming state of a filter.
**Notes:**

All DirectShow filters implement this interface. It provides methods for switching the filter between states (stopped, paused, and running); for retrieving the filter's current state; and for setting a reference clock. Applications should not call MediaFilter methods on filters.

The Filter Graph Manager also exposes this interface. Applications can use the SetSyncSource method to set the graph reference clock, and GetSyncSource to retrieve the clock. Applications should not call the other methods on this interface. Instead, use the corresponding methods on the MediaControl interface.
The BaseFilter interface inherits from MediaFilter.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

### 67.24.2 Methods

### 67.24.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The private constructor.

### 67.24.4 Pause

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The Pause method pauses the filter.
**Notes:**

Lasterror is set.

When a filter is paused, it can receive, process, and deliver samples. However, a renderer filter will only accept one sample while paused. Therefore, when the filter graph is paused, samples move through the graph until the first sample reaches the renderer. At that point, streaming is paused until the Run method is called. Video renderers display the first sample as a still frame.

Live capture filters do not deliver any samples while paused, only while running.

The state transition might be asynchronous. If the method returns before the transition completes, the lasterror value is 1. A renderer filter does not complete the transition to paused until either (1) it receives one sample, or (2) it receives an end-of-stream notification. While the state transition is pending, State gives lasterror VFW_S_STATE_INTERMEDIATE.

### 67.24.5 Run(StartTime as Int64)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The Run method runs the filter.
**Notes:**

StartTime: Reference time corresponding to stream time 0.
Lasterror is set.

When a filter is running, it can receive, process, and deliver samples. Source filters generate new samples, and renderer filters render them.
The state transition might be asynchronous. If the method returns before the transition completes, the lasterror value is 1.
Stream time is calculated as the current reference time minus StartTime. To calculate when a media sample should be rendered, the renderer compares the time stamp with the current stream time. Thus, a media sample with a time stamp of zero should be rendered at time StartTime. For more information, see Time and Clocks in DirectShow.
When an application calls the Run method, the Filter Graph Manager calls Run on each filter. It sets the value of StartTime slightly in the future, to account for graph latency.

### 67.24.6 Stop

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The Stop method stops the filter.
**Notes:**

Lasterror is set.
When a filter is stopped, it does not process or deliver any samples, and it rejects samples from upstream filters.
The state transition might be asynchronous. If the method returns before the transition completes, the lasterror value is 1.
This method always sets the filter's state to kStateStopped, even if the method returns an error code.

### 67.24.7 Properties

### 67.24.8 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The internal object reference.
**Notes:**

Points to an IMediaFilter interface.
(Read and Write property)

### 67.24.9 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The last error code.

## 67.26 class DirectShowMonikerMBS

### 67.26.1 class DirectShowMonikerMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The moniker class to query information about devices.
**Notes:**

In this plugin we use monikers to enumerate filters and devices in order to connect with BindBaseFilter method.

Enables you to use a moniker object, which contains information that uniquely identifies a COM object. An object that has a pointer to the moniker object's IMoniker interface can locate, activate, and get access to the identified object without having any other specific information on where the object is actually located in a distributed system.
Monikers are used as the basis for linking in COM. A linked object contains a moniker that identifies its source. When the user activates the linked object to edit it, the moniker is bound; this loads the link source into memory.

### 67.26.6 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The private constructor.

### 67.26.7 DisplayName(BindContext as DirectShowBindContextMBS = nil) as string

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Retrieves the display name for the moniker.
**Notes:**

BindContext: The DirectShowBindContextMBS interface on the bind context to be used in this operation. The bind context caches objects bound during the binding process, contains parameters that apply to all operations using the bind context, and provides the means by which the moniker implementation should retrieve information about its environment. If you provide nil, the plugin creates a temporary context.

GetDisplayName provides a string that is a displayable representation of the moniker. A display name is not a complete representation of a moniker's internal state; it is simply a form that can be read by users. As a result, it is possible (though rare) for two different monikers to have the same display name.

This is not a text to show to user.

### 67.26.8 EnumMonikers(forward as boolean) as DirectShowEnumMonikerMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Retrieves enumerator for the components of a composite moniker.

# 67.27 class DirectShowNullRendererMBS

## 67.27.1 class DirectShowNullRendererMBS

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The null renderer filter.
**Notes:**

The Null Renderer filter is a renderer that discards every sample it receives, without displaying or rendering the sample data.

Use this filter when an output pin in the graph requires a downstream connection, but you do not wish to render the data from that pin. By connecting the output pin to the Null Renderer, you complete the connection without rendering the data.
Subclass of the DirectShowBaseFilterMBS class.

### 67.28.4 Methods

### 67.28.5 Accept(Type as DirectShowMediaTypeMBS) as Boolean

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The Accept method determines whether the pin accepts a specified media type.
**Notes:**

Lasterror is set.

A return value of true indicates that the pin will accept the media type, either on the next sample, or after a pin reconnection. The implementation should take into account the current state of the filter, including connections on other pins, and any properties that can be set on the filter.

Any other return value, including false, means that the pin rejects the media type. Therefore, test for true explicitly.

If the filter is running, a return value of true is ambiguous. The pin might accept a format change on the next media sample, without reconnecting; or it might need to reconnect. If the pin supports the IPinConnection interface, call the IPinConnection::DynamicQueryAccept method, which specifically tests whether the pin can accept the new type without reconnecting.

### 67.28.6 BaseFilter as DirectShowBaseFilterMBS

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The QueryDirection method gets the direction of the pin (input or output).
**Notes:** Lasterror is set.

### 67.28.11 Disconnect

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The Disconnect method breaks the current pin connection.
**Notes:**

The Filter Graph Manager calls this method when it disconnects two filters. Applications and filters should not call this method. Instead, call the DirectShowFilterGraphMBS.Disconnect method on the Filter Graph Manager.
Sets lasterror.

This method fails if the filter is paused or running. If the pin supports the PinConnection interface, call PinConnection DynamicDisconnect to disconnect the pin when the filter is paused or running.
This method does not disconnect the other pin in the pin connection.

### 67.28.12 Id as String

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

## 67.34 class DirectShowVideoWindowMBS

### 67.34.1 class DirectShowVideoWindowMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The direct show class for a video window.
**Notes:**

The DirectShowVideoWindowMBS interface sets properties on the video window. Applications can use it to set the window owner, the position and dimensions of the window, and other properties.

The Video Renderer filter and the Filter Graph Manager both expose this interface. The Filter Graph Manager forwards all method calls to the Video Renderer. It also forwards certain window messages that the Video Renderer needs to receive, such as WM_DISPLAYCHANGE. Because the video window is usually a child of an application window, the filter would not otherwise receive these messages. Therefore it relies on the Filter Graph Manager to forward them.

In most cases, an application should query the Filter Graph Manager for this interface, and not call the filter directly, because of the messaging issue just described. However, if the filter graph has more than one Video Renderer, the Filter Graph Manager only communicates with one of them, selected arbitrarily. Therefore, if your application uses multiple video windows, use the DirectShowVideoWindowMBS interface directly on the filters. In that case, you must forward window messages to each Video Renderer instance, using the NotifyOwnerMessage method.

Properties set on a video renderer persist between successive connections and disconnections.

Error codes: If the video renderer filter is not connected to another filter, all methods return the error code VFW_E_NOT_CONNECTED. For the Filter Graph Manager's implementation, if the graph does not contain a video renderer filter, all methods return E_NOINTERFACE. Note that the Filter Graph Manager exposes the interface even when the graph does not contain a video renderer, so an application can query for the interface before it builds the graph.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

### 67.34.18 MessageDrain as Variant

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

**Function:** The window to receive mouse and keyboard messages from the video window.
**Notes:**

Lasterror is set.
This method enables an application to respond to mouse and keyboard events generated within the video window.
If Drain is non-nil, the video renderer forwards certain messages to the specified window, using the PostMessage function. Which messages are forwarded might depend on the video renderer in use.

Can reference a Window or DesktopWindow object.
(Read and Write property)

### 67.34.19 messageDrainControl as Variant

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop only.

**Function:** The control to receive mouse and keyboard messages from the video window.
**Notes:**

Lasterror is set.
This method enables an application to respond to mouse and keyboard events generated within the video window.
If Drain is non-nil, the video renderer forwards certain messages to the specified window, using the PostMessage function. Which messages are forwarded might depend on the video renderer in use.

Can reference a Control or DesktopControl object.
(Read and Write property)

### 67.34.20 Owner as Variant

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

**Function:** The parent window for the video window.
**Notes:**

Lasterror is set.
Use this method to display videos in a compound document. This method changes the parent of the video window and sets the WS_CHILD style for the video window.
Reset the owner to nil before releasing the Filter Graph Manager. Otherwise, messages will continue to be sent to this window and errors will likely occur when the application is terminated.

Can reference a Window or DesktopWindow object.
(Read and Write property)

### 67.34.21 OwnerControl as Variant

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop only.

**Function:** The parent control for the video window.
**Notes:**

Lasterror is set.
Use this method to display videos in a compound document. This method changes the parent of the video window and sets the WS_CHILD style for the video window.
Reset the owner to nil before releasing the Filter Graph Manager. Otherwise, messages will continue to be sent to this window and errors will likely occur when the application is terminated.

Can reference a Control or DesktopControl object.
(Read and Write property)

### 67.34.22 AutoShow as Boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Whether the video renderer automatically shows the video window when it receives video data.
**Notes:**

Lasterror is set.
By default, when the filter graph changes state to paused or running, the video renderer shows the video window and moves it to the foreground. If the user closes the window, it will not automatically reappear.
(Read and Write computed property)

### 67.34.23 BackgroundPalette as Boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Whether the video window realizes its palette in the background.
**Notes:**

Lasterror is set.
If BackgroundPalette is true and the video image requires a palette, the video renderer will realize that palette in the background. Any colors that the palette uses will change to their closest match in the display palette prior to drawing. This ensures that an application will not have its palette disturbed. However, it imposes severe performance penalties on the video.
(Read and Write computed property)

### 67.34.24 BorderColor as color

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The color that appears around the edges of the destination rectangle.
**Notes:**

Lasterror is set.
If the destination rectangle is smaller than the client area of the video window, a border is exposed around the edges of the video. The default color is black. Use this method to override the default color. If a palette is in use, a nonsystem color is converted to its closest match.
(Read and Write computed property)

### 67.34.25 Caption as string

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The video window caption.

**Notes:**

Lasterror is set.
(Read and Write computed property)

### 67.34.26 FullScreenMode as Boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Enables or disables full-screen video rendering.
**Notes:**

Set to true to switch to full-screen mode. Set to false to disable full-screen mode. (Default.)
Lasterror is set.

Depending on the video renderer, the switch to full-screen mode may not be visible until the application runs or pauses the graph. In full-screen mode, if the user switches away from the application (for example, using ALT + TAB), the Filter Graph Manager sends an EC_FULLSCREEN_LOST event.
The following remarks describe how the Filter Graph Manager implements full-screen mode. Application developers can probably ignore this information, but it may be useful if you are writing a custom video renderer.
When an application switches to full-screen mode, the Filter Graph Manager searches for a video renderer that will function most efficiently. In order of preference, these are:

- Any video renderer in the filter graph that natively supports full-screen mode.
- Any video renderer in the filter graph that can stretch the video to full-screen without a significant performance cost.
- The Full Screen Renderer filter.
- Any video renderer in the filter graph that supports DirectShowVideoWindowMBS.

For the first option, the Filter Graph Manager sets FullScreenMode on every video renderer in the graph. Most renderers return E_NOTIMPL, indicating the filter does not natively support full-screen mode. If any renderer returns a value not equal to E_NOTIMPL, the Filter Graph Manager uses that one.
For the second option, the Filter Graph Manager calls GetMaxIdealImageSize and GetMinIdealImageSize on every video renderer in the graph. If the size of the display falls within the filter's reported range, it indicates that the filter can stretch the video without a significant performance cost.
Note If the graph is stopped, the Filter Graph Manager pauses each renderer before calling these methods. This gives the renderer an opportunity to initialize any resources it needs, because many renderers cannot determine these values while they are stopped.
Except on older hardware, the second option will generally succeed. The third option is to use the Full Screen Renderer filter, adding it to the graph if necessary. The fourth option is simply to find the first renderer in the graph that supports DirectShowVideoWindowMBS, and stretch the video regardless of performance.

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Defines the format of waveform-audio data.
**Notes:**

Only format information common to all waveform-audio data formats is included in this structure. For formats that require additional information, this structure is included as the first member in another structure, along with the additional information.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

### 67.35.4 Methods

### 67.35.5 Constructor

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The private constructor.

### 67.35.6 Properties

### 67.35.7 AvgBytesPerSec as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Required average data-transfer rate, in bytes per second, for the format tag.
**Notes:**

If wFormatTag is WAVE_FORMAT_PCM, nAvgBytesPerSec must equal nSamplesPerSec x nBlockAlign. For non-PCM formats, this member must be computed according to the manufacturer's specification of the format tag.

(Read and Write property)

### 67.35.8 BitsPerSample as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Bits per sample for the FormatTag format type.
**Notes:**

If wFormatTag is WAVE_FORMAT_PCM, then BitsPerSample should be equal to 8 or 16. For non-PCM formats, this member must be set according to the manufacturer's specification of the format tag. If FormatTag is WAVE_FORMAT_EXTENSIBLE, this value can be any integer multiple of 8.
Some compression schemes do not define a value for BitsPerSample, so this member can be zero.
(Read and Write property)

### 67.35.9 BlockAlign as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Block alignment, in bytes.
**Notes:**

The block alignment is the minimum atomic unit of data for the wFormatTag format type. If wFormatTag is WAVE_FORMAT_PCM, nBlockAlign must equal (nChannels × wBitsPerSample) / 8. For non-PCM formats, this member must be computed according to the manufacturer's specification of the format tag.
Software must process a multiple of nBlockAlign bytes of data at a time. Data written to and read from a device must always start at the beginning of a block. For example, it is illegal to start playback of PCM data in the middle of a sample (that is, on a non-block-aligned boundary).
(Read and Write property)

### 67.35.10 Channels as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Number of channels in the waveform-audio data.
**Notes:**

Monaural data uses one channel and stereo data uses two channels.
(Read and Write property)

### 67.35.11 Data as Ptr

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Pointer to raw data of WAVEFORMATEX structure.
**Notes:** (Read only property)

### 67.35.12 FormatTag as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Waveform-audio format type.
**Notes:**

Format tags are registered with Microsoft Corporation for many compression algorithms. A complete list of format tags can be found in the Mmreg.h header file. For one- or two-channel Pulse Code Modulation (PCM) data, this value should be WAVE_FORMAT_PCM.

- If FormatTag equals WAVE_FORMAT_EXTENSIBLE, the structure is interpreted as a WAVEFORMATEXTENSIBLE structure.
- If FormatTag equals WAVE_FORMAT_MPEG, the structure is interpreted as an MPEG1WAVEFORMAT structure.
- If FormatTag equals WAVE_FORMAT_MPEGLAYER3, the structure is interpreted as an MPEGLAYER3WAVEFORMAT structure.

Before reinterpreting a WAVEFORMATEX structure as one of these extended structures, verify that the actual structure size is sufficiently large and that the cbSize member indicates a valid size.

Please contact MBS if you need the above structures as classes in Xojo.
(Read and Write property)

### 67.35.13 SamplesPerSec as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Sample rate, in samples per second (hertz).
**Notes:**

If FormatTag is WAVE_FORMAT_PCM, then common values for SamplesPerSec are 8.0 kHz, 11.025 kHz, 22.05 kHz, and 44.1 kHz. For non-PCM formats, this member must be computed according to the manufacturer's specification of the format tag.
(Read and Write property)

### 67.35.14 Size as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Size, in bytes, of extra format information appended to the end of the WAVEFORMATEX structure.
**Notes:**

This information can be used by non-PCM formats to store extra attributes for the wFormatTag. If no extra information is required by the wFormatTag, this member must be set to zero. For WAVE_FORMAT_PCM formats (and only WAVE_FORMAT_PCM formats), this member is ignored. However it is still recommended to set the value.
(Read and Write property)

**Notes:**

Each time you want to burn to a disc, an instance of DRBurnMBS needs to be created.

When an instance is created, you pass in an instance of DRDevice to let the DRBurn object know what device to use. This object is retained for the life of the DRBurn instance. Before burning, you can set several options that control the behavior of the burn and the handling of the disc once the burn completes.

A DRBurn object will send out notifications through the DRNotificationCenter mechanism to broadcast the burn state to any interested observers. However, if for some reason you don't want to use notifications, you can poll the burn object at any time for the current status using the status properties. This is not recommended in any application using a run loop, because it involves polling.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

### 69.1.5 abort

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** Stops the burn.
**Notes:**

When this method returns the burn might not actually be fully stopped but it has been cancelled and only cleanup is going on. If a burn has not completed writing data to disc, you just made a coaster.

Typically this method is only used as a result of the user hitting a cancel/stop button somewhere in the user interface.

### 69.1.6 burnForDevice(device as DRDeviceMBS) as DRBurnMBS

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Notes:** Once a burn is created with this method, the object is ready to write data to the disc.

### 69.1.7 Constructor(device as DRDeviceMBS)

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** Creates a burn object.
**Notes:** Once a burn is created with this method, the object is ready to write data to the disc.

### 69.1.13 DRBurnDoubleLayerL0DataZoneBlocksKey as string

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** One of the property key constants.
**Notes:**

The burn property key whose value is an double containing the number of blocks desired for the layer 0 data zone on a double layer writable disc.

The size of the layer 0 data zone dictates where the transition point is from layer 0 to layer 1. If this key is present, the data zone size will be set prior to the start of the burn using the value for this key. If it is not present, the default layer 0 data zone will be used (half the available blocks on an empty disc).

The transition point can be specified two ways. If the value specified in this key is greater than 1.0, then it will designate an absolute block number for the transition point. In this case, the block number should be a multiple of 16 and at least 40000h per specification. If the value is less than 1.0, it will specify the percentage of the burn that should reside on layer 0. A typical value is 0.5, designating half the burn for each layer. A value of 0.0 or 1.0 will not change the layer 0 transition point.

### 69.1.14 DRBurnFailureActionEject as string

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** An string constant for FailureAction indicating that the burn object should eject the disc from the drive if the burn fails.

**Function:** An string constant for FailureAction indicating that the burn object should do nothing with the disc if the burn fails.

### 69.1.17 DRBurnOverwriteDiscKey as string

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** One of the property key constants.
**Notes:** The burn property whose value is a boolean indicating if the disc will be overwritten from block zero for the burn. If this key is not present, the burn will default to a value of false and the disc will be appended.

### 69.1.18 DRBurnRequestedSpeedKey as string

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** One of the property key constants.
**Notes:** The burn property whose value is a number containing the speed at which the burn should run, expressed as a float value of kilobytes per second. If this key is not present, the speed will default to DRDeviceBurnSpeedMax.

If this value is set to true, and the device does not support the type(s) of burn requested, the burn will fail with kDRDeviceBurnStrategyNotAvailableErr .

If this value is set to false, and the device does not support the type(s) of burn requested, the engine will choose an alternate burn strategy automatically - one that will provide an equivalent disc.

### 69.1.25 DRBurnStrategyKey as string

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** One of the property key constants.
**Notes:**

The burn property whose value is a string, or array of strings, indicating the burn strategy or strategies that are suggested. If this key is not present, the burn engine picks an appropriate burn strategy automatically. Most clients will not need to specify a specific burn strategy.

When more than one strategy is suggested, the burn engine will attempt to use the first strategy in the list which is available. A burn strategy will never be used if it cannot write the required data: for example, TAO cannot be used to write CD-Text.

The presence of this key by itself is just a suggestion, and if the burn engine cannot fulfill the request it will burn using whatever strategy is available. To make the suggestion into a requirement, add DRBurnStrategyIsRequiredKey with a value of true.

### 69.1.26 DRBurnTestingKey as string

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** One of the property key constants.

**Function:** One of the property key constants.
**Notes:**

This key points to a DRCDTextBlockMBS, or array of DRCDTextBlockMBS objects containing the CD-Text information for the disc. If this key is not present, the burn will not write CD-Text.

Before using this key, you should to make sure that the device supports CD-Text by checking the value of DRDeviceCanWriteCDTextKey in the device's write capabilities dictionary.

If this value is set to true, and the device does not support writing CD-Text, the burn will fail with kDRDeviceCantWriteCDTextErr.

If it is not present, the default layer 0 data zone will be used (half the available blocks on an empty disc).
The transition point can be specified two ways. If the value specified in this key is greater than 1.0, then it will designate an absolute block number for the transition point. In this case, the block number should be a multiple of 16 and at least & h40000 per specification. If the value is less than 1.0, it will specify the percentage of the burn that should reside on layer 0. A typical value is 0.5, designating half the burn for each layer. Acquiring exclusive access to the device prevents any process other than the one acquiring access from communicating with the device. So once exclusive access is granted, the device is unusable by any other process. Because of this all volumes mounted from media in the drive must be unmounted before exclusive access can be granted.

Exclusive access can be acquired multiple times. Each time this method is called, a call to releaseExclusiveAccess must be made at a later time, otherwise the process will never release its exclusive access.

**Function:** Manages a panel that allows users to specify the parameters of an erase.
**Notes:**

This class supports choosing the device to use and what sort of erase to perform. When the panel is closed by the user choosing to erase the media in the device, the device is exclusively held by the application for its own use to prevent possible bad or corrupt media from causing problem for the rest of the system. This means that if the erase object obtained from the panel is not used to do an erase, the device will remain unavailable to other applications until the exclusive access is released.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DRFSObjectMBS class.

### 69.9.19 symLinkPointingTo(original as DRFSObjectMBS, filesystem as string) as DRFileMBS

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** Creates a symbolic link to another file on the output disc.
**Example:**

```
dim SomeFolder as new DRFolderMBS("Some new folder")

// Let's have a file to test

dim data as string = "Hello World" // file content
dim name as string = "test.txt" // file name
dim testfile as DRFileMBS = DRFileMBS.virtualFileWithName(name, data)

// and create a sym link for it
dim SymLink as DRFileMBS = DRFileMBS.symLinkPointingTo(testfile, DRFileMBS.DRHFSPlus)
if SymLink = nil then
MsgBox "SymLink is nil!?"
else
SomeFolder.addChild SymLink
end if
```

**Notes:**

original: The file to point he hard link to
filesystem: The filesystem this link will exist on.

As with Mac OS X 10.6.4 this method seems to work just fine.

### 69.9.20 virtualFileWithName(name as string, data as memoryblock) as DRFileMBS

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** Creates a "virtual" file object.
**Example:**

```
dim data as string = "Hello World" // file content
dim name as string = "test.txt" // file name

dim f as DRFileMBS = DRFileMBS.virtualFileWithName(name, data)

MsgBox f.baseName
```

**Notes:** This type of DRFile burns the data passed in to disc, creating a file with the passed in name.

### 69.9.21 Events

### 69.9.22 calculateSizeOfFile(fork as Integer, estimating as boolean) as uint64

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: .

**Function:** Calculates the size of a file's fork.
**Notes:**

This method may be sent at any time after the file object has been instantiated. Requests that the recevier calculate the file size of file fork (for instance data or resource).

If estimate is true, you are being asked for an estimate of the final fork size, perhaps to provide an estimate of the track size, and do not have to be exact. Estimates should err on the high side; it's better to overestimate than underestimate.

An estimate call may be made at any time.

If estimate is false, you are being asked for the actual fork size, to be used in the burn. This call is only made in the burn phase.

fork: The fork of the file whose size is to be calculated.
estimate: If the file size should be estimated or exact.

Return the length of the file's fork.

### 69.9.23 cleanupFileAfterBurn

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: .

**Function:** Cleanup the file once the burn is complete.
**Notes:** Sent to the receiver after the burn completes. This would be an appropriate place to close files, or do any other teardown work needed. This message will always be sent regardless of whether the burn succeeded or failed.

### 69.9.24 prepareFileForBurn as boolean

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: .

**Function:** Prepare the file object for burning.
**Notes:**

Sent to the recevier before the burn begins. This would be an appropriate method to open files, or do any other prep work needed. The disc's entire hierarchy is completely in place and can be queried if needed.

After this call, the burn's content is locked down, and you should be able to respond to the calculateSizeOfFile messages with exact values.

### 69.9.25 prepareFileForVerification as boolean

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: .

**Function:** Prepare the file object for verification.
**Notes:** Called during the burn (after production, before the cleanupFileAfterBurn event is called) to indicate that verification is about to begin. Now would be a good time to rewind to the start of the file, reset state machines, or do whatever else is needed to prepare to produce again.

### 69.9.26 produceFile(fork as Integer, buffer as memoryblock, Bufferlen as uint32, address as uint64, blocksize as uint32) as uint32

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: .

**Function:** Calculates the size of a file's fork.
**Notes:**

Sent during the burn (after the prepareFileForBurn message) requesting that the receiver produce the data fork contents.

The recevier should fill up the buffer passed in as full as possible and then return control to the caller. Since while burning, keeping the drive's buffer full is of utmost importance, you should not perform lengthy operations or block for data in this method. This method should return the number of bytes actually in the buffer or 0 to indicate that there was an error producing the data.

You may be asked to produce twice, once during the actual burn and once during verification.

fork: The fork of the file to produce.
buffer: The buffer to produce data into.

bufferLength: The length of the buffer to produce data into
blockSize: The size of the track blocks

Return the number of bytes produced.

### 69.9.27 Constants

### 69.9.28 DRFileForkData = 0

MBS MacControls Plugin, Plugin Version: 7.4.

**Function:** The constant which specifies which fork is currently needed.
**Notes:**

The data fork contains the primary information for the file and is the fork used for files such as JPEGs, text files, etc.

The resource fork contains secondary meta-data, which is not important to the primary content of the file and may safely be ignored when the file is sent to a filesystem or OS which does not support multiple forks.

### 69.9.29 DRFileForkResource = 1

MBS MacControls Plugin, Plugin Version: 7.4.

**Function:** The constant which specifies which fork is currently needed.
**Notes:**

The data fork contains the primary information for the file and is the fork used for files such as JPEGs, text files, etc.

The resource fork contains secondary meta-data, which is not important to the primary content of the file and may safely be ignored when the file is sent to a filesystem or OS which does not support multiple forks.

## 69.10 class DRFolderMBS

### 69.10.1 class DRFolderMBS

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** A class for folder objects used in filesystem creation.
**Notes:**

A DRFile object is a subclass of DRFSObject and represents a folder on the finished disc. DRFolders can be either a pointer to an existing folder (residing on a hard drive for example) or can be a "virtual" folder which existsonly on the resulting burned disc. A DRFolder pointing to an existing folder ("real" folder) cannot have it's contents changed - only those files/folders which are children of the actual folder on disk will be included on the resulting disc. "Virtual" folders are entirely created programatically and any virtual folder structure can exist and be burned to disc. It is possible to convert a "real" folder to a "virtual" folder using the makeVirtual method.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DRFSObjectMBS class.

### 69.10.4 Methods

### 69.10.5 addChild(child as DRFSObjectMBS)

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** Adds an object reference (either a file or folder) as a child of a virtual folder object.
**Notes:** This method only applies to virtual folders. Real folders are considered "leaf nodes" and cannot have children.

### 69.10.6 children as DRFSObjectMBS()

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

**Function:** Returns an array containing the children of a virtual folder.
**Notes:** The order of children in the array is arbitrary – since the various filesystems being generated may have different sorting requirements, there is no one true way to sort the children. The ordering will change only when children are added or removed. You should sort the children according to the needs of your display, and in a consistent manner. This function only applies to virtual folders. Real folders are considered "leaf nodes" and should not be passed into this call.

### 69.10.7 Constructor

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** The dummy constructor.

### 69.10.10 count as Integer

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** Returns the number of children of a virtual folder.
**Notes:** This method returns a "shallow" count of only those children that are immediately contained within the virtual folder. This method only applies to virtual folders. Real folders are considered "leaf nodes" and should not be passed into this call.

### 69.10.11 folderWithPath(path as folderitem) as DRFolderMBS

### 69.10.13 makeVirtual

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** Changes the real DRFolder object into a "virtual" DRFolder object.
**Notes:** The virtual folder created in this way is a snapshot of the on-disk folder at the moment of the call. The newly created virtual folder will contain real folder and file objects corresponding to the on-disk children of the original on-disk folder. If the on-disk folder is modified (eg, if the folder attributes change, or if children are added to or removed from the on-disk tree): during this call, the virtual folder may or may not reflect the changes. If modified after this call, the virtual folder will not reflect the changes.

### 69.10.14 removeChild(child as DRFSObjectMBS)

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** Removes an object reference (either a file or folder) as a child of a virtual folder object.
**Notes:** This method only applies to virtual folders. Real folders are considered "leaf nodes" and cannot have children.

### 69.10.15 virtualFolderWithName(name as string) as DRFolderMBS

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** Creates a "virtual" folder object with a name.

## 69.11 class DRFSObjectMBS

### 69.11.1 class DRFSObjectMBS

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** A class which defines common features of all filesystem content objects.
**Notes:**

Please read Apples documentation for more details.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

**Function:** The parent object.

### 69.11.56 propertiesForFilesystem(filesystem as string, mergeWithOtherFilesystems as boolean) as dictionary

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** Returns all the filesystem properties set for the specified filesystem.
**Notes:**

filesystem: The filesystem to look in.
merge: If true, also look for properties in the umbrella DRAllFilesystems .

Normally you would call this method with merge set to true since you are interested in the set of properties that will be used when writing the object to disc. But if you have a need to determine what properties are set just for a specific filesystem, then pass in false for merge. In this case only the specific filesystem is checked. So if filesystem is set to DRHFSPlus and merge is false then the properties dictionary contains the values set for the HFS+ filesytem only. If no properties have been directly set for HFS+ yet, then this properties dictionary will be empty.

### 69.11.57 propertyForKey(key as string, filesystem as string, mergeWithOther-Filesystems as boolean) as Variant

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** Returns a file/folder property specified by key for the specified filesystem.
**Notes:**

key: The property to return.
filesystem: The filesystem to look in.
merge: If true, also look for the property in the umbrella DRAllFilesystems .

Returs the value associated with the property.

Normally you would call this method with merge set to true since you are interested in the property that will be used when writing the object to disc. But if you have a need to determine what property is set just for a specific filesystem, then pass in false for merge. In this case only the specific filesystem is checked. So if DRHFSPlus is passed in for filesystem and merge is false then the property returned is the value set for the HFS+ filesytem only. If that property has not been directly set for HFS+ yet, then the returned value will be nil.

### 69.11.58 setProperties(Value as dictionary, filesystem as string)

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** Sets the value of all the receiver's properties specified by the keys in properties for the specific filesystem.
**Notes:**

properties: The value of the property.
filesystem: The filesystem to set the property in.

The properties are set only in the filesystem dictionary specified by filesystem. DRAllFilesystems may be specified as the filesystem in which case he umbrella property affecting all filesystems at once will be set. Setting properties for DRAllFilesystems does not preclude setting a filesystem specific property.

### 69.11.59 setProperty(Value as Variant, key as string, filesystem as string)

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** Sets the value of the receiver's property specified by key for the specific filesystem.
**Notes:**

property: The value of the property.
key: The property key.
filesystem: The filesystem to set the property in.

The property is set only in the filesystem dictionary specified by filesystem. DRAllFilesystems may be specified as the filesystem in which case the umbrella property affecting all filesystems at once will be set. Setting a property for DRAllFilesystems does not preclude setting a filesystem specific property.

### 69.11.60 sourcePath as string

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

**Function:** The source path.

### 69.11.61 Properties

### 69.11.62 baseName as string

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** Returns the base name for the receiver.
**Notes:**

The base name is the name from which any necessary filesystem-specific names are automatically generated.

Because the content creation API is able to generate multiple filesystems which require multiple varied naming conventions, a sensible system for naming is required. Thus each file has a "base name" which corresponds to its default name in any filesystem.

Whenever possible, the "base name" will be used in the generated filesystem without modification. If the name cannot be used as-is (if, for example, it contains illegal characters, exceeds the length requirements, doesn't meet the required format, or a name collision is detected) then an acceptable name that meets the filesystem's criteria will be generated automatically from the base name.

The default base name for a real file or folder is the actual on-disk name of the item.
(Read and Write computed property)

### 69.11.63 explicitFilesystemMask as Integer

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** The explicit filesystem mask set for the reciever.
**Notes:** (Read and Write computed property)

### 69.11.64 specificNameForFilesystem(filesystem as string) as string

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** A single filesystem-specific name for this fsobject.
**Notes:**

Use DRISO9660LevelOne, DRISO9660, DRHFSPlus, DRUDF, DRJoliet, DRISO9660LevelTwo or DRAllFilesystems for the filesystem parameter.
(Read and Write computed property)

### 69.11.65 specificNames as dictionary

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** The names used for the receiver in the different filesystems all at once.
**Notes:**

An Dictionary of filesystem keys with corresponding name strings as their values for each specific filesystem name that should be set.

Every effort will be made to use the names passed in. However, if a name is illegal, it will be modified to fit the rules for that filesystem's names. Because of this, you should always call specificNames after setSpecificNames: to ensure that you are always displaying the most current names to the user.
(Read and Write computed property)

## 69.12 class DRMSFMBS

### 69.12.1 class DRMSFMBS

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** Minutes/Seconds/Frames handling.
**Notes:**

On CDs, minutes/seconds/frames are used to identify positioning on a disc (which is most useful on an audio disc), but applies to any position on a disc no matter what type of data is present.

A frame is equivalent to a sector or block in normal disk parlance. 75 frames make up one second, so a 2 second pause (typical pregap size) is 150 frames.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

### 69.12.2 Methods

### 69.12.3 Constructor

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** The dummy constructor.

- 69.12.4 Constructor(frames as Integer) 13597

### 69.12.6 description as string

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** Returns a textual representation.

### 69.12.7 descriptionWithFormat(format as string) as string

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** Returns a textual representation of the receiver.
**Notes:**

The format string is very similar to
A printf-style format string with % -escaped formatting characters.

| | |
|---|---|
| % % | A "% " character |
| % m | Minutes as a decimal number |
| % s | Seconds as a decimal number |
| % f | Frames as a decimal number |

In addition to these formatting characters an optional length specifier can come between then % and the formatting character. This length specifier will force the field in question to be at least that wide. For example a format specifier of "% 02m:% 02s" will cause a DRMSF object representing 3 minutes 9 seconds to be formatted as "03:09".

A formatter is aware of and respects rounding. If a bit of the msf is no zero, but the format does not display that value, the next higher value will be increased by one to reflect that. Extending our example above, an DRMSF with a value of 3 minutes, 9 seconds, 15 frames using a format specfier of "% 02m:% 02s", will be formatted as "03:10" since the 15 frames rounds up the seconds to the next value

Returns a string containing a textual representation of the object utilizing the specified format.

### 69.12.8 frames as Integer

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** Returns the number of frames represented by the receiver.
**Notes:** This method differs from sectors in that it returns to the caller the number of frames remaining in the current second. For example an DRMSF value of 5:30:72 will return 72 from frames.

### 69.12.9 isEqualToMSF(value as DRMSFMBS) as boolean

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** Compares on emsf to another.

**Function:** Returns the number of minutes represented by the receiver.
**Notes:** If the receiver represents a non integral number of minutes, only the whole minute value is returned. For example an DRMSF value of 5:30:72 will return 5 from a minutes.

### 69.12.11 msf as DRMSFMBS

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

### 69.13.2 Methods

### 69.13.3 addObserver(observer as NSNotificationObserverMBS, name as string="", theObject as Variant=nil)

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** Adds an entry to the receiver's dispatch table with an observer and optional criteria: notification name and sender.
**Notes:**

observer: Object registering as an observer. This value must not be nil.
name: The name of the notification for which to register the observer; that is, only notifications with this name are delivered to the observer. If you pass nil, the notification center doesn't use a notification's name to decide whether to deliver it to the observer.
theObject: The object whose notifications the observer wants to receive; that is, only notifications sent by this sender are delivered to the observer. If you pass nil, the notification center doesn't use a notification's sender to decide whether to deliver it to the observer.

### 69.13.4 Constructor

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** The constructor to create a new instance of notification center pointing to the default notification center.
**Notes:**

A DRNotificationCenter object (or simply, notification center) is essentially a notification dispatch table. It notifies all observers of notifications meeting specific criteria. This information is encapsulated in NSNotification objects, also known as notifications. Client objects register themselves with the notification center as observers of specific notifications posted by DiscRecording. When an event occurs, DiscRecording posts an appropriate notification to the notification center. The notification center dispatches a message to each registered observer, passing the notification as the sole argument.

There are two main differences between a DRNotificationCenter and the NSNotificationCenter from Foundation. First is that only Disc Recording posts notifications received through this mechanism. You use this to obtain device plug/unplug events, burn status, etc. Second, there can be multple notification centers active at once. Each run loop of your application will have it's own notification center and notifications from that notification center will be posted to the runloop it was created on.

### 69.13.5 removeObserver(observer as NSNotificationObserverMBS, name as string, theObject as Variant=nil)

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** Removes matching entries from the receiver's dispatch table.
**Notes:**

notificationObserver: Observer to remove from the dispatch table. Specify an observer to remove only entries for this observer. Must not be nil, or message will have no effect.
notificationName: Name of the notification to remove from dispatch table. Specify a notification name to remove only entries that specify this notification name. When nil, the receiver does not use notification names as criteria for removal.
notificationSender: Sender to remove from the dispatch table. Specify a notification sender to remove only entries that specify this sender. When nil, the receiver does not use notification senders as criteria for removal.

Be sure to invoke this method before the observer object or any object specified in addObserver is deallocated.

## 69.14 class DRSetupPanelMBS

### 69.14.1 class DRSetupPanelMBS

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

**Function:** Base class for the DiscRecordingUI setup panels.
**Notes:**

// we need a track
track=CreateTrack

if track<>nil then
bsp=new DRBurnSetupPanelMBS

// set a few options
bsp.setCanSelectAppendableMedia true
bsp.setCanSelectTestBurn true

if bsp.runSetupPanel=bsp.NSOKButton then
bpp=new DRBurnProgressPanelMBS

// And start off the burn itself. This will put up the progress dialog
// and do all the nice pretty things that a happy app does.
bpp.beginProgressPanelForBurn bsp.burnObject, track

else
MsgBox "You pressed cancel."
end if
end if
```

**Notes:**

A DRTrack provides data to the for the burn and contains a description of the track on disc (length, block type, data format, etc). Data is provided for the burn in a real-time thread. It is up to the track to provide this data in a timely manner, otherwise a burn underrun can occur and ruin a disc.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** One of the key constants for the properties dictionary.
**Notes:**

For CD-DA audio tracks only. This key points to a boolean value indicating whether the track data has four channels, as opposed to the two channels of normal stereo. If this key is not present, the engine will use a default value of false and standard two-channel stereo is assumed.

Note that while four-channel is technically allowed in the Red Book, it never caught on and is probably being replaced by SACD, so you probably shouldn't attempt to use it.

On the media, this key corresponds to bit 3 of the control field in sub-channel Q.

### 69.15.11 DRAudioPreEmphasisKey as string

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** One of the key constants for the properties dictionary.
**Notes:** Date containing the default date to use for any unspecified dates in the filesystem. The current date and time is used if unspecified.

### 69.15.20 DRDVDCopyrightInfoKey as string

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** One of the key constants for the properties dictionary.
**Notes:** For DVD tracks only. A binary string containing the DVD copyright info structure sent through the SEND DVD STRUCTURE command. The contents of this will be sent directly to the drive.

### 69.15.21 DRDVDTimestampKey as string

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** One of the key constants for the properties dictionary.

MBS MacControls Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

**Function:** One of the key constants for the properties dictionary.
**Notes:**

For CD tracks only. This key points to an NSArray of NSNumbers, indicating the index points inside the track. Each index point is specified as a number of blocks (frames) relative to the start of the track. There are 75 blocks in one second of CD audio. No more than 98 index points may be specified for a track.

Not all drives are capable of writing index points, and not all consumer CD players report or use them. If this key is present in any track and the drive cannot write index points, the burn will fail with kDRDeviceCantWriteIndexPointsErr.

### 69.15.24 DRISOLevel as string

When subchannel data is also produced, the producer is expected to return user data of DRBlockSizeKey in length with an additonal 96 bytes of subchannel data. Depending on the data form specified in this key, the format of this 96 bytes is either in raw or pack format. When subchannel data is requested from the producer, the DRFlagSubchannelDataRequested flag is set in the flags parameter of producePreGapForTrack or produceDataForTrack and blockSize is increased by 96 bytes.

Since while burning, keeping the drive's buffer full is of utmost importance, you should not perform lengthy operations or block for data in this method. This method should return the number of bytes actually in the buffer or 0 to indicate that there was an error producing the data..

buffer: The buffer to place data into
bufferLength: The length of buffer
address: The on-disc address of where data will be written
blockSize: the size of each block on the disc. It's best to return a multiple of this size.
flags: Some flags. Not yet used.

Return the number of bytes produced.

### 69.15.98 producePreGapForTrack(buffer as memoryblock, Bufferlen as uint32, address as uint64, blocksize as uint32, byref flags as uint32) as uint32

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: .

**Function:** Produces the pregap data.
**Notes:**

This method is called to obtain data for the track's pregap. If the DRPreGapLengthKey key is present in the track properties, the track producer will be asked for the pregap data first. If the producer implements this selector, then it's the responsibility of the producer to provide data for the pregap, otherwise that length of silence will be produced by DiscRecording.

The buffer passed in will be a multiple of blockSize (bufferLength = blockSize * N, where N >1) and should be filled as full as possible with data. address is the sector address on the disc from the start of the track that is the buffer will be written to.

Since while burning, keeping the drive's buffer full is of utmost importance, you should not perform lengthy operations or block for data in this method. This method should return the number of bytes actually in the

buffer or 0 to indicate that there was an error producing the data..

buffer: The buffer to place data into
bufferLength: The length of buffer
address: The on-disc address of where data will be written
blockSize the size of each block on the disc. It's best to return a multiple of this size.
flags: Some flags (not used).

Return the number of bytes produced.

### 69.15.99 verifyDataForTrack(buffer as memoryblock, Bufferlen as uint32, address as uint64, blocksize as uint32, byref flags as uint32) as boolean

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: .

**Function:** Cleans up the track after the burn completes.
**Notes:**

If the class implementing this method asks for a verification type of DRVerificationTypeReceiveData, then a series of calls to this method will start. It's up to the class to reproduce the data again and compare it to the data passed in buffer. The buffer passed in will be a multiple of blockSize (bufferLength == blockSize * N, where N >1). address is the sector address on the disc from the start of the track that is the buffer was written to.

buffer: The data read in from the track to compare with
bufferLength: The length of buffer
address: The on-disc address of where data will was read from.
blockSize: the size of each block on the disc. It's best to return a multiple of this size.
flags: Some flags. Not used.

Return true to indicate that the data compared successfully and false to indicate a failure occurred.

### 69.15.100 verifyPreGapForTrack(buffer as memoryblock, Bufferlen as uint32, address as uint64, blocksize as uint32, byref flags as uint32) as boolean

MBS MacControls Plugin, Plugin Version: 7.4, Platform: macOS, Targets: .

**Function:** Checks the integrity track pregap after a burn.
**Notes:**

If the class implementing this method asks for a verification type of DRVerificationTypeReceiveData, then a series of calls to this method will start. It's up to the class to reproduce the pregap again and compare it to the data passed in buffer. The buffer passed in will be a multiple of blockSize (bufferLength == blockSize *

N, where N >1). address is the sector address on the disc from the start of the track that is the buffer was written to.

buffer: The data read in from the track to compare with
bufferLength: The length of buffer
address: The on-disc address of where data will was read from.
blockSize: the size of each block on the disc. It's best to return a multiple of this size.
flags: Some flags. (not used)

Return true to indicate that the data compared successfully and false to indicate a failure occurred.

### 69.15.101 Constants

### 69.15.102 DRFlagSubchannelDataRequested = 2

MBS MacControls Plugin, Plugin Version: 10.4.

**Function:** A flag passed to producePreGapForTrack or produceDataForTrack.
**Notes:**

Indicates that the blockSize passed in includes room for subchannel data.
Data producers should check this flag and perform subchannel data production in addition to user fata production. Each block requested from the producer in this case will be formatted as [ user data (as specified in track properties) ] [ subchannel data(96 bytes) ] .

For example an audio producer callback should repeatedly produce 2352 bytes of audio data into bytes 0-2351 of the block and an additional 96 bytes of subchannel data into bytes 2352-2447.

### 70.17.4 Methods

### 70.17.5 QueryRecord(InterfaceIndex as Integer, FullName as string, rrType as Integer, rrClass as Integer, Flags as Integer = 0) as boolean

MBS Network Plugin, Plugin Version: 16.1, Platforms: macOS, Windows, Targets: All.

**Function:** Query for an arbitrary DNS record.
**Notes:**

Flags: kFlagsForceMulticast or kFlagsLongLivedQuery. Pass kFlagsLongLivedQuery to create a "long-lived" unicast query to a unicast DNS server that implements the protocol. This flag has no effect on link-local multicast queries.
interfaceIndex: If non-zero, specifies the interface on which to issue the query (the index for a given interface is determined via the if_nametoindex() family of calls.) Passing 0 causes the name to be queried for on all interfaces. See "Constants for specifying an interface index" for more details.
fullname: The full domain name of the resource record to be queried for.
rrtype: The numerical type of the resource record to be queried for (e.g. kType_PTR, kType_SRV, etc)
rrclass: The class of the resource record (usually kClass_IN).

Lasterror is set: Returns kErr_NoError on success (any subsequent, asynchronous errors are delivered to the event), otherwise returns an error code indicating the error that occurred.
Returns false in case of error or true in case of success.

You can use DNSServiceBaseMBS.ConstructFullName to build the full name.

### 70.17.6 Events

### 70.17.7 ServiceQueryRecord(flags as Integer, InterfaceIndex as Integer, ErrorCode as Integer, Fullname as string, rrType as Integer, rrClass as Integer, Length as Integer, Data as string, ttl as Integer)

MBS Network Plugin, Plugin Version: 16.1, Platforms: macOS, Windows, Targets: .

**Function:** The event called when data is received for DNS query.
**Notes:**

flags: Possible values are kFlagsMoreComing and kFlagsAdd. The Add flag is NOT set for PTR records with a ttl of 0, i.e. "Remove" events.
InterfaceIndex: The interface on which the query was resolved.
errorCode: Will be kErr_NoError on success, otherwise will indicate the failure that occurred. Other parameters are undefined if errorCode is nonzero.
fullname: The resource record's full domain name.
rrtype: The resource record's type (e.g. kType_PTR, kType_SRV, etc)
rrclass: The class of the resource record (usually kClass_IN).
Length: The length, in bytes, of the resource record rdata.
Data: The raw record data of the resource record.
ttl: If the client wishes to cache the result for performance reasons, the TTL indicates how long the client may legitimately hold onto this result, in seconds. After the TTL expires, the client should consider the result no longer valid, and if it requires this data again, it should be re-fetched with a new query. Of course, this only applies to clients that cancel the asynchronous operation when they get a result. Clients that leave the asynchronous operation running can safely assume that the data remains valid until they get another callback telling them otherwise.

## 71.2 class HASPHLDMBS

### 71.2.1 class HASPHLDMBS

MBS Dongle Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

**Function:** A class for accessing HASP HL or Sentinel dongles.
**Example:**

```
// Load your vendor library or the demo one
dim LibFile as FolderItem = GetFolderItem("hasp_darwin_12345.dylib")

if HASPHLDMBS.LoadLibrary(LibFile) then
'MsgBox "OK"
else
MsgBox "Failed to load library."
Return
end if

// init dongle
' This method runs the actual tests on the given program number
dim blob as MemoryBlock // container for data for en-/decryption

dim FeatureID = HASPHLDMBS.HASP_DEFAULT_FID
dim VendorCode = "123456" // your vendor code here, some big Base64 encoded block

dim hasp as new HASPHLDMBS(FeatureID, VendorCode)
Select case hasp.Lasterror
case HASPHLDMBS.HASP_STATUS_OK
// ok
case HASPHLDMBS.HASP_HASP_NOT_FOUND
MsgBox "Dongle not found."
return
case HASPHLDMBS.HASP_INV_VCODE
MsgBox "Invalid vendor code"
Return
else
MsgBox "Error: "+str(hasp.Lasterror)
return
end Select

// read a file ID
dim fileid as Integer = 65524
dim size as Integer = hasp.GetSize( fileid )

if hasp.Lasterror = HASPHLDMBS.HASP_STATUS_OK then // ONLY IF FILE IS SUPPORTED
```

```
// read to memoryblock
blob = hasp.ReadMemory( fileid, 0, size )
if hasp.Lasterror = HASPHLDMBS.HASP_STATUS_OK then
// show in MsgBox
s = Blob.stringvalue(0,blob.size)
MsgBox DefineEncoding(s,Encodings.UTF8)
end if
end if
```

**Notes:**

Please use HASP Master Wizard Suite to generate your own runtime libraries. Than you get a couple of DLLs which you can load with this class. For the demo keys, you can use the demo DLLs.
The demo DLL for example is named "hasp_windows_x64_demo.dll" or including your vendor code "hasp_windows_x64_12345.dll" (64bit). 32bit Windows DLL is named hasp_windows_12345.dll, hasp_windows_demo.dll or haspvlib_12345.dll.

Now when you have the platform dependent libraries, you can use LoadLibrary() function in this class to load the right one.

HASPHLMBS uses a linked in library. This is okay for older HASP HL versions. But newer versions require you to create your own signed libraries. For them use the HASPHLDMBS class.

**Function:** Logs out from a context or session.
**Notes:**

Called automatically for you by the destructor.

Lasterror is set.

### 71.2.9 Constructor(FeatureID as Integer, scope as string, VendorCode as string)

MBS Dongle Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

**Function:** Logs into a Feature to establish a session, according to predefined search parameters.
**Notes:**

This function is used to specify conditions that describe where login information is to searched for.

The requisite Vendor Codes are stored in a VendorCodes folder in your system. Without the correct Vendor Code, the function call cannot succeed.

You can open up to 512 simultaneous login sessions.

This function does not work with legacy HASP Features.

FeatureID: Unique identifier for a specific Feature stored in a Sentinel HASP protection key
Scope: Definition of the search parameters for this Feature ID. See the additional HASP API Reference documentation for more information about Scope XML Tags.
VendorCode: the vendor code

Lasterror is set. This calls SDK function hasp_login_scope.

### 71.2.10 Constructor(FeatureID as Integer, VendorCode as string)

MBS Dongle Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

**Function:** Logs into a Feature and thereby establishes a session context.
**Notes:**

This function establishes a context to a Sentinel HASP protection key containing a license for the requested Feature ID.
The requisite Vendor Codes are stored in a VendorCodes folder in your system. Without the correct Vendor Code, the function call cannot succeed.

You can open up to 512 simultaneous login sessions.

Legacy HASP Remarks
For local prognum Features, concurrency is not handled and each login performs a decrement if it is a counting license.

Network "prognum" features continue to use the old HASP LM login logic, with its inherent limitations.

There is only support for concurrent usage of one server (global server address).

With "Program Number" features (see HASP_FEATURETYPE_MASK), 8 bits are reserved for legacy options (see HASP_PROGNUM_OPT_MASK, currently 5 bits are used):

- only local
- only remote
- login is counted per process ID
- disable terminal server check
- enable access to old (HASP3/HASP4) keys

FeatureID: Unique identifier for a specific Feature stored in a Sentinel HASP protection key
VendorCode: the Vendor Code

Lasterror is set. This calls SDK function hasp_login.

MBS Dongle Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

**Function:** Decrypts a buffer.
**Notes:**

Decrypts data using the decryption engine in the Sentinel HASP protection key.

**Function:** Decrypts a buffer.
**Notes:**

Decrypts data using the decryption engine in the Sentinel HASP protection key.

### 71.2.14 Detach(detachAction as string, scope as string, VendorCode as string, recipient as string, byref info as string) as Integer

MBS Dongle Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

**Function:** Detaches or cancels an attached license, according to customizable parameters
**Notes:**

You do not need to be logged in to a Sentinel HASP Feature in order to use this function.
This function is used to detach a license for a Product (i.e. all Sentinel HASP Features and Memory files which belong to this Product) from a HASP SL Protection key. The function returns a H2R file which must then be applied on the recipient machine using hasp_update() or the ACC.
This function only works with HASP SL Protection Keys; HASP HL Protection Keys are ignored.
This function can also be used on the recipient machine to cancel an attached license. In this case, the recipient parameter is ignored and should be set to NULL. For cancelling, the function returns a R2H file which must be applied on the host machine using hasp_update() or the ACC. If the detached Product is already expired, no R2H file will be returned.

The required Vendor Codes are stored in a VendorCodes folder in your system. Without the correct Vendor Code, the function call cannot succeed.

| Parameter | Description |
|---|---|
| detachAction: | Parameters for the operation, in XML format. For more information, see the accompanying Sentinel HASP Run-time API help documentation. |
| scope: | Search parameters for the Product that is to be detached |
| VendorCode: | The Vendor Code. |

You do not need to be logged in to a Sentinel Feature in order to use this function.

This function is used to perform the following task as per its
"action" parameter.
for "detach" action: detach a license for a Product (i.e. all Sentinel Features and Memory files which belong to this Product) from a Sentinel SL/SL-AdminMode/SL-UserMode key. The function returns a bufferwhich should be saved as H2R file.

for "cancel" action: This action runs on the recipient machine to cancel an attached license. In this case, the
recipient parameter is ignored and should be set to "". For cancelling, the function returns a buffer which must be applied on the host machine using Update() or ACC If the detached Product is already expired, no buffer will be returned.

for "rehost" action: create a tranferable a license for given container (i.e. all Sentinel Features and Memory files
which belong to this container) from SL-AdminMode/SL-UserMode Protection key. The function returns buffer on success which must be saved as V2C file. Update() or ACC is used to apply this on destination machine.

This function only works with Sentinel SL/SL-AdminMode/SL-UserMode Protection Keys; Sentinel HL Protection Keys are ignored.

The required Vendor Codes are stored in a VendorCodes folder in your system. Without the correct Vendor Code, the function call cannot succeed.

action: Parameters for the operation, in XML format. For more information, see the accompanying Sentinel Licensing API help documentation.
scope: Search parameters for the conatiner-id that is to be re-hosted. For more information, see the accompanying

VendorCode: The Vendor Code
recipient: Definition in XML format of the recipient computer, on which the detached Product will be installed.

This information can be retrieved using either GetInfo or GetSessionInfo together with the format specifier

info: String for the information that is retrieved, in XML format. This information is a V2C, which can then be installed on the destination computer via Update.

Lasterror property is set.

### 71.9.14 ReadProductId as UInt32

MBS Dongle Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

**Function:** Reads the 16-bit ProductId from the SG-Lock.
**Notes:**

Lasterror property is set.

The ProductId is an identifier that eases to distinguish between different protected applications of SG-Lock users. For example company X protects its application A and B with SG-Lock and gives all keys for application A the ProductId 1 and the keys for application B the ProductId 2, then all keys of application B are ”hidden“ for application A and vice versa. This simple mechanism offers an effective way to prevent confusion between keys of different applications. Setting of the ProductId should be integrated into the initial- ization process of the SG-Locks before distributing with the protected software.

Returns the ProductId assigned to dongle.
Lasterror is set.

### 71.9.15 ReadSerialNumber(ProductId as UInt32) as UInt32

MBS Dongle Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

**Notes:**

ProductId: Indicates the ProductId of the SG-Lock

Returns the serial number will be given back to the calling application

Lasterror property is set.

Every SG-Lock has a serial number that is unique, which is also not depending on type and interface.

### 71.9.16 SearchLock(ProductId as UInt32) as Boolean

MBS Dongle Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

**Function:** Searches for a SG-Lock device.
**Notes:**

ProductId: Indicates the ProductId of the SG-Lock looked for

Updates HardwareVersion, CounterCount, KeyCount, MemorySize, MemorySizeBytes, SerialNumber, SoftwareVersion, Type and InterfaceType properties.

### 71.9.17 SignData(ProductId as UInt32, AppSignKey as MemoryBlock, LockSignKeyNum as UInt32, LockSignInterval as UInt32 = 0, Data as MemoryBlock) as MemoryBlock

MBS Dongle Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

**Function:** Signs the data.
**Notes:**

The task will will be processed by the SG-Lock and if desired also by the application (PC-CPU) to accelerate the signing process (combined mode). Important condition for combined mode: Both keys (application and SG-Lock internal) have to be different, to ensure highest security! The signature is 64-bit long.

ProductId: Indicates the ProductId of the SG-Lock
AppSignKey: The 128-bit key used by the application for sign- ing and verification. Pointer to an array of 4 in- teger values of 32-bit. Only needed in combined mode otherwise set 0.
LockSignKeyNum: Number of 128-bit key in SG-Lock for signing and verification.
LockSignInterval: Indicates the partitioning of computing power between SG-Lock and application (PC-CPU). 0 is SG-Lock only. If >0 the value is used as the power of 2, where the result of that determines which block index is signed or verified by the SG-Lock. E.g. value= 8, 28ˆ=256, that means the first and after that every 256th block is processed by the SG-Lock and all others by the application (PC-CPU). That means 1/256= 0.4% of the task is done by the SG-Lock and 99.6% by the PC- CPU. The result is a very high acceleration of the process.
Data: Pointer to the memoryblock with of 32-bit values to sign or verify.

Returns signature as memoryblock.

Lasterror property is set.

The same value for the parameter LockSignInterval has to be used for signing and verifying a certain data block, when using different 128-bit keys in the SG-Lock and application (highly recommended for highest security). The reasons is, that the 128-bit key in the application is less safe than the 128-bit key in the SG-Lock. When a hacker succeeds to investigate the 128-bit key in the application (which is in principle possible), then he will try that also first for the SG-Lock. That will fail, if a differnt 128-bit key is used in the SG-Lock. For a deeper understanding of the function, please take a look into the SG-Lock include/header file for your programming language. You will find the source code of the function in it.

### 71.9.18 TeaDecipher(data as MemoryBlock, Key as MemoryBlock) as MemoryBlock

**Notes:**

Encryption happens in plugin using sample code from SG.
Data is memoryblock with 8 bytes of data.
Key is memoryblock with 16 bytes in size.

Lasterror property is set.

### 71.9.19 TeaEncipher(data as MemoryBlock, Key as MemoryBlock) as MemoryBlock

MBS Dongle Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

**Function:** Encrypt data.
**Notes:**

Encryption happens in plugin using sample code from SG.
Data is memoryblock with 8 bytes of data.
Key is memoryblock with 16 bytes in size.

Lasterror property is set.

### 71.9.20 VerifyData(ProductId as UInt32, AppSignKey as MemoryBlock, LockSignKeyNum as UInt32, LockSignInterval as UInt32 = 0, Data as MemoryBlock, Signature as MemoryBlock) as Boolean

MBS Dongle Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

**Function:** Verifies the signature with the data.
**Notes:**

The task will will be processed by the SG-Lock and if desired also by the application (PC-CPU) to accelerate the signing process (combined mode). Important condition for combined mode: Both keys (application and SG-Lock internal) have to be different, to ensure highest security! The signature is 64-bit long.

ProductId: Indicates the ProductId of the SG-Lock
AppSignKey: The 128-bit key used by the application for sign- ing and verification. Pointer to an array of 4 in- teger values of 32-bit. Only needed in combined mode otherwise set 0.
LockSignKeyNum: Number of 128-bit key in SG-Lock for signing and verification.
LockSignInterval: Indicates the partitioning of computing power between SG-Lock and application (PC-CPU). 0 is SG-Lock only. If >0 the value is used as the power of 2, where the result of that determines which block index is signed or verified by the SG-Lock. E.g. value= 8, 28ˆ=256, that means the first and after that every 256th block is processed by the SG-Lock and all others by the application (PC-CPU). That means 1/256= 0.4% of the task is done by the SG-Lock and 99.6% by the PC- CPU. The result is a very high acceleration of the process.
Data: Pointer to the memoryblock with of 32-bit values to sign or verify.
Signature: The signature as memory block.

Lasterror property is set.

The same value for the parameter LockSignInterval has to be used for signing and verifying a certain data block, when using different 128-bit keys in the SG-Lock and application (highly recommended for highest security). The reasons is, that the 128-bit key in the application is less safe than the 128-bit key in the SG-Lock. When a hacker succeeds to investigate the 128-bit key in the application (which is in principle possible), then he will try that also first for the SG-Lock. That will fail, if a differnt 128-bit key is used in the SG-Lock. For a deeper understanding of the function, please take a look into the SG-Lock include/header file for your programming language. You will find the source code of the function in it.

NSDraggingInfo messages should be sent to this object; you never need to create a class that implements the NSDraggingInfo protocol.

**Function:** Whether the dragging formation animates while the drag is over this destination.
**Notes:**

During the conclusion of an accepted drag, if this property is set to true, the drag manager will animate each dragging image to their NSDraggingFormationNone locations. Otherwise, the drag images are removed without any animation.

This property is inspected between prepareForDragOperation and performDragOperation. You should enumerate through the dragging items during performDragOperation to set the item's draggingFrame to the correct destinations.

Available in OS X v10.7 and later.
(Read and Write property)

### 72.3.12 draggedImage as Variant

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

**Function:** Returns the image being dragged.
**Notes:**

Value is a NSImageMBS object. Returned as Variant to reduce plugin dependencies.

This image object visually represents the data put on the pasteboard during the drag operation; however, it is the pasteboard data and not this image that is ultimately utilized in the dragging operation.

This method returns non-nil for a local drag, but nil for a cross-process drag. With the new multi-image dragging capabilities, a cross-process destination may participate and change the drag image. But it still

cannot get the current drag image.
(Read only property)

### 72.3.13 draggedImageLocation as NSPointMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

**Function:** Returns the current location of the dragged image's origin.
**Notes:**

Returns the dragged image's origin, in the base coordinate system of the destination object's window.
The image moves along with the mouse pointer (the position of which is given by draggingLocation) but may be positioned at some offset.
(Read only property)

### 72.3.14 draggingDestinationWindow as Variant

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

**Function:** Returns the destination window for the dragging operation.
**Notes:**

Value is a NSWindowMBS object. Returned as Variant to reduce plugin dependencies.

Either this window is the destination itself, or it contains the view object that is the destination.
(Read only property)

### 72.3.15 draggingFormation as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

**Function:** Returns the dragging formation while the drag is over this destination.
**Notes:**

Set this property to change the formation of the drag items. This is generally done during the updateDraggingItemsForDrag method or whenever you enumerate the dragging items.

The default value is the current drag formation.

Note: Set this property before or after the NSDraggingInfo or NSDraggingSession class's method enumerateDraggingItemsWithOptions not inside the enumeration Block.

Available in OS X v10.7 and later.
(Read and Write property)

### 72.3.16 draggingLocation as NSPointMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

**Function:** Returns the current location of the mouse pointer in the base coordinate system of the destination object's window.
**Notes:** (Read only property)

### 72.3.17 draggingPasteboard as Variant

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

**Function:** Returns the pasteboard object that holds the data being dragged.
**Notes:**

Value is a NSPasteboardMBS object. Returned as Variant to reduce plugin dependencies.

The dragging operation that is ultimately performed utilizes this pasteboard data and not the image returned by the draggedImage method.
(Read only property)

### 72.3.18 draggingSequenceNumber as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

**Function:** Returns a number that uniquely identifies the dragging session.
**Notes:** (Read only property)

### 72.3.19 draggingSource as Variant

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

**Function:** Returns the source, or owner, of the dragged data.
**Notes:**

This method returns nil if the source is not in the same application as the destination. The dragging source implements methods from the NSDraggingSource protocol.
(Read only property)

### 72.3.20 draggingSourceOperationMask as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

**Function:** Returns the dragging operation mask of the dragging source.
**Notes:**

The dragging operation mask, which is declared by the dragging source through the NSDraggingSource sourceOperationMaskForDraggingContext method (preferred) or the NSDraggingSource draggingSourceOperationMaskForLocal method. If the source does not permit any dragging operations, this method should return NSDragOperationNone.

If the source permits dragging operations, the elements in the mask are one or more of the constants described in "Obtaining Information About the Dragging Session", combined using the C bitwise OR operator.

If the user is holding down a modifier key during the dragging session and the source does not prohibit modifier keys from affecting the drag operation (through its ignoreModifierKeysWhileDragging method), then the operating system combines the dragging operation value that corresponds to the modifier key (see the descriptions below) with the source's mask using the C bitwise AND operator.

The modifier keys are associated with the dragging operation options shown below:

| Modifier Key | Dragging Operation |
|---|---|
| Control | NSDragOperationLink |
| Option | NSDragOperationCopy |
| Command | NSDragOperationGeneric |

(Read only property)

### 72.3.21 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

**Function:** The internal object reference.
**Notes:** (Read and Write property)

### 72.3.22 numberOfValidItemsForDrop as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

**Function:** Specifies the number of valid items for a drop operation.

**Notes:**

During draggingEntered or draggingUpdated, you are responsible for returning the drag operation. In some cases, you may accept some, but not all items on the dragging pasteboard. (For example, your application may only accept image files.)

If you only accept some of the items, set this property to the number of items accepted so the drag manager can update the drag count badge.

When updateDraggingItemsForDrag is called, you should set the image of non-valid dragging items to nil. If none of the drag items are valid then you should not updateItems, simply return NSDragOperationNone from your implementation of draggingEntered and, or draggingUpdated and do not modify any drag item properties.

Available in OS X v10.7 and later.
(Read and Write property)

This method simplifies modifying the components of an NSDraggingItem when there is only one component.

This is a convenience method. This method sets the draggingFrame and creates a single NSDraggingImageComponent instance with one image corresponding to the NSDraggingImageComponentIconKey key. You should only use this method under the following conditions: the drag image for this item is composed of a single image., or there are a reasonable number of dragging item instances being created or enumerated.

This method will set the draggingFrame and imageComponents properties.
Available in OS X v10.7 and later.

**Notes:**

pic: the picture to use.
width and height: The size of the picture.
x and y: The location of the cursor within the drag image. The point should contain the offset from the upper-left corner of the drag image to the location of the cursor.

Requires Windows 2000 Professional with SP3, Windows XP.
On success the HelperHandle property is not zero.

Turn off antialiasing when drawing text. Otherwise, artifacts could occur at the edges, between the text color and the color key.

This function takes the picture (and it's mask) and turns it in a nice drag picture. This includes applying the mask and passing black for the background color. Dark colors which should be transparent will be made lighter.

## 72.8 class WindowsDragSourceMBS

### 72.8.1 class WindowsDragSourceMBS

MBS Win Plugin, Plugin Version: 10.5, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The class for Drag and Drop on Windows to create a drag source.
**Notes:**

The WindowsDragSourceMBS class is one of the class you implement to provide drag-and-drop operations in your application. It contains methods used in any application used as a data source in a drag-and-drop operation. The data source application in a drag-and-drop operation is responsible for:

- Determining the data being dragged based on the user's selection.
- Initiating the drag-and-drop operation based on the user's mouse actions.
- Generating some of the visual feedback during the drag-and-drop operation, such as setting the cursor and highlighting the data selected for the drag-and-drop operation.
- Canceling or completing the drag-and-drop operation based on the user's mouse actions.
- Performing any action on the original data caused by the drop operation, such as deleting the data on a drag move.

WindowsDragSourceMBS contains the events for generating visual feedback to the end user and for canceling or completing the drag-and-drop operation.

When To Implement

Implement WindowsDragSourceMBS if you are developing a container or server application that can act as a data source for a drag-and-drop operation. The WindowsDragSourceMBS interface is only required during the drag-and-drop operation.

If you implement the WindowsDragSourceMBS class, you must also implement the DataObjectMBS class on the same object to represent the data being transferred.

You can use the same implementation of DataObjectMBS for drag-and-drop data as for the data object offered to the clipboard. After you have implemented clipboard operations in your application, you can add drag-and-drop operations with only a little extra work.

When To Use

You do not usually call the WindowsDragSourceMBS methods directly. Instead, your data source calls the DoDragDrop function when it detects that the user has initiated a drag-and-drop operation. Then, DoDragDrop calls the WindowsDragSourceMBS methods during the drag-and-drop operation.

For example, DoDragDrop calls WindowsDragSourceMBS.GiveFeedback when you need to change the cursor shape or when you need to provide some other visual feedback. DoDragDrop calls WindowsDragSourceMBS.QueryContinueDrag when there is a change in the mouse button state to determine if the drag-and-drop operation was canceled or completed.

While the drag classes compile for Web Edition, they run on the server, so they have no effect on the client browser!

### 72.8.4 Methods

### 72.8.5 DoDragDrop(dataObject as WinDataObjectMBS, OKEffect as Integer, byref Effect as Integer) as Integer

MBS Win Plugin, Plugin Version: 10.5, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** Carries out an OLE drag and drop operation.
**Notes:**

Parameters:

dataObject: The WinDataObjectMBS data object that contains the data being dragged.
OKEffects: Effects the source allows in the OLE drag-and-drop operation. Most significant is whether it permits a move. The OKEffect and Effect parameters obtain values from the DROPEFFECT* constants.
Effect: Pointer to a value that indicates how the OLE drag-and-drop operation affected the source data. The pdwEffect parameter is set only if the operation is not canceled.

This function returns S_OK on success. Other possible values include the following.

Remarks

| Return code | Description |
|---|---|
| DRAGDROP_S_DROP | The OLE drag-and-drop operation was successful. |
| DRAGDROP_S_CANCEL | The OLE drag-and-drop operation was canceled. |
| E_UNSPEC | Unexpected error occurred. |

If you are developing an application that can act as a data source for an OLE drag-and-drop operation, you must call DoDragDrop when you detect that the user has started an OLE drag-and-drop operation.

The DoDragDrop function enters a loop in which it calls various methods in the WindowsDragSourceMBS and WindowsDropTargetMBS interfaces. (For a successful drag-and-drop operation, the application acting as the data source must also implement WindowsDragSourceMBS, while the target application must implement WindowsDropTargetMBS.)

The DoDragDrop function determines the window under the current cursor location. It then checks to see if this window is a valid drop target.

If the window is a valid drop target, DoDragDrop calls WindowsDropTargetMBS.DragEnter. This method supplies an effect code indicating what would happen if the drop actually occurred. For a list of valid drop effects, see the DROPEFFECT* constants.

DoDragDrop calls WindowsDragSourceMBS.GiveFeedback with the effect code so that the drop source interface can provide appropriate visual feedback to the user.

DoDragDrop tracks mouse cursor movements and changes in the keyboard or mouse button state.

If the user moves out of a window, DoDragDrop calls WindowsDropTargetMBS.DragLeave.

If the mouse enters another window, DoDragDrop determines if that window is a valid drop target and then calls WindowsDropTargetMBS.DragEnter for that window.

If the mouse moves but stays within the same window, DoDragDrop calls WindowsDropTargetMBS.DragOver.

If there is a change in the keyboard or mouse button state, DoDragDrop calls WindowsDragSourceMBS.QueryContinueDrag and determines whether to continue the drag, to drop the data, or to cancel the operation based on the return value.

If the return value is S_OK, DoDragDrop first calls WindowsDropTargetMBS.DragOver to continue the operation. This method returns a new effect value and DoDragDrop then calls WindowsDragSourceMBS.GiveFeedback with the new effect so appropriate visual feedback can be set. For a list of valid drop effects, see the DROPEFFECT constants. WindowsDropTargetMBS.DragOver and WindowsDragSourceMBS.Give-

Feedback are paired so that as the mouse moves across the drop target, the user is given the most up-to-date feedback on the mouse's position.

If the return value is DRAGDROP_S_DROP, DoDragDrop calls WindowsDropTargetMBS.Drop. The DoDragDrop function returns the last effect code to the source, so the source application can perform the appropriate operation on the source data, for example, cut the data if the operation was a move.

If the return value is DRAGDROP_S_CANCEL, the DoDragDrop function calls WindowsDropTargetMBS.DragLeave.

### 72.8.6 Properties

### 72.8.7 Handle as Integer

**Function:** The internal handle.
**Notes:** (Read and Write property)

### 72.8.8 Events

### 72.8.9 GiveFeedback(Effect as Integer) as Integer

MBS Win Plugin, Plugin Version: 10.5, Platform: Windows, Targets: .

**Function:** Enables a source application to give visual feedback to the end user during a drag-and-drop operation by providing the DoDragDrop function with an enumeration value specifying the visual effect.
**Notes:**

Effect: The drop effect value returned by the most recent call to WindowsDropTargetMBS.DragEnter, WindowsDropTargetMBS.DragOver, or WindowsDropTargetMBS.DragLeave.

Return S_OK on success. Return DRAGDROP_S_USEDEFAULTCURSORS to indicate successful completion of the method, and requests OLE to update the cursor using the OLE-provided default cursors.

When your application detects that the user has started a drag-and-drop operation, it should call the DoDragDrop function. DoDragDrop enters a loop, calling WindowsDropTargetMBS.DragEnter when the mouse first enters a drop target window, WindowsDropTargetMBS.DragOver when the mouse changes its position within the target window, and WindowsDropTargetMBS.DragLeave when the mouse leaves the target window.

For every call to either WindowsDropTargetMBS.DragEnter or WindowsDropTargetMBS.DragOver, DoDragDrop calls WindowsDropTargetMBS.GiveFeedback, passing it the drop effect value returned from the drop target call.

DoDragDrop calls WindowsDropTargetMBS.DragLeave when the mouse has left the target window. Then, DoDragDrop calls WindowsDropTargetMBS.GiveFeedback and passes the DROPEFFECT_NONE value in the dwEffect parameter.

The Effect parameter can include DROPEFFECT_SCROLL, indicating that the source should put up the drag-scrolling variation of the appropriate pointer.

Notes to Implementers

This function is called frequently during the DoDragDrop loop, so you can gain performance advantages if you optimize your implementation as much as possible.

GiveFeedback is responsible for changing the cursor shape or for changing the highlighted source based on the value of the dwEffect parameter. If you are using default cursors, you can return DRAGDROP_S_USEDEFAULTCURSORS, which causes OLE to update the cursor for you, using its defaults.

### 72.8.10 QueryContinueDrag(EscapePressed as boolean, KeyState as Integer) as Integer

MBS Win Plugin, Plugin Version: 10.5, Platform: Windows, Targets: .

**Function:** Determines whether a drag-and-drop operation should be continued, canceled, or completed. You do not call this method directly.
**Notes:**

The OLE DoDragDrop function calls this method during a drag-and-drop operation.

EscapePressed: Indicates whether the Esc key has been pressed since the previous call to QueryContinueDrag or to DoDragDrop if this is the first call to QueryContinueDrag. A true value indicates the end user has pressed the escape key; a false value indicates it has not been pressed.

KeyState: The current state of the keyboard modifier keys on the keyboard. Possible values can be a combination of any of the flags MK_CONTROL, MK_SHIFT, MK_ALT, MK_BUTTON, MK_LBUTTON, MK_MBUTTON, and MK_RBUTTON.

This event can return the following values.

| Return code | Description |
|---|---|
| S_OK | The drag operation should continue. This result occurs if no errors are detected, the mouse button starting the drag-and-drop operation has not been released, and the Esc key has not been detected. |
| DRAGDROP_S_DROP | The drop operation should occur completing the drag operation. This result occurs if KeyState indicates that the key that started the drag-and-drop operation has been released. |
| DRAGDROP_S_CANCEL | The drag operation should be canceled with no drop operation occurring. This result occurs if EscapePressed is true, indicating the Esc key has been pressed. |

The DoDragDrop function calls QueryContinueDrag whenever it detects a change in the keyboard or mouse button state during a drag-and-drop operation. QueryContinueDrag must determine whether the drag-and-drop operation should be continued, canceled, or completed based on the contents of the parameters KeyState and EscapePressed.

MBS Win Plugin, Plugin Version: 10.5.

**Function:** One of the OLE error codes.

### 72.8.15 DROPEFFECT_COPY = 1

MBS Win Plugin, Plugin Version: 10.5.

**Function:** One of the drop effect constants.
**Notes:**

Drop results in a copy. The original data is untouched by the drag source.

Your application should always mask drop effect constants to ensure compatibility with future implementations. Presently, only some of the bit positions in a drop effect value have meaning. In the future, more interpretations for the bits will be added. Drag sources and drop targets should carefully mask these values appropriately before comparing. They should never compare a drop effect value against, say, DROPEFFECT_COPY by doing the following:

if DropEffect = DROPEFFECT_COPY then

Instead, the application should always mask for the value or values being sought as using one of the following techniques:

if bitwiseAnd(DropEffect, DROPEFFECT_COPY) = DROPEFFECT_COPY then

This allows for the definition of new drop effects, while preserving backwards compatibility with existing code.

## 72.9 class WindowsDropTargetMBS

### 72.9.1 class WindowsDropTargetMBS

MBS Win Plugin, Plugin Version: 10.5, Platform: Windows, Targets: Desktop, Console & Web.

**Function:** The WindowsDropTargetMBS interface is one of the interfaces you implement to provide drag-and-drop operations in your application.
**Notes:**

It contains methods used in any application that can be a target for data during a drag-and-drop operation. A drop-target application is responsible for:

- Determining the effect of the drop on the target application.
- Incorporating any valid dropped data when the drop occurs.
- Communicating target feedback to the source so the source application can provide appropriate visual feedback such as setting the cursor.
- Implementing drag scrolling.
- Registering and revoking its application windows as drop targets.

The WindowsDropTargetMBS class contains methods that handle all these responsibilities except registering and revoking the application window as a drop target, for which you must call the AttachToWindow functions.

When To Implement

Implement the WindowsDropTargetMBS interface if you are developing an application that can act as a target for a drag-and-drop operation. The WindowsDropTargetMBS interface is associated with your application windows and is implemented on your window objects. Call the AttachToWindow function to register your window objects as drop targets.

When To Use

You do not call the methods of WindowsDropTargetMBS directly. The DoDragDrop function calls the WindowsDropTargetMBS methods during the drag-and-drop operation.

For example, DoDragDrop calls WindowsDropTargetMBS.DragEnter when it detects the mouse has moved over a window that is registered as a drag target. After the mouse has entered a drag-target window, DoDragDrop calls WindowsDropTargetMBS.DragOver as the mouse moves through the window and calls WindowsDropTargetMBS.DragLeave if the mouse leaves the target window or if the user cancels or completes the drag-and-drop operation. DoDragDrop calls WindowsDropTargetMBS.Drop if the drop finally

occurs.

To see the ghost picture of the drag, please register a WindowsDragSourceMBS for the same window.

While the drag classes compile for Web Edition, they run on the server, so they have no effect on the client browser!

### 72.9.13 DragEnter(dataObject as WinDataObjectMBS, keystate as Integer, x as Integer, y as Integer, byref effect as Integer) as Integer

MBS Win Plugin, Plugin Version: 10.5, Platform: Windows, Targets: .

**Function:** Indicates whether a drop can be accepted, and, if so, the effect of the drop.
**Notes:**

dataObject: This data object contains the data being transferred in the drag-and-drop operation. If the drop occurs, this data object will be incorporated into the target.

KeyState: The current state of the keyboard modifier keys on the keyboard. Possible values can be a combination of any of the flags MK_CONTROL, MK_SHIFT, MK_ALT, MK_BUTTON, MK_LBUTTON, MK_MBUTTON, and MK_RBUTTON.

x and y: A point containing the current cursor coordinates in screen coordinates.

effect: The value of the Effect parameter of the DoDragDrop function. On return, must contain one of the DROPEFFECT flags, which indicates what the result of the drop operation would be.

Return S_OK on success. Other possible values include the following.

| Return code | Description |
|---|---|
| E_UNEXPECTED | An unexpected error has occurred. |
| E_INVALIDARG | The Effect parameter is NULL on input. |
| E_OUTOFMEMORY | There was insufficient memory available for this operation. |

You do not call DragEnter directly; instead the DoDragDrop function calls it to determine the effect of a drop the first time the user drags the mouse into the registered window of a drop target.

To implement DragEnter, you must determine whether the target can use the data in the source data object by checking three things:

- The format and medium specified by the data object
- The input value of Effect
- The state of the modifier keys

To check the format and medium, use the WinDataObjectMBS object.

On entry to WindowsDropTargetMBS.DragEnter, the Effect parameter is set to the effects given to the OkEffect parameter of the DoDragDrop function. The WindowsDropTargetMBS.DragEnter method must choose one of these effects or disable the drop.

The following modifier keys affect the result of the drop.

On return, the method must write the effect, one of the DROPEFFECT flags, to the Effect parameter. DoDragDrop then takes this parameter and writes it to its Effect parameter. You communicate the effect

| Key Combination | User-Visible Feedback | Drop Effect |
|---|---|---|
| CTRL + SHIFT | = | DROPEFFECT_LINK |
| CTRL | + | DROPEFFECT_COPY |
| No keys or SHIFT | None | DROPEFFECT_MOVE |

of the drop back to the source through DoDragDrop in the Effect parameter. The DoDragDrop function then calls WindowsDragSourceMBS.GiveFeedback so that the source application can display the appropriate visual feedback to the user through the target window.

### 72.9.14 DragLeave as Integer

MBS Win Plugin, Plugin Version: 10.5, Platform: Windows, Targets: .

**Function:** Removes target feedback and releases the data object.
**Notes:**

Return S_OK on success. Other possible values include the following.

| Return code | Description |
|---|---|
| E_OUTOFMEMORY | There is insufficient memory available for this operation. |

You do not call this method directly. The DoDragDrop function calls this method in either of the following cases:

- When the user drags the cursor out of a given target window.
- When the user cancels the current drag-and-drop operation.

To implement WindowsDropTargetMBS.DragLeave, you must remove any target feedback that is currently displayed. You must also release any references you hold to the data transfer object.

### 72.9.15 DragOver(keystate as Integer, x as Integer, y as Integer, byref effect as Integer) as Integer

MBS Win Plugin, Plugin Version: 10.5, Platform: Windows, Targets: .

**Function:** Provides target feedback to the user and communicates the drop's effect to the DoDragDrop function so it can communicate the effect of the drop back to the source.
**Notes:**

KeyState: The current state of the keyboard modifier keys on the keyboard. Valid values can be a combination of any of the flags MK_CONTROL, MK_SHIFT, MK_ALT, MK_BUTTON, MK_LBUTTON,

MK_MBUTTON, and MK_RBUTTON.
x and y: The point containing the current cursor coordinates in screen coordinates.
Effect: On input, pointer to the value of the Effect parameter of the DoDragDrop function. On return, must contain one of the DROPEFFECT flags, which indicates what the result of the drop operation would be.

Return S_OK on success. Other possible values include the following.

| Return code | Description |
|---|---|
| E_UNEXPECTED | An unexpected error has occurred. |
| E_INVALIDARG | The Effect value is not valid. |
| E_OUTOFMEMORY | There was insufficient memory available for this operation. |

You do not call DragOver directly. The DoDragDrop function calls this method each time the user moves the mouse across a given target window. DoDragDrop exits the loop if the drag-and-drop operation is canceled, if the user drags the mouse out of the target window, or if the drop is completed.

In implementing WindowsDropTargetMBS.DragOver, you must provide features similar to those in WindowsDropTargetMBS.DragEnter. You must determine the effect of dropping the data on the target by examining the FORMATETC defining the data object's formats and medium, along with the state of the modifier keys. The mouse position may also play a role in determining the effect of a drop. The following modifier keys affect the result of the drop.

| Key Combination | User-Visible Feedback | Drop Effect |
|---|---|---|
| CTRL + SHIFT | = | DROPEFFECT_LINK |
| CTRL | + | DROPEFFECT_COPY |
| No keys or SHIFT | None | DROPEFFECT_MOVE |

You communicate the effect of the drop back to the source through DoDragDrop in Effect. The DoDragDrop function then calls WindowsDragSourceMBS.GiveFeedback so the source application can display the appropriate visual feedback to the user.

On entry to WindowsDropTargetMBS.DragOver, the Effect parameter must be set to the allowed effects passed to the OkEffect parameter of the DoDragDrop function. The WindowsDropTargetMBS.DragOver method must be able to choose one of these effects or disable the drop.

Upon return, Effect is set to one of the DROPEFFECT flags. This value is then passed to the Effect parameter of DoDragDrop. Reasonable values are DROPEFFECT_COPY to copy the dragged data to the target, DROPEFFECT_LINK to create a link to the source data, or DROPEFFECT_MOVE to allow the dragged data to be permanently moved from the source application to the target.

You may also wish to provide appropriate visual feedback in the target window. There may be some target feedback already displayed from a previous call to WindowsDropTargetMBS.DragOver or from the initial

WindowsDropTargetMBS.DragEnter. If this feedback is no longer appropriate, you should remove it.

For efficiency reasons, a data object is not passed in WindowsDropTargetMBS.DragOver. The data object passed in the most recent call to WindowsDropTargetMBS.DragEnter is available and can be used.

When WindowsDropTargetMBS.DragOver has completed its operation, the DoDragDrop function calls WindowsDragSourceMBS.GiveFeedback so the source application can display the appropriate visual feedback to the user.

Notes to Implementers

This function is called frequently during the DoDragDrop loop so it makes sense to optimize your implementation of the DragOver method as much as possible.

### 72.9.16 Drop(dataObject as WinDataObjectMBS, keystate as Integer, x as Integer, y as Integer, byref effect as Integer) as Integer

MBS Win Plugin, Plugin Version: 10.5, Platform: Windows, Targets: .

**Function:** Incorporates the source data into the target window, removes target feedback, and releases the data object.
**Notes:**

dataObject: The data object being transferred in the drag-and-drop operation.
KeyState: The current state of the keyboard modifier keys on the keyboard. Possible values can be a combination of any of the flags MK_CONTROL, MK_SHIFT, MK_ALT, MK_BUTTON, MK_LBUTTON, MK_MBUTTON, and MK_RBUTTON.
x and y: The point containing the current cursor coordinates in screen coordinates.
Effect: On input, the value of the Effect parameter of the DoDragDrop function. On return, must contain one of the DROPEFFECT flags, which indicates what the result of the drop operation would be.

Return S_OK on success. Other possible values include the following.

| Return code | Description |
|---|---|
| E_UNEXPECTED | An unexpected error has occurred. |
| E_INVALIDARG | The pdwEffect parameter is not valid. |
| E_OUTOFMEMORY | There is insufficient memory available for this operation. |

You do not call this method directly. The DoDragDrop function calls this method when the user completes the drag-and-drop operation.

In implementing Drop, you must incorporate the data object into the target. Use the formats available in WinDataObjectMBS, available through dataObject, along with the current state of the modifier keys to determine how the data is to be incorporated, such as linking or embedding.

In addition to incorporating the data, you must also clean up as you do in the WindowsDropTargetMBS.DragLeave method:

Remove any target feedback that is currently displayed.
Release any references to the data object.
You also pass the effect of this operation back to the source application through DoDragDrop, so the source application can clean up after the drag-and-drop operation is complete:

Remove any source feedback that is being displayed.
Make any necessary changes to the data, such as removing the data if the operation was a move.

### 72.9.17 Constants

### 72.9.18 DROPEFFECT_COPY = 1

MBS Win Plugin, Plugin Version: 10.5.

**Function:** One of the drop effect constants.
**Notes:**

Drop results in a copy. The original data is untouched by the drag source.

Your application should always mask drop effect constants to ensure compatibility with future implementations. Presently, only some of the bit positions in a drop effect value have meaning. In the future, more interpretations for the bits will be added. Drag sources and drop targets should carefully mask these values appropriately before comparing. They should never compare a drop effect value against, say, DROPEFFECT_COPY by doing the following:

if DropEffect = DROPEFFECT_COPY then

Instead, the application should always mask for the value or values being sought as using one of the following techniques:

if bitwiseAnd(DropEffect, DROPEFFECT_COPY) = DROPEFFECT_COPY then

This allows for the definition of new drop effects, while preserving backwards compatibility with existing code.

1. Initialize the playback framework with calling Open. The DVDPlayback framework can only be opened by one process at a time. If a second process attempts to initialize it, an error will be returned.

2. Set the playback window with SetPlayWindow.
4. Set the video bounds with SetVideoBounds. This is the bounds within the window and is in port coordinates.
5. Open the media with OpenMediaVolume (DVD disc) or OpenMediaFile (VIDEO_TS folder).
6. Play the media.
7. When finished or switching media, close with the appropriate call (CloseMediaVolume or CloseMediaFile)
8. When quitting or finishing session, tear down the DVDPlayback framework with calling close.

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The class for a callback for use in declares.
**Notes:**

Allows you to dynamically create callback functions.
Pass the function pointer to a C function which later calls back your callback.

Please make sure this callback object stays alive, e.g. stored in a global property. When the object is released and the callback later invoked, the application will crash.

### 75.1.6 Methods

### 75.1.7 Constructor(Signature as String)

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Creates a new callback object.
**Notes:**

Please pass a valid signature, e.g. "(pi)v" for a function taking one pointer, one integer and return nothing (void).
If the signature doesn't match the values put on the stack, the app may crash.

### 75.1.8 ParameterType(Index as Integer) as String

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Queries type of a parameter.
**Notes:** Index in range from 0 to ParameterCount-1.

### 75.1.9 Properties

### 75.1.10 AllowAsync as Boolean

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Whether the callbacks are allowed to go asynchronously.
**Notes:**

For MacOS/iOS only.

Asynchronous callbacks have no chance to return a value as the call to the Xojo event happens later and the C function returns before the Xojo event is started.
Synchronous callbacks would let the callback wait for the Xojo main thread to react to the event and then return the result back.

AllowAsync is set to true automatically for callbacks with void as return automatically.
(Read and Write property)

### 75.1.11 CallCount as Integer

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The call counter.

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Sets whether a parameter needs to be retained via CFRetain() call.
**Notes:**

If the callback is within Apple's frameworks passing a CoreFoundation object, you can set this property to true, so we call CFRetain method on it in the callback and later release when the Xojo event was called.
This allows to avoid crashes with CoreFoundation objects passed from one thread to another thread for multi threaded callbacks.

Parameter must be of type pointer.
(Read and Write computed property)

### 75.1.20 ParameterCopyString(Index as Integer) as Boolean

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Sets whether a parameter needs to be copied as a zero terminated string.
**Notes:**

If the callback receives a C string, you can set this property to true, so we copy it in the callback and later release when the Xojo event was called.
This allows to avoid crashes with strings passed from one thread to another thread for multi threaded callbacks.

Parameter must be of type pointer or string.
(Read and Write computed property)

### 75.1.21 ParameterNSRetain(Index as Integer) as Boolean

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Sets whether a parameter needs to be retained via [ NSObject retain ] call.
**Notes:**

If the callback is within Apple's frameworks passing a Objective-C object, you can set this property to true, so we call retain method on it in the callback and later release when the Xojo event was called.
This allows to avoid crashes with NSObject objects passed from one thread to another thread for multi threaded callbacks.

### 76.39.1 class DynaPDFMBS

MBS DynaPDF Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** The dynapdf class.
**Notes:**

A pdf library to create, modify, import pdf files.
You need a separate dynapdf license key for this class.

Please note that all constants have the prefix k. In the dynapdf_help.pdf file, the constants don't have a k prefix. And the C functions there have IPDF parameters which the plugin automatically passes for you. So

SI32 pdfSetPageCoords(const void* IDPF, TPageCoord PageCoords)

translates in Xojo to

function SetPageCoords(PageCoords as Integer) as Integer

and you call it like this:

call pdf.SetPageCoords pdf.kpcTopDown

where in this sample the DynaPDF object is named pdf.

Pro license is required for the following functions:

- BeginTransparencyGroup
- ConvertColors
- Create3DAnnot
- CreateSoftMask
- FlattenForm
- GetPageText
- ImportPage and ImportPageEx
- ParseContent

- RenderAnnotOrField
- RenderPage
- SetCMapDir
- SetExtColorSpace, SetExtFillColorSpace and SetExtStrokeColorSpace.
- SetUseGlobalImpFiles

Lite is required for:

- AddRenderingIntent and AddRenderingIntentEx
- CreateFormFields
- CloseFileEx
- ConvertEMFSpool
- CreateCollection
- CreateExtGState
- InsertMetafile and InsertMetafileEx
- OpenImportBuffer, OpenImportFile and OpenImportStream
- SetPDFVersion for PDF/A and PDF/X

And all functions relaying on those functions internally.

### 76.39.8 Methods

### 76.39.9 ActivateAltFontList(FontListHandle as Integer, EnableSysFonts as Boolean) as Boolean

MBS DynaPDF Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** Activates or deactivates an alternate font list that was created by CreateAltFontList().
**Notes:**

An alternate font list represents a list of fallback fonts which are tested if one or more required glyphs were not found in the current font.
If no compatible font was found in the list, then system fonts are tested if EnableSysFonts was set to true. Although EnableSysFonts should be set to true in most cases, it is sometimes useful to disable system fonts, e.g. to restrict the number of fonts which can be embeded.
In order to disable the current alternate font list set the parameter Handle to -1. The value of EnableSysFonts is ignored this case. To fully deactivate font substitution disable system fonts with SetUseSystemFonts() before calling a text function.
Please note that alternate font lists are used only, if complex text layout was enabled. This can be done by setting the flag kgfComplexText with SetGStateFlags().

This function adds a search path to the list of available font search paths. An arbitrary number of search paths can be added at runtime. Subdirectories are included recursively if the parameter Recursive is true. DynaPDF requires no separate metric files for Type1 fonts.

The list of search directories can be cleared at runtime with the function ClearHostFonts().

If system fonts are enabled (default) DynaPDF adds the default font directories of the operating system automatically to the list of font search paths (Windows and Mac OSX only, see SetUseSystemFonts() for further information). On Windows this is the % Windows% /Fonts directory as well as fonts listed in the Registry and linked fonts.

On Mac OSX the following directories are added to the list of font search paths (in this order):

- users font folder in
  textasciitilde /Library/Fonts
- /Library/Fonts
- /System/Library/Fonts

If the function succeeds the function returns the number of found font files (this is maybe not the number of available fonts, because the list is cleared each time all fonts in the list are processed during font selection). If the function fails a negative error code is returned.

Please call this method on Linux to get fonts loaded from your font folder.
See also AddFontSearchPath function in DynaPDF manual.

### 76.39.33 AddFontSearchPath(path as string, recursive as boolean = true) as Integer

MBS DynaPDF Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

**Function:** This function adds a search path to the list of available font search paths.
**Example:**

```
dim d as new DynaPDFMBS
if TargetLinux then
call d.AddFontSearchPath "/usr/share/fonts/truetype", true
else
// on Mac and Windows we use system fonts.
end if
```

**Notes:**

This function adds a search path to the list of available font search paths. An arbitrary number of search paths can be added at runtime. Subdirectories are included recursively if the parameter Recursive is true. DynaPDF requires no separate metric files for Type1 fonts.

This function is implemented in an ANSI and Unicode compatible version. However, Unicode file paths are converted back to ANSI on Windows. On non-Windows operating systems the path is converted to UTF-8 and passed to the ANSI version of the function.

The list of search directories can be cleared at runtime with the function ClearHostFonts().

If system fonts are enabled (default) DynaPDF adds the default font directories of the operating system automatically to the list of font search paths (Windows and Mac OSX only, see SetUseSystemFonts() for further information). On Windows this is the % Windows% /Fonts directory as well as fonts listed in the Registry and linked fonts.

On Mac OSX the following directories are added to the list of font search paths (in this order):

- users font folder in
  textasciitilde /Library/Fonts
- /Library/Fonts
- /System/Library/Fonts

If the function succeeds the function returns the number of found font files (this is maybe not the number of available fonts, because the list is cleared each time all fonts in the list are processed during font selection). If the function fails a negative error code is returned.

Please call this method on Linux to get fonts loaded from your font folder.

**Notes:**

For the filter you use one of the kcf* constants.
For the flags you use either kicNone of kicUseCCITT4.

TIFF is the only format that supports different compression filters. The Filter parameter of the function AddImage() is ignored if the image format supports only one specific compression filter.
Note that images are automatically converted to the nearest supported color space if the image format does not support the color space of the image.
See also AddImage function in DynaPDF manual.

### 76.39.35 AddInkList(InkAnnot as UInt32, points() as DynaPDFPointMBS) as boolean

**Notes:**

The function must be called within an open page.
An ink annotation can contain an arbitrary number of paths. The points will be connected by curves to achieve a smooth transition between points. The coordinates are treated in current user space. Any transformation that was applied on the coordinate system will be taken into account.
If the number of points is zero then all paths will be deleted from the annotation.

Returns true on success.
